  Note: Examples of a response include decreased pain or stiffness, improved function or activities of daily living. The patient may not have a full response, but there should have been a recent or past response to Cosentyx.

S) Plaque Psoriasis. Approve for the duration noted if the patient meets ONE of the following (A or B):
- **A)** Initial Therapy. Approve for 3 months if the patient meets ALL of the following criteria (i, ii, and iii):
  - **i.** Patient is ≥ 18 years of age; AND
  - **ii.** Patient meets ONE of the following conditions (a or b):
    - **1.** Patient has tried at least at least one traditional systemic agent for psoriasis for at least 3 months, unless intolerant; OR
      Note: Examples include methotrexate, cyclosporine, acitretin, or psoralen plus ultraviolet A light (PUVA). An exception to the requirement for a trial of one traditional systemic

agent for psoriasis can be made if the patient has already has a 3-month trial or previous intolerance to at least one biologic for this condition. (Refer to **Appendix** for examples of biologics used for psoriasis.) These patients who have already tried a biologic for psoriasis are not required to "step back" and try a traditional systemic agent for psoriasis).

2. Patient has a contraindication to methotrexate, as determined by the prescriber; AND

iii. Cosentyx is prescribed by or in consultation with a dermatologist.

B) Patient is Currently Receiving Cosentyx. Approve for 3 years if the patient has responded, as determined by the prescriber.
Note: Patient may not have a full response, but there should have been a recent or past response to Cosentyx.

T) Psoriatic Arthritis. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if Cosentyx is prescribed by or in consultation with a rheumatologist or a dermatologist.

B) Patient is Currently Receiving Cosentyx. Approve for 3 years if the patient has responded, as determined by the prescriber.
Note: Examples of a response include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improvements in acute phase reactants (for example, C-reactive protein). The patient may not have a full response, but there should have been a recent or past response to Cosentyx.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Cosentyx is not recommended in the following situations:

1. **Concurrent Use with other Biologics or Targeted Synthetic Disease-Modifying Antirheumatic Drugs (DMARDs).** Cosentyx should not be administered in combination with another biologic or targeted synthetic DMARD used for an inflammatory condition (See Appendix for examples). Combination therapy is generally not recommended due to a potential for a higher rate of adverse effects with combinations and lack of evidence for additive efficacy.
Note: This does NOT exclude the use of conventional synthetic DMARDs (e.g., methotrexate, leflunomide, hydroxychloroquine, and sulfasalazine) in combination with Cosentyx.

185. **Crohn's Disease.** Exacerbations of Crohn's disease, in some cases serious, occurred in clinical trials with Cosentyx-treated patients.[1] In a Phase II published study in patients with Crohn's disease (n = 59), an intravenous formulation of Cosentyx did not reduce the Crohn's disease activity index by ≥ 50 points compared with placebo and the study was terminated prematurely.[6]

186. **Patients < 18 Years of Age.** Cosentyx is indicated in adults ≥ 18 years of age. Safety and efficacy in pediatric patients have not been established.[1]

187. **Rheumatoid Arthritis.** In a published, double-dummy Phase III study, Cosentyx was less effective that current treatments in patients with rheumatoid arthritis who were previously treated with a TNFi.[7] Patients were randomized to one of four treatment groups: 1) induction with an intravenous formulation of Cosentyx (10 mg/kg) followed by Cosentyx 150 mg subcutaneously given once every 4 weeks Q4W) [n = 137]; 2) secukinumab intravenous induction (10 mg/kg) followed by Cosentyx 75 mg subcutaneously Q4W (n = 138). At Week 24, ACR 20 response was significantly better with Cosentyx 150 mg subcutaneously (31%) and Orencia intravenous (43%) vs. placebo (18%). ACR 20

response with Cosentyx 75 mg was 28%, which was not significantly better than the placebo group. ACR 50/70 responses were 17%/10% with Cosentyx 150 mg and 12%/5% with Cosentyx 75 mg which was not significantly different than placebo (9%/5%). The group treated with Orencia intravneous had significantly improved ACR 50/70 responses at Week 24 (28%/12%). Using as observed data, ACR 20/50/70 responses at Week 52 were 63%/46%/19% with Cosentyx 150 mg, 57%/26%/7% with Cosentyx 75 mg, and 75%/52%/23% with Orencia intravenous. There is a published Phase II dose-ranging study (n = 237) evaluating Cosentyx in rheumatoid arthritis.[8-10] The ACR 20 response at Week 16 (using last observation carried forward analysis) was 34%, 46.9%, 46.5%, 53.7% for the 25, 75, 150, and 300 mg doses vs. 36% for placebo; however, this did not achieve statistical significance. After Week 16, patients who responded to Cosentyx sustained their response through Week 52 with patients on the 150 mg dose having the greatest improvement over time (55% and 40% of patients with ACR 50 and ACR 70 responses, respectively, at Week 52). In another Phase II study, Cosentyx did not achieve higher ACR 20 response rates at Week 12 vs. placebo.[11] There was an open-label treatment period where ACR responses were generally maintained through Week 52. Some patients were treated with an intravenous formulation of secukinumab and generally responded similarly to those treated with Cosentyx. In another Phase II study, an intravenous formulation of secukinumab demonstrated limited efficacy in biologic-naïve patients with rheumatoid arthritis associated with the HLA-DRB1 allele.[12]

188. Uveitis. Efficacy is not established for this condition. There was not a statistically significant difference between Cosentyx SC and placebo in three Phase III studies that included patients with Behcet's uveitis (n = 118); active, noninfectious, non-Behcet's uveitis (n = 31); and quiescent, noninfectious, non-Behcet's uveitis (n = 125) [SHEILD, INSURE, and ENDURE studies, respectively].[13]

189. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Entyvio Intravenous Prior Authorization Policy
- Entyvio™ (vedolizumab intravenous injection – Takeda Pharmaceuticals America, Inc.)

REVIEW DATE: 08/26/2020

OVERVIEW
Entyvio, an integrin receptor antagonist, is indicated for the following uses:[1]
- **Crohn's disease**, in adults with moderately to severely active disease.
- **Ulcerative colitis**, in adults with moderately to severely active disease.

The product labeling states that Entyvio should be discontinued in patients who show no benefit by Week 14. In the pivotal studies evaluating Entyvio, all patients had previously tried corticosteroids and/or conventional agents for Crohn's disease and ulcerative colitis.

Guidelines
The American College of Gastroenterology (ACG) has updated guidelines (2018) for Crohn's disease. Entyvio is among the treatment recommendations for treatment of patients with moderate to severe disease or moderate to high risk disease (for induction of remission as well as maintenance of this remission).[2] Updated ACG guidelines for ulcerative colitis (2019) note that the following agents can be used for induction of remission in moderately to severely active disease: Uceris (budesonide extended-release tablets); oral or intravenous systemic corticosteroids, Entyvio, Xeljanz, or tumor necrosis factor inhibitors (adalimumab, Simponi SC, infliximab).[3]

POLICY STATEMENT
Prior Authorization is recommended for prescription benefit coverage of Entyvio. All approvals are provided for the duration listed below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Entyvio as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Entyvio to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Entyvio is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Crohn's Disease.** Approve for the duration noted if the patient meets ONE of the following (A or B):
   D) Initial Therapy. Approve for 14 weeks if the patient meets ALL of the following (i, ii, and iii):
   i. Patient is ≥ 18 years of age; AND
   ii. Patient meets ONE of the following (a or b):
      1. Patient has tried or is currently taking systemic corticosteroids, or corticosteroids are contraindicated in this patient; OR
      2. Patient has tried one conventional systemic therapy for Crohn's disease; AND
         Note: Examples include azathioprine, 6-mercaptopurine, or methotrexate. An exception to the requirement for a trial of or contraindication to steroids or a trial of one other conventional systemic agent can be made if the patient has already tried at least one biologic. Refer to Appendix for examples of biologics used for Crohn's disease. These patients who have already received a biologic are not required to "step back" and try another agent.

   iii. The medication is prescribed by or in consultation with a gastroenterologist.
   E) Patient is Currently Receiving Entyvio. Approve for 1 year if the patient has had a response to therapy, as determined by the prescriber.

2. **Ulcerative Colitis.** Approve for the duration noted if the patient meets ONE of the following (A or B):
   A) Initial Therapy. Approve for 14 weeks if the patients meets ALL of the following (i, ii, and iii):
   a) Patient is ≥ 18 years of age; AND
   b) Patient has had a trial of ONE systemic agent for ulcerative colitis; AND
      Note: Examples include 6-mercaptopurine, azathioprine, cyclosporine, tacrolimus, or a corticosteroid such as prednisone, methylprednisolone. A trial of a biologic also counts as a trial of one systemic agent for UC. Refer to Appendix for examples of biologics used for ulcerative colitis.
   c) The medication is prescribed by or in consultation with a gastroenterologist.
   B) Patient is Currently Receiving Entyvio. Approve for 1 year if the patient has had a response to therapy, as determined by the prescriber.
      Note: Examples of a response to therapy include decreased stool frequency or rectal bleeding.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Entyvio is not recommended in the following situations:

1. **Concurrent Use with Other Biologics or with Targeted Synthetic Disease-Modifying Antirheumatic Drugs (DMARDs) used for an Inflammatory Condition.** Entyvio should not be used in combination with tumor necrosis factor inhibitors or with Tysabri due to increased risk of infections.[1] There is also a increased risk of progressive multifocal leukoencephalopathy if used in combination with Tysabri. Combination therapy with other biologics or with targeted synthetic DMARDs used to treat inflammatory conditions (see Appendix for examples) is generally not recommended due to a potential for a higher rate of adverse effects with combinations and lack of data supportive of additive efficacy.
   Note: This does NOT exclude the use of conventional immunosuppressants (e.g., 6-mercaptopurine, azathioprine) in combination with Entyvio.

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Etanercept Products
- Enbrel® (etanercept for subcutaneous injection – Immunex/Amgen)

REVIEW DATE: 11/06/2019

OVERVIEW

Etanercept products are human soluble receptor fusion proteins which inhibit the binding of tumor necrosis factor (TNF)α and β to cell surface TNF receptors.[1] TNF is a proinflammatory cytokine that is involved in normal inflammatory and immune responses. At this time, Enbrel is the only etanercept product commercially available in the US. Enbrel is indicated for the following uses:

1. Rheumatoid arthritis, for reducing the signs and symptoms, inducing major clinical response, inhibiting the progression of structural damage, and improving physical function in patients with moderate or severe active disease; AND
2. Juvenile idiopathic arthritis (JIA), for reducing the signs and symptoms of moderate or severe active polyarticular disease in patients aged ≥ 2 years; AND
3. Psoriatic arthritis (PsA), for reducing the signs and symptoms, inhibiting the progression of structural damage of active arthritis, and improving physical function in patients with psoriatic arthritis (PsA); AND
4. Ankylosing spondylitis (AS), for reducing signs and symptoms in patients with active disease; AND
5. Plaque psoriasis, for treatment patients 4 years of age or older with chronic moderate to severe plaque psoriasis who are candidates for systemic therapy or phototherapy.

For RA and PsA, Enbrel can be used in combination with methotrexate (MTX) or used alone.[1]

Disease Overview

TNF is a naturally occurring cytokine that mediates inflammation and modulates cellular immune responses. Increased levels of TNF have been implicated in the pathology of inflammatory conditions such as psoriasis, psoriatic arthritis, and rheumatoid arthritis (RA). Increased levels of TNF are found in the

synovial fluid of patients with RA, JIA, AS, and PsA; TNF has an important role in both the pathologic inflammation and the joint destruction that are characteristic of this disease. In psoriasis, increased levels of TNF are found in the blood and skin lesions. Etanercept products neutralize the biological activity of TNFα and inhibits binding of TNFα with its receptors.

Guidelines

TNFis feature prominently in guidelines for treatment of inflammatory conditions.

- Rheumatoid Arthritis: Guidelines from the American College of Rheumatology (ACR) [2015] have TNF inhibitors and non-TNF biologics, administered with or without MTX, equally positioned as a recommended therapy following a trial of a conventional synthetic DMARD (e.g., MTX, leflunomide, hydroxychloroquine, sulfasalazine).[2]
- Juvenile Idiopathic Arthritis: In polyarticular disease, the 2019 ACR recommendations propose initial DMARD treatment with a conventional synthetic DMARD such as MTX in most patients prior to a TNFi.[3] In those who are secondary nonresponders to a TNFi, a second TNFi may be tried; however, a non-TNF biologic is recommended for primary nonresponders. TNFis may also be used as second- or third-line treatment for systemic JIA.[4]
- Spondyloarthritis: Guidelines for ankylosing spondylitis and nonradiographic axial spondylitis are published by the American College of Rheumatology (ACR)/Spondylitis Association of America/Spondyloarthritis Research and Treatment Network (2019).[5] TNFis are recommended for the initial biologic. In those who are secondary nonresponders to a TNFi, a second TNFi is recommended over switching out of the class.
- Plaque Psoriasis: Guidelines from the American Academy of Dermatologists (AAD) and National Psoriasis Foundation (NPF) [2019] recommend adalimumab as a monotherapy treatment option for adults with moderate to severe disease.[6]
- Psoriatic Arthritis: Guidelines from ACR (2019) recommend TNFis over other biologics for use in treatment-naïve patients with PsA and in those who were previously treated with an oral therapy.[7]
- Ocular Inflammatory Disorders: The American Academy of Ophthalmology (AAO) [2014] note that TNFis may be used in patients with uveitis due to various causes (e.g., spondyloarthropathy-associated or human leukocyte antigen [HLA]-B27-associated uveitis, JIA-associated uveitis, and other posterior uveitides and panuveitis syndromes).[8] TNFis should be considered second-line in vision-threatening JIA-associated uveitis when MTX has failed or is not tolerated and may be used as corticosteroid-sparing treatment for vision-threatening chronic uveitis from seronegative spondyloarthropathy. TNFis may also be considered in other patients who have vision-threatening or corticosteroid-dependent disease who have failed first-line therapies and as a second-line immunomodulatory agent for severe ocular inflammatory conditions (including chronic and severe scleritis).
- Behcet's Disease: EULAR recommendations (2018) include TNFis for initial or recurrent sight-threatening uveitis.[9] For patients refractory to first-line treatments (e.g., corticosteroids), TNFis are among the treatment options for mucocutaneous manifestations, venous thrombosis, severe or refractory gastrointestinal disease, and recurrent/chronic joint involvement. Recommendations for the use of TNFis in ocular inflammatory disorders from the AAO note that TNFis may be used first-line in patients with ophthalmic manifestations of Behcet's disease and for acute exacerbations of pre-existing Behcet's disease.[8]
- Pyoderma Gangrenosum: Although guidelines are not current, multiple topical and systemic therapies have been used for pyoderma gangrenosum.[10-13] Oral prednisone is the most common initial immunosuppressant medication. Other systemic therapies include cyclosporine, MTX, azathioprine, cyclophosphamide, mycophenolate mofetil, and TNFis (infliximab, etanercept, adalimumab). In case reports, TNFis have been effective.
- Graft versus Host Disease: Guidelines (2012) generally recommend TNFis as a treatment option following a trial of first-line agent(s) [e.g., cyclosporine, intravenous methylprednisolone] for acute GVHD (grade III or IV disease).[14-15] A number of small studies demonstrate efficacy when etanercept was used in GVHD.[16-23]

- Still's Disease: There are not current guidelines for treatment of Still's disease. However, it presents in adults with features similar to those of systemic onset JIA.[24] In addition, there is a small trial which demonstrated efficacy of etanercept used for this condition.

Safety
Etanercept products have Boxed Warnings concerning risks of serious infection and the risk of malignancy.[1] Prior to initiating therapy, patients should be evaluated for active tuberculosis (TB) infection; periodically during therapy, patients should be assessed for latent TB infection. Patients should also be monitored for signs and symptoms of infection during and after treatment with an etanercept product, and if a serious infection or sepsis develops, discontinue therapy. It is also noted that lymphoma and other malignancies have been reported in children and adolescents taking TNFis.

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of etanercept products. Because of the specialized skills required for evaluation and diagnosis of patients as well as the monitoring required for adverse events (AEs) and long-term efficacy, initial approval requires etanercept products to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of etanercept products is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Rheumatoid Arthritis.** Approve for the duration noted if the patient meets ONE of the following (A or B):
   - **A)** Initial Therapy. Approve for 3 months if the patient meets BOTH of the following criteria (i and ii):
     - **i.** The patient has tried ONE conventional synthetic disease-modifying antirheumatic drug (DMARD) for at least 3 months.
       Note: Examples include methotrexate (oral or injectable), leflunomide, hydroxychloroquine, and sulfasalazine. An exception to the requirement for a trial of one conventional synthetic DMARD can be made if the patient has already has a 3-month trial at least one biologic (e.g., Cimzia [certolizumab pegol SC injection], an adalimumab product, an infliximab product, Simponi [golimumab SC injection], Simponi Aria [golimumab IV infusion], Actemra [tocilizumab IV infusion; tocilizumab SC injection], Kevzara [sarilumab SC injection], Kineret [anakinra SC injection], Orencia [abatacept IV infusion; abatacept SC injection], or a rituximab product). These patients who have already tried a biologic for RA are not required to "step back" and try a conventional synthetic DMARD; AND
     - **ii.** The agent is prescribed by or in consultation with a rheumatologist.
   - **B)** Patients Currently Receiving an Etanercept Product. Approve for 3 years if the patient has had a response, as determined by the prescriber.
     Note: Examples of a response include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths;

improved laboratory values; reduced dosage of corticosteroids. The patient may not have a full response, but there should have been a recent or past response to an etanercept product.

2. **Ankylosing Spondylitis.** Approve for the duration noted if the patient meets ONE of the following (A or B):
   A) Initial Therapy. Approve for 3 months if prescribed by or in consultation with a rheumatologist.
   B) Patients Currently Receiving an Etanercept Product. Approve for 3 years if the patient has had a response, as determined by the prescriber.
   Note: Examples of a response to therapy include decreased pain or stiffness, or improvement in function or activities of daily living. The patient may not have a full response, but there should have been a recent or past response to an etanercept product.

3. **Juvenile Idiopathic Arthritis (JIA) [or Juvenile Rheumatoid Arthritis {JRA}] (regardless of type of onset)** [Note: This includes patients with juvenile spondyloarthropathy/active sacroiliac arthritis. Approve for the duration noted if the patient meets ONE of the following (A or B):
   U) Initial Therapy. Approve for 3 months if the patient meets BOTH of the following criteria (i and ii):
      i. The patient meets one of the following conditions (a, b, c, or d):
         i) The patient has tried one other agent for this condition.
         Note: Examples of other agents for JIA include methotrexate (MTX), sulfasalazine, or leflunomide, a nonsteroidal anti-inflammatory drug (NSAID) [e.g., ibuprofen, naproxen]. A previous trial of a biologic (e.g., an adalimumab product, an infliximab product, Actemra [tocilizumab IV infusion, tocilizumab SC injection], Kineret [anakinra SC injection], or Orencia [abatacept IV infusion, abatacept SC injection]) also counts as a trial of one agent for JIA; OR
         j) The patient will be starting on an etanercept product concurrently with methotrexate (MTX), sulfasalazine, or leflunomide; OR
         k) The patient has an absolute contraindication to methotrexate (MTX), sulfasalazine, or leflunomide.
         Note: Examples of contraindications to MTX include pregnancy, breast feeding, alcoholic liver disease, immunodeficiency syndrome, blood dyscrasias; OR
         l) The patient has aggressive disease, as determined by the prescriber; AND
      ii. The agent is prescribed by or in consultation with a rheumatologist.
   B) Patients Currently Receiving an Etanercept Product. Approve for 3 years if the patient has had a response, as determined by the prescriber.
   Note: Examples of a response include improvement in limitation of motion, less joint pain or tenderness, decreased duration of morning stiffness or fatigue, improved function or activities of daily living, reduced dosage of corticosteroids. The patient may not have a full response, but there should have been a recent or past response to an etanercept product.

4. **Plaque Psoriasis**. Approve for the duration noted if the patient meets ONE of the following (A or B):
   A) Initial Therapy. Approve for 3 months if the patient meets the following criteria (i, ii, and iii):
      i. The patient is greater than or equal to 4 years of age; AND
      ii. The patient meets one of the following conditions (a or b):
         a) The patient has tried at least at least one traditional systemic agent for psoriasis for at least 3 months, unless intolerant.
         Note: Examples include methotrexate (MTX), cyclosporine, acitretin [Soriatane®, generics], or psoralen plus ultraviolet A light (PUVA). An exception to the requirement for a trial of one traditional systemic agent for psoriasis can be made if the patient has already has a 3-month trial or previous intolerance to at least one biologic (e.g., an adalimumab product, Cimzia [certolizumab pegol SC injection], an infliximab product, Siliq [brodalumab SC injection], Cosentyx® [secukinumab SC injection], Ilumya

[tildrakizumab SC injection], Stelara® [ustekinumab SC injection], Skyrizi [risankizumab-rzaa SC injection], Taltz® [ixekizumab SC injection], or Tremfya [guselkumab SC injection]). These patients who have already tried a biologic for psoriasis are not required to "step back" and try a traditional systemic agent for psoriasis; OR

b) The patient has a contraindication to methotrexate (MTX), as determined by the prescriber; AND

iii. The agent is prescribed by or in consultation with a dermatologist.

B) Patients Currently Receiving an Etanercept Product. Approve for 3 years if the patient has had a response, as determined by the prescriber.
Note: The patient may not have a full response, but there should have been a recent or past response to an etanercept product.

5. Psoriatic Arthritis (PsA). Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if the agent is prescribed by or in consultation with a rheumatologist or a dermatologist.

B) Patients Currently Receiving an Etanercept Product. Approve for 3 years if the patient has had a response, as determined by the prescriber.
Note: Examples of a response include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improvements in acute phase reactants [for example, C-reactive protein [CRP]). The patient may not have a full response, but there should have been a recent or past response to an etanercept product.

Other Uses with Supportive Evidence

6. Behcet's Disease. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets ONE of the following (i or ii):

i. The patient has tried at least one conventional therapy.
Note: Examples include systemic corticosteroids (e.g., methylprednisolone), immunosuppressants (e.g., azathioprine, methotrexate [MTX], mycophenolate mofetil, cyclosporine, tacrolimus, Leukeran® [chlorambucil], cyclophosphamide], interferon alfa). An exception to the requirement for a trial of one conventional therapy can be made if the patient has already had a trial of at least one tumor necrosis factor inhibitor (e.g., an adalimumab or infliximab product. These patients who have already tried a biologic for Behcet's disease are not required to "step back" and try a conventional therapy); OR

ii. The agent is prescribed by or in consultation with a rheumatologist, dermatologist, ophthalmologist, gastroenterologist, or neurologist.

B) Patients Currently Receiving an Etanercept Product. Approve for 1 year if the patient has responded to therapy, as determined by the prescriber.
Note: The patient may not have a full response, but there should a recent or past response to an etanercept product.

7. Graft-Versus-Host Disease (GVHD). Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 1 month if the patient meets ONE of the following (i or ii):

i. The patient meets one of the following conditions (i or ii):

a) The Patient has tried one conventional treatment for graft-versus-host disease (GVHD) [e.g., high-dose systemic corticosteroids, antithymocyte globulin, cyclosporine, thalidomide, tacrolimus, mycophenolate mofetil]; OR

b) The patient is concurrently receiving at least one of these medications (e.g., high-dose systemic corticosteroids, antithymocyte globulin, cyclosporine, Thalomid® (thalidomide capsules), tacrolimus, mycophenolate mofetil) in combination with an etanercept product.

Note: Examples of conventional treatments the patient may have tried or may be receiving include a high-dose corticosteroid (e.g., methylprednisolone), antithymocyte globulin, cyclosporine, Thalomid (thalidomide tablets), tacrolimus, and mycophenolate mofetil; AND

ii. The agent is prescribed by or in consultation with an oncologist, hematologist, or a physician affiliated with a transplant center.

B) Patients Currently Receiving an Etanercept Product. Approve for 3 months if the patient has responded to therapy, as determined by the prescriber.

8. Pyoderma Gangrenosum. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 4 months if the patient meets BOTH of the following criteria (i and ii):

14 The patient meets ONE of the following (a or b):

a) The patient has tried one systemic corticosteroid; OR

b) The patient has tried one other immunosuppressant for at least 2 months or was intolerant to one of these agents;

Note: Examples include mycophenolate mofetil and cyclospore; AND

15 The agent is prescribed by or in consultation with a dermatologist.

B) Patients Currently Receiving an Etanercept Product. Approve for 1 year if the patient has responded to therapy, as determined by the prescriber.

Note: There may not have been a full response, but there should a recent or past response to an etanercept product.

9. Scleritis or Sterile Corneal Ulceration. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets BOTH of the following (i and ii):

14 The patient has tried one other therapy for these.

Note: Examples include oral nonsteroidal anti-inflammatory drugs (NSAIDs) such as indomethacin, naproxen, or ibuprofen; oral, topical (ophthalmic) or IV corticosteroids (such as prednisone, prednisolone, methylprednisolone); methotrexate (MTX); cyclosporine; or other immunosupressants; AND

15 The agent is prescribed by or in consultation with an ophthalmologist.

B) Patients Currently Receiving an Etanercept Product. Approve for 1 year if the patient has responded to therapy, as determined by the prescriber.

Note: Examples of a response to therapy include decreased inflammation, reduced use of steroids or immunomodulators, decreased eye pain, redness, and/or photophobia. The patient may not have a full response but there should be a recent or past response to an etanercept product.

10. Spondyloarthritis (SpA), Other Subtypes (e.g., undifferentiated arthritis, non-radiographic axial SpA, Reactive Arthritis [Reiter's disease]) [Note: For AS or PsA, refer to the respective criteria under FDA-approved indications]. Approve for the duration noted if the patient meets ONE of the following (A or B):

C) Initial Therapy. Approve for 3 months if the patient meets BOTH of the following (i and ii):

i. The patient meets ONE of the following conditions (a or b):

a) The patient has arthritis primarily in the knees, ankles, elbows, wrists, hands, and/or feet AND has tried at least ONE conventional synthetic disease-modifying antirheumatic drug (DMARD) has been tried.
Note: Examples include methotrexate [MTX], leflunomide, sulfasalazine; OR

b) The patient has axial spondyloarthritis AND has objective signs of inflammation, defined as at least one of the following [(1) or (2)]:
a. C-reactive protein (CRP) elevated beyond the upper limit of normal for the reporting laboratory; OR
b. Sacroiliitis reported on magnetic resonance imaging (MRI); AND

ii. The agent is prescribed by or in consultation with a rheumatologist.

D) Patients Currently Receiving an Etanercept Product. Approve for 1 year if the patient has had a response, as determined by the prescriber.
Note: Examples of a response include decreased pain or stiffness, improved function or activities of daily living. The patient may not have a full response, but there should have been a recent or past response to an etanercept product.

11. Still's Disease (systemic-onset RA in adults, the disease may have begun in childhood). Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets ALL of the following (i, ii, and iii):
~~14~~ Patient has tried one corticosteroid; AND
~~15~~ Patient has tried one conventional synthetic disease-modifying antirheumatic drug (DMARD) given for at least 2 months or was intolerant to a conventional synthetic DMARD.
Note: An example is methotrexate; AND
16 The agent is prescribed by or in consultation with a rheumatologist.

B) Patients Currently Receiving an Etanercept Product. Approve for 1 year if the patient has responded to therapy, as determined by the prescriber.
Note: The patient may not have a full response, but there should have been a recent or past response to an etanercept product.

12. Uveitis (including other posterior uveitides and panuveitis syndromes). Approve for the duration noted if the patient meets the ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets BOTH of the following (i and ii):
14 The patient has tried one of the following therapies for this condition: periocular, intraocular, or systemic corticosteroids or immunosuppressives.
Note: Examples of corticosteroids include prednisolone, triamcinolone, betamethasone, methylprednisolone, and prednisone. Examples of immunosuppressives include methotrexate (MTX), mycophenolate mofetil, azathioprine, and cyclosporine. An exception to the requirement for a trial of one of these therapies can be made if the patient has already had a trial of an adalimumab or infliximab product for uveitis. These patients who have already tried a biologic for uveitis are not required to try a another agent; AND
15 The agent is prescribed by or in consultation with an ophthalmologist.

B) Patients Currently Receiving an Etanercept Product. Approve for 1 year if the patient has responded to therapy, as determined by the prescriber.
Note: Examples of a response include decreased inflammation, reduced use of steroids or immunomodulators, and improvement in visual acuity. The patient may not have a full response, but there should have been a recent or past response to an etanercept product.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Etanercept products (Enbrel) have not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

1. **Concurrent Use with a Biologic DMARD or Targeted Synthetic DMARD.** Etanercept products should not be administered in combination with another biologic or with a targeted synthetic DMARD used for an inflammatory condition (see APPENDIX for examples). Combination therapy is generally not recommended due to a higher rate of AEs with combinations and lack of data supportive of additional efficacy. Note: This does NOT exclude the use of conventional synthetic DMARDs (e.g., MTX, leflunomide, hydroxychloroquine, and sulfasalazine) in combination with etanercept products.

2. **Crohn's Disease.** In a double-blind, placebo-controlled trial etanercept (Enbrel) was not effective for the treatment of moderate to severe Crohn's disease.[25] However, arthritis (spondyloarthropathy, ankylosing spondylitis) may be associated with Crohn's disease and etanercept products may be effective for spondyloarthropathy in these patients.[26]

3. **Inflammatory Myopathies (Polymyositis, Dermatomyositis, Inclusion Body Myositis).** Information is conflicting. In one retrospective review of eight patients with either dermatomyositis or polymyositis some patients responded (improved motor strength and decreased fatigue) to treatment with an etanercept product.[27] In this case series, an etanercept product was added on to treatment with corticosteroids, intravenous immunoglobulin (IVIG), and DMARDs; there were no standardized outcome measures. In another case series in patients (n = 5) with dermatomyositis who had not responded to steroids and cytotoxic therapy (MTX, azathioprine, cyclosporine), the cytotoxic drugs were discontinued and etanercept was given for at least 3 months.[28] All patients had exacerbation of disease and etanercept was stopped. In a 1-year, double-blind study, patients were randomized to receive etanercept 50 mg weekly (n = 11) or placebo (n = 5).[29] All patients who received placebo were judged as treatment failures whereas five patients in the etanercept group were successfully weaned off of prednisone. More studies are needed demonstrating the efficacy of etanercept and its long-term effects.[30] In a 6-month, open-label study of etanercept in patients with refractory juvenile dermatomyositis (n = 9), minimal improvement was noted in disease activity with some patients experiencing worsening disease.[31]

4. **Hidradenitis Suppurativa.** A prospective, randomized, double-blind, placebo-controlled study assigned patients (n = 20) to treatment with etanercept 50 mg twice weekly or placebo for 12 weeks.[32] Following 12 weeks of treatment, all patients received open-label etanercept for an additional 12 weeks. The study found no statistically significant difference between etanercept 50 mg twice weekly and placebo among physician global assessment, patient global assessment, and the Dermatology Life Quality Index (DLQI) at Week 12 or Week 24. A systematic review (2013) extracted data from case reports and RCTs and recommended against the use of etanercept for treatment of hidradenitis suppurativa.[33]

5. **Polymyalgia Rheumatica (PMR).** ACR/EULAR guidelines for the management of PMR (2015) strongly recommend against the use of TNFis for treatment of PMR.[34] This recommendation is based on lack of evidence for benefit as well as considerable potential for potential harm. While etanercept has been evaluated in small numbers of patients with PMR, efficacy has not been established.[35-37]

6. **Sarcoidosis.** Evidence does not support use of etanercept in ocular or pulmonary disease. Recommendations for the use of TNFis in ocular inflammatory disorders from the AAO (2014) note that Remicade or Humira may be considered as second-line immunomodulary therapy for patients failing or intolerant of standard immunomodulatory agents.[8] A discretionary recommendation (indicating trade-offs are less certain) is that etanercept should not be used in the treatment of ocular

sarcoidosis (moderate-quality evidence). In a double-blind study patients (n = 18) with chronic ocular sarcoidosis and ongoing inflammation were randomized to etanercept or placebo for 6 months.[38] Patients had received ≥ 6 months of therapy with MTX and were currently on corticosteroids. For most of the patients, therapy with etanercept was not associated with significant improvement. In a prospective, open-label trial in patients with Stage II or III progressive pulmonary sarcoidosis, treatment with etanercept was frequently associated with early or late treatment failure.[39] This trial was ended early because an excessive number of patients (n = 11/17) had disease progression on etanercept. Recommendations for best practice in the management of pulmonary and systemic sarcoidosis mention Humira and Remicade as therapeutic options for management of disease.[40]

7. **Large Vessel Vasculitis (e.g., Giant Cell Arteritis, Takayasu's Arteritis).** Guidelines from EULAR for the management of large vessel vasculitis (e.g., giant cell arteritis, Takayasu's arteritis) do not mention the use of TNFis.[41] Additionally, a meta-analysis of RCTs did not find evidence supporting remission or reduction of corticosteroid dose with the use of TNFis in large vessel vasculitis.[42] In a double-blind trial patients with biopsy proven giant cell arteritis with AEs due to corticosteroids were randomized to etanercept 25 mg twice weekly (n = 8) or placebo (n = 9) for 12 months.[43] Corticosteroids were continued but were reduced if possible according to a predefined protocol. The primary outcome was the ability to withdraw the corticosteroid therapy and control disease activity at 12 months. After 12 months, 50% of etanercept patients and 22.2% of placebo patients were able to control the disease without corticosteroid therapy (not statistically significant). But patients on etanercept had a significantly lower dose of accumulated prednisone during the first year of treatment (P = 0.03). In a retrospective single center study in patients with refractory Takayasu's arteritis (n = 25), patients were treated with Remicade (n = 21) or etanercept (n = 9).[44] Five patients who were initially treated with etanercept were switched to Remicade. Therapy with anti-TNF agents was associated with remission in many patients and dose reduction or discontinuation of prednisone and other immunosuppressant therapies. A randomized controlled trial is needed to better define the efficacy and safety of etanercept.

8. **Wegener's Granulomatosis.** Etanercept is not effective in the induction or maintenance of disease remissions in patients with Wegener's. In a double-blind trial, 180 patients with active Wegener's granulomatosis were randomized to etanercept or placebo in combination with standard therapies (e.g., cyclophosphamide, MTX, corticosteroids) depending on disease severity.[45] When remission was achieved, standard medications were tapered according to protocol guidelines. Patients were enrolled over 28 months and the mean follow-up was 27 months. Of the 174 patients who were evaluable, 126 patients (72.4%) achieved sustained remissions, but only 86 patients overall (49.4%) maintained their disease remissions throughout the trial. There were no differences between etanercept and the control group in the percent of patients achieving sustained remissions (69.7% vs. 75.3%, P = 0.39); in the percent of patients with sustained periods of low disease activity (86.5% vs. 90.6%); or time to achieve these outcomes. Disease flares were common in both groups. AEs were frequent and often severe. During the study, 56.2% of patients on etanercept and 57.1% on placebo had at least one severe or life-threatening AE or died. Six of the etanercept patients and none of the controls developed solid malignancies. Use of etanercept in patients with Wegener's granulomatosis who are receiving immunosuppressant drugs is not recommended.[1]

9. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

APPENDIX

Brand (generic name)	Mechanism of Action
Adalimumab SC Products (Humira®, biosimilars)	Inhibition of TNF
Cimzia® (certolizumab pegol SC injection)	Inhibition of TNF
Etanercept SC Products (Enbrel®, biosimilars)	Inhibition of TNF
Infliximab IV Products (Remicade®, biosimilars)	Inhibition of TNF
Simponi®, Simponi® Aria™ (golimumab SC injection, golimumab IV infusion)	Inhibition of TNF
Actemra® (tocilizumab IV infusion, tocilizumab SC injection)	Inhibition of IL-6
Kevzara® (sarilumab SC injection)	Inhibition of IL-6
Orencia® (abatacept IV infusion, abatacept SC injection)	T-cell costimulation modulator
Rituximab IV Products (Rituxan®, biosimiars)	CD20-directed cytolytic antibody
Kineret® (anakinra SC injection)	Inhibition of IL-1
Stelara® (ustekinumab SC injection, ustekinumab IV infusion)	Inhibition of IL-12/23
Siliq™ (brodalumab SC injection)	Inhibition of IL-17
Cosentyx™ (secukinumab SC injection)	Inhibition of IL-17A
Taltz® (ixekizumab SC injection)	Inhibition of IL-17A
Ilumya™ (tildrakizumab-asmn SC injection)	Inhibition of IL-23
Skyrizi™ (risankizumab-rzza SC injection)	Inhibition of IL-23
Tremfya™ (guselkumab SC injection)	Inhibition of IL-23
Entyvio™ (vedolizumab IV infusion)	Integrin receptor antagonist
Otezla® (apremilast tablets)	Inhibition of PDE4
Olumiant® (baricitinib tablets)	Inhibition of the JAK pathways
Xeljanz®, Xeljanz XR (tofacitinib tablets, tofacitinib extended-release tablets)	Inhibition of the JAK pathways

SC – Subcutaneous; TNF – Tumor necrosis factor; IV – Intravenous, IL – Interleukin; PDE4 – Phosphodiesterase 4; JAK – Janus kinase.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Ilaris Prior Authorization Policy
- Ilaris® (canakinumab for subcutaneous injection – Novartis)

REVIEW DATE: 04/22/2020; selected revision 06/24/2020

OVERVIEW

Ilaris, an interleukin-1β (IL-1β) blocker, is indicated for the following uses:[1]

- **Cryopyrin-Associated Periodic Syndromes** (CAPS), including Familial Cold Autoinflammatory Syndrome and Muckle-Wells Syndrome, for treatment of patients who are ≥ 4 years of age.
- **Still's Disease**, including Active **adult-onset Still's Disease** and **systemic juvenile idiopathic arthritis** (SJIA), in patients ≥ 2 years of age.
- **Tumor necrosis factor receptor associated periodic syndrome** (TRAPS), in adult and pediatric patients.
- **Hyperimmunoglobulin D Syndrome/mevalonate kinase deficiency**, in adult and pediatric patients.
- **Familial Mediterranean Fever**, in adult and pediatric patients.

In the pivotal study for period fevers (TRAPS, Hyperimmunoglobulin D Syndrome/mevalonate kinase deficiency, and Familial Mediterranean Fever), patients were assessed for a response following 4 months of treatment with Ilaris.

Guidelines

Ilaris is used for a variety of periodic fever syndromes and inflammatory conditions.

- **SJIA:** There are standardized treatment plans published for use of Ilaris.[7,8] At Month 3, patients with unchanged or worsening disease or patients whose steroid dose is > 50% of the starting dose should have an increase in prednisone plus either addition of methotrexate or change to Actemra. Guidelines from the American College of Rheumatology for the management of SJIA (2013) mention Ilaris as a treatment alternative, depending upon the manifestations of SJIA being treated.[9] While there are a number of other effective options for treating synovitis in patients with active SJIA, effective options for treatment of macrophage activation syndrome are much more limited and include Kineret (anakinra subcutaneous injection), calcineurin inhibitors, and systemic corticosteroids (no preferential sequencing noted). Although use of Ilaris is uncertain in some situations, macrophage activation syndrome is a potentially life-threatening situation with limited treatment options.
- **TRAPS:** European guidelines for autoinflammatory disorders (2015) note that IL-1 blockade is beneficial for the majority of patients; maintenance with IL-1 blockade, which may limit corticosteroid exposure, may be used in patients with frequent attacks and/or subclinical inflammation between attacks.
- **Mevalonate Kinase Deficiency:** European guidelines for autoinflammatory disorders (2015) recommend consideration of short-term use of IL-1 blockers for termination of attacks and to limit or prevent steroid adverse events.[5] Maintenance therapy with an IL-1 blocker may be used in patients with mevalonate kinase deficiency and frequent attacks and/or subclinical inflammation between attacks.
- **Familial Mediterranean Fever:** Guidelines for familial Mediterranean fever from the European League Against Rheumatism (EULAR) [2016] note that treatment goals are to prevent the clinical attacks and to suppress chronic subclinical inflammation.[6] IL-1 blockade is an option for patients

with protracted febrile myalgia. In patients who develop AA amyloidosis, the maximal tolerated dose of colchicine and biologics (especially IL-1 blockade) are recommended.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Ilaris. Because of the specialized skills required for evaluation and diagnosis of patients treated with Ilaris as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Ilaris to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

All reviews for use of Ilaris for COVID-19 and/or cytokine release syndrome associated with COVID-19 will be forwarded to the Medical Director.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Ilaris is recommended in those who meet the following criteria:

FDA-Approved Indications

2. **Cryopyrin-Associated Periodic Syndromes (CAPS) [including Familial Cold Autoinflammatory Syndrome, Muckle-Wells Syndrome, and Neonatal Onset Multisystem Inflammatory Disease {NOMID} or Chronic Infantile Neurological Cutaneous and Articular {CINCA} Syndrome].** Approve for the duration noted if the patient meets ONE of the following (A or B):
   3. Initial Therapy. Approve for 3 months if the patient meets the following conditions (i and ii):
      i. Patient is ≥ 4 years of age; AND
      ii. Ilaris is prescribed by or in consultation with a rheumatologist, geneticist, allergist/immunologist, or dermatologist.
   4. Patient is Currently Receiving Ilaris. Approve for 1 year if the patient has had a response, as determined by the prescriber.

5. **Familial Mediterranean Fever.** Approve for the duration noted if the patient meets ONE of the following (A or B):
   A) Initial Therapy. Approve for 4 months if prescribed by or in consultation with a rheumatologist, nephrologist, geneticist, gastroenterologist, oncologist, or hematologist.
   B) Patient is Currently Receiving Ilaris. Approve for 1 year if the patient has had a response, as determined by the prescriber.
   Note: The patient may not have a full response, but there should have been a recent or past response to Ilaris.

3. **Hyperimmunoglobulin D Syndrome/Mevalonate Kinase Deficiency.** Approve for the duration noted if the patient meets ONE of the following (A or B):
   A) Initial Therapy. Approve for 4 months if Ilaris is prescribed by or in consultation with a rheumatologist, nephrologist, geneticist, oncologist, or hematologist.

B) Patient is Currently Receiving Ilaris. Approve for 1 year if the patient has had a response, as determined by the prescriber.
Note: The patient may not have a full response, but there should have been a recent or past response to Ilaris.

4. Systemic Juvenile Idiopathic Arthritis (SJIA). Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months (which is adequate for three doses) if the patient meets ALL of the following conditions (i, ii, and iii):

i. Patient is ≥ 2 years of age; AND

ii. Patient meets ONE of the following conditions (a, b, or c):

a) Patient has tried at least TWO other biologics; OR
Note: Examples of biologics for SJIA include Actemra (tocilizumab intravenous infusion, tocilizumab subcutaneous injection), Kineret (anakinra subcutaneous injection), Orencia (abatacept intravenous infusion, abatacept subcutaneous injection), an etanercept product, adalimumab product, or infliximab product.

b) Patient meets BOTH of the following [(1) and (2)]:

(1) Patient has features of poor prognosis, as determined by the prescriber; AND
Note: Examples of features of poor prognosis include arthritis of the hip, radiographic damage, 6-month duration of significant active systemic disease, defined by: fever, elevated inflammatory markers, or requirement for treatment with systemic glucocorticoids.

(2) Patient has tried Actemra or Kineret; OR

c) Patient meets BOTH of the following [(1) and (2)]:

(1) Patient has features of SJIA with active systemic features with concerns of progression to macrophage activation syndrome, as determined by the prescriber; AND

(2) Patient has tried Kineret; AND

iii. Ilaris is prescribed by or in consultation with a rheumatologist.

B) Patient is Currently Receiving Ilaris. Approve for 1 year if the patient has had a response as determined by the prescriber.
Note: Examples of responses to therapy include resolution of fevers or rash, improvement in limitation of motion, less joint pain or tenderness, decreased duration of morning stiffness or fatigue; improved function or activities of daily living, and reduced dosage of corticosteroids. The patient may not have a full response, but there should have been a recent or past response to Ilaris.

5. Stills Disease, Adult Onset. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months (which is adequate for three doses) if the patient meets ALL of the following conditions (i, ii, and iii):

i. Patient is ≥ 18 years of age; AND
Note: If the patient is < 18 years of age, refer to criteria for systemic juvenile idiopathic arthritis.

ii. Patient meets ONE of the following conditions (a, b, or c):

a) Patient has tried at least TWO other biologics; OR
Note: Examples of biologics include Actemra (tocilizumab intravenous infusion, tocilizumab subcutaneous injection), Kineret (anakinra subcutaneous injection), Orencia (abatacept intravenous infusion, abatacept subcutaneous injection), an etanercept product, adalimumab product, or infliximab product.

b) Patient meets BOTH of the following [(1) and (2)]:

(1) Patient has features of poor prognosis, as determined by the prescriber; AND
Note: Examples of features of poor prognosis include arthritis of the hip, radiographic damage, 6-month duration of significant active systemic disease, defined by: fever, elevated inflammatory markers, or requirement for treatment with systemic glucocorticoids.
(2) Patient has tried Actemra or Kineret; OR

c) Patient meets BOTH of the following [(1) and (2)]:
(1) Patient has active systemic features with concerns of progression to macrophage activation syndrome, as determined by the prescriber; AND
(2) Patient has tried Kineret; AND

iii. Ilaris is prescribed by or in consultation with a rheumatologist.

B) Patient is Currently Receiving Ilaris. Approve for 1 year if the patient has had a response as determined by the prescriber.
Note: Examples of responses to therapy include resolution of fevers or rash, improvement in limitation of motion, less joint pain or tenderness, decreased duration of morning stiffness or fatigue; improved function or activities of daily living, and reduced dosage of corticosteroids. The patient may not have a full response, but there should have been a recent or past response to Ilaris.

5. **Tumor Necrosis Factor Receptor Associated Periodic Syndrome (TRAPS).** Approve for the duration noted if the patient meets ONE of the following (A or B):
A) Initial Therapy. Approve for 4 months if prescribed by or in consultation with a rheumatologist, geneticist, nephrologist, oncologist, or hematologist.
B) Patient is Currently Receiving Ilaris. Approve for 1 year if the patient has had a response, as determined by the prescriber.
Note: The patient may not have a full response, but there should have been a recent or past response to Ilaris.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Ilaris is not recommended in the following situations:

1. **Concurrent Biologic Therapy.** Ilaris has not been evaluated and should not be administered in combination with another biologic agent for an inflammatory condition (see Appendix for examples). An increased incidence of serious infections has been associated with another IL-1 blocker, Kineret, when given in combination with tumor necrosis factor inhibitor in patients with rheumatoid arthritis. Concomitant administration of Ilaris and other agents that block IL-1 or its receptors is not recommended.

2. **COVID-19 (Coronavirus Disease 2019).** Forward all requests to the Medical Director.
Note: This includes requests for cytokine release syndrome associated with COVID-19.

3. **Rheumatoid Arthritis.** Efficacy is not established.[11,12] In a 12-week, Phase II, placebo-controlled, double-blind study, 277 patients who had failed methotrexate were randomized to Ilaris or placebo.[11] Although the ACR 50 at Week 12 was higher for Ilaris 150 mg (given every 4 weeks) compared with placebo (26.5% vs. 11.4%, respectively; P = 0.028), there was not a statistically significant difference in ACR 50 for the other Ilaris treatment groups (Ilaris 300 mg every 2 weeks; Ilaris 600 mg loading dose followed by 300 mg every 2 weeks).

4. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Ilumya™ (tildrakizumab-asmn for subcutaneous injection – Sun Pharmaceuticals)

REVIEW DATE: 04/22/2020

OVERVIEW

Ilumya is a humanized immunoglobulin G monoclonal antibody that binds to interleukin (IL)-23, a pro-inflammatory cytokine.[1] It binds to the p19 subunit of IL-23 and inhibits the intracellular and downstream signaling of IL-23 which is required for the terminal differentiation and survival of T helper 17 cells. Ilumya is indicated for treatment of adults with moderate to severe plaque psoriasis who are candidates for systemic therapy or phototherapy. It is administered subcutaneously (SC) at Weeks 0 and 4 and then once every 12 weeks thereafter. Ilumya should be administered by a healthcare professional.

Disease Overview

Although the etiology of psoriasis is not fully established, abnormal keratin formation, epidermal proliferation, activation of the immune system, and hereditary factors appear to play roles in the pathogenesis of the disease. In psoriasis, levels of IL-23p40 and IL-12/23p40 messenger RNA are

upregulated but decrease with treatment. By blocking the release of proinflammatory cytokines and chemokines, Ilumya has an inhibitory effect on the inflammatory process.

Guidelines

Joint guidelines from the American Academy of Dermatology and National Psoriasis Medical Board (2019) have been published for management of psoriasis with biologics.[2] These guidelines list Ilumya as a monotherapy treatment option for patients with moderate to severe plaque psoriasis. Guidelines from the European Dermatology Forum (2015) recommend biologics (i.e., etanercept, adalimumab, infliximab, Stelara SC) as second-line therapy for induction and long-term treatment if phototherapy and conventional systemic agents have failed, are contraindicated, or are not tolerated.[3]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Ilumya. Because of the specialized skills required for evaluation and diagnosis of patients treated with Ilumya as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Ilumya to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Ilumya is recommended in those who meet the following criteria:

V) Plaque Psoriasis. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets ALL of the following criteria (i, ii, and iii):

i. The patient is ≥ 18 years of age; AND

ii. The patient meets ONE of the following conditions (a or b):

a) The patient has tried at least at least one traditional systemic agent for psoriasis for at least 3 months, unless intolerant.

Note: Examples of one traditional systemic agent include methotrexate [MTX], cyclosporine, acitretin tablets, or psoralen plus ultraviolet A light [PUVA]). An exception to the requirement for a trial of one traditional systemic agent for psoriasis can be made if the patient has already had a 3-month trial or previous intolerance to at least one biologic. Refer to **Appendix** for examples of biologics used for plaque psoriasis. These patients who have already tried a biologic for psoriasis are not required to "step back" and try a traditional systemic agent for psoriasis); OR

b) The patient has a contraindication to methotrexate (MTX), as determined by the prescriber; AND

iii. Ilumya is prescribed by or in consultation with a dermatologist.

B) Patient is Currently Receiving Ilumya. Approve for 3 years if the patient has responded, as determined by the prescriber.

Note: The patient may not have a full response, but there should have been a recent or past response to Ilumya.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Ilumya has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

190. Concurrent Use with other Biologics or with Targeted Synthetic Disease-Modifying Antirheumatic Drugs (DMARDs). Data are lacking evaluating concomitant use of Ilumya with another biologic or with a targeted synthetic DMARD for an inflammatory condition (see **Appendix** for examples). Combination therapy with biologics and/or biologics + targeted synthetic DMRADs has a potential for a higher rate of adverse effects and lack controlled trial data in support of additive efficacy.[4]

Note: This does NOT exclude the use of MTX (a traditional systemic agent used to treat psoriasis) in combination with Ilumya.

191. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

APPENDIX

	Mechanism of Action	Examples of Inflammatory Indications for Products*
Biologics		
Adalimumab SC Products (Humira®, biosimilars)	Inhibition of TNF	AS, CD, PJIA, PsO, PsA, RA, SJIA, UC
Cimzia® (certolizumab pegol SC injection)	Inhibition of TNF	AS, CD, PsO, PsA, RA
Etanercept SC Products (Enbrel®, biosimilars)	Inhibition of TNF	AS, PJIA, PsO, PsA, RA, SJIA
Infliximab IV Products (Remicade®, biosimilars)	Inhibition of TNF	AS, CD, PJIA, PsO, PsA, RA, SJIA, UC
Simponi®, Simponi® Aria™ (golimumab SC injection, golimumab IV infusion)	Inhibition of TNF	SC formulation: AS, PsA, RA, UC
		IV formulation: AS, PsA, RA
Actemra® (tocilizumab IV infusion, tocilizumab SC injection)	Inhibition of IL-6	SC formulation: PJIA, RA, SJIA
		IV formulation: PJIA, RA, SJIA
Kevzara® (sarilumab SC injection)	Inhibition of IL-6	RA
Orencia® (abatacept IV infusion, abatacept SC injection)	T-cell costimulation modulator	SC formulation: PJIA, PSA, RA
		IV formulation: PJIA, PsA, RA
Rituximab IV Products (Rituxan®, biosimilars)	CD20-directed cytolytic antibody	RA
Ilaris (canakinumab SC injection**)**	Inhibition of IL-1β	SJIA
Kineret® (anakinra SC injection)	Inhibition of IL-1	RA, SJIA^
Stelara® (ustekinumab SC injection, ustekinumab IV infusion)	Inhibition of IL-12/23	SC formulation: CD, PsO, PsA, UC
		IV formulation: CD, UC
Siliq™ (brodalumab SC injection)	Inhibition of IL-17	PsO
Cosentyx™ (secukinumab SC injection)	Inhibition of IL-17A	AS, PsO, PsA
Taltz® (ixekizumab SC injection)	Inhibition of IL-17A	AS, PsO, PsA
Ilumya™ (tildrakizumab-asmn SC injection)	Inhibition of IL-23	PsO
Skyrizi™ (risankizumab-rzza SC injection)	Inhibition of IL-23	PsO
Tremfya™ (guselkumab SC injection)	Inhibition of IL-23	PsO
Entyvio™ (vedolizumab IV infusion)	Integrin receptor antagonist	CD, UC
Targeted Synthetic DMARDs		
Otezla® (apremilast tablets)	Inhibition of PDE4	PsO, PsA
Olumiant® (baricitinib tablets)	Inhibition of the JAK pathways	RA
Rinvoq® (upadacitinib extended-release tablets)	Inhibition of the JAK pathways	RA
Xeljanz®, Xeljanz XR (tofacitinib tablets, tofacitinib extended-release tablets)	Inhibition of the JAK pathways	RA, PsA, UC

* Not an all-inclusive list of indication (e.g., oncology indications and rare inflammatory conditions are not listed). Refer to the prescribing information for the respective agent for FDA-approved indications; SC – Subcutaneous; TNF – Tumor necrosis factor; IV – Intravenous, IL – Interleukin; PDE4 – Phosphodiesterase 4; JAK – Janus kinase; AS – Ankylosing spondylitis; CD – Crohn's disease; PJIA – Polyarticular juvenile idiopathic arthritis; PsO – Plaque psoriasis; PsA – Psoriatic arthritis; RA – Rheumatoid arthritis; SJIA – Systemic juvenile idiopathic arthritis; UC – Ulcerative colitis; ^ Off-label use of SJIA supported in guidelines.

OVERVIEW OF DISEASE STATE FOR PRIOR AUTHORIZATION DOCUMENT

Subject: Biologics for Inflammatory Bowel Disease

Date Revised: 03/30/2017

INDICATIONS

Table 1. Products Approved for IBD.[*1-6]

	Cimzia	Entyvio	adalimumab products[#]	infliximab products[+]	Simponi SC	Stelara IV/SC	Tysabri
Crohn's Disease	√	√	√	√	--	√	√
Ulcerative Colitis	--	√	√	√	√	--	--

IBD – Inflammatory bowel disease; [*] Refer to the selected *ESI Standard Prior Authorization Policies* for the specific patient population approved for each indication; [#] Examples of adalimumab products include Amjevita and Humira; [+] Examples of infliximab products include Inflectra and Remicade; SC – Subcutaneous; IV – Intravenous.

CROHN'S DISEASE

Crohn's disease is characterized by inflammation in the gastrointestinal (GI) tract at any point from the mouth to the rectum.[7] In the US, the prevalence is 201 cases per 100,000 adults with the median age at diagnosis of 20 to 30 years of age. Though the cause of Crohn's disease is unknown, smoking and use of oral contraceptives and nonsteroidal anti-inflammatory drugs (NSAIDs) have been shown to exacerbate symptoms. Common symptoms include abdominal pain, diarrhea, fever, GI bleeding, and weight loss. It is common for patients to experience extra-intestinal manifestations such as anemia, ophthalmic manifestations (uveitis, episcleritis, scleritis) cholelithiasis, inflammatory arthropathies, osteoporosis, or venous thromboembolism. The goals of therapy include steroid-free sustained clinical remission, induction and maintenance of mucosal healing, potential induction and maintenance of radiological healing, prevention of surgery, maintenance of normal GI function, and prevention of disability.[8] To achieve these goals, the underlying inflammation must be treated rather than a treatment regimen that only treats symptoms. In Crohn's disease, surgery is not curative because disease recurs at the anastomotic site.

In clinical trials of Crohn's disease, the Crohn's Disease Activity Index (CDAI) is the most commonly used disease activity index.[9] The CDAI is a composite score that includes eight subjective and objective criteria: the number of liquid or very soft stools per day, the severity of abdominal pain or cramping, general well-being, the presence or absence of extra intestinal manifestations of disease, the presence or absence of an abdominal mass, the use of antidiarrheal agents, hematocrit and body weight. A higher score indicates more severe disease; the maximum score is 600 and > 450 indicates severe illness. Remission is usually defined as a CDAI of ≤ 150, and response is defined as a reduction in total score of between 70 and 100 points. Moderate-severe Crohn's disease (CDAI usually 220 to 450) refers to patients who have failed to respond to treatment for mild-moderate disease (CDAI usually 150 to 220) or those with more prominent symptoms of fevers, significant weight loss, abdominal pain or tenderness, intermittent nausea or vomiting (without obstructive findings), or significant anemia.[10] Therapy first treats acute disease or induces clinical remission and then maintains response/remission. Remission refers to patients who are asymptomatic or without inflammatory sequelae and includes patients who have responded to acute medical intervention or have undergone surgical resection without gross evidence of residual disease.

Practice Parameters for Crohn's Disease and Inflammatory Bowel Disease (IBD)

Guidelines for Crohn's disease have not been updated since the approval of adalimuamb for reducing signs and symptoms and inducing and maintaining clinical remission in pediatric patients 6 years of age and older with moderately to severely active Crohn's disease, whereas previously only infliximab was approved in patients ≤ 6 years of age with Crohn's disease.[1,4] Entyvio™ (vedolizumab injection for intravenous [IV] use) is an integrin receptor antagonist that has also been approved since the guidelines were published.[5] Entyvio is indicated for achieving a clinical response, achieving clinical remission, and achieving corticosteroid-free remission in adult patients with moderately to severely active CD who have had an

inadequate response with, lost response to, or were intolerant to a TNF blocker or immunomodulator; or had an inadequate response with, were intolerant to, or demonstrated dependence on steroids. Stelara is also been approved for treatment of moderately to severely active CD, in adults who have failed or were intolerant to immunomodulators or corticosteroids but not TNFis, or failed or were intolerant to at least one TNFi. Induction therapy is with a single weight-based infusion of Stelara IV administered by a healthcare professional followed by Stelara subcutaneous (SC) 90 mg injection 8 weeks later, then every 8 weeks thereafter for maintenance.

For CD in adults, the American Gastroenterological Association (AGA) has developed guidelines (2013) prior to the availability of Entyvio.[11] For induction therapy, TNF blockers are listed as a strong recommendation for patients with moderately severe CD (moderate-quality evidence). This compares with the recommendation *against* using thiopurine monotherapy to induce remission in patients with moderately severe CD (weak recommendation, moderate-quality evidence). However, starting a thiopurine at the same time as corticosteroids in a patient with moderately severe CD is noted to be a reasonable treatment strategy (strength of recommendation not provided). For induction, TNF blockers + thiopurines are recommended over thiopurine monotherapy in patients with moderately severe CD (strong recommendation, high-quality evidence). For induction, TNF blockers + thiopurines are recommended over TNF blocker monotherapy in patients with moderately severe CD (weak recommendation, moderate-quality evidence).

The AGA guidelines for CD do not mention Tysabri, an integrin receptor antagonist indicated for inducing and maintaining clinical response and remission in adult patients with moderately to severely active CD with evidence of inflammation who have had an inadequate response to or are unable to tolerate conventional therapies and TNF blockers.[11] Of note, due to the risks of PML, Tysabri is only available through a restricted distribution program called the CD TOUCH® prescribing program.

ULCERATIVE COLITIS

Ulcerative colitis (UC) is a chronic condition resulting in inflammation of the colon.[12] In UC, there is always involvement of the rectum with inflammation spreading from the distal to the proximal colon. Though there is considerable variability among patients, typical symptoms of UC include abdominal pain, bloody and/or mucous diarrhea; severe cases may also present with weight loss, tachycardia, fever, anemia, and bowel distention. The goal of therapy is the rapid induction of a steroid-free remission and prevention of complications due to treatment of the disease. UC is curable by colectomy, and treatment algorithms generally favor a step-up approach, with Remicade, cyclosporine, tacrolimus, or surgery considered as rescue therapy.

Practice Guideline for Ulcerative Colitis

American College of Gastroenterology (ACG) practice guidelines for ulcerative colitis were published in 2010, prior to the approval of Entyvio, Humira, and Simponi® (golimumab for SC injection) in UC.[1-2,5] Remicade is recommended for mild-to-moderate extensive colitis (active disease) and has been effective in patients who are refractory to steroids or who are dependent on steroids despite adequate doses of a thiopurine (e.g., azathioprine, 6-mercaptopurine) or in patients who cannot tolerate these medications.[4] To maintain remission in mild to moderate extensive colitis, Remicade has been effective in patients who responded to induction therapy with Remicade. In patients with severe colitis who are refractory to optimized therapy with oral agents (prednisone, aminosalicylates) and topical agents, Remicade may be used if urgent hospitalization is not required.[4] Remicade may also be effective in helping to avoid colectomy in patients who fail on IV corticosteroids, but long term efficacy is not known. An evidence-based systematic review on medical therapies for IBD, including ulcerative colitis (2011) recommends mesalamine, steroids, or Remicade to induce remission in various patient populations.[13] In certain patients who are hospitalized with severe disease, IV cyclosporine may be considered. In patients who are in remission, mesalamine, azathioprine, or 6-mercaptopurine is recommended to prevent relapse. The review notes that there is insufficient evidence to make a recommendation for biologic agents and antibiotics to prevent relapse.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Infliximab Products

- Avsola™ (infliximab-axxq for injection, for intravenous use – Amgen)
- Inflectra™ (infliximab-dyyb for injection, for intravenous use – Hospira/Pfizer)
- Remicade® (infliximab for intravenous infusion – Janssen Biotech, Inc.)
- Renflexis® (infliximab-abda intravenous infusion – Samsung Bioepis/Merck)

REVIEW DATE: 08/28/2019; selected revision 06/03/2020

OVERVIEW

Infliximab products are tumor necrosis factor inhibitors (TNFis) approved for the following indications:[1-3]

- **Rheumatoid arthritis** (RA), in combination with methotrexate (MTX) for reducing signs and symptoms, inhibiting the progression of structural damage and improving physical function in patients with moderately to severely active RA.
- **Crohn's disease**, for the following uses:
  - reducing the signs and symptoms and inducing and maintaining clinical remission in patients ≥ 6 years of age with moderately to severely active Crohn's disease who have had an inadequate response to conventional therapy; AND
  - reducing in the number of draining enterocutaneous and rectovaginal fistulas and maintaining fistula closure in adults with fistulizing Crohn's disease.
- **Ankylosing spondylitis** (AS), for reducing signs and symptoms of active disease;
- **Psoriatic arthritis** (PsA), for reducing signs and symptoms of active arthritis, inhibiting the progression of structural damage and improving physical function.
- **Plaque psoriasis**, for treatment of adults with chronic severe (i.e., extensive and/or disabling) disease who are candidates for systemic therapy and when other systemic therapies are less appropriate; AND
- **Ulcerative colitis** (UC), for the following uses:
  - for reducing signs and symptoms, inducing and maintaining clinical remission and mucosal healing, and eliminating corticosteroid use in adults with moderately to severely active disease who have had an inadequate response to conventional therapy; AND
  - for reducing signs and symptoms and inducing and maintaining clinical remission patients ≥ 6 years of age with moderately to severely active disease who have had an inadequate response to conventional therapy.

Avsola, Inflectra and Renflexis were approved as biosimilar to Remicade, indicating no clinically meaningful differences in safety and effectiveness and the same mechanism of action, route of administration, dosage form, and strength as Remicade.[2-3] However, minor differences in clinically inactive components are allowed. At this time, only biosimilarity has been demonstrated (not interchangeability). The recommended dose of infliximab is weight-based and varies slightly by indication. Dosing increase, interval shortening, or changing to another therapy is generally recommended for attenuation of response.[2]

Guidelines

TNFis feature prominently in guidelines for treatment of many inflammatory conditions.

- **Spondyloarthritis:** Guidelines from the Assessment of SpondyloArthritis International Society (ASAS)/EULAR (2016) recommend biologics (e.g., TNFis, Cosentyx) in patients with persistently high disease activity despite traditional conventional treatments (e.g., nonpharmacological management, NSAIDs).[4] Purely axial disease should not be treated with conventional synthetic DMARDs. Guidelines from the American College of Rheumatology (ACR) and the Spondyloarthritis Research and Treatment Network (SPARTAN) [2015] recommend TNFis for

patients with active disease despite treatment with an NSAID (includes patients with non-radiographic axial [nr-ax]SpA).[5] Predominantly axial manifestations are not recommended for a conventional synthetic DMARD prior to a TNFi. However, for symptomatic peripheral arthritis, a conventional synthetic DMARD is recommended (preferably sulfasalazine).

- **Crohn's Disease:** The American College of Gastroenterology (ACG) has guidelines for Crohn's disease (2018).[6] TNFis are listed as an option for disease that is resistant to corticosteroids, severely active disease, perianal fistulizing disease, and maintenance of remission. In post-operative Crohn's disease, a TNFi should be started within 4 weeks of surgery to prevent recurrence.
- **Plaque Psoriasis:** Guidelines from the American Academy of Dermatologists (AAD) and National Psoriasis Foundation (NPF) recommend infliximab as a monotherapy treatment option for adults with moderate to severe disease.[7]
- **Psoriatic Arthritis:** Guidelines from ACR (2019) recommend TNFis over other biologics for use in treatment-naïve patients with PsA and in those who were previously treated with an oral therapy.[8]
- **Rheumatoid Arthritis:** Guidelines from the American College of Rheumatology (ACR) [2015] have TNF inhibitors and non-TNF biologics, administered with or without MTX, equally positioned as a recommended therapy following a trial of a conventional synthetic DMARD (e.g., MTX, leflunomide, hydroxychloroquine, sulfasalazine).[9]
- **Ulcerative Colitis:** Updated ACG guidelines for UC (2019) note that the following agents can be used for induction of remission in moderately to severely active disease: Uceris tablets; Oral or intravenous systemic corticosteroids Entyvio, Xeljanz, or TNFis (adalimumab, Simponi SC, infliximab).[10] In addition to the approved indication, clinical guidelines for the management of pouchitis, published in 2009 indicate that first-line therapy for pouchitis is antibiotic therapy (e.g. metronidazole, ciprofloxacin).[11] Other treatment options include maintenance probiotics, oral or topical budesonide, anti-inflammatory drugs (e.g., mesalamine), or immunosuppressive drugs (e.g., infliximab). A retrospective, open-label, case series demonstrated some efficacy of Humira in patients with pouchitis previously treated with infliximab.[10]

Other Uses with Supportive Evidence

There are guidelines and/or published data supporting the use of infliximab products in the following conditions:

- **Behcet's Disease:** EULAR recommendations (2018) include TNFis for initial or recurrent sight-threatening uveitis.[12] For patients refractory to first-line treatments (e.g., corticosteroids), TNFis are among the treatment options for mucocutaneous manifestations, venous thrombosis, severe or refractory gastrointestinal disease, and recurrent/chronic joint involvement. Recommendations for the use of TNFis in ocular inflammatory disorders from the American Academy of Ophthalmology (AAO) [2014] notes that TNFis may be used first-line in patients with ophthalmic manifestations of Behcet's disease and for acute exacerbations of pre-existing Behcet's disease.[13]
- **Graft-Versus-Host Disease:** In retrospective analyses and case series, infliximab has been effective in treating some patients with steroid-refractory acute or chronic graft-versus-host disease.[19-24] In a prospective study in 19 patients, infliximab was not effective in the *prophylaxis* of acute GVHD, but may have delayed platelet engraftment and was associated with frequent infectious complications. In studies evaluating the role of infliximab for treatment of steroid-refractory acute GVHD, the overall response rates ranged from 15% to 100%, with the highest response rates in patients with GI and skin disease.
- **Hidradenitis Suppurativa:** In a Phase II double-blind, placebo-controlled crossover trial, adult patients with moderate to severe hidradenitis suppurativa were randomized to placebo (n = 23) or infliximab 5 mg/kg (n = 15) at Weeks 0, 2, and 6.[25] After Week 8, patients were unblinded, and placebo patients were offered induction with placebo. Maintenance was continued through 22 weeks of treatment. Following Week 8, more patients in the infliximab-treatment group

experienced a 50% or greater decrease in the Hidradenitis Suppurativa Severity Index (HSSI) score (approximately 26% and 5% of patients receiving infliximab and placebo, respectively [data presented graphically]; P = 0.092). In post-hoc analysis, significantly more patients treated with infliximab responded with a 25% to < 50% response (60% and 5.6% for infliximab and placebo, respectively; P < 0.001). Improvement was noted through Week 30. In case series, infliximab has been effective in treating hidradenitis suppurativa that was refractory to other therapies.[26-28]

- **Indeterminate Colitis:** Infliximab has been effective in some patients with refractory indeterminate colitis (retrospective reviews).[29,30] When patients who are refractory to standard therapy can be definitively classified as having ulcerative colitis, colectomy is considered an effective long-term surgical treatment. Patient's with Crohn's disease, however, have a high risk of complications after ileal pouch-anal anastomosis and are treated more aggressively with medical interventions since surgical options cannot offer the same likelihood of success as in ulcerative colitis.
- **Ocular Inflammatory Disorders:** Recommendations for the use of TNFis in ocular inflammatory disorders from the AAO (2014) note that infliximab may be used as second-line corticosteroid-sparing therapy for chronic and severe scleritis.[13] Infliximab may be used in patients with uveitis due to various causes (e.g., spondyloarthropathy-associated or human leukocyte antigen [HLA]-B27-associated uveitis, JIA-associated uveitis, and other posterior uveitides and panuveitis syndromes).[13] Infliximab should be considered second-line in vision-threatening JIA-associated uveitis when MTX has failed or is not tolerated (strong recommendation) and vision-threatening chronic uveitis from seronegative spondyloarthropathy (strong recommendation). Infliximab may also be considered in other patients who have vision-threatening or corticosteroid-dependent disease who have failed first-line therapies. The recommendations point out that studies evaluating Infliximab in uveitis included patients with birdshot chorioretinitis (BSCR), a bilateral posterior uveitis generally treated with systemic immunomodulation; these patients showed a good response to Infliximab.
- **Immunotherapy-Related Toxicities Associated with Checkpoint Inhibitors:** NCCN has guidelines in partnership with the American Society of Clinical Oncology (ASCO) [version 1.2019 – November 14, 2018] for Management of Immunotherapy-Related Toxicities.[14] Recommended therapies include use of infliximab to manage many toxicities. Some severe toxicities (e.g., pneumonitis, cardiac toxicity, renal failure) may also be treated with infliximab but are more likely to be administered in the hospital setting.
- **Juvenile Idiopathic Arthritis (JIA):** The 2011 ACR recommendations for the treatment of JIA propose initial DMARD treatment with MTX in most patients; however, sulfasalazine is recommended for patients with enthesitis-related arthritis and may also be used in certain patients with sacroiliac arthritis.[15] Leflunomide may be an appropriate initial DMARD in those with high disease activity and/or a poor prognosis. Kineret may be used in systemic arthritis and Actemra may be used in systemic and polyarticular juvenile arthritis.[15-16] TNF antagonists such as infliximab may also be used as second- or third-line treatment for systemic JIA.[15]
- **Pyoderma Gangrenosum:** Although guidelines are not current, multiple topical and systemic therapies have been used for pyoderma gangrenosum. Oral prednisone is the most common initial immunosuppressant medication.[17] Other systemic therapies include cyclosporine, MTX, azathioprine, cyclophosphamide, mycophenolate mofetil, and TNFis (i.e., infliximab, etanercept, and adalimumab products). In case reports, TNFis have been effective.
- **Still's Disease:** Still's disease presents in adults with features similar to those of systemic onset JIA.[31-32] In case series, infliximab has been effective in patients with Still's disease that was refractory to therapy with corticosteroids, MTX, azathioprine, and cyclophosphamide.[33]
- **Sarcoidosis:** Recommendations for best practice in the management of pulmonary and systemic sarcoidosis recommend glucocorticoids as first-line therapy.[18] Patients who cannot be weaned to a

prednisone-equivalent dose of < 10 mg/day are appropriate candidates for steroid-sparing treatment with cytotoxic agents (e.g., MTX, azathioprine, leflunomide). If these agents fail or cause toxicity, adalimumab, infliximab, cyclophosphamide, or mycophenolate mofetil are proposed.

Dosing Information

The recommended dose of infliximab is weight-based and varies slightly by indication.[1-3] Dosing increase, interval shortening, or changing to another therapy is generally recommended for attenuation of response. Thus, published recommendations note that the dose and interval of infliximab may be adjusted, as needed, in patients who initially respond but then lose that response.[2] Additionally, data are emerging concerning tapering of infliximab dosage in patients with inflammatory conditions who are in remission or have low disease activity.[110-113] At this time, there is not a consensus regarding tapering. The 2015 ACR guidelines for RA mention tapering, defined as scaling back therapy (reducing dose or frequency) as a treatment option for patients who are in remission.[18] Although specific tapering schedules are not recommended, it is noted that minimizing therapy may decrease toxicity and lowers the risk of treating patients unnecessarily. When the dose of any RA therapy is tapered, it is recommended that there be a comprehensive plan to monitor disease activity and address possible flares.

Safety

Infliximab has Boxed Warnings concerning risks of serious infection and the risk of malignancy.[1] Prior to initiating therapy with infliximab, patients should be evaluated for active tuberculosis (TB) infection, and periodically during therapy patients should be assessed for latent TB infection. Patients should also be monitored for signs and symptoms of infection during and after treatment with infliximab, and if a serious infection or sepsis develops, infliximab should be discontinued. It is also recommended that patients treated with any TNF antagonist should be monitored for malignancies.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of infliximab products. Because of the specialized skills required for evaluation and diagnosis of patients treated with infliximab as well as the monitoring required for adverse events and long-term efficacy, initial approval requires infliximab to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration listed below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of infliximab products is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Ankylosing Spondylitis (AS).** Approve for the duration noted if the patient meets ONE of the following (A or B):
   - **A)** Initial Therapy. Approve for 3 months if prescribed by or in consultation with a rheumatologist.
   - **B)** Patients Currently Receiving an Infliximab Product. Approve for 1 year if the patient has had a response as determined by the prescriber.
     Note: Examples of a response to therapy include decreased pain or stiffness, improved function or activities of daily living. The patient may not have a full response, but there should have been a recent or past response to an infliximab product.

2. **Crohn's Disease.** Approve for the duration noted if the patient meets ONE of the following (A or B):
   - **A)** Initial Therapy. Approve for 3 months if the patient meets the following criteria (i ii, and iii):
     - **i.** The patient is greater than or equal to 6 years of age; AND
     - **ii.** The patient meets ONE of the following conditions (a, b, c, or d):
       - **a)** The patient has tried or is currently taking corticosteroids, or corticosteroids are contraindicated in this patient; OR
         Note: Examples of corticosteroids are prednisone and methylprednisolone.
       - **b)** The patient has tried one other agent for Crohn's disease; OR
         Note: Examples of other agents for Crohn's disease include azathioprine, 6-mercaptopurine, or methotrexate (MTX). A previous trial of a biologic (e.g., Cimzia [certolizumab pegol SC injection], an adalimumab product [e.g., Humira], Entyvio [vedolizumab IV infusion], or Stelara [ustekizumab IV infusion, ustekizumab SC injection]) also counts as a trial of one other agent for Crohn's disease).
       - **c)** The patient has enterocutaneous (perianal or abdominal) or rectovaginal fistulas; OR
       - **d)** The patient has had ileocolonic resection (to reduce the chance of Crohn's disease recurrence); AND
     - **iii.** The agent is prescribed by or in consultation with a gastroenterologist.
   - **B)** Patients Currently Receiving an Infliximab Product. Approve for 1 year if the patient has had a response, as determined by the prescriber.
     Note: The patient may not have a full response, but there should have been a recent or past response to an infliximab product.

3. **Plaque Psoriasis.** Approve for the duration noted if the patient meets ONE of the following (A or B):
   - **A)** Initial Therapy. Approve for 3 months if the patient meets the following criteria (i, ii, and iii):
     - **i.** The patient is an adult greater than or equal to 18 years of age; AND
     - **ii.** The patient meets ONE of the following conditions (a or b):
       - **a)** The patient has tried at least at least one traditional systemic agent for psoriasis for at least 3 months, unless intolerant; OR
         Note: Examples include methotrexate (MTX), cyclosporine, acitretin [Soriatane®, generics], or psoralen plus ultraviolet A light (PUVA). An exception to the requirement for a trial of one traditional systemic agent for psoriasis can be made if the patient has already has a 3-month trial or previous intolerance to at least one biologic (e.g., an adalimumab product [e.g., Humira], Cimzia [certolizumab pegol SC injection], an etanercept product [e.g., Enbrel], Cosentyx [secukinumab SC injection], Ilumya [tildrakizumab SC injection], Siliq [brodalumab SC injection], Skyrizi [risankizumab-rzaa SC injection], Stelara [ustekinumab for SC injection], Taltz [ixekizumab for SC injection), or Tremfya [guselkumab SC injection]). These patients who have already tried a biologic for psoriasis are not required to "step back" and try a traditional systemic agent for psoriasis).

b) The patient has a contraindication to methotrexate (MTX), as determined by the prescriber.

iii. The agent is prescribed by or in consultation with a dermatologist.

B) Patients Currently Receiving an Infliximab Product. Approve for 1 year if the patient has had a response, as determined by the prescriber.
Note: The patient may not have a full response, but there should have been a recent or past response to an infliximab product.

4. Psoriatic Arthritis (PsA). Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if prescribed by or in consultation with a rheumatologist or a dermatologist.

B) Patients Currently Receiving an Infliximab Product. Approve for 1 year if the patient has had a response as determined by the prescriber.
Note: Examples of a response include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improvements in acute phase reactants [for example, C-reactive protein [CRP]). The patient may not have a full response, but there should have been a recent or past response to an infliximab product.

5. Rheumatoid Arthritis (RA). Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets BOTH of the following criteria (i and ii):

i. The patient has tried ONE conventional synthetic disease-modifying antirheumatic drug (DMARD) for at least 3 months; AND
Note: Examples include methotrexate (oral or injectable), leflunomide, hydroxychloroquine, and sulfasalazine. An exception to the requirement for a trial of one conventional synthetic DMARD can be made if the patient has already had a 3-month trial at least one biologic (e.g., Cimzia [certolizumab pegol SC injection], an etanercept product [e.g., Enbrel], an adalimumab product [e.g., Humira], Simponi/Aria [golimumab SC injection, golimumab IV infusion], Actemra [tocilizumab IV infusion, tocilizumab SC injection], Kevzara [sarilumab SC injection], Kineret [anakinra SC injection], Orencia [abatacept IV infusion, abatacept SC injection], and a rituximab product [Rituxan, Truxima]. These patients who have already tried a biologic for RA are not required to "step back" and try a conventional synthetic DMARD).

ii. The agent is prescribed by or in consultation with a rheumatologist.

B) Patients Currently Receiving an Infliximab Product. Approve for 1 year if the patient has had a response as determined by the prescriber.
Note: Examples of a response include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improved laboratory values; reduced dosage of corticosteroids. The patient may not have a full response, but there should have been a recent or past response to an infliximab product.

6. Ulcerative Colitis. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets the following criteria (i ii, and iii):

i. The patient is greater than or equal to 6 years of age; AND

ii. The patient meets ONE of the following conditions (a or b):

a) Patient has had a trial of one systemic agent or was intolerant to one of these agents for ulcerative colitis; OR

Note: Examples include 6-mercaptopurine, azathioprine, cyclosporine, tacrolimus, or a corticosteroid such as prednisone, methylprednisolone. A previous trial of a biologic (e.g., an adalimumab product [e.g., Humira], Simponi SC [golimumab SC injection], or Entyvio [vedolizumab IV infusion] also counts as a trial of one systemic agent for UC).

b) The patient has pouchitis AND has tried therapy with an antibiotic, probiotic, corticosteroid enema, or Rowasa® (mesalamine) enema; AND
Note: Examples of antibiotics include metronidazole and ciprofloxacin. Examples of corticosteroid enemas include hydrocortisone enema (Cortenema, generics).

iii. The agent is prescribed by or in consultation with a gastroenterologist.

B) Patients Currently Receiving an Infliximab Product. Approve for 1 year if the patient has had a response as determined by the prescriber.
Note: Examples of a response include decreased stool frequency or rectal bleeding. The patient may not have a full response, but there should have been a recent or past response to an infliximab product.

Other Uses with Supportive Evidence

7. Behcet's Disease. Approve for the duration noted if the patient meets the following criteria (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets BOTH of the following conditions (i and ii):

i. The patient meets ONE of the following (a or b):

a) The patient has tried at least ONE conventional therapy; OR
Note: Examples include systemic corticosteroids (e.g., methylprednisolone), immunosuppressants (azathioprine, methotrexate [MTX], mycophenolate mofetil, cyclosporine, tacrolimus, Leukeran® [chlorambucil], cyclophosphamide], interferon alfa). An exception to the requirement for a trial of one conventional therapy can be made if the patient has already had a trial of at least one tumor necrosis factor inhibitor (e.g., an adalimumab product [e.g., Humira], an etanercept product [e.g., Enbrel]). These patients who have already tried a biologic for Behcet's disease are not required to "step back" and try a conventional therapy).

b) The patient has ophthalmic manifestations of Behcet's disease; AND

ii. The agent is prescribed by or in consultation with a rheumatologist, dermatologist, ophthalmologist, gastroenterologist, or neurologist.

B) Patients Currently Receiving an Infliximab Product. Approve for 1 year if the patient has had a response, as determined by the prescriber.
Note: The patient may not have a full response by Month 2 or 3, but there should be some response.

8. Graft-Versus-Host Disease (GVHD). Approve for the duration noted if the patient meets the following criteria (A or B):

A) Initial Therapy. Approve for 1 month if the patient meets BOTH of the following (i and ii):

i. The patient meets ONE of the following conditions (a or b):

a) Patient has tried one conventional treatment for graft-versus-host disease (GVHD); OR

b) Patient is concurrently receiving at least one of these medications in combination with an infliximab product; AND
Note: Examples of conventional treatments the patient may have tried or may be receiving include a high-dose corticosteroid (e.g., methylprednisolone), antithymocyte globulin, cyclosporine, Thalomid (thalidomide tablets), tacrolimus, and mycophenolate mofetil.

ii. The agent is prescribed by or in consultation with an oncologist, hematologist, or a physician affiliated with a transplant center.

B) Patients Currently Receiving an Infliximab Product. Approve for 3 months if the has had a response, as determined by the prescriber.

9. Hidradenitis Suppurativa. Approve for the duration noted if the patient meets the following criteria (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets BOTH of the following (i and ii):

i. The patient has tried one other therapy; AND
Note: Examples include intralesional or oral corticosteroids (such as triamcinolone, prednisone), systemic antibiotics (e.g., clindamycin, dicloxacillin, erythromycin), isotretinoin).

ii. The agent is prescribed by or in consultation with a dermatologist.

B) Patients Currently Receiving an Infliximab Product. Approve for 1 year if the patient has had a response, as determined by the prescriber.

10. Immunotherapy-Related Toxicities Associated with Checkpoint Inhibitor Therapy. Approve for the duration noted if the patient meets ONE of the following (A or B):

C) Initial Therapy. Approve for 3 months if the patient meets ALL of the following (i, ii, iii, and iv):

i. The patient developed an immunotherapy-related toxicity involving the gastrointestinal system, inflammatory arthritis, or ocular toxicity; AND
Note: An example of a gastrointestinal system toxicity is colitis. Examples of ocular toxicities include uveitis/iritis, episcleritis, and blepharitis.

ii. The patient developed this immune-related toxicity while receiving a checkpoint inhibitor; AND
Note: Examples of checkpoint inhibitors include Keytruda (pembrolizumab IV infusion), Opdivo (nivolumab IV infusion), Yervoy (ipilimumab IV infusion), Tecentriq (atezolizumab IV infusion), Bavancio (avelumab IV infusion), or Imfinzi (durvalumab IV infusion).

iii. The patient has tried a systemic corticosteroid; AND
Note: Examples include methyprednisone and prednisone.

iv. The agent is prescribed by or in consultation with an oncologist, gastroenterologist, rheumatologist, or ophthalmologist.

D) Patients Currently Receiving an Infliximab Product. Approve for 1 year if the patient has responded and needs continued treatment, as determined by the prescriber.

11. Indeterminate Colitis (defined as colitis that cannot be classified with certainty as either ulcerative colitis or Crohn's disease). Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 4 months if the patient meets ALL of the following (i, ii, iii, iv, and v):

i. The patient is greater than or equal to 6 years of age; AND

ii. Patient has tried one systemic corticosteroid; AND
Note: Examples include prednisone andmethylprednisolone.

iii. The patient has tried mesalamine; AND

iv. The patient has tried either azathioprine or 6-mercaptopurine; AND

v. The agent is prescribed by or in consultation with a gastroenterologist.

B) Patients Currently Receiving an Infliximab Product. Approve for 1 year if the patient has had a response, as determined by the prescriber.

12. Juvenile Idiopathic Arthritis (JIA) [or Juvenile Rheumatoid Arthritis {JRA}] (regardless of type of onset) [Note: This includes patients with juvenile spondyloarthropathy/active sacroiliac arthritis]. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets the following criteria (i and ii):

i. Patient meets ONE of the following conditions (a or b):

a) Patient has tried one other agent for this condition; OR
Note: Examples of other agents for JIA include methotrexate (MTX), sulfasalazine, or leflunomide, a nonsteroidal anti-inflammatory drug (NSAID) [e.g., ibuprofen, naproxen]. A previous trial of a biologic (e.g., an adalimumab product [e.g, Humira], an etanercept product [e.g., Enbrel], Orencia [abatacept IV infusion, abatacept SC injection], Kineret [anakinra SC injection], and Actemra [tocilizumab IV infusion, tocilizumab SC injection] also counts as a trial of one agent for JIA).

b) The patient has aggressive disease, as determined by the prescriber; AND

ii. The agent is prescribed by or in consultation with a rheumatologist.

B) Patients Currently Receiving an Infliximab Product. Approve for 1 year if the patient has had a response as determined by the prescriber.
Note: Examples of a response include improvement in limitation of motion, less joint pain or tenderness, decreased duration of morning stiffness or fatigue, improved function or activities of daily living, reduced dosage of corticosteroids. The patient may not have a full response, but there should have been a recent or past response to an infliximab product.

13. Pyoderma Gangrenosum. Approve for the duration noted if the patient meets the following criteria (A or B):

A) Initial Therapy. Approve for 4 months if the patient meets BOTH of the following conditions (i and ii):

i. The patient meets ONE of the following conditions (a or b):

a) The patient has tried one systemic corticosteroid; OR
Note: An example is prednisone.

b) The patient has tried one other immunosuppressant for at least 2 months or was intolerant to one of these agents; AND
Note: Examples include mycophenolate mofetil and cyclosporine.

ii. The agent is prescribed by or in consultation with a dermatologist.

B) Patients Currently Receiving an Infliximab Product. Approve for 1 year if the patient has had a response, as determined by the prescriber.
Note: The patient may not have a full response by Month 4 or 5 (after 4 doses), but there should be some response.

14. Sarcoidosis. Approve for the duration noted if the patient meets ONE of the following criteria (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets ALL of the following conditions (i, ii, and iii):

i. The patient has tried at least one corticosteroid; AND
Note: An example is prednisone.

ii. The patient has tried at least one immunosuppressive agent; AND
Note: Examples include methotrexate (MTX), azathioprine, cyclosporine, Leukeran or Thalomid® (thalidomide capsules) or chloroquine.

iii. The agent is prescribed by or in consultation with a pulmonologist, ophthalmologist, or dermatologist.

B) Patients Currently Receiving an Infliximab Product. Approve for 1 year if the patient has had a response, as determined by the prescriber.
Note: The patient may not have a full response by Month 3, but there should be some response.

15. Scleritis or Sterile Corneal Ulceration. Approve for the duration noted if the patient meets ONE of the following criteria (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets BOTH of the following conditions (i and ii):

i. The patient has tried one other therapy for this condition; AND
Note: Examples include oral non-steroidal anti-inflammatory drugs (NSAIDs) such as indomethacin; oral, topical (ophthalmic) or IV corticosteroids (such as prednisone, prednisolone, methylprednisolone); methotrexate (MTX); cyclosporine; or other immunosupressants.

ii. The agent is prescribed by or in consultation with an ophthalmologist.

B) Patients Currently Receiving an Infliximab Product. Approve for 1 year if the patient has had a responseas determined by the prescriber.
Note: Examples of a response to therapy include decreased inflammation, reduced use of steroids or immunomodulators, decreased eye pain, redness, and/or photophobia. The patient may not have a full response by Month 2 or 3, but there should be some response.

16. Still's Disease. Approve for the duration noted if the patient meets ONE of the following criteria (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets ALL of the following conditions (i, ii, and iii):

i. The patient has tried one corticosteroid; AND
Note: An example is prednisone.

ii. The patient has tried one conventional synthetic disease-modifying antirheumatic drug (DMARD) given for at least 2 months or was intolerant to a conventional synthetic DMARD; AND
Note: An example is methotrexate.

iii. The agent is prescribed by or in consultation with a rheumatologist.

B) Patients Currently Receiving an Infliximab Product. Approve for 1 year if the patient has had a response, as determined by the prescriber.
Note: The patient may not have a full response by Month 2 or 3, but there should be some response.

17. Spondyloarthritis (SpA), Other Subtypes (Note: Examples of other subtypes include undifferentiated arthritis, non-radiographic axial SpA, Reactive Arthritis [Reiter's disease]. For AS or PsA, refer to the respective criteria under FDA-approved indications). Approve for the duration noted if ONE of the following conditions are met (A or B):

E) Initial Therapy. Approve for 3 months if the patient meets BOTH of the following conditions (i and ii):

i. The patient meets ONE of the following (a or b):

a) The patient has arthritis primarily in the knees, ankles, elbows, wrists, hands, and/or feet AND has tried at least ONE conventional synthetic disease-modifying antirheumatic drug (DMARD) has been tried; OR
Note: Examples include methotrexate [MTX], leflunomide, sulfasalazine.

b) The patient has axial spondyloarthritis AND has objective signs of inflammation, defined as at least one of the following [(1) or (2)]:

(1) C-reactive protein (CRP) elevated beyond the upper limit of normal for the reporting laboratory; OR
(2) Sacroiliitis reported on magnetic resonance imaging (MRI); AND

ii. The agent is prescribed by or in consultation with a rheumatologist.

F) Patients Currently Receiving an Infliximab Product. Approve for 1 year if the patient has had a response as determined by the prescriber.
Note: Examples of a response include decreased pain or stiffness, improved function or activities of daily living. The patient may not have a full response, but there should have been a recent or past response to an infliximab product.

18. Uveitis (including other posterior uveitides and panuveitis syndromes). Approve for the duration noted if the patient meets ONE of the following criteria (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets BOTH of the following conditions (i and ii):

i. The patient has tried one of the following therapies: periocular, intraocular, or systemic corticosteroids or immunosuppressives; AND
Note: Examples of corticosteroids include prednisolone, triamcinolone, betamethasone, methylprednisolone, prednisone. Examples of immunosuppressives include methotrexate (MTX), mycophenolate mofetil, and cyclosporine. An exception to the requirement for a trial of one of these therapies can be made if the patient has already had a trial of an etanercept product (e.g., Enbrel) or an adalimumab product (e.g., Humira) for uveitis. These patients who have already tried a biologic for uveitis are not required to try another agent).

ii. The agent is prescribed by or in consultation with an ophthalmologist.

B) Patients Currently Receiving an Infliximab Product. Approve for 1 year if the patient has had a responseas determined by the prescriber.
Note: Examples of a response include decreased inflammation, reduced use of steroids or immunomodulators, and improvement in visual acuity. The patient may not have a full response by Month 2 or 3, but there should be some response.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of infliximab products is not recommended in the following situations:

1. Concurrent Use with a Biologic or with a Targeted Synthetic DMARD. Data are lacking evaluating concomitant use of an infliximab product in combination with another biologic or with a targeted synthetic DMARD used for an inflammatory condition (see APPENDIX for examples). Combination therapy with biologics and/or biologics + targeted synthetic DMARDs has a potential for a higher rate of AEs with combinations and lack controlled trial data in support of additive efficacy.[34-35] Note: This does NOT exclude the use of conventional synthetic DMARDs (e.g., MTX, leflunomide, hydroxychloroquine, and sulfasalazine) in combination with an infliximab product.

2. Inflammatory Myopathies (Polymyositis, Dermatomyositis, Inclusion Body Myositis). Exceptions are not recommended. In an open-label pilot study in 13 patients, four infliximab 5 mg/kg infusions given over 14 weeks were not effective in refractory inflammatory myopathies.[36] Infliximab could worsen muscle inflammation in these patients.

3. Large Vessel Vasculitis (e.g., Giant Cell Arteritis, Takayasu's Arteritis). Guidelines from EULAR for the management of large vessel vasculitis (e.g., giant cell arteritis, Takayasu's arteritis) do not mention the use of TNF blockers.[37] Additionally, a meta-analysis of RCTs did not find evidence

supporting remission or reduction of corticosteroid dose with the use of TNF blockers in large vessel vasculitis.[38] In a controlled trial, 44 patients with newly diagnosed giant cell arteritis that was in glucocorticoid-induced remission were randomized to Infliximab 5 mg/kg plus glucocorticoid (n = 28) or placebo plus glucocorticoid (n = 16).[39] Infliximab did not increase the percentage of patients without relapse at Week 22 nor did it increase the percentage of patients whose glucocorticoid dose was decreased to 10 mg/day without relapse. Use of TNF blockers such as infliximab for Takayasu's arteritis is limited to case series where TNF blockers are often used third line, after treatment with corticosteroids and other immunosuppressants (e.g., azathioprine, MTX, MMF, cyclophosphamide).[40-44] Infliximab has been effective in a very limited number of patients with vasculitis (e.g., RA, cryoglobulinemia, polyangiitis, polymyalgia rheumatica, Takayasu's arteritis) who were refractory to standard therapy.[40-41,45-49] However, in a randomized study in 51 patients with newly diagnosed polymyalgia rheumatica, adding infliximab 3 mg/kg to prednisone was of no benefit and may have been harmful.[50-51]

4. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

OVERVIEW OF DISEASE STATE FOR PRIOR AUTHORIZATION DOCUMENT

Subject: Inflammatory Conditions – Juvenile Idiopathic Arthritis

Date Revised: 05/16/2017

Juvenile idiopathic arthritis (JIA) [previously referred to as juvenile rheumatoid arthritis {JRA}] is a broad term referring to a group of disorders characterized by chronic arthritis diagnosed in children less than 16 years of age with arthritis for at least 6 weeks and with other causes of arthritis excluded.[1-4,6] The International League of Associations for Rheumatology (ILAR) classification system of JIA with frequency is as follows: oligoarticular (persistent or extended) [50% to 60%]; polyarticular (rheumatoid factor negative or positive) [30% to 35%]; systemic (10% to 20%); psoriatic (2% to 15%); enthesitis-related (ankylosing spondylitis, arthritis associated with inflammatory bowel disease) [1% to 7%]; and other.[2] The subtypes are recognized based on the clinical features during the first 6 months of disease. Radiologic joint damage occurs in most patients with systemic onset and polyarticular arthritis within 2 years and in oligoarticular arthritis within 5 years.[1] Many patients continue to have active disease as adults.

Since JIA is not one disease, the treatment varies between the subtypes.[1-3] Disease modifying antirheumatic drugs (DMARDs) that have been effective in JIA include conventional synthetic DMARDs (i.e., sulfasalazine, methotrexate [MTX], leflunomide), tumor necrosis factor inhibitors (TNFis) [i.e., etanercept subcutaneous [SC] injection [e.g., Enbrel®, Erelzi™], adalimumab SC injection [e.g., Humira®, Amjevita™], infliximab intravenous [IV] infusion [e.g., Remicade®, Inflectra™, Renflexis®]), an inhibitor of T cell costimulation (i.e., Orencia® [abatacept IV infusion, abatacept SC injection], interleukin (IL)-1 blockers (i.e., Kineret® [anakinra SC injection], Ilaris® [canakinumab SC injection]), and an IL-6 blocker (i.e., Actemra™ [tocilizumab IV infusion]).[5] Some DMARDs may be effective in certain situations. For example, sulfasalazine may be effective in late-onset oligoarticular arthritis and in juvenile spondyloarthropathy. MTX may be effective in patients with a history of arthritis in five or more joints or in patients with arthritis in four or fewer joints. Leflunomide has also been effective in polyarticular JIA (PJIA) but experience is limited. Systemic JIA (SJIA) has systemic symptoms such as spiking fever, skin rash, hepatosplenomegaly or serositis and patients may or may not have active arthritis.[6-7] It is also associated with macrophage activation syndrome. When SJIA presents without active arthritis, it usually responds poorly to MTX.[5]

The 2011 American College of Rheumatology (ACR) recommendations for the treatment of JIA propose initial DMARD treatment with MTX in most patients; however, sulfasalazine is recommended for patients with enthesitis-related arthritis and may also be used in certain patients with sacroiliac arthritis.[5] Leflunomide may be an appropriate initial DMARD in certain patients with high disease activity and/or a poor prognosis. Kineret may be used in systemic arthritis. TNFis may be used for SJIA *with* active arthritis but have relatively poor effectiveness for SJIA with active systemic features *without* active arthritis. Patients with aggressive disease (e.g., sacroiliac arthritis) may be started early on a biologic agent. Orencia or a TNFi may be tried if initial treatment with a TNFi is unsuccessful. Rituxan® (rituximab for IV infusion) is also mentioned as an alternative for patients who have received sequential treatment with a TNFi and

Orencia. NSAIDs, systemic glucocorticoids, and Kineret are treatment options for patients with systemic arthritis with active systemic features *without* active arthritis. Updated guidelines from ACR were published for SJIA (2013).[7] The guidelines make recommendations for patients with active systemic features and varying degrees of synovitis based on the physician global assessment (MD global, on a 10-point visual analog scale [VAS] where 0 = no disease activity and 10 = the most severe) and active joint count (AJC = 0 joints, 1-4 joints, or > 4 joints). Based on the recommendations, Kineret is appropriate *initial therapy* in SJIA if the MD global is ≥ 5 (with any AJC) OR if MD global < 5 and AJC > 4 OR if MD global < 5 and AJC 1-4. Kineret is also considered an appropriate second- and third- line agent for all patients with SJIA (in patients with and without active systemic features). In patients with active systemic features and varying degrees of synovitis, Actemra and Ilaris are recommended for continued therapy in certain patients with disease activity following 1 month of Kineret, 2 weeks of therapy with glucocorticoids, or 1 month of NSAIDs, with exact treatment recommendations depending on physician global assessment and AJC. In patients without active systemic features and varying degrees of synovitis exact treatment recommendations also depend on physician global assessment and AJC. However, Orencia, Actemra, and a TNFi are options for certain patients with continued disease activity following 3 months of treatment with MTX or leflunomide. Orencia, TNFi, or Actemra are also options in certain patients with disease activity following 1 month of Kineret. There are also consensus treatment plans for new-onset SJIA developed by the Childhood Arthritis and Rheumatology Research Alliance (CARRA) specific for Actemra and Kineret.[8]

In clinical trials of JIA, response is often assessed using the ACR Pediatric (Pedi) 30 definition of improvement which is a ≥ 30% improvement in ≥ three of the six JIA core set variables with no more than one remaining variable worsening by > 30%.[4] The core set variables are: (1) physician global assessment of overall disease activity; (2) parent/patient global assessment of overall well-being (each scored on a 10 cm visual analog scale [VAS]); (3) functional ability; (4) number of joints with active arthritis; (5) number of joints with limited range of motion; (6) erythrocyte sedimentation rate (ESR); and (7) an absence of a spiking fever in the week prior to the evaluation (SJIA only).

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Kevzara Prior Authorization Policy

- Kevzara™ (sarilumab for subcutaneous injection – Regeneron)

REVIEW DATE: 07/01/2020

OVERVIEW

Kevzara, an interleukin-6 (IL-6) receptor inhibitor, is indicated for the treatment of rheumatoid arthritis in adults with moderate to severe active disease who have had an inadequate response or intolerance to one or more disease-modifying anti-rheumatic drugs (DMARDs).[1] Kevzara + conventional synthetic (cs)DMARD has demonstrated superior efficacy over placebo + csDMARD as assessed by American College of Rheumatology (ACR) responses, physical function, and radiographic progression.

Guidelines

Guidelines from the American College of Rheumatology (ACR) [2015], last updated prior to the approval of Kevzara, have TNF inhibitors and non-TNF biologics, administered with or without MTX, equally positioned as a recommended therapy following a trial of a conventional synthetic DMARD (e.g., MTX, leflunomide, hydroxychloroquine, sulfasalazine).[2] Guidelines for treatment of inflammatory conditions recommend assessment of response to initial therapy, most often within 3 months of initiating or changing therapy.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Kevzara. Because of the specialized skills required for evaluation and diagnosis of patients treated with Kevzara as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Kevzara to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the approval duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

All reviews for use of Kevzara for COVID-19 and/or cytokine release syndrome associated with COVID-19 will be forwarded to the Medical Director.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Kevzara is recommended in those who meet one of the following criteria:

FDA-Approved Indications

13. Rheumatoid Arthritis. Approve for the duration noted if the patient meets ONE of the following criteria (A or B):
- **A)** Initial Therapy. Approve for 3 months if the patient meets the following criteria (i and ii):
  - **i.** Patient has tried ONE conventional synthetic disease-modifying antirheumatic drug (DMARD) for at least 3 months; AND
    Note: Examples of conventional synthetic DMARDs include methotrexate (oral or injectable), leflunomide, hydroxychloroquine, and sulfasalazine. An exception to the requirement for a trial of one conventional synthetic DMARD can be made if the patient has already had a 3-month trial of at least one biologic. Refer to Appendix for examples of biologics used for rheumatoid arthritis. These patients who have already tried a biologic are not required to "step back" and try a conventional synthetic DMARD).
  - **ii.** Kevzara is prescribed by or in consultation with a rheumatologist.
- **B)** Patient is Currently Receiving Kevzara. Approve for 3 years if the patient has had a response, as determined by the prescriber.
  Note: Examples of a response to therapy include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improved laboratory values; reduced dosage of corticosteroids. The patient may not have a full response, but there should have been a recent or past response to Kevzara.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Coverage of Kevzara is not recommended in the following situations:

4. Ankylosing Spondylitis. In a Phase II study, Kevzara did not demonstrate efficacy in patients with AS.[3]

5. Concurrent use with a Biologic or with a Targeted Synthetic DMARD. Kevzara should not be administered in combination with another biologic or with a targeted synthetic DMARD used for an inflammatory condition (see Appendix for examples). Combination therapy is generally not recommended due to a potential for a higher rate of adverse effects with combinations and lack of evidence for additive efficacy. Note: This does NOT exclude the use of conventional synthetic DMARDs (e.g., MTX, leflunomide, hydroxychloroquine, and sulfasalazine) in combination with Kevzara.

1. COVID-19 (Coronavirus Disease 2019). Forward all requests to the Medical Director.[4-6]
Note: This includes requests for cytokine release syndrome associated with COVID-19.

6. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

* Not an all-inclusive list of indication (e.g., oncology indications and rare inflammatory conditions are not listed). Refer to the prescribing information for the respective agent for FDA-approved indications; SC – Subcutaneous; TNF – Tumor necrosis factor; IV – Intravenous, IL – Interleukin; PDE4 – Phosphodiesterase 4; JAK – Janus kinase; AS – Ankylosing spondylitis; CD – Crohn's disease; PJIA – Polyarticular juvenile idiopathic arthritis; PsO – Plaque psoriasis; PsA – Psoriatic arthritis; RA – Rheumatoid

arthritis; SJIA – Systemic juvenile idiopathic arthritis; UC – Ulcerative colitis; nr-axSpA – Non-radiographic axial spondyloarthritis; ^ Off-label use of SJIA supported in guidelines; DMARDs – Disease-modifying antirheumatic drugs.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Kineret® (anakinra for subcutaneous injection – Biovitrim)

DATE REVIEWED: 04/01/2020

OVERVIEW

Kineret is an interleukin-1 (IL-1) receptor antagonist indicated to reduce the signs and symptoms and slow the progression of structural damage in adult patients with moderately to severely active rheumatoid arthritis (RA) who have failed one or more disease-modifying antirheumatic drugs (DMARDs).[1] Kineret is also indicated in Cryopyrin-Associated Periodic Syndromes (CAPS) for treatment of Neonatal-Onset Multisystem Inflammatory Disease (NOMID). In RA, Kineret can be used alone or in combination with DMARDs other than tumor necrosis factor inhibitors (TNFis).

Disease Overview

IL-1 production is induced in response to inflammation and mediates various physiologic responses including inflammatory and immunological responses.[1] In patients with RA, there are elevated amounts of IL-1 produced in the synovium and synovial fluid. Kineret blocks the biologic activity of IL-1 alpha and beta by competitively inhibiting IL-1 binding to the IL-1 type I receptor, which is expressed on a variety of cells. CAPS is a rare inherited inflammatory disease associated with overproduction of IL-1. In CAPS, spontaneous mutations in the CIAS1/NLRP3 gene leads to secretion of IL-1 beta, which has an important role in the systemic inflammation and manifestations of disease.

CAPS encompasses three rare genetic syndromes. Familial Cold Autoinflammatory Syndrome, Muckle-Wells Syndrome, and NOMID or chronic infantile neurological cutaneous and articular syndrome are thought to be one condition along a spectrum of disease severity.[2,3] There are no reliable prevalence statistics for CAPS, but the estimated number of persons with CAPS in the US is 200 to 500. In many cases, patients have had an immediate clinical response to Kineret with rash, fever, and arthritis disappearing within a few days and not recurring during follow-up.[4] Dramatic and persistent normalization of inflammatory markers and hematologic tests have also been achieved.

Guidelines

Il-1 blockers are mentioned in multiple guidelines for treatment of inflammatory conditions.

- Rheumatoid Arthritis: Current recommendations for the treatment of RA from the American College of Rheumatology (ACR) [2015] do not make a recommendation for the use of Kineret.[5] The recommendations also note that Kineret is used infrequently for RA and that TNFis and other non-TNFi biologics (i.e., rituximab, Actemra (tocilizumab IV infusion, tocilizumab SC injection], and Orencia [abatacept IV infusion, abatacept SC injection]) are appropriate initial biologic therapy for most patients with RA.
- Systemic Juvenile Idiopathic Arthritis (SJIA): The 2013 update of the 2011 ACR recommendations for the treatment of SJIA advise Kineret as appropriate initial therapy in SJIA for patients with active systemic features and varying degrees of synovitis. Kineret is also considered an appropriate second- and third-line agent for all patients with SJIA (in patients with and without active systemic features).

Other Uses With Supportive Evidence

SJIA is a subtype of JIA characterized by arthritis of unknown origin and extra-articular symptoms such as spiking fever, macular rash, serositis, hepatosplenomegaly, and generalized lymphadenopahty due to reticuloendothelial involvement.[7] Macrophage activation syndrome (MAS) is a severe and potentially lethal complication associated with SJIA. Symptoms include non-remitting fever, hepatosplenomegaly, lymphadenopathy, encephalopathy, and coagulopathy and may also include multi-organ failure. Laboratory abnormalities may include pancytopenia, hyperferritinemia, hypertriglyceridemia, and elevated serum transaminases. There is insufficient evidence for the use of TNFis in MAS associated with SJIA. Case-series have shown rapid remission of MAS as well as treatment of the underlying condition with the use of Kineret. Still's disease presents in adults with features similar to those of SJIA.[8] As in SJIA, Kineret has been effective in reducing fever, symptoms, and markers of inflammation in patients with adult-onset Still's disease who were refractory to conventional treatment with a corticosteroid, nonsteroidal anti-inflammatory drug (NSAID), and/or conventional synthetic DMARDs such as methotrexate (MTX).[9-14]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Kineret. Because of the specialized skills required for evaluation and diagnosis of patients treated with Kineret as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Kineret to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

All reviews for use of Kineret for COVID-19 and/or cytokine release syndrome associated with COVID-19 will be forwarded to the Medical Director.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Kineret is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Rheumatoid Arthritis (RA)**. Approve for the duration noted if the patient meets ONE of the following (A or B):
   - **A)** Initial Therapy. Approve for 3 months if the patient meets BOTH of the following criteria (i and ii):
     - **i.** The patient has had a 3-month trial of a biologic OR targeted synthetic disease-modifying antirheumatic drug (DMARD) for this condition, unless intolerant; AND
       Note: Refer to Appendix for examples of biologics and targeted synthetic DMARDs used for rheumatoid arthritis. Conventional synthetic DMARDs such as methotrexate (MTX), leflunomide, hydroxychloroquine, and sulfasalazine do not count.
     - **ii.** Kineret is prescribed by or in consultation with a rheumatologist.
   - **B)** Patients Currently Receiving Kineret. Approve for 3 years if the patient has had a response, as determined by the prescriber.
     Note: Examples of response include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths;

improved laboratory values; reduced dosage of corticosteroids. The patient may not have a full response, but there should have been a recent or past response to Kineret.

2. **Cryopyrin-Associated Periodic Syndromes (CAPS).** Approve for the duration noted if the patient meets ONE of the following (A or B):
   - **A)** Initial Therapy. Approve for 3 months if the patient meets BOTH of the following criteria (i and ii):
     - **i.** Kineret is being used for treatment of Neonatal Onset Multisystem Inflammatory Disease (NOMID), Familial Cold Autoinflammatory Syndrome (FCAS), Muckle-Wells Syndrome (MWS), and/or chronic infantile neurological cutaneous and articular (CINCA) syndrome; AND
     - **ii.** Kineret is prescribed by or in consultation with a rheumatologist, geneticist, or a dermatologist.
   - **B)** Patients Currently Receiving Kineret. Approve for 3 years if the patient has had a response, as determined by the prescriber.

     Note: The patient may not have a full response, but there should have been a recent or past response to Kineret.

Other Uses with Supportive Evidence

3. **Systemic Juvenile Idiopathic Arthritis (SJIA).** Approve for the duration noted if the patient meets ONE of the following (A or B):
   - **A)** Initial Therapy. Approve for 3 months if the patient meets BOTH of the following criteria (i and ii):
     - **i.** Patient meets ONE of the following conditions (a, b, or c):
       - **a)** The patient has tried one other systemic agent for this condition; OR

         Note: Examples of one other systemic agent include a corticosteroid (oral, IV); a conventional synthetic disease-modifying antirheumatic drug (DMARD; e.g., methotrexate [MTX], leflunomide, sulfasalazine); or a 1-month trial of a nonsteroidal anti-inflammatory drug (NSAID). A previous trial of a biologic (e.g, Actemra IV), a tumor necrosis factor (TNF) inhibitor (e.g., an etanercept product, an adalimumab product, or an infliximab product), or Ilaris (canakinumab for SC injection) also counts towards a trial of one other systemic agent for SJIA.
       - **b)** The patient has at least moderate to severe active systemic features of this condition OR the patient has active systemic features with an active joint count of one joint or greater, according to the prescriber; OR

         Note: Examples of moderate to severe active systemic features include fever, rash, lymphadenopathy, hepatomegaly, splenomegaly, and serositis.
       - **c)** The patient has active systemic features with concerns of progression to macrophage activation syndrome (MAS), as determined by the prescriber; AND
     - **ii.** Kineret is prescribed by or in consultation with a rheumatologist.
   - **B)** Patients Currently Receiving Kineret. Approve for 3 years if the patient has responded, as determined by the prescriber.

     Note: Examples of response include improvement in limitation of motion; less joint pain or tenderness; decreased duration of morning stiffness or fatigue; improved function or activities of daily living; reduced dosage of corticosteroids. The patient may not have a full response, but there should have been a recent or past response to Kineret.

4. **Still's Disease.** Approve for the duration noted if the patient meets ONE of the following (A or B):
   - **A)** Initial Therapy. Approve for 3 months if the patient meets BOTH of the following criteria (i and ii)::
     - **i.** Patient meets ONE of the following conditions (a, b, or c):
       - **a)** The patient meets ALL of the following criteria (1 and 2):
         - **(1)** The patient has tried one corticosteroid; AND
         - **(2)** The patient has had an inadequate response to one conventional synthetic disease-modifying antirheumatic drug (DMARD) such as methotrexate (MTX) given for at least 2 months or was intolerant to a conventional synthetic DMARD.
           Note: A previous trial of a biologic (e.g., Actemra IV, Arcalyst, Ilaris) also counts towards a trial of one other systemic agent for Still's disease; OR
       - **b)** The patient has at least moderate to severe active systemic features of this condition, according to the prescriber.
         Note: Examples of moderate to severe active systemic features include fever, rash, lymphadenopathy, hepatomegaly, splenomegaly, and serositis; OR
       - **c)** The patient has active systemic features with concerns of progression to macrophage activation syndrome, as determined by the prescriber; AND
     - **ii.** Kineret is prescribed by or in consultation with a rheumatologist; OR
   - **B)** Patients Currently Receiving Kineret. Approve for 1 year if the patient has responded, as determined by the prescriber.
     Note: Examples of response include improvement in limitation of motion; less joint pain or tenderness; decreased duration of morning stiffness or fatigue; improved function or activities of daily living; reduced dosage of corticosteroids. The patient may not have a full response, but there should have been a recent or past response to Kineret.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Kineret has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

1. **Ankylosing Spondylitis (AS).** Kineret has been beneficial in a few patients with AS, but results are not consistent.[15,16] In a small open-label study, patients with active AS who were refractory to NSAIDs (n = 20) received Kineret 100 mg daily.[16] The Bath Ankylosing Spondylitis Disease Activity Index (BASDAI) score decreased over a 6-month period but was not significant (5.8 at baseline vs. 5.0 at Week 12, and 4.8 at Week 24). No significant change was found in Bath Ankylosing Spondylitis Functional Index (BASFI), patients' and physicians' global assessment or general pain during the study. After 12 weeks, both the ASsessment in AS (ASAS) 20 and 40 responses improved in 10.5% of patients (intent-to-treat analysis). After 24 weeks, ASAS 20 was attained in 26% of patients, ASAS 40 in 21% of patients, and ASAS 70 in 10.5% of patients. Guidelines for axial spondyloarthritis from the Assessment of SpondyloArthritis International Society (ASAS)/European Union Against Rheumatism (EULAR) [2016] do not mention Kineret as a treatment option.[17]

2. **Concurrent Use with a Biologic or with a Targeted Synthetic Disease-Modifying Antirheumatic Drug (DMARD).** Data are lacking evaluating concomitant use of Kineret in combination with another biologic or with a targeted synthetic DMARD used for an inflammatory condition (See Appendix for examples). Combination therapy with biologics and/or biologics + targeted synthetic DMRADs has a

potential for a higher rate of adverse effects and lack controlled trial data in support of additive efficacy.[18]
Note: This does NOT exclude the use of conventional synthetic DMARDs (e.g., MTX, leflunomide, hydroxychloroquine, and sulfasalazine) in combination with Kineret.

2. **COVID-19 (Coronavirus Disease 2019).** Forward all requests to the Medical Director.
Note: This includes requests for cytokine release syndrome associated with COVID-19.

3. **Lupus Arthritis.** The effectiveness and safety of Kineret were evaluated in an open 3-month pilot trial in patients (n = 4) with systemic lupus erythematosis (SLE) and severe, therapy-refractory non-erosive polyarthritis (three patients had deforming Jaccoud's arthropathy) and no other uncontrolled major organ involvement.[19] Patients were refractory to NSAIDs, antimalarials, corticosteroids, MTX, cyclophosphamide, and azathioprine. SLE was controlled with stable doses of corticosteroids and/or antirheumatic or immunosuppressive agents; pain was managed with NSAIDs and/or other medications. Patients had improved clinically after 4 weeks on Kineret, but after 12 weeks the clinical activity parameters tended to increase again. The results from this study are preliminary and a larger controlled study is needed.

4. **Osteoarthritis (OA), Symptomatic.** In a Phase II study in patients with painful OA of the knee, Kineret 150 mg administered by intraarticular injection was well tolerated.[20] The study was not designed to assess the analgesic efficacy of Kineret since there was no control group. Intraarticular injections are often associated with a significant placebo effect. Patients with OA of the knee were enrolled in a multicenter, double-blind, placebo-controlled study and randomized to Kineret 50 mg, Kineret 150 mg, or placebo for intraarticular injection.[21] Although the injections were well tolerated, there were no significant differences in improvement in knee pain, stiffness, function or cartilage turnover between Kineret doses and placebo. Similar to other studies in this population, there was a significant placebo effect noted.

5. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

* Not an all-inclusive list of indication (e.g., oncology indications and rare inflammatory conditions are not listed). Refer to the prescribing information for the respective agent for FDA-approved indications; SC – Subcutaneous; TNF – Tumor necrosis factor; IV – Intravenous, IL – Interleukin; PDE4 – Phosphodiesterase 4; JAK – Janus kinase; AS – Ankylosing spondylitis; CD – Crohn's disease; PJIA – Polyarticular juvenile idiopathic arthritis; PsO – Plaque psoriasis; PsA – Psoriatic arthritis; RA – Rheumatoid arthritis; SJIA – Sytemice juvenile idiopathic arthritis; UC – Ulcerative colitis. ^ Off-label use of SJIA supported in guidelines.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Olumiant Prior Authorization Policy

- Olumiant (baricitinib tablets – Lilly)

REVIEW DATE: 07/01/2020

OVERVIEW

Olumiant, an inhibitor of the Janus kinases (JAK) pathways, is indicated for the treatment of rheumatoid arthritis in adults with moderate to severe active disease who have had an inadequate response to one or

more tumor necrosis factor inhibitors.[1] It is a targeted synthetic disease-modifying antirheumatic drugs (DMARD) that may be used either as monotherapy or in combination with MTX or other conventional synthetic DMARDs. Olumiant is not recommended for use in combination with other JAK inhibitors, or in combination with biologics or potent immunosuppressants such as azathioprine or cyclosporine.

Guidelines

Guidelines from the American College of Rheumatology (2015), updated prior to the approval of Olumiant, have tumor necrosis factor (TNF) inhibitors and non-TNF biologics, administered with or without MTX, equally positioned as a recommended therapy following a trial of a conventional synthetic DMARD (e.g., MTX, leflunomide, hydroxychloroquine, sulfasalazine).[4] Although Olumiant is not yet addressed, another JAK inhibitor (Xeljanz/Xeljanz XR [tofacitinib tablets, tofacitinib extended release tablets]) is not recommended for early RA; in established RA, Xeljanz/XR is most frequently recommended for patients with moderate or high disease activity despite use of multiple biologics. Guidelines for treatment of inflammatory conditions recommend assessment of response to initial therapy, most often within 3 months of initiating or changing therapy.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Olumiant. Because of the specialized skills required for evaluation and diagnosis of patients treated with Olumiant as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Olumiant to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

All reviews for use of Oluminat for COVID-19 and/or cytokine release syndrome associated with COVID-19 will be forwarded to the Medical Director.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Olumiant is recommended in those who meet the following criteria:

FDA-Approved Indications

17. Rheumatoid Arthritis. Approve for the duration noted if the patient meets ONE of the following criteria (A or B):

A) Initial Therapy. Approve for three months if the patient meets BOTH of the following (i and ii):

i. Patient has had a 3-month trial of at least ONE tumor necrosis factor inhibitor (TNFi) for this condition, unless intolerant; AND
Note: Refer to Appendix for examples of tumor necrosis factor inhibitors used for rheumatoid arthritis. Conventional synthetic DMARDs such as methotrexate (MTX), leflunomide, hydroxychloroquine, and sulfasalazine do not count.

ii. Olumiant is prescribed by or in consultation with a rheumatologist.

B) Patients Currently Receiving Olumiant. Approve for 3 years if the patient has had a response as determined by the prescriber.
Note: Examples of a response to therapy include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improved laboratory values; reduced dosage of corticosteroids. The patient may not have a full response, but there should have been a recent or past response to Olumiant.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Olumiant is not recommended in the following situations:

192. Concurrent Use with a Biologic or with a Targeted Synthetic DMARD. Olumiant should not be administered in combination with another biologic or with a targeted synthetic DMARD used for an inflammatory condition (see Appendix for examples).[1] Combination therapy is generally not recommended due to a potential for a higher rate of adverse effects with combinations and lack of evidence for additive efficacy.

193. Concurrent use with Other Potent Immunosuppressants (e.g., azathioprine, cyclosporine).[1] Coadministration with other potent immunosuppressive drugs has the risk of added immunosuppression and has not been evaluated in RA. Note: This does NOT exclude use of Olumiant with MTX; Olumiant has been evaluated with background MTX or combinations of conventional synthetic DMARDs containing MTX.

194. COVID-19 (Coronavirus Disease 2019). Forward all requests to the Medical Director.
Note: This includes requests for cytokine release syndrome associated with COVID-19.

195. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

APPENDIX

	Mechanism of Action	Examples of Inflammatory Indications for Products*
Biologics		
Adalimumab SC Products (Humira®, biosimilars)	Inhibition of TNF	AS, CD, PJIA, PsO, PsA, RA, SJIA, UC
Cimzia® (certolizumab pegol SC injection)	Inhibition of TNF	AS, CD, nr-axSpA, PsO, PsA, RA
Etanercept SC Products (Enbrel®, biosimilars)	Inhibition of TNF	AS, PJIA, PsO, PsA, RA, SJIA
Infliximab IV Products (Remicade®, biosimilars)	Inhibition of TNF	AS, CD, PJIA, PsO, PsA, RA, SJIA, UC
Simponi®, Simponi® Aria™ (golimumab SC injection, golimumab IV infusion)	Inhibition of TNF	SC formulation: AS, PsA, RA, UC
		IV formulation: AS, PsA, RA
Actemra® (tocilizumab IV infusion, tocilizumab SC injection)	Inhibition of IL-6	SC formulation: PJIA, RA, SJIA
		IV formulation: PJIA, RA, SJIA
Kevzara® (sarilumab SC injection)	Inhibition of IL-6	RA
Orencia® (abatacept IV infusion, abatacept SC injection)	T-cell costimulation modulator	SC formulation: PJIA, PSA, RA
		IV formulation: PJIA, PsA, RA
Rituximab IV Products (Rituxan®, biosimilars)	CD20-directed cytolytic antibody	RA
Ilaris (canakinumab SC injection**)**	Inhibition of IL-1β	SJIA
Kineret® (anakinra SC injection)	Inhibition of IL-1	RA, SJIA^
Stelara® (ustekinumab SC injection, ustekinumab IV infusion)	Inhibition of IL-12/23	SC formulation: CD, PsO, PsA, UC
		IV formulation: CD, UC
Siliq™ (brodalumab SC injection)	Inhibition of IL-17	PsO
Cosentyx™ (secukinumab SC injection)	Inhibition of IL-17A	AS, PsO, PsA
Taltz® (ixekizumab SC injection)	Inhibition of IL-17A	AS, nr-axSpA, PsO, PsA
Ilumya™ (tildrakizumab-asmn SC injection)	Inhibition of IL-23	PsO
Skyrizi™ (risankizumab-rzza SC injection)	Inhibition of IL-23	PsO
Tremfya™ (guselkumab SC injection)	Inhibition of IL-23	PsO
Entyvio™ (vedolizumab IV infusion)	Integrin receptor antagonist	CD, UC
Targeted Synthetic DMARDs		
Otezla® (apremilast tablets)	Inhibition of PDE4	PsO, PsA
Olumiant® (baricitinib tablets)	Inhibition of the JAK pathways	RA
Rinvoq® (upadacitinib extended-release tablets)	Inhibition of the JAK pathways	RA
Xeljanz®, Xeljanz XR (tofacitinib tablets, tofacitinib extended-release tablets)	Inhibition of the JAK pathways	RA, PsA, UC

* Not an all-inclusive list of indication (e.g., oncology indications and rare inflammatory conditions are not listed). Refer to the prescribing information for the respective agent for FDA-approved indications; SC – Subcutaneous; TNF – Tumor necrosis factor; IV – Intravenous, IL – Interleukin; PDE4 – Phosphodiesterase 4; JAK – Janus kinase; AS – Ankylosing spondylitis; CD – Crohn's disease; PJIA – Polyarticular juvenile idiopathic arthritis; PsO – Plaque psoriasis; PsA – Psoriatic arthritis; RA – Rheumatoid arthritis; SJIA – Systemic juvenile idiopathic arthritis; UC – Ulcerative colitis; nr-axSpA – Non-radiographic axial spondyloarthritis; ^ Off-label use of SJIA supported in guidelines; DMARDs – Disease-modifying antirheumatic drugs.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Orencia Intravenous Prior Authorization Policy

- Orencia® (abatacept for intravenous infusion)

REVIEW DATE: 06/17/2020

OVERVIEW

Orencia intravenous, a selective T-cell costimulation modulator, is indicated for the following uses:

- **Rheumatoid arthritis**, for reducing signs and symptoms, inducing major clinical response, inhibiting the progression of structural damage, and improving physical function in adult patients with moderately to severely disease. In RA, Orencia intravenous may be used as monotherapy or concomitantly with disease-modifying antirheumatic drugs (DMARDs) other than tumor necrosis factor inhibitors (TNFis).
- **Juvenile idiopathic arthritis**, for reducing signs and symptoms in pediatric patients ≥ 2 years of age with moderately to severely active polyarticular disease. In juvenile idiopathic arthritis, Orencia intravenous may be used alone or in combination with methotrexate (MTX).
- **Psoriatic arthritis**, in adults with active disease.

Orencia should not be administered concomitantly with TNFis and is not recommended for use concomitantly with other biologics for rheumatoid arthritis. Orencia is available as an intravenous infusion that is dosed on body weight. There is also a subcutaneous injection available in prefilled syringes (50 mg, 87.5 mg, and 125 mg per syringe) to allow for use in adults and weight-based dosing in pediatric patients. Some patients initiating therapy with Orencia subcutaneous will receive a single loading dose with Orencia intravenous.

Guidelines

Orencia is addressed in guidelines for treatment of various inflammatory conditions.

- **Rheumatoid Arthritis:** Guidelines from the American College of Rheumatology (ACR) [2015] have TNFis and non-TNF biologics such as Orencia, administered with or without methotrexate, equally positioned as a recommended therapy following a trial of a conventional synthetic DMARD (e.g., methotrexate, leflunomide, hydroxychloroquine, sulfasalazine).[2]
- **Juvenile Idiopathic Arthritis:** Guidelines (2019) list biologics among the treatment options for subsequent therapy in patients with polyarthritis.[3] Initial therapy with a biologic may be considered for patients with risk factors and involvement of high-risk joints (e.g., cervical spine, wrist, or hip), high disease activity, and/or those judged to be at high risk of disabling joint damage. In patients with active sacroiliitis or enthesitis despite nonsteroidal anti-inflammatory drug, a TNFi is recommended.
- **Psoriatic Arthritis:** Guidelines from ACR (2018) recommend TNFis over other biologics for use in treatment-naïve patients with PsA and in those who were previously treated with an oral therapy.[4] However, Orencia may be considered over other biologics in patients with recurrent or serious infections.

Safety

Orencia intravenous has Warnings concerning risks of serious infection.[1] Prior to initiating therapy with Orencia, patients should be evaluated for active tuberculosis infection. If a serious infection develops, treatment with Orencia should be discontinued.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Orencia intravenous. Because of the specialized skills required for evaluation and diagnosis of patients treated with Orencia as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Orencia intravenous to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

FDA-Approved Indications

2. **Rheumatoid Arthritis.** Approve for the duration noted if the patient meets ONE of the following (A or B):
   - **a)** Initial Therapy. Approve for 3 months if the patient meets the following criteria (i and ii):
     - i. Patient has tried ONE conventional synthetic disease-modifying antirheumatic drug (DMARD) for at least 3 months; AND
       Note: Examples of conventional synthetic DMARDs include methotrexate (oral or injectable), leflunomide, hydroxychloroquine, and sulfasalazine. An exception to the requirement for a trial of one conventional synthetic DMARD can be made if the patient has already has a 3-month trial at least one biologic. Refer to Appendix for examples of biologics used for rheumatoid arthritis. These patients who have already tried a biologic are not required to "step back" and try a conventional synthetic DMARD.
     - ii. The agent is prescribed by or in consultation with a rheumatologist.
   - **b)** Patient is Currently Receiving Orencia (Intravenous or Subcutaneous). Approve for 1 year if the patient has had a response, as determined by the prescriber.
     Note: Examples of a response include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improved laboratory values; reduced dosage of corticosteroids. The patient may not have a full response, but there should have been a recent or past response to Orencia.

3. **Juvenile Idiopathic Arthritis (JIA) [or Juvenile Rheumatoid Arthritis] (regardless of type of onset).** Approve for the duration noted if the patient meets ONE of the following (A or B):
   - **a)** Initial Therapy. Approve for 3 months if the patient meets BOTH of the following criteria (i and ii):
     - i. Patient meets one of the following conditions (a, b, c, or d):
       - **a)** Patient has tried one other agent for this condition; OR
         Note: Examples of therapies which could have been tried include methotrexate, sulfasalazine, or leflunomide, and a nonsteroidal anti-inflammatory drug (NSAID). A

biologic also counts as a trial of one agent for JIA. Refer to Appendix for examples of biologics used for JIA.

b) Patient will be starting on therapy concurrently with methotrexate, sulfasalazine, or leflunomide; OR

c) Patient has an absolute contraindication to methotrexate, sulfasalazine, or leflunomide; OR
Note: Examples of absolute contraindications to methotrexate include pregnancy, breast feeding, alcoholic liver disease, immunodeficiency syndrome, blood dyscrasias.

d) Patient has aggressive disease, as determined by the prescriber; AND

ii. The agent is prescribed by or in consultation with a rheumatologist.

b) Patient is Currently Receiving Orencia (Intravenous or Subcutaneous). Approve for 1 year if the patient has had a response, as determined by the prescriber.
Note: Examples of a response include improvement in limitation of motion; less joint pain or tenderness; improved function or activities of daily living; decreased duration of morning stiffness or fatigue; reduced dosage of corticosteroids; decreased soft tissue swelling in joints or tendon sheaths; improved laboratory values. The patient may not have a full response, but there should have been a recent or past response to Orencia.

4. Psoriatic Arthritis. Approve for the duration noted if the patient meets ONE of the following (A or B):

a) Initial Therapy. Approve for 3 months if prescribed by or in consultation with a rheumatologist or a dermatologist.

b) Patient is Currently Receiving Orencia (Intravenous or Subcutaneous). Approve for 1 year if the patient has responded, as determined by the prescriber.
Note: Examples of a response include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improvements in acute phase reactants (for example, C-reactive protein). The patient may not have a full response, but there should have been a recent or past response to Orencia.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Orencia intravenous is not recommended in the following situations:

196. Ankylosing Spondylitis (AS). In an open-label Phase II trial, Orencia was administered by IV infusion on Days 1, 15, 29, and every 28 days thereafter to patients with active AS.[5] Patients received a fixed dosage of Orencia of approximately 10 mg/kg based on body weight. The primary endpoint was a 40% improvement in disease activity at Week 24 in the Assessment of SpondyloArthritis international Society criteria (ASAS 40). At Week 24, the ASAS 40 was 13.3% (n = 2/15) in TNF blocker-naïve patients compared with no responses in patients who had previously failed TNF blockers (n = 15). ASAS 20 response was 26.7% (n = 4/15) in TNF blocker-naïve patients compared with 20% (n = 3/15) in those who had previously failed TNF blockers. A major response was not shown with treatment to Orencia.

197. Concurrent Use with a Biologic or with a Targeted Synthetic DMARD. Orencia IV should not be administered in combination with another biologic or with a targeted synthetic DMARD used for an inflammatory condition (see Appendix for examples). Combination therapy is generally not recommended due to a higher rate of AEs with combinations and lack of data supportive of additional efficacy.[6-7] Note: This does NOT exclude the use of conventional synthetic DMARDs (e.g., MTX, leflunomide, hydroxychloroquine, and sulfasalazine) in combination with Orencia IV.

198. Inflammatory Bowel Disease (i.e., Crohn's Disease [CD], Ulcerative Colitis [UC]). In placebo-controlled trials evaluating the efficacy of Orencia IV for induction and maintenance in adults with active, moderate to severe CD (n = 451) and UC (n = 490), Orencia was no more effective than placebo.[8] Patients were randomized to Orencia 30, 10, or 3 mg/kg IV (according to body weight) or placebo and dosed at Weeks 0, 2, 4, and 8. A total of 90 patients with CD and 131 patients with UC who responded to Orencia IV induction were then randomized to Orencia 10 mg/kg IV or placebo every 4 weeks through Week 52. When used for induction of CD, 17.2%, 10.2%, and 15.5% of patients receiving Orencia 30 mg, 10 mg, and 3 mg/kg IV achieved a clinical response at Weeks 8 and 12 compared with 14.4% of patients receiving placebo (P = not significant [NS] for all comparisons). In patients with CD, response and remission at Week 52 was not significantly different between the Orencia IV and placebo treatment groups. When used as induction therapy in UC, 21.4%, 19.0%, and 20.3% of patients receiving Orencia 30 mg, 10 mg, and 3 mg/kg IV achieved a clinical response at Week 12 compared with 29.5% of patients receiving placebo (P = 0.043 for 10 mg/kg vs. placebo; other comparisons NS). At Week 52, 12.5% (n = 8/64) and 14.1% (n = 9/64) of patients with UC were in remission (P = NS) and 17.2% of patients in each treatment group (n = 11/64 for each group) had achieved a response.

199. Psoriasis. (Note: Patients with concomitant plaque psoriasis and psoriatic arthritis may be reviewed under the psoriatic arthritis criteria above.) In a multicenter, Phase I, 26-week, open-label dose-escalation study, 43 patients with stable plaque psoriasis (10% to 49% body surface area involvement) received four doses of Orencia given as a 1-hour IV infusion on Days 1, 3, 16 and 29.[9] The starting dose was 0.5 mg/kg. Four to six patients were accrued to each of eight dose levels: 0.5, 1, 2, 4, 8, 16, 25 and 50 mg/kg. A parallel control group was matched for age and overall disease severity. In all, 46% of patients on Orencia for IV infusion achieved a 50% or greater sustained improvement in clinical disease activity (Physician's Global Assessment of disease activity) compared with baseline psoriasis evaluation. Progressively greater effects were observed with the highest doses. Further studies are needed to establish safety and efficacy in plaque psoriasis.

200. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Orencia Subcutaneous Prior Authorization Policy

- Orencia® (abatacept subcutaneous injection – Bristol Myers Squibb)

REVIEW DATE: 06/17/2020

OVERVIEW

Orencia subcutaneous, a selective T-cell costimulation modulator, is indicated for the following uses:

- **Rheumatoid arthritis**, for reducing signs and symptoms, inducing major clinical response, inhibiting the progression of structural damage, and improving physical function in adult patients with moderately to severely disease. In RA, Orencia intravenous may be used as monotherapy or

concomitantly with disease-modifying antirheumatic drugs (DMARDs) other than tumor necrosis factor inhibitors (TNFis).

- **Juvenile idiopathic arthritis**, for reducing signs and symptoms in pediatric patients ≥ 2 years of age with moderately to severely active polyarticular disease. In juvenile idiopathic arthritis, Orencia intravenous may be used alone or in combination with methotrexate (MTX).
- **Psoriatic arthritis**, in adults with active disease.

Orencia should not be administered concomitantly with TNFis and is not recommended for use concomitantly with other biologics for rheumatoid arthritis. The subcutaneous injection is available in prefilled syringes containing three different doses (50 mg, 87.5 mg, and 125 mg per syringe) to allow for weight-based dosing in adults and pediatric patients. It is also available as an intravenous infusion that is dosed on body weight.

Guidelines

Orencia is addressed in guidelines for treatment of various inflammatory conditions.

- **Rheumatoid Arthritis:** Guidelines from the American College of Rheumatology (ACR) [2015] have TNFis and non-TNF biologics such as Orencia, administered with or without MTX, equally positioned as a recommended therapy following a trial of a conventional synthetic DMARD (e.g., MTX, leflunomide, hydroxychloroquine, sulfasalazine).[2]
- **Juvenile Idiopathic Arthritis:** Guidelines (ACR, 2019) list biologics among the treatment options for subsequent therapy in patients with polyarthritis.[3] Initial therapy with a biologic may be considered for patients with risk factors and involvement of high-risk joints (e.g., cervical spine, wrist, or hip), high disease activity, and/or those judged to be at high risk of disabling joint damage. In patients with active sacroiliitis or enthesitis despite nonsteroidal anti-inflammatory drug, a TNFi is recommended.
- **Psoriatic Arthritis:** Guidelines from ACR (2018) recommend TNFis over other biologics for use in treatment-naïve patients with psoriatic arthritis and in those who were previously treated with an oral therapy.[4] However, Orencia may be considered over other biologics in patients with recurrent or serious infections.

Safety

Orencia subcutaneous has Warnings concerning risks of serious infection.[1] Prior to initiating therapy with Orencia, patients should be evaluated for active tuberculosis infection. If a serious infection develops, treatment with Orencia should be discontinued.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Orencia subcutaneous injection. Because of the specialized skills required for evaluation and diagnosis of patients treated with Orencia as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Orencia subcutaneous to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

FDA-Approved Indications

2. Rheumatoid Arthritis. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets BOTH of the following criteria (i and ii):

i. Patient has tried ONE conventional synthetic disease-modifying antirheumatic drug (DMARD) for at least 3 months; AND

Note: Examples of conventional synthetic DMARDs include methotrexate (oral or injectable), leflunomide, hydroxychloroquine, and sulfasalazine. An exception to the requirement for a trial of one conventional synthetic DMARD can be made if the patient has already has a 3-month trial at least one biologic. Refer to Appendix for examples of biologics used for rheumatoid arthritis. These patients who have already tried a biologic are not required to "step back" and try a conventional synthetic DMARD).

ii. The agent is prescribed by or in consultation with a rheumatologist.

B) Patient is Currently Receiving Orencia (Intravenous or Subcutaneous). Approve for 3 years if the patient has had a response, as determined by the prescriber.

Note: Examples of a response include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improved laboratory values; reduced dosage of corticosteroids. The patient may not have a full response, but there should have been a recent or past response to Orencia.

3. Juvenile Idiopathic Arthritis (JIA) [or Juvenile Rheumatoid Arthritis {JRA}] (regardless of type of onset). Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve Orencia SC for 3 months if the patient meets BOTH of the following criteria (i and ii):

i. The patient meets one of the following conditions (a, b, c, or d):

m) Patient has tried one other agent for this condition; OR

Note: Examples of therapies which could have been tried include methotrexate, sulfasalazine, or leflunomide, and a nonsteroidal anti-inflammatory drug (NSAID). A biologic also counts as a trial of one agent for JIA. Refer to Appendix for examples of biologics used for JIA.

n) Patient will be starting on therapy concurrently with methotrexate, sulfasalazine, or leflunomide; OR

o) Patient has an absolute contraindication to methotrexate, sulfasalazine, or leflunomide; OR

Note: Examples of absolute contraindications to methotrexate include pregnancy, breast feeding, alcoholic liver disease, immunodeficiency syndrome, blood dyscrasias.

p) Patient has aggressive disease, as determined by the prescriber; AND

ii. The agent is prescribed by or in consultation with a rheumatologist.

B) Patient is Currently Receiving Orencia (Intravenous or Subcutaneous). Approve for 3 years if the patient has had a response, as determined by the prescriber.
Note: Examples of a response include improvement in limitation of motion; less joint pain or tenderness; improved function or activities of daily living; decreased duration of morning stiffness or fatigue; reduced dosage of corticosteroids; decreased soft tissue swelling in joints or tendon sheaths; improved laboratory values. The patient may not have a full response, but there should have been a recent or past response to Orencia.

4. Psoriatic Arthritis. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if prescribed by or in consultation with a rheumatologist or a dermatologist.

B) Patient is Currently Receiving Orencia (Intravenous or Subcutaneous). Approve for 3 years if the patient has responded, as determined by the prescriber.
Note: Examples of a response include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improvements in acute phase reactants (for example, C-reactive protein). The patient may not have a full response, but there should have been a recent or past response to Orencia.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Orencia subcutaneous is not recommended in the following situations:

201. Ankylosing Spondylitis. In an open-label Phase II trial, Orencia was administered by IV infusion on Days 1, 15, 29, and every 28 days thereafter to patients with active AS.[5] Patients received a fixed dosage of Orencia of approximately 10 mg/kg based on body weight. The primary endpoint was a 40% improvement in disease activity at Week 24 in the Assessment of SpondyloArthritis international Society criteria (ASAS 40). At Week 24, the ASAS 40 was 13.3% (n = 2/15) in TNF blocker-naïve patients compared with no responses in patients who had previously failed TNF blockers (n = 15). ASAS 20 response was 26.7% (n = 4/15) in TNF blocker-naïve patients compared with 20% (n = 3/15) in those who had previously failed TNF blockers. A major response was not shown with treatment to Orencia.

202. Concurrent Use with a Biologic or with a Targeted Synthetic DMARD. Orencia SC should not be administered in combination with another biologic or with a targeted synthetic DMARD used for an inflammatory condition (see APPENDIX for examples). Combination therapy is generally not recommended due to a higher rate of AEs with combinations and lack of data supportive of additional efficacy.[6-7] Note: This does NOT exclude the use of conventional synthetic DMARDs (e.g., MTX, leflunomide, hydroxychloroquine, and sulfasalazine) in combination with Orencia (IV or SC).

203. Inflammatory Bowel Disease (i.e., Crohn's Disease [CD], Ulcerative Colitis [UC]). In placebo-controlled trials evaluating the efficacy of Orencia IV for induction and maintenance in adults with active, moderate to severe CD (n = 451) and UC (n = 490), Orencia was no more effective than placebo.[8] Patients were randomized to Orencia 30, 10, or 3 mg/kg IV (according to body weight) or placebo and dosed at Weeks 0, 2, 4, and 8. A total of 90 patients with CD and 131 patients with UC who responded

to Orencia IV induction were then randomized to Orencia 10 mg/kg IV or placebo every 4 weeks through Week 52. When used for induction of CD, 17.2%, 10.2%, and 15.5% of patients receiving Orencia 30 mg, 10 mg, and 3 mg/kg IV achieved a clinical response at Weeks 8 and 12 compared with 14.4% of patients receiving placebo (P = not significant [NS] for all comparisons). In patients with CD, response and remission at Week 52 was not significantly different between the Orencia IV and placebo treatment groups. When used as induction therapy in UC, 21.4%, 19.0%, and 20.3% of patients receiving Orencia 30 mg, 10 mg, and 3 mg/kg IV achieved a clinical response at Week 12 compared with 29.5% of patients receiving placebo (P = 0.043 for 10 mg/kg vs. placebo; other comparisons NS). At Week 52, 12.5% (n = 8/64) and 14.1% (n = 9/64) of patients with UC were in remission (P = NS) and 17.2% of patients in each treatment group (n = 11/64 for each group) had achieved a response.

204. **Psoriasis**. (Note: Patients with concomitant plaque psoriasis and psoriatic arthritis may be reviewed under the psoriatic arthritis criteria above.) In the pivotal trial evaluating Orencia SC for PsA, there was not a significant difference at Week 24 in PASI 50 response vs. placebo ± csDMARD (27% vs. 20% with placebo ± csDMARD; P = not significant).[10] In a multicenter, Phase I, 26-week, open-label dose-escalation study, 43 patients with stable plaque psoriasis (10% to 49% body surface area involvement) received four doses of Orencia given as a 1-hour IV infusion on Days 1, 3, 16 and 29.[9] The starting dose was 0.5 mg/kg. Four to six patients were accrued to each of eight dose levels: 0.5, 1, 2, 4, 8, 16, 25 and 50 mg/kg. A parallel control group was matched for age and overall disease severity. In all, 46% of patients on Orencia for IV infusion achieved a 50% or greater sustained improvement in clinical disease activity (Physician's Global Assessment of disease activity) compared with baseline psoriasis evaluation. Progressively greater effects were observed with the highest doses. Further studies are needed to establish safety and efficacy in plaque psoriasis.

205. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

* Not an all-inclusive list of indication (e.g., oncology indications and rare inflammatory conditions are not listed). Refer to the prescribing information for the respective agent for FDA-approved indications; SC – Subcutaneous; TNF – Tumor necrosis factor; IV – Intravenous, IL – Interleukin; PDE4 – Phosphodiesterase 4; JAK – Janus kinase; AS – Ankylosing spondylitis; CD – Crohn's disease; PJIA – Polyarticular juvenile idiopathic arthritis; PsO – Plaque psoriasis; PsA – Psoriatic arthritis; RA – Rheumatoid arthritis; SJIA – Systemic juvenile idiopathic arthritis; UC – Ulcerative colitis; nr-axSpA – Non-radiographic axial spondyloarthritis; ^ Off-label use of SJIA supported in guidelines.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Otezla® (apremilast tablets – Amgen)

DATE REVIEWED: 04/29/2020

OVERVIEW

Otezla, an oral phosphodiesterase 4 (PDE4) inhibitor, is indicated for the following indications:

1. Psoriatic arthritis (PsA) in adults; and
2. Plaque psoriasis, in moderate to severe disease in patients who are candidates for phototherapy or systemic therapy; and
3. Behcet's disease, in adults with oral ulcers.[1]

Disease Overview

PDE4 regulates immune and inflammatory processes through control of intracellular cAMP levels and downstream protein kinase A pathways. The production of a number of key inflammatory cytokines is affected by PDE4 including interferon (IFN)γ, tumor necrosis factor (TNF)α, interleukin (IL)-12, and IL-23, thus shaping the immune response.[2] Otezla is a targeted synthetic disease-modifying anti-rheumatic drug (DMARD) that specifically targets intracellular PDE4 and, therefore, has an inhibitory effect on multiple cytokines involved in the inflammatory process.[2-3]

Guidelines

Joint guidelines from the American Academy of Dermatology (AAD) and National Psoriasis Medical Board (2020) have been published for management of psoriasis with systemic nonbiologic therapies.[8] These guidelines list Otezla as a monotherapy treatment option for patients with moderate to severe plaque psoriasis. For treatment of moderate to severe psoriasis in adults, Otezla has a similar level of evidence and strength of recommendations as methotrexate. Additionally, data support use of MTX in combination with other systemic therapies for psoriasis,[4,8] whereas there is no strong evidence supporting combination use of Otezla with other systemic therapies or with phototherapy.[4] Guidelines from the American College of Rheumatology (ACR) [2019] recommend TNF inhibitors over other biologics and Otezla for use in treatment-naïve patients with PsA and in those who were previously treated with an oral therapy.[6]

EULAR recommendations for the management of Behcet's disease (2018) mention Otezla as a treatment option for Behcet's disease with mucocutaneous involvement.[7] Other options include topical steroids, colchicine, azathioprine, thalidomide, interferon-alpha, and TNFis. TNFis are also listed among the therapeutic options for patients who present with eye involvement, refractory venous thrombosis, arterial involvement, refractory/severe gastrointestinal involvement, nervous system involvement, and/or joint involvement.

Safety

Warnings/Precautions for Otezla include depression, weight decrease, and drug interactions with strong cytochrome P450 inducers. The most commonly observed adverse events (AEs) [incidence ≥ 5%] were diarrhea, nausea, and headache.[1] Of note, Otezla does not have Warnings regarding serious infection and malignancy, which are listed for the biologic DMARDs approved for PsA, nor does Otezla have warnings for organ toxicity and laboratory monitoring that are noted with methotrexate (MTX) and leflunomide.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Otezla. Because of the specialized skills required for evaluation and diagnosis of patients treated with Otezla as well as the monitoring required for AEs and long-term efficacy, initial approval requires Otezla to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Otezla is recommended in those who meet the following criteria:

FDA-Approved Indications

18. Plaque Psoriasis. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 4 months if the patient meets ALL of the following criteria (i, ii, and iii):

i. The patient is an adult greater than or equal to 18 years of age; AND

ii. The patient meets ONE of the following conditions (a or b):

a) The patient has tried at least one traditional systemic agent for psoriasis for at least 3 months, unless intolerant.
Note: Examples of traditional systemic agents for psoriasis include methotrexate (MTX), cyclosporine, acitretin tablets, or psoralen plus ultraviolet A light (PUVA). An exception to the requirement for a trial of one traditional systemic agent for psoriasis can be made if the patient has already had a 3-month trial or previous intolerance to at least one biologic. Refer to Appendix for examples of biologics used for plaque psoriasis. These patients who have already tried a biologic for psoriasis are not required to "step back" and try a traditional systemic agent for psoriasis); OR

b) The patient has a contraindication to methotrexate (MTX), as determined by the prescriber; AND

iii. Otezla is prescribed by or in consultation with a dermatologist.

B) Patient is Currently Receiving Otezla. Approve for 3 years if the patient meets BOTH of the following conditions (i and ii):

i. The patient has already received at least 4 months of therapy with Otezla.
Note: Patients who have received < 4 months of therapy or those who are restarting therapy with Otezla should be considered under criterion 1A (Plaque Psoriasis, initial therapy); AND

ii. The patient has had a response, as determined by the prescriber.
Note: There may not be a full response by Month 4, but there should be some response.

19. Psoriatic Arthritis (PsA). Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 4 months if the patient meets the BOTH of following (i and ii):

i. *The patient is an adult greater than or equal to 18 years of age; AND*

ii. Otezla is prescribed by or in consultation with a rheumatologist or a dermatologist.

B) Patient is Currently Receiving Otezla. Approve for 3 years if the patient meets BOTH of the following conditions (i and ii):

i. The patient has already received at least 4 months of therapy with Otezla.

Note: Patients who have received < 4 months of therapy or those who are restarting therapy with Otezla should be considered under criterion 2A [PsA, initial therapy]); AND

ii. The patient has had a response, as determined by the prescriber.
Note: Examples of a response to therapy include: less joint pain, morning stiffness, or fatigue; improved function or activities of daily living, decreased soft tissue swelling in joints or tendon sheaths, improvements in acute phase reactants [for example, C-reactive protein]).

3. Behcet's Disease. Approve for the duration noted if the patient meets the following criteria (A or B):

A) Initial Therapy. Approve for 4 months if the patient meets ALL of the following (i, ii, iii, and iv):

i. The patient is an adult greater than or equal to 18 years of age; AND

ii. The patient has oral ulcers or other mucocutaneous involvement; AND

iii. The patient has tried at least ONE other systemic therapy.
Note: Examples of systemic therapies include colchicine, systemic corticosteroids, azathioprine, thalidomide, interferon alpha, tumor necrosis factor inhibitors (e.g., adalimumab [Humira], etanercept [Enbrel], certolizumab pegol [Cimzia], golimumab [Simponi/Aria], or infliximab products [Inflectra, Remicade, Renflexis]); AND

iv. Otezla is prescribed by or in consultation with a rheumatologist or dermatologist.

B) Patient is Currently Receiving Otezla. Approve for 1 year if the patient is currently taking Otezla for ≥ 120 days and has responded to therapy, as determined by the prescriber.
Note: Examples of a response to therapy include: a decrease in the number/frequency of oral and/or genital ulcers. Patients who have received < 4 months of therapy or those who are restarting therapy with Otezla should be considered under criterion 3A (Behcet's disease, initial therapy).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Otezla has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

206. Ankylosing Spondylitis (AS). Current evidence does not support use of Otezla in AS. In a published double-blind, placebo-controlled Phase II study, patients (n = 38) were randomized in a 1:1 ratio to treatment with Otezla 30 mg BID or placebo.[13] At Week 12, there was not a statistically significant change from baseline compared with placebo in multiple endpoints, including the Bath Ankylosing Spondylitis Disease Activity Index, Functional Index, Global Score, or Metrology Index (BASDAI, BASFI, BAS-G, or BASMI), the Functional Assessment of Chronic Illness Therapy-Fatigue (FACIT-F), or night pain scores.

207. Concurrent Use with a Biologic or with a Targeted Synthetic DMARD. Otezla is a small molecule that specifically targets intracellular PDE4 and has an inhibitory effect on multiple cytokines involved in the inflammatory process, including TNF, IFNγ, IL-12, and IL-23.[2-3] Co-administration of Otezla with a biologic or another targeted synthetic DMARD (see Appendix for examples) has the risk of added immunosuppression and has not been evaluated. Note: This does NOT exclude the use of conventional synthetic DMARDs (e.g., MTX, leflunomide, hydroxychloroquine, and sulfasalazine) in combination with Otezla.

208. Rheumatoid Arthritis (RA). Current evidence does not support use of Otezla in RA. A multicenter, double-blind, Phase II study (n = 237) randomized patients in a 1:1:1 ratio to treatment with Otezla 20 mg BID, Otezla 30 mg BID, or placebo.[14] All patients were required to take a stable dose of MTX

throughout the study. At Week 16, a similar proportion of patients in all treatment groups achieved an American College of Rheumatology (ACR) 20 response (28%, 34%, and 35%, respectively). At Week 16, patients who were non-responders, defined as patients with a swollen joint count and tender joint count that had not improved by at least 20%, were required to enter early escape (patients who were receiving placebo were transitioned to Otezla 20 mg BID and patients receiving Otezla continued on the assigned therapy for an additional year). At Week 24, all patients who received placebo were similarly transitioned to Otezla. At Weeks 24 and 52, both doses of Otezla were associated with generally similar changes versus placebo, including ACR 20, ACR 50, and ACR 70. A subset of patients underwent magnetic resonance imaging (MRI) evaluation; however, no significant difference in response rates was observed at Week 16. The study was terminated early; data were not analyzed at Year 2 as originally planned.

209. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

OVERVIEW OF DISEASE STATE FOR PRIOR AUTHORIZATION DOCUMENT

Subject: Inflammatory Conditions – Plaque Psoriasis

Date Reviewed: 05/16/2017

Psoriasis is a multisystem disease that affects the skin and joints.[1-2] It is a chronic inflammatory skin disease with scaly, erythematous patches, papules, and plaques and is often pruritic. It affects > 3% of persons in the US (>6million people).[3] The disease primarily affects adults and occurs equally in men and women.[1-2]

In plaque psoriasis, the most common form of psoriasis (80% to 90% of patients), there are patches of thick, inflamed skin covered with a silvery scale that can cause significant pain and discomfort. These plaques usually occur on the elbows, knees, legs, scalp, lower back, trunk and buttocks. Psoriasis may also affect the fingernails, toenails, soft tissues of the genitals, and inside the mouth. About 80% of patients have mild to moderate disease and 20% have moderate to severe psoriasis affecting more than 5% of body surface area (BSA) or areas such as the palms of the hands, soles the feet, face or genitals.[1] About 1 million of the people with psoriasis also have psoriatic arthritis (PsA). Triggers that may cause flare-ups of psoriasis include infections, stress, medications (e.g., lithium, beta adrenergic blockers), and changes that dry the skin. Other forms of psoriasis besides plaque type include guttate, pustular, inverse, and erythrodermic. Psoriasis may be associated with considerable physical and/or psychological disabilities. Treatment of psoriasis depends on the severity of the disease; the extent of disease (BSA involved); type of psoriasis; location of the lesions; symptoms; the patient's response to previous therapy; accessibility to a dermatologist, hospital, and ultraviolet (UV) light facilities; and co-morbid disease states. Since psoriasis is a chronic disease, long-term safety of medications must be considered.

For plaque psoriasis, if the disease is limited, topical therapies with corticosteroids ± vitamin D analogs (e.g., calcipotriene calcitriol), tazarotene (Tazorac®, generics), anthralin, coal tar preparations, keratolytics (salicylic acid, lactic acid, urea), topical moisturizers and combinations or sequential use of these topical therapies are indicated.[2,5] However, for patients with chronic plaque psoriasis that does not respond to topical therapies or patients with more extensive disease, systemic therapy may be used. The traditional systemic agents for plaque psoriasis are methotrexate (MTX), acitretin tablets (Soriatane®, generics), and cyclosporine.[5] These medications may have significant adverse effects (e.g., hepatotoxicity, nephrotoxicity, teratogenicity). Other systemic agents have been investigated in psoriasis (e.g., azathioprine, tacrolimus, and mycophenolate mofetil). Phototherapy (e.g., ultraviolet B [UVB]) and photochemotherapy (psoralen and ultraviolet A **[**UVA] light [PUVA]) may also be used.[6-7] Acitretin is a first-line systemic agent for patients with chronic palmoplantar or pustular psoriasis, but it has a limited role in patients with plaque psoriasis.[7] Cyclosporine is a fast-acting agent commonly used for certain types of pustular or erythrodermic psoriasis. Cyclosporine is also used intermittently (up to 12 weeks) to control psoriasis flares. MTX may be used for plaque psoriasis; compared to cyclosporine, MTX has a moderate effect but can be used long-term. The biologics have established efficacy in plaque psoriasis. Narrow band (NB) UVB can be used in the physician's office or at home and is slightly less effective than PUVA.[1,6] The injectable biologic agents, etanercept subcutaneous [SC] injection (e.g., Enbrel®, Erelzi™), adalimumab SC injection (e.g., Humira®, Amjevita™), infliximab intravenous (IV) infusion (e.g., Remicade®, Inflectra™, Renflexis®), Stelara® (ustekinumab SC injection), Cosentyx® (secukinumab SC injection), Siliq™ (brodalumab SC injection), and Taltz® (ixekizumab SC injection) are options for patients who are candidates for phototherapy or systemic therapy, especially those who are intolerant of or unresponsive to traditional systemic agents.[7] Another agent available is Otezla® (apremilast tablets), an oral phosphodiesterase 4 (PDE4) inhibitor that is indicated for treatment patients with moderate to severe plaque psoriasis who are candidates for phototherapy or systemic therapy.[12]

Long-term safety is an important consideration.[7] The long-term risks of PUVA, MTX, and cyclosporine increase with cumulative dose. Safety concerns with the biologics include serious infections such as sepsis and tuberculosis, autoimmune conditions such as lupus and demyelinating disorders, and lymphoma. Patients with PsA, regardless of skin involvement, may require systemic therapy with MTX or Stelara, Cosentyx, or a tumor necrosis factor inhibitor (TNFi) such as etanercept, adalimumab, or infliximab that are effective for both plaque psoriasis and PsA.[2,14-15] Of note, Simponi® (golimumab for SC injection) and Cimzia® (certolizumab pegol SC injection) are TNFis indicated for PsA, but not for plaque psoriasis.[8,16] Note that Otezla is also indicated in PsA, and it does <u>not</u> have warnings regarding serious infection and malignancy, which are listed for the biologics approved for PsA, nor does Otezla have warnings for organ toxicity and laboratory monitoring that are noted with MTX and leflunomide.[12] Warnings/Precautions for

Otezla include depression, weight decrease, and drug interactions with strong cytochrome P450 inducers, and the most commonly observed adverse events (AEs) [incidence ≥ 5%] were diarrhea, nausea, and headache.

Almost all well-controlled clinical trials of psoriasis treatment include patients with chronic plaque psoriasis and exclude less common types of psoriasis and those involving the palms and soles, scalp, and intertriginous areas.[1]

One of the methods used to evaluate psoriasis in clinical trials is the psoriasis area-and-severity index (PASI) score.[1,9-10] The PASI ranges from 0 (no psoriasis) to 72 (the most severe disease possible) and combines the scores for the degree of erythema, induration, desquamation, and the percentage of BSA impacted. A primary endpoint in clinical trials is the PASI 75 which is ≥ 75% reduction from the baseline PASI score. Patients usually attain meaningful disease and quality of life improvements with at least a 50% decrease in PASI score.[10] Psoriasis severity (plaque, scaling, erythema) is also evaluated via global assessments by the physician.[11] The static Physician Global Assessment (sPGA) is reported on a six- or seven-point scale (e.g., ranging from 5 = severe to 0 = none indicating the physician's overall assessment of psoriasis severity). Other dynamic PGA scales define the endpoint using scales such as "clear" or "minimal" or "almost clear". The Dermatology Life Quality Index (DLQI) has been used as a guide in patient management (e.g., for assessment of disease severity).[8]

OVERVIEW OF DISEASE STATE FOR PRIOR AUTHORIZATION DOCUMENT

Subject: Inflammatory Conditions – Psoriatic Arthritis Overview for PA Policy

Date Revised: 03/24/2017

Psoriatic arthritis (PsA) is considered a spondyloarthropathy and is distinct from rheumatoid arthritis (RA) and other inflammatory arthritides.[1] PsA may be defined as an inflammatory arthritis associated with psoriasis.[2] PsA develops in approximately one-third of patients with psoriasis; however, up to 20% of patients with PsA develop symptoms of arthritis prior to skin manifestations of disease.[1] Patients with PsA may have joint inflammation and synovitis, enthesitis, dactylitis, spinal involvement, and skin and nail psoriasis. Manifestations of PsA are very heterogeneous and multiple tissues may be involved with varying degrees of severity.[3] Joint damage in PsA is a result of bone destruction, bone formation, and cartilage loss.[4] Data from rheumatology referral centers indicate erosive and deforming arthritis occurs in 40% to 60% of patients with PsA and may be progressive as early as within one year of diagnosis.[2] Arthritis mutilans is a rare form of PsA which occurs when osteolysis and destructive changes in the joint lead to functional loss of the joint and irreversible deformity.[5] In the general population, PsA may have a milder course.[2]

Assessments used for clinical evaluation of PsA include the American College of Rheumatology (ACR) scoring system which has been used as the primary endpoint in clinical trials.[2-3] The distal interphalangeal (DIP) joints of the hand and both the proximal interphalangeal and DIP joints of the feet are counted and assessed in PsA. The Disease Activity Score (DAS) is also used in PsA trials and accommodates the commonly involved DIP and carpal-metacarpal joints. The PsA Response Criteria (PsARC) were specifically developed for PsA; these criteria focus on peripheral manifestations of PsA and have a limited capacity to capture features distinctive to PsA such as dactylitis and enthesitis. For axial disease, disease activity may be measured with the Bath Ankylosing Spondylitis Disability Activity Index (BASDAI).[3] The PsA Joint Activity Index (PsAJAI) was developed to assess joint disease in PsA.[6] The Composite Psoriatic Disease Activity Index (CPDAI) was also developed to consider joint, skin, dactylitis, enthesitis and back involvement in PsA. The CPDAI was developed and included the following domains: peripheral arthritis, skin disease, enthesitis, dactylitis, and spinal disease. On this index, a total score from 0 to 15 is possible, with a score of 0 corresponding with no disease and a score of 3 corresponding with severe disease for each domain.[7] In clinical practice, measure of response such as joint tenderness and swelling, global and pain response measures, functional indices and acute phase reactants have been used for monitoring and appear responsive.[8] Ultrasound and magnetic resonance imaging (MRI) have also been shown to be effective in detecting enthesitis and inflammation of the joints in patients with PsA.[9] Predictors of progressive PsA include polyarticular disease, elevated acute phase reactants, physical disability, erosive joint disease, and lack of response to initial therapies.

Guidelines

The European League Against Rheumatism (EULAR) has updated guidelines for PsA (2015).[10] In peripheral arthritis, a conventional synthetic disease-modifying drug (DMARD) [methotrexate {MTX} preferred) should be initiated early. Use of MTX in the Norwegian DMARD registry and TICOPA trial are cited to support this recommendation. If there is an inadequate response to at least one conventional synthetic DMARD, a biologic (usually a tumor necrosis factor [TNF] blocker) should be started. This recommendation is supported by the long-term experience and established safety/efficacy balance of TNF blockers vs. other biologics. In patients with an inadequate response to one conventional synthetic DMARD

and when TNF blockers are not appropriate, an interleukin (IL)-12/23 blocker (e.g., Stelara® [ustekinumab subcutaneous {SC} injection) or IL-17 blocker (e.g., Cosentyx® [secukinumab SC injection]) should be considered. It is noted that long-term data are needed to fully appreciate the benefit/risk profile of IL blockers. In patients with peripheral arthritis who have an inadequate response to at least one conventional synthetic DMARD, and when biologics are not appropriate, a targeted synthetic DMARD (e.g., Otezla® [apremilast tablets]) may be considered. It was acknowledged that Otezla has relatively low efficacy, plus there is a lack of radiographic data with Otezla. Lack of comparative studies and the safety profile were used to support this recommendation. In patients with enthesitis, dactylitis, or axial disease, the initial DMARD recommended are biologics; according to current practice a TNF blocker would be used. The guidelines note that comparison across trials is difficult because different outcomes were used. For enthesitis/dactylitis, the longest clinical experience is with TNF blockers. For axial disease, limited data with Stelara and a lack of data with Cosentyx influenced this recommendation. In patients who fail to respond to a biologic, switching to another biologic should be considered, including switching between TNF blockers.

Drug therapy for PsA has also been recommended by the Group for Research and Assessment of Psoriasis and Psoriatic Arthritis (GRAPPA) [2015] which includes both rheumatologists and dermatologists.[3] Treatment recommendations are made focusing on the following clinical domains of PsA: peripheral arthritis, axial disease, enthesitis, dactylitis, skin, and nail disease. General recommendations (standard therapeutic route) are made considering the following groupings: TNF blokers (e.g., Cimzia® [certolizumab pegol SC injection], Enbrel® [etanercept SC injection], Humira® [adalimumab SC injection], an infliximab product (e.g., Remicade®, Inflectra™], Simponi® [golimumab SC injection]), IL-12/23 (e.g., Stelara), IL-17 (e.g., Cosentyx), and phosphodiesterase 4 (PDE4) inhibitor (e.g., Otezla). In peripheral arthritis, TNF blockers or Otezla are recommended before Stelara or Cosentyx. However, the recommendation for TNF blockers is a stronger recommendation than Otezla. In axial disease, a TNF blocker, Stelara, or Cosentyx are recommended (TNF blockers have a stronger recommendation). Otezla is not recommended in axial disease. In patients with enthesitis, a TNF blocker, Stelara, Cosentyx or Otezla are recommended, but TNF blockers and Stelara have stronger recommendations than Cosentyx and Otezla. In patients with dactylitis, Otezla is conditionally recommended on equal footing with conventional synthetic DMARDs (MTX, leflunomide, sulfasalazine), followed by a trial of a TNF blocker or Stelara. In dactylitis, there is also an expedited route that leads to a TNF blocker or Stelara prior to a trial of conventional synthetic DMARD or Otezla. Cosentyx is conditionally recommended as a switch biologic (after a TNF blocker or Stelara). In those with skin disease, Otezla is recommended on equal footing with conventional synthetic DMARDs (MTX, cyclosporine, acetretin, fumaric acid esters). In skin disease, a TNF blocker, Stelara, Cosentyx, or Otezla is recommended following one of these therapies or as an expedited therapeutic route. For nail disease, a TNF blocker, Stelara, Cosentyx, and Otezla are potential first-line treatments. However, biologics have a stronger recommendation than Otezla.

OVERVIEW OF DISEASE STATE FOR PRIOR AUTHORIZATION DOCUMENT

Subject: Inflammatory Conditions – Rheumatoid Arthritis Overview for PA Policy

Date Revised: 03/24/2017

In 2010, the American College of Rheumatology (ACR) and European League Against Rheumatism (EULAR) collaborative initiative developed new classification criteria for rheumatoid arthritis (RA).[1] In this criteria, "definite RA" is based on the confirmed presence of synovitis in at least one joint, absence of an alternative diagnosis to better explain the synovitis, and achievement of a score ≥ 6 (out of 10) from individual scores of four domains (number and site of involved joints, serologic abnormality, elevated acute-phase response, and symptom duration). This system focuses on diagnosis of earlier-stage disease rather than late-stage RA.

Disease modifying antirheumatic drugs (DMARDs) are indicated for reducing signs and symptoms and inhibiting the progression of structural damage in patients with RA.[2] Patients with newly diagnosed RA should be started on DMARD therapy as soon as the diagnosis is made since these drugs may alter the disease course. The goal of therapy is to achieve and maintain remission or low disease activity.[3-4] Patients with a poor prognosis have one or more of the following features of RA: functional limitation (e.g., Health Assessment Questionnaire Disability Index [HAQ-DI]); extraarticular disease such as the presence of rheumatoid nodules, RA vasculitis, or Felty's syndrome; positive rheumatoid factor or anti-cyclic citrullinated peptide (CCP) antibodies; or bony erosions by radiograph.[2] Drug therapy should be adjusted every 3 months until the desired target is achieved.[4] When clinical decisions are made, structural changes and functional impairment must both be considered, as well as composite measures of disease activity.

Conventional Synthetic DMARDs vs. Biologics for RA

RA is a life-long disease. There is general speculation that earlier treatment of RA results in better outcomes, partially because joint damage is largely irreversible, making *prevention* of damage an important

goal.[2] According to the ACR, early intensive therapy may provide the best opportunity to preserve function and health-related quality of life and reduce work-related disability. However, one ideal treatment strategy for all patients with RA has not been established. Results from recent trials, including the RA: Comparison of Active Therapies (RACAT) and the Treatment of EArly Rheumatoid Arthritis (TEAR) studies have demonstrated similar efficacy with triple conventional synthetic (cs)DMARD therapy and Enbrel® (etanercept for subcutaneous [SC] injection) + methotrexate (MTX) in certain patient populations with RA.[5-6] Refer to Tables 1 and 2 for listings of DMARDs for RA.

Table 1. Conventional Synthetic DMARDs in RA.

Traditional Synthetic DMARDs	
Trade Name	**Generic Name (route)**
Rheumatrex®, Trexall®, Otrexup®, Rasuvo®	methotrexate (MTX) [oral, injection], generics
Arava®	leflunomide (oral), generics
Azulfidine En-tabs®, Azulfidine®	sulfasalazine (oral), generics
generics, Plaquenil®	hydroxychloroquine (oral), generics
Minocin®	minocycline (oral), generics
Imuran®	azathioprine (oral), generics
Neoral®, Sandimmune®	cyclosporine (oral), generics
Cuprimine®, Depen®	d-penicillamine (oral)

Table 1 (continued). Conventional Synthetic DMARDs in RA.

Traditional Synthetic DMARDs	
Trade Name	**Generic Name (route)**
gold compounds	
Myochrysine®	gold sodium thiomalate (injection), generics
Ridaura®	auranofin (oral)

DMARDs – Disease-modifying antirheumatic drugs; RA – Rheumatoid arthritis.

Table 2. Biologics and Targeted Synthetic DMARD used in RA.

Brand (generic name)	Mechanism of Action	Grouping
Actemra® (tocilizumab for IV infusion)	Inhibition of IL-6	Non-TNF biologic
Actemra® (tocilizumab for SC injection)	Inhibition of IL-6	Non-TNF biologic
Xeljanz®, Xeljanz XR (tofacitinib tablets)	Inhibition of the JAK pathways	Targeted synthetic DMARD
Infliximab products (IV) [e.g., Remicade® Inflectra™]	Inhibition of TNF	Infused TNF
Simponi® Aria™ (golimumab for IV infusion)	Inhibition of TNF	Infused TNF
Cimzia® (certolizumab pegol for SC injection)	Inhibition of TNF	Self-administered TNF
Etanercept products (SC) [e.g., Enbrel®, Erelzi™]	Inhibition of TNF	Self-administered TNF
Adalimumab products (SC) [e.g., Humira®, Amjevita™]	Inhibition of TNF	Self-administered TNF
Simponi® (golimumab for SC injection)	Inhibition of TNF	Self-administered TNF
Orencia® (abatacept for IV infusion)	T-cell costimulation modulator	Non-TNF biologic
Orencia® (abatacept for SC injection)	T-cell costimulation modulator	Non-TNF biologic
Rituxan® (rituximab for IV infusion)	CD20-directed cytolytic antibody	Non-TNF biologic
Kineret® (anakinra for subcutaneous SC injection)	Inhibition of IL-1	Non-TNF biologic

IV – Intravenous; IL – Interleukin; TNF – Tumor necrosis factor; SC – Subcutaneous; PDE4 – Phosphodiesterase 4; JAK – Janus kinase.

Guidelines

Updated guidelines from ACR (2015) detail treatment strategies for patients with RA.[2] In DMARD-naïve patients, conventional synthetic DMARD monotherapy (preferably MTX) is recommended as the initial treatment in early and established disease. Following failure of DMARD monotherapy there are several recommended options, including tumor necrosis factor (TNF) blockers (e.g., Cimzia® [certolizumab pegol subcutaneous SC injection], Enbrel, Humira® [adalimumab SC injection], Remicade® [infliximab intravenous {IV} infusion], Simponi® [golimumab SC injection], Simponi Aria® [golimumab IV infusion]) or non-TNF biologics (Actemra® [tocilizumab IV infusion, tocilizumab SC injection], Orencia® [abatacept IV infusion, abatacept SC injection], Rituxan® [rituximab IV infusion]). Xeljanz® (tofacitinib tablets) is most commonly listed as a treatment option following at least two biologics. Note that Xeljanz is disadvantaged because of potential longer-term safety concerns. Also, there is less clinical experience as well as concerns of the actual benefit/risk profile with Xeljanz. These guidelines do not make recommendations for Kineret® (anakinra SC injection) due to infrequent use in RA and lack of new data. Of note, for groupings that include IV and SC products, no distinction is made based on route of administration. A change in therapy is generally recommended when the patient has moderately or highly active disease despite the previous therapy. Refer to Table 3.

Table 3. Recommendations from ACR 2015 Guidelines, Early and Established RA.[2]

Clinical Scenario	Major Treatment Recommendations
DMARD-naïve patients (low, moderate, or high disease activity)	Early and established RA: • Traditional DMARD, monotherapy*
Following failure with DMARD monotherapy	Early and established RA (**no order of preference**):ᴷ • Combination DMARDs^ • TNFi ± MTX • Non-TNF biologics ± MTX
Following failure of a single TNFi	• Non-TNF biologics ± MTX (**preferred first option**) • TNFi ± MTX
Following failure of multiple TNFis	• Non-TNF biologic ± MTX (**preferred first option**) • Xeljanz ± MTX
Following failure of a single non-TNF biologic	• Non-TNF biologic ± MTX
Following failure of one TNFi and one non-TNF biologic	• Non-TNF biologics ± MTX (**preferred first option**) • Xeljanz ± MTX
Following failure of multiple non-TNF biologics	• TNFi ± MTX (if TNFi-naïve) • Xeljanz ± MTX

DMARD – Includes methotrexate (MTX), sulfasalazine (SSZ), leflunomide (LEF), and hydroxychloroquine (HCQ); ^ Includes double- or triple-therapy with MTX, SSZ, LEF, HCQ; TNFi – Tumor necrosis factor inhibitor; ᴷ Xeljanz ± MTX is also listed as an option for established RA only.

Updated RA guidelines from EULAR (2016) note that treatment decisions are based on disease activity and other patient factors such as progression of structural damage, comorbidities, and safety issues.[11] DMARDs should be started at diagnosis of RA, with MTX as part of the first treatment strategy. In patients with contraindications or an early intolerance to MTX, leflunomide or sulfasalazine should be considered. In every patient, the treatment goal should be sustained remission or low disease activity. Frequent monitoring (i.e., every 1 to 3 months) is recommended for active disease; therapy adjustments are recommended if no improvement within 3 months of starting a therapy or if the treatment target has not been reached after 6 months of on therapy. Glucocorticoids may be considered short-term when initiating or changing csDMARD therapy, but they should be tapered as soon as clinically feasible. Poor prognostic factors include: moderate to high disease activity after csDMARD therapy, high acute phase reactant levels, high swollen joint counts, presence of RF and/or ACPA (especially at high levels), presence of early erosions, and/or failure of ≥ two csDMARDs. In patients who do not have poor prognostic factors, if the treatment target is not reached with the first csDMARD strategy, other csDMARDs should be considered. In a patient with poor prognostic factors who fails to reach the treatment target following the first csDMARD, a biologic or targeted synthetic DMARD is recommended (current practice is a biologic). It is recommended that biologics and targeted synthetic DMARDs are given in combination with a csDMARD; however, IL-6 inhibitors and targeted synthetic DMARDs may have advantages in patients who cannot use csDMARDs. If one of these treatments is failed, another biologic or targeted synthetic DMARD with the same or different mechanism of action may be tried. Tapering may be considered in certain patients who are in persistent remission.

Treatment Strategy

Patients with RA should be treated with conventional synthetic DMARD(s) [monotherapy; combination therapy may be considered after monotherapy with a conventional synthetic DMARD] prior to receiving

a biologic for RA.[2] It is remarkable that the RA population is a heterogeneous population, often with many comorbidities that may need to be considered for drug therapy on a case-by-case basis (e.g., pregnancy, alcoholism, congestive heart failure, malignancy/history of malignancy, etc.).

Disease Assessment

The ACR criteria assess 68 joints for tenderness and 66 joints for swelling.[8] ACR definition of improvement in RA trials is defined as improvement in the joint counts and improvement in three of the following parameters: patient assessment, physician assessment, erythrocyte sedimentation rate (ESR), pain scale, and/or functional questionnaire. Improvement is denoted as either ACR 20, ACR 50, or ACR 70 which reflects either an improvement to the 20%, 50%, or 70% level in the parameters outlined. An ACR 20 response indicates a decrease of at least 20% in both the number of tender joints and the number of swollen joints, in addition to a 20% improvement in at least 3 of the following: the patient's global assessment of disease status, the patient's assessment of pain, the patient's assessment of physical function (measured with the Modified Stanford HAQ), the physician's global assessment of disease status, and the C-reactive protein (CRP) level. The ACR score, as a combined index, is not used in clinical practice to measure individual response to treatment or when following a patient over time. In clinical practice, individual response can be measured using many composite measures of disease activity which include joint assessments.[9] The DAS 28 is an assessment that uses tender joint count (28 joints), swollen joint count (28 joints), patient reported general health status on a visual analog scale (VAS), and uses either CRP or ESR. It is recommended that physicians measure and record RA disease activity as low, moderate, or high using a standardized scale or composite index (such as the DAS 28 [ESR or CRP]) at least yearly. In clinical studies, functional status/physical function is assessed using the HAQ. There are 20 questions in the HAQ from eight categories (dressing, rising, eating, walking, hygiene, reach, grip, and errands/chores) and the HAQ score is the mean of the highest score in each of the eight categories with a possible range of 0 to 3; the HAQ-DI is a weighted sum of the scale scores.[10]

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Rinvoq Prior Authorization Policy
- Rinvoq® (upadacitinib extended-release tablets – AbbVie)

REVIEW DATE: 08/26/2020

OVERVIEW

Rinvoq is a Janus kinase inhibitor (JAKi).[1] It is indicated for the treatment of adults with moderately to severely active rheumatoid arthritis who have had an inadequate response or intolerance to methotrexate, either as monotherapy or in combination with methotrexate or other nonbiologic disease-modifying antirheumatic drugs (DMARDs). Rinvoq is not recommended for use in combination with other JAKis, biologics, or potent immunosuppressants such as azathioprine or cyclosporine.

Across the pivotal studies, response to Rinvoq was assessed at Week 12.

Guidelines

Guidelines from the American College of Rheumatology (ACR) [2015], updated prior to the approval of Rinvoq, have tumor necrosis factor (TNF) inhibitors and non-TNF biologics, administered with or without methotrexate, equally positioned as a recommended therapy following a trial of a conventional synthetic DMARD (e.g., methotrexate leflunomide, hydroxychloroquine, sulfasalazine).[2] Although Rinvoq and Olumiant (baricitinib tablets) [another approved JAKi] are not yet addressed, another JAKi (Xeljanz/Xeljanz XR [tofacitinib tablets, tofacitinib extended release tablets]) is not recommended for early rheumatoid arthrits in established RA, Xeljanz/XR is most frequently recommended for patients with moderate or high disease activity despite use of multiple biologics.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Rinvoq. Because of the specialized skills required for evaluation and diagnosis of patients treated with Rinvoq as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Rinvoq to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

All reviews for use of Rinvoq for COVID-19 and/or cytokine release syndrome associated with COVID-19 will be forwarded to the Medical Director.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Rinvoq is recommended in those who meet the following criteria:

FDA-Approved Indications

20. Rheumatoid Arthritis. Approve Rinvoq for the duration noted if the patient meets ONE of the following criteria (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets ALL of the following (i, ii, and iii):

i. Patient is ≥ 18 years of age; AND

ii. Patient has tried ONE conventional synthetic disease-modifying antirheumatic drug (DMARD) for at least 3 months; AND

Note: Examples include methotrexate [oral or injectable], leflunomide, hydroxychloroquine, and sulfasalazine. An exception to the requirement for a trial of one conventional synthetic DMARD can be made if the patient has already had a 3-month trial of at least one biologic. Refer to Appendix for examples of biologics used for rheumatoid arthritis. These patients who have already tried a biologic for RA are not required to "step back" and try a conventional synthetic DMARD.

iii. The medication is prescribed by or in consultation with a rheumatologist.

B) Patient is Currently Receiving Rinvoq. Approve for 3 years if the patient has had a response, as determined by the prescriber.

Note: Examples of a response to therapy include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improved laboratory values; reduced dosage of corticosteroids. The patient may not have a full response, but there should have been a recent or past response to Rinvoq.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Rinvoq is not recommended in the following situations:

210. Concurrent Use with a Biologic or with a Targeted Synthetic Disease-Modifying Antirheumatic Drug (DMARD). Rinvoq should not be administered in combination with a biologic used for an inflammatory condition (see Appendix for examples).[1] Combination therapy is generally not recommended due to a potential for a higher rate of adverse effects with combinations and lack of evidence supporting additive efficacy. There are no data evaluating combination of Rinvoq with other targeted synthetic DMARD (e.g., Otezla [apremilast tablets], Xeljanz/XR [tofacitinib tablets/extended-release tablets], Olumiant [baricitinib tablets]); therefore, safety and efficacy of this combination is unknown.

211. Concurrent use with Other Potent Immunosuppressants (e.g., azathioprine, cyclosporine).[1] Coadministration with other potent immunosuppressive drugs has the risk of added immunosuppression and has not been evaluated in rheumatoid arthritis. Note: This does NOT exclude use of Rinvoq with methotrexate. Rinvoq has been evaluated with background methotrexate and other conventional synthetic DMARDs.

212. COVID-19 (Coronavirus Disease 2019). Forward all requests to the Medical Director.
Note: This includes requests for cytokine release syndrome associated with COVID-19.

213. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Infliximab IV Products (Remicade®, biosimilars)	Inhibition of TNF	AS, CD, PsO, PsA, RA, UC
Simponi®, Simponi® Aria™ (golimumab SC injection, golimumab IV infusion)	Inhibition of TNF	SC formulation: AS, PsA, RA, UC
		IV formulation: AS, PsA, RA
Actemra® (tocilizumab IV infusion, tocilizumab SC injection)	Inhibition of IL-6	SC formulation: PJIA, RA, SJIA
		IV formulation: PJIA, RA, SJIA
Kevzara® (sarilumab SC injection)	Inhibition of IL-6	RA
Orencia® (abatacept IV infusion, abatacept SC injection)	T-cell costimulation modulator	SC formulation: JIA, PSA, RA
		IV formulation: JIA, PsA, RA
Rituximab IV Products (Rituxan®, biosimilars)	CD20-directed cytolytic antibody	RA
Kineret® (anakinra SC injection)	Inhibition of IL-1	JIA^, RA
Stelara® (ustekinumab SC injection, ustekinumab IV infusion)	Inhibition of IL-12/23	SC formulation: CD, PsO, PsA, UC
		IV formulation: CD, UC
Siliq™ (brodalumab SC injection)	Inhibition of IL-17	PsO
Cosentyx™ (secukinumab SC injection)	Inhibition of IL-17A	AS, nr-axSpA, PsO, PsA
Taltz® (ixekizumab SC injection)	Inhibition of IL-17A	AS, nr-axSpA, PsO, PsA
Ilumya™ (tildrakizumab-asmn SC injection)	Inhibition of IL-23	PsO
Skyrizi™ (risankizumab-rzza SC injection)	Inhibition of IL-23	PsO
Tremfya™ (guselkumab SC injection)	Inhibition of IL-23	PsO
Entyvio™ (vedolizumab IV infusion)	Integrin receptor antagonist	CD, UC
Targeted Synthetic Disease-Modifying Antirheumatic Drugs		
Otezla® (apremilast tablets)	Inhibition of PDE4	PsO, PsA
Olumiant® (baricitinib tablets)	Inhibition of the JAK pathways	RA
Rinvoq® (upadacitinib extended-release tablets)	Inhibition of the JAK pathways	RA
Xeljanz®, Xeljanz XR (tofacitinib tablets, tofacitinib extended-release tablets)	Inhibition of the JAK pathways	RA, PsA, UC

* Not an all-inclusive list of indication (e.g., oncology indications and rare inflammatory conditions are not listed). Refer to the prescribing information for the respective agent for FDA-approved indications; SC – Subcutaneous; TNF – Tumor necrosis factor; AS – Ankylosing spondylitis; CD – Crohn's disease; JIA – Juvenile idiopathic arthritis; PsO – Plaque psoriasis; PsA – Psoriatic arthritis; RA – Rheumatoid arthritis; UC – Ulcerative colitis; nr-axSpA – Non-radiographic axial spondyloarthritis; IV – Intravenous; PJIA – Polyarticular juvenile idiopathic arthritis; SJIA – Systemic juvenile idiopathic arthritis; ^ Off-label use of Kineret in JIA supported in guidelines; JAK – Janus kinase.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Rituximab Intravenous Products for Rheumatoid Arthritis (RA)

- Rituxan® (rituximab for intravenous infusion – Genentech)
- Ruxience™ (rituximab-pvvr IV injection – Pfizer)
- Truxima® (rituximab-abbs injection for intravenous use – Celltrion/Teva)

DATE REVIEWED: 11/20/2019

OVERVIEW

Rituximab is a chimeric murine/human monoclonal antibody directed specifically against the CD20 antigen found on the surface of normal and malignant B lymphocytes.[1-3] The antigen CD20 is expressed on > 90% of B-cell non-Hodgkin's lymphomas (NHLs). B-cells are thought to play a role in the pathogenesis of rheumatoid arthritis (RA) and associated chronic synovitis.

Ruxience and Truxima are approved as biosimilar to Rituxan intravenous (IV), indicating no clinically meaningful differences in safety and effectiveness and the same mechanism of action, route of administration, dosage form, and strength as Rituxan IV. However, minor differences in clinically inactive components are allowed. At this time, Ruxience and Truxima has only demonstrated biosimilarity, not interchangeability.

All approved rituximab intravenous products are indicated for treatment of the following conditions:

1. Non-Hodgkin lymphoma (NHL), for previously untreated follicular, CD20-positive disease, in combination with first-line chemotherapy, and in patients achieving a complete or partial response to Rituxan in combination with chemotherapy, as a single-agent maintenance therapy; AND
2. NHL, for relapsed or refractory, low-grade or follicular, CD20-positive, B-cell, disease; AND
3. NHL, for non-progressing (including stable disease) low-grade, CD20-positive, B-cell disease as a single agent after first-line cyclophosphamide/vincristine/prednisone (CVP) chemotherapy; AND
4. NHL, for previously untreated diffuse large B-cell, CD20-positive disease, in combination with cyclophosphamide/doxorubicin/vincristine/prednisone (CHOP) or other anthracycline-based chemotherapy regimens; AND
5. Chronic lymphocytic leukemia (CLL), in combination with fludarabine and cyclophosphamide (FC) for the treatment of patients with previously untreated and previously treated CD20-positive disease.

In addition to the above indications, Rituxan IV and Ruxience are also indicated for the following condition:

1. Granulomatosis with polyangitis (GPA) [Wegener's granulomatosis {WG}] and microscopic polyangiitis (MPA) in adults, in combination with glucocorticoids.

Rituxan IV is also indicated for treatment of the following conditions:

1. Rheumatoid arthritis (RA), in adult patients with moderately to severely active disease, in combination with methotrexate (MTX) for patients who have had an inadequate response to one or more tumor necrosis factor inhibitors (TNFis); AND
2. Pemphigus vulgaris, for adults with moderate to severe.

Disease Overview

RA is a chronic, systemic, autoimmune, inflammatory disorder of unknown origin characterized by synovial inflammation.[8] RA causes joint swelling, stiffness, and tenderness which may lead to cartilage damage, bone erosions, and joint destruction, and is often associated with significant activity limitations and disability. Compared with patients who do not have RA, mortality is increased in patients with established RA with approximately 40% of deaths in the RA population attributed to cardiovascular causes such as ischemic heart disease or stroke.[9] RA is associated with a decreased quality of life and can contribute to reduced employment rates and increased costs of care.[8] B-cells are thought to play a role in the pathogenesis of RA and associated chronic synovitis.[1] In patients with RA, rituximab produces a rapid and sustained depletion of circulating and tissue-based B-cells. Most patients have near complete depletion within 2 weeks after the first dose; the majority have peripheral B-cell depletion for at least 6 months which is followed by gradual recovery.

Guidelines

Guidelines from the American College of Rheumatology (ACR) [2015] have TNFis (e.g., Cimzia® [certolizumab pegol for subcutaneous {SC} injection], etanercept products [e.g., Enbrel®], adalimumab products [e.g., Humira®], infliximab IV products [e.g., Remicade®, Renflexis, Inflectra], Simponi® [golimumab for SC injection], Simponi Aria® [golimumab for intravenous {IV} infusion]) and non-TNF biologics (i.e., Actemra® [tocilizumab for IV infusion, tocilizumab for SC injection], Orencia® [abatacept for IV infusion, abatacept for SC injection], and rituximab products [e.g., Rituxan, Truxima]), administered with or without MTX, equally positioned as a recommended therapy following a trial of a conventional synthetic disease-modifying antirheumatic drug (csDMARD) [e.g., MTX, leflunomide, hydroxychloroquine, sulfasalazine].[3]

Safety

Rituximab IV products have Boxed Warnings due to fatal infusion reactions, severe mucocutaneous reactions, hepatitis B virus (HBV) reactivation, and progressive multifocal leukoencephalopathy (PML). Deaths within 48 hours of rituximab infusions have been reported, primarily (80%) associated with the first infusion. Screen all patients for HBV infection and monitor during and after treatment with rituximab IV. Discontinue rituximab products in cases of HBV reactivation.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of rituximab IV for RA. The intent of this policy is to provide recommendations for use in RA only. Because of the specialized skills required for evaluation and diagnosis of patients treated with rituximab as well as the monitoring required for adverse events and long-term efficacy, initial approval requires rituximab IV products to be prescribed by or in consultation with a physician who specializes in RA (i.e., a rheumatologist). All approvals for RA are provided for a duration of 1 month (where 1 month is equal to 30 days); all approvals for other indications are provided for 1 year in duration.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of rituximab IV products is recommended in those with RA who meet the following criteria:

Food and Drug Administration (FDA)-Approved Indications

1. **Rheumatoid Arthritis.** Approve for the duration noted if the patient meets ONE of the following (A or B):
   - **A)** Initial Therapy. Approve for 1 month (which is adequate duration to administer one course of therapy) if the patient meets the following conditions (i, ii, and iii):
     - **i.** The patient has tried ONE conventional synthetic disease-modifying antirheumatic drug (DMARD) for at least 3 months.
       Note: Examples of conventional synthetic disease-modifying antirheumatic drugs include methotrexate [oral or injectable], leflunomide, hydroxychloroquine, and sulfasalazine. An exception to the requirement for a trial of one conventional synthetic DMARD can be made if the patient has already has a 3-month trial at least one biologic. These patients who have already tried a biologic for RA are not required to "step back" and try a conventional synthetic DMARD; AND
     - **ii.** The agent will not be used concurrently with another biologic or with a targeted synthetic DMARD.

     Note: Examples of biologics include Cimzia, adalimumab products, etanercept products, infliximab products, Simponi (Aria or SC), Actemra (IV or SC), Kevzara, Kineret, and Orencia (IV or SC). Examples of targeted synthetic DMARDs include Xeljanz/XR, Oluminat, and Rinvoq.
     - **iii.** Rituximab IV is prescribed by or in consultation with a rheumatologist.
   - **B)** Patient has already Received One or More Courses of Rituximab for Rheumatoid Arthritis (RA). Approve for 1 month (which is adequate duration to administer one course of therapy) if the patient meets BOTH of the following conditions (i and ii):
     - **i.** 16 weeks or greater will elapse between treatment courses.
       Note: For example, there will be a minimum of 16 weeks since the first dose of the previous rituximab course and the first dose of the next course of rituximab; AND
     - **ii.** If the patient has already received two or more courses of therapy, the patient has responded to therapy, as determined by the prescribing physician.
       Note: Examples of a response to therapy include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths, improved laboratory values, and reduced dosage of corticosteroids.

2. **Indications Other than Rheumatoid Arthritis (RA).** Approve for 1 year.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Rituximab IV products have not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

1. Coverage for RA is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Siliq™ (brodalumab for subcutaneous injection – Valeant Pharmaceuticals)

DATE REVIEWED: 04/08/2020

OVERVIEW

Siliq is indicated for treatment of adults with moderate-to-severe plaque psoriasis who are candidates for systemic therapy or phototherapy and have failed to respond or have lost response to other systemic therapies.[1] In plaque psoriasis, the recommended dose is 210 mg subcutaneously (SC) at Week 0, 1, and 2 followed by 210 mg once every 2 weeks (Q2W). Consider discontinuing if an adequate response has not been achieved after 12 to 16 weeks; continued treatment is unlikely to result in greater success. Siliq is intended for use under the guidance and supervision of a physician. Those trained in SC injection technique may self-inject when deemed appropriate.

Disease Overview

IL-17A is a naturally occurring cytokine involved in normal inflammatory and immune responses. However, levels of IL-17A are elevated in psoriatic plaques.[1] Siliq is a human monoclonal immunoglobulin G (IgG)2 antibody which selectively binds to interleukin (IL)-17RA and inhibits its interaction with cytokines IL-17A, IL-17-F, IL-17C, IL-17A/F heterodimer, and IL-25. By blocking IL-17RA, Siliq inhibits IL-17 cytokine-induced responses, including the release of pro-inflammatory cytokines and chemokines involved in the inflammatory process.

Guidelines

Joint guidelines from the American Academy of Dermatology (AAD) and National Psoriasis Medical Board (2019) have been published for management of psoriasis with biologics.[2] These guidelines list Siliq as a monotherapy treatment option for patients with moderate to severe plaque psoriasis. Guidelines from the European Dermatology Forum (EDF) [2015] recommend biologics (i.e., etanercept, adalimumab, infliximab, Stelara SC) as second-line therapy for induction and long-term treatment if phototherapy and conventional systemic agents have failed, are contraindicated, or are not tolerated.[3]

Safety

Siliq has a Boxed Warning, Risk Evaluation and Mitigation Strategy (REMS) program, and limited distribution program due to risks of suicidal ideation and behavior. The REMS program requires prescribers and pharmacies to be certified to prescribe and/or dispense Siliq.[4] Patients must sign a patient-prescriber agreement form and be aware of the need to seek medical attention for any new/worsening suicidal thoughts or behavior, depression, anxiety, or mood changes. Siliq is also contraindicated in Crohn's disease.[1] Other Warnings/Precautions include infections, risk for latent tuberculosis reactivation, and vaccinations.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Siliq. Because of the specialized skills required for evaluation and diagnosis of patients treated with Siliq as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Siliq to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Siliq is recommended in those who meet the following criteria:

FDA-Approved Indications

W) Plaque Psoriasis. Approve for the duration noted if the patient meets ONE of the following (A or B):

- **A)** Initial Therapy. Approve for 3 months if the patient meets ALL of the following criteria (i, ii, and iii):
  - **i.** The patient is ≥ 18 years of age; AND
  - **ii.** The patient meets ONE of the following conditions (a or b):
    - **a)** The patient has tried at least at least one traditional systemic agent for psoriasis for at least 3 months, unless intolerant.
      Note: Examples of traditional systemic agents for psoriasis include methotrexate (MTX), cyclosporine, acitretin tablets, or psoralen plus ultraviolet A light (PUVA). An exception to the requirement for a trial of one traditional systemic agent for psoriasis can be made if the patient has already had a 3-month trial or previous intolerance to at least one biologic. Refer to **Appendix** for examples of biologics used for plaque psoriasis. These patients who have already tried a biologic for psoriasis are not required to "step back" and try a traditional systemic agent for psoriasis; OR
    - **b)** The patient has a contraindication to methotrexate (MTX), as determined by the prescriber; AND
  - **iii.** Siliq is prescribed by or in consultation with a dermatologist.

B) Patient is Currently Receiving Siliq. Approve for 3 years if the patient has responded, as determined by the prescriber.
Note: The patient may not have a full response, but there should have been a recent or past response to Siliq.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Siliq has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

214. Concurrent Use with other Biologics or with Targeted Synthetic Disease-Modifying Antirheumatic Drugs (DMARDs). Siliq should not be administered in combination with a biologic used for an inflammatory condition (see Appendix for examples). Combination therapy with biologics and/or biologics + targeted synthetic DMRADs has a potential for a higher rate of adverse effects and lack controlled trial data in support of additive efficacy.[5-6] Note: This does NOT exclude the use of conventional synthetic DMARDs (e.g., MTX, leflunomide, hydroxychloroquine, and sulfasalazine) in combination with Siliq.

215. Crohn's Disease. Siliq is contraindicated in patients with Crohn's disease.[1] There is a published Phase II study evaluating Siliq in Crohn's disease (n = 130) that was terminated early due to a disproportionate number of worsening Crohn's disease and lack of efficacy.[7]

216. Rheumatoid Arthritis. Efficacy has not been established. A published Phase II study (n = 252) did not demonstrate improvement in American College of Rheumatology (ACR) 20/50/70 responses with Siliq vs. placebo for treatment of rheumatoid arthritis in patients who had previously failed methotrexate.[8]

217. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Simponi Aria® (golimumab injection for intravenous use – Janssen Biotech)

DATE REVIEWED: 10/16/2019

OVERVIEW

Simponi Aria is a recombinant human monoclonal antibody specific for human tumor necrosis factor alpha (TNFα).[1] It is indicated for the following conditions:

1. Rheumatoid arthritis (RA), in combination with methotrexate (MTX) for treatment of adult patients with moderately to severely active disease; AND
2. Ankylosing spondylitis (AS), in adults with active disease; AND
3. Psoriatic arthritis (PsA), in adults with active disease.

For patients with AS and PsA, Simponi Aria may be given alone or in combination with MTX or other conventional synthetic disease-modifying antirheumatic drugs (csDMARDs). For all approved conditions, corticosteroids, nonsteroidal anti-inflammatory drugs (NSAIDs), and/or other analgesics may be continued during treatment with Simponi Aria. Simponi Aria is a biologic that is administered by intravenous (IV) infusion by a healthcare professional. Efficacy has not been established for patients switching between the Simponi Aria and the subcutaneous (SC) formulation of golimumab (Simponi SC).

Disease Overview

TNF is a naturally occurring cytokine that mediates inflammation and modulates cellular immune responses. Increased levels of TNF have been implicated in the pathology of inflammatory conditions such as psoriasis, psoriatic arthritis, and rheumatoid arthritis (RA). Increased levels of TNF are found in the synovial fluid of patients with RA, JIA, AS, and PsA; TNF has an important role in both the pathologic inflammation and the joint destruction that are characteristic of this disease. In psoriasis, increased levels of TNF are found in the blood and skin lesions. Simponi Aria neutralize the biological activity of TNFα and inhibits binding of TNFα with its receptors.

Guidelines

TNFis feature prominently in guidelines for treatment of inflammatory conditions.

- Ankylosing Spondylitis: Guidelines for ankylosing spondylitis and nonradiographic axial spondylitis are published by the American College of Rheumatology (ACR)/Spondylitis Association of America/Spondyloarthritis Research and Treatment Network (2019).[2] TNFis are recommended for the initial biologic. In those who are secondary nonresponders to a TNFi, a second TNFi is recommended over switching out of the class.
- Psoriatic Arthritis: Guidelines from the American College of Rheumatology (ACR) [2019] recommend TNF inhibitors over other biologics for use in treatment-naïve patients with PsA and in those who were previously treated with an oral therapy.[3]
- Rheumatoid Arthritis: Guidelines from the American College of Rheumatology (ACR) [2015] have TNF inhibitors and non-TNF biologics, administered with or without MTX, equally positioned as a recommended therapy following a trial of a conventional synthetic DMARD (e.g., MTX, leflunomide, hydroxychloroquine, sulfasalazine).[4]

Safety

Simponi Aria has Boxed Warnings concerning risks of serious infection and the risk of malignancy.[1] Prior to initiating therapy with Simponi Aria, patients should be evaluated for active tuberculosis (TB) infection; in addition, patients should be assessed for latent TB infection periodically during therapy. Patients should also be monitored for signs and symptoms of infection during and after treatment with Simponi Aria and if a serious infection or sepsis develops, Simponi Aria should be discontinued. Lymphoma and other malignancies have been reported in patients who have taken TNFis such as Simponi Aria.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Simponi Aria. Because of the specialized skills required for evaluation and diagnosis of patients treated with Simponi Aria as well as the

monitoring required for adverse events (AEs) and long-term efficacy, initial approval requires Simponi Aria to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. .

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Simponi Aria is recommended in those who meet one the following criteria:

Food and Drug Administration (FDA)-Approved Indications

1. **Ankylosing Spondylitis (AS).** Approve Simponi Aria for the duration noted if the patient meets ONE of the following conditions (A or B):
   - **A)** Initial Therapy. Approve for 3 months if prescribed by or in consultation with a rheumatologist.
   - **B)** Patients Currently Receiving Simponi (SC or Aria). Approve for 1 year if the patient has had a response, as determined by the prescriber.
     Note: Examples of a response to therapy include decreased pain or stiffness, improved function or activities of daily living. The patient may not have a full response, but there should have been a recent or past response to Simponi (SC or Aria).

X) **Psoriatic Arthritis (PsA).** Approve Simponi Aria for the duration noted if the patient meets ONE of the following conditions (A or B):
   - **A)** Initial Therapy. Approve for 3 months if prescribed by or in consultation with a rheumatologist or a dermatologist.
   - **B)** Patients Currently Receiving Simponi (SC or Aria). Approve for 1 year if the patient has had a response, as determined by the prescriber.
     Note: Examples of a response to therapy include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improvements in acute phase reactants (for example, C-reactive protein [CRP]). The patient may not have a full response, but there should have been a recent or past response to Simponi (SC or Aria).

Y) **Rheumatoid Arthritis (RA).** Approve Simponi Aria for the duration noted if the patient meets ONE of the following conditions (A or B):
   - **A)** Initial Therapy: Approve for 3 months if the patient meets BOTH of the following criteria (i and ii):
     - **i.** The patient has tried ONE conventional synthetic disease-modifying antirheumatic drug (DMARD) for at least 3 months.
       Note: Examples of conventional synthetic DMARDs include methotrexate (oral or injectable), leflunomide, hydroxychloroquine, and sulfasalazine. An exception to the requirement for a trial of one conventional synthetic DMARD can be made if the patient has already has a 3-month trial at least one biologic (e.g., Cimzia [certolizumab pegol SC injection], an etanercept product, an adalimumab product, an infliximab product, Simponi SC, Actemra [IV or SC], Kevzara [sarilumab SC injection], Kineret [anakinra SC injection], Orencia [abatacept IV infusion, abatacept SC injection], and a rituximab product). These patients who have already tried a biologic for RA are not required to "step back" and try a conventional synthetic DMARD; AND

ii. The agent is prescribed by or in consultation with a rheumatologist.

B) Patients Currently Receiving Simponi (Aria or SC). Approve for 1 year if the patient has had a response, as determined by the prescriber.
Note: Examples of a response to therapy include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improved laboratory values; reduced dosage of corticosteroids. The patient may not have a full response, but there should have been a recent or past response to Simponi (Aria or SC).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Simponi Aria has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

~~7.~~ **Concurrent Use with a Biologic or with a Targeted Synthetic Disease-Modifying Antirheumatic Drug (DMARD).** Data are lacking evaluating concomitant use of Simponi Aria in combination with another biologic or with a targeted synthetic DMARD for an inflammatory condition (see APPENDIX for examples). Combination therapy with biologics and/or biologics + targeted synthetic DMARDs has a potential for a higher rate of adverse events with combinations and lack controlled trial data in support of additive efficacy. Note: This does NOT exclude the use of conventional synthetic DMARDs (e.g., MTX, leflunomide, hydroxychloroquine, and sulfasalazine) in combination with Simponi Aria.

8. Ulcerative Colitis (UC). Simponi SC is indicated for treatment of UC.[5] A single-dose induction study in patients with UC (n = 176) evaluated doses of 1 mg/kg, 2 mg/kg, and 4 mg/kg; however, enrollment was stopped due to lower than expected efficacy in the dose-ranging Phase II portion of the study.[6] Appropriate dosing of Simponi Aria in UC is unclear.

9. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes*	TAC Approval Date
Selected revision	Update previous therapy required in the RA criteria. Criteria now require a trial of a conventional synthetic DMARD. There is an exception for patients who have already tried a biologic; these patients are not required to "step back" and try a conventional synthetic DMARD. Remove requirement that Simponi Aria be taken in combination with a conventional synthetic DMARD such as MTX. Remove other exceptions for patients who are not required to try a conventional synthetic DMARD prior to this biologic.	01/06/2016
Annual revision	No changes to criteria.	09/14/2016
Annual revision	No changes to criteria; however, Kevzara is added to list of examples of a previous therapy and Remicade is changed to "an infliximab product" with Remicade, Renflexis, and Inflectra listed as examples of specific infliximab products that may have been tried.	09/13/2017
Selected revision	Add AS and PsA with criteria for approval. Remove AS and PsA from the Conditions not Recommended for Coverage.	11/01/2017
Annual revision	For Patients Currently Receiving Simponi Aria or SC, change approval duration to 1 year (previously was 3 years) to align with Simponi Aria Medical Policy.	10/10/2018
Annual revision	No criteria changes.	10/16/2019

* For a further summary of criteria changes, refer to respective TAC minutes available at: http://esidepartments/sites/Dep043/Committees/TAC/Forms/AllItems.aspx; TAC – Therapeutic Assessment Committee; DMARDs – Disease-modifying antirheumatic drugs; RA – Rheumatoid arthritis; AS – Ankylosing spondylitis; PsA – Psoriatic arthritis.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Simponi® (golimumab for subcutaneous injection – Janssen Biotech, Inc.)

DATE REVIEWED: 04/29/2020

OVERVIEW

Simponi SC is a recombinant human monoclonal antibody specific for human tumor necrosis factor alpha (TNFα).[1] It is indicated for the following uses:

- Ankylosing spondylitis (AS), for treatment of adults with active AS either alone or in combination with MTX or other non-biologic DMARDs; AND
- Psoriatic arthritis (PsA), for treatment of adults with active PsA either alone or in combination with MTX or other non-biologic disease-modifying antirheumatic drugs (DMARDs); AND
- Rheumatoid arthritis (RA), for treatment of adults with moderate to severe active RA in combination with methotrexate (MTX); AND
- Ulcerative colitis (UC), for inducing and maintaining clinical response, improving endoscopic appearance of the mucosa during induction, inducing clinical remission, and achieving and sustaining clinical remission in induction responders in adults with moderate to severe disease who have demonstrated corticosteroid dependence or who have had an inadequate response to or failed to tolerate oral aminosalicylates, oral corticosteroids, azathioprine, or 6-mercaptopurine.

Disease Overview

TNF is a naturally occurring cytokine that mediates inflammation and modulates cellular immune responses. Increased levels of TNF have been implicated in the pathology of inflammatory conditions such as inflammatory bowel disease, psoriatic arthritis, and rheumatoid arthritis (RA). Increased levels of TNF are found in the synovial fluid of patients with RA and TNF has an important role in both the pathologic inflammation and the joint destruction that are characteristic of this disease. In Crohn's disease, increased

levels of TNF are found in the bowel wall in areas involved by Crohn's disease. Simponi SC neutralizes the biological activity of TNFα and inhibits binding of TNFα with its receptors.

Guidelines

TNFis feature prominently in guidelines for treatment of inflammatory conditions.

- Spondyloarthritis: Guidelines for ankylosing spondylitis and nonradiographic axial spondylitis are published by the American College of Rheumatology (ACR)/Spondylitis Association of America/Spondyloarthritis Research and Treatment Network (2019).[2] TNFis are recommended for the initial biologic. In those who are secondary nonresponders to a TNFi, a second TNFi is recommended over switching out of the class.
- Psoriatic Arthritis: Guidelines from ACR (2019) recommend TNFis over other biologics for use in treatment-naïve patients with PsA and in those who were previously treated with an oral therapy.[3]
- Rheumatoid Arthritis: Guidelines from the American College of Rheumatology (ACR) [2015] have TNF inhibitors and non-TNF biologics, administered with or without MTX, equally positioned as a recommended therapy following a trial of a conventional synthetic DMARD (e.g., MTX, leflunomide, hydroxychloroquine, sulfasalazine).[4]
- Ulcerative Colitis: Updated ACG guidelines for UC (2019) note that the following agents can be used for induction of remission in moderately to severely active disease: Uceris tablets; Oral or intravenous systemic corticosteroids Entyvio, Xeljanz, or TNFis (adalimumab, Simponi SC, infliximab).[5]

Safety

Simponi SC has Boxed Warnings concerning risks of serious infection and the risk of malignancy.[1] Prior to initiating therapy, patients should be evaluated for active tuberculosis (TB) infection; in addition, patients should be assessed for latent TB infection periodically during therapy. Patients should also be monitored for signs and symptoms of infection during and after treatment with Simponi SC; if a serious infection or sepsis develops, Simponi SC should be discontinued. Lymphoma and other malignancies have been reported in patients who have taken TNFis such as Simponi SC.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Simponi SC. Because of the specialized skills required for evaluation and diagnosis of patients treated with Simponi SC as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Simponi SC to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration listed below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Simponi SC is recommended in those who meet the following criteria:

FDA-Approved Indications

Z) Ankylosing Spondylitis (AS). Approve for the duration noted if the patient meets ONE of the following conditions (A or B):
A) Initial Therapy. Approve for 3 months if prescribed by or in consultation with a rheumatologist.

B) Patients Currently Receiving Simponi (SC or Aria). Approve for 3 years if the patient has had a response, as determined by the prescriber.
Note: Examples of a response include decreased pain or stiffness and improved function or activities of daily living. The patient may not have a full response, but there should have been a recent or past response to Simponi (SC or Aria).

AA) Psoriatic Arthritis (PsA). Approve for the duration noted if the patient meets ONE of the following conditions (A or B):

A) Initial Therapy. Approve for 3 months if Simponi SC is prescribed by or in consultation with a rheumatologist or a dermatologist.

B) Patients Currently Receiving Simponi (SC or Aria). Approve for 3 years if the patient has had a response as determined by the prescriber.
Note: Examples of a response include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; and improvements in acute phase reactants such as C-reactive protein (CRP). The patient may not have a full response, but there should have been a recent or past response to Simponi (SC or Aria).

BB) Rheumatoid Arthritis (RA). Approve for the duration noted if the patient meets ONE of the following conditions (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets BOTH of the following criteria (i and ii):

i. The patient has tried ONE conventional synthetic disease-modifying antirheumatic drug (DMARD) for at least 3 months.
Note: Examples of conventional synthetic DMARDs include methotrexate (oral or injectable), leflunomide, hydroxychloroquine, and sulfasalazine. An exception to the requirement for a trial of one conventional synthetic DMARD can be made if the patient has already has a 3-month trial at least one biologic. Refer to Appendix for examples of biologics used for RA. These patients who have already tried a biologic for RA are not required to "step back" and try a conventional synthetic DMARD; AND

ii. Simponi SC is prescribed by or in consultation with a rheumatologist.

B) Patients Currently Receiving Simponi (SC or Aria). Approve for 3 years if the patient has had a response, as determined by the prescriber.
Note: Examples of a response include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improved laboratory values; reduced dosage of corticosteroids. The patient may not have a full response, but there should have been a recent or past response to Simponi (SC or Aria).

CC) Ulcerative Colitis (UC). Approve for the duration noted if the patient meets ONE of the following conditions (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets BOTH of the following criteria (i, ii. and iii):

i. The patient is ≥ 18 years of age; AND

ii. The patient meets ONE of the following conditions (a or b):

i. Patient has had a trial of one conventional systemic agent or a corticosteroid such as prednisone or methylprednisolone, or was intolerant to one of these agents for ulcerative colitis.

Note: Examples of systemic therapies for ulcerative colitis include 6-mercaptopurine, azathioprine, cyclosporine, and tacrolimus. An exception to this criterion can be made if the patient has already tried a biologic. These patients who have already received a biologic are not required to "step back" and try another agent. Refer to Appendix for examples of biologics used for ulcerative colitis; OR

ii. The patient meets BOTH of the following [(1) and (2)]:

1. The patient has pouchitis; AND

2. The patient has tried therapy with an antibiotic, probiotic, corticosteroid enema, or Rowasa® (mesalamine) enema.

Note: Examples of antibiotics include metronidazole and ciprofloxacin. Hydrocortisone enemas is an examples of a corticosteroid enemas; AND

iii. Simponi SC is prescribed by or in consultation with a gastroenterologist.

B) Patients Currently Receiving Simponi (SC or Aria). Approve for 3 years if the patient has had a response, as determined by the prescriber.

Note: Examples of a response include decreased stool frequency or rectal bleeding. The patient may not have a full response, but there should have been a recent or past response to Simponi (SC or Aria).

Other Uses with Supportive Evidence

DD) Spondyloarthritis (SpA), Other Subtypes (e.g., undifferentiated arthritis, non-radiographic axial SpA, Reactive Arthritis [Reiter's disease]) [Note: For AS or PsA, refer to the respective criteria under FDA-approved indications]. Approve for the duration noted if ONE of the following conditions are met (A or B):

G) Initial Therapy. Approve for 3 months if the patient meets BOTH of the following conditions (i and ii):

i. The patient meets ONE of the following (a or b):

a) The patient has arthritis primarily in the knees, ankles, elbows, wrists, hands, and/or feet AND has tried at least ONE conventional synthetic DMARD has been tried.

Note: Examples of conventional synthetic DMARDs include methotrexate (MTX), leflunomide, and sulfasalazine; OR

b) The patient has axial spondyloarthritis AND has objective signs of inflammation, defined as at least one of the following [(1) or (2)]:

(1) C-reactive protein (CRP) elevated beyond the upper limit of normal for the reporting laboratory; OR

(2) Sacroiliitis reported on magnetic resonance imaging (MRI); AND

ii. Simponi SC is prescribed by or in consultation with a rheumatologist.

H) Patients Currently Receiving Simponi (SC or Aria). Approve for 1 year if the patient has had a response, as determined by the prescriber.

Note: Examples of a response include decreased pain or stiffness and improved function or activities of daily living. The patient may not have a full response, but there should have been a recent or past response to Simponi (SC or Aria).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Simponi SC has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

10. **Concurrent Use with a Biologic or with a Targeted Synthetic Disease-Modifying Antirheumatic Drug (DMARD).** Simponi SC should not be administered in combination with another biologic or with a targeted synthetic DMARD used for an inflammatory condition (see Appendix for examples). Combination therapy is generally not recommended due to a potentially higher rate of AEs with combinations and lack of data supportive of additional efficacy.[6,7] Note: This does NOT exclude the use of conventional synthetic DMARDs (e.g., MTX, leflunomide, hydroxychloroquine, and sulfasalazine) in combination with an adalimumab product.

11. **Plaque Psoriasis without Psoriatic Arthritis.** Simponi SC has been studied in patients with psoriatic arthritis who had plaque psoriasis. Plaque psoriasis improved in these patients with a Psoriasis Area Severity Index (PASI)-75 being attained by 40% of patients on Simponi 50 mg SC every 4 weeks and by 58% in the Simponi 100 mg SC group at Week 14.[8] Simponi SC is indicated in patients with psoriatic arthritis, but not in patients with plaque psoriasis without psoriatic arthritis. Prospective,

controlled trials are needed to determine safety and efficacy in plaque psoriasis. Other TNFα antagonists (Enbrel, Humira, and Remicade) are indicated for the treatment of plaque psoriasis.

3. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Xeljanz®, Xeljanz XR (tofacitinib tablets, tofacitinib extended-release tablets)	Inhibition of the JAK pathways	RA, PsA, UC

* Not an all-inclusive list of indication (e.g., oncology indications and rare inflammatory conditions are not listed). Refer to the prescribing information for the respective agent for FDA-approved indications; SC – Subcutaneous; TNF – Tumor necrosis factor; IV – Intravenous, IL – Interleukin; PDE4 – Phosphodiesterase 4; JAK – Janus kinase; AS – Ankylosing spondylitis; CD – Crohn's disease; PJIA – Polyarticular juvenile idiopathic arthritis; PsO – Plaque psoriasis; PsA – Psoriatic arthritis; RA – Rheumatoid arthritis; SJIA – Sytemice juvenile idiopathic arthritis; UC – Ulcerative colitis. ^ Off-label use of SJIA supported in guidelines.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Skyrizi™ (risankizumab-rzaa subcutaneous injection – Abbvie)

REVIEW DATE: 04/29/2020

OVERVIEW

Skyrizi is a humanized immunoglobulin (Ig)G monoclonal antibody.[1] It binds to interleukin (IL)-23, a naturally occurring cytokine involved in inflammatory and immune responses, that selectively binds to the p19 subunit of the IL-23 cytokine and inhibits its interaction with the IL-23 receptor. Skyrizi is indicated for treatment of adults with

moderate to severe plaque psoriasis who are candidates for systemic therapy or phototherapy. In plaque psoriasis, the recommended dose is 150 mg (two injections) subcutaneously (SC) at Weeks 0 and 4 and then once every 12 weeks thereafter. Skyrizi is intended for use under the guidance and supervision of a physician. A patient or care giver trained in SC injection technique may administer Skyrizi, if deemed appropriate.

Disease Overview

Although the etiology of psoriasis is not fully established, abnormal keratin formation, epidermal proliferation, activation of the immune system, and hereditary factors appear to play roles in the pathogenesis of the disease. In psoriasis, levels of IL-23p40 and IL-12/23p40 messenger RNA are upregulated but decrease with treatment. By blocking the release of proinflammatory cytokines and chemokines, Skyrizi has an inhibitory effect on the inflammatory process.

Guidelines

Joint guidelines from the American Academy of Dermatology (AAD) and National Psoriasis Medical Board (2019) have been published for management of psoriasis with biologics.[2] These guidelines list Skyrizi as a monotherapy treatment option for patients with moderate to severe plaque psoriasis. Guidelines from the European Dermatology Forum (EDF) [2015] recommend biologics (i.e., etanercept, adalimumab, infliximab, Stelara SC) as second-line therapy for induction and long-term treatment if phototherapy and conventional systemic agents have failed, are contraindicated, or are not tolerated.[3]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Skyrizi. Because of the specialized skills required for evaluation and diagnosis of patients treated with Skyrizi as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Skyrizi to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Skyrizi is recommended in those who meet the following criteria:

FDA-Approved Indications

EE) Plaque Psoriasis. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets ALL of the following criteria (i, ii, and iii):

i. The patient is an adult ≥ 18 years of age; AND

ii. The patient meets ONE of the following conditions (a or b):

c) The patient has tried at least at least one traditional systemic agent for psoriasis for at least 3 months, unless intolerant.

Note: Examples of traditional systemic agents for psoriasis include methotrexate (MTX), cyclosporine, acitretin tablets, or psoralen plus ultraviolet A light (PUVA). An exception to the requirement for a trial of one traditional systemic agent for psoriasis can be made if the patient has already had a 3-month trial or previous intolerance to at least one biologic Refer to Appendix for examples of biologics used for psoriasis. These patients who have already tried a biologic for psoriasis are not required to "step back" and try a traditional systemic agent for psoriasis); OR

d) The patient has a contraindication to methotrexate (MTX), as determined by the prescriber; AND

iii. The agent is prescribed by or in consultation with a dermatologist.

B) Patient is Currently Receiving Skyrizi. Approve for 3 years if the patient has responded, as determined by the prescriber.

Note: The patient may not have a full response, but there should have been a recent or past response to Skyrizi.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Skyrizi has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

218. Concurrent Use with other Biologics or with Targeted Synthetic Disease-Modifying Antirheumatic Drugs (DMARDs). Data are lacking evaluating concomitant use of Skyrizi with another biologic or with a targeted synthetic DMARD for an inflammatory condition (see APPENDIX for examples). Combination therapy with biologics and/or biologics + targeted synthetic DMARDs has a potential for a higher rate of adverse effects and lack controlled trial data in support of additive efficacy.[4] Note: This does NOT exclude the use of MTX (a traditional systemic agent used to treat psoriasis) in combination with Skyrizi.

219. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Rinvoq® (upadacitinib extended-release tablets)	Inhibition of the JAK pathways	RA
Xeljanz®, Xeljanz XR (tofacitinib tablets, tofacitinib extended-release tablets)	Inhibition of the JAK pathways	RA, PsA, UC

* Not an all-inclusive list of indication (e.g., oncology indications and rare inflammatory conditions are not listed). Refer to the prescribing information for the respective agent for FDA-approved indications; SC – Subcutaneous; TNF – Tumor necrosis factor; IV – Intravenous, IL – Interleukin; PDE4 – Phosphodiesterase 4; JAK – Janus kinase; AS – Ankylosing spondylitis; CD – Crohn's disease; PJIA – Polyarticular juvenile idiopathic arthritis; PsO – Plaque psoriasis; PsA – Psoriatic arthritis; RA – Rheumatoid arthritis; SJIA – Systemic juvenile idiopathic arthritis; UC – Ulcerative colitis; ^ Off-label use of SJIA supported in guidelines.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Stelara® (ustekinumab intravenous infusion – Janssen Biotech)

REVIEW DATE: 09/11/2019; selected revision 10/23/2019

OVERVIEW

Stelara for intravenous (IV) infusion is a human immunoglobulin G (IgG) 1κ monoclonal antibody against the p40 subunit of the interleukin (IL)-12 and IL-23 cytokines.[1] It is indicated for the treatment of patients ≥ 18 years of age with the following indications:

1. Crohn's disease, in patients with moderate to severe active disease; AND

2. Ulcerative colitis, in patients with moderate to severe active disease.

In Crohn's disease and ulcerative colitis, a single weight-based dose is administered by IV infusion. Following induction therapy with the IV product, the recommended maintenance is Stelara for subcutaneous (SC) injection, given as a 90 mg SC injection administered 8 weeks after the initial IV dose, then once every 8 weeks (Q8W) thereafter.

Disease Overview

The P40 subunit of the IL-12 and IL-23 cytokines are involved in inflammatory and immune responses.[1] Stelara SC binds to the P40 subunit of used by both the IL-12 and IL-23 cytokines. By binding to this location, Stelara SC disrupts IL-12 and -23 mediated signaling and cytokine cascade. The IL-12 and -23 cytokines have been implicated as important contributors to the chronic inflammation that is observed in inflammatory bowel disease (Crohn's disease and ulcerative colitis).By blocking IL-12 and -23, Stelara may control the inflammatory response in patients with these conditions.

Guidelines

The American College of Gastroenterology (ACG) has guidelines for Crohn's disease (2018).[2] Stelara is a treatment option in patients who have moderate to severe disease despite treatment with another agent (e.g., corticosteroid, thiopurine, methotrexate, or TNFi). Stelara is not addressed in the 2019 ACG guidelines for UC.[3] These guidelines note that the following agents can be used for induction of remission in moderately to severely active disease: Uceris (budesonide extended-release tablets), oral or intravenous systemic corticosteroids, Entyvio, Xeljanz, or TNFis (adalimumab, Simponi SC, infliximab).

Safety

Stelara has Warnings concerning risks of serious infection and the risk of malignancy.[1] Prior to initiating therapy with Stelara, patients should be evaluated for active tuberculosis (TB) infection. Patients should also be monitored for signs and symptoms of infection during treatment with Stelara, and if a serious infection develops, it should be stopped until the infection resolves.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Stelara IV. Because of the specialized skills required for evaluation and diagnosis of patients treated with Stelara as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Stelara IV to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for 30 days, which is an adequate duration for the patient to receive one dose.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Stelara IV is recommended in those who meet the following criteria:

FDA-Approved Indications

8. Crohn's Disease. Approve a single dose if the patient meets the following criteria (A, B, C, and D):
- **i.** The patient is 18 years of age or older; AND
- **ii.** Stelara IV will be used as induction therapy; AND
- **iii.** The patient meets one of the following conditions (i or ii):

a) The patient has tried or is currently taking corticosteroids, or corticosteroids are contraindicated in this patient; OR

b) The patient has tried one other agent for Crohn's disease.
Note: Examples of other agents for Crohn's disease include azathioprine, 6-mercaptopurine (6-MP), or methotrexate (MTX). A previous trial of a biologic (e.g., Cimzia® [certolizumab pegol SC injection], Entyvio [vedolizumab for IV infusion], an adalimumab product, or an infliximab product) also counts as a trial of one other agent for Crohn's disease; AND

iv. Stelara IV is prescribed by or in consultation with a gastroenterologist.
Note: Patients with fistulizing Crohn's disease or Crohn's disease of the ileal pouch must meet the above criteria for Crohn's disease in adults.

9. Ulcerative Colitis. Approve a single dose if the patient meets the following criteria (A, B, C, and D):

A) The patient is 18 years of age or older; AND

B) Stelara IV will be used as induction therapy; AND

C) The patient has had a trial of one systemic agent for ulcerative colitis.
Note: Examples include 6-mercaptopurine, azathioprine, cyclosporine, tacrolimus, or a corticosteroid such as prednisone or methylprednisolone. A trial of a biologic (e.g., an adalimumab product, an infliximab product, Simponi® [golimumab for SC injection], or Entyvio [vedolizumab injection]) also counts as a trial of one systemic agent for UC; AND

D) The agent is prescribed by or in consultation with a gastroenterologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Stelara IV has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

5. Ankylosing Spondylitis (AS). There are other biologic therapies indicated in AS (e.g., Cimzia, etanercept products [Enbrel], adalimumab products [Humira], infliximab products [Remicade, biosimilars], Simponi SC, Cosentyx [secukinumab SC injection], and Taltz [ixekizumab SC injection]). More data are needed to demonstrate efficacy of Stelara in this condition. There is a published proof-of-concept trial evaluating Stelara in AS (TOPAS – UsTekinumab for the treatment Of Patients with active Ankylosing Spondylitis).[4] TOPAS was a prospective, open-label study evaluating Stelara 90 mg SC at Week 0, 4, and 16 in patients (n = 20) with AS. After Week 16, patients were followed through Week 28. Patients who previously failed to respond to TNF blockers were excluded, but patients who discontinued a TNF for reasons other than lack of efficacy were allowed to enroll. The primary endpoint was a 40% improvement in disease activity at Week 24 according to the Assessment of SpondyloArthritis International Society (ASAS) criteria (ASAS40). Efficacy analysis was completed in the intent-to-treat (ITT) population which included all patients who received at least one dose of Stelara. In all, 65% of patients (95% confidence interval [CI]: 41%, 85%; n = 13/20) achieved an ASAS40 response at Week 24. There was at least a 50% improvement of the BASDAI (Bath Ankylosing Spondylitis Disease Activity Index) achieved by 55% of patients (95% CI: 32%, 77%; n = 11/20); improvement in other secondary endpoints were also noted. However, enthesitis (measured by MASES [Maastricht AS Entheses Score] and SPARCC [SPondyloArthritis Research Consortium of Canada] enthesitis indices) and the number of swollen joints were not significantly improved at Week 24. There was a significant reduction of active inflammation on magnetic resonance imaging (MRI) at Week 24 compared with baseline in sacroiliac joints.

6. **Concurrent Use with a Biologic or with a Targeted Synthetic Disease-Modifying Antirheumatic Drug (DMARD).** Stelara IV should not be administered in combination with another biologic or with a targeted synthetic DMARD for an inflammatory condition (see APPENDIX for examples). Combination therapy is generally not recommended due to a potential for a higher rate of adverse effects with combinations and lack of additive efficacy. Note: This does NOT exclude the use of conventional agents (e.g., MTX, 6-MP, azathioprine, and sulfasalazine) in combination with Stelara IV.

7. **Children or Adolescents < 18 Years of Age.** Stelara IV is indicated in adult patients ≥ 18 years of age.[1] Efficacy and optimal dosing needs to be identified for the intravenous formulation.

8. **Plaque Psoriasis.** Stelara for SC injection is indicated for treatment of plaque psoriasis.[1] Appropriate dosing of Stelara IV in plaque psoriasis is unclear.

9. **Psoriatic Arthritis.** Stelara for SC injection is indicated for treatment of psoriatic arthritis.[1] Appropriate dosing of Stelara IV in psoriatic arthritis is unclear.

10. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Stelara Subcutaneous Prior Authorization Policy
- Stelara® (ustekinumab subcutaneous injection – Janssen Biotech)

REVIEW DATE: 08/05/2020

OVERVIEW

Stelara subcutaneous, an interleukin-12/23 blocker, is indicated for the following uses:[1]

- **Crohn's disease**, in patients ≥ 18 years of age with moderate to severe active disease.
- **Plaque psoriasis**, in patients ≥ 6 years of age with moderate to severe disease who are candidates for phototherapy or systemic therapy.
- **Psoriatic arthritis**, in patients ≥ 18 years of age with active disease, given alone or in combination with methotrexate.
- **Ulcerative colitis**, in patients ≥ 18 years of age with moderate to severe active disease.

A weight-based dose is administered by subcutaneous injection under the supervision of a physician or by the patient or a caregiver. For each condition, the pivotal trials for Stelara subcutaneous assessed a response to therapy on or before Month 3.

Guidelines

Guidelines for the treatment of inflammatory conditions recommend use of Stelara subcutaneous.

- **Crohn's Disease:** The American College of Gastroenterology has guidelines for Crohn's disease (2018).[2] Stelara is a treatment option in patients who have moderate to severe disease despite

treatment with another agent (e.g., corticosteroid, thiopurine, methotrexate, or tumor necrosis factor inhibitors).

- **Plaque Psoriasis:** Guidelines (2019) from the American Academy of Dermatology and National Psoriasis Foundation recommend Stelara as a monotherapy treatment option or in combination with other therapies for adults with moderate to severe disease.[3]
- **Psoriatic Arthritis:** Guidelines from the American College of Rheumatology (2018) recommend Stelara after other agents (e.g., tumor necrosis factor inhibitors) have been tried.[4] Stelara may be used in patients who have active disease despite treatment with other agents, particularly in those with concomitant inflammatory bowel disease.[4]
- **Ulcerative Colitis:** Stelara is not addressed in the 2019 American College of Gastroenterology guidelines for ulcerative colitis.[5] These guidelines note that the following agents can be used for induction of remission in moderately to severely active disease: Uceris (budesonide extended-release tablets); oral or intravenous systemic corticosteroids, Entyvio (vedolizuamb intravenous infusion), Xeljanz (tofacitinib tablets, extended-release tablets), or tumor necrosis factor inhibitors (adalimumab, Simponi SC, infliximab). Guidelines from the American Gastroenterological Association (2020) recommend Stelara for moderate to severe ulcerative colitis.[6]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Stelara subcutaneous. Because of the specialized skills required for evaluation and diagnosis of patients treated with Stelara subcutaneous as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Stelara SC to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration listed below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Stelara subcutaneous is recommended in those who meet the following criteria:

FDA-Approved Indications

10. Crohn's Disease. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets the following criteria (i, ii, iii, and iv):

v. Patient is ≥ 18 years of age; AND

vi. Patient meets one of the following conditions (a or b):

a) The patient has tried or is currently taking corticosteroids, or corticosteroids are contraindicated in this patient; OR

b) The patient has tried one conventional systemic therapy for Crohn's disease; AND
Note: Examples of conventional systemic therapy for Crohn's disease include azathioprine, 6-mercaptopurine, or methotrexate. An exception to the requirement for a trial of or contraindication to steroids or a trial of one other conventional systemic agent can be made if the patient has already tried at least one biologic. Refer to Appendix for examples of biologics used for Crohn's disease. These patients who have already received a biologic are not required to "step back" and try another agent.

vii. According to the prescriber, the patient will receive a single induction dose with Stelara intravenous within 2 months of initiating therapy with Stelara subcutaneous; AND

viii. The agent is prescribed by or in consultation with a gastroenterologist.

B) Patient is Currently Receiving Stelara Subcutaneous. Approve for 3 years if the patient has had a response to Stelara subcutaneous, as determined by the prescriber.
Note: Examples of a response to therapy include a decrease in symptoms such as diarrhea, pain, and/or bleeding; and/or improvement in erythrocyte sedimentation rate (ESR), C-reactive protein (CRP), complete blood count (CBC), and/or fecal calprotectin (fCal). The patient may not have a full response, but there should have been a recent or past response to Stelara.

Note: Patients with fistulizing Crohn's disease or Crohn's disease of the ileal pouch must meet the above criteria for Crohn's disease in adults.

11. Plaque Psoriasis. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets ALL of the following criteria (i, ii, and iii):

i. Patient is ≥ 6 years of age; AND

ii. Patient meets ONE of the following conditions (a or b):

a) Patient has tried at least one traditional systemic agent for psoriasis for at least 3 months, unless intolerant; OR
Note: Examples of traditional systemic agents used for psoriasis include methotrexate, cyclosporine, acitretin, or psoralen plus ultraviolet A light (PUVA). An exception to the requirement for a trial of one traditional systemic agent for psoriasis can be made if the patient has already has a 3-month trial or previous intolerance to at least one biologic. Refer to Appendix for examples of biologics used for plaque psoriasis. These patients who have already tried a biologic for psoriasis are not required to "step back" and try a traditional systemic agent for psoriasis.

b) Patient has a contraindication to methotrexate as determined by the prescriber; AND

iii. The agent is prescribed by or in consultation with a dermatologist.

B) Patient is Currently Receiving Stelara Subcutaneous. Approve for 3 years if the patient has responded, as determined by the prescriber.
Note: The patient may not have a full response, but there should have been a recent or past response to Stelara.

12. Psoriatic Arthritis. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if prescribed by or in consultation with a rheumatologist or a dermatologist.

B) Patient is Currently Receiving Stelara Subcutaneous. Approve for 3 years if the patient has responded, as determined by the prescriber.
Note: Examples of a response to therapy include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improvements in acute phase reactants (for example, C-reactive protein). The patient may not have a full response, but there should have been a recent or past response to Stelara.

13. Ulcerative Colitis. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets ALL of the following (i, ii, iii, and iv):

i. The patient ≥ to 18 years of age; AND

ii. The patient has had a trial of one systemic agent for ulcerative colitis; AND
Note: Examples include 6-mercaptopurine, azathioprine, cyclosporine, tacrolimus, or a corticosteroid such as prednisone, methylprednisolone. A trial of a biologic also counts as a

trial of one systemic agent for ulcerative colitis. Refer to Appendix for examples of biologics used for ulcerative colitis.

iii. According to the prescriber, the patient will receive a single induction dose with Stelara intravenous within 2 months of initiating therapy with Stelara subcutaneous; AND

iv. The agent is prescribed by or in consultation with a gastroenterologist.

B) Patient is Currently Receiving Stelara Subcutaneous. Approve for 3 years if the patient has had a response to therapy, as determined by the prescriber.
Note: Examples of a response to therapy include decreased stool frequency or rectal bleeding.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Stelara SC is not recommended in the following situations:

11. Ankylosing Spondylitis. There are other biologic therapies indicated in ankylosing spondylitis (e.g., Cimzia, Enbrel, Humira, Remicade, Simponi SC, Cosentyx). More data are needed to demonstrate efficacy of Stelara in this condition. There is a published proof-of-concept trial evaluating Stelara in ankylosing spondylitis.[7] TOPAS was a prospective, open-label study evaluating Stelara 90 mg at Week 0, 4, and 16 in patients (n = 20) with ankylosing spondylitis After Week 16, patients were followed through Week 28. Patients who previously failed to respond to TNF blockers were excluded, but patients who discontinued a TNF for reasons other than lack of efficacy were allowed to enroll. The primary endpoint was a 40% improvement in disease activity at Week 24 according to the Assessment of SpondyloArthritis International Society (ASAS) criteria (ASAS40). Efficacy analysis was completed in the intent-to-treat population which included all patients who received at least one dose of Stelara. In all, 65% of patients (95% confidence interval [CI]: 41%, 85%; n = 13/20) achieved an ASAS40 response at Week 24. There was at least a 50% improvement of the BASDAI (Bath Ankylosing Spondylitis Disease Activity Index) achieved by 55% of patients (95% CI: 32%, 77%; n = 11/20); improvement in other secondary endpoints were also noted. However, enthesitis (measured by MASES [Maastricht AS Entheses Score] and SPARCC [SPondyloArthritis Research Consortium of Canada] enthesitis indices) and the number of swollen joints were not significantly improved at Week 24. There was a significant reduction of active inflammation on magnetic resonance imaging at Week 24 compared with baseline in sacroiliac joints.

12. Concurrent Use with a Biologic or with a Targeted Synthetic Disease-Modifying Antirheumatic Drug (DMARD). Stelara should not be administered in combination with another biologic agent or with a targeted synthetic DMARD used for an inflammatory condition (see Appendix for examples).[8] Combination therapy is generally not recommended due to a potential for a higher rate of adverse effects with combinations and lack of additive efficacy. Note: This does NOT exclude the use of conventional synthetic DMARDs (e.g., methotrexate leflunomide, hydroxychloroquine, and sulfasalazine) in combination with Stelara.

3. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Taltz® (ixekizumab SC injection)	Inhibition of IL-17A	AS, nr-axSpA, PsO, PsA
Ilumya™ (tildrakizumab-asmn SC injection)	Inhibition of IL-23	PsO
Skyrizi™ (risankizumab-rzza SC injection)	Inhibition of IL-23	PsO
Tremfya™ (guselkumab SC injection)	Inhibition of IL-23	PsO, PsA
Entyvio™ (vedolizumab IV infusion)	Integrin receptor antagonist	CD, UC
Targeted Synthetic DMARDs		
Otezla® (apremilast tablets)	Inhibition of PDE4	PsO, PsA
Olumiant® (baricitinib tablets)	Inhibition of the JAK pathways	RA
Rinvoq® (upadacitinib extended-release tablets)	Inhibition of the JAK pathways	RA
Xeljanz®, Xeljanz XR (tofacitinib tablets, tofacitinib extended-release tablets)	Inhibition of the JAK pathways	RA, PsA, UC

* Not an all-inclusive list of indication (e.g., oncology indications and rare inflammatory conditions are not listed). Refer to the prescribing information for the respective agent for FDA-approved indications; SC – Subcutaneous; TNF – Tumor necrosis factor; IV – Intravenous, IL – Interleukin; PDE4 – Phosphodiesterase 4; JAK – Janus kinase; AS – Ankylosing spondylitis; CD – Crohn's disease; JIA – Juvenile idiopathic arthritis; PsO – Plaque psoriasis; PsA – Psoriatic arthritis; RA – Rheumatoid arthritis; UC – Ulcerative colitis; nr-axSpA – Non-radiographic axial spondyloarthritis; ^ Off-label use of Kineret in JIA supported in guidelines.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Taltz Prior Authorization Policy
- Taltz® (ixekizumab for subcutaneous injection – Eli Lilly and Company)

REVIEW DATE: 04/08/2020; selected revision 06/10/2020

OVERVIEW

Taltz, an interleukin (IL)-17A blocker, is indicated for the following uses:[1]
- **Ankylosing spondylitis**, in adults with active disease.
- **Non-radiographic axial spondyloarthritis**, in adults with active disease and objective signs of inflammation.

- **Plaque psoriasis**, in patients ≥ 6 years of age with moderate to severe disease who are candidates for systemic therapy or phototherapy.
- **Psoriatic arthritis**, in adults with active disease.

In the pivotal trial for non-radiographic axial spondyloarthritis, patients were required to have objective signs of inflammation, indicated by elevated C-reactive protein and/or sacroilitis on magnetic resonance imaging.

Guidelines

- **Spondyloarthritis:** Guidelines for ankylosing spondylitis and nonradiographic axial spondylitis are published by the American College of Rheumatology (ACR)/Spondylitis Association of America/Spondyloarthritis Research and Treatment Network (2019).[2] Following primary nonresponse to a TNFi, either Cosentyx or Taltz is recommended; however, if the patient is a secondary nonresponder, a second TNFi is recommended over switching out of the class. In patients with a contraindication to a TNFi, use of an IL blocker is recommended over traditional oral agents such as methotrexate or sulfasalazine.
- **Plaque Psoriasis:** Joint guidelines from the American Academy of Dermatology (AAD) and National Psoriasis Medical Board (2019) have been published for management of psoriasis with biologics.[3] These guidelines list Taltz as a monotherapy treatment option for patients with moderate to severe plaque psoriasis. Guidelines from the European Dermatology Forum (EDF) [2015] recommend biologics (i.e., etanercept, adalimumab, infliximab, Stelara SC) as second-line therapy for induction and long-term treatment if phototherapy and conventional systemic agents have failed, are contraindicated, or are not tolerated.[4]
- **Psoriatic Arthritis:** Guidelines from the American College of Rheumatology (ACR) [2019] recommend TNF inhibitors over other biologics for use in treatment-naïve patients with PsA and in those who were previously treated with an oral therapy.[5]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Taltz. Because of the specialized skills required for evaluation and diagnosis of patients treated with Taltz as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Taltz to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Taltz is recommended in those who meet the following criteria:

FDA-Approved Indications

FF) Ankylosing Spondylitis. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if prescribed by or in consultation with a rheumatologist.

B) Patient is Currently Receiving Taltz. Approve for 3 years if the patient has had a response, as determined by the prescriber.
Note: Examples of a response to therapy include decreased pain or stiffness, improved function or activities of daily living. The patient may not have a full response, but there should have been a recent or past response to Taltz. The patient may not have a full response, but there should have been a recent or past response to Taltz.

2. Non-Radiographic Axial Spondyloarthritis. Approve for the duration noted if the patient meets ONE of the following (A or B):

C) Initial Therapy. Approve for 3 months if the patient meets BOTH of the following (i and ii):

i. The patient has objective signs of inflammation, defined as at least one of the following (a or b):

a) C-reactive protein elevated beyond the upper limit of normal for the reporting laboratory; OR

b) Sacroiliitis reported on magnetic resonance imaging; AND

ii. The agent is prescribed by or in consultation with a rheumatologist.

D) Patients Currently Receiving Taltz. Approve for 3 years if the patient has had a response, as determined by the prescriber.
Note: Examples of a response include decreased pain or stiffness, improved function or activities of daily living. The patient may not have a full response, but there should have been a recent or past response to Taltz.

GG) Plaque Psoriasis. Approve Taltz for the duration noted if the patient meets ONE of the following conditions (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets ALL of the following criteria (i, ii, and iii):

i. The patient is ≥ 6 years of age; AND

ii. The patient meets ONE of the following conditions (a or b):

1. The patient has tried at least at least one traditional systemic agent for psoriasis for at least 3 months, unless intolerant; OR
Note: Examples include methotrexate (MTX), cyclosporine, acitretin [Soriatane®, generics], or psoralen plus ultraviolet A light (PUVA). An exception to the requirement for a trial of one traditional systemic agent for psoriasis can be made if the patient has already had a 3-month trial or previous intolerance to at least one biologic. Refer to **Appendix** for examples of biologics used for plaque psoriasis. These patients who have already tried a biologic for psoriasis are not required to "step back" and try a traditional systemic agent for psoriasis).

2. The patient has a contraindication to methotrexate (MTX), as determined by the prescribing physician; AND

iii. The agent is prescribed by or in consultation with a dermatologist.

B) Patient is Currently Receiving Taltz. Approve for 3 years if the patient has responded, as determined by the prescriber.
Note: The patient may not have a full response, but there should have been a recent or past response to Taltz.

HH) Psoriatic Arthritis (PsA). Approve Taltz for the duration noted if the patient meets ONE of the following conditions (A or B):

A) Initial Therapy. Approve for 3 months if prescribed by or in consultation with a rheumatologist or a dermatologist.

B) Patient is Currently Receiving Taltz. Approve for 3 years if the patient has responded as determined by the prescriber.
Note: Examples of a response include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improvements in acute phase reactants [for example, C-reactive protein [CRP]). The patient may not have a full response, but there should have been a recent or past response to Taltz.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Taltz is not recommended in the following situations:

220. Concurrent Use with other Biologics or with Targeted Synthetic Disease-Modifying Antirheumatic Drugs (DMARDs). Taltz should not be administered in combination with a biologic used for an inflammatory condition (see Appendix for examples). Combination therapy with biologics and/or biologics + targeted synthetic DMRADs has a potential for a higher rate of adverse effects and lack controlled trial data in support of additive efficacy.[6,7] Note: This does NOT exclude the use of MTX (a traditional systemic agent used to treat psoriasis) in combination with Taltz.

221. Inflammatory Bowel Disease (i.e., Crohn's disease, ulcerative colitis). Exacerbations of inflammatory bowel disease, in some cases serious, occurred in clinical trials with Taltz-treated patients.[1]

222. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Orencia® (abatacept IV infusion, abatacept SC injection)	T-cell costimulation modulator	SC formulation: PJIA, PSA, RA
		IV formulation: PJIA, PsA, RA
Rituximab IV Products (Rituxan®, biosimilars)	CD20-directed cytolytic antibody	RA
Ilaris (canakinumab SC injection**)**	Inhibition of IL-1β	SJIA
Kineret® (anakinra SC injection)	Inhibition of IL-1	RA, SJIA^
Stelara® (ustekinumab SC injection, ustekinumab IV infusion)	Inhibition of IL-12/23	SC formulation: CD, PsO, PsA, UC
		IV formulation: CD, UC
Siliq™ (brodalumab SC injection)	Inhibition of IL-17	PsO
Cosentyx™ (secukinumab SC injection)	Inhibition of IL-17A	AS, PsO, PsA
Taltz® (ixekizumab SC injection)	Inhibition of IL-17A	AS, PsO, PsA
Ilumya™ (tildrakizumab-asmn SC injection)	Inhibition of IL-23	PsO
Skyrizi™ (risankizumab-rzza SC injection)	Inhibition of IL-23	PsO
Tremfya™ (guselkumab SC injection)	Inhibition of IL-23	PsO
Entyvio™ (vedolizumab IV infusion)	Integrin receptor antagonist	CD, UC
Targeted Synthetic DMARDs		
Otezla® (apremilast tablets)	Inhibition of PDE4	PsO, PsA
Olumiant® (baricitinib tablets)	Inhibition of the JAK pathways	RA
Rinvoq® (upadacitinib extended-release tablets)	Inhibition of the JAK pathways	RA
Xeljanz®, Xeljanz XR (tofacitinib tablets, tofacitinib extended-release tablets)	Inhibition of the JAK pathways	RA, PsA, UC

* Not an all-inclusive list of indication (e.g., oncology indications and rare inflammatory conditions are not listed). Refer to the prescribing information for the respective agent for FDA-approved indications; SC – Subcutaneous; TNF – Tumor necrosis factor; IV – Intravenous, IL – Interleukin; PDE4 – Phosphodiesterase 4; JAK – Janus kinase; AS – Ankylosing spondylitis; CD – Crohn's disease; PJIA – Polyarticular juvenile idiopathic arthritis; PsO – Plaque psoriasis; PsA – Psoriatic arthritis; RA – Rheumatoid arthritis; SJIA – Systemic juvenile idiopathic arthritis; UC – Ulcerative colitis; ^ Off-label use of SJIA supported in guidelines.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Tremfya Prior Authorization Policy

- Tremfya™ (guselkumab for subcutaneous injection– Janssen Biotech/Johnson & Johnson)

REVIEW DATE: 07/22/2020

OVERVIEW

Tremfya, an interleukin (IL)-23 blocker, is indicated for the following uses:[1]

- **Plaque psoriasis**, in adults with moderate to severe disease who are candidates for systemic therapy or phototherapy.
- **Psoriatic arthritis**, in adults with active disease (given ± a conventional synthetic disease-modifying antirheumatic drug).

Guidelines

Joint guidelines from the American Academy of Dermatology and National Psoriasis Medical Board (2019) have been published for management of psoriasis with biologics.[2] These guidelines list Tremfya as a monotherapy treatment option for patients with moderate to severe plaque psoriasis. It is recommended that a response to therapy be ascertained after 12 weeks of continuous therapy. Guidelines from the European Dermatology Forum (2015) recommend biologics (i.e., etanercept, adalimumab, infliximab, Stelara SC) as second-line therapy for induction and long-term treatment if phototherapy and conventional systemic agents have failed, are contraindicated, or are not tolerated.[3]

Guidelines from the American College of Rheumatology/National Psoriasis Foundation (2018) were published prior to approval of Tremfya for psoriatic arthritis. However, these guidelines generally recommend tumor necrosis factor inhibitors as the first-line treatment strategy over other biologics (e.g., IL-17 blockers, IL-12/23 inhibitor) with differing mechanisms of action.[4]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Tremfya. Because of the specialized skills required for evaluation and diagnosis of patients treated with Tremfya as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Tremfya to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Tremfya is recommended in those who meet the following criteria:

FDA-Approved Indications

II) Plaque Psoriasis. Approve for the duration noted if the patient meets ONE of the following (A or B):
- **A)** Initial Therapy. Approve for 3 months if the patient meets ALL of the following (i, ii, and iii):
  - **i.** Patient is an adult ≥ 18 years of age; AND
  - **ii.** Patient meets ONE of the following conditions (a or b):
    - **a)** Patient has tried at least at least one traditional systemic agent for psoriasis for at least 3 months, unless intolerant; OR
      Note: Examples include methotrexate (MTX), cyclosporine, acitretin [Soriatane®, generics], or psoralen plus ultraviolet A light (PUVA). An exception to the requirement for a trial of one traditional systemic agent for psoriasis can be made if the patient has already had a 3-month trial or previous intolerance to at least one biologic for this condition. (Refer to **Appendix** for examples of biologics used for psoriasis.) These patients who have already tried a biologic for psoriasis are not required to "step back" and try a traditional systemic agent for psoriasis).
    - **b)** Patient has a contraindication to methotrexate, as determined by the prescriber; AND
  - **iii.** The requested agent is prescribed by or in consultation with a dermatologist.
- **B)** Patient is Currently Receiving Tremfya. Approve for 3 years if the patient has responded, as determined by the prescriber. The patient may not have a full response, but there should have been a recent or past response to Tremfya.

JJ) Psoriatic Arthritis. Approve for the duration noted if the patient meets ONE of the following (A or B):
- **A)** Initial Therapy. Approve for 3 months if Tremfya is prescribed by or in consultation with a rheumatologist or a dermatologist.
- **B)** Patient is Currently Receiving Tremfya. Approve for 3 years if the patient has responded, as determined by the prescriber.
  Note: Examples of a response include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improvements in acute phase reactants (for example, C-reactive protein). The patient may not have a full response, but there should have been a recent or past response to therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Coverage of Tremfya is not recommended in the following situations:

223. Concurrent Use with other Biologics or with Targeted Synthetic Disease-Modifying Antirheumatic Drugs (DMARDs). Data are lacking evaluating concomitant use of Tremfya in combination with another biologic or with a targeted synthetic DMARD for an inflammatory condition (see Appendix for examples). Combination therapy with biologics and/or biologics + targeted synthetic DMARDs has a potential for a higher rate of adverse effects and lack controlled trial data in support of additive efficacy.
Note: This does NOT exclude the use of MTX (a traditional systemic agent used to treat psoriasis) in combination with Tremfya.

224. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Xeljanz/Xeljanz XR Prior Authorization Policy

- Xeljanz®/Xeljanz XR (tofacitinib tablets/tofacitinib extended-release tablets – Pfizer)

REVIEW DATE: 07/15/2020

OVERVIEW

Xeljanz/Xeljanz XR is an inhibitor of the Janus kinases (JAK) pathways approved for the following uses:[1]

- **Psoriatic arthritis**, for treatment of patients who have had an inadequate response or intolerance to methotrexate or other disease-modifying antirheumatic drugs (DMARDs). In psoriatic arthritis, Xeljanz/XR should be used in combination with a conventional synthetic DMARD.
- **Rheumatoid arthritis**, for treatment of adults with moderately to severely active disease who have had an inadequate response or intolerance to methotrexate, either as monotherapy or in combination with methotrexate or other nonbiologic DMARDs.
- **Ulcerative colitis**, for treatment of adults with moderately to severely active disease who have had an inadequate response or who are intolerant to tumor necrosis factor inhibitors (TNFis).

Safety and efficacy have not been established in patients < 18 years of age. For all indications, Xeljanz/XR is not recommended for use in combination with biologics or potent immunosuppressants such as azathioprine or cyclosporine.

Guidelines

Guidelines for treatment of inflammatory conditions recommend assessment of response to initial therapy, most often within 3 months of initiating or changing therapy. In ulcerative colitis, the Prescribing Information recommends discontinuation of Xeljanz/XR if adequate therapeutic response is not achieved by Week 16.

- **Psoriatic Arthritis:** Guidelines from American College of Rheumatology (ACR) [2019] recommend TNFis over other biologics and Xeljanz for use in treatment-naïve patients with psoriatic arthritis and in those who were previously treated with an oral therapy.[2]
- **Rheumatoid Arthritis:** Guidelines from ACR (2015) have TNFis and non-TNF biologics, administered with or without methotrexate, equally positioned as a recommended therapy following a trial of a conventional synthetic DMARD (e.g., methotrexate, leflunomide, hydroxychloroquine, sulfasalazine).[3]
- **Ulcerative Colitis:** Guidelines from the American College of Gastroenterology for UC (2019) note that the following agents can be used for induction of remission in moderately to severely active disease: Uceris tablets; Oral or intravenous systemic corticosteroids Entyvio, Xeljanz, or TNFis (adalimumab, Simponi SC, infliximab).[4] Guidelines from the American Gastroenterological Association (2020) recommend Xeljanz only after failure of or intolerance to a TNFi.[5]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Xeljanz/Xeljanz XR. Because of the specialized skills required for evaluation and diagnosis of patients treated with Xeljanz as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Xeljanz/Xeljanz XR to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

All reviews for use of Xeljanz/XR for COVID-19 and/or cytokine release syndrome associated with COVID-19 will be forwarded to the Medical Director.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Xeljanz/Xeljanz XR is recommended in those who meet the following criteria:

FDA-Approved Indications

21. Psoriatic Arthritis. Approve for the duration noted if the patient meets ONE of the following criteria (A or B):
- **A)** Initial Therapy. Approve for 3 months if the patient meets ALL of the following (i, ii, iii, and iv):
  - **i.** Patient is ≥ 18 years of age; AND
  - **ii.** Patient has tried ONE conventional synthetic disease-modifying antirheumatic drug (DMARD) for at least 3 months; AND
    Note: Examples include methotrexate (oral or injectable), leflunomide, hydroxychloroquine, and sulfasalazine. An exception to the requirement for a trial of one conventional synthetic DMARD can be made if the patient has already has a 3-month trial at least one biologic. Refer to Appendix for examples of biologics used for psoriatic arthritis. These patients who have already tried a biologic are not required to "step back" and try a conventional synthetic DMARD).
  - **iii.** The medication will be used concomitantly with methotrexate or another conventional synthetic DMARD, unless contraindicated; AND
    Note: Examples of other conventional synthetic DMARDs include leflunomide and sulfasalazine.
  - **iv.** The agent is prescribed by or in consultation with a rheumatologist or a dermatologist.
- **B)** Patient is Currently Receiving Xeljanz/XR. Approve for 3 years if the patient meets BOTH of the following (i and ii):
  - **i.** The medication will be used concomitantly with methotrexate or another conventional synthetic DMARD, unless contraindicated; AND
    Note: Examples of other conventional synthetic DMARDs include leflunomide and sulfasalazine.
  - **ii.** The patient has responded as determined by the prescriber.
    Note: Examples of a response to therapy include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improvements in acute phase reactants (for example, C-reactive protein). The patient may not have a full response, but there should have been a recent or past response to Xeljanz/XR.

22. Rheumatoid Arthritis. Approve for the duration noted if the patient meets ONE of the following criteria (A or B):
- **C)** Initial Therapy. Approve for 3 months if the patient meets ALL of the following (i, ii, and iii):
  - **i.** Patient is ≥ 18 years of age; AND
  - **ii.** Patient has tried ONE conventional synthetic disease-modifying antirheumatic drug (DMARD) for at least 3 months; AND
    Note: Examples include methotrexate (oral or injectable), leflunomide, hydroxychloroquine, and sulfasalazine. An exception to the requirement for a trial of one conventional synthetic DMARD can be made if the patient has already has a 3-month trial at least one biologic. Refer to Appendix for examples of biologics used for rheumatoid arthritis. These patients who have already tried a biologic are not required to "step back" and try a conventional synthetic DMARD).
  - **ii.** The agent is prescribed by or in consultation with a rheumatologist.

D) Patient is Currently Receiving Xeljanz/Xeljanz XR. Approve for 3 years if the patient has had a response, as determined by the prescriber.
Note: Examples of a response to therapy include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improved laboratory values; reduced dosage of corticosteroids. The patient may not have a full response, but there should have been a recent or past response to Xeljanz/Xeljanz XR.

23. Ulcerative Colitis. Approve for the duration noted if the patient meets ONE of the following (A or B):

C) Initial Therapy. Approve for 4 months if the patient meets ALL of the following (i, ii, and iii):
- **i.** Patient is ≥ 18 years of age; AND
- **ii.** Patient has had a trial of at least ONE tumor necrosis factor inhibitor for ulcerative colitis; AND
  Note: Examples of a tumor necrosis factor inhibitor include an adalimumab product, an infliximab product, Simponi SC (golimumab SC injection).
- **iii.** The agent is prescribed by or in consultation with a gastroenterologist.

D) Patient is Currently Receiving Xeljanz/XR. Approve for 3 years if the patient has had a response, as determined by the prescriber.
Note: Examples of a response include decreased stool frequency or rectal bleeding. The patient may not have a full response, but there should have been a recent or past response to Xeljanz/XR.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Xeljanz/Xeljanz XR is not recommended in the following situations:

225. Concurrent Use with a Biologic or with a Targeted Synthetic DMARD. Xeljanz/XR should not be administered in combination with a biologic used for an inflammatory condition (see Appendix for examples).[1] Combination therapy is generally not recommended due to a potential for a higher rate of adverse effects with combinations and lack of evidence supporting additive efficacy.[7-8] There are no data evaluating combination of Xeljanz/XR with a targeted synthetic DMARD (e.g., Otezla); therefore, safety and efficacy of this combination is unknown.

226. Concurrent use with Other Potent Immunosuppressants (e.g., azathioprine, tacrolimus, cyclosporine, mycophenolate mofetil).[1] Coadministration with other potent immunosuppressive drugs has the risk of added immunosuppression and has not been evaluated in RA. In UC, Xeljanz is not recommended for use in combination with potent immunosuppressants such as azathioprine and cyclosporine.
Note: This does NOT exclude use of Xeljanz/Xeljanz XR with MTX for RA; Xeljanz/Xeljanz XR has been evaluated in patients with RA taking background MTX, leflunomide, or combinations of DMARDs containing MTX and/or leflunomide.

227. COVID-19 (Coronavirus Disease 2019). Forward all requests to the Medical Director.
Note: This includes requests for cytokine release syndrome associated with COVID-19.

228. Renal Transplantation. More data are needed. A Phase IIb study in kidney transplant patients (n = 331) found Xeljanz was equivalent to cyclosporine in preventing acute rejection.[9] However, based on Phase IIb studies, there are concerns of Epstein Barr Virus-associated post-transplant lymphoproliferative disorder (PTLD) in certain transplant patients receiving Xeljanz.[1,6]

229. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

APPENDIX

Biologic	Mechanism of Action	Examples of Inflammatory Indications for Products*
Biologics		
Adalimumab SC Products (Humira®, biosimilars)	Inhibition of TNF	AS, CD, JIA, PsO, PsA, RA, UC
Cimzia® (certolizumab pegol SC injection)	Inhibition of TNF	AS, CD, nr-axSpA, PsO, PsA, RA
Etanercept SC Products (Enbrel®, biosimilars)	Inhibition of TNF	AS, JIA, PsO, PsA
Infliximab IV Products (Remicade®, biosimilars)	Inhibition of TNF	AS, CD, PsO, PsA, RA, UC
Simponi®, Simponi® Aria™ (golimumab SC injection, golimumab IV infusion)	Inhibition of TNF	SC formulation: AS, PsA, RA, UC
		IV formulation: AS, PsA, RA
Actemra® (tocilizumab IV infusion, tocilizumab SC injection)	Inhibition of IL-6	SC formulation: PJIA, RA, SJIA
		IV formulation: PJIA, RA, SJIA
Kevzara® (sarilumab SC injection)	Inhibition of IL-6	RA
Orencia® (abatacept IV infusion, abatacept SC injection)	T-cell costimulation modulator	SC formulation: JIA, PSA, RA
		IV formulation: JIA, PsA, RA
Rituximab IV Products (Rituxan®, biosimilars)	CD20-directed cytolytic antibody	RA
Kineret® (anakinra SC injection)	Inhibition of IL-1	JIA^, RA
Stelara® (ustekinumab SC injection, ustekinumab IV infusion)	Inhibition of IL-12/23	SC formulation: CD, PsO, PsA, UC
		IV formulation: CD, UC
Siliq™ (brodalumab SC injection)	Inhibition of IL-17	PsO
Cosentyx™ (secukinumab SC injection)	Inhibition of IL-17A	AS, nr-axSpA, PsO, PsA
Taltz® (ixekizumab SC injection)	Inhibition of IL-17A	AS, nr-axSpA, PsO, PsA
Ilumya™ (tildrakizumab-asmn SC injection)	Inhibition of IL-23	PsO
Skyrizi™ (risankizumab-rzza SC injection)	Inhibition of IL-23	PsO
Tremfya™ (guselkumab SC injection)	Inhibition of IL-23	PsO
Entyvio™ (vedolizumab IV infusion)	Integrin receptor antagonist	CD, UC
Targeted Synthetic DMARDs		
Otezla® (apremilast tablets)	Inhibition of PDE4	PsO, PsA
Olumiant® (baricitinib tablets)	Inhibition of the JAK pathways	RA
Rinvoq® (upadacitinib extended-release tablets)	Inhibition of the JAK pathways	RA
Xeljanz®, Xeljanz XR (tofacitinib tablets, tofacitinib extended-release tablets)	Inhibition of the JAK pathways	RA, PsA, UC

* Not an all-inclusive list of indication (e.g., oncology indications and rare inflammatory conditions are not listed). Refer to the prescribing information for the respective agent for FDA-approved indications; SC – Subcutaneous; TNF – Tumor necrosis factor; IV – Intravenous, IL – Interleukin; PDE4 – Phosphodiesterase 4; JAK – Janus kinase; AS – Ankylosing spondylitis; CD – Crohn's disease; JIA – Juvenile idiopathic arthritis; PsO – Plaque psoriasis; PsA – Psoriatic arthritis; RA – Rheumatoid arthritis; UC – Ulcerative colitis; nr-axSpA – Non-radiographic axial spondyloarthritis; ^ Off-label use of Kineret in JIA supported in guidelines; DMARDs – Disease-modifying antirheumatic drug.

PRIOR AUTHORIZATION POLICY

POLICY: Interferon – Actimmune® (interferon gamma-1b subcutaneous injection – Horizon Pharma)

DATE REVIEWED: 04/15/2020

OVERVIEW

Actimmune is indicated for reducing the frequency and severity of serious infections associated with chronic granulomatous disease (CGD) of patients ≥ 1 year of age.[1] Actimmune is also indicated for delaying time to disease progression age with severe, malignant osteopetrosis (SMO) of patients ≥ 1 month of age. Actimmune has shown a treatment-related enhancement of superoxide production by phagocytes and was found to enhance osteoclast function in vivo. Actimmune, an interferon gamma, is a single-chain polypeptide containing 140 amino acids. Specific effects of interferon gamma include the enhancement of the oxidative metabolism of macrophages, antibody dependent

cellular cytotoxicity, activation of natural killer cells, and the expression of Fc receptors and major histocompatibility antigens.[1]

Disease Overview

Chronic Granulomatous Disease

CGD is an inherited primary immunodeficiency caused by functional impairment of the dihydronicotinamide-adenine dinucleotide phosphate (NADPH) oxidase complex in neutrophilic granulocytes and monocytes characterized by recurrent and severe infections, dysregulated inflammation, and autoimmunity.[2] CGD may present any time from infancy to late adulthood; however, the vast majority of affected individuals are diagnosed before age five years.[3] Some people with chronic granulomatous disease do not have any identified mutation gene. The cause of the condition in these individuals is unknown.[4] Mutations in the CYBA, CYBB, NCF1, NCF2, or NCF4 gene can cause CGD.
The American Academy of Allergy, Asthma & Immunology (AAAAI) and the American College of Allergy, Asthma & Immunology (ACAAI) have jointly accepted responsibility for establishing the practice parameter for the diagnosis and management of primary immunodeficiency.[5] Screening for CGD should include direct measurement of superoxide production (nitroblue tetrazolium reduction test [NBT] or dihydrorhodamine 123 [DHR] oxidation test) confirmed with testing for genetic mutation in the genes that make up the NADPH.[6] Neutrophils from a small sample of peripheral blood are activated to produce superoxide which is detected by the NBT, which is converted from a yellow water-soluble compound to a dark-blue insoluble formazan that can be clearly detected microscopically. Activation of neutrophils with phorbol myristate acetate results in oxidation of DHR to a fluorescent compound, rhodamine 123, which can be measured by flow cytometry. Flow cytometry can distinguish between the different genetic forms of CGD. Summary statement 153 of the practice parameter recommends patients with CGD be given prophylaxis with antimicrobial agents and Actimmune.

Severe, Malignant Osteopetrosis

SMO is an inherited disorder characterized by an osteoclast defect, leading to bone density overgrowth, and by deficient phagocyte oxidative metabolism. This leads to accumulation of bone with defective structure, making them brittle and susceptible to fracture. In some cases, this is also accompanied by skeletal abnormalities.[7] About thirty percent of all cases of osteopetrosis the cause of the condition is unknown, however, nine gene-related mutations are associated with osteopetrosis (CA2, CLCN7, IKBKG, ITGB3, OSTM1, PLEKHM1, TCIRG1, TNFRSF11A, TNFSF11).[8] The Osteopetrosis Working Group developed expert consensus guidelines for the diagnosis and management of osteopetrosis.[9] The guidelines recommend diagnosis is determined by classic radiographic (X-ray) features of osteopetrosis followed up by genetic testing to differentiate between the different forms of osteopetrosis with unique complications. The guidelines suggests the use of Actimmune to be considered experimental in noninfantile osteopetrosis with limited clinical experience. Furthermore, acknowledging the FDA indication for SMO and advising the indication pertains only to severe infantile osteopetrosis.

In both disorders, the exact mechanism(s) of Actimmune's treatment effect has not been established. Changes in superoxide levels during Actimmune therapy do not predict efficacy and should not be used to assess patient response to therapy.[1]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Actimmune. Because of the specialized skills required for evaluation and diagnosis of patients treated with Actimmune as well as the monitoring required for adverse events and long-term efficacy, approval requires Actimmune to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Actimmune is recommended in those who meet the following criteria:

FDA-Approved Indications

121. Chronic Granulomatous Disease. Approve for 1 year if the patient meets of the following criteria (A and B):
- **A)** Diagnosis has been established by a molecular genetic test identifying a gene-related mutation linked to chronic granulomatous disease; AND
  Note: Examples of gene-related mutations linked to chronic granulomatous disease include biallelic pathogenic variants in *CYBA*, *CYBB*, *NCF1*, *NCF2*, and *NCF4*.
- **B)** The medication is prescribed by, or in consultation with, an immunologist.

122. Malignant Osteopetrosis, Severe Infantile. Approve for 1 year if the patient meets of the following criteria (A and B):
- **A)** Diagnosis has been established by one of the following (i or ii)
  - **i.** Patient has had a radiographic (X-ray) imaging demonstrating skeletal features related to osteopetrosis; OR
  - **ii.** Patient has had a molecular genetic test identifying a gene-related mutation linked to malignant osteopetrosis, severe infantile; AND
- **B)** The medication is prescribed by, or in consultation with, an endocrinologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Actimmune has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

230. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Iron Replacement – Feraheme® (ferumoxytol injection, for intravenous use – AMAG Pharmaceuticals)

DATE REVIEWED: 12/18/2019; selected revision 03/04/2020

OVERVIEW

Feraheme is an iron replacement product indicated for treatment of iron deficiency anemia in adult patients with chronic kidney disease (CKD), have an intolerance to oral iron, or have had unsatisfactory response to oral iron. Feraheme is administered by intravenous (IV) infusion and treatment may be repeated if iron deficiency remains persistent or recurring. The recommended dose of Feraheme is an initial 510 mg dose followed by a second 510 mg dose 3 to 8 days later per treatment cycle.

Disease Overview

Iron deficiency anemia is a very broad diagnosis and can have many different etiologies; underlying causes should be corrected when appropriate. Anemia is generally characterized by a decrease in hemoglobin (Hb) or in the volume of red blood cells, which decrease the oxygen-carrying capacity in the blood.[2] Anemia is defined by the World Health Organization as Hb < 13.0 g/dL in men, < 12.0 g/dL in women, and < 11 g/dL during pregnancy.[2,3] Acute-onset anemia can present with tachycardia, lightheadedness, and shortness of breath.[2] Chronic anemia can manifest as weakness, fatigue, headache, dizziness, and pallor. Worldwide, iron deficiency is the most common nutritional deficiency. Anemia is prevalent in patients with CKD and the frequency and severity of anemia may increase with declining renal function. The severity and causes are variable and it can be a sign of other illnesses. Iron deficiency anemia is characterized by decreased levels of ferritin and serum iron, as well as decreased transferrin saturation (TSAT); decreases in Hb and hematocrit may follow.

Guidelines

The KDIGO guidelines for anemia in CKD (2012) make various recommendations regarding iron therapy.[4] For adults with CKD and anemia not on iron or erythroid stimulating agent (ESA) therapy, a trial of IV iron (or in non-dialysis patients with CKD, alternatively, a 1 to 3 month trial of oral iron therapy) is recommended if an increase in Hb concentration without starting ESA treatment is desired and TSAT is ≤ 30% and ferritin is ≤ 500 ng/mL. For adults with CKD on ESA therapy who are not receiving iron supplementation, a trial of IV iron (or in non-dialysis CKD patients, alternatively, a 1 to 3 month trial of oral iron therapy) is recommended if an increase in Hb concentration or a decrease in ESA dose is desired and TSAT is ≤ 30% and ferritin is ≤ 500 ng/mL. For all pediatric patients with CKD with anemia not on iron or ESA therapy, oral iron (or IV iron in patients receiving hemodialysis) is recommended when TSAT is ≤ 20% and ferritin is ≤ 100 ng/mL. For all pediatric patients with CKD who are receiving ESA therapy but not receiving iron supplementation, it is recommended to administer oral iron (or IV iron for patients receiving hemodialysis) to maintain TSAT > 20% and ferritin > 100 ng/dL.

Other Uses with Supportive Evidence

A 2017 focused update of the 2013 American College of Cardiology Foundation/American Heart Association guideline for the management of heart failure. It states that patients with New York Heart Association class II or III heart failure, absolute iron deficiency (ferritin < 100 ng/mL) or functional iron deficiency (ferritin = 100 to 300 mg/mL if transferring saturation is < 20%), and with or without anemia, IV iron replacement may be reasonable to improve function status and quality of life.[5] Benefits noted with IV iron therapies included improvement in functional capacity, improvements in the six-minute walk test and improved functional capacity.

The National Comprehensive Cancer Network guidelines on Hematopoietic Growth Factors (version 1.2020 – November 15, 2019) discuss the management of cancer- and chemotherapy-induced anemia.[6] IV iron therapy is considered an option for patients with absolute iron deficiency (ferritin < 30 ng/mL and TSAT < 20%), functional iron deficiency (ferritin = 30 to 500 ng/mL and TSAT < 50%), and possible functional iron deficiency (ferritin = 501 to 800 ng/mL and TSAT < 50%).

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Feraheme. For patients with chronic kidney disease who are on dialysis, prior authorization is not required for prescription benefit coverage. All approvals are

provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Feraheme as well as the monitoring required for adverse events and long-term efficacy, approval requires Feraheme to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Feraheme is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Iron Deficiency Anemia in Patients with Chronic Kidney Disease who are on Dialysis**. Approve for 3 years.

2. **Iron Deficiency Anemia in Patients with Chronic Kidney Disease who are not on Dialysis**. Approve for 1 year if the product meets the following criteria (A and B):
   - **A)** The patient is ≥ 18 years of age; AND
   - **B)** Feraheme is prescribed by, or in consultation with, a nephrologist or hematologist.

3. **Iron Deficiency Anemia, Other.** Approve for 1 year if the patient meets the following (A and B):
   - **A)** The patient is ≥ 18 years of age; AND
   - **B)** The patient meets one of the following (i, ii, iii, or iv):
     - **i.** The patient meets both of the following (a and b):
       - **a)** The patient has tried oral iron supplementation; AND
       - **b)** According to the prescriber, oral iron supplementation was ineffective or intolerable; OR
     - **ii.** The patient has a condition which, per the prescriber, will interfere with oral iron absorption (e.g., inflammatory bowel disease, Crohn's disease); OR
     - **iii.** The patient is currently receiving an erythroid stimulating agent; OR
       Note: Examples of erythroid stimulating agents include an epoetin alfa product, a darbepoetin alfa product, or a methoxy polyethylene glycol-epoetin beta product.
     - **iv.** The medication is being requested for cancer- or chemotherapy-related anemia.

Other Uses with Supportive Evidence

4. **Iron Deficiency Associated with Heart Failure.** Approve for 1 year if the product meets the following criteria (A and B):
   - **A)** The patient is ≥ 18 years of age; AND
   - **B)** Feraheme is being prescribed by, or in consultation with, a cardiologist or hematologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Feraheme not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

112. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Iron Replacement – Ferrlecit® (sodium ferric gluconate complex in sucrose injection, for intravenous use – sanofi-aventis)

DATE REVIEWED: 12/18/2019; selected revision 03/04/2020

OVERVIEW

Ferrlecit is an iron replacement product indicated for treatment of iron deficiency anemia in adults and pediatric patients ≥ 6 years of age with chronic kidney disease (CKD) receiving hemodialysis who are receiving supplemental epoetin therapy.[1] Ferrlecit is administered by intravenous (IV) infusion or slow injection and treatment may be repeated if iron deficiency remains persistent or recurring. The recommended dosage of Ferrlecit for the repletion treatment of iron deficiency in hemodialysis patients is 10 mL of Ferrlecit (125 mg of elemental iron). For repletion treatment most adult patients may require a cumulative dose of 1000 mg of elemental iron administered over 8 dialysis sessions. The recommended pediatric dosage in hemodialysis patients is 0.12 mL/kg Ferrlecit (1.5 mg/kg of elemental iron) administered by intravenous infusion per dialysis session. The maximum pediatric dosage should not exceed 125 mg per dose.

Disease Overview

Iron deficiency anemia is a very broad diagnosis and can have many different etiologies; underlying causes should be corrected when appropriate. Anemia is generally characterized by a decrease in hemoglobin (Hb) or in the volume of red blood cells, which decrease the oxygen-carrying capacity in the blood.[2] Anemia is defined by the World Health Organization as Hb < 13.0 g/dL in men, < 12.0 g/dL in women, and < 11 g/dL during pregnancy.[2,3] Acute-onset anemia can present with tachycardia, lightheadedness, and shortness of breath.[2] Chronic anemia can manifest as weakness, fatigue, headache, dizziness, and pallor. Worldwide, iron deficiency is the most common nutritional deficiency. Anemia is prevalent in patients with CKD and the frequency and severity of anemia may increase with declining renal function. The severity and causes are variable and it can be a sign of other illnesses. Iron deficiency anemia is characterized by decreased levels of ferritin and serum iron, as well as decreased transferrin saturation (TSAT); decreases in Hb and hematocrit may follow.

Guidelines

The KDIGO guidelines for anemia in CKD (2012) make various recommendations regarding iron therapy.[4] For adults with CKD and anemia not on iron or erythroid stimulating agent (ESA) therapy, a trial of IV iron (or in non-dialysis patients with CKD, alternatively, a 1 to 3 month trial of oral iron therapy) is recommended if an increase in Hb concentration without starting ESA treatment is desired and TSAT is ≤ 30% and ferritin is ≤ 500 ng/mL. For adults with CKD on ESA therapy who are not receiving iron supplementation, a trial of IV iron (or in non-dialysis CKD patients, alternatively, a 1 to 3 month trial of oral iron therapy) is recommended if an increase in Hb concentration or a decrease in ESA dose is desired and TSAT is ≤ 30% and ferritin is ≤ 500 ng/mL. For all pediatric patients with

CKD with anemia not on iron or ESA therapy, oral iron (or IV iron in patients receiving hemodialysis) is recommended when TSAT is ≤ 20% and ferritin is ≤ 100 ng/mL. For all pediatric patients with CKD who are receiving ESA therapy but not receiving iron supplementation, it is recommended to administer oral iron (or IV iron for patients receiving hemodialysis) to maintain TSAT > 20% and ferritin > 100 ng/dL.

Other Uses with Supportive Evidence

A 2017 focused update of the 2013 American College of Cardiology Foundation/American Heart Association guideline for the management of heart failure. It states that patients with New York Heart Association class II or III heart failure, absolute iron deficiency (ferritin < 100 ng/mL) or functional iron deficiency (ferritin 100 to 300 mg/mL if TSAT is < 20%), and with or without anemia, IV iron replacement may be reasonable to improve functional status and quality of life.[5] Benefits noted with IV iron therapies included improvement in functional capacity and improvements in the six-minute walk test.

The National Comprehensive Cancer Network guidelines on Hematopoietic Growth Factors (version 1.2020 – November 15, 2019) discuss the management of cancer- and chemotherapy-induced anemia.[6] IV iron therapy is considered an option for patients with absolute iron deficiency (ferritin < 30 ng/mL and TSAT < 20%), functional iron deficiency (ferritin = 30 to 500 ng/mL and TSAT < 50%), and possible functional iron deficiency (ferritin = 501 to 800 ng/mL and TSAT < 50%).

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Ferrlecit. For patients with chronic kidney disease who are on dialysis, prior authorization is not required for prescription benefit coverage. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Ferrlecit as well as the monitoring required for adverse events and long-term efficacy, approval requires Ferrlecit to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Ferrlecit is recommended in those who meet the following criteria:

FDA-Approved Indications

5. **Iron Deficiency Anemia in Patients with Chronic Kidney Disease who are on Dialysis**. Approve for 3 years.

6. **Iron Deficiency Anemia in Patients with Chronic Kidney Disease who are not on Dialysis**. Approve for 1 year if the product meets the following criteria (A and B):
   - **C)** The patient is ≥ 6 years of age; AND
   - **D)** Ferrlecit is prescribed by, or in consultation with, a nephrologist or hematologist.

Other Uses with Supportive Evidence

7. **Iron Deficiency Anemia, Other.** Approve for 1 year if the patient meets the following (A and B):
   - **C)** The patient is ≥ 6 years of age; AND
   - **D)** The patient meets one of the following (i, ii, iii, or iv):
     - **i.** The patient meets both of the following (a and b):
       - **a)** The patient has tried oral iron supplementation; AND
       - **b)** According to the prescriber, oral iron supplementation was ineffective or intolerable; OR
     - **ii.** The patient has a condition which, per the prescriber, will interfere with oral iron absorption (e.g., inflammatory bowel disease, Crohn's disease); OR
     - **iii.** The patient is currently receiving an erythroid stimulating agent; OR

Note: Examples of erythroid stimulating agents include an epoetin alfa product, a darbepoetin alfa product, or a methoxy polyethylene glycol-epoetin beta product.

iv. The medication is being requested for cancer- or chemotherapy-related anemia.

8. Iron Deficiency Associated with Heart Failure. Approve for 1 year if the product meets the following criteria (A and B):

C) The patient is ≥ 6 years of age; AND

D) Ferrlecit is being prescribed by, or in consultation with, a cardiologist or hematologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Ferrlecit not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

113. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Iron Replacement – INFeD® (iron dextran injection, for intravenous or intramuscular use – Actavis Pharma)

DATE REVIEWED: 12/18/2019; selected revision 03/04/2020

OVERVIEW

INFeD is an iron replacement product indicated for treatment of iron deficiency anemia in whom oral administration is unsatisfactory or impossible. INFeD is administered by intravenous (IV) or intramuscular injection and treatment may be repeated if iron deficiency remains persistent or recurring. The INFeD prescribing information gives formulas and table guides for individualized dosages.

Disease Overview

Iron deficiency anemia is a very broad diagnosis and can have many different etiologies; underlying causes should be corrected when appropriate. Anemia is generally characterized by a decrease in hemoglobin (Hb) or in the volume of red blood cells, which decrease the oxygen-carrying capacity in the blood.[2] Anemia is defined by the World Health Organization as Hb < 13.0 g/dL in men, < 12.0 g/dL in women, and < 11 g/dL during pregnancy.[2,3] Acute-onset anemia can present with tachycardia, lightheadedness, and shortness of breath.[2] Chronic anemia can manifest as

weakness, fatigue, headache, dizziness, and pallor. Worldwide, iron deficiency is the most common nutritional deficiency. Anemia is prevalent in patients with chronic kidney disease (CKD) and the frequency and severity of anemia may increase with declining renal function. The severity and causes are variable and it can be a sign of other illnesses. Iron deficiency anemia is characterized by decreased levels of ferritin and serum iron, as well as decreased transferrin saturation (TSAT); decreases in Hb and hematocrit may follow.

Guidelines

The KDIGO guidelines for anemia in CKD (2012) make various recommendations regarding iron therapy.[4] For adults with CKD and anemia not on iron or erythroid stimulating agent (ESA) therapy, a trial of IV iron (or in non-dialysis patients with CKD, alternatively, a 1 to 3 month trial of oral iron therapy) is recommended if an increase in Hb concentration without starting ESA treatment is desired and TSAT is ≤ 30% and ferritin is ≤ 500 ng/mL. For adults with CKD on ESA therapy who are not receiving iron supplementation, a trial of IV iron (or in non-dialysis CKD patients, alternatively, a 1 to 3 month trial of oral iron therapy) is recommended if an increase in Hb concentration or a decrease in ESA dose is desired and TSAT is ≤ 30% and ferritin is ≤ 500 ng/mL. For all pediatric patients with CKD with anemia not on iron or ESA therapy, oral iron (or IV iron in patients receiving hemodialysis) is recommended when TSAT is ≤ 20% and ferritin is ≤ 100 ng/mL. For all pediatric patients with CKD who are receiving ESA therapy but not receiving iron supplementation, it is recommended to administer oral iron (or IV iron for patients receiving hemodialysis) to maintain TSAT > 20% and ferritin > 100 ng/dL.

Other Uses with Supportive Evidence

A 2017 focused update of the 2013 American College of Cardiology Foundation/American Heart Association guideline for the management of heart failure. It states that patients with New York Heart Association class II or III heart failure, absolute iron deficiency (ferritin < 100 ng/mL) or functional iron deficiency (ferritin 100 to 300 mg/mL if TSAT is < 20%), and with or without anemia, IV iron replacement may be reasonable to improve functional status and quality of life.[5] Benefits noted with IV iron therapies included improvement in functional capacity and improvements in the six-minute walk test.

The National Comprehensive Cancer Network guidelines on Hematopoietic Growth Factors (version 1.2020 – November 15, 2019) discuss the management of cancer- and chemotherapy-induced anemia.[6] IV iron therapy is considered an option for patients with absolute iron deficiency (ferritin < 30 ng/mL and TSAT < 20%), functional iron deficiency (ferritin = 30 to 500 ng/mL and TSAT < 50%), and possible functional iron deficiency (ferritin = 501 to 800 ng/mL and TSAT < 50%).

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of INFeD. For patients with chronic kidney disease who are on dialysis, prior authorization is not required for prescription benefit coverage. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with INFeD as well as the monitoring required for adverse events and long-term efficacy, approval requires INFeD to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of INFeD is recommended in those who meet the following criteria:

FDA-Approved Indications

9. Iron Deficiency Anemia, Other. Approve for 1 year if the patient meets one of the following (A, B, C, or D):

E) The patient meets both of the following (i and ii):

i. The patient has tried oral iron supplementation; AND

ii. According to the prescriber, oral iron supplementation was ineffective or intolerable; OR

F) The patient has a condition which, per the prescriber, will interfere with oral iron absorption (e.g., inflammatory bowel disease, Crohn's disease); OR
G) The patient is currently receiving an erythroid stimulating agent; OR
Note: Examples of erythroid stimulating agents include an epoetin alfa product, a darbepoetin alfa product, or a methoxy polyethylene glycol-epoetin beta product.
H) The medication is being requested for cancer- or chemotherapy-related anemia.

Other Uses with Supportive Evidence

10. Iron Deficiency Anemia in Patients with Chronic Kidney Disease who are on Dialysis. Approve for 3 years.

11. Iron Deficiency Anemia in Patients with Chronic Kidney Disease who are not on Dialysis. Approve for 1 year if the product is prescribed by, or in consultation with, a nephrologist or hematologist.

12. Iron Deficiency Associated with Heart Failure. Approve for 1 year if the product is being prescribed by, or in consultation with, a cardiologist or hematologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

INFeD not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

114. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Iron Replacement – Injectafer® (ferric carboxymaltose injection, for intravenous use – American Regent)

DATE REVIEWED: 12/18/2019; selected revision 03/04/2020

OVERVIEW

Injectafer is an iron replacement product indicated for treatment of iron deficiency anemia in adult patients who have non-dialysis dependent chronic kidney disease (CKD), who have intolerance to oral iron, or have had unsatisfactory response to oral iron. Injectafer is administered by intravenous (IV) infusion or slow injection and treatment may be

repeated if iron deficiency remains persistent or recurring. The recommended dose is up to 750 mg per dose with a total cumulative dose not to exceed 1500 mg per treatment course.

Disease Overview

Iron deficiency anemia is a very broad diagnosis and can have many different etiologies; underlying causes should be corrected when appropriate. Anemia is generally characterized by a decrease in hemoglobin (Hb) or in the volume of red blood cells, which decrease the oxygen-carrying capacity in the blood.[2] Anemia is defined by the World Health Organization as Hb < 13.0 g/dL in men, < 12.0 g/dL in women, and < 11 g/dL during pregnancy.[2,3] Acute-onset anemia can present with tachycardia, lightheadedness, and shortness of breath.[2] Chronic anemia can manifest as weakness, fatigue, headache, dizziness, and pallor. Worldwide, iron deficiency is the most common nutritional deficiency. Anemia is prevalent in patients with chronic kidney disease (CKD) and the frequency and severity of anemia may increase with declining renal function. The severity and causes are variable and it can be a sign of other illnesses. Iron deficiency anemia is characterized by decreased levels of ferritin and serum iron, as well as decreased transferrin saturation (TSAT); decreases in Hb and hematocrit may follow.

Guidelines

The KDIGO guidelines for anemia in CKD (2012) make various recommendations regarding iron therapy.[4] For adults with CKD and anemia not on iron or erythroid stimulating agent (ESA) therapy, a trial of IV iron (or in non-dialysis patients with CKD, alternatively, a 1 to 3 month trial of oral iron therapy) is recommended if an increase in Hb concentration without starting ESA treatment is desired and TSAT is ≤ 30% and ferritin is ≤ 500 ng/mL. For adults with CKD on ESA therapy who are not receiving iron supplementation, a trial of IV iron (or in non-dialysis CKD patients, alternatively, a 1 to 3 month trial of oral iron therapy) is recommended if an increase in Hb concentration or a decrease in ESA dose is desired and TSAT is ≤ 30% and ferritin is ≤ 500 ng/mL. For all pediatric patients with CKD with anemia not on iron or ESA therapy, oral iron (or IV iron in patients receiving hemodialysis) is recommended when TSAT is ≤ 20% and ferritin is ≤ 100 ng/mL. For all pediatric patients with CKD who are receiving ESA therapy but not receiving iron supplementation, it is recommended to administer oral iron (or IV iron for patients receiving hemodialysis) to maintain TSAT > 20% and ferritin > 100 ng/dL.

Other Uses with Supportive Evidence

A 2017 focused update of the 2013 American College of Cardiology Foundation/American Heart Association guideline for the management of heart failure. POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Injectafer. For patients with chronic kidney disease who are on dialysis, prior authorization is not required for prescription benefit coverage. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Injectafer as well as the monitoring required for adverse events and long-term efficacy, approval requires Injectafer to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Injectafer is recommended in those who meet the following criteria:

FDA-Approved Indications

13. **Iron Deficiency Anemia in Patients with Chronic Kidney Disease who are on Dialysis**. Approve for 3 years.

14. **Iron Deficiency Anemia in Patients with Chronic Kidney Disease who are not on Dialysis**. Approve for 1 year if the product meets the following criteria (A and B):
    - **E)** The patient is ≥ 18 years of age; AND
    - **F)** Injectafer is prescribed by, or in consultation with, a nephrologist or hematologist.

15. **Iron Deficiency Anemia, Other.** Approve for 1 year if the patient meets the following (A and B):
    - **I)** The patient is ≥ 18 years of age; AND
    - **J)** The patient meets one of the following (i, ii, iii, or iv):
        - **i.** The patient meets both of the following (a and b):
            - **a)** The patient has tried oral iron supplementation; AND
            - **b)** According to the prescriber, oral iron supplementation was ineffective or intolerable; OR
        - **ii.** The patient has a condition which, per the prescriber, will interfere with oral iron absorption (e.g., inflammatory bowel disease, Crohn's disease); OR
        - **iii.** The patient is currently receiving an erythroid stimulating agent; OR
          Note: Examples of erythroid stimulating agents include an epoetin alfa product, a darbepoetin alfa product, or a methoxy polyethylene glycol-epoetin beta product.
        - **iv.** The medication is being requested for cancer- or chemotherapy-related anemia.

Other Uses with Supportive Evidence

16. **Iron Deficiency Associated with Heart Failure.** Approve for 1 year if the product meets the following criteria (A and B):
    - **E)** The patient is ≥ 18 years of age; AND
    - **F)** Injectafer is being prescribed by, or in consultation with, a cardiologist or hematologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Injectafer not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

115. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Iron Replacement – Monoferric® (ferric derisomaltose injection for intravenous use – Pharmacosmos)

DATE REVIEWED: 03/04/2020

OVERVIEW

Monoferric is an iron replacement product indicated for treatment of iron deficiency anemia in patients ≥ 18 years of age with non-hemodialysis chronic kidney disease, have an intolerance to oral iron, or have had unsatisfactory response to oral iron. Monoferric is administered by intravenous (IV) infusion and treatment may be repeated if iron deficiency remains persistent or recurring. The recommended dose of Monoferric is 1000 mg in patients weighing ≥ 50 kg administered as a single dose per treatment cycle. For patients weighing < 50 kg, the recommended dose is 20 mg/kg administered as a single dose per treatment cycle.

Disease Overview

Iron deficiency anemia is a very broad diagnosis and can have many different etiologies; underlying causes should be corrected when appropriate. Anemia is generally characterized by a decrease in hemoglobin (Hb) or in the volume of red blood cells, which decrease the oxygen-carrying capacity in the blood.[2] Anemia is defined by the World Health Organization as Hb < 13.0 g/dL in men, < 12.0 g/dL in women, and < 11 g/dL during pregnancy.[2,3] Acute-onset anemia can present with tachycardia, lightheadedness, and shortness of breath.[2] Chronic anemia can manifest as weakness, fatigue, headache, dizziness, and pallor. Worldwide, iron deficiency is the most common nutritional deficiency. Anemia is prevalent in patients with chronic kidney disease (CKD) and the frequency and severity of anemia may increase with declining renal function. The severity and causes are variable and it can be a sign of other illnesses. Iron deficiency anemia is characterized by decreased levels of ferritin and serum iron, as well as decreased transferrin saturation (TSAT); decreases in Hb and hematocrit may follow.

Guidelines

The KDIGO guidelines for anemia in CKD (2012) make various recommendations regarding iron therapy.[4] For adults with CKD and anemia not on iron or erythroid stimulating agent (ESA) therapy, a trial of IV iron (or in non-dialysis patients with CKD, alternatively, a 1 to 3 month trial of oral iron therapy) is recommended if an increase in Hb concentration without starting ESA treatment is desired and TSAT is ≤ 30% and ferritin is ≤ 500 ng/mL. For adults with CKD on ESA therapy who are not receiving iron supplementation, a trial of IV iron (or in non-dialysis CKD patients, alternatively, a 1 to 3 month trial of oral iron therapy) is recommended if an increase in Hb concentration or a decrease in ESA dose is desired and TSAT is ≤ 30% and ferritin is ≤ 500 ng/mL. For all pediatric patients with CKD with anemia not on iron or ESA therapy, oral iron (or IV iron in patients receiving hemodialysis) is recommended when TSAT is ≤ 20% and ferritin is ≤ 100 ng/mL. For all pediatric patients with CKD who are receiving ESA therapy but not receiving iron supplementation, it is recommended to administer oral iron (or IV iron for patients receiving hemodialysis) to maintain TSAT > 20% and ferritin > 100 ng/dL.

Other Uses with Supportive Evidence

A 2017 focused update of the 2013 American College of Cardiology Foundation/American Heart Association guideline for the management of heart failure. It states that patients with New York Heart Association class II or III heart failure, absolute iron deficiency (ferritin < 100 ng/mL) or functional iron deficiency (ferritin = 100 to 300 mg/mL if transferring saturation is < 20%), and with or without anemia, IV iron replacement may be reasonable to improve

function status and quality of life.[5] Benefits noted with IV iron therapies included improvement in functional capacity, improvements in the six-minute walk test and improved functional capacity.

The National Comprehensive Cancer Network guidelines on Hematopoietic Growth Factors (version 1.2020 – November 15, 2019) discuss the management of cancer- and chemotherapy-induced anemia.[6] IV iron therapy is considered an option for patients with absolute iron deficiency (ferritin < 30 ng/mL and TSAT < 20%), functional iron deficiency (ferritin = 30 to 500 ng/mL and TSAT < 50%), and possible functional iron deficiency (ferritin = 501 to 800 ng/mL and TSAT < 50%).

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Monoferric. For patients with chronic kidney disease who are on dialysis, prior authorization is not required for prescription benefit coverage. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Monoferric as well as the monitoring required for adverse events and long-term efficacy, approval requires Monoferric to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Monoferric is recommended in those who meet the following criteria:

FDA-Approved Indications

17. **Iron Deficiency Anemia in Patients with Chronic Kidney Disease who are not on Dialysis**. Approve for 1 year if the product meets the following criteria (A and B):
    - **G)** The patient is ≥ 18 years of age; AND
    - **H)** Monoferric is prescribed by, or in consultation with, a nephrologist or hematologist.

18. **Iron Deficiency Anemia, Other.** Approve for 1 year if the patient meets the following (A and B):
    - **K)** The patient is ≥ 18 years of age; AND
    - **L)** The patient meets one of the following (i, ii, iii, or iv):
        - **i.** The patient meets both of the following (a and b):
            - **a)** The patient has tried oral iron supplementation; AND

PRIOR AUTHORIZATION POLICY

POLICY: Iron Replacement – Venofer® (iron sucrose injection, for intravenous use – American Regent)

DATE REVIEWED: 12/18/2019; selected revision 03/04/2020

OVERVIEW

Venofer is an iron replacement product indicated for treatment of iron deficiency anemia in patients with chronic kidney disease (CKD).[1] Venofer is administered by intravenous (IV) infusion or slow injection and treatment may be repeated if iron deficiency remains persistent or recurring. Dosage and dosing frequency varies depending on patient age, if there is a need for dialysis, and, if needed, what type if dialysis (hemodialysis or peritoneal). The recommended maximum total course dose is 1000 mg per treatment cycle.

Disease Overview

Iron deficiency anemia is a very broad diagnosis and can have many different etiologies; underlying causes should be corrected when appropriate. Anemia is generally characterized by a decrease in hemoglobin (Hb) or in the volume of red blood cells, which decrease the oxygen-carrying capacity in the blood.[2] Anemia is defined by the World Health Organization as Hb < 13.0 g/dL in men, < 12.0 g/dL in women, and < 11 g/dL during pregnancy.[2,3] Acute-onset anemia can present with tachycardia, lightheadedness, and shortness of breath.[2] Chronic anemia can manifest as weakness, fatigue, headache, dizziness, and pallor. Worldwide, iron deficiency is the most common nutritional deficiency. Anemia is prevalent in patients with chronic kidney disease (CKD) and the frequency and severity of anemia may increase with declining renal function. The severity and causes are variable and it can be a sign of other

illnesses. Iron deficiency anemia is characterized by decreased levels of ferritin and serum iron, as well as decreased transferrin saturation (TSAT); decreases in Hb and hematocrit may follow.

Guidelines

The KDIGO guidelines for anemia in CKD (2012) make various recommendations regarding iron therapy.[4] For adults with CKD and anemia not on iron or erythroid stimulating agent (ESA) therapy, a trial of IV iron (or in non-dialysis patients with CKD, alternatively, a 1 to 3 month trial of oral iron therapy) is recommended if an increase in Hb concentration without starting ESA treatment is desired and TSAT is ≤ 30% and ferritin is ≤ 500 ng/mL. For adults with CKD on ESA therapy who are not receiving iron supplementation, a trial of IV iron (or in non-dialysis CKD patients, alternatively, a 1 to 3 month trial of oral iron therapy) is recommended if an increase in Hb concentration or a decrease in ESA dose is desired and TSAT is ≤ 30% and ferritin is ≤ 500 ng/mL. For all pediatric patients with CKD with anemia not on iron or ESA therapy, oral iron (or IV iron in patients receiving hemodialysis) is recommended when TSAT is ≤ 20% and ferritin is ≤ 100 ng/mL. For all pediatric patients with CKD who are receiving ESA therapy but not receiving iron supplementation, it is recommended to administer oral iron (or IV iron for patients receiving hemodialysis) to maintain TSAT > 20% and ferritin > 100 ng/dL.

Other Uses with Supportive Evidence

A 2017 focused update of the 2013 American College of Cardiology Foundation/American Heart Association guideline for the management of heart failure. It states that patients with New York Heart Association class II or III heart failure, absolute iron deficiency (ferritin < 100 ng/mL) or functional iron deficiency (ferritin = 100 to 300 mg/mL if transferring saturation is < 20%), and with or without anemia, IV iron replacement may be reasonable to improve function status and quality of life.[5] Benefits noted with IV iron therapies included improvement in functional capacity, improvements in the six-minute walk test and improved functional capacity.

The National Comprehensive Cancer Network guidelines on Hematopoietic Growth Factors (version 1.2020 – November 15, 2019) discuss the management of cancer- and chemotherapy-induced anemia.[6] IV iron therapy is considered an option for patients with absolute iron deficiency (ferritin < 30 ng/mL and TSAT < 20%), functional iron deficiency (ferritin = 30 to 500 ng/mL and TSAT < 50%), and possible functional iron deficiency (ferritin = 501 to 800 ng/mL and TSAT < 50%).

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Venofer. For patients with chronic kidney disease who are on dialysis, prior authorization is not required for prescription benefit coverage. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Venofer as well as the monitoring required for adverse events and long-term efficacy, approval requires Venofer to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Venofer is recommended in those who meet the following criteria:

FDA-Approved Indications

21. **Iron Deficiency Anemia in Patients with Chronic Kidney Disease who are on Dialysis**. Approve for 3 years.

22. **Iron Deficiency Anemia in Patients with Chronic Kidney Disease who are not on Dialysis**. Approve for 1 year if the product is prescribed by, or in consultation with, a nephrologist or hematologist.

Other Uses with Supportive Evidence

23. Iron Deficiency Anemia, Other. Approve for 1 year if the patient meets one of the following (A, B, C, or D):

M) The patient meets both of the following (i and ii):
- **i.** The patient has tried oral iron supplementation; AND
- **ii.** According to the prescriber, oral iron supplementation was ineffective or intolerable; OR

N) The patient has a condition which, per the prescriber, will interfere with oral iron absorption (e.g., inflammatory bowel disease, Crohn's disease); OR

O) The patient is currently receiving an erythroid stimulating agent; OR
Note: Examples of erythroid stimulating agents include an epoetin alfa product, a darbepoetin alfa product, or a methoxy polyethylene glycol-epoetin beta product.

P) The medication is being requested for cancer- or chemotherapy-related anemia.

24. Iron Deficiency Associated with Heart Failure. Approve for 1 year if the product is being prescribed by, or in consultation with, a cardiologist or hematologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Venofer not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Keveyis® (dichlorphenamide tablets – Taro Pharmaceuticals)

DATE REVIEWED: 12/18/2019

OVERVIEW

Keveyis, a carbonic anhydrase inhibitor, is indicated for the treatment of primary hyperkalemic periodic paralysis (HyperPP), primary hypokalemic periodic paralysis (HypoPP), and related variants.[1] The primary periodic paralyses are rare muscle disorders caused by genetic mutations in ion channels.[2] HypoPP is caused in 80% of cases by point mutations in the voltage-gated calcium channel gene on chromosome 1. Mutation in the *CACNA1S, SCN4A,* or *KCNJ18* genes alter the usual structure and function of calcium or

sodium channels.[3,4] The altered channels cannot properly regulate the flow of ions into muscle cells, which reduces the ability of skeletal muscles to contract, leading to severe muscle weakness or paralysis.[3] HyperPP and HypoPP are inherited in an autosomal dominant manner, so one copy of the altered gene in each cell is sufficient to cause the disorder.[5] Other channelopathies include Andersen-Tawil syndrome, paramyotonia congenital, and potassium-aggravated myotonia.

The recommended initial dose of Keveyis is 50 mg once or twice daily.[1] The maximum recommended total daily dose is 200 mg. Primary HyperPP, primary HypoPP, and related variants are a heterogeneous group of conditions, for which the response to Keveyis may vary. Therefore, prescribers should evaluate the patient's response to Keveyis after 2 months to decide whether it should be continued.

The normal serum potassium concentration ranges from 3.5 to 5.0 mEq/L, although there may be slight fluctuations in the normal range depending on the laboratory.[4] Generally, serum potassium concentration < 3.5 mEq/L is considered hypokalemia and serum potassium concentration > 5.0 mEq/L or 5.5 mEq/L is considered hyperkalemia.

Efficacy Data

The efficacy of Keveyis was established in two Phase III studies.[1,6,9] In both of these studies, when Keveyis was compared with placebo there was a statistically significant decrease in the attack frequency per week, severity-weighted attack rate, and the duration of attacks.

Other Drug Therapies

Oral potassium salts can be taken as maintenance/prophylactic therapy for patients with HypoPP; however, this does not completely prevent attacks.[4] Although data are limited to case reports and single-blind trials, acetazolamide, another carbonic anhydrase inhibitor, has been used historically for primary periodic paralysis. In one Keveyis published study, 40% of patients (n = 29/73) were receiving prophylactic treatment at baseline; 76% of these patients (n = 22/29) were taking acetazolamide and the rest were taking dichlorphenamide.[6] Acetazolamide treatment is beneficial in approximately 50% of patients with HypoPP and it has no effect in 30% of affected patients.[4] It can also exacerbate symptoms in 20% of patients. Keveyis has been reported to be 30 times more potent than acetazolamide *in vitro*.[9] Prior to initiating Keveyis it is important to verify if the patient has had exacerbation with acetazolamide, since Keveyis is considered to be more potent and may potentially lead to more exacerbations.[7]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Keveyis. Because of the specialized skills required for evaluation and diagnosis of patients treated with Keveyis, as well as the monitoring required for adverse events and long-term efficacy, approval requires Keveyis to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Keveyis is recommended in those who meet the following criteria:

FDA-Approved Indications

24. Hypokalemic Periodic Paralysis (HypoPP) and Related Variants.

A) Initial Therapy. Approve for 2 months if the patient meets the following criteria (i, ii, iii, iv, v, and vi):

- **i.** Patient has a confirmed diagnosis of primary hypokalemic periodic paralysis by meeting at least ONE of the following (a, b, or c):
  - **a)** Patient has had a serum potassium concentration of less than 3.5 mEq/L during a paralytic attack; OR
  - **b)** Patient has a family history of the condition; OR
  - **c)** Patient has a genetically confirmed skeletal muscle calcium or sodium channel mutation; AND
- **ii.** The prescriber has excluded other reasons for acquired hypokalemia (e.g., renal, adrenal, or thyroid dysfunction; renal tubular acidosis; diuretic or laxative abuse); AND
- **iii.** Patient has had improvements in paralysis attack symptoms with potassium intake; AND
- **iv.** Patient has tried oral acetazolamide therapy (e.g., Diamox tablets, Diamox Sequels extended-release capsules, generics); AND
- **v.** According to the prescriber, acetazolamide therapy did not worsen the paralytic attack frequency or severity in the patient; AND
- **vi.** Keveyis is prescribed by or in consultation with a neurologist or a physician who specializes in the care of patients with primary periodic paralysis (e.g., muscle disease specialist, physiatrist).

B) Patients Continuing Therapy. Approve for 1 year if the patient has responded to Keveyis (e.g., decrease in the frequency or severity of paralytic attacks) as determined by the prescriber.

25. Hyperkalemic Periodic Paralysis (HyperPP) and Related Variants.

A) Initial Therapy. Approve for 2 months if the patient meets the following criteria (i, ii, iii, iv and v):

- **i.** Patient has a confirmed diagnosis of primary hyperkalemic periodic paralysis by meeting at least ONE of the following criteria (a, b, c, or d):
  - **a)** Patient has had an increase from baseline in serum potassium concentration of greater than or equal to 1.5 mEq/L during a paralytic attack; OR
  - **b)** Patient has had a serum potassium concentration during a paralytic attack of greater than 5.0 mEq/L; OR
  - **c)** Patient has a family history of the condition; OR
  - **d)** Patient has a genetically confirmed skeletal muscle sodium channel mutation; AND
- **ii.** The prescriber has excluded other reasons for acquired hyperkalemia (e.g., drug abuse, renal and adrenal dysfunction); AND
- **iii.** Patient has tried oral acetazolamide therapy (e.g., Diamox tablets, Diamox Sequels extended-release capsules, generics); AND
- **iv.** According to the prescriber, acetazolamide therapy did not worsen the paralytic attack frequency or severity in the patient; AND
- **v.** Keveyis is prescribed by or in consultation with a neurologist or a physician who specializes in the care of patients with primary periodic paralysis (e.g., muscle disease specialist, physiatrist).

B) Patients Continuing Therapy. Approve for 1 year if the patient has responded to Keveyis (e.g., decrease in the frequency or severity of paralytic attacks) as determined by the prescriber.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Keveyis has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

231. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Lidocaine Patch Prior Authorization Policy

- Lidoderm® (lidocaine 5% patch – Endo Pharmaceuticals, generics)
- ZTlido™ (lidocaine 1.8% topical system – Scilex)

REVIEW DATE: 08/19/2020

OVERVIEW

Lidocaine 5% patch and ZTlido are indicated for the relief of pain associated with postherpetic neuralgia (PHN).[1,2]

Lidocaine is an amide-type local anesthetic agent whose neuronal membrane stabilizing effect produces a local analgesic effect when applied transdermally.[1,2] The lidocaine penetration into intact skin is adequate to produce an analgesic effect, but less than the amount needed to produce a complete sensory block. In a single-dose, crossover study in healthy volunteers, ZTlido demonstrated equivalent exposure and peak concentration of lidocaine to lidocaine patch 5% (Lidoderm, generics).[2]

Other Uses with Supportive Evidence

Lidocaine 5% patches have been shown to be effective in treating low back pain in open-label studies in patients not achieving adequate pain relief despite as needed or stable doses of non-selective nonsteroidal

anti-inflammatory drugs (NSAIDs), cyclooxygenase-2 (COX-2) inhibitors, gabapentin, tramadol, or opioids.[3-5] The guidelines for treatment of low back pain (2017) do not address the use of topical lidocaine; however, various other agents are used for pain associated with low back pain.[6] In patients with acute or subacute low back pain, the guidelines recommend NSAIDs or skeletal muscle relaxants as pharmacologic treatment options (strong recommendation; moderate-quality evidence). In patients with chronic low back pain who have had an inadequate response to nonpharmacologic therapy, the guidelines recommend consideration of pharmacologic treatment with NSAIDs as first-line therapy or tramadol or duloxetine as second-line therapy. Of note, tramadol is a narcotic and, like other opioids, is associated with the risk for abuse. Clinicians should only consider opioids as an option in patients who have failed the aforementioned treatments and only if the potential benefits outweigh the risks for individual patients and after a discussion of known risks and realistic benefits with patients (weak recommendation; moderate-quality evidence). Moderate-quality evidence showed no difference in pain between tricyclic antidepressants (TCAs) or selective serotonin reuptake inhibitors (SSRIs) vs. placebo, and low-quality evidence showed no differences in function for antidepressants. Moderate-quality evidence showed that duloxetine was associated with a small improvement in pain intensity and function vs. placebo.

Lidocaine 5% patch has been shown to be effective in treating neuropathic pain of various forms and etiologies as monotherapy and, more commonly, as adjunctive therapy to a stable analgesic regimen.[3,7-14] There is evidence to suggest that lidocaine 5% patch, along with several other analgesics (i.e., opioids, tramadol, TCAs), can be effective as first-line therapy in the management of neuropathic pain.[12] The 2011 evidence-based guideline on treatment of painful diabetic neuropathy, published by the American Academy of Neurology (AAN), indicates the lidocaine 5% patch may be considered for the treatment of painful diabetic neuropathy.[15] Recommendations for the pharmacological management of neuropathic pain, published by the Mayo Foundation, indicate that lidocaine 5% patch has shown efficacy in patients with varying types of neuropathic pain, and are considered a first-line therapy.[16]

Several open-label trials have shown lidocaine 5% patches to be effective in treating pain associated with osteoarthritis of the knee both as monotherapy and in combination with other analgesics (e.g., NSAIDs, COX-2 inhibitors, opioids, tramadol, acetaminophen).[17-20] In one open-label comparative trial (prematurely terminated before enrollment goals were achieved due to safety concerns surrounding the entire COX-2 class),[21] treatment of knee osteoarthritis with lidocaine 5% patches (1 ⅓ patches applied every 24 hours) resulted in comparable reductions in pain intensity scores as celecoxib 200 mg/day.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of lidocaine patches. All approvals are provided for the duration noted below.

Automation: When available, the ICD-10 codes for postherpetic polyneuropathy (B02.23) will be used as part of automation to allow approval of the requested medication.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of lidocaine patches is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Postherpetic Neuralgia (PHN).** Approve for 3 years.

Other Uses with Supportive Evidence

2. **Low Back Pain.** Approve for 3 years after trying at least three pharmacologic therapies with each one from a different class of medication used to treat low back pain.
   Note: Examples of different classes of pharmacologic therapies for low back pain include acetaminophen, nonsteroidal anti-inflammatory drugs, muscle relaxants, celecoxib, duloxetine, gabapentin. Examples of nonsteroidal anti-inflammatory drugs include etodolac, meloxicam, and nabumetone. Examples of muscle relaxants include carisoprodol, chlorzoxazone, cyclobenzaprine, metaxalone, methocarbamol, and orphenadrine.

3. **Neuropathic Pain.** Approve for 3 years.
   Note: For neuropathic pain due to radiculopathy or sciatica, please refer to the Not Recommended for Approval section for Radiculopathy or Sciatica.

4. **Osteoarthritis.** Approve for 3 years after trying at least three pharmacologic therapies with each one from a different class of medication used for the treatment of osteoarthritis.
   Note: Examples of different classes of pharmacologic therapies for osteoarthritis include acetaminophen, celecoxib, nonsteroidal anti-inflammatory drugs, salicylates, intraarticular glucocorticoids, intraarticular hyaluronan, topical capsaicin, and topical methylsalicylate.[22] Examples of nonsteroidal anti-inflammatory drugs include etodolac, meloxicam, and nabumetone.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Coverage of lidocaine patches is not recommended in the following situations:

232. **Carpal Tunnel Syndrome.** Two open-label trials have investigated the lidocaine 5% patch for the relief of pain associated with carpal tunnel symdrome.[23,24] In an open-label, parallel-group, single-center, active-controlled trial,[23] 40 patients with carpal tunnel syndrome were randomized to daily treatment with lidocaine patch 5% or an injection of lidocaine 1% plus methylprednisolone. After 4 weeks of treatment, both groups reported statistically significant improvement in pain scores. A 6-week, randomized, parallel-group, open-label multicenter study[24] found that lidocaine 5% patches given every 24 hours and naproxen 500 mg twice daily both led to significant reductions is the Average Pain Intensity scores in 100 patients with carpal tunnel syndrome. The 2016 American Academy of Orthopaedic Surgeons (AAOS) guidelines on carpal tunnel syndrome do not mention topical lidocaine in their recommendations for treatment.[25] In addition, the AAOS guidelines have a supplemental evidence table that addresses the studies AAOS evaluated for their guidelines. This table states that the above-referenced articles were excluded from their guidelines because they used non-validated outcome measures.

233. **Fibromyalgia.** There are no data available on the use of lidocaine patches in treating pain associated with fibromyalgia.

234. **Myofascial Pain as Adjunctive Therapy.** Published data are limited to small ($n \leq 60$ in each study) studies of lidocaine 5% patches.[26-29] Larger, controlled studies are needed to fully determine the place in therapy of lidocaine patches for the treatment of myofascial pain.

235. **Pain Associated with Rib Fractures.** Lidocaine 5% patch did not significantly improve pain control in patients with traumatic rib fractures in one randomized, double-blind, placebo-controlled study.[30] A

retrospective chart analysis found lidocaine patches decreased pain scores in 29 patients with rib fractures vs. 29 matched controls, with no change in narcotic use and no difference in time to return to baseline activity.[31] A small (n = 44) double-blind, placebo-controlled study in hospitalized patients with traumatic rib fracture in Taiwan found that lidocaine 5% patch decreased pain scores after Day 5 of therapy vs. placebo, with no difference in oral opioid use but decreased meperidine injection use.[32] Larger, controlled studies are needed to fully determine the place in therapy of lidocaine 5% patch for the treatment of pain associated with rib fractures.

236. Radiculopathy. Published data on the use of lidocaine patches in treating pain associated with radiculopathy is limited.[11,33] Larger, controlled studies are needed to fully determine the place in therapy of lidocaine patches for the treatment of radiculopathy.

237. Rheumatoid Arthritis (RA). There are no data available on the use of lidocaine patches in treating pain associated with RA.

238. Sciatica. There are no data available on the use of lidocaine patches in treating pain associated with sciatica.

239. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Lipodystrophy – Egrifta® (tesamorelin injection – EMD Serono)

DATE REVIEWED: 04/15/2020

OVERVIEW

Egrifta is an analog of human growth hormone-releasing factor (GRF), indicated for the reduction of excess abdominal fat in human immunodeficiency virus (HIV)-infected patients with lipodystrophy.[1-3] At this time, the long-term cardiovascular (CV) safety and potential long-term CV benefit are not established and careful consideration should be given to continue Egrifta in patients who do not show a clear efficacy response, as judged by the degree of reduction in visceral adipose tissue.[1] Egrifta has a weight-neutral effect and is not indicated for weight loss management. There are no data supporting improved compliance with anti-retroviral therapies in HIV-positive patients who take Egrifta. In the pivotal trial, all patients had lipodystrophy and excess abdominal fat, evidenced by a waist circumference ≥ 95 cm (≥ 94 cm for women) and a waist-to-hip ratio ≥ 0.94 (≥ 0.88 for women). Patients were required to be on a stable antiretroviral regimen for at least 8 weeks. Safety and effectiveness of Egrifta have been established in patients between the ages of 18 and 65 years of age.

Disease Overview

Lipodystrophy is the change in body fat which affects some patients with HIV infection, either due HIV infection or due to medication to treat HIV.[5] Egrifta binds and stimulates human GRF receptors with similar potency as endogenous GRF. GRF stimulates the synthesis and pulsatile release of endogenous growth hormone (GH), which is both anabolic and lipolytic. GH exerts its effect by interacting with receptors on a variety of target cells resulting in the pharmacodynamic effect. A decrease in nocturnal secretion of GH and insulin-like growth factor 1 (IGF-1) is associated with increased visceral adipose tissue (VAT) in patients with HIV-associated lipodystrophy.[2] Egrifta increases secretion of GH and has been shown to decrease VAT and spare subcutaneous adipose tissue (SAT).[3-4] Egrifta is contraindicated in patients with disruption of the hypothalamic-pituitary axis due to hypophysectomy, hypopituitarism, pituitary tumor or surgery, head irradiation, or head trauma; patients with known hypersensitivity to Egrifta or mannitol; pregnant women; and in patients with an active malignancy.[1] Any pre-existing malignancy should be inactive; patients should complete treatment prior to beginning Egrifta.

Other Therapies

There are no other therapies approved specifically for treatment of HIV-associated lipodystrophy and treatment options are limited.[5-6] Administration of GH has demonstrated a significant decrease in VAT, but also a decrease in SAT, compared with placebo.[7] Management strategies for lipodystrophy include: switching antiretroviral therapy, exercise and diet, cosmetic procedures (e.g., liposuction, facial fillers), and prevention of lipodystrophy by selection of regimens less likely to cause lipohypertrophy.[6]

Safety

Because the long-term CV safety and potential long-term CV benefit are not established, careful consideration should be given whether to continue Egrifta treatment in patients who do not show a clear efficacy response, as judged by the degree of reduction in visceral adipose tissue measured by waist circumference or CT scan. In the pivotal studies, efficacy of Egrifta was assessed at Week 26. Because Egrifta induces the release of endogenous GH (a known growth factor) and increases serum IGF-1, the benefits of treatment should be weighed against the increased risk of malignancies in HIV-positive patients. Since the effect of prolonged IGF-1 elevations on the development or progression of malignancies is unknown, monitor IGF-1 levels closely during Egrifta therapy and consider discontinuation in patients with persistent elevations of IGF-1 levels (e.g., > 3 standard deviation scores [SDS]), especially if the patient has not experienced a robust response. Egrifta should be used with caution in patients who develop glucose intolerance or diabetes; discontinuation of therapy should be considered for patients who do not show a clear efficacy response.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Egrifta. Because of the specialized skills required for evaluation and diagnosis of patients treated with Egrifta as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Egrifta to be prescribed by or in consultation with a physician who specializes in the condition being treated. In the approval indication, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: men are defined as individuals with the biological traits of a man, regardless of the individual's gender identity or gender expression. When approvals are authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Egrifta is recommended in those who meet the following criteria:

FDA-Approved Indications

E) Lipodystrophy in Human Immunodeficiency Virus (HIV)-Infected Patients. Approve for the duration noted if the patient meets ONE of the following (A or B):

- **A)** Initial Therapy. Approve for 6 months if the patient meets ALL of the following criteria (i, ii, iii, iv, and v):
  - **iv.** The patient is ≥ 18 years of age; AND
  - **v.** Egrifta is prescribed for the reduction of excess abdominal fat; AND
  - **vi.** The patient meets ONE of the following (1 or 2):
    - **a)** If male*, waist circumference is ≥ 95 cm (37.4 in) and waist-to-hip ratio is ≥ 0.94; OR
    - **b)** If female*, waist circumference is ≥ 94 cm (37 in) and waist-to-hip ratio is ≥ 0.88; AND
  - **vii.** The patient has been stable on an anti-retroviral regimen for at least 8 weeks.

Note: Examples include antiretroviral regimens containing protease inhibitors, nucleoside reverse-transcriptase inhibitors, and/or nonnucleoside reverse-transcriptase inhibitors; AND

viii. Egrifta is prescribed by or in consultation with an endocrinologist or a physician specializing in the treatment of human immunodeficiency virus (HIV) infection (e.g., infectious disease [ID], oncology).

D) Patient is Currently Receiving Egrifta. Approve for 1 year if the patient has responded, as determined by the prescriber.

Note: Examples of a response include reduction in visceral adipose tissue measured by waist circumference or computed tomography (CT) scan.

***** Refer to the Policy Statement.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Egrifta has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

240. Abdominal Obesity in Patients without Human Immunodeficiency Virus (HIV) Infection. More data are needed. Egrifta has been studied in a very limited number patients who have abdominal obesity without HIV infection.[8] To be eligible for the published trial, patients were required to have a peak stimulated GH no higher than 9 µg/L on a standardized GH-releasing hormone (GHRH)-arginine stimulation test. Patients (n = 60) were randomized in a 1:1 ratio to treatment with Egrifta 2 mg once daily (QD) or placebo. The primary endpoint was the change in VAT from baseline. Over 12 months (using last observation carried forward [LOCF]), VAT improved significantly in patients treated with Egrifta compared with placebo (net treatment effect vs. placebo: -35 [95% confidence interval {CI}: -58, -12]; P = 0.003). Treatment with Egrifta increased IGF-1 by 90%, decreased triglycerides by 20%, and decreased log C-reactive protein (CRP) by 24% compared with placebo. There was no effect on total cholesterol, high-density lipoprotein cholesterol (HDL-C), or low-density lipoprotein cholesterol (LDL-C) in the treatment groups.

241. Human Immunodeficiency Virus (HIV)-Related Cachexia, Weight Loss, or Fat Distribution other than Lipodystrophy. Egrifta has not been studied in these conditions.

242. Patients > 65 Years of Age. There is no information on the use of Egrifta in patients greater than 65 years of age with HIV and lipodystrophy.[1]

243. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Lipodystrophy – Myalept® (metreleptin for subcutaneous injection – Aegerion)

REVIEW DATE: 09/25/2019

OVERVIEW

Myalept, a recombinant analog of human leptin, is indicated as an adjunct to diet as replacement therapy to treat complications of leptin deficiency in patients with congenital or acquired generalized lipodystrophy.[1] Limitations of Use: The safety and efficacy of Myalept have not been established for the treatment of complications of partial lipodystrophy, liver disease (including nonalcoholic steatophepatitis [NASH], human immunodeficiency virus (HIV)-related lipodystrophy, or metabolic disease without concurrent evidence of generalized lipodystrophy.

Disease Overview

Generalized lipodystrophy is a rare, "ultra-orphan", chronic, heterogeneous, and life-threatening disorder in which there is an abnormality of adipose tissue distribution and insufficient fat tissue, which is required for normal metabolic function.[2] Robust epidemiological data are not available. Approximately 400 cases of generalized lipodystrophy have been reported in the literature.[2-3] A recent publication estimates the prevalence of all types of lipodystrophy to be between 1.3 and 4.7 cases per million based on available literature, with the prevalence of generalized lipodystrophy estimated to be much lower at approximately 0.23 cases per million.[24] Although there is heterogeneity in the lipodystrophy syndromes, all share the feature of subcutaneous (SC) adipose tissue loss resulting in more severe metabolic abnormalities (e.g., diabetes mellitus and hypertriglyceridemia) than generally noted with obesity.[4-5]

Guidelines

Guidelines on the diagnosis and management of lipodystrophy syndromes were published in 2016 and endorsed by multiple groups of endocrine experts, including the Endocrine Society, the Pediatric Endocrine Society, the American Diabetes Association, and the American Association of Clinical Endocrinologists.[7]

These guidelines note that lipodystrophy is an incurable condition and no treatment will regrow adipose tissue. Myalept is the only drug specifically indicated for the treatment of lipodystrophy. Myalept, along with diet, is recommended as the first-line treatment for metabolic and endocrine abnormalities in patients with generalized lipodystrophy (Class I, Level B). In children, Myalept may also be used to prevent the development of comorbidities (Class IIb, Level C). While not FDA-approved for use in patients with partial lipodystrophy, the guidelines state that Myalept may be used in this setting, if the patient is hypoleptinemic (leptin < 4 ng/mL) and has a glycosylated hemoglobin (HbA1c) > 8% and/or triglycerides > 500 mg/dL (Class IIb, Level B); although it is noted that response to

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Myalept. Because of the specialized skills required for evaluation and diagnosis of patients treated with Myalept, as well as the monitoring required for AEs and long-term efficacy, approval requires Myalept to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for 3 years in duration unless otherwise noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Myalept is recommended in those who meet the following criteria:

FDA-Approved Indications

26. Generalized Lipodystrophy (Congenital or Acquired): Approve Myalept for 3 years in patients with generalized lipodystrophy if the medication is prescribed by, or in consultation with, an endocrinologist or a geneticist physician specialist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Myalept has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

244. General Obesity not associated with Congenital Leptin Deficiency: Myalept is contraindicated in patients with general obesity not associated with congenital leptin deficiency.[1] Myalept was previously evaluated in two clinical development programs for obesity, both as monotherapy (n > 1,100) and in combination with Symlin® (pramlintide acetate for injection; n > 600).[4] Published studies on the effects of leptin therapy in these patients without leptin deficiency yielded conflicting efficacy results.[8-9] The studies involving obese patients (some with type 2 diabetes mellitus), with the exception of one dose-escalation trial, failed to show significant weight loss with Myalept therapy and resulted in clinically insignificant changes in other metabolic parameters, such as insulin sensitivity.[10-14] One additional randomized, double-blind, placebo-controlled crossover study evaluated the efficacy of leptin administration to promote further weight reduction in patients who had undergone Roux-en-Y gastric bypass surgery.[20] Following 16 weeks of therapy, Myalept was not found to promote additional decreases in body weight compared with placebo.

245. Human Immunodeficiency Virus (HIV)-related Lipodystrophy. Myalept is not indicated for the treatment of patients with HIV-related lipodystrophy.[1] Results from four small studies of patients with HIV-associated lipodystrophy and leptin deficiency showed mixed results with Myalept therapy.[15-18] One study found significantly improved fasting insulin levels, insulin resistance and high-density lipoprotein (HDL) levels, but no significant differences in fasting glucose levels, free-fatty acid levels, or low-density lipoprotein (LDL) levels when Myalept was compared with placebo.[15] Another demonstrated improved fasting insulin levels, but no difference in intravenous glucose disappearance, fasting serum glucose concentration, glycosylated hemoglobin (HbA_{1C}) levels, body mass index (BMI), or lipid parameters after treatment with Myalept.[16] Two additional studies found that therapy with Myalept improved some, but not all metabolic parameters in patients infected with HIV.[17-18] More

information is needed to determine if Myalept is a safe and effective treatment for HIV-related lipodystrophy.

246. Partial Lipodystrophy. The safety and efficacy of Myalept in the treatment of the complications of partial lipodystrophy have not been established.[1] The effects of Myalept therapy in patients with partial lipodystrophy have been evaluated; the pivotal trial of Myalept included a subset of patients (n = 24) with partial lipodystrophy.[19] Overall, patients with partial lipodystrophy had milder baseline metabolic abnormalities than patients with generalized lipodystrophy. Following 12 months of Myalept therapy, patients experienced a reduction in HbA_{1C}, fasting plasma glucose, and fasting triglycerides; however, the magnitude of the improvements was less than those observed in patients with generalized lipodystrophy. There are data showing sustained improvements out to 36 months as well.[25] Additional data also highlight the heterogeneity of partial lipodystrophy; Myalept may provide improvement in some metabolic parameters in certain patients with partial lipodystrophy, but more data are needed to confirm these benefits.[21-23] Current lipodystrophy guidelines (2016) outline certain patients with partial lipodystrophy that may benefit from Myalept therapy, but indicate a lower level of evidence to support use in this patient population compared with generalized lipodystrophy.[7] Myalept prescribing information continues to list partial lipodystrophy as a limitation of use.[1]

247. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Lucemyra Prior Authorization Policy
- Lycemyra™ (lofexidine tablets – US WorldMeds)

REVIEW DATE: 07/22/2020

OVERVIEW

Lucemyra, a central alpha-2 adrenergic agonist, is indicated for mitigation of opioid withdrawal symptoms to facilitate abrupt opioid discontinuation in adults.[1] The usual Lucemyra starting dosage is 0.54 mg (three 0.18 mg tablets) four times daily (QID) during the period of peak withdrawal symptoms (generally the first

5 to 7 days following last use of opioid) with dosing guided by symptoms and adverse events. There should be 5 to 6 hours between each dose. The total daily dosage of Lucemyra should not exceed 2.88 mg (16 tablets), and no single dose should exceed 0.72 mg (four tablets). Lucemyra treatment may continue for up to 14 days with dosing guided by symptoms. Discontinue Lucemyra with a gradual dose reduction over a 2- to 4-day period to mitigate Lucemyra withdrawal symptoms (e.g., reducing by one tablet per dose every 1 to 2 days). The Lucemyra dose should be reduced, held, or discontinued for individuals who demonstrate a greater sensitivity to Lucemyra adverse events. Lower doses may be appropriate as opioid withdrawal symptoms wane. Lucemyra can be administered in the presence or absence of food. Dosage adjustments are recommended for patients with hepatic or renal impairment. In the pivotal trials for Lucemyra, patients also had access to a variety of support medications for withdrawal symptoms (e.g., guaifenesin, antacids, docusate sodium, psyllium, bismuth sulfate, acetaminophen, and zolpidem).

Clonidine is not approved by the FDA for use in opioid withdrawal but it has been extensively studied and used for this indication outside the US.[2,3] Clonidine reduces withdrawal symptoms such as nausea, vomiting, diarrhea, cramps, and sweating. Doses of 0.1 mg to 0.3 mg every 6 to 8 hours, to a maximum dose of 1.2 mg/day, may be used to assist in the management of opioid withdrawal symptoms. As with Lucemyra, clonidine can be combined with other non-narcotic medications targeting specific opioid withdrawal symptoms such as benzodiazepines for anxiety, loperamide for diarrhea, acetaminophen or nonsteroidal anti-inflammatory drugs (NSAIDs) for pain, and ondansetron or other agents for nausea.

Disease Overview

Opioid addiction (or opioid use disorder) is a primary, chronic and relapsing central nervous system (CNS) disease of brain reward, motivation, memory, and related circuitry characterized by an individual pathologically pursuing reward and/or relief by substance use and other behaviors.[4] Since the 1990s, opioid use and abuse have risen markedly in the US.[5] Symptoms of opioid withdrawal include the following: autonomic (diarrhea, rhinorrhea, diaphoresis, lacrimation, shivering, nausea, emesis, piloerection); CNS arousal (sleeplessness, restlessness, tremors); pain (abdominal cramping, bone pains, diffuse muscle aching); and craving for the opioid medication. Symptoms of opioid withdrawal usually begin two to three half-lives after the last opioid dose (6 to 12 hours for short half-life opioids such as heroin and morphine and 36 to 48 hours for long half-life opioids such as methadone).[6] Following cessation of a short half-life opioid, symptoms reach peak intensity within 2 to 4 days, with most of the physical withdrawal signs no longer apparent after 7 to 14 days. As with the onset of withdrawal, the duration also varies with the half-life of the opioid used and the duration of use. While opioid withdrawal is rarely life-threatening, the combination of uncomfortable symptoms and intense craving makes completion of withdrawal difficult for most people.

Guidelines

The American Psychiatric Association (APA) practice guideline for the treatment of patients with substance use disorders (2006) notes several strategies as effective treatments for opioid dependence including the abrupt discontinuation of the opioid with the use of clonidine to suppress withdrawal symptoms and clonidine-naltrexone detoxification, where withdrawal symptoms are precipitated by naltrexone and then suppressed by clonidine.[2] The guidelines note that the completion rate for clonidine-treated outpatients is relatively low and roughly comparable to that of methadone withdrawal.

The American Society of Addiction Medicine (ASAM) practice guideline for the treatment of opioid use disorder (2020) discusses two primary strategies for the management of opioid withdrawal.[3] In one strategy, alpha-2 adrenergic agonists (i.e., clonidine, Lucemyra) are used along with other non-narcotic medications to reduce withdrawal symptoms. The use of non-opioid medications may be the only option available in some healthcare settings and may also assist the transition of patients to opioid antagonist medications (i.e., naltrexone) helping to prevent subsequent relapse. Comparative data are limited but

Lucemyra and clonidine appear to be similarly effective in the treatment of opioid withdrawal with hypotension occurring less frequently with Lucemyra. While clonidine is not FDA-approved for the treatment of opioid withdrawal, it has been extensively used off-label for this purpose. Clonidine can be combined with other non-narcotic medications targeting specific opioid withdrawal symptoms. ASAM states that alpha-2 adrenergic agonists are safe and effective for management of opioid withdrawal. However, the guideline notes that methadone and buprenorphine are more effective in reducing the symptoms of opioid withdrawal, in retaining patients in withdrawal management, and in supporting the completion of withdrawal management.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Lucemyra. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Lucemyra as well as the monitoring required for adverse events, initial approval requires Lucemyra to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Lucemyra is recommended in those who meet the following criteria:

FDA-Approved Indications

27. Opioid Withdrawal Symptoms. Approve for 2 weeks (14 days) if the patient meets the following criteria (A and B):
- **72.** Lucemyra is being used to facilitate abrupt opioid discontinuation; AND
- **73.** Patient has a history of clonidine use (e.g., patches, tablets) and experienced unacceptable toxicity and/or inadequate efficacy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Lucemyra is not recommended in the following situations:

248. Cannabis Use Disorder (Cannabis Dependence). One published study has evaluated the safety and efficacy of dronabinol and lofexidine in treating cannabis dependence (n = 156).[7] In this 11-week, placebo-controlled study, the combined intervention did not show efficacy as a treatment for cannabis use disorder.

249. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Lyrica® CR (pregabalin extended-release tablets – Pfizer)

DATE REVIEWED: 03/04/2020

OVERVIEW

Lyrica CR is indicated for the management of neuropathic pain associated with diabetic peripheral neuropathy (DPN) and postherpetic neuralgia (PHN).[1] The efficacy of Lyrica CR has not been established for the management of fibromyalgia or as adjunctive therapy for adults with partial onset seizures. Lyrica CR is an analog of the neurotransmitter gamma-aminobutyric acid (GABA). Lyrica CR is dosed once daily (QD), and it is a Schedule V controlled substance.

Gabapentin immediate-release (IR) [Neurontin, generics] is also a GABA analog.[2] Gabapentin is indicated for the management of PHN in adults and as adjunctive therapy in the treatment of partial onset seizures, with and without secondary generalization, in adults and pediatric patients ≥ 3 years of age with epilepsy. Gabapentin IR has been used off-label extensively and is included as a treatment option in various guidelines. Pregabalin immediate-release capsules and oral solution are approved for neuropathic pain associated with DPN, PHN, adjunctive therapy for the treatment of partial onset seizures in patients ≥ 1 month of age, fibromyalgia, and neuropathic pain associated with spinal cord injury.[3] Like Lyrica CR, pregabalin immediate-release is a Schedule V controlled substance.

Disease Overview

These drugs exert their pharmacologic action by binding to the alpha-2-delta subunit of voltage-gated calcium channels.[4] The binding of this subunit reduces the release of several neurotransmitters including glutamate, noradrenaline, and substance P.

PHN is the persistence of the pain of herpes zoster > 3 months after resolution of the rash; it is relatively common, affecting 10 to 15% of those with herpes zoster.[5] The time interval used in the clinical case definition of PHN varies in the literature from 1 to 6 months after resolution of the rash. The incidence of PHN increases with age. The duration of PHN is highly variable; in one longitudinal study, only 48% of patients who developed PHN were symptomatic 1 year after onset. Thus, the natural history of resolution of PHN over time is a confounder in the evaluation of treatment efficacy and may limit the ability to generalize the results of controlled clinical trials in this population. Administration of antiviral agents within 72 hours of the onset of herpes zoster can reduce the intensity and duration of acute illness, and can prevent PHN. Efforts to prevent herpes zoster and PHN are important in that 40% to 50% of patients with PHN do not respond to any treatment.

The diabetic neuropathies are a heterogeneous group of disorders with diverse clinical manifestations.[6] The early recognition and appropriate management of neuropathy in the patient with diabetes is important. Diabetic neuropathy is a diagnosis of exclusion. Up to 50% of diabetic peripheral neuropathy (DPN) may be asymptomatic. Painful diabetic neuropathy (PDN) affects 16% of patients with diabetes, and it is frequently unreported (12.5%) and more frequently untreated (39%).[7] If not recognized and if preventive foot care is not implemented, patients are at risk for injuries to their insensate feet.[6] Recognition and treatment of autonomic neuropathy may improve symptoms, reduce sequelae, and improve quality of life. Glycemic control can effectively prevent DPN in type 1 diabetes and may modestly slow their progression in type 2 diabetes but does not reverse neuronal loss. Therapeutic strategies (pharmacologic and nonpharmacologic) for the relief of painful DPN can potentially reduce pain and improve quality of life.

Clinical Efficacy

Support for the efficacy of Lyrica CR for the management of PHN and DPN was based on the efficacy of IR Lyrica for these indications, along with one study of Lyrica CR in adults with PHN.[1] This 19-week, randomized, withdrawal study compared Lyrica CR 82.5 mg, 165 mg, 247.5 mg, 330 mg, 495 mg, or 660 mg QD with placebo. Those enrolled were required to have pain present for > 3 months after healing of the herpes zoster skin rash and a baseline pain score ≥ 4 on the numeric rating scale (NRS)-Pain (assessed over a 1 week recall period). Patients who responded to treatment in the single-blind phase of the study (≥ 50% reduction in pain) moved into the double-blind phase and were randomized to the Lyrica CR dose achieved in the single-blind phase or placebo. Patients were treated for ≤ 3 months following randomization. Lyrica CR demonstrated statistically significant improvement in the efficacy endpoint of change in mean pain score from baseline compared with placebo. In the Lyrica CR arm, 80% of patients achieved ≥ 30% improvement and 74% of patients achieved ≥ 50% improvement in pain intensity. In the placebo group, 65% of patients achieved ≥ 30% improvement and 55% of patients achieved ≥ 50% improvement in pain intensity.

Guidelines

Various guidelines for the treatment of DPN, neuropathic pain, PHN, and restless legs syndrome recommend gabapentin or pregabalin immediate-release as treatment options.[5-14] Guidelines have not been updated to address Lyrica CR.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Lyrica CR. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Lyrica CR is recommended in those who meet the following criteria:

FDA-Approved Indications

28. Neuropathic Pain Associated with Diabetic Peripheral Neuropathy (DPN). Approve Lyrica CR for 1 year if the patient the patient meets ONE of the following criteria (A or B):

A) Patient has tried gabapentin immediate-release (brand [Neurontin] or generic) or generic pregabalin; OR

B) Patient is currently established on therapy with Lyrica CR.

29. Postherpetic Neuralgia. Approve Lyrica CR for 1 year if the patient meets ONE of the following criteria (A or B):
A) Patient has tried gabapentin immediate-release (brand [Neurontin] or generic) or generic pregabalin; OR
B) Patient is currently established on therapy with Lyrica CR.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Lyrica CR has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

250. Fibromyalgia. A double-blind, placebo-controlled, randomized withdrawal trial of Lyrica CR in adults with fibromyalgia failed to demonstrate efficacy.[1]

251. Partial Onset Seizures. A double-blind, placebo-controlled, randomized trial of Lyrica CR as adjunctive therapy in adults with partial onset seizures failed to demonstrate efficacy.[1]

252. Restless Legs Syndrome. No data are available for Lyrica CR for the treatment of restless legs at this time.

253. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Makena® (hydroxyprogesterone caproate injection [subcutaneous and intramuscular] – AMAG, Pharmaceuticals, Inc.; generics [intramuscular only])

REVIEW DATE: 09/04/2019

OVERVIEW

Makena is an injectable progestin indicated to reduce the risk of preterm birth in women with a singleton pregnancy who have a history of singleton spontaneous preterm birth (SPTB).[1] The effectiveness of Makena is based on improvement in the proportion of women who delivered < 37 weeks of gestation. There are no clinical trials demonstrating a direct clinical benefit, such as improvement in neonatal mortality and morbidity. Limitations of Use: While there are many risk factors for preterm birth, safety and efficacy of Makena has been demonstrated only in women with a prior spontaneous singleton preterm birth. It is not intended for use in women with multiple gestations or other risk factors for preterm birth. Makena is administered by the intramuscular route (IM) at a dose of 250 mg (1 mL) once weekly or by the subcutaneous (SC) route using an auto-injector at a dose of 275 mg (1.1 mL) once weekly; both products require administration by a healthcare professional. Generic Makena, hydroxyprogesterone caproate injection, is available for IM administration only. Makena should be administered beginning between 16 weeks, 0 days and 20 weeks, 6 days gestation and continued once weekly until week 37 (through 36 weeks, 6 days) of gestation or delivery, whichever occurs first.

The efficacy and safety of Makena was established in one randomized, double-blind, multicenter, vehicle-controlled, pivotal study in women between the ages of 16 and 43 years.[1] Women were pregnant with a singleton pregnancy with a documented history of singleton SPTB, defined as delivery < 37 weeks gestation following spontaneous preterm labor or premature rupture of membranes (PROM). Major exclusion criteria included a pregnancy with multiple gestations. Patients were randomized between 16 weeks, 0 days gestation and 20 weeks, 6 days gestation. The primary endpoint was the proportion of women in each treatment arm who delivered at < 37 weeks gestation. The study took place in the US and was conducted with an investigational formulation of hydroxyprogesterone caproate identical to Makena.[2-3] Patients were assigned to treatment with Makena, 250 mg in 1 mL (n = 310), or vehicle (castor oil) [n = 153] in a 2:1 ratio.

There was a statistically significant reduction in the rate of delivery before 37 weeks gestation in patients treated with Makena compared with vehicle. The rates of delivery prior to Week 37 were similar for Black and non-Black women.[2-3] Among women of similar risk, the number-needed-to-treat (NNT) was 5 to 6 women (95% confidence interval [CI]: 3.6, 11.1) to prevent one preterm delivery prior to 37 weeks gestation. Patients treated with Makena also had statistically significant reductions in the rates of delivery prior to 35 weeks and 32 weeks gestation. A small increase in the rate of miscarriage and stillbirth occurred in the Makena group; however, this difference was not statistically significant compared with the patients treated with vehicle.

The approval of Makena for SC use was based on usability studies and one pharmacokinetic study that confirmed bioequivalence between the IM dosing regimen and the SC dosing regimen.[4]

Guidelines

The Society for Maternal-Fetal Medicine (SMFM) published guidelines (2012, reaffirmed 2014) regarding the use of progesterone in preterm birth prevention.[5] Intramuscular 17 alpha hydroxyprogesterone caproate (17P) is recommended for use in women with singleton pregnancy with prior history of spontaneous preterm birth (approved indication). A SMFM statement (2017) continued to recommend all women with a prior spontaneous preterm birth of a singleton pregnancy be offered 17P therapy in subsequent pregnancy with a singleton gestation.[6] Also included in this statement are discussions about women with a prior SPTB who start 17P and subsequently develop cervical shortening. It is unknown whether there is any benefit to change progestogen to vaginal progesterone (with or without cervical cerclage placement) in this circumstance. Based on data regarding the lack of benefit of vaginal progesterone in women with a history of a prior SPTB, the SMFM recommends the continuation of 17P in women with a history of a prior SPTB throughout pregnancy despite the development of cervical shortening (with or without cervical cerclage placement).[6]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Makena (and generics). All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Makena (SC or IM administration) and generics are recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Reduce Risk of Preterm Birth.** Approve for up to 5 months of therapy (21 injections) in patients who meet the following criteria (A, B, and C):
   - **A)** Patient is pregnant with a singleton pregnancy; AND
   - **B)** Patient has a history of singleton spontaneous preterm birth (SPTB) prior to 37 weeks gestation; AND
   - **C)** Treatment will begin in patients who are at least 16 weeks, 0 days of gestation, according to the prescribing physician or other prescriber.

   NOTE: In cases where there was an inaccuracy in dating the pregnancy, a one-month authorization may be granted to patients who have already received 21 injections and are < 37 weeks pregnant.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Makena (SC or IM) has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

1. **History of a Threatened Preterm Birth.** Makena is not indicated in pregnant women who experienced a past threatened preterm birth but delivered a full-term infant after 36 completed weeks gestation.[1]

2. **Infertility.** Some studies have evaluated hydroxyprogesterone caproate as the progesterone used for *in vitro* fertilization.[7-8] However, progesterone in oil or vaginally administered progesterone are mentioned for use during the luteal phase and in early pregnancy in the treatment of infertility by an educational bulletin by the Practice Committee of the American Society of Reproductive Medicine.[9]

3. **Patients Pregnant with Multiple Gestations.** Makena is not indicated in patients pregnant with multiple gestations (e.g., twins, triplets, or other multiples).[1] Hydroxyprogesterone caproate has failed to decrease preterm birth in women pregnant with twins and triplets.[10-12] In a randomized, double-blind, placebo-controlled study in 661 women, delivery or fetal death prior to Week 35 occurred in 41.5% of women pregnant with twins in the hydroxyprogesterone caproate group compared to 37.3% of those pregnant with twins in the placebo group (relative risk [RR]: 1.1; 95% CI: 0.9, 1.5).[10] In a randomized, double-blind, placebo-controlled study in women pregnant with triplets (n = 134), treatment with hydroxyprogesterone caproate did not affect the rate of delivery or fetal loss prior to Week 35 (RR: 1.0; 95% CI: 0.9, 1.1).[11] In an another randomized, double-blind, placebo-controlled study, 56 women pregnant with triplets were assigned to treatment with hydroxyprogesterone caproate and 25 women were assigned to placebo.[12] There was not a significant difference in delivery prior to Week 28, 32, or 35 in either treatment group; however, significantly more stillbirths/miscarriages occurred in the hydroxyprogesterone group (8%) compared to no stillbirths/miscarriages in the placebo group (P = 0.01). In one randomized, double-blind, controlled trial in unselected women with twin pregnancies, IM 17P (not Makena; another marketed product in Europe) did not reduce preterm birth before 37 weeks of gestation; however, it did reduce neonatal morbidity parameters and also increased birthweight.[13] Other studies in women with multiple gestations (primarily twin gestations) have not shown a prolonged gestation or a reduction in neonatal morbidity with 17P compared with placebo.[14-16]

4. **Pregnant Patient with Short Cervix Without a History of a Prior Singleton Spontaneous Preterm Birth.** Makena is not indicated for use in pregnant women with short cervix and no history of singleton SPTB prior to 37 weeks gestation. IM 17P is recommended for use in singleton pregnancies with prior spontaneous preterm birth (approved indication).[5,6]

5. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Metabolic Disorders – Carbaglu (carglumic acid tablets for oral suspension – Orphan Europe, SARL/Recordati Rare Diseases)

DATE REVIEWED: 03/11/2020

OVERVIEW

Carbaglu is indicated in pediatric and adult patients, both as an adjunctive therapy for the treatment of acute hyperammonemia, and for maintenance therapy for chronic hyperammonemia, due to the deficiency of the hepatic enzyme N-acetylglutamate (NAGS). It is a synthetic structural analogue of N-acetylglutamate (NAG) thereby acting as a replacement for NAG in patients with NAGS deficiency. During acute hyperammonia, other therapies, including protein restriction, is recommended. During the maintenance therapy, concomitant use of other ammonia lowering therapies and protein restriction may be needed based on plasma ammonia levels.

Disease Overview

NAGS deficiency is one of the rarest urea cycle disorders.[2-3] NAGS is an enzyme that is located in the liver and intestine, and is essential for the function of the urea cycle. Although NAGS deficiency can be suspected based on patient/family history and high levels of ammonia in the blood, the diagnosis is confirmed by molecular genetic testing.[5] Of note, there are 12 gene mutations that have been identified resulting a NAGS deficiency. The neonatal-onset phenotype usually reflects complete absence of NAGS activity.[2-3] Symptoms result primarily from hyperammonemia. If newborns survive

the acute hyperammonemic episode, they typically go on to exhibit significant developmental delays, residual neurologic impairments, and seizure disorders. The degree of neurologic impairment in urea cycle disorders has been shown to correlate with peak levels of ammonia and the duration of hyperammonemic coma. Late-onset NAGS deficiency has a variable age of onset, and the degree of residual enzyme activity is heterogeneous.

Clinical Efficacy

In the pivotal trial evaluating Carbaglu, all patients had NAGS gene mutations by DNA testing with elevation of baseline ammonia levels prior to initial dose of Carbaglu (range, 72 to 1,428 µmol/L [normal range, 5 to 50 µmol/L]).[1] By Day 3, the mean ammonia level decreased below 50 µmol/L and remained in this range with long-term treatment.

Safety

Carbaglu has a Warning/Precaution for hyperammonemia. Any episode of acute, severe symptomatic hyperammonemia should be treated as a life-threatening emergency. Treatment of severe hyperammonemia may require dialysis, preferably hemodialysis and/or hemofiltration, to reduce plasma ammonia concentration. Untreated hyperammonemia can result in brain damage and death, and prompt use of all therapies necessary to reduce plasma ammonia level is essential.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Carbaglu. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Carbaglu as well as the monitoring required for adverse events and long-term efficacy, approval requires Carbaglu to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Carbaglu is recommended in those who meet the following criteria:

FDA-Approved Indications

123. N-Acetylglutamate Synthase (NAGS) Deficiency with Hyperammonemia. Approve for the duration noted below if the patient meets ALL of the following criteria (A, B, and C):

- **A)** According to the prescriber, diagnosis is supported by one of the following (i or ii):
  - **i.** Approve for 1 year if genetic testing confirmed a mutation leading to N-acetylglutamate synthase deficiency (NAGS); OR
  - **ii.** Approve for 3 months if the patient has hyperammonemia diagnosed with an ammonia level above the upper limit of the normal reference range for the reporting laboratory.
    Note: Reference ranges are dependent upon patient's age; AND
- **B)** The medication is prescribed in conjunction with a protein-restricted diet; AND
- **C)** The medication is prescribed by or in consultation with a metabolic disease specialist (or specialist who focuses in the treatment of metabolic diseases).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Carbaglu has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

117. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Metabolic Disorders – Cystaran (cysteamine 0.44% ophthalmic solution – Leadiant Biosciences)

REVIEW DATE: 03/11/2020

OVERVIEW
Cystaran is a cystine-depleting agent indicated for the treatment of corneal cystine crystal accumulation in patients with cystinosis.[1] The recommended dose is one drop into each every waking hour.

Disease Overview
Cystinosis is a rare autosomal recessive inborn error of metabolism in which the transport of cystine out of lysosomes is abnormal.[2-4] As a result of deficient or absent cystinosin (which normally transports cystine out of the lysosome), cystine accumulates within lysosomes and forms crystals in many tissues, including the kidneys, liver, bone marrow, pancreas, muscle, rectal mucosa, brain and eye. Patients with cystinosis also experience growth failure and rickets, and cystine deposits in the cornea cause photophobia. With time, most organs are damaged. Patients may present only with corneal crystal deposition but no associated systemic manifestations; the kidney, retina, and other organs are free of cystine accumulation in these patients. In patients without systemic symptoms, diagnosis of ocular cystinosis is often in adulthood when corneal crystal deposits are noted on ocular examination.[5] Cystaran is the only approved treatment for corneal cystine crystal accumulation. Of note, with oral cysteamine the concentration obtained in corneal tissue is inadequate and does not affect corneal cystine crystals. Topical treatment is required to dissolve existing cystine crystals.

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of Cystaran. All approvals are provided for the duration noted below. If prescriber specialty is required, add support for this to policy statement. For example: Because of the specialized skills required for evaluation and diagnosis of patients treated with Cystaran as well as the monitoring required for adverse events and long-term efficacy, approval requires Cystaran to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Cystaran is recommended in those who meet the following criteria:

FDA-Approved Indications

124. Cystinosis, Corneal Cysteine Crystal Deposits. Approve for 1 year if the patient meets the following criteria (A and B):

A) The patient has corneal cysteine crystal deposits confirmed by slit-lamp examination; AND

B) The agent is prescribed by or in consultation with an ophthalmologist or a metabolic disease specialist (or specialist who focuses in the treatment of metabolic diseases).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Cystaran has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

118. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Metabolic Disorders – Cysteamine (Oral) Products

- Cystagon (cysteamine bitartrate capsules – Mylan Pharmaceuticals)
- Procysbi (cysteamine bitartrate delayed-release capsule, delayed release granules – Raptor Therapeutics Inc.)

DATE REVIEWED: 03/11/2020

OVERVIEW

Cystagon and Procysbi are cystine-depleting agent indicated for the management of nephropathic cystinosis in adults and children.[1-2] Note that Procysbi is indicated specifically in patients who are 1 year of age and older.[1] Therapy with a cysteamine product should be initiated promptly once the diagnosis is confirmed (i.e., increased white blood cell cystine concentration). Cystagon needs to be administered four times daily, whereas Procysbi (a delayed-release formulation of cysteamine) is given once every 12 hours.[1-2] For patients who are unable to swallow capsules, both products have instructions for opening the capsules and administering in food and/or liquids.

Disease Overview

Cystinosis is a very rare autosomal recessive inborn error of metabolism in which the transport of cystine out of lysosomes is abnormal.[3-5] As a result of deficient or absent cystinosin (which normally transports cystine out of the lysosome), cystine accumulates within lysosomes and forms crystals in many tissues, including the kidneys, liver, bone marrow, pancreas, muscle, rectal mucosa, brain and eye. Diagnosis is confirmed by measuring cystine levels in polymorphonuclear leukocytes.[6] Molecular genetic testing idenitifies a characteristic mutation of the *CTNS* gene. Prenatal diagnosis is possible (i.e., by elevation of cystine in amniotic fluid or chorionic villi). Patients with cystinosis also experience growth

failure and rickets, and cystine deposits in the cornea cause photophobia.[3-5] Over time, most organs are damaged. Cysteamine products are aminothiols that act as cystine-depleting agents.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of cysteamine oral products (Cystagon and Procysbi). All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with cysteamine oral products (Cystagon and Procysbi) as well as the monitoring required for adverse events and long-term efficacy, approval requires cysteamine oral products (Cystagon and Procysbi) to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of cysteamine oral products (Cystagon and Procysbi) is recommended in those who meet the following criteria:

FDA-Approved Indications

125. Cystinosis, Nephropathic. Approve for 1 year if the patient meets the following criteria (A, B, and C):

A) According to the prescriber, the diagnosis was confirmed by one of the following (i or ii):

i. Genetic testing confirmed a mutation of the *CTNS* gene; OR

ii. White blood cell cystine concentration above the upper limit of the normal reference range for the reporting laboratory.

Note: The methods used for measuring cystine vary among individual laboratories and depend upon the assay method used by the individual laboratory; values obtained from using different assay methods may not be interchangeable; AND

B) The patient will not be using Cystagon and Procysbi concurrently; AND

C) The medication is prescribed by or in consultation with a nephrologist or a metabolic disease specialist (or specialist who focuses in the treatment of metabolic diseases).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Cysteamine oral products (Cystagon and Procysbi) have not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

119. Concomitant Therapy with Cystagon and Procysbi. There are no data available to support concomitant use.

120. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Metabolic Disorders – Dojolvi Prior Authorization Policy

- Dojolvi™ (triheptanoin oral liquid – Ultragenyx)

REVIEW DATE: 07/22/2020

OVERVIEW

Dojolvi, a synthetic medium odd-chain triglyceride, is indicated as a source of calories and fatty acids for the treatment of adults and pediatric patients with molecularly confirmed long-chain fatty acid oxidation disorders (LC-FAODs).[1]

For patients receiving another medium-chain triglyceride product, discontinue prior to the first dose of Dojolvi.

Disease Overview

LC-FAODs are a group of autosomal recessive genetic metabolic disorders in which the body is unable to properly oxidize long-chain fatty acid in the mitochondria (normally an important energy pathway when glucose is low).[2,3] The four most commonly affected enzymes are carnitine palmitoyl transferase 2 (CPT-2), very long-chain acyl-CoA dehydrogenase (VLCAD), long-chain 3-hydroxyacyl-CoA dehydrogenase (LCHAD), and mitochondrial trifunctional protein (TFP).[4] Other less common mutations may also occur.[2,4] Onset may occur anywhere from the neonatal period to adulthood. Clinical manifestations are heterogeneous and not well correlated with genotype.[2] Diagnosis of LC-FAODs has increased with the use of routine newborn screening. Newborn screening tests measure acylcarnitines in dried blood spots.[5] Abnormal newborn screening results or the presence of symptoms associated with LC-FAODs warrant further evaluation involving plasma acylcarnitine measurement, enzyme activity assays, and/or genetic testing. The activity of specific enzymes can be measured in lymphocytes or skin fibroblasts since these cells express all enzymes involved in long-chain fatty acid oxidation.[3] Mutation analysis can identify the specific genetic defect. However, new mutations and variants are regularly identified, requiring functional studies such as enzyme activity measurements for confirmation of the diagnosis.

Guidelines

A consensus statement regarding treatment recommendations in LC-FAODs was published in 2009; Dojolvi is not specifically addressed, although medium-chain triglycerides (MCT) are discussed more broadly.[6] Dietary recommendations are provided for VLCAD deficiency but it is noted that these can also be applied to similar disorders, such as CPT-2 deficiency. For symptomatic patients with VLCAD deficiency, long-chain fat content of the diet is suggested to be 25% to 30% of total energy. The diet should be enriched with MCT to provide 20% of total energy from MCT. In asymptomatic VLCAD deficiency, the necessity of dietary long-chain fat restriction is under debate. Per the consensus statement, the current recommendation is to mildly reduce fat content to 30% to 40% of total energy in these patients. However, it is noted that the clinical course is not predictable. Even for patients in whom long-chain triglyceride restriction is deemed unnecessary, MCT supplementation (especially prior to exercise) may still be needed. For LCHAD and TFP deficiency, both symptomatic and asymptomatic patients should follow long-chain fat restriction with MCT supplementation.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Dojolvi. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Dojolvi as well as the monitoring required for adverse events and long-term efficacy, approval requires Dojolvi to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Dojolvi is recommended in those who meet the following criteria:

FDA-Approved Indications

126. Long-Chain Fatty Acid Oxidation Disorders. Approve for 1 year if the patient meets the following criteria (A, B, and C):

A) Patient has a molecularly confirmed diagnosis of a long-chain fatty acid oxidation disorder based on at least TWO of the following (TWO of i, ii, or iii):

i. Disease-specific elevations of acylcarnitines on a newborn blood spot or in plasma; OR

ii. Enzyme activity assay (in cultured fibroblasts or lymphocytes) below the lower limit of the normal reference range for the reporting laboratory; OR
Note: Examples of enzyme assays include carnitine palmitoyl transferase 2 (CPT-2), very long-chain acyl-CoA dehydrogenase (VLCAD), long-chain 3-hydroxyacyl-CoA dehydrogenase (LCHAD), and mitochondrial trifunctional protein (TFP).

iii. Genetic testing demonstrating pathogenic mutation in a gene associated with long-chain fatty acid oxidation disorders; AND
Note: Examples of genes associated with long-chain fatty acid disorders include *CPT2* (encodes CPT-2), *ACADVL* (encodes VLCAD), *HADHA* (encodes LCHAD and TFP), and *HADHB* (encodes TFP).

B) Patient will not use any other medium-chain triglyceride products concomitantly with Dojolvi; AND

C) The medication is prescribed by, or in consultation with, a metabolic disease specialist or a physician who specializes in the management of long-chain fatty acid oxidation disorders.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Dojolvi is not recommended in the following situations:

121. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Metabolic Disorders – Nitisinone Products

- Orfadin (nitisinone capsules and suspension – Sobi, Inc., generic [capsules only])
- Nityr (nitisinone tablets – Cycle Pharmacetuicals)

REVIEW DATE: 10/09/2019

OVERVIEW

Nitisinone products are hydroxy-phenylpyruvate dioxygenase inhibitors indicated for the treatment of adult and pediatric patients with hereditary tyrosinemia type 1 in combination with dietary restriction of tyrosine and phenylalanine.[1-2]

Disease Overview

Hereditary tyrosinemia type 1 is a genetic disorder characterized by elevated blood levels of the amino acid tyrosine.[3-4] It is caused by mutations in the *FAH* gene, which lead to a deficiency of the enzyme fumarylacetoacetate hydrolase that is required for the breakdown of tyrosine. Symptoms usually appear in the first few months after birth and include failure to thrive, diarrhea, vomiting, jaundice, cabbage-like odor, and increased tendency to bleed. Diagnosis is most often via newborn screening (i.e., elevated alpha-fetoprotein and succinylacetone); however, carrier genetic testing and prenatal diagnosis by detection of succinylacetone in the amniotic fluid is also possible. Treatment should be immediately upon diagnosis with a diet restricted in tyrosine and phenylalanine and with nitisinone, which blocks the second step in the tyrosine degradation pathway.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of nitisinone products. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with nitisinone products as well as the monitoring required for adverse events and long-term efficacy, approval requires the agent to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of nitisinone products is recommended in those who meet the following criteria:

FDA-Approved Indications

127. Hereditary Tyrosinemia Type 1. Approve for 1 year if the patient meets the following criteria (A, B, C, and D):

- **A)** According to the prescriber, diagnosis is supported by one of the following (i or ii):
  - **i.** Genetic testing confirmed a mutation of the *FAH* gene; OR
  - **ii.** The patient has elevated serum levels of alpha-fetoprotein (AFP) and succinylacetone; AND
- **B)** The medication is prescribed in conjunction with a tyrosine- and phenylalanine-restricted diet; AND
- **C)** The patient will not be taking the requested agent concurrently with another nitisinone product. Note: Examples of nitisinone products include Orfadin, generic nitisinone capsules, and Nityr. Concurrent use of these agents is not allowed; AND
- **D)** The medication is prescribed by or in consultation with a metabolic disease specialist (or specialist who focuses in the treatment of metabolic diseases).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Nitisinone products have not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

122. Concomitant Therapy with Nitisinone Products. Note: For example, concomitant use of Orfadin, generic nitisinone capsules, and/or Nityr. There are no data available to support concomitant use.

123. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Metabolic Disorders – Phenylbutyrate Products

- Buphenyl (sodium phenylbutyrate tablets and powder for oral solution – Horizon Pharma, generics)
- Ravicti (glycerol phenylbutyrate oral liquid – Horizon Pharma)

DATE REVIEWED: 03/11/2020

OVERVIEW

Buphenyl is indicated as adjunctive therapy in the chronic management of patients with urea cycle disorders involving deficiencies of carbamylphosphate synthetase, ornithine transcarbamylase, or argininosuccinic acid synthetase.[1] It is indicated in all patients with neonatal-onset deficiency (complete enzymatic deficiency, presenting within the first 28 days of life). It is also indicated in patients with late-onset disease (partial enzymatic deficiency, presenting after the first month of life) who have a history of hyperammonemic encephalopathy. Early diagnosis is important so that treatment is initiated early for improved survival. Any episode of acute hyperammonemia should be treated as a life-threatening emergency. Buphenyl must be combined with dietary protein restriction and, in some cases, essential amino acid supplementation. Of note, Buphenyl tablet/powder contains 124 mg of sodium per gram of sodium phenylbutyrate (12.4% w/w) or about 2.5 grams of sodium in 40 tablets; safety or efficacy data unavailable for > 40 tablets/day. Therefore, it should be used with great care, if at all, in patients with congestive heart failure or severe renal insufficiency, and in clinical states in which there is sodium retention with edema.

Ravicti is indicated for use as a nitrogen-binding agent for chronic management patients with urea cycle disorders that cannot be managed by dietary protein restriction and/or amino acid supplementation alone.[2] Ravicti must be used with dietary protein restriction and, in some cases, dietary supplements (e.g., essential amino acids, arginine, citrulline, protein-free calorie supplements). Ravicti is not indicated for the treatment of acute hyperammonemia in patients with urea cycle disorders. Safety and efficacy for the treatment of N-acetyl glutamate synthase (NAGS) deficiency have not been established.

Disease Overview

Urea cycle disorders are rare inborn errors of metabolism which result from mutations in the genes encoding for one of the six enzymes necessary for normal function of the urea cycle: arginase, citrullinemia, arginosuccinic acid synthetase, N-acetyl glutamate synthetase, ornithine transcarbamylase, and carbamyl phosphate synthetase.[3-4] They lead to increased amounts of ammonia in the blood which may cause disturbed brain function and severe brain damage. Signs of disease include decreased mental awareness, vomiting, combativeness, slurred speech, unstable gait, and unconsciousness. Diagnosis begins with a clinical suspicion of hyperammonemia.[6] Typically, patients have normal glucose and electrolyte levels. Enzymatic diagnosis and/or genetic testing is also available; however, treatment should not be delayed while waiting for a final diagnosis. Most deaths have occurred during an episode of acute hyperammonemic encephalopathy.[3-4] Treatment includes use of alternative waste nitrogen excretion pathways (e.g., Buphenyl, Ravicti); other treatments may include hemodialysis, dietary protein restriction, and, in some cases, essential amino acid supplementation.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Phenylbutyrate Products (Buphenyl, Ravicti). All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Phenylbutyrate Products (Buphenyl, Ravicti) as well as the monitoring required for adverse events and long-term efficacy, approval requires these agents to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Phenylbutyrate Products (Buphenyl, Ravicti) is recommended in those who meet the following criteria:

FDA-Approved Indications

128. Urea Cycle Disorders (Note: Examples include deficiencies of carbamylphosphate synthetase, ornithine transcarbamylase, or argininosuccinic acid synthetase). Approve for the duration noted if the patient meets ALL of the following (A, B, C, and D):

- **A)** According to the prescriber, the diagnosis was confirmed by one of the following (i or ii):
  - **i.** Approve for 1 year if genetic testing confirmed a mutation resulting in a urea cycle disorder; OR
  - **ii.** Approve for 3 months if the patient has hyperammonemia diagnosed with an ammonia level above the upper limit of the normal reference range for the reporting laboratory.
    Note: Reference ranges are dependent upon patient's age; AND
- **B)** The medication is prescribed in conjunction with a protein-restricted diet; AND
- **C)** The patient will not be taking Buphenyl and Ravicti concurrently; AND
- **D)** The medication is prescribed by or in consultation with a metabolic disease specialist (or specialist who focuses in the treatment of metabolic diseases).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Phenylbutyrate Products (Buphenyl, Ravicti) have not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

124. Concomitant Therapy with Buphenyl and Ravicti. There are no data available to support concomitant use.

125. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Metabolic Disorders – Tiopronin Products
- Thiola® (tiopronin tablets – Mission Pharmacal)
- Thiola® EC (tiopronin delayed-release tablets – Mission Pharmacal)

REVIEW DATE: 09/18/2019

OVERVIEW

Thiola and Thiola EC are indicated, in combination with high fluid intake, alkali, and diet modification, for the prevention of cystine kidney stone formation in adults and pediatric patients ≥ 20 kg with severe homozygous cystinuria, who are not responsive to these measures alone.[1,2]

Disease Overview

Cystinuria is an autosomal recessive disorder of abnormal cystine transport.[3] The estimated prevalence is 1:7,000 to 1:10,000 individuals in the US. Excessive undissolved cystine in the urine leads to formation of stones in the kidney, bladder, and/or ureter. Symptoms typically begin to manifest between 10 and 30 years of age, although elevated cystine excretion may be found in infancy. Diagnosis is made clinically based on quantitative urinary cystine assays; genetic testing is not routine as it does not change medical management.[4] Homozygotes exhibit urinary cystine excretion > 300 to 400 mg/L/day, whereas heterozygotes have intermediate urinary cystine excretion. Treatment is directed at decreasing urinary cystine concentration (generally targeting a urine cystine < 250 mg/L) and enhancing solubility.[4,5] Tiopronin products work by binding to cystine and increasing urinary solubility.[4]

Guidelines

According to the American Urological Association guideline for medical management of kidney stones (2014), all patients with cystine kidney stones should be encouraged to drink large amounts of fluid to maintain low urinary cystine concentrations; often volumes of 4 liters per day are required.[5] Recommended dietary modifications include restriction of sodium and animal proteins. Alkalization of urine is also used to improve cystine solubility. This can be achieved through increased fruit and vegetable intake and/or with medications such as potassium citrate. The guideline recommends tiopronin for patients with cystine kidney stones who are unresponsive to increased fluid intake, dietary modification, and urinary alkalization. Captopril, another thiol agent, has not been shown to be effective for the prevention of recurrent cystine stones. D-penicillamine may be associated with more adverse events and is not preferred.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of tiopronin products (Thiola, Thiola EC). Because of the specialized skills required for evaluation and diagnosis of patients treated with tiopronin products, approval requires the requested medication to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Thiola or Thiola EC is recommended in those who meet the following criteria:

FDA-Approved Indications

25. Cystinuria. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **E)** Diagnosis of cystinuria has been confirmed based on laboratory testing (e.g., urinary cystine crystals present on microscopy, quantitative urine cystine assay); AND
- **F)** According to the prescriber, the patient has had an inadequate response to high fluid intake, dietary modification, and urinary alkalization; AND
- **G)** The medication is prescribed by, or in consultation with, a nephrologist, urologist, or physician who specializes in the treatment of cystinuria.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Tiopronin products have not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

4. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Metabolic Disorders – Xuriden Prior Authorization Policy
- Xuriden® (uridine triacetate oral granules – Wellstat Therapeutics)

REVIEW DATE: 07/29/2020

OVERVIEW
Xuriden, a pyrimidine analog for uridine replacement, is indicated for the treatment of hereditary orotic aciduria.[1] Xuriden is supplied as oral granules in a 2 gram packet. The recommended starting dose is 60

mg/kg once daily, which may be increased to 120 mg/kg (not to exceed 8 grams) once daily for insufficient efficacy. Any unused portion of a packet must be discarded; it should not be saved for subsequent doses.

Disease Overview

Hereditary orotic aciduria, also known as orotic aciduria type 1, is an extremely rare, autosomal recessive genetic disorder estimated to affect less than 1:1,000,000 live births.[1-3] Only about 20 cases have been reported in the medical literature.[2] In hereditary orotic aciduria, mutation in the *UMPS* gene leads to defective uridine 5'monophosphate synthase.[1,2] Deficiency in this enzyme prevents the last two steps in pyrimidine biosynthesis, leading to inadequate levels of uridine monophosphate and excess levels of orotic acid (a uridine precursor). Because the condition is so rare, hereditary orotic aciduria is not fully understood. Affected infants may develop megaloblastic anemia, developmental delays, or failure to thrive. Orotic acid crystals in the urine can lead to urinary obstruction. Xuriden replaces uridine in the circulation, and as a result of feedback inhibition, overproduction of orotic acid is reduced. Diagnosis is made by detailed patient and family history as well as thorough clinical evaluation and examination of urine. Most individuals have their diagnosis confirmed through molecular genetic testing; however, this is only available at specialized laboratories.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Xuriden. Because of the specialized skills required for evaluation and diagnosis of patients treated with Xuriden, approval requires the requested medication to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Xuriden is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Hereditary Orotic Aciduria (Orotic Aciduria Type 1).** Approve for 1 year if the patient meets the following criteria (A and B):
   - **A)** Patient has hereditary orotic aciduria confirmed by at least one of the following (i or ii):
     - **i.** Molecular genetic testing confirming mutation in the *UMPS* gene; OR
     - **ii.** Clinical diagnosis supported by both of the following (a and b):
       - **a)** First-degree family relative (i.e., parent or sibling) with hereditary orotic aciduria; AND
       - **b)** Urinary orotic acid level above the normal reference range for the reporting laboratory; AND
   - **B)** Xuriden is prescribed by, or in consultation with, a metabolic specialist, geneticist, or physician specializing in the condition being treated.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Xuriden is not recommended in the following situations:

5. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

118. Orotic aciduria type 1. Genetic and Rare Diseases Information Center. Updated September 13, 2017. Available at: https://rarediseases.info.nih.gov/diseases/5429/orotic-aciduria-type-1. Accessed on July 22, 2020.

PRIOR AUTHORIZATION POLICY

POLICY: Methergine® (methylergonovine maleate tablets, USP – Lupin Pharma, generics)

DATE REVIEWED: 05/27/2020

OVERVIEW

Methylergonovine is a semi-synthetic ergot alkaloid used for the prevention and control of postpartum hemorrhage.[1] Methylergonovine is indicated for management of uterine atony, hemorrhage and subinvolution of the uterus following delivery of the placenta.

The National Headache Foundation notes that methylergonovine can cause constriction of the smooth muscles in the blood vessels and this effect can be helpful in treating vascular headaches, such as migraines.[2] Although methylergonovine is more commonly used for prevention of migraine headaches, it can be taken for acute attacks. However, methylergonovine should only be used for limited periods of time in most patients and only under careful supervision of a physician. The dose of methylergonovine used for migraines is 0.2 to 0.4 mg three times a day; a maximum dose of 1.6 mg/day has been reported (eight 0.2 mg tablets per day).[3]

Disease Overview, Migraine

Migraine, a chronic neurologic disease, is characterized by attacks of throbbing headache with sensitivities to light and sound.[4] The treatment of migraines is individualized and choice of therapy is based on many factors, including: patient preference; severity and frequency of attacks; the presence, type, and severity of associated symptoms; treatment response to prior therapies; presence of comorbid and coexistent illness; contraindications (e.g., cardiovascular disease); and use of concomitant medications.

Guidelines/Recommendations

An updated assessment of the preventive and acute treatment of migraine by the American Headache Society (2018) reaffirms previous migraine guidelines. The current update lists the triptans and dihydroergotamine (DHE) as effective treatments for moderate or severe acute migraine attacks and mild to moderate attacks that respond poorly to nonsteroidal anti-inflammatory drugs (NSAIDs) or caffeinated combinations (e.g., aspirin + acetaminophen + caffeine). Opioid medications are probably effective; however, they are not recommended for regular use. The recommendation remains that clinicians must consider medication efficacy, potential side effects, and potential medication-related adverse events when prescribing acute medications for migraines. Treatment at the first sign of pain improves the probability of achieving freedom from pain and reduces attack-related disability. Migraine patients who need to use acute treatments on a regular basis should limit treatment to an average of two headache days per week, and patients who exceed this limit should be offered preventive treatment. Therapies that are used for migraine prevention include antiepileptics (divalproex sodium, valproate sodium, topiramate), beta-blockers

(metoprolol, propranolol, timolol), onabotulinumtoxin A, and frovatriptan (for short-term preventive treatment of menstrual migraine).

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of methylergonovine prescriptions with quantities exceeding 28 tablets per 30 days. Twenty-eight (28) tablets per month will be sufficient to treat uterine atony, hemorrhage and subinvolution of the uterus following the delivery of the placenta (FDA-approved indication). Because of the specialized skills required for evaluation and diagnosis of patients with migraines who are treated with methylergonovine as well as the monitoring required for adverse events and long-term efficacy, approval requires methylergonovine to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for 1 year in duration unless otherwise noted below.

Automation: Methylergonovine prescriptions for 28 tablets (0.2 mg strength) per 30 days are excluded from Prior Authorization (PA). The PA policy will only apply to methylergonovine prescriptions with quantities exceeding 28 tablets per 30 days.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of methylergonovine is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Uterine Atony, Hemorrhage and Subinvolution of the Uterus.** Do not approve. The initial quantity of 28 tablets is sufficient to treat this condition; quantities > 28 tablets for this indication will not be approved.

Other Uses with Supportive Evidence

2. **Migraine Headaches (Acute Treatment).** Approve methylergonovine for 1 year if the patient meets ONE of the following criteria (A or B):
   - **F)** Patient is already receiving methylergonovine therapy; OR
   - **G)** The patient meets all of the following criteria (i, ii, and iii):
     - **i.** Patient has tried and had inadequate efficacy and/or unacceptable side effects to at least one triptan therapy.
       Note: Examples of triptans: almotriptan, eletriptan, frovatriptan, naratriptan, rizatriptan, sumatriptan, and zolmitriptan); AND
     - **ii.** Patient has tried and had inadequate efficacy and/or unacceptable side effects to at least one other type of abortive therapy.
       Note: Examples of abortive therapies include analgesics [acetaminophen, nonsteroidal anti-inflammatories {NSAIDs}], butalbital-containing products [butalbital-acetaminophen, butalbital-acetaminophen-caffeine, butalbital-acetaminophen-caffeine-codeine, butalbital-aspirin-caffeine, butalbital-aspirin-caffeine-codeine], dihydroergotamine [DHE, Migranal®, generics]); AND
     - **iii.** The medication is prescribed by, or in consultation with, a neurologist or headache specialist.

3. **Migraine Headaches (Prophylaxis).** Approve methylergonovine for 1 year if the patient meets both of the following criteria (A and B):
   A) Patient has tried at least two other prophylactic pharmacologic therapies, each from a different pharmacologic class.
   Note: Examples of prophylactic pharmacologic therapies include angiotensin receptor blocker [e.g., candesartan], angiotensin converting enzyme inhibitor [e.g., lisinopril], anticonvulsant [e.g., divalproex sodium, sodium valproate, topiramate], beta-blocker [e.g., atenolol, metoprolol, nadolol, propranolol, timolol], calcium channel blocker [e.g., diltiazem, verapamil], tricyclic antidepressant [e.g., amitriptyline], other antidepressant [e.g., venlafaxine]); AND
   B) The medication is prescribed by, or in consultation with, a neurologist or headache specialist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Methylergonovine has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below.

254. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Migraine – Nurtec™ ODT (rimegepant sulfate orally disintegrating tablet – Biohaven)

DATE REVIEWED: 03/04/2020; selected revision 06/03/2020

OVERVIEW

Nurtec ODT is indicated for the acute treatment of migraine with or without aura in adults.[1] Limitations of Use: Nurtec ODT is not indicated for the prevention of migraine. The recommended dose of Nurtec ODT is 75 mg taken orally. The maximum dose is 75 mg in a 24 hour period. The safety of treating more than 15 migraines in a 30 day period has not been established.

Disease Overview

Migraine is a common, ongoing condition marked by paroxysmal, unilateral attacks of moderate to severe throbbing headache which is aggravated by routine physical activity (e.g., walking or climbing stairs) and associated with nausea, vomiting, and/or photophobia and phonophobia.[2] Migraine headache episodes typically last 4 to 72 hours, if untreated. Migraine affects approximately 15% of US adults.[3] Migraines have been defined as chronic or episodic. Chronic

migraine is described by the International Headache Society as headache occurring on ≥ 15 days/month for more than 3 months, which has the features of migraine headache on ≥ 8 days/month.[2] Episodic migraine is characterized by headaches that occur < 15 days/month.[4] Patients with episodic migraine may transform to chronic migraine over time at a rate of about 2.5% of patients per year. Potential strategies for preventing migraine transformation include preventing and treating headaches, lifestyle modifications, or effective management of comorbidities (e.g., obesity, obstructive sleep apnea, depression, anxiety). Episodic migraine is more common than chronic migraine; however, chronic migraine is associated with a markedly greater personal and societal burden.

Triptans (e.g., almotriptan, eletriptan, frovatriptan, naratriptan, rizatriptan, sumatriptan, and zolmitriptan) are considered the gold standard for acute treatment of moderate to severe migraine headaches or mild to moderate migraine headaches that respond poorly to over-the-counter (OTC) analgesics. An updated assessment of the **preventive and acute treatment of migraine by the American Headache Society** (2018) lists the triptans and dihydroergotamine as effective treatments for moderate or severe acute migraine attacks and mild to moderate attacks that respond poorly to nonsteroidal anti-inflammatory drugs (NSAIDs) or caffeinated combinations (e.g., aspirin + acetaminophen + caffeine).[5] Treat at the first sign of pain to improve the probability of achieving freedom from pain and reduce attack-related disability.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Nurtec ODT. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Nurtec ODT is recommended in those who meet the following criteria:

FDA-Approved Indications

129. Migraine, Acute Treatment. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** The patient is ≥ 18 years of age; AND
- **B)** The patient meets ONE of the following (i or ii):
  - **i.** The patient has tried at least one triptan therapy; OR
  - **ii.** The patient has a contraindication to triptan(s) according to the prescriber.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Nurtec ODT has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

126. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Migraine – Reyvow™ (lasmiditan tablet – Lilly)

DATE REVIEWED: 12/18/2019; selected revision 06/03/2020

OVERVIEW

Reyvow, a serotonin (5-HT) subtype 1F receptor agonist, is indicated for the acute treatment of migraine with or without aura in adults.[1] Limitations of Use: Reyvow is not indicated for the preventive treatment of migraine. Reyvow is a first-in-class ditan that binds with high affinity and selectivity to the 5-HT_{1F} receptor.[1-4] The 5-HT_{1F} receptor subtype is located in the trigeminal ganglion, the trigeminal nucleus caudalis, and cephalic blood vessels. Activation of this receptor does not constrict blood vessels. Migraine involves activation and sensitization of trigeminal nociceptors in the dura mater. Reyvow acts on the trigeminal system without causing vasoconstriction because of its low affinity for 5-HT_{1B} receptors. The precise mechanism of action of Reyvow for the treatment of migraine headache is unknown.[1] The recommended dose is 50 mg, 100 mg, or 200 mg as needed with or without food. No more than one dose should be taken in 24 hours; a second dose has not been shown to be effective for the same migraine attack. Reyvow should not be taken unless the patient can wait at least 8 hours between dosing and driving or operating machinery. The safety of treating an average of more than four migraine attacks in a 30-day period has not been established.

Disease Overview

Migraine is a common, ongoing condition marked by paroxysmal, unilateral attacks of moderate to severe throbbing headache which is aggravated by routine physical activity (e.g., walking or climbing stairs) and associated with nausea, vomiting, and/or photophobia and phonophobia.[5] Migraine headache episodes typically last 4 to 72 hours, if untreated. Migraine affects approximately 15% of US adults.[6] Migraines have been defined as chronic or episodic. Chronic migraine is described by the International Headache Society as headache occurring on ≥ 15 days/month for more than 3 months, which has the features of migraine headache on ≥ 8 days/month.[5] Episodic migraine is characterized by headaches that occur < 15 days/month.[7] Patients with episodic migraine may transform to chronic migraine over time at a rate of about 2.5% of patients per year. Potential strategies for preventing migraine transformation include preventing and treating headaches, lifestyle modifications, or effective management of comorbidities (e.g., obesity, obstructive sleep apnea, depression, anxiety). Episodic migraine is more common than chronic migraine; however, chronic migraine is associated with a markedly greater personal and societal burden.

Triptans (e.g., almotriptan, eletriptan, frovatriptan, naratriptan, rizatriptan, sumatriptan, and zolmitriptan) are considered the gold standard for acute treatment of moderate to severe migraine headaches or mild to moderate migraine headaches that respond poorly to over-the-counter (OTC) analgesics. An updated assessment of the **preventive and acute treatment of migraine by the American Headache Society** (2018) lists the triptans and dihydroergotamine as effective treatments for moderate or severe acute migraine attacks and mild to moderate attacks that respond poorly to nonsteroidal anti-inflammatory drugs (NSAIDs) or caffeinated combinations (e.g., aspirin + acetaminophen + caffeine).[8] Treat at the first sign of pain to improve the probability of achieving freedom from pain and reduce attack-related disability.

Safety

Reyvow may cause significant driving impairment.[1] Patients should not engage in potentially hazardous activities requiring complete mental alertness, such as driving a motor vehicle or operating machinery, for at least 8 hours after each dose of Reyvow, and those who cannot follow this advice should not take Reyvow. In a study of healthy volunteers, driving performance was assessed at 90 minutes after administration of Reyvow 50 mg, 100 mg, 200 mg,

alprazolam 1 mg, and placebo in a randomized, double-blind, placebo- and active-controlled, five-period crossover study using a computer-based driving simulation (n = 90). Driving performance was evaluated using a validated threshold established in a population with blood alcohol concentration of 0.05%. The primary outcome measure was the difference from placebo in the standard deviation of lateral position (SDLP), a measure of driving performance. All doses of Reyvow exhibited a dose-dependent impairment of simulated driving performance at 90 minutes after administration. In a separate randomized, double-blind, placebo- and active-controlled, four-period crossover study in healthy volunteers, driving performance was assessed at 8, 12, and 24 hours after administration of Reyvow 100 mg or 200 mg, using diphenhydramine 50 mg as the control (n = 67). The study evaluated computer-based simulated driving performance with the primary endpoint of SDLP. The mean SDLP did not reach the threshold for driving impairment at ≥ 8 hours after administration of Reyvow 100 or 200 mg.

Reyvow may also cause CNS depression, including dizziness and sedation, and should be used with caution if used in combination with alcohol or other CNS depressants.[1] In controlled clinical trials, dizziness and increased systolic blood pressure occurred more frequently in patients who were ≥ 65 years of age compared with patients who were < 65 years of age. In general, dose selection for an elderly patient should be cautious, starting at the low end of the dosing range, reflecting the greater frequency of decreased hepatic, renal, or cardiac function, and of concomitant disease or other drug therapy.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Reyvow. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Reyvow is recommended in those who meet the following criteria:

FDA-Approved Indications

130. Migraine, Acute Treatment. Approve for 1 year if the patient meets the following criteria (A and B):

- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient meets ONE of the following (i or ii):
  - **i.** Patient has tried at least one triptan therapy; OR
  - **ii.** Patient has a contraindication to triptan(s) according to the prescriber.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Reyvow has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

127. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Migraine – Ubrelvy™ (ubrogepant tablet – Allergan)

DATE REVIEWED: 01/29/2020; selected revision 06/03/2020

OVERVIEW

Ubrelvy, a calcitonin gene-related peptide receptor antagonist, is indicated for the acute treatment of migraine headache with or without aura in adults.[1] Limitations of Use: Ubrelvy is not indicated for the preventive treatment of migraine. The recommended dose of Ubrelvy is 50 mg or 100 mg taken orally with or without food. If needed, a second dose may be taken ≥ 2 hours after the initial dose. The maximum dose in a 24-hour period is 200 mg. The safety of treating more than 8 migraines in a 30-day period has not been established.

Disease Overview

Migraine is a common, ongoing condition marked by paroxysmal, unilateral attacks of moderate to severe throbbing headache which is aggravated by routine physical activity (e.g., walking or climbing stairs) and associated with nausea, vomiting, and/or photophobia and phonophobia.[2] Migraine headache episodes typically last 4 to 72 hours, if untreated. Migraine affects approximately 15% of US adults.[3] Migraines have been defined as chronic or episodic. Chronic migraine is described by the International Headache Society as headache occurring on ≥ 15 days/month for more than 3 months, which has the features of migraine headache on ≥ 8 days/month.[2] Episodic migraine is characterized by headaches that occur < 15 days/month.[4] Patients with episodic migraine may transform to chronic migraine over time at a rate of about 2.5% of patients per year. Potential strategies for preventing migraine transformation include preventing and treating headaches, lifestyle modifications, or effective management of comorbidities (e.g., obesity, obstructive sleep apnea, depression, anxiety). Episodic migraine is more common than chronic migraine; however, chronic migraine is associated with a markedly greater personal and societal burden.

Triptans (e.g., almotriptan, eletriptan, frovatriptan, naratriptan, rizatriptan, sumatriptan, and zolmitriptan) are considered the gold standard for acute treatment of moderate to severe migraine headaches or mild to moderate migraine headaches that respond poorly to over-the-counter (OTC) analgesics. An updated assessment of the **preventive and acute treatment of migraine by the American Headache Society** (2018) lists the triptans and dihydroergotamine as effective treatments for moderate or severe acute migraine attacks and mild to moderate attacks that respond poorly to nonsteroidal anti-inflammatory drugs (NSAIDs) or caffeinated combinations (e.g., aspirin + acetaminophen + caffeine).[5] Treat at the first sign of pain to improve the probability of achieving freedom from pain and reduce attack-related disability.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Ubrelvy. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Ubrelvy is recommended in those who meet the following criteria:

FDA-Approved Indications

131. Migraine, Acute Treatment. Approve for 1 year if the patient meets the following criteria (A and B):

- **A)** The patient is ≥ 18 years of age; AND
- **B)** The patient meets ONE of the following (i or ii):
  - **i.** The patient has tried at least one triptan therapy; OR
  - **ii.** The patient has a contraindication to triptan(s) according to the prescriber.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Ubrelvy has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

128. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Multiple Sclerosis – Ampyra® (dalfampridine extended-release tablets – Acorda Therapeutics, generic)

REVIEW DATE: 10/02/2019

OVERVIEW

Ampyra is a potassium channel blocker that is indicated to improve walking in adult patients with multiple sclerosis (MS).[1] This was demonstrated by an increase in walking speed.

Safety

Ampyra is contraindicated in patients with a history of seizures; moderate or severe renal impairment (estimated creatinine clearance [CrCl] ≤ 50 mL/min); and in those with a history of hypersensitivity to Ampyra or 4-aminopyridine.[1] The risk of seizures in those with mild renal impairment (estimated CrCl between 50 to 80 mL/min) is unknown, but the plasma levels of Ampyra in such patients may approach those noted at a dose of 15 mg twice daily (BID), a dose related to an increase risk of seizures. Of note, the maximum recommended Ampyra dose is 10 mg BID. Also, Ampyra should not be taken with other forms of 4-aminopyridine (4-AP, fampridine), which is an immediate-release agent that sometimes is compounded, because the active ingredients are similar. The most common adverse events noted with Ampyra (incidence ≥ 2% and at a rate greater than placebo) were urinary tract infection, insomnia, dizziness, headache, nausea, asthenia, back pain, balance disorder, MS relapse, paresthesia, nasopharyngitis, constipation, dyspepsia, and pharyngolaryngeal pain. The safety and effectiveness in children aged < 18 years have not been established.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Ampyra. Because of the specialized skills required for evaluation and diagnosis of patients treated with Ampyra as well as the monitoring required for adverse events and long-term efficacy, approval requires Ampyra to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for 1 year in duration unless otherwise noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Ampyra is recommended in those who meet the following criteria:

FDA-Approved Indications

37. Multiple Sclerosis (MS). Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** Ampyra is being used to improve mobility in a patient with MS; AND
- **B)** Ampyra is prescribed by or in consultation with a neurologist or a physician who specializes in the treatment of MS.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Ampyra has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

255. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Multiple Sclerosis – Aubagio Prior Authorization Policy
- Aubagio® (teriflunomide tablets – Genzyme/Sanofi)

REVIEW DATE: 08/05/2020

OVERVIEW
Aubagio, a pyrimidine synthesis inhibitor, is indicated for the treatment of patients with relapsing forms of multiple sclerosis (MS) to include clinically isolated syndrome, relapsing-remitting disease, and active secondary progressive disease, in adults.[1]

Disease Overview
MS is a chronic, inflammatory, demyelinating, autoimmune disease of the central nervous system (CNS) that impacts almost 1,000,000 people in the US.[2] The condition is marked by inflammation and demyelination, as well as degenerative alterations. Patients usually experience relapses and remissions in their neurological symptoms. For most patients, the onset of MS symptoms occurs when patients are 20 to 40 years of age; however, children can get MS and new onset disease can occur in older adults. The MS disease course is heterogeneous but has some patterns. Approximately 85% to 90% of patients have a relapsing pattern at onset. However, this transitions over time in patients who are untreated to a worsening with very few or no relapses or magnetic resonance imaging (MRI) activity (secondary progressive MS). Around 10% to 15% of patients have a steady progression of symptoms over time (primary progressive MS), marked by some clinical manifestations or by MRI activity. Primary progressive MS is generally diagnosed in patients on the upper level of the typical age range (e.g., almost 40 years of age) and the distribution is equivalent among the two genders. Advances in the understanding of the MS disease process, as well as in MRI technology, spurned updated disease course descriptions in 2013,[3] as well as in 2017.[4] The revised disease courses are clinically isolated syndrome, relapsing remitting MS, primary progressive MS, and secondary progressive MS.[2-4] Clinically isolated syndrome is now more recognized among the course descriptions of MS. It is the first clinical presentation of MS that displays characteristics of inflammatory demyelination that may possibly be MS but has yet to fulfill diagnostic criteria. It is notable that the other MS designations can be further characterized considering whether patients have active disease (or not active), as well as if disease is worsening or stable. Disability in MS is commonly graded on the deterioration of mobility per the Expanded Disability Status Scale (EDSS) an ordinal scale that ranges from 0 to 10, with higher scores indicating greater disability.

Guidelines

In September 2019, a consensus paper was updated by the MS Coalition that discusses the use of disease-modifying therapies in MS.[2] Many options from various disease classes, involving different mechanisms of action and modes of administration, have shown benefits in patients with MS.

Safety

Aubagio has a Boxed Warning regarding hepatotoxicity and the risk of embryofetal toxicity.[1]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Aubagio. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Aubagio as well as the monitoring required for adverse events and long-term efficacy, approval requires Aubagio to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Aubagio is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **Multiple Sclerosis.** Approve for 1 year if the patient meets the following criteria (A and B):
   - **A)** The patient has a relapsing form of multiple sclerosis; AND
   - **B)** The agent is prescribed by or in consultation with a neurologist or a physician who specializes in the treatment of multiple sclerosis.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Aubagio is not recommended in the following situations:

256. Concurrent Use with Other Disease-Modifying Agents Used for Multiple Sclerosis.

Note: Examples of disease modifying agents used for multiple sclerosis include Avonex® (interferon beta 1a injection [intramuscular]), Betaseron®/Extavia® (interferon beta-1b injection), Rebif® (interferon beta-1a injection [subcutaneous]), Copaxone®/Glatopa® (glatiramer acetate injection), Plegridy® (peginterferon beta-1a injection), Gilenya® (fingolimod tablets), Mavenclad® (cladribine tablets), Mayzent® (siponomid tablets), Tecfidera® (dimethyl fumarate delayed-release capsules), Bafiertam® (monomethyl fumarate delayed-release capsules), Vumerity® (diroximel fumarate delayed-release capsules), Zeposia® (ozanimod capsules), Ocrevus® (ocrelizumab injection for intravenous use), Tysabri® (natalizumab injection for intravenous infusion), and Lemtrada® (alemtuzumab injection for intravenous use).[2] These agents are not indicated for use in combination. Additional data are required to determine if use of disease-modifying MS agents in combination is safe provides added efficacy.

257. Non-Relapsing Forms of Multiple Sclerosis.

Note: An example of a non-relapsing form of multiple sclerosis is primary progressive multiple sclerosis. The efficacy of Aubagio has not been established in patients with multiple sclerosis with non-relapsing forms of multiple sclerosis.[1]

258. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Multiple Sclerosis – Avonex Prior Authorization Policy

- Avonex® (interferon beta-1a injection for intramuscular use – Biogen)

REVIEW DATE: 08/05/2020

OVERVIEW

Avonex is indicated for the treatment of patients with relapsing forms of multiple sclerosis (MS) to include clinically isolated syndrome, relapsing remitting disease, and active secondary progressive disease in adults.[1]

Disease Overview

MS is a chronic, inflammatory, demyelinating, autoimmune disease of the central nervous system (CNS) that impacts almost 1,000,000 people in the US.[2] The condition is marked by inflammation and demyelination, as well as degenerative alterations. Patients usually experience relapses and remissions in their neurological symptoms. For most patients, the onset of MS symptoms occurs when patients are 20 to 40 years of age; however, children can get MS and new onset disease can occur in older adults. The MS disease course is heterogeneous but has some patterns. Approximately 85% to 90% of patients have a relapsing pattern at onset. However, this transitions over time in patients who are untreated to a worsening with very few or no relapses or magnetic resonance imaging (MRI) activity (secondary progressive MS). Around 10% to 15% of patients have a steady progression of symptoms over time (primary progressive MS), marked by some clinical manifestations or by MRI activity. Primary progressive MS is generally diagnosed in patients on the upper level of the typical age range (e.g., almost 40 years of age) and the distribution is equivalent among the two genders. Advances in the understanding of the MS disease process, as well as in MRI technology, spurned updated disease course descriptions in 2013,[3] as well as in 2017.[4] The revised disease courses are clinically isolated syndrome, relapsing remitting MS, primary progressive MS, and secondary progressive MS.[2-4] Clinically isolated syndrome is now more recognized among the course descriptions of MS. It is the first clinical presentation of MS that displays characteristics of inflammatory demyelination that may possibly be MS but has yet to fulfill diagnostic criteria. It is notable that the other MS designations can be further characterized considering whether patients have active disease (or not active), as well as if disease is worsening or stable. Disability in MS is commonly graded on the deterioration of mobility per the Expanded Disability Status Scale (EDSS) an ordinal scale that ranges from 0 to 10, with higher scores indicating greater disability.

Guidelines

In September 2019, a consensus paper was updated by the MS Coalition that discusses the use of disease-modifying therapies in MS.[2] Many options from various disease classes, involving different mechanisms of action and modes of administration, have shown benefits in patients with MS.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Avonex. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Avonex as well as the monitoring required for adverse events and long-term efficacy, approval requires Avonex to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Avonex is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **Multiple Sclerosis.** Approve for 3 years if the patient meets the following criteria (A and B):
   R) The patient has a relapsing form of multiple sclerosis; AND
   S) The agent is prescribed by or in consultation with a neurologist or a physician who specializes in the treatment of multiple sclerosis.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Avonex is not recommended in the following situations:

22. **Concurrent Use with Other Disease-Modifying Agents Used for Multiple Sclerosis.**
    Note: Examples of disease modifying agents used for multiple sclerosis include Betaseron®/Extavia® (interferon beta-1b injection), Rebif® (interferon beta-1a injection [subcutaneous]), Copaxone®/Glatopa® (glatiramer acetate injection), Plegridy® (peginterferon beta-1a injection), Aubagio® (teriflunomide tablets), Gilenya® (fingolimod tablets), Mavenclad® (cladribine tablets), Mayzent® (siponimod tablets), Tecfidera® (dimethyl fumarate delayed-release capsules), Bafiertam® (monomethyl fumarate delayed-release capsules), Vumerity® (diroximel fumarate delayed-release capsules), Zeposia® (ozanimod capsules), Ocrevus® (ocrelizumab injection for intravenous use), Tysabri® (natalizumab injection for intravenous infusion), and Lemtrada® (alemtuzumab injection for intravenous use).[2] These agents are not indicated for use in combination. Additional data are required to determine if use of disease-modifying MS agents in combination is safe provides added efficacy.

23. **Non-Relapsing Forms of Multiple Sclerosis.**
    Note: An example of a non-relapsing form of multiple sclerosis is primary progressive multiple sclerosis. The efficacy of Avonex has not been established in patients with multiple sclerosis with non-relapsing forms of multiple sclerosis.[1]

24. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Multiple Sclerosis – Bafiertam Prior Authorization Policy

- Bafiertam™ (monomethyl fumarate delayed-release capsules – Banner Life Sciences LLC)

REVIEW DATE: 08/05/2020

OVERVIEW

Bafiertam is indicated for the treatment of relapsing forms of multiple sclerosis (MS) to include clinically isolated syndrome, relapsing remitting disease, and active secondary progressive MS in adults.[1]

Disease Overview

MS is a chronic, inflammatory, demyelinating, autoimmune disease of the central nervous system (CNS) that impacts almost 1,000,000 people in the US.[2] The condition is marked by inflammation and demyelination, as well as degenerative alterations. Patients usually experience relapses and remissions in their neurological symptoms. For most patients, the onset of MS symptoms occurs when patients are 20 to 40 years of age; however, children can get MS and new onset disease can occur in older adults. The MS disease course is heterogeneous but has some patterns. Approximately 85% to 90% of patients have a relapsing pattern at onset. However, this transitions over time in patients who are untreated to a worsening with very few or no relapses or magnetic resonance imaging (MRI) activity (secondary progressive MS). Around 10% to 15% of patients have a steady progression of symptoms over time (primary progressive MS), marked by some clinical manifestations or by MRI activity. Primary progressive MS is generally diagnosed in patients on the upper level of the typical age range (e.g., almost 40 years of age) and the distribution is equivalent among the two genders. Advances in the understanding of the MS disease process, as well as in MRI technology, spurned updated disease course descriptions in 2013,[3] as well as in 2017.[4] The revised disease courses are clinically isolated syndrome, relapsing remitting MS, primary progressive MS, and secondary progressive MS.[2-4] Clinically isolated syndrome is now more recognized among the course descriptions of MS. It is the first clinical presentation of MS that displays characteristics of inflammatory demyelination that may possibly be MS but has yet to fulfill diagnostic criteria. It is notable that the other MS designations can be further characterized considering whether patients have active disease (or not active), as well as if disease is worsening or stable. Disability in MS is commonly graded on the deterioration of mobility per the Expanded Disability Status Scale (EDSS) an ordinal scale that ranges from 0 to 10, with higher scores indicating greater disability.

Guidelines

In September 2019, a consensus paper was updated by the MS Coalition that discusses the use of disease-modifying therapies in MS.[2] Many options from various disease classes, involving different mechanisms of action and modes of administration, have shown benefits in patients with MS.

Safety

Progressive multifocal leukoencephalopathy has occurred in patients with MS treated with Tecfidera® (dimethyl fumarate delayed-release capsules), which is the prodrug of Bafiertam.[1]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Bafiertam. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Bafiertam as well as the monitoring required for adverse events and efficacy, approval requires Bafiertam to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Bafiertam is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **Multiple Sclerosis.** Approve for 1 year if the patient meets the following criteria (A and B):
   - **A)** The patient has a relapsing form of multiple sclerosis; AND
   - **B)** The agent is prescribed by or in consultation with a neurologist or a physician who specializes in the treatment of multiple sclerosis.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Bafiertam is not recommended in the following situations:

259. Concurrent Use with Other Disease-Modifying Agents Used for Multiple Sclerosis.

Note: Examples of disease modifying agents used for multiple sclerosis include Aubagio® (teriflunomide tablets), Avonex® (interferon beta 1a injection [intramuscular]), Betaseron®/Extavia® (interferon beta-1b injection), Rebif® (interferon beta-1a injection [subcutaneous]), Copaxone®/Glatopa® (glatiramer acetate injection), Plegridy® (peginterferon beta-1a injection), Gilenya® (fingolimod tablets), Mavenclad® (cladribine tablets), Mayzent® (siponomid tablets), Tecfidera® (dimethyl fumarate delayed-release capsules), Vumerity® (diroximel fumarate delayed-release capsules), Ocrevus® (ocrelizumab injection for intravenous use), Tysabri® (natalizumab injection for intravenous infusion), Lemtrada® (alemtuzumab injection for intravenous use), and Zeposia® (ozanimod capsules).[2] These agents are not indicated for use in combination. Additional data are required to determine if use of disease-modifying MS agents in combination is safe provides added efficacy.

260. Non-Relapsing Forms of Multiple Sclerosis.

Note: An example of a non-relapsing form of multiple sclerosis is primary progressive multiple sclerosis. The efficacy of Bafiertam has not been established in patients with multiple sclerosis with non-relapsing forms of multiple sclerosis.[1]

261. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Multiple Sclerosis – Betaseron/Extavia Prior Authorization Policy

- Betaseron® (interferon beta-1b injection for subcutaneous use – Bayer)
- Extavia® (interferon beta-1b injection for subcutaneous use – Novartis)

REVIEW DATE: 08/05/2020

OVERVIEW

Betaseron and Extavia are indicated for the treatment of relapsing forms of multiple sclerosis (MS) to include clinically isolated syndrome, relapsing-remitting disease, and active secondary progressive disease in adults.[1,2] Extavia and Betaseron are essentially the same formulation of interferon beta-1b. The only difference is that Extavia is supplied with a 27 gauge needle compared to a 30 gauge needle that is given with Betaseron.

Disease Overview

MS is a chronic, inflammatory, demyelinating, autoimmune disease of the central nervous system (CNS) that impacts almost 1,000,000 people in the US.[3] The condition is marked by inflammation and demyelination, as well as degenerative alterations. Patients usually experience relapses and remissions in their neurological symptoms. For most patients, the onset of MS symptoms occurs when patients are 20 to 40 years of age; however, children can get MS and new onset disease can occur in older adults. The MS disease course is heterogeneous but has some patterns. Approximately 85% to 90% of patients have a relapsing pattern at onset. However, this transitions over time in patients who are untreated to a worsening with very few or no relapses or magnetic resonance imaging (MRI) activity (secondary progressive MS). Around 10% to 15% of patients have a steady progression of symptoms over time (primary progressive MS), marked by some clinical manifestations or by MRI activity. Primary progressive MS is generally diagnosed in patients on the upper level of the typical age range (e.g., almost 40 years of age) and the distribution is equivalent among the two genders. Advances in the understanding of the MS disease process, as well as in MRI technology, spurned updated disease course descriptions in 2013,[4] as well as in 2017.[5] The revised disease courses are clinically isolated syndrome, relapsing remitting MS, primary progressive MS, and secondary progressive MS.[3-5] Clinically isolated syndrome is now more recognized among the course descriptions of MS. It is the first clinical presentation of MS that displays characteristics of inflammatory demyelination that may possibly be MS but has yet to fulfill diagnostic criteria. It is notable that the other MS designations can be further characterized considering whether patients have active disease (or not active), as well as if disease is worsening or stable. Disability in MS is commonly graded on the deterioration of mobility per the Expanded Disability Status Scale (EDSS) an ordinal scale that ranges from 0 to 10, with higher scores indicating greater disability.

Guidelines

In September 2019, a consensus paper was updated by the MS Coalition that discusses the use of disease-modifying therapies in MS.[3] Many options from various disease classes, involving different mechanisms of action and modes of administration, have shown benefits in patients with MS.

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of Betaseron and Extavia. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Betaseron/Extavia as well as the monitoring required for adverse events and long-term efficacy, approval requires Betaseron and Extavia to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Betaseron/Extavia is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **Multiple Sclerosis.** Approve for 3 years if the patient meets the following criteria (A and B):
   A) The patient has a relapsing form of multiple sclerosis; AND
   B) The agent is prescribed by or in consultation with a neurologist or a physician who specializes in the treatment of multiple sclerosis.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Coverage of Betaseron/Extavia is not recommended in the following situations:

~~25.~~ **Concurrent Use with Other Disease-Modifying Agents Used for Multiple Sclerosis.**
Note: Examples of disease modifying agents used for multiple sclerosis include Avonex® (interferon beta 1a injection [intramuscular]), Rebif® (interferon beta-1a injection [subcutaneous]), Copaxone®/Glatopa® (glatiramer acetate injection), Plegridy® (peginterferon beta-1a injection), Aubagio® (teriflunomide tablets), Gilenya® (fingolimod tablets), Mavenclad® (cladribine tablets), Mayzent® (siponimod tablets), Tecfidera® (dimethyl fumarate delayed-release capsules), Bafiertam® (monomethyl fumarate delayed-release capsules), Vumerity® (diroximel fumarate delayed-release capsules), Zeposia® (ozanimod capsules), Ocrevus® (ocrelizumab injection for intravenous use), Tysabri® (natalizumab injection for intravenous infusion), and Lemtrada® (alemtuzumab injection for intravenous use).[3] These agents are not indicated for use in combination. Additional data are required to determine if use of disease-modifying multiple sclerosis agents in combination is safe provides added efficacy.

26. **Non-Relapsing Forms of Multiple Sclerosis.**
Note: An example of a non-relapsing form of multiple sclerosis is primary progressive multiple sclerosis. The efficacy of Betaseron/Extavia have not been established in patients with multiple sclerosis with non-relapsing forms of multiple sclerosis.[1]

27. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Multiple Sclerosis – Gilenya Prior Authorization Policy
- Gilenya® (fingolimod capsules – Novartis)

REVIEW DATE: 08/05/2020

OVERVIEW

Gilenya, a sphingosine 1-phosphate receptor modulator, is indicated for the treatment of patients with relapsing forms of multiple sclerosis (MS), to include clinically isolated syndrome, relapsing-remitting disease, and active secondary progressive disease in patients 10 years of age and older.[1]

Disease Overview

MS is a chronic, inflammatory, demyelinating, autoimmune disease of the central nervous system (CNS) that impacts almost 1,000,000 people in the US.[2] The condition is marked by inflammation and demyelination, as well as degenerative alterations. Patients usually experience relapses and remissions in their neurological symptoms. For most patients, the onset of MS symptoms occurs when patients are 20 to 40 years of age; however, children can get MS and new onset disease can occur in older adults. The MS disease course is heterogeneous but has some patterns. Approximately 85% to 90% of patients have a relapsing pattern at onset. However, this transitions over time in patients who are untreated to a worsening with very few or no relapses or magnetic resonance imaging (MRI) activity (secondary progressive MS). Around 10% to 15% of patients have a steady progression of symptoms over time (primary progressive MS), marked by some clinical manifestations or by MRI activity. Primary progressive MS is generally diagnosed in patients on the upper level of the typical age range (e.g., almost 40 years of age) and the distribution is equivalent among the two genders. Advances in the understanding of the MS disease process, as well as in MRI technology, spurned updated disease course descriptions in 2013,[3] as well as in 2017.[4] The revised disease courses are clinically isolated syndrome, relapsing remitting MS, primary progressive MS, and secondary progressive MS.[2-4] Clinically isolated syndrome is now more recognized among the course descriptions of MS. It is the first clinical presentation of MS that displays characteristics of inflammatory demyelination that may possibly be MS but has yet to fulfill diagnostic criteria. It is notable that the other MS designations can be further characterized considering whether patients have active disease (or not active), as well as if disease is worsening or stable. Disability in MS is commonly graded on the deterioration of mobility per the Expanded Disability Status Scale (EDSS) an ordinal scale that ranges from 0 to 10, with higher scores indicating greater disability.

Guidelines

In September 2019, a consensus paper was updated by the MS Coalition that discusses the use of disease-modifying therapies in MS.[2] Many options from various disease classes, involving different mechanisms of action and modes of administration, have shown benefits in patients with MS.[2] The American Academy of Neurology has practice guidelines regarding disease-modifying therapies for adults with MS.[5] The guidelines cites Gilenya as one of the agents to consider for patients with MS who have highly active disease.

Safety

The initiation of Gilenya leads to decreases in heart rate.[1] After the first dose of Gilenya, the heart rate decreases are noted within an hour and generally are greatest at 6 hours, although the effects can be observed 24 hours after the first dose in some patients. The first dose of Gilenya should be given in a setting with resources to appropriately manage symptomatic bradycardia. Observe patients for 6 hours after the first Gilenya dose for signs and symptoms of bradycardia. Patients with prolonged QTc interval at baseline or during the observation period, or taking medications with known risks of torsades de pointes, should be observed overnight with continuous electrocardiographic (ECG) monitoring. When restarting Gilenya after discontinuation for more than 14 days after the first treatment month, perform first-dose monitoring. There are several contraindications for use which mainly include patients with background cardiovascular disease. Gilenya is associated with serious toxicities such as decreased heart rate and/or atrioventricular condition after the first dose; an increased risk of infections; macular edema; pulmonary toxicity; and elevated liver enzymes. Cases of progressive multifocal leukoencephalopathy (PML) have occurred in patients who were given Gilenya in the postmarketing setting.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Gilenya. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Gilenya as well as the monitoring required for adverse events and efficacy, approval requires Gilenya to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Gilenya is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Multiple Sclerosis.** Approve for 1 year if the patient meets all of the following criteria (A and B):
   - **A)** The patient has a relapsing form of multiple sclerosis; AND
   - **B)** The agent is prescribed by or in consultation with a neurologist or a physician who specializes in the treatment of multiple sclerosis.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Gilenya is not recommended in the following situations:

262. Concurrent Use with Other Disease-Modifying Agents Used for Multiple Sclerosis.

Note: Examples of disease-modifying agents used for multiple sclerosis include Avonex® (interferon beta 1a injection [intramuscular]), Betaseron®/Extavia® (interferon beta-1b injection), Rebif® (interferon beta-1a injection [subcutaneous]), Copaxone®/Glatopa® (glatiramer acetate injection), Plegridy® (peginterferon beta-1a injection), Aubagio® (teriflunomide tablets), Mavenclad® (cladribine tablets), Mayzent® (siponimod tablets), Tecfidera® (dimethyl fumarate delayed-release capsules), Bafiertam® (monomethyl fumarate delayed-release capsules), Vumerity® (diroximel fumarate delayed-release capsules), Zeposia® (ozanimod capsules), Ocrevus® (ocrelizumab injection for intravenous use), Tysabri® (natalizumab injection for intravenous infusion), and Lemtrada® (alemtuzumab injection for intravenous use).[2] These agents are not indicated for use in combination. Additional data are required to determine if use of disease-modifying multiple sclerosis agents in combination is safe provides added efficacy.

263. Non-Relapsing Forms of Multiple Sclerosis.

Note: An example of a non-relapsing form of multiple sclerosis is primary progressive multiple sclerosis. In the INFORMS trial Gilenya did not slow disease progression in patients with primary progressive multiple sclerosis.[6]

264. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Multiple Sclerosis – Glatiramer Products Prior Authorization Policy

- Copaxone® (glatiramer acetate for subcutaneous injection [20 mg/mL and 40 mg/mL] – Teva, generic)
- Glatopa® (glatiramer acetate for subcutaneous injection [20 mg/mL and 40 mg/mL] – Sandoz)

REVIEW DATE: 08/05/2020

OVERVIEW

Copaxone, Glatopa and generic glatiramer acetate are indicated for the treatment of relapsing forms of multiple sclerosis (MS) to include clinically isolated syndrome, relapsing remitting disease, and active secondary progressive disease, in adults.[1-4]

Disease Overview

MS is a chronic, inflammatory, demyelinating, autoimmune disease of the central nervous system (CNS) that impacts almost 1,000,000 people in the US.[5] The condition is marked by inflammation and demyelination, as well as degenerative alterations. Patients usually experience relapses and remissions in their neurological symptoms. For most patients, the onset of MS symptoms occurs when patients are 20 to 40 years of age; however, children can get MS and new onset disease can occur in older adults. The MS disease course is heterogeneous but has some patterns. Approximately 85% to 90% of patients have a relapsing pattern at onset. However, this transitions over time in patients who are untreated to a worsening with very few or no relapses or magnetic resonance imaging (MRI) activity (secondary progressive MS). Around 10% to 15% of patients have a steady progression of symptoms over time (primary progressive MS), marked by some clinical manifestations or by MRI activity. Primary progressive MS is generally diagnosed in patients on the upper level of the typical age range (e.g., almost 40 years of age) and the distribution is equivalent among the two genders. Advances in the understanding of the MS disease process, as well as in MRI technology, spurned updated disease course descriptions in 2013,[6] as well as in 2017.[7] The revised disease courses are clinically isolated syndrome, relapsing remitting MS, primary progressive MS, and secondary progressive MS.[5-7] Clinically isolated syndrome is now more recognized among the course descriptions of MS. It is the first clinical presentation of MS that displays characteristics of inflammatory demyelination that may possibly be MS but has yet to fulfill diagnostic criteria. It is notable that the other MS designations can be further characterized considering whether patients have active disease (or not active), as well as if disease is worsening or stable. Disability in MS is commonly graded on the deterioration of mobility per the Expanded Disability Status Scale (EDSS) an ordinal scale that ranges from 0 to 10, with higher scores indicating greater disability.

Guidelines

In September 2019, a consensus paper was updated by the MS Coalition that discusses the use of disease-modifying therapies in MS.[5] Many options from various disease classes, involving different mechanisms of action and modes of administration, have shown benefits in patients with MS.

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of Copaxone (20 mg/mL and 40 mg/mL) and Glatopa (20 mg/mL and 40 mg/mL). All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Copaxone/Glatopa as well as the monitoring required for adverse events and long-term efficacy, approval requires Copaxone/Glatopa to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of glatiramer is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **Multiple Sclerosis.** Approve for 3 years if the patient meets the following criteria (A and B):
   T) The patient has a relapsing form of multiple sclerosis; AND
   U) The medication is prescribed by or in consultation with, a neurologist or a physician who specializes in the treatment of multiple sclerosis.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Coverage of glatiramer is not recommended in the following situations:

28. **Concurrent Use with Other Disease-Modifying Agents Used for Multiple Sclerosis.**
    Note: Examples of disease modifying agents used for multiple sclerosis include Avonex® (interferon beta-1a injection [intramuscular]), Betaseron®/Extavia® (interferon beta-1b injection), Rebif® (interferon beta-1a injection [subcutaneous]), Plegridy® (peginterferon beta-1a injection), Aubagio® (teriflunomide tablets), Gilenya® (fingolimod tablets), Mavenclad® (cladribine tablets), Mayzent® (siponimod tablets), Tecfidera® (dimethyl fumarate delayed-release capsules), Bafiertam® (monomethyl fumarate delayed-release capsules), Vumerity® (diroximel fumarate delayed-release capsules), Zeposia® (ozanimod capsules), Ocrevus® (ocrelizumab injection for intravenous use), Tysabri® (natalizumab injection for intravenous infusion), and Lemtrada® (alemtuzumab injection for intravenous use).[2] These agents are not indicated for use in combination. Additional data are required to determine if use of disease-modifying multiple sclerosis agents in combination is safe provides added efficacy.

29. **Non-Relapsing Forms of Multiple Sclerosis.**
    Note: An example of non-relapsing form of multiple sclerosis is primary progressive multiple sclerosis. The efficacy of Copaxone and Glatopa have not been established in patients with multiple sclerosis with non-relapsing forms of multiple sclerosis.[1-4]

30. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Multiple Sclerosis – Kesimpta Prior Authorization Policy
- Kesimpta® (ofatumumab injection for subcutaneous use – Novartis)

REVIEW DATE: 08/26/2020

OVERVIEW
Kesimpta, a CD20-directed cytolytic antibody, is indicated for the treatment of relapsing forms of multiple sclerosis (MS) to include clinically isolated syndrome, relapsing remitting disease, and active secondary progressive MS in adults.[1]

Disease Overview
MS is a chronic, inflammatory, demyelinating, autoimmune disease of the central nervous system (CNS) that impacts almost 1,000,000 people in the US.[2] The condition is marked by inflammation and demyelination, as well as degenerative alterations. Patients usually experience relapses and remissions in their neurological symptoms. For most patients, the onset of MS symptoms occurs when patients are 20 to 40 years of age; however, children can get MS and new onset disease can occur in older adults. The MS disease course is heterogeneous but has some patterns. Approximately 85% to 90% of patients have a relapsing pattern at onset. However, this transitions over time in patients who are untreated to a worsening with very few or no relapses or magnetic resonance imaging (MRI) activity (secondary progressive MS). Around 10% to 15% of patients have a steady progression of symptoms over time (primary progressive MS), marked by some clinical manifestations or by MRI activity. Primary progressive MS is generally diagnosed in patients on the upper level of the typical age range (e.g., almost 40 years of age) and the distribution is equivalent among the two genders. Advances in the understanding of the MS disease process, as well as in MRI technology, spurned updated disease course descriptions in 2013,[3] as well as in 2017.[4] The revised disease courses are clinically isolated syndrome, relapsing remitting MS, primary progressive MS, and secondary progressive MS.[2-4] Clinically isolated syndrome is now more recognized among the course descriptions of MS. It is the first clinical presentation of MS that displays characteristics of inflammatory demyelination that may possibly be MS but has yet to fulfill diagnostic criteria. It is notable that the other MS designations can be further characterized considering whether patients have active disease (or not active), as well as if disease is worsening or stable. Disability in MS is commonly graded on the deterioration of mobility per the Expanded Disability Status Scale (EDSS) an ordinal scale that ranges from 0 to 10, with higher scores indicating greater disability.

Guidelines
In September 2019, a consensus paper was updated by the MS Coalition that discusses the use of disease-modifying therapies in MS.[2] Many options from various disease classes, involving different mechanisms of action and modes of administration, have shown benefits in patients with MS.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Kesimpta. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Kesimpta as well as the monitoring required for adverse events and long-term efficacy, approval requires Kesimpta to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Kesimpta is recommended in those who meet the following criteria:

FDA-Approved Indications

132. Multiple Sclerosis. Approve for 1 year if the patient meets the following criteria (A, B and C):
- **A)** Patient has a relapsing form of multiple sclerosis; AND
- **B)** Patient is ≥ 18 years; AND
- **C)** Medication is prescribed by or in consultation with a neurologist or a physician who specializes in the treatment of multiple sclerosis.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Kesimpta is not recommended in the following situations:

265. Concurrent Use with Other Disease Modifying Agents Used for Multiple Sclerosis.
Note: Examples of disease modifying agents used for multiple sclerosis include Aubagio® (teriflunomide tablets), Avonex® (interferon beta 1a injection for intramuscular use), Betaseron®/Extavia® (interferon beta-1b injection for subcutaneous use), Rebif® (interferon beta-1a injection for subcutaneous use), Copaxone®/Glatopa® (glatiramer acetate injection for subcutaneous use), glatiramer acetate injection, Plegridy® (peginterferon beta-1a injection for subcutaneous use), Tecfidera® (dimethyl fumarate delayed-release capsules), Gilenya® (fingolimod capsules), Mavenclad® (cladribine tablets), Mayzent® (siponomid tablets), Bafiertam® (monomethyl fumarate delayed-release capsules), Vumerity® (diroximel fumarate delayed-release capsules), Zeposia® (ozanimod capsules), Ocrevus® (ocrelizumab injection for intravenous use), Tysabri® (natalizumab injection for intravenous infusion), and Lemtrada® (alemtuzumab injection for intravenous use).[2] These agents are not indicated for use in combination. Additional data are required to determine if use of disease-modifying multiple sclerosis agents in combination is safe provides added efficacy.

266. Non-Relapsing Forms of Multiple Sclerosis.
Note: An example of a non-relapsing form of multiple sclerosis is primary progressive multiple sclerosis. The efficacy of Kesimpta has not been established in patients with multiple sclerosis with non-relapsing forms of multiple sclerosis.[1]

267. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Multiple Sclerosis – Lemtrada® (alemtuzumab injection for intravenous use)

DATE REVIEWED: 11/13/2019

OVERVIEW

Lemtrada, a CD52-directed cytolytic monoclonal antibody, is indicated for the treatment of patients with relapsing forms of multiple sclerosis (MS) to include relapsing remitting disease and active secondary progressive MS in adults.[1] Due to its safety profile, use of Lemtrada should generally be reserved for patients who have had an inadequate response to two or more medications indicated for the treatment of MS. Limitations of Use. Lemtrada is not recommended for use in patients with clinically isolated syndrome because of its safety profile. The recommended dose of Lemtrada is 12 mg/day given by intravenous (IV) infusion for two treatment courses. The first treatment course is 12 mg/day IV on 5 consecutive days (60 mg total dose) and the second treatment course is 12 mg/day IV on 3 consecutive days (36 mg total dose) given 12 months after the first treatment course. Following the second treatment course, subsequent treatment courses of 12 mg per day on 3 consecutive days (36 mg total dose) may be given, as needed, at least 12 months after the last dose of any prior treatment course. Infuse Lemtrada over 4 hours and administer the agent in a setting that has equipment and personnel to appropriately manage anaphylaxis or serious infusion reactions.[1] Lemtrada contains the same active ingredient found in Campath® (alemtuzumab injection for IV use), which is FDA-approved for the treatment of B-cell chronic lymphocytic leukemia.[6]

Disease Overview

MS is a chronic, inflammatory, demyelinating, autoimmune disease of the central nervous system (CNS) that impacts almost 1,000,000 people in the US.[2] The condition is marked by inflammation and demyelination, as well as degenerative alterations. Patients usually experience relapses and remissions in their neurological symptoms. For most patients, the onset of MS symptoms occurs when patients are 20 to 40 years of age; however, children can get MS and new onset disease can occur in older adults. The MS disease course is heterogeneous but has some patterns. Approximately 85% to 90% of patients have a relapsing pattern at onset. However, this transitions over time in patients who are untreated to a worsening with very few or no relapses or magnetic resonance imaging (MRI) activity (secondary progressive MS). Around 10% to 15% of patients have a steady progression of symptoms over time (primary progressive MS), marked by some clinical manifestations or by MRI activity. Primary progressive MS is generally diagnosed in patients on the upper level of the typical age range (e.g., almost 40 years of age) and the distribution is equivalent among the two genders. Advances in the understanding of the MS disease process, as well as in MRI technology, spurned updated disease course descriptions in 2013,[3] as well as in 2017.[4] The revised disease courses are clinically isolated syndrome, relapsing remitting MS, primary progressive MS, and secondary progressive MS.[2-4] Clinically isolated syndrome is now more recognized among the

course descriptions of MS. It is the first clinical presentation of MS that displays characteristics of inflammatory demyelination that may possibly be MS but has yet to fulfill diagnostic criteria. It is notable that the other MS designations can be further characterized considering whether patients have active disease (or not active), as well as if disease is worsening or stable. Disability in MS is commonly graded on the deterioration of mobility per the Expanded Disability Status Scale (EDSS) an ordinal scale that ranges from 0 to 10, with higher scores indicating greater disability.

Many disease-modifying MS agents are FDA-approved for use in patients with relapsing forms of MS.[2] Options include self-administered injectable agents (e.g., glatiramer acetate products and interferon beta agents), oral agents (i.e., Tecfidera® [dimethyl fumarate delayed-release capsules], Gilenya® [fingolimod capsules], Mayzent® [siponimod tablets]), Aubagio® [teriflunomide tablets], Mavenclad® [cladribine tablets], Vumerity™ [diroximel fumarate delayed-release capsules]), and intravenously infused agents (i.e., Tysabri® [natalizumab injection for intravenous use], Ocrevus® [ocrelizumab injection for intravenous use], and mitoxantrone injection for intravenous use). Ocrevus is the only agent FDA-approved for primary progressive MS.

Guidelines

A practice guideline recommendation regarding disease-modifying agents for adults with MS from the American Academy of Neurology (2018) states to consider Lemtrada for patients with MS who have highly active disease.[5]

Safety

Lemtrada is available only through a restricted Risk Evaluation Mitigation Strategy (REMS) program called the LEMTRADA REMS Program due to the risks of autoimmunity, infusion reactions, stroke, and malignancies.[1] Some program requirements include that prescribers must be certified with the program by enrolling and completing training. Also, patients must enroll in the program and comply with ongoing monitoring requirements. Pharmacies are required to be certified with the program and must only dispense Lemtrada to certified healthcare facilities that are authorized to receive Lemtrada. It is required that healthcare facilities enroll in the program and verify that patients are authorized before infusing Lemtrada. Healthcare facilities must have on-site access to equipment and personnel trained to manage infusion reactions.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Lemtrada injection. Because of the specialized skills required for evaluation and diagnosis of patients treated with Lemtrada, as well as the monitoring required for adverse events and long-term efficacy, approval requires Lemtrada to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are noted for the durations below.

Automation: None.

Documentation: In the *Multiple Sclerosis – Lemtrada Prior Authorization Policy*, documentation is required for initiation of therapy where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes and magnetic resonance imaging (MRI) reports.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Lemtrada injection is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Multiple Sclerosis (MS).** Approve for the duration of therapy noted if the patient meets one of the following criteria (A or B):
   - **A)** Initial Therapy (this includes patients who have started but not completed the first course of Lemtrada Therapy). Approve for 5 days in patients who meet all of the following criteria (i, ii, iii, and iv):
     - **i.** The patient is ≥ 17 years of age; AND
     - **ii.** The patient has a relapsing form of MS; AND
     - **iii.** Lemtrada is prescribing by or in consultation with a neurologist or a physician who specializes in the treatment of multiple sclerosis; AND
     - **iv.** The patient meets one of the following (a or b):
       - **a)** According to the prescriber the patient has had an inadequate response or is unable to tolerate two disease-modifying agents used for MS; OR Note: Examples include Avonex, Rebif, Betaseron, Extavia, Copaxone, Plegridy, Gilenya, Glatopa, glatiramer acetate injection, Aubagio, Tecfidera, Mavenclad, Mayzent, Vumerity, Tysabri, or Ocrevus); OR
       - **b)** According to the prescriber the patient has highly-active or aggressive multiple sclerosis by meeting one of the following (1, 2, 3, or 4):
         1. The patient has demonstrated rapidly-advancing deterioration(s) in physical functioning (e.g., loss of mobility/or lower levels of ambulation, severe changes in strength or coordination) **[documentation required]**; OR
         2. Disabling relapse(s) with suboptimal response to systemic corticosteroids **[documentation required]**; OR
         3. Magnetic resonance imaging [MRI] findings suggest highly-active or aggressive multiple sclerosis (e.g., new, enlarging, or a high burden of T2 lesions or gadolinium-enhancing lesions) **[documentation required]**; OR
         4. Manifestations of multiple sclerosis-related cognitive impairment **[documentation required]**; OR
   - **B)** Patient Who Has Completed a Previous Lemtrada Therapy Course. Approve for 3 days in patients who meet all of the following criteria (i, ii, iii and iv):
     - **i.** The patient is ≥ 17 years of age; AND
     - **ii.** The patient has a relapsing form of MS; AND
     - **iii.** Lemtrada is prescribed by or in consultation with a neurologist or a physician that specializes in the treatment of MS; AND
     - **iv.** At least 12 months has elapsed from the last dose of any prior Lemtrada treatment course.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Lemtrada has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

1. **Concurrent Use with Other Disease-Modifying Agents Used for Multiple Sclerosis (MS).** Note: Examples of disease-modifying agents used for MS include Betaseron®/Extavia® (interferon beta-1b injection), Rebif® (interferon beta-1a injection [subcutaneous]), Copaxone®/Glatopa® (glatiramer acetate injection), glatiramer acetate injection, Avonex® (interferon beta-1a injection [intramuscular]), Plegridy® (peginterferon beta-1a injection), Gilenya® (fingolimod tablets), Aubagio® (teriflunomide

tablets), Mavenclad® (cladribine tablets), Mayzent® (siponimod tablets), Tecfidera® (dimethyl fumarate delayed-release capsules), Vumerity™ (diroximel fumarate delayed-release capsules), Tysabri® (natalizumab injection for intravenous use), and Ocrevus® (ocrelizumab injection for intravenous use). Lemtrada should not be given in combination with other disease-modifying agents used for MS. Concomitant use of Lemtrada with immunosuppressive therapies could increase the risk of immunosuppression.[1]

2. **Human Immunodeficiency Virus (HIV) Infection (Patients With).** Use of Lemtrada is contraindicated in patients who are infected with HIV because Lemtrada causes prolonged reductions of CD4+ lymphocyte counts.[1]

3. **Non-Relapsing Forms of Multiple Sclerosis.** Note: An example of a non-relapsing form of MS is primary progressive MS. The efficacy of Lemtrada has not been established in patients with MS with non-relapsing forms of the disease.[1]

4. **Clinically Isolated Syndrome.** Lemtrada is not recommended for use in patients with clinically isolated syndrome due to its safety profile.[1]

5. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Multiple Sclerosis – Mavenclad Prior Authorization Policy
- Mavenclad® (cladribine tablets – EMD Serono)

REVIEW DATE: 08/05/2020

OVERVIEW

Mavenclad, a purine antimetabolite, is indicated for the treatment of relapsing forms of multiple sclerosis (MS), to include relapsing remitting disease, and active secondary progressive disease, in adults.[1] Due to its safety profile, use of Mavenclad is generally recommended for patients who have had an inadequate response to, or are unable to tolerate, an alternative drug for the treatment of MS.[1] A limitation of use is

that Mavenclad is not recommended for use in patients with clinically isolated syndrome because of its safety profile.

Disease Overview

MS is a chronic, inflammatory, demyelinating, autoimmune disease of the central nervous system (CNS) that impacts almost 1,000,000 people in the US.[2] The condition is marked by inflammation and demyelination, as well as degenerative alterations. Patients usually experience relapses and remissions in their neurological symptoms. For most patients, the onset of MS symptoms occurs when patients are 20 to 40 years of age; however, children can get MS and new onset disease can occur in older adults. The MS disease course is heterogeneous but has some patterns. Approximately 85% to 90% of patients have a relapsing pattern at onset. However, this transitions over time in patients who are untreated to a worsening with very few or no relapses or magnetic resonance imaging (MRI) activity (secondary progressive MS). Around 10% to 15% of patients have a steady progression of symptoms over time (primary progressive MS), marked by some clinical manifestations or by MRI activity. Primary progressive MS is generally diagnosed in patients on the upper level of the typical age range (e.g., almost 40 years of age) and the distribution is equivalent among the two genders. Advances in the understanding of the MS disease process, as well as in MRI technology, spurned updated disease course descriptions in 2013,[3] as well as in 2017.[4] The revised disease courses are clinically isolated syndrome, relapsing remitting MS, primary progressive MS, and secondary progressive MS.[2-4] Clinically isolated syndrome is now more recognized among the course descriptions of MS. It is the first clinical presentation of MS that displays characteristics of inflammatory demyelination that may possibly be MS but has yet to fulfill diagnostic criteria. It is notable that the other MS designations can be further characterized considering whether patients have active disease (or not active), as well as if disease is worsening or stable. Disability in MS is commonly graded on the deterioration of mobility per the Expanded Disability Status Scale (EDSS) an ordinal scale that ranges from 0 to 10, with higher scores indicating greater disability.

Guidelines

In September 2019, a consensus paper was updated by the MS Coalition that discusses the use of disease-modifying therapies in MS.[2] Many options from various disease classes, involving different mechanisms of action and modes of administration, have shown benefits in patients with MS.

Safety

Mavenclad has a Boxed Warning regarding malignancies and the risk of teratogenicity.[1] Mavenclad may increase the risk of malignancy. Also, Mavenclad is a cytotoxic drug. Special handling instructions and disposal procedures should be followed. There are several contraindications associated with the use of Mavenclad including: patients with current malignancy; pregnant women, women and men of reproductive potential who do not plan to use effective contraception during Mavenclad dosing and for 6 months after the last dose in each treatment course; human immunodeficiency virus (HIV); active chronic infection (e.g., hepatitis or tuberculosis); history of hypersensitivity to cladribine; and women intending to breastfeed on a treatment day in which Mavenclad is administered and for 10 days after the last dose. Warnings and Precautions for Mavenclad include lymphopenia, infections, hematologic toxicity, graft-versus-host disease with blood transfusion, and liver injury.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Mavenclad. All approvals are provided for the duration cited below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Mavenclad as well as the monitoring required for adverse events and

long-term efficacy, approval requires Mavenclad to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Mavenclad is recommended in those who meet the following criteria:

FDA-Approved Indications

3. Multiple Sclerosis. Approve for 1 year if the patient meets the following criteria (A and B):
- **C)** The patient has a relapsing form of multiple sclerosis; AND
- **D)** The agent is prescribed by or in consultation with a neurologist or a physician that specializes in the treatment of multiple sclerosis.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Mavenclad is not recommended in the following situations:

268. Clinically Isolated Syndrome. Mavenclad is not recommended for use in patients with clinically isolated syndrome due to its safety profile.[1]

269. Current Use with Other Disease-Modifying Agents Used for Multiple Sclerosis.
Note: Examples of disease modifying agents used for multiple sclerosis include Avonex® (interferon beta 1a injection [intramuscular]), Betaseron®/Extavia® (interferon beta-1b injection), Rebif® (interferon beta-1a injection [subcutaneous]), Copaxone®/Glatopa® (glatiramer acetate injection), Plegridy® (peginterferon beta-1a injection), Aubagio® (teriflunomide tablets), Gilenya® (fingolimod tablets), Mayzent® (siponimod tablets), Tecfidera® (dimethyl fumarate delayed-release capsules), Bafiertam® (monomethyl fumarate delayed-release capsules), Vumerity® (diroximel fumarate delayed-release capsules), Zeposia® (ozanimod capsules), Ocrevus® (ocrelizumab injection for intravenous use), Tysabri® (natalizumab injection for intravenous infusion), and Lemtrada® (alemtuzumab injection for intravenous use).[2] These agents are not indicated for use in combination. Additional data are required to determine if use of disease-modifying multiple sclerosis agents in combination is safe provides added efficacy.

270. Non-Relapsing Forms of Multiple Sclerosis.
Note: An example of a non-relapsing form of multiple sclerosis is primary progressive multiple sclerosis. The efficacy of Mavenclad has not been established in patients with multiple sclerosis with non-relapsing forms of the disease.[1]

271. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Multiple Sclerosis – Mayzent Prior Authorization Policy
- Mayzent® (siponimod tablets – Novartis)

REVIEW DATE: 08/05/2020

OVERVIEW

Mayzent, a sphingosine 1-phosphate receptor modulator, is indicated for the treatment of relapsing forms of multiple sclerosis (MS), to include clinically isolated syndrome, relapsing-remitting disease, and active secondary progressive disease in adults.[1]

Disease Overview

MS is a chronic, inflammatory, demyelinating, autoimmune disease of the central nervous system (CNS) that impacts almost 1,000,000 people in the US.[2] The condition is marked by inflammation and demyelination, as well as degenerative alterations. Patients usually experience relapses and remissions in their neurological symptoms. For most patients, the onset of MS symptoms occurs when patients are 20 to 40 years of age; however, children can get MS and new onset disease can occur in older adults. The MS disease course is heterogeneous but has some patterns. Approximately 85% to 90% of patients have a relapsing pattern at onset. However, this transitions over time in patients who are untreated to a worsening with very few or no relapses or magnetic resonance imaging (MRI) activity (secondary progressive MS). Around 10% to 15% of patients have a steady progression of symptoms over time (primary progressive MS), marked by some clinical manifestations or by MRI activity. Primary progressive MS is generally diagnosed in patients on the upper level of the typical age range (e.g., almost 40 years of age) and the distribution is equivalent among the two genders. Advances in the understanding of the MS disease process, as well as in MRI technology, spurned updated disease course descriptions in 2013,[3] as well as in 2017.[4] The revised disease courses are clinically isolated syndrome, relapsing remitting MS, primary progressive MS, and secondary progressive MS.[2-4] Clinically isolated syndrome is now more recognized among the course descriptions of MS. It is the first clinical presentation of MS that displays characteristics of inflammatory demyelination that may possibly be MS but has yet to fulfill diagnostic criteria. It is notable that the other MS designations can be further characterized considering whether patients have active disease (or not active), as well as if disease is worsening or stable. Disability in MS is commonly graded on the deterioration of mobility per the Expanded Disability Status Scale (EDSS) an ordinal scale that ranges from 0 to 10, with higher scores indicating greater disability.

Guidelines

In September 2019, a consensus paper was updated by the MS Coalition that discusses the use of disease-modifying therapies in MS.[2] Many options from various disease classes, involving different mechanisms of action and modes of administration, have shown benefits in patients with MS.

Safety

The initiation of Mayzent leads to decreases in heart rate.[1] First-dose 6-hour monitoring is recommended in certain patients with preexisting cardiac conditions. Additional monitoring beyond 6 hours may also be required. After the initial titration is complete, if Mayzent therapy is interrupted for four or more consecutive daily doses, reinitiate treatment with Day 1 of the titration regimen and also complete first-dose monitoring for patients for whom it is recommended. The most common adverse events AEs with Mayzent include headache, hypertension, and transaminase elevations. Mayzent has Warnings/Precautions regarding infections, macular edema, bradyarrhythmias and atrioventricular conduction delays, respiratory effects, liver injury, increased blood pressure, and posterior reversible encephalopathy syndrome.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Mayzent. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Mayzent as well as the monitoring required for adverse events and long-term efficacy, approval requires Mayzent to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Mayzent is recommended in those who meet the following criteria:

FDA-Approved Indications

4. Multiple Sclerosis. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** The patient has a relapsing form of multiple sclerosis; AND
- **B)** The agent is prescribed by or in consultation with neurologist or a physician who specializes in the treatment of multiple sclerosis.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Mayzent is recommended in those who meet the following criteria:

272. Current Use with Other Disease-Modifying Agents Used for Multiple Sclerosis.

Note: Examples of disease-modifying agents used for multiple sclerosis include Avonex® (interferon beta 1a injection [intramuscular]), Betaseron®/Extavia® (interferon beta-1b injection), Rebif® (interferon beta-1a injection [subcutaneous]), Copaxone®/Glatopa® (glatiramer acetate injection), Plegridy® (peginterferon beta-1a injection), Aubagio® (teriflunomide tablets), Gilenya® (fingolimod tablets), Mavenclad® (cladribine tablets), Tecfidera® (dimethyl fumarate delayed-release capsules), Bafiertam® (monomethyl fumarate delayed-release capsules), Vumerity® (diroximel fumarate delayed-release capsules), Zeposia® (ozanimod capsules), Ocrevus® (ocrelizumab injection for intravenous use), Tysabri® (natalizumab injection for intravenous infusion), and Lemtrada® (alemtuzumab injection for intravenous use).[2] These agents are not indicated for use in combination. Additional data are required to determine if use of disease-modifying multiple sclerosis agents in combination is safe provides added efficacy.

273. Non-Relapsing Forms of Multiple Sclerosis.

Note: An example of a non-relapsing form of multiple sclerosis is primary progressive multiple sclerosis. The efficacy of Mayzent has not been established in patients with multiple sclerosis with non-relapsing forms of the disease.[1]

274. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Multiple Sclerosis – Ocrevus® (ocrelizumab injection for intravenous use – Genentech/Roche)

DATE REVIEWED: 11/13/2019

OVERVIEW

Ocrevus is a CD20-directed cytolytic antibody indicated for the treatment of relapsing forms of multiple sclerosis (MS) to include clinically isolated syndrome, relapsing remitting MS, and active secondary progressive MS in adults.[1] Ocrevus is also indicated for primary progressive MS in adults. Ocrevus is the only MS medication indicated for use in primary progressive MS.

Disease Overview

MS is a chronic, inflammatory, demyelinating, autoimmune disease of the central nervous system (CNS) that impacts almost 1,000,000 people in the US.[2] The condition is marked by inflammation and demyelination, as well as degenerative alterations. Patients usually experience relapses and remissions in their neurological symptoms. For most patients, the onset of MS symptoms occurs when patients are 20 to 40 years of age; however, children can get MS and new onset disease can occur in older adults. The MS disease course is heterogeneous but has some patterns. Approximately 85% to 90% of patients have a relapsing pattern at onset. However, this transitions over time in patients who are untreated to a worsening with very few or no relapses or magnetic resonance imaging (MRI) activity (secondary progressive MS). Around 10% to 15% of patients have a steady progression of symptoms over time (primary progressive MS), marked by some clinical manifestations or by MRI activity. Primary progressive MS is generally diagnosed in patients on the upper level of the typical age range (e.g., almost 40 years of age) and the distribution is equivalent among the two genders.

Advances in the understanding of the MS disease process, as well as in MRI technology, spurned updated disease course descriptions in 2013,[3] as well as in 2017.[4] The revised disease courses are clinically isolated syndrome, relapsing remitting MS, primary progressive MS, and secondary progressive MS.[2-4] Clinically

isolated syndrome is now more recognized among the course descriptions of MS. It is the first clinical presentation of MS that displays characteristics of inflammatory demyelination that may possibly be MS but has yet to fulfill diagnostic criteria. It is notable that the other MS designations can be further characterized considering whether patients have active disease (or not active), as well as if disease is worsening or stable. Disability in MS is commonly graded on the deterioration of mobility per the Expanded Disability Status Scale (EDSS) an ordinal scale that ranges from 0 to 10, with higher scores indicating greater disability. Table 1 provides a comparison between relapsing MS and primary progressive MS.

Table 1. Relapsing MS vs. Primary Progressive MS.[2,5]

Characteristic	Relapsing MS	Primary Progressive MS
Percentage of the MS population	85% to 90%	10% to 15%
Clinical course	Recurrent subacute events of neurological dysfunction followed by complete or partial recovery.	Worsening of neurological dysfunction at disease onset with little or no recovery.
Age at onset	30 years of age	40 years of age
Gender	2:1 ratio of females to males	1:1 ratio of females to males
Disability prognosis	Generally can occur after many years.	Rapid progression of disability.
Inflammation/brain lesions	There is less inflammation with primary progressive MS. Also, patients with primary progressive MS have fewer brain lesions vs. relapsing MS and the lesions tend to contain fewer inflammatory cells.	
Systems impacted	Patients with primary progressive MS have relatively more issues with ambulation compared to patients with relapsing forms of MS.	

MS – Multiple sclerosis.

Many disease-modifying MS agents are FDA-approved for use in patients with relapsing forms of MS.[2] Options include self-administered injectable agents (e.g., glatiramer acetate products, and interferon beta agents), oral agents (i.e., Tecfidera® [dimethyl fumarate delayed-release capsules], Gilenya® [fingolimod capsules], Mayzent® [siponimod tablets]), Aubagio® [teriflunomide tablets], Mavenclad® [cladribine tablets], Vumerity™ [diroximel fumarate delayed-release capsules]), and intravenously infused agents (i.e., Tysabri® [natalizumab injection for intravenous use], Lemtrada® [alemtuzumab injection for intravenous use], and mitoxantrone injection for intravenous use). No other therapies, besides Ocrevus, are FDA-approved for primary progressive MS.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Ocrevus. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Ocrevus as well as the monitoring required for adverse events (AEs) and long-term efficacy, approval requires Ocrevus to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Ocrevus is recommended in those who meet the following criteria:

FDA-Approved Indications

2. Multiple Sclerosis (MS), Relapsing Forms. Approve for 1 year if the patient meets all of the following criteria (A, B, and C):
- **E)** The patient is ≥ 18 years of age; AND
- **F)** The patient has a relapsing form of multiple sclerosis (MS); AND
- **G)** Ocrevus is prescribed by or in consultation with a physician who specializes in the treatment of MS and/or a neurologist.

30. Multiple Sclerosis (MS), Primary Progressive. Approve for 1 year if the patient meets all of the following criteria (A and B).
- **74.** The patient is ≥ 18 years of age; AND
- **75.** Ocrevus is prescribed by or in consultation with a physician who specializes in the treatment of MS and/or a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Ocrevus has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below.

275. Concurrent Use with Other Disease-Modifying Agents Used for Multiple Sclerosis (MS). Note: Examples of disease modifying agents used for multiple sclerosis include Avonex® (interferon beta-1a injection [intramuscular]), Betaseron/Extavia (interferon beta-1b injection), Rebif® (interferon beta-1a injection [subcutaneous]), Plegridy® (peginterferon beta-1a injection), Copaxone®/Glatopa® (glatiramer acetate injection), glatiramer acetate injection, Gilenya® (fingolimod tablets), Aubagio® (teriflunomide tablets), Tecfidera® (dimethyl fumarate delayed-release capsules), Tysabri® (natalizumab injection for intravenous use), Mayzent® (siponimod tablets), Mavenclad® (cladribine tablets), Vumerity™ (diroximel fumarate delayed-release capsules), and Lemtrada® (alemtuzumab injection for intravenous use). The concomitant use of Ocrevus with other immune-modulating or immunosuppressive therapies is anticipated to increase the risk of immunosuppression.[1] Ocrevus is not indicated for use in combination with other MS disease-modifying therapies and the safety and efficacy have not been adequately established.

276. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Multiple Sclerosis – Plegridy Prior Authorization Policy

- Plegridy® (peginterferon beta-1a injection [subcutaneous] – Biogen Idec)

REVIEW DATE: 08/05/2020

OVERVIEW

Plegridy, an interferon beta product, is indicated for the treatment of relapsing forms of multiple sclerosis (MS) to include clinically isolated syndrome, relapsing remitting disease, and active secondary progressive disease in adults.[1]

Disease Overview

MS is a chronic, inflammatory, demyelinating, autoimmune disease of the central nervous system (CNS) that impacts almost 1,000,000 people in the US.[2] The condition is marked by inflammation and demyelination, as well as degenerative alterations. Patients usually experience relapses and remissions in their neurological symptoms. For most patients, the onset of MS symptoms occurs when patients are 20 to 40 years of age; however, children can get MS and new onset disease can occur in older adults. The MS disease course is heterogeneous but has some patterns. Approximately 85% to 90% of patients have a relapsing pattern at onset. However, this transitions over time in patients who are untreated to a worsening with very few or no relapses or magnetic resonance imaging (MRI) activity (secondary progressive MS). Around 10% to 15% of patients have a steady progression of symptoms over time (primary progressive MS), marked by some clinical manifestations or by MRI activity. Primary progressive MS is generally diagnosed in patients on the upper level of the typical age range (e.g., almost 40 years of age) and the distribution is equivalent among the two genders. Advances in the understanding of the MS disease process, as well as in MRI technology, spurned updated disease course descriptions in 2013,[3] as well as in 2017.[4] The revised disease courses are clinically isolated syndrome, relapsing remitting MS, primary progressive MS, and secondary progressive MS.[2-4] Clinically isolated syndrome is now more recognized among the course descriptions of MS. It is the first clinical presentation of MS that displays characteristics of inflammatory demyelination that may possibly be MS but has yet to fulfill diagnostic criteria. It is notable that the other MS designations can be further characterized considering whether patients have active disease (or not active), as well as if disease is worsening or stable. Disability in MS is commonly graded on the deterioration of mobility per the Expanded Disability Status Scale (EDSS) an ordinal scale that ranges from 0 to 10, with higher scores indicating greater disability.

Guidelines

In September 2019, a consensus paper was updated by the MS Coalition that discusses the use of disease-modifying therapies in MS.[2] Many options from various disease classes, involving different mechanisms of action and modes of administration, have shown benefits in patients with MS.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Plegridy. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Plegridy as well as the monitoring required for adverse events and long-term efficacy, approval requires Plegridy to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Plegridy is recommended in those who meet the following criteria:

FDA-Approved Indication

2. **Multiple Sclerosis.** Approve for 3 years if the patient meets the following criteria (A and B):
   - **V)** The patient has a relapsing form of multiple sclerosis; AND
   - **W)** The medication is prescribed by or in consultation with a neurologist or a physician who specializes in the treatment of multiple sclerosis.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Coverage of Plegridy is not recommended in the following situations:

31. Concurrent Use with Other Disease-Modifying Agents Used for Multiple Sclerosis.
Note: Examples of disease modifying agents used for multiple sclerosis include Avonex® (interferon beta-1a injection [intramuscular]), Betaseron®/Extavia® (interferon beta-1b injection), Rebif® (interferon beta-1a injection [subcutaneous]), Copaxone®/Glatopa® (glatiramer acetate injection), Aubagio® (teriflunomide tablets), Gilenya® (fingolimod tablets), Mavenclad® (cladribine tablets), Mayzent® (siponimod tablets), Tecfidera® (dimethyl fumarate delayed-release capsules), Bafiertam® (monomethyl fumarate delayed-release capsules), Vumerity® (diroximel fumarate delayed-release capsules), Zeposia® (ozanimod capsules), Ocrevus® (ocrelizumab injection for intravenous use), Tysabri® (natalizumab injection for intravenous infusion), and Lemtrada® (alemtuzumab injection for intravenous use).[2] These agents are not indicated for use in combination. Additional data are required to determine if use of disease-modifying multiple sclerosis agents in combination is safe provides added efficacy.

32. Non-Relapsing Forms of Multiple Sclerosis.
Note: An example of a non-relapsing form of multiple sclerosis is primary progressive multiple sclerosis. The efficacy of Plegridy has not been established in patients with multiple sclerosis with non-relapsing forms of multiple sclerosis.[1]

33. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Multiple Sclerosis – Vumerity Prior Authorization Policy
- Vumerity® (diroximel fumarate delayed-release capsules – Biogen/Alkermes)

REVIEW DATE: 08/05/2020

OVERVIEW
Vumerity is indicated for the treatment of patients with relapsing forms of multiple sclerosis (MS) to include clinically isolated syndrome, relapsing remitting disease, and active secondary progressive MS in adults.[1]

Disease Overview
MS is a chronic, inflammatory, demyelinating, autoimmune disease of the central nervous system (CNS) that impacts almost 1,000,000 people in the US.[2] The condition is marked by inflammation and demyelination, as well as degenerative alterations. Patients usually experience relapses and remissions in their neurological symptoms. For most patients, the onset of MS symptoms occurs when patients are 20 to 40 years of age; however, children can get MS and new onset disease can occur in older adults. The MS disease course is heterogeneous but has some patterns. Approximately 85% to 90% of patients have a relapsing pattern at onset. However, this transitions over time in patients who are untreated to a worsening with very few or no relapses or magnetic resonance imaging (MRI) activity (secondary progressive MS). Around 10% to 15% of patients have a steady progression of symptoms over time (primary progressive MS), marked by some clinical manifestations or by MRI activity. Primary progressive MS is generally diagnosed in patients on the upper level of the typical age range (e.g., almost 40 years of age) and the distribution is equivalent among the two genders. Advances in the understanding of the MS disease process, as well as in MRI technology, spurned updated disease course descriptions in 2013,[3] as well as in 2017.[4] The revised disease courses are clinically isolated syndrome, relapsing remitting MS, primary progressive MS, and secondary progressive MS.[2-4] Clinically isolated syndrome is now more recognized among the course descriptions of MS. It is the first clinical presentation of MS that displays characteristics of inflammatory demyelination that may possibly be MS but has yet to fulfill diagnostic criteria. It is notable that the other MS designations can be further characterized considering whether patients have active disease (or not active), as well as if disease is worsening or stable. Disability in MS is commonly graded on the deterioration of mobility per the Expanded Disability Status Scale (EDSS) an ordinal scale that ranges from 0 to 10, with higher scores indicating greater disability.

Guidelines

In September 2019, a consensus paper was updated by the MS Coalition that discusses the use of disease-modifying therapies in MS.[2] Many options from various disease classes, involving different mechanisms of action and modes of administration, have shown benefits in patients with MS.

Safety

Progressive multifocal leukoencephalopathy has occurred in patients with MS treated with Tecfidera® (dimethyl fumarate delayed-release capsules), which has the same active metabolite as Vumerity.[1]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Vumerity. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Vumerity as well as the monitoring required for adverse events and efficacy, approval requires Vumerity to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Vumerity is recommended in those who meet the following criteria.

FDA-Approved Indication

1. **Multiple Sclerosis.** Approve for 1 year if the patient meets the following criteria (A and B):
   - **E)** The patient has a relapsing form of multiple sclerosis; AND
   - **F)** The agent is prescribed by or in consultation with a neurologist or a physician who specializes in the treatment of multiple sclerosis.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Vumerity is not recommended in the following situations:

280. Concurrent Use with Other Disease-Modifying Agents Used for Multiple Sclerosis.

Note: Examples of disease modifying agents used for multiple sclerosis include Aubagio® (teriflunomide tablets), Avonex® (interferon beta 1a injection [intramuscular]), Betaseron®/Extavia® (interferon beta-1b injection), Rebif® (interferon beta-1a injection [subcutaneous]), Copaxone®/Glatopa® (glatiramer acetate injection), Plegridy® (peginterferon beta-1a injection), Gilenya® (fingolimod tablets), Mavenclad® (cladribine tablets), Mayzent® (siponomid tablets), Tecfidera® (dimethyl fumarate delayed-release capsules), Bafiertam® (monomethyl fumarate delayed-release capsules), Zeposia® (ozanimod capsules), Ocrevus® (ocrelizumab injection for intravenous use), Tysabri® (natalizumab injection for intravenous infusion), and Lemtrada® (alemtuzumab injection for intravenous use).[2] These agents are not indicated for use in combination. Additional data are required to determine if use of disease-modifying multiple sclerosis agents in combination is safe provides added efficacy.

281. Non-Relapsing Forms of Multiple Sclerosis.

Note: An example of a non-relapsing form of multiple sclerosis is primary progressive multiple sclerosis. The efficacy of Vumerity has not been established in patients with multiple sclerosis with non-relapsing forms of multiple sclerosis.[1]

282. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Multiple Sclerosis – Zeposia Prior Authorization Policy
- Zeposia® (ozanimod capsules – Celegene)

REVIEW DATE: 08/05/2020

OVERVIEW
Zeposia, a sphingosine 1-phosphate receptor modulator, is indicated for the treatment of relapsing forms of multiple sclerosis (MS), to include clinically isolated syndrome, relapsing-remitting disease, and active secondary progressive disease in adults.[1]

Disease Overview
MS is a chronic, inflammatory, demyelinating, autoimmune disease of the central nervous system (CNS) that impacts almost 1,000,000 people in the US.[2] The condition is marked by inflammation and demyelination, as well as degenerative alterations. Patients usually experience relapses and remissions in their neurological symptoms. For most patients, the onset of MS symptoms occurs when patients are 20 to 40 years of age; however, children can get MS and new onset disease can occur in older adults. The MS disease course is heterogeneous but has some patterns. Approximately 85% to 90% of patients have a relapsing pattern at onset. However, this transitions over time in patients who are untreated to a worsening with very few or no relapses or magnetic resonance imaging (MRI) activity (secondary progressive MS). Around 10% to 15% of patients have a steady progression of symptoms over time (primary progressive MS), marked by some clinical manifestations or by MRI activity. Primary progressive MS is generally diagnosed in patients on the upper level of the typical age range (e.g., almost 40 years of age) and the distribution is equivalent among the two genders. Advances in the understanding of the MS disease process, as well as in MRI technology, spurned updated disease course descriptions in 2013,[3] as well as in 2017.[4] The revised disease courses are clinically isolated syndrome, relapsing remitting MS, primary progressive MS, and secondary progressive MS.[2-4] Clinically isolated syndrome is now more recognized among the course descriptions of MS. It is the first clinical presentation of MS that displays characteristics of inflammatory demyelination that may possibly be MS but has yet to fulfill diagnostic criteria. It is notable that the other MS designations can be further characterized considering whether patients have active disease (or not active), as well as if disease is worsening or stable. Disability in MS is commonly graded on the deterioration of mobility per the Expanded Disability Status Scale (EDSS) an ordinal scale that ranges from 0 to 10, with higher scores indicating greater disability.

Guidelines

In September 2019, a consensus paper was updated by the MS Coalition that discusses the use of disease-modifying therapies in MS.[2] Many options from various disease classes, involving different mechanisms of action and modes of administration, have shown benefits in patients with MS.

Safety

Various assessments are required prior to the first dose of Zeposia (e.g., complete blood count, cardiac evaluation).[1] The most common adverse events with Zeposia include upper respiratory tract infection, hepatic transaminase elevations, orthostatic hypotension, urinary tract infection, back pain, and hypertension. Zeposia has Warnings/Precautions regarding infections, macular edema, bradyarrhythmias and atrioventricular conduction delays, respiratory effects, liver injury, increased blood pressure, and respiratory effects. Due to the time it takes to eliminate the drug from the body after cessation of treatment, the potential risk of the fetus may persist, therefore, women of childbearing potential should use effective contraception to avoid pregnancy during and for up to 3 months after cessation of Zeposia therapy.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Zeposia. All approvals are provided for the duration cited below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Zeposia as well as the monitoring required for adverse events and long-term efficacy, approval requires Zeposia to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zeposia is recommended in those who meet the following criteria:

FDA-Approved Indications

5. Multiple Sclerosis. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** The patient has a relapsing form of multiple sclerosis; AND
- **B)** The agent is prescribed by or in consultation with neurologist or a physician who specializes in the treatment of multiple sclerosis.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Zeposia is not recommended in the following situations:

283. Current Use with Other Disease-Modifying Agents Used for Multiple Sclerosis.

Note: Examples of disease-modifying agents used for multiple sclerosis include Avonex® (interferon beta 1a injection [intramuscular]), Betaseron®/Extavia® (interferon beta-1b injection), Rebif® (interferon beta-1a injection [subcutaneous]), Copaxone®/Glatopa® (glatiramer acetate injection), Plegridy® (peginterferon beta-1a injection), Aubagio® (teriflunomide tablets), Gilenya® (fingolimod tablets), Mavenclad® (cladribine tablets), Mayzent® (siponimod tablets), Tecfidera® (dimethyl fumarate delayed-release capsules), Vumerity® (diroximel fumarate delayed-release capsules), Bafiertam® (monomethyl fumarate delayed-release capsules), Ocrevus® (ocrelizumab injection for

intravenous use), Tysabri® (natalizumab injection for intravenous infusion), and Lemtrada® (alemtuzumab injection for intravenous use).[2] These agents are not indicated for use in combination. Additional data are required to determine if use of disease-modifying multiple sclerosis agents in combination is safe provides added efficacy.

284. Non-Relapsing Forms of Multiple Sclerosis.
Note: An example of a non-relapsing form of multiple sclerosis is primary progressive multiple sclerosis. The efficacy of Zeposia has not been established in patients with multiple sclerosis with non-relapsing forms of the disease.[1]

285. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Multiple Sclerosis and Crohn's Disease – Tysabri® (natalizumab injection for intravenous use – Biogen)

DATE REVIEWED: 11/13/2019

OVERVIEW

Tysabri, an integrin receptor antagonist, is indicated for the treatment of relapsing forms of multiple sclerosis (MS) to include clinically isolated syndrome, relapsing remitting disease, and active secondary progressive disease in adults.[1] Tysabri increases the risk of progressive multifocal leukoencephalopathy (PML). When initiating and continuing treatment with Tysabri physicians should consider whether the expected benefit of Tysabri is sufficient to offset the risks. Tysabri is also indicated for inducing and maintaining clinical response and remission in adults with moderately to severely active Crohn's disease with evidence of inflammation who have had an inadequate response to, or are unable to tolerate, conventional Crohn's disease therapies and inhibitors of tumor necrosis factor (TNF)-α.[1] Tysabri should not be used in combination with immunosuppressants (e.g., azathioprine, 6-mercaptopurine, cyclosporine, methotrexate) or inhibitors of TNFα. For both indications, the recommended dose of Tysabri is 300 mg by intravenous infusion over approximately 1 hour once every 4 weeks.[1]

Disease Overview

Multiple Sclerosis (MS)

MS is a chronic, inflammatory, demyelinating, autoimmune disease of the central nervous system (CNS) that impacts almost 1,000,000 people in the US.[2] The condition is marked by inflammation and

demyelination, as well as degenerative alterations. Patients usually experience relapses and remissions in their neurological symptoms. For most patients, the onset of MS symptoms occurs when patients are 20 to 40 years of age; however, children can get MS and new onset disease can occur in older adults. The MS disease course is heterogeneous but has some patterns. Approximately 85% to 90% of patients have a relapsing pattern at onset. However, this transitions over time in patients who are untreated to a worsening with very few or no relapses or magnetic resonance imaging (MRI) activity (secondary progressive MS). Around 10% to 15% of patients have a steady progression of symptoms over time (primary progressive MS), marked by some clinical manifestations or by MRI activity. Primary progressive MS is generally diagnosed in patients on the upper level of the typical age range (e.g., almost 40 years of age) and the distribution is equivalent among the two genders. Advances in the understanding of the MS disease process, as well as in MRI technology, spurned updated disease course descriptions in 2013,[3] as well as in 2017.[4] The revised disease courses are clinically isolated syndrome, relapsing remitting MS, primary progressive MS, and secondary progressive MS.[2-4] Clinically isolated syndrome is now more recognized among the course descriptions of MS. It is the first clinical presentation of MS that displays characteristics of inflammatory demyelination that may possibly be MS but has yet to fulfill diagnostic criteria. It is notable that the other MS designations can be further characterized considering whether patients have active disease (or not active), as well as if disease is worsening or stable. Disability in MS is commonly graded on the deterioration of mobility per the Expanded Disability Status Scale (EDSS) an ordinal scale that ranges from 0 to 10, with higher scores indicating greater disability.

Many disease-modifying MS agents are FDA-approved for use in patients with relapsing forms of MS.[2] Options include self-administered injectable agents (e.g., glatiramer acetate products, and interferon beta agents), oral agents (i.e., Tecfidera® [dimethyl fumarate delayed-release capsules], Gilenya® [fingolimod capsules], Mayzent® [siponimod tablets]), Aubagio® [teriflunomide tablets], Mavenclad® [cladribine tablets], Vumerity™ [diroximel fumarate delayed-release capsules]), and intravenously infused agents (i.e., Lemtrada® [alemtuzumab injection for intravenous use], Ocrevus® [ocrelizumab injection for intravenous use], and mitoxantrone injection for intravenous use).

Crohn's disease
Crohn's disease is a chronic inflammatory disease of the gastrointestinal tract.[6] The prevalence has been increasing worldwide.[7] Common symptoms of Crohn's disease include abdominal pain, diarrhea, fatigue, weight loss, fever, anemia, and recurrent fistulas. Adults with Crohn's disease may be at risk of bone fractures, as well as thromboembolism. Other extraintestinal manifestations may occur (e.g., primary sclerosing cholangitis). Younger patients may experience growth failure.[6,7] The chronic intestinal inflammation over time leads to intestinal complications such as strictures, fistulas, and abscesses. Only 20% to 30% of patients with Crohn's disease will have a nonprogressive or indolent course. Therefore, it is appropriate to identify therapies that will achieve adequate control for the patient. Many different therapies are available including corticosteroids, immunomodulators (e.g., azathiopurine, 6-mercaptopurine), and anti-TNF agents (e.g., infliximab products, adalimumab products, Cimzia® [certolizumab pegol injection for subcutaneous use]).

Guidelines
A practice guideline recommendation regarding disease-modifying agents for adults with MS from the American Academy of Neurology (2018) states to consider Tysabri for patients with MS who have highly active disease.[5]

The American College of Gastroenterology (ACG) has guidelines on management of Crohn's disease in adults (2018).[7] Some of the recommendations are summarized for moderate to severe disease or moderate to high-risk disease. Oral corticosteroids are effective and can be used short-term to alleviate signs and

symptoms of moderately to severely active Crohn's disease. Thiopurines (azathiopurine, 6-mercaptopurine) are effective and should be considered for use for steroid-sparing Crohn's disease. Azathioprine and 6-mercaptopurine are effective therapies and should be considered for patients with Crohn's disease for maintenance of remission. Anti-TNF agents (e.g., infliximab products, adalimumab products, Cimzia® [certolizumab pegol injection for subcutaneous use]) should be used to treat Crohn's disease that is resistant to treatment with corticosteroids. Anti-TNF agents should be given for Crohn's disease refractory to thiopurines or methotrexate. For patients with moderately to severely active Crohn's disease and objective evidence of active disease, anti-integrin therapy (with Entyvio® [vedolizumab injection for intravenous use) with or without an immunomodulator is more effective than placebo and should be considered for use for induction of symptomatic remission in patients with Crohn's disease. Tysabri is more effective than placebo and should be considered to be used for induction of symptomatic response and remission in patients with active Crohn's disease (strong recommendation; high level of evidence). Tysabri should be used for maintenance of Tysabri-induced remission of Crohn's disease only if serum antibody to John Cunningham virus is negative. Stelara® (ustekinumab injection for subcutaneous or intravenous use) should be given for moderate to severe Crohn's disease patients who failed treatment with corticosteroids, thiopurines, methotrexate, or anti-TNF inhibitors or who have had no prior exposure to anti-TNF inhibitors.

Safety

Tysabri has a Boxed Warning regarding the risk of PML. Tysabri is available only through a special restricted distribution Risk Evaluation and Mitigation Strategy (REMS) program called the TOUCH® Prescribing Program, which requires registration by the prescribers, patients, infusion centers, and pharmacies associated with infusion centers.[1] Tysabri must be administered only to patients enrolled in and who meet all the conditions of the TOUCH Prescribing Program.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Tysabri injection. Because of the specialized skills required for evaluation and diagnosis of patients treated with Tysabri as well as the monitoring required for adverse events and long-term efficacy, approval requires Tysabri to be prescribed by or in consultation with a physician who specializes in the condition being treated. Approvals for multiple sclerosis are provided for 1 year in duration. Approvals for Crohn's disease are for an initial 3-month approval duration (where 1 month is equal to 30 days), and then for a 1 year approval for patients currently receiving Tysabri.

Automation: None.

Documentation: In the *Multiple Sclerosis – Tysabri Prior Authorization Policy*, documentation is required where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes and magnetic resonance imaging (MRI) reports.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tysabri injection is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Multiple Sclerosis (MS).** Approve for 1 year if the patient meets one of the following criteria (A or B):

A) Initial Therapy. Approve for 1 year if the patient meets all of the following criteria (i, ii, iii and iv):
- **i.** The patient is ≥ 18 years of age; AND
- **ii.** The patient has a relapsing form of multiple sclerosis (MS); AND
- **iii.** Tysabri is prescribed by or in consultation with a physician who specializes in the treatment of multiple sclerosis (MS) and/or a neurologist; AND
- **iv.** The patient meets one of the following (a or b):
  - **a)** According to the prescriber the patient has had an inadequate response or is unable to tolerate one disease-modifying agent used for MS. Note: Examples of disease-modifying agents for multiple sclerosis include Avonex (interferon beta-1a for intramuscular [IM] injection), Rebif [interferon beta-1a for subcutaneous [SC] injection), Betaseron (interferon beta-1b for SC injection), Extavia (interferon beta-1b for SC injection), Copaxone/Glatopa (glatiramer acetate injection for SC use), glatiramer acetate injection, Plegridy (peginterferon beta-1a SC injection), Gilenya (fingolimod capsules), Aubagio (teriflunomide tablets), Tecfidera (dimethyl fumarate delayed-release capsules), Mavenclad (cladribine tablets), Mayzent (siponimod tablets), Vumerity™ (diroximel fumarate delayed-release capsules), Lemtrada® (alemtuzumab injection for intravenous use), and Ocrevus® (ocrelizumab injection for intravenous); OR
  - **b)** According to the prescriber the patient has highly-active or aggressive multiple sclerosis by meeting one of the following (1, 2, 3, or 4):
    - **5.** The patient has demonstrated rapidly-advancing deterioration(s) in physical functioning (e.g., loss of mobility/or lower levels of ambulation, severe changes in strength or coordination) **[documentation required]**; OR
    - **6.** Disabling relapse(s) with suboptimal response to systemic corticosteroids **[documentation required]**; OR
    - **7.** Magnetic resonance imaging [MRI] findings suggest highly-active or aggressive multiple sclerosis (e.g., new, enlarging, or a high burden of T2 lesions or gadolinium-enhancing lesions) **[documentation required]**; OR
    - **8.** Manifestations of multiple sclerosis-related cognitive impairment **[documentation required]**; OR

B) Patients currently receiving Tysabri. Approve for 1 year if the patient meets all of the following criteria (i, ii, and iii):
- **i.** The patient is ≥ 18 years of age; AND
- **ii.** The patient has a relapsing form of multiple sclerosis; AND
- **iii.** Tysabri is prescribed by or in consultation with a physician who specializes in the treatment of MS and/or a neurologist.

2. Crohn's Disease. Approve for the duration noted below if the patient meets one of the following criteria (A OR B):

A) Initial Therapy. Approve for 3 months if the patient meets all of the following criteria (i, ii, iii, and iv):
- **i.** The patient is ≥ 18 years of age; AND
- **ii.** The patient has moderately to severely active Crohn's disease; AND
- **iii.** Tysabri is prescribed by or in consultation with a gastroenterologist; AND
- **iv.** The patient has tried at least two biologics for Crohn's disease; Note: Examples include an adalimumab product, Cimzia (certolizumab pegol for SC injection), an infliximab product, Entyvio (vedolizumab injection for IV use), or Stelara (ustekinzumab for SC injection or for IV infusion); OR

B) For patients currently receiving Tysabri. Approve for 1 year if the patient meets all of the following criteria (i, ii and iii):
- **i.** The patient is ≥ 18 years of age; AND
- **ii.** The patient has had a response (e.g., reduced number of liquid/soft stools, reduced abdominal pain, less use of antidiarrheal agents) as determined by the prescriber; AND
- **iii.** Tysabri is prescribed by or in consultation with a gastroenterologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Tysabri has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

1. **Concurrent Use with an Immunosuppressant Agent in Patients with Crohn's Disease.** Note: Examples include 6-mercaptopurine, azathioprine, cyclosporine, methotrexate, an infliximab product, an adalimumab product, Cimzia, Entyvio and Stelara. Ordinarily, patients who are receiving chronic immunosuppressant or immunomodulatory therapy or who have systemic medical conditions resulting in significantly compromised immune function should not take Tysabri.[1]

2. **Concurrent Use with Other Disease-Modifying Agents Used for Multiple Sclerosis (MS).** Note: Examples of disease-modifying agents used for multiple sclerosis include–Betaseron®/Extavia® (interferon beta-1b injection), Rebif® (interferon beta-1a injection [subcutaneous]), Copaxone®/Glatopa® (glatiramer acetate injection), glatiramer acetate injection, Avonex® (interferon beta-1a injection [intramuscular]), Lemtrada® (alemtuzumab injection for intravenous use), Plegridy® (peginterferon beta-1a injection), Gilenya® (fingolimod tablets), Aubagio® (teriflunomide tablets), Tecfidera® (dimethyl fumarate delayed-release capsules), Vumerity™ (diroximel fumarate delayed-release capsules), Mayzent® (siponimod tablets), Mavenclad® (cladribine tablets), and Ocrevus® (ocrelizumab injection for intravenous use). Tysabri is only indicated as monotherapy due to an increased risk of PML.[1]

3. **Non-Relapsing Forms of Multiple Sclerosis.** Note: An example of a non-relapsing form of multiple sclerosis (MS) is primary progressive MS. The safety and efficacy of Tysabri have not been established in patients with primary progressive MS.

4. **Ulcerative Colitis.** Efficacy data with use of Tysabri are limited.[8]

5. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Muscular Dystrophy – Emflaza™ (deflazacort tablets and oral suspension – PTC Therapeutics, Inc.)

DATE REVIEWED: 3/11/2020

OVERVIEW

Emflaza is a corticosteroid indicated for the treatment of patients 2 years of age and older with Duchenne muscular dystrophy (DMD).[1] The efficacy and safety of Emflaza have not been established in patients < 2 years of age. The Emflaza oral suspension contains benzyl alcohol as a preservative and therefore carries a warning about the risk of gasping syndrome which can occur in neonates and low birth weight infants.

Disease Overview

DMD is an X-linked recessive disease affecting 1 in 3,600 to 6,000 newborn male infants.[2] The disease is attributed to large frame-shift deletions in the DMD gene (chromosome Xp21) which lead to loss of a structural protein of muscle cells (dystrophin).[3] Females carriers are usually asymptomatic but some may show mild symptoms.[2] Most patients present with symptoms of DMD between the ages of 3 and 5 years. There are wide variances in how quickly DMD progresses, but without intervention death is at approximately 19 years of age.[2-3] With respiratory, cardiac, orthopedic and rehabilitative interventions and use of corticosteroids, children born today can have a life expectancy of up to 40 years.

Clinical Efficacy

The efficacy and safety of Emflaza were established in two pivotal trials in boys with DMD who were ≥ 5 years of age.[4-5] In one study, treatment consisted of Emflaza 0.9 mg/kg/day, Emflaza 1.2 mg/kg/day, or prednisone 0.75 mg/kg/day (n = 196).[4] The primary efficacy analysis, mean change from baseline to Week 12 in average muscle strength (assessed by modified Medical Research Council [MRC]), demonstrated a significant least squares (LS) mean difference in favor of active treatment vs. placebo: Emflaza 0.9 mg/kg/day (0.25 vs. -0.1, P = 0.17), Emflaza 1.2 mg/kg/day (0.36 vs. -0.1, P = 0.0003), and prednisone 0.75 mg/kg/day (0.37 vs. -0.1, P = 0.0002). Adverse events (AEs) differed between prednisone and Emflaza treatment groups. Cushingoid appearance (69.4%), erythema (41.8%), and hirsutism (39.3%) were observed in a numerically greater proportion of patients in the prednisone group compared with either dose of Emflaza. Central obesity was reported in a statistically significant greater proportion of patients treated with prednisone vs. Emflaza. Psychiatric AEs were generally reported at a higher rate in the prednisone group compared with both Emflaza groups.

Guidelines

There are guidelines for the diagnosis and management of DMD available from the DMD Care Considerations Working Group (updated 2018).[6] Dystrophin gene deletion and duplication testing are

usually the first test done to confirm a diagnosis of DMD. If deletion/duplication testing is negative, dystrophin gene sequencing is done to look for remaining types of mutations. If generic testing does not confirm a diagnosis of DMD, then a muscle biopsy should be performed to test for the presence of dystrophin protein. These guidelines additionally discuss the benefits of glucocorticoids in patients with DMD. These benefits include the loss of ambulation at a later age, preservation of upper limb and respiratory function, and avoidance of scoliosis surgery. Although the benefits of glucocorticoids are well established, based on available data, there is uncertainty about which specific products and doses are best.[6]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Emflaza. Because of the specialized skills required for evaluation and diagnosis of patients treated with Emflaza as well as the monitoring required for adverse events and long-term efficacy, approval requires Emflaza to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for 1 year.

Documentation: Documentation is required where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes and/or laboratory data.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage Emflaza is recommended in those who meet the following criteria:

FDA-Approved Indications

31. Duchenne Muscular Dystrophy (DMD). Approve for 1 year if the patient meets ALL of the following criteria (A, B, and C):

- **A)** The patient is 2 years of age and older; AND
- **B)** The patient meets ONE of the following conditions (i or ii):
  - **i.** The patient has tried prednisone for ≥ 6 months **[documentation required]** AND according to the prescriber, the patient has had at least one of the following significant intolerable adverse effects (AEs) [a, b, c, or d]:
    - **a)** Cushingoid appearance **[documentation required]**; OR
    - **b)** Central (truncal) obesity **[documentation required]**; OR
    - **c)** Undesirable weight gain defined as ≥ 10% of body weight gain increase over a 6-month period **[documentation required]**; OR
    - **d)** Diabetes and/or hypertension that is difficult to manage according to the prescribing physician] **[documentation required]**.
  - **ii.** According to the prescriber, the patient has experienced a severe behavioral adverse event (AE) while on prednisone therapy that has or would require a prednisone dose reduction **[documentation required]**.
- **C)** The medication is prescribed by or in consultation with a physician who specializes in the treatment of Duchenne muscular dystrophy (DMD) and/or neuromuscular disorders.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Emflaza has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

286. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Muscular Dystrophy – Exondys 51™ (eteplirsen intravenous infusion – Sarepta)

DATE REVIEWED: 04/15/2020

OVERVIEW

Exondys 51 is indicated for the treatment of Duchenne muscular dystrophy (DMD) in patients who have a confirmed mutation of the DMD gene that is amenable to exon 51 skipping.[1] Exondys 51 was approved for this indication under accelerated approval based on an increase in dystrophin observed in the skeletal muscle of some patients who received the drug. However, a clinical benefit of Exondys has not been established. The prescribing information notes that continued FDA-approval for this indication may be contingent upon verification and description of clinical benefit in confirmatory trials.

Disease Overview

DMD is an X-linked recessive disease affecting 1 in 3,600 to 6,000 newborn male infants.[2] The disease is attributed to large frame-shift deletions in the DMD gene (chromosome Xp21) which lead to loss of a structural protein of muscle cells (dystrophin).[3] Over 4,700 mutations on the DMD gene have been identified which lead to a deficiency in production of dystrophin.[2] Therefore, the type of mutation and its effect on the production of dystrophin accounts for the variable phenotypic expression.[4] Females carriers are usually asymptomatic but some may show mild symptoms.[2] There are wide variances in how quickly DMD progresses, but without intervention death is at approximately 19 years of age.[2-4] With respiratory,

cardiac, orthopedic and rehabilitative interventions and use of corticosteroids, children born today can have a life expectancy of up to 40 years.

Exondys 51 is an antisense oligonucleotide designed to bind to exon 51 of dystrophin pre-mRNA, resulting in exclusion of this exon during mRNA processing in patients with genetic mutations that are amenable to exon 51 skipping.[1] These patients represent approximately 13% of all patients with DMD.[5] This genetic manipulation intends to restore the reading frame of the resulting mRNA. The result would be production of a shortened, but partially functional dystrophin protein as seen in less severe forms of muscular dystrophy (e.g., Becker muscular dystrophy).

Guidelines

There are guidelines for the diagnosis and management of DMD available from the DMD Care Considerations Working Group (2018).[4] Genetic testing for a DMD mutation in a blood sample is always required. By fully characterizing the mutation, the predicted effect on the reading frame can be identified, which is the major determinant of phenotype and will determine eligibility for mutation-specific clinical trials. In patients with no mutation identified but with signs/symptoms of DMD, a muscle biopsy is clinically indicated. Glucocorticoids slow decline in muscle strength and function in DMD. Use of corticosteroids reduces the risk of scoliosis and stabilizes pulmonary function. Continued treatment after the patient loses ambulation provides a reduction in the risk of progressive scoliosis and stabilization of pulmonary function tests. Therefore, glucocorticoids should be considered for all patients with DMD. Exondys 51 is mentioned as an emerging product, approved by an accelerated pathway for those with a mutation in the dystrophin gene amenable to exon 51 skipping.

POLICY STATEMENT

The prescribing information for Exondys 51 states that a clinical benefit has not been established. Due to the lack of clinical efficacy data, **approval is not recommended** for Exondys 51.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

None.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Exondys 51 has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

1. **Duchenne Muscular Dystrophy (DMD).** Due to the lack of clinical efficacy data, approval is not recommended for Exondys 51. The prescribing information for Exondys 51 states that a clinical benefit has not been established.[1] Furthermore, a systemic review and meta-analysis does not show benefit of exon-skipping therapies for DMD.[10] FDA has required a randomized, controlled trial evaluation post-marketing to establish efficacy of Exondys 51. Results are expected in 2021.

   The efficacy of Exondys 51 was evaluated in open-label studies in patients with DMD that is amenable to exon 51 skipping.[1,6-9] One study (n = 12) assessed the effect of Exondys 51 on dystrophin and the potential clinical benefit; however, there was insufficient information on dystrophin levels prior to treatment so it is not possible to estimate a treatment effect on dystrophin levels. The adjusted mean

change in the 6-minute walk test (6MWT) from baseline to Week 24 was -25.8 (±30.6) meters for placebo; -128.2 (±31.6) meters for Exondys 51, 30 mg/kg; and -0.3 (±31.2) meters for Exondys 51, 50 mg/kg. An extension of this study evaluated the same patients and compared disease progression with matched historical controls; at Month 36 the difference in 6MWT distance for Exondys 51 vs. historical control was 121 meters in favor of the Exondys 51 cohort (P = 0.028). Over 36 months, ambulation was lost in 16.7% of patients (n = 2/12) treated with Exondys 51 vs. 46.2% of patients (n = 6/13) in the historical control cohort. The average dystrophin protein level after 180 weeks of treatment with Exondys 51 was 0.93% of the dystrophin level in healthy subjects. But because there was insufficient information on baseline dystrophin levels prior to treatment, it is not possible to estimate a treatment effect. Following 240 weeks of treatment, the percent predicted forced vital capacity (FVC%p) was a decrease of 2.3% per year with Exondys 51 compared with a decrease of 4.1% in a natural history cohort.[11] In patients treated with Exondys 51, the percent predicted maximum inspiratory pressure (MIP%p) decreased by 1% per year, and the percent predicted maximum expiratory pressure (MEP%p) decreased by 2.6% per year. However, MIP and MEP were not assessed in the natural history cohort. Another study included 12 new patients with DMD and reports only on the effect of Exondys 51 on dystrophin levels; further clinical efficacy data are not yet available for these 12 patients.[7-9] After 48 weeks of treatment with Exondys 51 the dystrophin level was 0.44% ± 0.43% of the dystrophin level in healthy subjects (P < 0.05). The median increase after 48 weeks was 0.1%.

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Muscular Dystrophy – Viltepso Prior Authorization Policy
- Viltepso™ (viltolarsen for intravenous injection)

REVIEW DATE: 08/19/2020

OVERVIEW

Viltepso, an antisense oligonucleotide, is indicated for the treatment of Duchenne muscular dystrophy (DMD) in patients who have a confirmed mutation of the DMD gene that is amenable to exon 53 skipping.[1] This indication was granted accelerated approval based on an increase in dystrophin in skeletal muscle observed in patients treated with Viltepso. The prescribing information notes that continued FDA-approval for this indication may be contingent upon verification of clinical benefit in a confirmatory trial.

Viltepso is an antisense oligonucleotide designed to bind to exon 53 of dystrophin pre-mRNA, resulting in exclusion of this exon during mRNA processing in patients with genetic mutations that are amenable to exon 53 skipping.[1] These patients represent up to 10% of all patients with DMD.[2] This genetic manipulation intends to restore the reading frame of the resulting mRNA. The result would be production of a shortened, but partially functional dystrophin protein as seen in less severe forms of muscular dystrophy (e.g., Becker muscular dystrophy). Of note, the reading frame of certain deletions (e.g., exon 52 deletions) can be restored by skipping either exon 51 or exon 53.[3] Approximately 8% of mutations are amenable to skipping exon 53 with Viltepso but are not amenable to skipping of exon 51.

Guidelines

Viltepso and other exon 53 skipping therapies are not addressed in guidelines for DMD. There are guidelines for the diagnosis and management of DMD available from the DMD Care Considerations Working Group (2018).[4] Genetic testing for a DMD mutation in a blood sample is always required. By fully characterizing the mutation, the predicted effect on the reading frame can be identified, which is the major determinant of phenotype and will determine eligibility for mutation-specific clinical trials. In patients with no mutation identified but with signs/symptoms of DMD, a muscle biopsy is clinically indicated. Glucocorticoids slow decline in muscle strength and function in DMD. Use of corticosteroids reduces the risk of scoliosis and stabilizes pulmonary function. Continued treatment after the patient loses

ambulation provides a reduction in the risk of progressive scoliosis and stabilization of pulmonary function tests. Therefore, glucocorticoids should be considered for all patients with DMD. Exondys 51 (eteplirsen intravenous infusion) is mentioned as an emerging product, approved by an accelerated pathway for those with a mutation in the dystrophin gene amenable to exon 51 skipping.

POLICY STATEMENT

The prescribing information for Viltepso states that approval is based on dystrophin production in a limited number of patients (n = 8 treated with the approved dose) with DMD, but approval may be contingent upon a confirmatory trial. Due to inadequate clinical efficacy data, **approval is not recommended** for Viltepso.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
None.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Coverage of Viltepso is not recommended in the following situations:

3. **Duchenne Muscular Dystrophy (DMD).** Due to inadequate clinical efficacy data, approval is not recommended for Viltepso. A systemic review and meta-analysis of other exon skipping therapies (i.e., Exondys 51, drisapersen) does not show benefit of these therapies for DMD.[5] The prescribing information notes that continued approval for this indication may be contingent upon verification of clinical benefit in a confirmatory trial.[1] FDA has required a post-marketing trial to verify clinical efficacy of Viltepso. Thus, patients are being recruited for the Phase III RACER53 study, to further evaluate safety and efficacy of Viltepso in 74 ambulatory boys with DMD.

   Viltepso is under evaluation in one ongoing Phase II pivotal study in patients with DMD amenable to exon 53 skipping.[6] The primary endpoint is the effect of Viltepso on dystrophin as a surrogate outcome marker. Functional outcomes were among the secondary endpoints and were compared with a natural history cohort controlled for age, functional status, geographic location, and glucocorticoid treatment status. In this pivotal study (n = 16), the proportion of normal dystrophin protein level was higher at Week 25 (0.6% of normal at baseline vs. 5.9% of normal at Week 24 biopsy). The change from baseline in some functional outcomes were significantly improved with Viltepso vs. the natural history cohort (time to run walk 10 meters [0.23 meters/second vs. -0.04 meters/second], time to stand from supine [-0.19 seconds vs. 0.66 seconds], and distance on the 6-minute walk test [28.9 meters vs. -65.3 meters]). However, velocity in the time to stand from supine test, time to climb 4 stairs test, North Star Ambulatory Assessment test, and measures of muscle strength by isometric testing were not significantly different from the control group.

4. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Muscular Dystrophy – Vyondys 53 (golodirsen intravenous infusion – Sarepta)

REVIEW DATE: 12/13/2019

OVERVIEW

Vyondys 53 is indicated for the treatment of Duchenne muscular dystrophy (DMD) in patients who have a confirmed mutation of the DMD gene that is amenable to exon 53 skipping.[1] Vyondys 53 was approved for this indication under accelerated approval based on an increase in dystrophin observed in the skeletal muscle of patients who received the drug. The prescribing information notes that continued FDA-approval for this indication may be contingent upon verification of clinical benefit in confirmatory trials.

Disease Overview

DMD is an X-linked recessive disease affecting 1 in 3,600 to 6,000 newborn male infants.[2] The disease is attributed to large frame-shift deletions in the DMD gene (chromosome Xp21) which lead to loss of a structural protein of muscle cells (dystrophin).[3] Over 4,700 mutations on the DMD gene have been identified which lead to a deficiency in production of dystrophin.[2] Therefore, the type of mutation and its effect on the production of dystrophin accounts for the variable phenotypic expression.[4] Females carriers are usually asymptomatic but some may show mild symptoms.[2] There are wide variances in how quickly DMD progresses, but without intervention death is at approximately 19 years of age.[2-4] With respiratory, cardiac, orthopedic and rehabilitative interventions and use of corticosteroids, children born today can have a life expectancy of up to 40 years.

Vyondys 53 is an antisense oligonucleotide designed to bind to exon 53 of dystrophin pre-mRNA, resulting in exclusion of this exon during mRNA processing in patients with genetic mutations that are amenable to exon 53 skipping.[1] These patients represent up to 10% of all patients with DMD.[5] This genetic manipulation intends to restore the reading frame of the resulting mRNA. The result would be production of a shortened, but partially functional dystrophin protein as seen in less severe forms of muscular dystrophy (e.g., Becker muscular dystrophy). Of note, the reading frame of certain deletions (e.g., exon 52 deletions) can be restored by skipping either exon 51 or exon 53.[6] Approximately 8% of mutations are amenable to skipping exon 53 with Vyondys 53 but are not amenable to skipping of exon 51.

Guidelines

There are guidelines for the diagnosis and management of DMD available from the DMD Care Considerations Working Group (2018).[4] Genetic testing for a DMD mutation in a blood sample is always required. By fully characterizing the mutation, the predicted effect on the reading frame can be identified, which is the major determinant of phenotype and will determine eligibility for mutation-specific clinical trials. In patients with no mutation identified but with signs/symptoms of DMD, a muscle biopsy is clinically indicated. Glucocorticoids slow decline in muscle strength and function in DMD. Use of corticosteroids reduces the risk of scoliosis and stabilizes pulmonary function. Continued treatment after the patient loses ambulation provides a reduction in the risk of progressive scoliosis and stabilization of pulmonary function tests. Therefore, glucocorticoids should be considered for all patients with DMD. Exondys 51 (eteplirsen intravenous infusion) is mentioned as an emerging product, approved by an accelerated pathway for those with a mutation in the dystrophin gene amenable to exon 51 skipping. However, these guidelines do not specifically address exon 53 skipping or mention Vyondys 53 in the guidelines.

POLICY STATEMENT

The prescribing information for Vyondys 53 states that approval is based on dystrophin production in a limited number of patients (n = 25) with DMD, but approval may be contingent upon a confirmatory trial. Due to inadequate clinical efficacy data, **approval is not recommended** for Vyondys 53.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
None.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Vyondys 53 has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

5. **Duchenne Muscular Dystrophy (DMD).** Due to inadequate clinical efficacy data, approval is not recommended for Vyondys 53. A systemic review and meta-analysis of other exon skipping therapies (i.e., Exondys 51, drisapersen) does not show benefit of these therapies for DMD.[9] The prescribing information notes that continued approval for this indication may be contingent upon verification of clinical benefit in confirmatory trials.[1] FDA has required a post-marketing trial to verify clinical efficacy of Vyondys 53.

   The efficacy of Vyondys 53 was evaluated in one unpublished, open-label study in patients with DMD that is amenable to exon 53 skipping.[1,7,8] Dystrophin protein at Week 48 and 6-minute walk test (6MWT) results at Week 144 were the primary clinical endpoints. Among the patients who received Vyondys 53 in Part 2 of the study (n = 25) the normal dystrophin protein increased from baseline (0.10%) through Week 48 (1.02%; $P < 0.001$). In individual patient biopsies at Week 48, the dystrophin level ranged from 0.09% to 4.3%, with a mean per-patient 16.0-fold increase in dystrophin. At Week 48, the mean level of exon 53 skipping increased to 18.6% (SD, 13.2%; range, 2.6% to 150.3%) vs. 2.6% (SD, 4.1%; range, 0.0 to 14.7%) at baseline. The percent dystrophin-positive fibers scoring increased from 1.4% (SD, 2.4%; range, 0.06% to 9.8%) at baseline to 10.5% (SD, 10.1%; range, 0.9% to 32.6%) [$P < 0.001$) at Week 48. There was a mean per-patient 13.5-fold increase in percent dystrophin-positive fibers from baseline through Week 48. 6MWT results have not yet been reported.

6. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Natpara® (parathyroid hormone for subcutaneous injection – Shire-NPS Pharmaceuticals)

DATE REVIEWED: 04/22/2020

OVERVIEW

Natpara, a replica of the endogenous parathyroid hormone, is indicated as an adjunct to calcium and vitamin D to control hypocalcemia in patients with hypoparathyroidism.[1] There are several limitations to Natpara use: because of the potential risk of osteosarcoma, Natpara is recommended only for patients who cannot be well-controlled on calcium supplements and active forms of vitamin D alone; it was not studied in patients with hypoparathyroidism caused by calcium-sensing receptor mutations; and it was not studied in patients with acute post-surgical hypoparathyroidism. The dose of Natpara should be individualized based on total serum calcium and 24-hour urinary calcium excretion. The initial dose of Natpara is 50 mcg once daily (QD) given as a subcutaneous injection; the dose may be decreased to as low as 25 mcg/day or increased to the maximum daily dose of 100 mcg.

Before initiating and during therapy with Natpara, 25-hydroxyvitamin D stores should be sufficient and serum calcium concentration should be > 7.5 mg/dL before initiating Natpara therapy.[1] In the pivotal study, a responder to Natpara therapy was defined as an individual who had: ≥ 50% reduction from baseline in the dose of active vitamin D, ≥ 50% reduction from baseline in the dose of oral calcium supplementation, and an albumin-corrected total serum calcium concentration between 7.5 mg/dL and 10.6 mg/dL.[1]

Natpara has a Boxed Warning about the risk of osteosarcoma.[1] Parathyroid hormone has been shown to increase the incidence of osteosarcoma in male and female rats; the risk was dependent on dose and treatment duration. A risk to humans could not be excluded. Natpara is available only through a restricted

Risk Evaluation and Mitigation Strategy (REMS) program; only certified healthcare providers can prescribe and only certified pharmacies can dispense Natpara.

Disease Overview
Hypoparathyroidism is a rare endocrine disorder that affects approximately 60,000 individuals in the US.[2,3] This condition is characterized by low calcium and high phosphate levels and low or inappropriately normal parathyroid hormone level.[4] The parathyroid hormone plays a critical role in maintaining calcium homeostasis and bone metabolism (osteoclasts and osteoblasts).[3,5-7] In some cases, the parathyroid glands produce insufficient parathyroid hormone and in other cases, the parathyroid glands have been removed.[2,5,8] The goals of treatment of hypoparathyroidism are to maintain serum calcium and the calcium-phosphate product within the normal range and avoid hypercalciuria.[4] The standard of care includes oral calcium and (active or parental) vitamin D to manage the hypocalcemia that results from the condition.[6-8] While these products maintain serum calcium concentration within normal limits and minimize the symptoms of hypocalcemia, they do not address the physiologic aspects of hypoparathyroidism. Additionally, there are long-term complications associated with calcium and vitamin D therapy, including renal function deterioration, renal stones, and soft tissue calcification.[3,6,9-11]

Guidelines/Recommendations
A consensus statement released in 2019 notes the use of calcium supplements and active vitamin D as the conventional therapy for hypoparathyroidism.[12] Although these therapies address the hypocalcemic aspect of hypoparathyroidism, they fail to provide a physiologic replacement of parathyroid hormone. Natpara therapy should be considered in patients experiencing inadequate control of serum calcium; patients who require > 2.5 g of calcium or > 1.5 µg of calcitriol per day to control serum calcium or symptoms; patients with hypercalciuria, renal stones, nephrocalcinosis, stone risk or reduced creatinine clearance or estimated glomerular filtration rate (eGFR) (< 60 mL/min); or patients with hyperphosphatemia and/or calcium-phosphate product > 55 mg^2/dL^2 or 4.4 $mmol^2/L^2$. Natpara therapy may also be beneficial in patients who have malabsorption or who are intolerant of large doses of oral calcium supplements or who are noncompliant with taking several tablets a day.

The First International Conference on the Management of Hypoparathyroidism provided some guidelines on the management of this condition (2016).[9] Conventional management of chronic hypoparathyroidism includes use of calcium supplements, active vitamin D or analogs, magnesium, thiazide diuretics (when necessary to help manage hypercalciuria and low salt diet), and phosphate binders and low phosphate diet (if necessary to control hyperphosphatemia). Natpara therapy may be considered in patients with well-established chronic hypoparathyroidism of any etiology except for autosomal dominant hypocalcemia; variable and inconsistent control of the serum calcium with frequent episodes of hypo- and hypercalcemia; nephrolithiasis, nephrocalcinosis, or reduced creatinine clearance or eGFR to < 60 mL/min; hypercalciuria and/or other biochemical indices or renal stone risk; persistently elevated serum phosphate and/or calcium-phosphate product (> 55 mg^2/dL^2 or 4.4 $mmol^2/L^2$); excessive amounts of oral medications required to control symptoms such as > 2.5 g of calcium or > 1.5 µg of active vitamin D, or both; and a gastrointestinal tract disorder that might lead to variable calcium and vitamin D absorption.

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of Natpara. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Natpara as well as the monitoring required for adverse events and long-term efficacy, approval requires Natpara to be prescribed by, or in consultation with, a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Natpara is recommended in those who meet the following criteria:

FDA-Approved Indications

32. Chronic Hypoparathyroidism. Approve for 3 years if the patient meets ONE of the following conditions (A or B):
- **A)** Initial Therapy. Approve if the patient meets ALL of the following criteria (i, ii, iii, and iv)
  - **i.** The patient cannot be well-controlled on calcium supplements and active forms of vitamin D alone; AND
  - **ii.** The patient's 25-hydroxyvitamin D stores are sufficient (before initiating Natpara therapy) per the prescriber; AND

iii. The patient's serum calcium concentration is > 7.5 mg/dL before initiating Natpara therapy; AND

iv. The medication is prescribed by, or in consultation with, an endocrinologist.

B) Patient is Currently Receiving Natpara. Approve if the patient meets ALL of the following criteria (i, ii, and iii):

i. The patient cannot be well-controlled on calcium supplements and active forms of vitamin D alone; AND

ii. The patient's 25-hydroxyvitamin D stores are sufficient (during Natpara therapy) per the prescriber ; AND

iii. The patient is responding to Natpara therapy (e.g., reduction in the patient's oral calcium dose; reduction in the patient's active vitamin D dose; maintenance of a stable albumin-corrected total serum calcium concentration), as determined by the prescriber.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Natpara has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

287. Acute Post-Surgical Hypoparathyroidism. Natpara was only studied in patients with chronic hypoparathyroidism.

288. Hypoparathyroidism Caused by Calcium-Sensing Receptor Mutations. Natpara was not studied in this patient population.

289. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Neurology – Brineura® (cerliponase alfa injection for intraventricular use – BioMarin)

DATE REVIEWED: 04/08/2020

OVERVIEW

Brineura is indicated to slow the loss of ambulation in symptomatic pediatric patients ≥ 3 years of age with late infantile neuronal ceroid lipofuscinosis type 2 (CLN2), also known as tripeptidyl peptidase 1 (TPP1) deficiency.[1] Brineura is recombinant human TPP1 produced using recombinant DNA technology. The recommended dose of Brineura is 300 mg administered once every other week (QOW) via intracerebroventricular (ICV) infusion. Following Brineura administration, the patient must also receive an infusion of intraventricular electrolytes. The drug is administered into the cerebral spinal fluid via a surgically implanted reservoir and catheter. It should only be administered by or under the direction of a physician who is knowledgeable in ICV administration.

Disease Overview

CLN2 disease is an extremely rare neurodegenerative disorder that is part of a group neuronal ceroid lipofuscinoses (NCLs) sometimes referred to as Batten disease.[2] NCL diseases are a heterogenous group of incurable neurodegenerative lysosomal storage diseases. They manifest as early impairment of vision, loss of cognitive and motor functions, seizures, and premature death. To date, 13 genetic mutations have been discovered to cause the multiple variations of the disease (e.g., CLN1, CLN2, CLN3 etc.). Classic late infantile NCL disease is caused by a mutation in the CLN2 gene, which encodes for lysosomal TPP1. Without TPP1, lysosomal storage materials accumulate, contributing to the progressive and persistent neurogeneration.[2] In CLN2 disease, symptom onset is typically between 2 and 4 years of age, and lifespan is to around 6 to 14 years. Other NCLs result in deficiencies in enzymes other than TPP1. As Brineura is human recombinant TPP1, its efficacy is specific to CLN2 disease.

Clinical Efficacy

The efficacy of Brineura in CLN2 disease was assessed in patients 3 to 8 years of age and compared with a natural history cohort.[1] All patients had confirmed TPP1 deficiency. The Motor domain of the CLN2 Clinical Rating Scale assessed declining function, with scores ranging from 3 (indicating grossly normal) to 0 (profoundly impaired). Decline was defined as having an unreversed 2-category decline or an unreversed score of 0. At Week 96, the matched analysis demonstrated fewer patients declined in the Motor domain with Brineura-treated patients (n = 1/17) compared with untreated patients in the natural history cohort (n = 11/17).

Guidelines

Recently published expert recommendations state that patients with a suspected NCL disorder require NCL-specific diagnostic testing.[3] Patients require assessment by a metabolic specialist/geneticist, an NCL specialist, or a pediatric neurologist with experience in diagnosis NCL disorders. While there is no standardized method for identifying patients CLN2 disease, diagnosis is generally based on biochemical measurement of enzyme activity and genetic testing.[3-4]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Brineura. All approvals are provided for the duration noted below. Because of the of the specialized skills required for evaluation and diagnosis of patients treated

with Brineura as well as the monitoring required for adverse events and long-term efficacy, approval requires Brineura to be prescribed by or in consultation with a physician who specializes in the condition being treated.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Brineura is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **Late Infantile Neuronal Ceroid Lipofuscinosis Type 2 (CLN2).** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
   - **B)** The patient is ≥ 3 years of age; AND
   - **C)** The patient has a diagnosis of CLN2 disease as confirmed by ONE of the following (i or ii):
     - i. The patient has had a genetic test which confirms the diagnosis of CLN2 disease; OR
     - ii. The patient has had a test which confirms reduced activity of tripeptidyl peptidase 1 (TPP1); AND
   - **D)** Brineura is prescribed by or in consultation with a metabolic specialist, geneticist, pediatric neurologist, or a physician specializing in the treatment of neuronal ceroid lipofuscinoses (NCLs).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Brineura has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval).

1. **Neuronal Ceroid Lipofuscinoses (NCLs) other than late infantile ceroid lipofuscinosis type 2 (CLN2) [e.g., CLN1, CLN3, CLN10, CLN13, and others].** Brineura has not been studied for NCLs involving mutations in genes other than CLN2.[1]

2. Coverage is not recommended for circumstances *not* listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Neurology – Radicava® (edaravone intravenous injection – Mitsubishi Tanabe)

DATE REVIEWED: 04/08/2020

OVERVIEW

Radicava is indicated for the treatment of amyotrophic lateral sclerosis (ALS).[1] It is an anti-oxidative, free radical scavenger which eliminates lipid peroxide and hydroxyl radicals; however, it is unknown exactly how Radicava exerts its therapeutic effect in ALS.[1-2]

Disease Overview

ALS, also known as Lou Gehrig's disease, is a rapidly progressive, paralyzing disease characterized by degeneration of upper motor neurons (UMNs) and lower motor neurons (LMNs) in the brain, brainstem, and the spinal cord resulting in muscle weakness.[2-4] Patients with ALS typically present with painless, progressive muscle atrophy and weakness, which eventually leads to paralysis and death, primarily due to respiratory failure. The accurate diagnosis of ALS is challenging and delays in diagnosis are common (average diagnostic delay of 11 to 12 months or more). The El Escorial criteria (used in the clinical studies of Radicava) were developed to standardize the diagnosis of ALS (revised by Airlie House in 1999).[3-5] The average survival following diagnosis of ALS is approximately 3 years; 50% of patients will die within 30 months of symptom onset. However, median survival can range from months to several years and the rate of progression of the disease varies considerably between patients.

Clinical Efficacy

The efficacy of Radicava was established in one Phase III, randomized, double-blind, placebo-controlled, Japanese trial (published) [n = 137].[6] This study enrolled patients who had a "definite" or "probable" diagnosis of ALS (based on El Escorial and revised Airlie House criteria; criteria provided in the Appendix) and were living independently at the time of screening. Patients also were required to have functionally retained most activities of daily living (defined as a score of two points or better on each individual item of the ALS Functional Rating Scale – Revised [ALSFRS-R]), have normal respiratory function (i.e., a percent-predicted forced vital capacity [FVC] value ≥ 80%), and have a disease duration of ≤ 2 years. Overall, 91% of patients were also receiving riluzole. The decline in the ALSFRS-R scores from baseline to Week 24 was statistically significantly less with Radicava compared with placebo.[1,6] In a separate study involving patients with longer disease duration, reduced respiratory function, and less certain ALS diagnosis, Radicava did not demonstrate benefit vs. placebo.[7]

Guidelines

The American Academy of Neurology (AAN) practice parameter on the care of patients with ALS (last updated 2009; reaffirmed 2014) does not yet address Radicava.[8-9] The practice parameter states that riluzole is safe and effective for slowing disease progression to a modest degree and should be offered to patients with ALS. However, riluzole may result in fatigue in some patients and if the risk of fatigue outweighs modest survival benefits, discontinuation of riluzole may be considered. Referral to a specialized multidisciplinary clinic should be considered for patients with ALS to optimize health care delivery, prolong survival, and enhance quality of life. Additionally, noninvasive mechanical ventilation may lengthen survival and can be considered to improve quality of life and slow FVC decline. The European Federation of Neurological Societies (EFNS) guidelines on the clinical management of ALS (2012) also recommend patients be offered treatment with riluzole as early as possible after diagnosis.[10] However, patients with progressive muscular atrophy, primary lateral sclerosis, or hereditary spastic paraplegia should not be treated with riluzole.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Radicava. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the of the specialized skills required for evaluation and diagnosis of patients treated with Radicava as well as the monitoring required for adverse events and long-term efficacy, approval requires Radicava to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Radicava is recommended in those who meet the following criteria:

FDA-Approved Indications

2. Amyotrophic Lateral Sclerosis (ALS). Approve for 6 months if the patient meets ONE of the following (A or B):

E) Initial Therapy. Approve if the patient meets ALL of the following (i, ii, iii, iv, v, and vi):

i. According to the prescriber, the patient has a "definite" or "probable" diagnosis of amyotrophic lateral sclerosis (ALS) based on the application of the El Escorial or the revised Airlie House diagnostic criteria; AND
ii. Patient has a score of two points or more on each item of the ALS Functional Rating Scale – Revised (ALSFRS-R) [i.e., has retained most or all activities of daily living]; AND
iii. Patient has a percent-predicted forced vital capacity (FVC) ≥ 80% (i.e., has normal respiratory function); AND
iv. Patient has been diagnosed with ALS for ≤ 2 years; AND
v. Patient has received or is currently receiving riluzole tablets (Rilutek®, generics), Tiglutik® (riluzole oral suspension), or Exservan™ (riluzole oral film); AND
vi. Radicava is prescribed by or in consultation with a neurologist, a neuromuscular disease specialist, or a physician specializing in the treatment of ALS.

F) Patients Currently Receiving Radicava. Approve if the patient meets ALL of the following (i, ii, and iii):

i. Radicava is prescribed by or in consultation with a neurologist, a neuromuscular disease specialist, or a physician specializing in the treatment of ALS; AND
ii. According to the prescriber, the patient continues to benefit from therapy; AND
iii. The patient is not requiring invasive ventilation.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Radicava has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

290. **Aneurysmal Subarachnoid Hemorrhage.** Radicava is not indicated for the treatment of aneurysmal subarachnoid hemorrhage (SAH).[1] One randomized controlled study (published) [n = 91] evaluated the efficacy of Radicava (formulation/dose not specified) in patients with aneurysmal SAH.[11] At 3 months post-SAH, the incidence of delayed ischemic neurologic deficits (DINDs) in patients treated with Radicava was 10% vs. 21% in patients in a control group; the between-group treatment difference was not significant (P = 0.118). In patients who had DINDs, 66% of patients in the control group had a cerebral infarction caused by vasospasm compared with 0% of Radicava-treated patients (P = 0.028). Additional, well-designed clinical studies are needed to establish if Radicava has a role in therapy post-SAH.

291. **Myocardial Infarction.** Radicava is not indicated for the treatment of myocardial; there are no US or North American studies of Radicava for this indication.[1] One randomized, placebo-controlled, open-label, Japanese study (published) [n = 101] evaluated the effect of Radicava on the long term prognosis in patients experiencing an acute myocardial infarction.[12] Patients were randomized to receive either Radicava (foreign formulation) 30 mg intravenous (IV) or placebo immediately prior to reperfusion. In all patients, successful reperfusion was obtained within 6 hours post-symptom onset. Radicava significantly attenuated the infarct size and incidence of reperfusion arrhythmia compared with placebo (P = 0.035 and P = 0.031, respectively). Further research is warranted to determine if Radicava has a place in therapy in the management of AMI.

292. **Radiation-Induced Brain Injury.** Radicava is not indicated for the treatment of radiation-induced brain injury; there are no US or North American studies of Radicava for this indication.[1] One randomized, open-label, 3-month, Chinese study (published) [n = 137] evaluated the protective effect of Radicava on radiation-induced brain necrosis in patients with nasopharyngeal carcinoma.[13] Patients were randomized to receive Radicava (foreign formulation) 30 mg intravenous (IV) twice daily for 2 weeks (not FDA-approved dosing) + IV corticosteroid therapy or placebo + IV corticosteroid therapy. Following 3 months of therapy, radiologic improvement (reduction in edema of ≥ 25%) was observed in 55.6% of patients who received Radicava (n = 40/72) compared with 35.4% of patients treated with placebo (n = 23/65) [P = 0.025]. The area of T1-weighted contrast enhancement was reduced from baseline with both Radicava and placebo (-1.67 cm and -1.20 cm, respectively); however, the difference between the treatment arms was not statistically significant. Improvement in neurologic signs and symptoms evaluated by the Late Effects of Normal Tissues – Subjective, Objective, Management, Analytic (LENT/SOMA) scale was also observed in 61.1% of Radicava-treated patients vs. 38.5% of placebo-treated patients (P = 0.006). Further research is warranted to determine if Radicava has a place in therapy in the treatment of radiation-induced brain injury.

293. **Retinal Vein Occlusion.** Radicava is not indicated for the prevention of macular edema and improvement of visual acuity after arteriovenous sheathotomy in patients with branch retinal vein occlusion; there are no US or North American studies of Radicava for this indication.[1] A single, small, prospective, Japanese study [published] (n = 47) evaluated the efficacy of Radicava (foreign formulation) in patients with branch retinal vein occlusion undergoing vitrectomy.[14] Patients either received Radicava 30 mg IV at the time of the procedure or no additional therapy. Visual acuity was measured before and 12 months after the procedure. At 12 months following the operation, the logarithm of the minimum angle of resolution (logMAR) units improved from 0.22 to 0.56 logMAR units in patients who had received Radicava and from 0.20 to 0.27 logMAR units in patients who did not receive active treatment (P = 0.016). Additional data are needed to support the use of Radicava for this indication.

294. **Sensorineural Hearing Loss.** Radicava is not indicated for the treatment of sensorineural hearing loss; there are no US-based studies of Radicava for this indication.[1] One small, Japanese study evaluated 14 patients with idiopathic sudden sensorineural hearing loss were treated with Radicava (foreign formulation; dose not specified).[15] These patients were compared with a control group of 14 patients with similar prognostic factors

who had been treated with hyperbaric oxygenation therapy. No significant differences were observed between the Radicava group and the control group.

295. Stroke. Radicava is not FDA-approved for the treatment of patients who have experienced stroke.[1] Radicava has been approved in other countries for this indication and there are some foreign data supporting its use.[16] There are no US-based studies of Radicava for stroke at this time. A systematic review assessed available efficacy data from three clinical trials (n = 496) of Radicava for acute ischemic stroke.[17] These trials compared Radicava 30 mg twice daily IV infusion for 14 days + another treatment vs. the other treatment alone within 72 hours of stroke symptom onset. One trial did not find significantly reduced mortality with Radicava vs. the control group; the other two studies did not report this endpoint. Overall, there was a significantly higher proportion of patients who had neurologic improvement in the Radicava group vs. control.

296. Coverage is not recommended for circumstances *not* listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

APPENDIX*

El Escorial criteria for the diagnosis of ALS were initially developed by the World Federation of Neurology (WFN) in 1990. In 1998, the WFN held a workshop for the Research Committee on Motor Neuron Diseases at the Airlie

Conference Center in Virginia, which resulted in a revision of the guidelines in 2000. The pivotal study of Radicava references the El Escorial criteria updated by the WFN in 2000 (Airlie House). According to these guidelines, the diagnosis of ALS requires:

The presence of:

- Evidence of lower motor neuron (LMN) degeneration by clinical, electrophysiological or neuropathologic examination; AND
- Evidence of upper motor neuron (UMN) degeneration by clinical examination; AND
- Progressive spread of symptoms or signs within a region or to other regions, as determined by history or examination.

Together with the absence of:

1. Electrophysiological or pathological evidence of other disease processes that might explain the signs of LMN and/or UMN degeneration; AND
2. Neuroimaging evidence of other disease processes that might explain the observed clinical and electrophysiological signs.

Without pathological confirmation, the diagnosis of ALS may be categorized into levels of certainty using clinical assessment. The following terms are used to describe the categories of diagnostic certainty.

- **Clinically Definite ALS:** defined on clinical evidence alone by the presence of UMN, as well as LMN signs, in the bulbar region and at least two spinal regions or the presence of UMN and LMN signs in three spinal regions.
- **Clinically Probable ALS:** defined on clinical evidence alone by UMN and LMN signs in at least two regions with some UMN signs necessarily rostral to (above) the LMN signs.
- **Clinically Probable ALS – Laboratory-supported:** defined when clinical signs of UMN and LMN dysfunction are in only one region, or when UMN signs alone are present in one region, and LMN signs defined by EMG criteria are present in at least two regions, with proper application of neuroimaging and clinical laboratory protocols to exclude other causes.
- **Clinically Possible ALS:** defined when clinical signs of UMN and LMN dysfunction are found together in only one region or UMN signs are found alone in two or more regions; or LMN signs are found rostral to UMN signs and the diagnosis of Clinically Probable ALS – Laboratory supported cannot be proven by evidence on clinical grounds in conjunction with electrodiagnostic, neurophysiologic, neuroimaging or clinical laboratory studies. Other diagnoses must have been excluded to accept a diagnosis of Clinically Possible ALS.

*** This appendix is for reference; it is NOT intended that patients meet the above criteria for approval of Radicava.**

PRIOR AUTHORIZATION POLICY

POLICY: Neurology – Riluzole Products Prior Authorization Policy

- Exservan™ (riluzole oral film – Covis Pharmaceuticals/Aquestive)
- Rilutek® (riluzole tablets – Covis Pharma; generics)
- Tiglutik® (riluzole oral suspension – ITF Pharma)

REVIEW DATE: 07/22/2020

OVERVIEW

All of the available riluzole products are indicated for the treatment of amyotrophic lateral sclerosis (ALS).[1,2,9] Riluzole is a member of the benzothiazole class; the mechanism by which it exerts its effects in patients with ALS is unknown. Riluzole tablets were initially approved by the FDA in 1995.[1] In the years since, two additional riluzole formulations, Exservan oral film and Tiglutik oral suspension, have been approved.[2,9]

Disease Overview

ALS, also known as Lou Gehrig's disease, is a rapidly progressive, paralyzing disease characterized by degeneration of upper motor neurons (UMNs) and lower motor neurons (LMNs) in the brain, brainstem, and the spinal cord resulting in muscle weakness.[3-5] Patients with ALS typically present with painless, progressive muscle atrophy and weakness, which eventually leads to paralysis and death, primarily due to respiratory failure. The accurate diagnosis of ALS is challenging and delays in diagnosis are common (average diagnostic delay of 11 to 12 months or more). The average survival following diagnosis of ALS is approximately 3 years; 50% of patients will die within 30 months of symptom onset. However, median survival can range from months to several years and the rate of progression of the disease varies considerably between patients.

Guidelines

The American Academy of Neurology (AAN) practice parameter on the care of patients with ALS (last updated 2009; reaffirmed 2020) states that riluzole should be offered to patients with ALS (Level A recommendation), as it is safe and effective for modestly slowing disease progression.[6,7] Based on available clinical trial data, the AAN estimates riluzole prolongs survival by 2 to 3 months. However, some large cohort studies that estimate survival to be prolonged for up to 21 months. Of note, a previous practice advisory from the AAN (1997) had recommended riluzole only in patients with definite or probable ALS of < 5 years duration, with a forced vital capacity (FVC) > 60% and without tracheostomy. However, the 2012 parameter does not include any stipulations on which patients should use riluzole. Riluzole may result in fatigue in some patients and if the risk of fatigue outweighs modest survival benefits, discontinuation of riluzole may be considered (Level C recommendation). The European Federation of Neurological Societies (EFNS) guidelines on the clinical management of ALS (2012) also recommend patients be offered treatment with riluzole as early as possible after diagnosis.[8] While it is noted that riluzole may be less effective in patients with late-stage disease, it is unclear when or if treatment should be discontinued. Patients with progressive muscular atrophy, primary lateral sclerosis, or hereditary spastic paraplegia are not recommended to use riluzole as they were not included in the clinical studies. However, some of these patients fall within the ALS syndrome and therefore may benefit from treatment with riluzole.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of riluzole. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with riluzole as well as the monitoring required for adverse events and long-term efficacy, approval requires riluzole to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of riluzole is recommended in those who meet the following criteria:

FDA-Approved Indications

133. Amyotrophic Lateral Sclerosis (ALS). Approve for 1 year if the agent is prescribed by or in consultation with a neurologist, a neuromuscular disease specialist, or a physician specializing in the treatment of ALS.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of riluzole is not recommended in the following situations:

129. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Northera® (droxidopa capsules – Chelsea Therapeutics)

DATE REVIEWED: 11/20/2019

OVERVIEW

Northera, a norepinephrine-type product, is indicated for the treatment of orthostatic dizziness, lightheadedness or the "feeling that one is about to black out" in adult patients with symptomatic neurogenic

orthostatic hypotension (NOH) caused by primary autonomic failure (Parkinson's disease [PD], multiple system atrophy [MSA], and pure autonomic failure [PAF]), dopamine beta-hydroxylase deficiency, and non-diabetic autonomic neuropathy.[1] According to the prescribing information, the effectiveness beyond 2 weeks of treatment has not been established and should be evaluated periodically. The mechanism of action of Northera is unknown. Northera is a synthetic amino acid analog that is metabolized to norepinephrine by dopa-decarboxylase, which is found throughout the body. Northera is thought to exert its effects through norepinephrine, which increases blood pressure (BP) by inducing peripheral arterial and venous vasoconstriction. Northera has a Boxed Warning regarding supine hypertension. Northera may cause or exacerbate supine hypertension in patients with NOH. Supine BP should be measured prior to initiating Northera and after dose increases.

Disease Overview

OH is a sustained reduction in SBP of at least 20 mmHg or DBP of 10 mmHg within 3 minutes of standing or head-up tilt to at least 60° on a tilt table.[2] OH is caused by an excessive fall in a patient's cardiac output or by defective or inadequate vasoconstrictor mechanisms. OH may be symptomatic or asymptomatic, with only symptomatic OH requiring treatment.[3] NOH is a specific subset of this condition, in which OH is due to inadequate release of norepinephrine from sympathetic vasomotor neurons leading to vasoconstrictor failure.[2] NOH is a rare, chronic and often debilitating condition that is associated with PD (prevalence: 16% to 58%), MSA (prevalence: 60% to 75%), and PAF (prevalence: 100%) and with peripheral neuropathies and ganglionopathies that affect the autonomic nerves.[2,3] Symptoms of NOH include dizziness, lightheadedness, blurred vision, fatigue, and fainting upon standing up.[2] These symptoms can adversely affect patients' quality of life and ability to conduct activities of daily living that involve standing or walking. Many patients with NOH have supine hypertension (i.e., high BP when lying down) even before treatment of hypotension is initiated. Patients with autonomic failure and the elderly are also susceptible to significant decreases in BP associated with meals. This may be exacerbated by large meals, meals high in carbohydrates, and alcohol intake. Medications may increase the frequency of symptomatic NOH, such as alpha-adrenergic antagonists (e.g., benign prostatic hypertrophy medications), antidepressants (particularly, tricyclic antidepressants), antipsychotics, and dopaminergic agonists (e.g., antiparkinsonian medications).[3]

Treatment of symptomatic NOH is aimed at increasing standing SBP into the range of compensatory cerebrovascular autoregulation (approximately 50 to 150 mmHg).[4,5] A variety of nonpharmacologic approaches have been used to treat symptoms of NOH, including arising slowly, elevating the head of the bed, and/or wearing elastic stockings.[6] Spreading total daily carbohydrate intake to multiple smaller meals has been shown to decrease OH symptoms.[7] Adequate salt and fluid intake may be useful (e.g., dietary sodium intake of at least 10 g/day and fluid intake of greater than 2 L/day) in patients without concomitant renal dysfunction.[6] These nonpharmacologic interventions should be considered first in the treatment of NOH. Unapproved pharmacologic agents include fludrocortisone (volume expansion and pressor effect), desmopressin (nasal spray or oral) [volume expansion], dihydroergotamine (oral) [pressor effect], indomethacin (oral or intravenous) [pressor effect], pyridostigmine, and erythropoietin (treatment of anemia of chronic autonomic failure can improve orthostatic intolerance).[6-8] Midodrine, an $alpha_1$-agonist, is the only other medication approved with a similar indication (treatment of symptomatic OH) to Northera.[9]

Clinical Efficacy

Northera was evaluated in one 12-month, open-label study which demonstrated the maintenance of improvements from baseline in patient-reported NOH symptom severity and impact on daily activities.[6]

Small studies have been published for the use of Northera in hemodialysis patients to prevent orthostatic hypotension (OH)[10,11] and also in restoring neurologic deficit in chronic stoke patients.[12]

Guidelines

According to the **American Academy of Neurology (AAN) practice parameter on treatment of nonmotor symptoms of PD (2010)**, there have been few placebo controlled trials of treatment for OH in PD, and the available data are insufficient to make a recommendation on the use of specific treatments for OH in PD.[13] Small studies have used domperidone, fludrocortisone, and indomethacin. While studies are lacking for mineralocorticoids, alpha-sympathomimetics, and pyridostigmine, they have pharmacologic actions that are consistent with improvement in OH. The only medications currently approved to treat OH are midodrine and Northera.

Consensus panel recommendations initiated by the American Autonomic Society and the National Parkinson Foundation for the screening, diagnosis, and treatment of NOH and associated supine hypertension were published in 2017.[14] Once a patient is diagnosed with NOH, the goals of treatment should be to reduce the burden of symptoms (especially falls), prolong standing time, and restore independence in activities of daily living. The recommendations propose a four-step treatment algorithm for NOH: assessing and adjusting pre-existing medications that may be causing or exacerbating NOH, utilizing non-pharmacologic approaches (e.g., blood volume repletion, increased salt intake, physical conditioning, compression garments, elevating the head of the bed), implementing single-agent pharmacologic treatment, and with great caution, combining pharmacologic treatments. After each step, a 2-week assessment period is recommended to establish whether sufficient symptomatic benefit has been achieved before moving onto the next step. Recommended treatments include midodrine, Northera, fludrocortisone, and pyridostigmine. The initial choice of NOH treatments should be individualized and should consider severity, comorbid disease (especially cardiac or renal failure), and treatment goals. Based on the experience of the consensus panel, the recommendation is to titrate to maximum tolerable dose of a single medication and then, if symptomatic benefit is not obtained, consider switching to a different medication or adding a second agent and titrate from its lowest starting dose.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Northera. Because of the specialized skills required for evaluation and diagnosis of patients treated with Northera as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Northera to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Northera is recommended in those who meet the following criteria:

Food and Drug Administration (FDA)-Approved Indications

76. Neurogenic Orthostatic Hypotension (NOH). Approve for 1 year if the patient meets the following criteria (a, b, c, d, and e):

a) Patient is ≥ 18 years of age; AND

b) Patient has been diagnosed with symptomatic NOH due to primary autonomic failure (Parkinson's disease [PD], multiple system atrophy [MSA], and pure autonomic failure [PAF]), dopamine beta-hydroxylase deficiency, or non-diabetic autonomic neuropathy; AND
c) Northera has been prescribed by or in consultation with a cardiologist or a neurologist; AND
d) Patient has tried two other medications (e.g., fludrocortisone, desmopressin, dihydroergotamine, indomethacin, pyridostigmine, erythropoietin, midodrine); AND
e) Patient has initiated non-pharmacological measures including but not limited to elevation of the head of the bed, orthostatic compression garments, and appropriate physical training.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Northera has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

297. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Nuedexta Prior Authorization Policy

- Nuedexta® (dextromethorphan hydrobromide and quinidine sulfate capsules – Avanir)

REVIEW DATE: 08/19/2020

OVERVIEW

Nuedexta, a combination product containing dextromethorphan hydrobromide (DM) and quinidine sulfate, is indicated for the treatment of pseudobulbar affect.[1]

DM is a sigma-1 receptor agonist and an uncompetitive *N*-methyl-D-aspartate receptor antagonist.[1] Quinidine increases plasma levels of DM by competitively inhibiting cytochrome P450 2D6, which catalyzes a major biotransformation pathway for DM. The mechanism by which DM exerts therapeutic effects in patients with pseudobulbar affect is unknown. The recommended starting dose is one capsule daily (20 mg of DM and 10 mg of quinidine) by mouth for the initial 7 days of therapy. Thereafter, the daily dose should be two capsules/day (40 mg of DM and 20 mg of quinidine), given as one capsule every 12 hours (BID). The need for continued treatment should be reassessed periodically, as spontaneous improvement of pseudobulbar affect occurs in some patients.

Disease Overview

Pseudobulbar affect is a neurologic condition characterized by involuntary outbursts of laughing and/or crying incongruous or disproportionate to the patients' emotional state.[2,7] There are many terms that have been used to describe this condition, including pathological laughing and crying, affective lability, emotional incontinence, emotionalism, and involuntary emotional expression disorder.[7] Pseudobulbar affect, hypothesized to arise from disconnection of brainstem structures from cortical inhibition, is associated with underlying central nervous system disorders including stroke, traumatic brain injury, Alzheimer's disease, amyotrophic lateral sclerosis (ALS), and multiple sclerosis (MS).[2] It is estimated that pseudobulbar affect impacts more than 1 million people in the US diagnosed with neurological disease or brain injury.[7] Prevalence studies have reported that pseudobulbar affect affects 11% of patients one year after a stroke, 11% of patients during the first year after traumatic brain injury, 18% of patients with Alzheimer's disease, 10% of patients with MS, and 49% of patients with ALS.[2] In addition to the effects of the underlying disorder, pseudobulbar affect pseudobulbar affect can have a severe impact on well-being and social functioning and can be highly disabling, owing in part to the stigma attached to loss of emotional control. Episodes of laughing can also lead to respiratory compromise, especially in patients with a neurological disorder that already compromises respiratory function, such as ALS.[7] For these reasons, treatment should be strongly considered in any patient with pseudobulbar affect. The goal of therapy is to reduce the frequency of attacks.

Clinical Efficacy

The efficacy of Nuedexta was established in one trial in patients with pseudobulbar affect with underlying ALS or MS.[1,2] Two additional trials conducted with higher doses (DM 30 mg/quinidine 30 mg) provided supportive evidence.[3,4] PRISM II, an open-label, 90-day, published study, evaluated Nuedexta in patients with pseudobulbar affect and a diagnosis of dementia, stroke, or traumatic brain injury (n = 367).[8] Nuedexta was shown to be an effective treatment for pseudobulbar affect secondary to dementia, stroke, or traumatic brain injury, showing similar improvement to that reported in patients with pseudobulbar affect secondary to ALS or MS.

Guidelines

There are no guidelines specific to the management of pseudobulbar affect. However, the American Academy of Neurology (AAN) published an evidence-based guideline on the assessment and management of psychiatric disorders in individuals with MS.[5] The guideline found that Nuedexta is possibly effective and may be considered for treating individuals with MS with pseudobulbar affect (Level C, one Class II study). Also, prior to the approval of Nuedexta, the AAN published a practice parameter on the care of the patient with ALS.[6] With regard to pharmacologic measures to reduce pseudobulbar affect, the AAN concludes that the combination DM/quinidine product is probably effective for pseudobulbar affect in ALS based on one Class I study[3], although side effects may limit its usefulness. Therefore, the AAN recommends that if approved by the FDA, and if side effects are acceptable, the combination DM/quinidine product should be considered for symptoms of pseudobulbar affect in patients with ALS (Level B). No other pharmacologic agents are addressed in the practice parameter for use in the management of pseudobulbar affect.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Nuedexta. Because of the specialized skills required for evaluation and diagnosis of patients treated with Nuedexta as well as the monitoring required for adverse events and long-term efficacy, approval requires Nuedexta to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Nuedexta is recommended in those who meet the following criteria:

FDA-Approved Indications

3. **Treatment of Pseudobulbar Affect.** Approve for 1 year if the patient meets BOTH of the following criteria (A and B):
   - **A)** Patient has pseudobulbar affect associated with a chronic neurological condition; AND
     Note: Examples of chronic neurological conditions include amyotrophic lateral sclerosis, multiple sclerosis, stroke, dementia, traumatic brain injury.
   - **B)** Nuedexta is prescribed by or in consultation with a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Nuedexta is not recommended in the following situations:

1. **Heroin Detoxification.** Limited published data are available in patients undergoing heroin detoxification.[9] The available study was conducted with the DM 30 mg/quinidine 30 mg formulation, using daily doses of DM 60 mg/quinidine 60 mg (dose cannot be achieved with Nuedexta capsules). There were no differences between DM/quinidine and placebo with regard to reducing opioid withdrawal symptoms.

2. **Levodopa-Induced Dyskinesia in Parkinson's Disease.** A single pilot study demonstrated benefit with dextromethorphan/quinidine for treating levodopa-induced dyskinesia in Parkinson's disease.[12]

Larger studies with a longer treatment duration are needed to define the place in therapy for Nuedexta in this condition.

3. **Neuropathic Pain.** Limited published data are available in patients (n = 36) with diabetic peripheral neuropathic (DPN) pain (open-label tolerability study).[10] The available study was conducted with the DM 30 mg/quinidine 30 mg formulation, using daily doses up to DM 120 mg/quinidine 120 mg (dose cannot be achieved with Nuedexta capsules). Higher daily doses of DM and quinidine (60 mg/60 mg and 90 mg/60 mg [doses cannot be achieved with Nuedexta capsules]) have also been evaluated in patients with DPN pain (n = 379) in one Phase III, randomized, placebo-controlled 13-week study.[7] Both DM/quinidine treatment groups had significant reductions in mean daily pain scores vs. placebo. More data are needed to define the place in therapy of Nuedexta in the treatment of neuropathic pain.

4. **Psychosis-Related Aggression**. A case series (n = 4) supports DM/quinidine as a potential alternative to conventional regimens for treating aggression and impulsive behavior in patients with psychotic disorder.[11] More data are needed to define the place in therapy of Nuedexta in the treatment of psychosis-related aggression.

5. **Treatment-Resistant Depression.** A Phase II, open-label, proof-of-concept study (n = 20) demonstrated preliminary efficacy for DM 45 mg/quinidine 10 mg every 12 hours. This dosing could not be achieved with Nuedexta capsules.[13] Additional data are needed to define the place in therapy for Nuedexta in the treatment of treatment-resistant depression.

6. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Abiraterone Acetate (Zytiga® tablets – Janssen Biotech Inc.; generics [250 mg tablets only])

DATE REVIEWED: 02/19/2020; selected revision 03/04/2020

OVERVIEW

Abiraterone acetate is an androgen biosynthesis inhibitor that inhibits the enzyme 17 α-hydroxylase/C17, 20-lyase (CYP17).[1] This enzyme is expressed in testicular, adrenal, and prostatic tumor tissues and is required for androgen biosynthesis. Abirateone acetate in combination with prednisone is indicated for use for the treatment of patients with metastatic castration-resistant prostate cancer (mCRPC) and for the treatment of metastatic high-risk castration-sensitive prostate cancer (mCSPC). Inhibition of CYP17 by abiraterone acetate can also result in increased mineralocorticoid production by the adrenal glands; the use of prednisone with abiraterone acetate is to counteract this mineralocorticoid excess.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on prostate cancer (version 4.2019 – August 19, 2019) have the following recommendations for drug therapies (primarily focusing on oral agents, abiraterone acetate and Xtandi® [enzalutamide capsules]).[2]

- At initial diagnosis, for patients classified in the regional risk group (metastases in regional nodes [N1] with no distant metastases [M0]) and with a > 5 year expected patient survival or symptomatic, external beam radiation therapy (EBRT) + androgen deprivation therapy (ADT) [preferred] ± abiraterone acetate and prednisone is a recommended option (category 2A). ADT (without EBRT) ± abiraterone and prednisone is also a category 2A recommended option in this setting.
- If patients are positive for distant metastasis (M1) and have castration-naïve disease, ADT + abiraterone and prednisone and ADT + docetaxel are both category 1 recommended options. Other options are also available.
- For patients who progress to CRPC and are positive for distant metastasis, M1 and there are no visceral metastases, abiraterone and prednisone, docetaxel, Xtandi, and Xofigo® (radium Ra 223 dichloride injection, for intravenous use) [for symptomatic bone metastases] are all category 1 recommended options.
  - If there are visceral metastases, Xtandi and docetaxel are category 1 recommended options. Abiraterone and prednisone, mitoxantrone with prednisone, or other secondary hormone therapies are other options (all category 2A).
  - For no visceral metastases, if patients had received prior therapy with Xtandi or abiraterone, then docetaxel and Xofigo are the category 1 options for subsequent therapy. If patients received prior docetaxel therapy, then Xtandi, abiraterone, Xofigo, and cabazitaxel are the category 1 options. For subsequent therapy with visceral metastases, docetaxel is the recommended category 1 option, if either Xtandi or abiraterone were used as prior therapies. For prior therapy with docetaxel, Xtandi, abiraterone, cabazitaxel are the recommended category 1 options.

The STAMPEDE trial assessed the efficacy of abiratereone acetate and prednisone in combination with ADT in newly diagnosed patients with metastatic, node-positive, or high-risk locally advanced prostate cancer.[4] About 20% of the patients had node-positive non-metastatic disease. However, the guidelines note that there was insufficient data available for failure-free survival and follow-up to recommend abiraterone for men with high-risk or very high-risk N0 M0 prostate cancer and more data are needed.[2]

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of abiraterone acetate. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of abiraterone acetate is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **Prostate Cancer – Metastatic, Castration-Resistant (mCRPC).** Approve for 3 years if the patient meets the following conditions (A and B):
   A) The medication is used in combination with prednisone; AND
   B) The patient meets ONE of the following criteria (i or ii):
      i. The medication is concurrently used with a gonadotropin-releasing hormone (GnRH) analog.
      Note: Examples are Lupron (leuprolide for injection), Lupron Depot (leuprolide acetate for depot suspension), Trelstar (triptorelin pamoate for injectable suspension), Zoladex (goserelin acetate implant), Vantas (histrelin acetate subcutaneous implant), Firmagon (degarelix for injection); OR
      ii. The patient has had a bilateral orchiectomy.

2. **Prostate Cancer –Metastatic, Castration-Sensitive (mCSPC).** Approve for 3 years if the patient meets the following criteria (A, B, and C):
   A) The medication is used in combination with prednisone; AND
   B) The patient has high-risk disease (e.g., evidence of measurable visceral metastases, lesions on bone scan, total Gleason score ≥ 8) as confirmed by the prescribing physician; AND
   C) The patient meets ONE of the following criteria (i or ii):
      i. The medication is concurrently used with a gonadotropin-releasing hormone (GnRH) analog.
      Note: Examples are Lupron (leuprolide for injection), Lupron Depot (leuprolide acetate for depot suspension), Trelstar (triptorelin pamoate for injectable suspension), Zoladex (goserelin acetate implant), Vantas (histrelin acetate subcutaneous implant), Firmagon (degarelix for injection); OR
      ii. The patient has had a bilateral orchiectomy.

Other Uses with Supportive Evidence

3. **Prostate Cancer – Regional Risk Group.** Approve for 3 years if the patient meets all of the following criteria (A, B, and C):
   A) The medication is used in combination with prednisone; AND
   B) Patient has regional lymph node metastases and no distant metastases; AND
   C) Patient meets one of the following criteria (i or ii):
      i. The medication with prednisone is used in combination with gonadotropin-releasing hormone (GnRH) analog.
      Note: Lupron [leuprolide acetate for injection], Lupron Depot [leuprolide acetate for depot suspension], Trelstar [triptorelin pamoate for injectable suspension], Zoladex [goserelin acetate implant], Vantas [histrelin acetate subcutaneous implant]), Firmagon (degarelix for injection); OR

ii. Patient has had an orchiectomy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Abiraterone acetate has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions are provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

298. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Afinitor® (everolimus tablets – Novartis)
Afinitor Disperz® (everolimus tablets for oral suspension – Novartis)
Everolimus tablets 2.5 mg, 5 mg, 7.5 mg (generics – Multiple manufacturers)

DATE REVIEWED: 05/27/2020

OVERVIEW

Afinitor, a kinase inhibitor, is indicated for the following conditions:[1]

1) treatment of postmenopausal women with advanced hormone receptor-positive (HR+), human epidermal growth factor receptor 2 (HER2)-negative breast cancer (advanced HR+ breast cancer) in combination with exemestane, after failure of treatment with letrozole or anastrozole;
2) treatment of adult patients with progressive neuroendocrine tumors (NETS) of pancreatic origin (PNET) and adults with progressive, well-differentiated, non-functional NETS of gastrointestinal (GI) or lung origin that are unresectable, locally advanced or metastatic. Limitation of Use: Afinitor is not indicated for the treatment of patients with functional carcinoid tumors;
3) treatment of adult patients with advanced renal cell carcinoma (RCC) after failure of treatment with Sutent® (sunitinib capsules) or Nexavar® (sorafenib tablets);
4) treatment of adult patients with renal angiomyolipoma and tuberous sclerosis complex (TSC) not requiring immediate surgery; and
5) treatment of adult patients with TSC who have subependymal giant cell astrocytoma (SEGA) that requires therapeutic intervention but cannot be curatively resected.[1]
6) adjunctive treatment of adult and pediatric patients ≥ 2 years of age with TSC-associated partial-onset seizures.

Afinitor 2.5 mg, 5 mg and 7.5 mg are available as generic tablets. Afinitor 10 mg tablets and Afinitor Disperz are only available as brand products.

Afinitor Disperz is indicated for the treatment of adult and pediatric patients aged ≥ 1 years with TSC who have SEGA that requires therapeutic intervention but cannot be curatively resected.[1] Afinitor Disperz is also indicated for the adjunctive treatment of adult and pediatric patients aged ≥ 2 years with TSC-associated partial-onset seizures. Of note, Zortress®, (everolimus tablets) is indicated in combination with other drugs for prophylaxis of organ rejection in adult patients undergoing kidney or liver transplant.[2] The tablet strengths and dosing is different for Zortress than with Afinitor.

Guidelines

The National Comprehensive Cancer Network (NCCN) Compendium recommends use of everolimus for the indications listed in the FDA-approved and Other Uses with Supportive Evidence sections. All of the recommendations are category 1 or category 2A.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Afinitor and Afinitor Disperz. All approvals are provided for 3 years in duration. In the clinical criteria, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: a woman is defined as an individual with the biological traits of a woman, regardless of the individual's gender identity or gender expression; men are defined as individuals with the biological traits of a man, regardless of the individual's gender identity or gender expression.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of everolimus (Afinitor, generics) 2.5mg, 5 mg, 7.5 mg, Afinitor 10 mg, or Afinitor Disperz is recommended in those who meet the following criteria:

FDA-Approved Indications

33. Breast Cancer. Approve for 3 years if the patient meets the following criteria (A, B, C, D, E, and F):
- **A)** The patient has recurrent or Stage IV, hormone receptor positive (HR+) [i.e., estrogen receptor positive {ER+} and/or progesterone receptor positive {PR+}] disease; AND
- **A)** The patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer;; AND
- **B)** The patient has tried at least one prior endocrine therapy (e.g., anastrozole, letrozole, or tamoxifen); AND
- **C)** The patient meets ONE of the following conditions (i or ii):
  - **i.** The patient is a postmenopausal female* or a male*; OR
  - **ii.** The patient is premenopausal or perimenopausal AND is receiving ovarian suppression/ablation[3] with a gonadotropin-releasing hormone (GnRH) agonist (e.g., Lupron® [leuprolide], Trelstar® [triptorelin], Zoladex® (goserelin]), or has had surgical bilateral oophorectomy or ovarian irradiation; AND
- **D)** The patient meets ONE of the following conditions (i or ii):
  - **i.** If patient is a male AND if Afinitor will be used in combination with exemestane, the patient is receiving a gonadotropin-releasing hormone (GnRH) agonist (e.g., Lupron [leuprolide], Trelstar [triptorelin], Zoladex (goserelin]); OR
  - **ii.** Afinitor will be used in combination with exemestane, fulvestrant , or tamoxifen; AND

E) The patient has not had disease progression while on Afinitor.

***** Refer to the Policy Statement.

34. Neuroendocrine Tumors of the Pancreas, Gastrointestinal Tract, Lung and Thymus (Carcinoid Tumors) – Advanced, Unresectable, or Metastatic. Approve for 3 years.

35. Renal Cell Carcinoma (Clear Cell or Non-Clear Cell Histology). Approve for 3 years if the patient meets the following criteria (A and B):
A) Patient has relapsed or Stage IV disease; AND
B) If using for clear cell disease, the patient has tried at least one prior systemic therapy (e.g., Inlyta [axitinib tablets], Votrient (pazopanib tablets), Sutent (sunitinib capsules), Cabometyx (cabozantinib tablets), Nexavar [sorafenib tablets]).

4. Tuberous Sclerosis Complex (TSC)-Associated Renal Angiomyolipoma. Approve for 3 years.

5. Tuberous Sclerosis Complex (TSC)-Associated Subependymal Giant Cell Astrocytoma (SEGA). Approve for 3 years if therapeutic intervention is required but SEGA cannot be curatively resected.

6. Tuberous Sclerosis Complex (TSC)-Associated Partial Onset Seizures. Approve for 3 years.

Other Uses with Supportive Evidence

7. Differentiated (i.e., papillary, follicular, and Hürthle cell) Thyroid Carcinoma. Approve for 3 years if refractory to radioactive iodine therapy.

8. Endometrial Carcinoma. Approve for 3 years if the patient meets the following criteria (A and B):
A) Afinitor will be used in combination with letrozole; AND
B) Patient has recurrent, metastatic, or high-risk disease.

9. Gastrointestinal Stromal Tumors (GIST). Approve for 3 years if the patient meets the following criteria (A, B, C, and D):
A) The patient has tried imatinib (Gleevec® tablets, generics); AND
B) The patient has tried Sutent (sunitinib capsules); AND
C) The patient has tried Stivarga® (regorafenib tablets); AND
D) Afinitor will be used in combination with imatinib (Gleevec tablets, generics), Sutent, or Stivarga.

10. Hodgkin Lymphoma, Classical (nodular sclerosis, mixed cellularity, lymphocyte depleted, and lymphocyte-rich subtypes of Hodgkin lymphoma). Approve for 3 years in adults ≥ 18 years of age with relapsed or refractory classical Hodgkin lymphoma.

11. Meningioma. Approve for 3 years if the patient has recurrent or progressive disease.

12. Perivascular Epitheloid Cell Tumors (PEComa), Recurrent Angiomyolipoma, Lymphangioleiomyomatosis. Approve for 3 years.

13. Thymomas and Thymic Carcinomas. Approve for 3 years if the patient has tried chemotherapy (e.g., cisplatin plus doxorubicin, cisplatin plus etoposide, carboplatin plus paclitaxel).

14. Waldenström's Macroglobulinemia/Lymphoplasmacytic Lymphoma (WM/LPL). Approve for 3 years in patients who meet the following criteria (A or B):

A) The patient has not responded to primary therapy (e.g., Velcade® [bortezomib intravenous or subcutaneous injection] with dexamethasone; Treanda® [bendamustine intravenous], Rituxan combination therapies; Velcade; Velcade with dexamethasone; Kyprolis® [carfilzomib intravenous injection] with Rituxan and dexamethasone; cyclophosphamide/ doxorubicin/vincristine/prednisone/Rituxan; Imbruvica® [ibrutinib capsules]; Rituxan; OR

B) The patient has progressive or relapsed disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Afinitor has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below.

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Alecensa® (alectinib capsules – Genentech)

DATE REVIEWED: 02/05/2020

OVERVIEW

Alecensa, a tyrosine kinase inhibitor (TKI), is indicated for the treatment of patients with anaplastic lymphoma kinase (ALK)-positive, metastatic non-small cell lung cancer (NSCLC).[1] Alecensa targets ALK and RET; it also has a major active metabolite, M4, which demonstrated similar *in vitro* potency and activity as alectinib.

GUIDELINES

According to the National Comprehensive Cancer Network (NCCN) NSCLC guidelines (version 2.2020 – December 23, 2019), Alecensa is the category 1preferred therapy for ALK+ NSCLC.[2] Alunbrig™ (brigatinib tablets) and Zykadia™ (ceritinib capsules) are the other recommended, category 1, first-line therapies. , Xalkori® (crizotinib capsules) is a category 1 recommended option "useful in certain circumstances". For subsequent therapy after progression on Xalkori, local therapy, continuing Xalkori therapy, or switching therapy to Zykadia, Alunbrig, or Alecensa (all category 2A) is recommended. For progression on For progression on one of Alecensa, Zykadia, or Alunbrig as first-line therapy, Lorbrena (lorlatinib tablets) can be used upon progression (category 2A).

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of Alecensa. All approvals are provided for 3 years in duration unless otherwise noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Alecensa is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Non-Small Cell Lung Cancer (NSCLC).** Approve for 3 years if the patient has *metastatic* anaplastic lymphoma kinase (*ALK*)-positive NSCLC as detected by an approved test.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Alecensa has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

299. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Alunbrig™ (brigatinib tablets – ARIAD/Takeda)

DATE REVIEWED: 06/10/2020

OVERVIEW

Alunbrig, a kinase inhibitor, is indicated for the treatment of patients with anaplastic lymphoma kinase (ALK)-positive, metastatic non-small cell lung cancer (NSCLC) as detected by an FDA-approved test.[1] Alunbrig targets *ALK*, c-ros oncogene 1 (*ROS1*), insulin-like growth factor-1 receptor (*IGF-1R*), *FLT-3*, epidermal growth factor receptor (*EGFR*) deletion and point mutations.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on NSCLC (version 5.2020 – May 27, 2020) recommend testing for ALK gene rearrangements in all patients with non-squamous NSCLC (category 1).[2] Testing is a prerequisite before treatment. Alecensa® (alectinib capsules) is the "Preferred" first-line therapy. Alecensa and Zykadia™ (ceritinib capsules) are category 1 recommended regiments under "Other Recommended" first-line therapies. Xalkori® (crizotinib capsules) is a category 1 therapy noted as "useful in certain circumstances". For subsequent therapy with progression on Xalkori, Xalkori can be continued, or therapy can be switched to Alecensa, Alunbrig, or Zykadia if not previously [all category 2A]. For patients who progress on Alecensa, Zykadia, or Alunbrig, local therapy can be considered in addition to continuing the kinase inhibitors or therapy can be switched to Lorbrena (lorlatinib tablets) for multiple systemic lesions.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Alunbrig. All approvals are provided for 3 years in duration unless otherwise noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Alunbrig is recommended in those who meet the following criteria:

FDA-Approved Indications

36. Non-Small Cell Lung Cancer (NSCLC). Approve for 3 years if the patient has *metastatic* NSCLC that is anaplastic lymphoma kinase (*ALK*)-positive as detected by an approved test.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Alunbrig has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

300. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Ayvakit® (avapritinib tablets – Blueprint Medicines)

DATE REVIEWED: 01/15/2020

OVERVIEW

Ayvakit, a kinase inhibitor, is indicated for the treatment of adults with unresectable or metastatic gastrointestinal stromal tumor (GIST) harboring a platelet-derived growth factor receptor alpha (*PDGFRA*) exon 18 mutation, including *PDGFRA D842V* mutations. Patients should be selected for treatment with Ayvakit based on the presence of a *PDGFRA* exon 18 mutation; an FDA-approved test for the detection of this mutation is not currently available.

Guidelines

According to the National Comprehensive Cancer Network (NCCN) soft tissue sarcoma guidelines (version 6.2019 – February 10, 2020), Ayvakit is one of the primary treatment options (category 2A) for GIST with *PDGFRA* exon 18 mutation, including *PDGFRA* D842V mutations.[2] Imatinib is a category 1 recommended option for primary treatment. The guidelines note that most mutations in the *PDGFRA* gene are associated with a response to imatinib, with the notable exception of *PDGFRA* D842V mutation. Upon disease progression on imatinib, Sutent® (sunitinib tablets) is a category 1 recommended option. The guidelines note that there are no appropriate treatment options for GIST progressing on Ayvakit. For disease progression on Sutent, Stivarga is the recommended option (category 1). Ayvakit is listed as one of the recommended therapies after disease progression on imatinib, Sutent, and Stivarga. Based on limited data, the guidelines recommend other small molecule inhibitors such as Nexavar® (sorafenib tablets), Votrient® (pazopanib tablets), Tasigna® (nilotinib tablets), and everolimus + TKI (all category 2A). Sprycel® (dasatinib tablets) is also recommended, based on limited data, for patients with *PDGFRA* D842V mutation (category 2A).

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of Ayvakit. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Ayvakit is recommended in those who meet the following criteria:

FDA-Approved Indications

38. Gastrointestinal Stromal Tumor (GIST). Approve for 3 years if the patient meets the following criteria (A and B):
- **A)** The patient has unresectable or metastatic disease; AND
- **B)** The tumor is positive for platelet-derived growth factor receptor alpha (*PDGFRA*) exon 18 mutation.
  Note: *PDGFRA* exon 18 mutation includes *PDGFRA D842V* mutations.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Ayvakit has not been shown to be effective or there are limited or preliminary data that are not supportive of general approval for the following conditions.

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Balversa™ (erdafitinib tablets – Janssen Pharmaceuticals)

DATE REVIEWED: 04/08/2019

OVERVIEW
Balversa is a kinase inhibitor which binds and inhibits the enzymatic activity of fibroblast growth factor receptor (FGFR) 1, FGFR2, FGFR3, and FGFR4, leading to decreased viability in cell lines expressing FGFR genetic alterations.[1] Balversa demonstrated antitumor activity in FGFR expressing cell lines and xenograft models, including bladder cancer.

Balversa is indicated for the treatment of adult patients with locally advanced or metastatic urothelial carcinoma that has susceptible FGFR3 or FGFR2 genetic alterations, and progressed during or following at least one line of prior platinum-containing chemotherapy, including within 12 months of adjuvant or neoadjuvant platinum-containing chemotherapy.[1]

Patients are selected for treatment with Balversa based on the presence of susceptible FGFR genetic alterations in tumor specimens detected by an FDA-approved companion diagnostic.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) clinical practice guidelines for bladder cancer (version 3.2020 – January 17, 2020) recommend Balversa as a single agent, post-platinum or –checkpoint inhibitor therapy in patients with bladder cancer, upper genitourinary tract tumors, and urothelial carcinoma of the prostate with susceptible FGFR2 or FGFR3 genetic alterations.[2,3]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Balversa. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Balversa is recommended in those who meet the following criteria:

FDA-Approved Indications

134. Urothelial Carcinoma, Locally Advanced or Metastatic. Approve for 3 years if the patient meets the following criteria (A and B):

A) The patient has susceptible fibroblast growth factor receptor 3 or fibroblast growth factor receptor 2 genetic alterations; AND

B) The patient has progressed during or following prior platinum-containing chemotherapy (i.e., cisplatin, oxaliplatin) or checkpoint inhibitor therapy.
Note: Checkpoint inhibitors include: Keytruda® (pembrolizumab injection for intravenous use), Opdivo® (nivolumab injection for intravenous use), Tecentriq® (atezolizumab injection for intravenous use), Imfinzi® (durvalumab injection for intravenous use), and Bavencio® (avelumab injection for intravenous use).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Balversa has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

130. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Bosulif® (bosutinib tablets – Pfizer)

DATE REVIEWED: 04/01/2020

OVERVIEW

Bosulif, a tyrosine kinase inhibitor (TKI), is indicated for the treatment of adults with: newly diagnosed chronic phase Philadelphia chromosome-positive (Ph+) chronic myelogenous leukemia (CML).[1] This indication was approved under accelerated approval based on molecular and cytogenetic response rates. Continued approval for this indication may be contingent upon verification and confirmation of clinical benefit in an ongoing long-term follow-up trial. Bosulif is also indicated for the treatment of adults with chronic phase (CP), accelerated phase (AP), or blast phase (BP) Ph+ CML with resistance or intolerance to prior therapy. Currently, there are four other TKIs approved for the treatment of Ph+ CML: Gleevec® (imatinib tablets, generic), Sprycel® (dasatinib tablets), Tasigna® (nilotinib capsules), and Iclusig® (ponatinib tablets).[2-5] These agents are indicated for the treatment of Ph+ CML in various phases; some TKIs are indicated after resistance or intolerance to prior therapy. Iclusig is approved for patients with T315I-positive CML and in adult patients with CML for whom no other TKI therapy is indicated.[5] Sprycel, Gleevec and Iclusig are also indicated for use in patients with Ph+ acute lymphoblastic leukemia (ALL).[2,3,5]

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for CML (version 3.2020 – January 30, 2020) state that for patients with CP CML with a low-risk score, the primary treatment recommended includes a first-generation TKI (Gleevec or generic imatinib 400 mg QD [Category 1]), or a second-generation TKI (Bosulif 400 mg QD [Category 1], Sprycel 100 mg QD [Category 1], or Tasigna 300 mg BID [Category 1]).[6] For patients with CP CML with an intermediate- or high-risk score, a second-generation TKI is preferred (Bosulif 400 mg QD [Category 1], Sprycel 100 mg QD [Category 1], or Tasigna 300 mg BID [Category 1]). A first-generation TKI (Gleevec or generic imatinib 400 mg QD) is an alternative [Category 2A]. Iclusig is an option for patients with a T315I mutation and for with disease that has not responded to multiple TKIs or in whom another TKI is not indicated.[6] The NCCN guidelines for ALL (adult and adolescent young adults) [version 1.2020 – January 15, 2020] recommend Bosulif as an option for patients with relapsed or refractory ALL..[7]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Bosulif. All approvals are provided for 3 years in duration.

AUTOMATION: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Bosulif is recommended in those who meet the following criteria:

FDA-Approved Indications

37. Chronic Myeloid Leukemia (CML) That is Philadelphia Chromosome Positive (Ph+). Approve for 3 years.

Other Uses with Supportive Evidence

2. Acute Lymphoblastic Leukemia (ALL) That is Philadelphia Chromosome Positive (Ph+). Approve for 3 years if the patient has tried at least one other tyrosine kinase inhibitor (TKI) for Ph+ ALL.
Note: Examples include Gleevec® (imatinib tablets) and Sprycel® (dasatinib tablets).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Bosulif has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Braftovi Prior Authorization Policy
- Braftovi® (encorafenib capsules – Array BioPharma)

REVIEW DATE: 07/08/2020

OVERVIEW

Braftovi, a BRAF inhibitor, is indicated for the following uses:[1]
- **Melanoma**, in combination with Mektovi® (binimetinib tablets), for the treatment of patients with unresectable or metastatic disease and a *BRAF V600E* or *V600K* mutation, as detected by an FDA-approved test.
- **Colorectal cancer**, in combination with Erbitux® (cetuximab infusion), for the treatment of adults with metastatic disease and a *BRAF V600E* mutation, as detected by an FDA-approved test, after prior therapy.

It is a limitation of use that Braftovi is not indicated for wild-type disease.

Guidelines

National Comprehensive Cancer Network (NCCN) guidelines support use of Braftovi in the following cancers.

- **Melanoma:** Guidelines (version 3.2020 – May 18, 2020) recommend BRAF/MEK inhibitor combinations for first-line (preferred if clinically needed for early response) and subsequent treatment of metastatic or unresectable melanoma with a *V600* activating mutation.[2] While combination BRAF/MEK inhibition is preferred, if a combination is contraindicated, monotherapy with a BRAF inhibitor (Tafinlar® [dabrafenib capsules] or Zelboraf® [vemurafenib tablets]) is a recommended option, particularly if the patient is not a candidate for checkpoint immunotherapy. Following resection of limited metastatic disease with a *BRAF V600*-activating mutation, BRAF/MEK combination therapy is among the treatment options for patients with no evidence of disease. Tafinlar + Mekinist® (trametinib tablets) is also recommended in guidelines as adjuvant therapy (including for nodal recurrence) in some patients with Stage III disease, including use post-surgery or use after complete lymph node dissection. If unacceptable toxicity to Tafinlar/Mekinist, other BRAF/MEK combinations can be considered.
- **Colon and Rectal Cancer:** Guidelines for colon cancer (version 4.2020 – June 15, 2020) and rectal cancer (version 6.2020 – June 25, 2020) recommend Braftovi for some situations in patients with *BRAF-V600E* mutated disease.[3,] For primary treatment (following adjuvant chemotherapy) or as subsequent use, Braftovi + Erbitux or Vectibix® (panitumumab IV infusion) is a recommended treatment option.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Braftovi. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Braftovi is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Melanoma.** Approve for 3 years if the patient meets BOTH of the following (A and B):
   A) Patient has unresectable, advanced, or metastatic melanoma; AND
   B) Patient has *BRAF V600* mutation-positive disease.

2. **Colon or Rectal Cancer.** Approve for 3 years if the patient meets the following (A, B, and C):
   2. Patient has *BRAF V600E* mutation-positive disease; AND
   3. Patient has previously received a chemotherapy regimen for colon or rectal cancer; AND
   Note: Examples of chemotherapy regimens include a fluoropyrimidine such as 5-fluorouracil (5-FU), capecitabine; oxaliplatin, irinotecan, or an adjunctive chemotherapy regimen such as FOLFOX (5-FU, leucovorin, and oxaliplatin) or CapeOX (capecitabine and oxaliplatin).
   4. The agent is prescribed as part of a combination regimen for colon or rectal cancer.
   Note: Examples of combination regimens include Braftovi + Erbitux (cetuximab IV infusion), Braftovi + Vectibix (panitumumab IV infusion).

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Coverage of Braftovi is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Brukinsa™ (zanubrutinib capsules – BeiGene)

DATE REVIEWED: 06/03/2020

OVERVIEW
Brukinsa, a kinase inhibitor, is indicated for the treatment of adults with mantle cell lymphoma who have received at least one prior therapy.[1] The indication was granted under accelerated approval based on overall response rate. Continued approval for this indication may be contingent upon verification and description of clinical benefit in a confirmatory trial.

Disease Overview

Mantle cell lymphoma is a rare and fasting-growing type of non-Hodgkin lymphoma (NHL).[2,3] It accounts for approximately 3% of cases of newly-diagnosed NHL. The condition is described as aggressive and non-curable. It is defined by the overexpression of cyclin D1. The median age at diagnosis is 68 years of age and it is more common in males. Mantle cell lymphoma is a cancer involving the lymphatic system which is part of the immune system comprised of lymph tissue, lymph nodes, the spleen, thymus, tonsils, and bone marrow. About 15% to 30% of patients have involvement of the gastrointestinal tract. Approximately one-third of patients with mantle cell lymphoma present with high levels of lactate dehydrogenase (LDH). Although there is no definitive standard of care, aggressive chemo-immunotherapy regiments containing rituximab and cytarbine are used for patients depending on fitness. Many targeted therapies are now available. Stem cell transplants is also an option.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for B-cell lymphomas (version 1.2020 – January 22, 2020) provide recommendations for patients with mantle cell lymphoma.[2] Various agents and chemotherapy regimens are recommended, many of which are given intravenously (IV) and involve rituximab-based therapies. For second-line therapy for patients with short response duration to prior chemoimmunotherapy preferred regimens include Bruton's tyrosine kinase (BTK) inhibitors Calquence® (acalabrutinib capsules); Imbruvica® (ibrutinib capsules and tablets) with or without a rituximab product; Brukinsa; Revlimid® (lenalidomide capsules) with or without a rituximab product; and Venclexta® (venetoclax tablets) [all 2A recommendations]. For second-line therapy for extended response duration prior to chemoimmunotherapy, preferred regimens include BTK inhibitors (Calquence; Imbruvica with or without a rituximab product; and Brukinsa); Revlimid with or without a rituximab product; Treanda® (bendamustine injection for intravenous use) with or without a rituximab product (if not previously given); and Velcade® (bortezomib injection for intravenous or subcutaneous use) with or without rituximab (all 2A recommendations).

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Brukinsa.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Brukinsa is recommended in those who meet the following criteria.

FDA-Approved Indication

1. **Mantle Cell Lymphoma.** Approve for 3 years if the patient has tried at least one prior therapy. Note: Example of therapies are Calquence® (acalbrutinib capsules); Imbruvica® (ibrutinib tablets and capsules) with or without a rituximab product; Revlimid® (lenalidomide capsules) with or without a rituximab product; Venclexta® (venetoclax tablets) with or without a rituximab product; RDHA (a rituximab product, dexamethasone, cytarabine) plus platinum (carboplatin, cisplatin, oxaliplatin); alternating RCHOP (a rituximab product, cyclophosphamide, doxorubin, vincristine, prednisone)/RDHAP (a rituximab product, dexamethasone, cytarbine, cisplatin); Treanda® (bendamustine injection) plus a rituximab product; RCHOP; NORDIC regimen (dose-intensified induction immunochemotherapy with ritixumab plus cyclophosphamide, vincristine, doxorubicin, prednisone [maxi-CHOP]) alternating with a rituximab product plus high-dose cytarbine);

HyperCVAD (cyclophosphamide, vincristine, doxorubicin, and dexamathsone alternating with high-dose methotrexate and cytarabine plus rituximab); and VR-CAP (Velcade® [bortezomib injection for subcutaneous or intravenous use], a rituximab product, cyclophosphamide, doxorubicin, and prednisone).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Brukinsa has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Cabometyx™ (cabozantinib tablets – Exelixis Inc.)

DATE REVIEWED: 02/05/2020

OVERVIEW

Cabometyx is a kinase inhibitor indicated for the treatment of patients with advanced renal cell carcinoma (RCC).[1] It is also indicated for the treatment of patients with hepatocellular carcinoma (HCC) who have been previously treated with Nexavar® (sorafenib tablets).

Guidelines

In the National Comprehensive Cancer Network (NCCN) clinical practice guidelines for kidney cancer (version 2.2020 – August 5, 2019), the recommendations for first-line oral therapy regimens in favorable risk patients with relapsed or Stage IV RCC with predominant clear cell histology are: Sutent® (sunitinib malate capsules), Votrient® (pazopanib tablets), Inlyta® (axitinib tablets) + Keytruda (pembrolizumab for injection) [all category 2A] are the preferred regimnes. Cabometyx (category 2B) is one of the "other recommended regimens" for favorable risk patients.[2] For patients in the poor/intermediate risk grouping, the preferred oral regimen is Cabometyx (category 2A). Inlyta is a category 2B agent that is useful under certain circumstances. Recommendations for subsequent oral therapies include Cabometyx (category 1, preferred), Inlyta (category 1), Lenvima™ (lenvatinib capsules) + everolimus [category 1]; everolimus, Sutent, or Votrient are all category 2A recommended therapies. For patients with non-clear cell histology RCC, Sutent and enrollment in clinical trials are noted as preferred therapies (category 2A, preferred); Cabometyx and everolimus are other recommended regimens (both category 2A).

The NCCN hepatobiliary cancers (version 4.2019 – December 20, 2019) recommends Nexavar and Lenvima as preferred first-line systemic therapy options.[3] Nexavar is a category 1 recommended option for Child-Pugh Class A or category 2A recommendation for Child-Pugh Class B7. Lenvima is a category 2A recommendation for Child-Pugh Class A only. The following are subsequent therapy options if there is disease progression: Stivarga (regorafenib tablets) [Child-Pugh Class A only; Category 1], Cabometyx (Child-Pugh Class A only; Category 1), Cyramza® (ramucirumab for intravenous injection) [Category 1], Opdivo (nivolumab for intravenous injection) [Child-Pugh Class A or B7; Category 2A], Nexavar (after first-line Lenvima; Category 2A), and Keytruda (pembrolizumab for intravenous injection) [Category 2A].

The NCCN Non-Small Cell Lung Cancer (NSCLC) guidelines (version 2.2020 – December 23, 2019) recommend cabozantinib for RET gene rearrangements (category 2A).[4] This is based on results from a small case series and a Phase II study in 25 patients.[5-6] Cabometyx 60 mg dose was used in the case series and the Phase II study. In the Phase II study, the rate of partial response was 28% and the median duration of response was 7.0 months.[6] At the time of data cutoff, 76% of the patients either had disease progression or died. The median progression-free survival (PFS) was 5.5 months and the median overall survival was 9.9 months.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Cabometyx. All approvals are provided for 3 years in duration unless otherwise noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Cabometyx is recommended in those who meet the following criteria:

FDA-Approved Indication

38. Renal Cell Carcinoma (RCC), Advanced (Predominant Clear Cell or Non-Clear Cell Histology). Approve for 3 years.

2. Hepatocellular Carcinoma. Approve for 3 years if the patient has been previously treated with at least one tyrosine kinase inhibitor therapy (e.g., Nexavar® (sorafenib tablets), Lenvima [lenvatinib capsules]).

Other Uses with Supportive Evidence

3. Non-Small Cell Lung Cancer with RET Gene Rearrangements. Approve for 3 years.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Cabometyx has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

1. **Metastatic Castration-Resistant Prostate Cancer (mCRPC).**

   Results from the COMET-1 Phase III pivotal study with Cabometyx 60 mg tablets in men with mCRPC are published.[7] Patients included in the study had disease progression after treatment with docetaxel as well as Zytiga® (abiraterone acetate tablets) and/or Xtandi® (enzalutamide capsules). The study failed to meet its primary endpoint of demonstrating statistically significant increase in overall survival (OS) compared with prednisone. The median OS with Cabometyx was 11.0 months vs. 9.8 months with prednisone (hazard ratio [HR] 0.90; 95% CI: 0.76, 1.06; P = 0.213). Based on these results, the second Phase III study, COMET-2 has been discontinued.[8]

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Calquence® (acalabrutinib capsules – AstraZeneca)

DATE REVIEWED: 06/03/2020

OVERVIEW

Calquence is a Bruton tyrosine kinase (BTK) inhibitor indicated for the treatment of adults with mantle cell lymphoma who have received at least one prior therapy.[1] Calquence is also indicated for the treatment of adults with chronic lymphocytic leukemia (CLL) or small lymphocytic leukemia (SLL).

Disease Overview

Mantle cell lymphoma is a rare and fasting-growing type of non-Hodgkin lymphoma (NHL).[3] It accounts for approximately 6% of cases of newly-diagnosed NHL. The median age at diagnosis is 68 years of age

and it is more common in males. Mantle cell lymphoma is a cancer involving the lymphatic system which is part of the immune system comprised of lymph tissue, lymph nodes, the spleen, thymus, tonsils, and bone marrow. Approximately one-third of patients with mantle cell lymphoma present with high levels of lactate dehydrogenase (LDH).

CLL is one of the most prevalent adult leukemias in the Western world.[4] In 2019, an estimated 20,720 patients will be diagnosed with CLL in the US, and approximately 3,930 patients will die from the disease. The condition usually is diagnosed in older adults (≥ 70 years of age) and occurs more frequently in men. The leukemic cells appear as small, mature lymphocytes. CLL and SLL are different manifestations of the same condition and are managed similarly. In CLL, many of the abnormal lymphocytes are found in the blood, as well as in the bone marrow and lymphoid tissue. In SLL, there are few, if any, abnormal lymphocytes circulating in blood and most of the disease is in the lymph nodes, bone marrow, and other lymphoid tissue. The diagnosis requires the presence of at least 5×10^9/L monoclonal B-lymphocytes in the peripheral blood. SLL requires the presence of lymphadenopathy and/or splenomegaly with $< 5 \times 10^9$/L B-lymphocytes found in the peripheral blood.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for B-cell lymphomas (version 1.2020 – January 22, 2020) provide recommendations for patients with mantle cell lymphoma.[3] Various agents and chemotherapy regimens are recommended, many of which are given intravenously (IV) and involve rituximab. Calquence is recommended as one of several preferred agents as second-line therapy in various clinical scenarios (category 2A).

The NCCN guidelines for CLL/SLL (version 4.2020 – December 20, 2019) list Calquence as a preferred option as first line therapy, as well as for relapsed/refractory therapy, in variety of clinical scenarios in patients with and without del(17p)/TP53 mutation.[4] In some clinical scenarios, Calquence is recommended to be given with Gazyva® (obinutuzumab injection for intravenous use).

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Calquence. All approvals are provided for the duration noted below.
Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Calquence is recommended in those who meet the following criteria:

FDA-Approved Indications

39. Mantle Cell Lymphoma. Approve for 3 years.

40. Chronic Lymphocytic Leukemia (CLL). Approve for 3 years.

41. Small Lymphocytic Lymphoma (SLL). Approve for 3 years.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Calquence has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

3. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Caprelsa® (vandetanib tablets – AstraZeneca)

DATE REVIEWED: 05/13/2020

OVERVIEW

Caprelsa is a kinase inhibitor indicated for the treatment of symptomatic or progressive medullary thyroid cancer (MTC) in patients with unresectable locally advanced or metastatic disease.[1] Due to the treatment related risks of Caprelsa, its use in patients with indolent, asymptomatic, or slowly progressing disease should be carefully considered. Caprelsa has a black box warning regarding the increased risk of QT prolongation, Torsades de pointes, and sudden death. It is available only through the restricted distribution program called the Caprelsa Risk Evaluation and Mitigation Strategy (REMS) program. Only prescribers and pharmacies certified with the program are able to prescribe or dispense Caprelsa.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for thyroid carcinoma (version 2.2019 – September 16, 2019) lists surgery as the main treatment option for MTC.[2-3] For *locoregional* , recurrent or persistent disease, or for distant metastases Caprelsa (category 1) or Cometriq™ (cabozantinib capsules) (category 1) are recommended for unresectable locoregional disease that is symptomatic or structurally progressive. The guidelines recommend that Caprelsa be considered if clinical trials or other systemic therapies are not available or appropriate for the treatment of progressive and/or symptomatic iodine refractory thyroid cancer that is unresectable recurrent or persistent locoregional disease or that is distant metastatic disease.[2-3] This recommendation is for follicular, Hürthle cell, and papillary cancer subtypes (all category 2A).

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of Caprelsa. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Caprelsa is recommended in those who meet the following criteria:

Food and Drug Administration (FDA)-Approved Indications

42. Medullary Thyroid Cancer (MTC). Approve for 3 years.

Other Uses with Supportive Evidence

2. Differentiated (i.e., papillary, follicular, and Hürthle) Thyroid Carcinoma. Approve for 3 years if the disease is refractory to radioactive iodine therapy.

3. **Non-Small Cell Lung Cancer with RET Gene Rearrangements.** Approve for 3 years.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Caprelsa has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

4. **Non-Small Cell Lung Cancer (NSCLC) [Without RET Gene Rearrangements].** The efficacy of Caprelsa for the treatment of NSCLC was evaluated in four Phase III studies; three of these studies did not show any statistically significant improvement with Caprelsa with regards to progression free survival (PFS) or overall survival. In the ZEST (Zactima Efficacy Study versus Tarceva) study, Caprelsa was compared with Tarceva® (erlotinib tablets) in patients (n = 1,240) with advanced NSCLC who have had treatment failure with one or two prior cytotoxic chemotherapy regimens.[6] There was no significant improvement in PFS in patients treated with Caprelsa vs. Tarceva (median PFS 2.6 months vs. 2.0 months, respectively; P = 0.721). In the second Phase III study (ZEPHYR), Caprelsa was assessed for overall survival benefit in patients with locally advanced or metastatic NSCLC who have had treatment failures with one or two previous chemotherapy regimens, including an EGFR tyrosine kinase inhibitor.[7] Patients (n = 924) were randomized 2:1 to receive either Caprelsa 300 mg/day or placebo. There was no statistically significant difference in the primary end point of overall survival in patients receiving Caprelsa or placebo. The median overall survival was 8.5 months for Caprelsa and 7.8 months with placebo (P = 0.527). The estimated percentage of patients alive after 1 year was 35.5% vs. 31.7% for Caprelsa and placebo, respectively. In the ZODIAC (Zactima in cOmbination with Docetaxel In non-smAll cell lung Cancer) Phase III study, Caprelsa in combination with docetaxel was compared with placebo and docetaxel in patients (n = 1,391) with locally advanced or metastatic NCSLC after progression following platinum-based first-line chemotherapy.[8] PFS was statistically significant in the Caprelsa group compared with the placebo group for the overall population (median PFS 4.0 months with Caprelsa vs. 3.2 months with placebo; P < 0.0001). There were no significant differences between the two groups for the secondary endpoint of overall survival. In the ZEAL (Zactima Efficacy with Alimta in Lung cancer) study the efficacy of Caprelsa was assessed in combination with Alimta® (pemetrexed disodium injection) for the second-line treatment of patients with advanced NSCLC.[9] The primary efficacy endpoint of PFS was not statistically significantly different between the treatment groups. The median PFS was 17.6 weeks for Caprelsa and 11.9 weeks for placebo (P = 0.108). There were also no significant differences between the two groups for overall survival.

5. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Cometriq™ (cabozantinib capsules – Exelixis Inc.)

DATE REVIEWED: 05/13/2020

OVERVIEW

Cometriq is a kinase inhibitor indicated for the treatment of patients with progressive, metastatic medullary thyroid cancer (MTC).[1] *In vitro* biochemical and cellular assays have shown Cometriq to inhibit the tyrosine kinase activity of rearranged during transfection (RET), MET, vascular endothelial cell growth factor receptor (VEGFR)-1, -2, and -3, KIT, tyrosine-related kinase B (TrkB), Fms-like tyrosine kinase 3 (FLT-3), AXL, and TIE-2.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for thyroid carcinoma (version 2.2019 – September 16, 2019) lists surgery as the main treatment option for MTC.[2-3] For *locoregional* , recurrent or persistent disease, or for distant metastases Caprelsa® (vandetanib tablets) [category 1] or Cometriq (category 1) are recommended for unresectable locoregional disease that is symptomatic or structurally progressive. The guidelines recommend that Cometriq be considered if clinical trials or other systemic therapies are not available or appropriate for the treatment of progressive and/or symptomatic iodine refractory thyroid cancer that is unresectable recurrent or persistent locoregional disease or that is distant metastatic disease.[2-3] This recommendation is for follicular, Hürthle cell, and papillary cancer subtypes (all category 2A).

The NCCN Compendium recommends the use of cabozantinib for RET gene rearrangements in non-small cell lung cancer (category 2A).[3]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Cometriq. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Cometriq is recommended in those who meet the following criteria:

FDA-Approved Indication

43. Medullary Thyroid Cancer (MTC). Approve for 3 years.

Other Uses with Supportive Evidence

44. Non-Small Cell Lung Cancer with RET Gene Rearrangements. Approve for 3 years.

45. Differentiated (i.e., papillary, follicular, and Hürthle) Thyroid Carcinoma. Approve for 3 years if the disease is refractory to radioactive iodine therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Cometriq has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

1. **Metastatic Castration-Resistant Prostate Cancer (mCRPC).** Results from the COMET-1 Phase III pivotal study with cabozantinib 60 mg tablets in men with mCRPC are published.[8] Patients included in the study had disease progressed after treatment with docetaxel as well as Zytiga® (abiraterone acetate tablets) and/or Xtandi® (enzalutamide capsules). The study failed to meet its primary endpoint of demonstrating statistically significant increase in overall survival (OS) compared with prednisone. The median OS with cabozantinib was 11.0 months vs. 9.8 months with prednisone (hazard ratio [HR] 0.90; 95% CI: 0.76, 1.06; P = 0.213). Based on these results, the second Phase III study, COMET-2 has been discontinued.[9]

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Copiktra™ (duvelisib capsules – Verastem)

REVIEW DATE: 10/09/2019

OVERVIEW

Copiktra, an inhibitor of phosphatidylinositol 3-kinase delta and gamma, is indicated for the treatment of adults with 1) relapsed or refractory chronic lymphocytic leukemia (CLL)/small lymphocytic lymphoma (SLL) after at least two prior therapies; and 2) relapsed or refractory follicular lymphoma after at least two prior systemic therapies.[1] Accelerated approval was given for the indication of follicular lymphoma based on overall response rate; continued approval for this indication may be contingent upon verification and description of clinical benefit in confirmatory trials.

Disease Overview

Chronic lymphocytic leukemia (CLL) is one of the most prevalent adult leukemias in the Western world, with an age-adjusted incidence of 4 to 5 per 100,000.[2,3] In 2019, an estimated 20,720 patients were diagnosed with CLL in the US, and around 3,930 patients will die from the disease.[3] The median age at diagnosis is 72 years of age and men are more affected than women (2:1).[2] Lymphadenopathy may be a finding upon presentation, as well as symptoms such as fevers, night sweat, weight loss, or fatigue.[2,3] CLL and SLL are different manifestations of the same condition but managed similarily.[3] Both diseases are characterized by a progressive accumulation of leukemic cells, which appear as small mature lymphocytes and may be found among occasional larger or atypical cells, in the peripheral blood, bone marrow, and lymphoid tissues. One major distinction is that in CLL, a significant number of the abnormal lymphocytes are present in blood, in addition to bone marrow and lymphoid tissue. Comparably, in SLL there are few, if any, abnormal lymphocytes circulating in blood. The bulk of the disease is in the lymph nodes, bone marrow, and in other lymphoid tissue. Many patients with CLL have cytogenetic abnormalities which can serve as markers that provide prognostic information. Drug therapy for CLL is not curative and is often not necessary in uncomplicated early disease. Some patients can be monitored without therapy until they have progressive or symptomatic/active disease. Many medications and therapy regimens are used to manage CLL. Factors to consider for recommending the most optimal regimen for a patient include disease stage, patient symptoms, fitness and other concomitant illnesses of the patient, genetic factors, and the treatment scenario.

Guidelines

The National Comprehensive Cancer Network (NCCN) clinical practice guidelines for CLL/SLL (version 1.2020 – August 23, 2019) address CLL. Copiktra is one of several therapies for relapsed or refractory therapy (category 2A).[3] The guidelines note that CLL and SLL are different manifestations of the same condition and are treated similarly.

The NCCN clinical practice guidelines for B-cell Lymphomas (version 5.2019 – September 23, 2019) recommend Copiktra as second-line and subsequent therapy in patients with follicular lymphoma (grade 1-2) among patients relapsed or refractory after two prior therapies.[4]

The NCCN clinical practice guidelines for B-Cell Lymphomas (version 5.2019 – September 23, 2019) recommend Copiktra as second-line and subsequent therapy for marginal zone lymphomas that are refractory or refracotyr to two prior therapies.[4] Other regimens are recommended first line including many that are rituximab-based. Many recommendations for the different types of gastric MALT and nongastric MALT lymphoma follow those of marginal zone lymphomas.

Safety

Copiktra has a Boxed Warning regarding fatal and serious toxicities such as infections, diarrhea or colitis, cutaneous reactions, and pneumonitis.[1] Copiktra was approved with a Risk Evaluation and Mitigation Strategy (REMS) program to assist physicians in the management of these risks. Other Warnings are present regarding hepatotoxicity, neutropenia, and embryofetal toxicity.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Copiktra. All approvals are provided for 3 years in duration unless otherwise noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Copiktra is recommended in those who meet the following criteria:

FDA-Approved Indications

46. **Chronic Lymphocytic Leukemia (CLL).** Approve for 3 years if the patient has tried two prior therapies. Note: Examples of therapies include Imbruvica® (ibrutinib capsules and tablets); Venclexta® [venetoclax tablets] with or without rituximab; Venclexta plus Gazyva® (obinutuzumab injection for intravenous use); chlorambucil plus Gazyva; chlorambucil plus rituximab; FCR (fludarabine, cyclophosphamide, and rituximab); FR (fludarabine plus rituximab); PCR (pentostatin, cyclophosphamide, and rituximab); Treanda® (bendamustine injection) with or without rituximab; high-dose methylprednisolone (HDMP) plus rituximab; Campath® (alemtuzumab injection for intravenous use) with or without rituximab; Calquence® (acalabrutinib capsules); Zydelig® (idelalisib tablets) with or without rituximab; Gazyva; Rituxan; Arzerra® (ofatumumab injection for intravenous use); or chlorambucil.

47. **Follicular Lymphoma.** Approve for 3 years if the patient has tried two prior therapies. Note: Examples of therapies include Treanda® (bendamustine injection) plus rituximab; Treanda plus Gazyva® (obinutuzumab injection for intravenous use); CHOP (cyclophosphamide, doxorubicin, vincristine, prednisone) plus Gazyyva; RCHOP (rituximab, cyclophosphamide, doxorubicin, vincristine, prednisone); RCVP (rituximab, cyclophosphamide, vincristine, prednisone); chlorambucil with or without rixtuximab; cyclophosphamide with or without rituximab; Gazyva; Revlimid® (lenalidomide capsules); CVP plus Gazyva; Zydelig® (idelalisib tablets); chlorambucil; cyclophosphamide; or Aliqopa® (copanlisib injection for intravenous use).

48. **Small Lymphocytic Lymphoma (SLL).** Approve for 3 years if the patient has tried two prior therapies. Note: Examples of therapies include Imbruvica® (ibrutinib capsules and tablets); Venclexta® (venetoclax tablets) with or without rituximab; Venclexta plus Gazyva® (obinutuzumab injection for intravenous use); chlorambucil plus Gazyva® [obinutuzumab injection for intravenous use]; chlorambucil plus rituximab; FCR (fludarabine, cyclophosphamide, and rituximab); FR (fludarabine plus rituximab); PCR (pentostatin, cyclophosphamide, and rituximab); Treanda® (bendamustine injection) with or without rituximab; high-dose methylprednisolone (HDMP) plus rituximab; Campath® (alemtuzumab injection for intravenous use) with or without rituximab; Calquence® (acalabrutinib capsules); Zydelig® (idelalisib tablets) with or without rituximab; Gazyva; Rituxan; Arzerra® (ofatumumab injection for intravenous use); or chlorambucil.

Other Uses with Supportive Evidence

6. **MALT Lymphoma (Gastric and Nongastric).** Approve for 3 years if the patient has tried two other therapies. Note: Examples of therapies include rituximab; Treanda® (bendamustine injection for intravenous use) plus rituximab; RCHOP (rituximab, cyclophosphamide, vincristine, prednisone); RCVP (rituximab, cyclophosphamide, vincristine, prednisone); chlorambucil with or without rituximab; cyclophosphamide with or without rituximab; Imbruvica® (ibrutinib tablets and capsules); Zydelig® (idelalisib tablets); Revlimid® (lenalidomide capsules) with or without rituximab; or Aliqopa® (copanlisib injection for intravenous use).

7. **Marginal Zone Lymphoma.** Approve for 3 years if the patient has tried two other therapies. Note: Examples of therapies include rituximab; Treanda® (bendamustine injection for intravenous use) plus rituximab; RCHOP (rituximab, cyclophosphamide, vincristine, prednisone); RCVP (rituximab, cyclophosphamide, vincristine, prednisone); chlorambucil with or without rituximab; cyclophosphamide with or without rituximab; Imbruvica® (ibrutinib tablets and capsules); Zydelig® (idelalisib tablets); Revlimid® (lenalidomide capsules) with or without rituximab; or Aliqopa® (copanlisib injection for intravenous use).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Copiktra has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Cotellic Prior Authorization Policy

- Cotellic® (cobimetinib tablets – Genentech/Roche)

REVIEW DATE: 07/08/2020

OVERVIEW

Cotellic is a mitogen-activated extracellular signal regulated kinase (MEK) inhibitor indicated in combination with Zelboraf® (vemurafenib tablets), for the treatment of patients with unresectable or metastatic melanoma with the *BRAF V600E* or *V600K* mutation.[1]

Guidelines

NCCN guidelines for melanoma (version 3.2020 – May 18, 2020) recommend BRAF/MEK inhibitor combinations for first-line (preferred if clinically needed for early response) and subsequent treatment of metastatic or unresectable melanoma with a *V600* activating mutation.[2] While combination BRAF/MEK inhibition is preferred, if a combination is contraindicated, monotherapy with a BRAF inhibitor (Tafinlar® [dabrafenib capsules] or Zelboraf® [vemurafenib tablets]) is recommended option, particularly if the patient is not a candidate for checkpoint immunotherapy. Following resection of limited metastatic disease with a *BRAF V600*-activating mutation, BRAF/MEK combination therapy is among the treatment options for patients with no evidence of disease. Tafinlar + Mekinist® (trametinib tablets) is also recommended in guidelines as adjuvant therapy (including for nodal recurrence) in some patients with Stage III disease, including use post-surgery or use after complete lymph node dissection. If unacceptable toxicity to Tafinlar/Mekinist, other BRAF/MEK combinations can be considered.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Cotellic. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Cotellic is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Melanoma.** Approve Cotellic for 3 years if the patient meets ALL of the following (A, B, and C):
   - **A)** Patient has unresectable, advanced, or metastatic melanoma; AND
   - **B)** Patient has *BRAF V600* mutation-positive disease; AND
   - **C)** Cotellic is being prescribed in combination with Zelboraf (vemurafenib tablets).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Cotellic is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Daurismo™ (glasdegib tablets – Pfizer)

REVIEW DATE: 12/11/2019

OVERVIEW

Daurismo, a hedgehog pathway inhibitor, is indicated, in combination with low-dose cytarabine, for the treatment of newly-diagnosed acute myeloid leukemia (AML) in adult patients who are ≥ 75 years of age or who have comorbidities that preclude use of intensive induction chemotherapy. Limitation of use. Daurismo has not been studied in patients with the comorbidities of severe renal impairment or moderate to severe hepatic impairment. The recommended dose is 100 mg orally once daily (QD) on Days 1 to 28 in combination with cytarabine 20 mg subcutaneously (SC) twice daily (BID) on Days 1 to 10 of each 28-day cycle. Dosage modifications of Daurismo are recommended in some clinical circumstances (e.g., QTc interval prolongation, hematologic toxicities, nonhematologic toxicity).

Disease Overview

AML is a heterogeneous hematologic malignancy that is hallmarked by clonal expansion of myeloid blasts in the peripheral blood, bone marrow, and/or other tissues.[2] It is a rather common form of acute leukemia in adults and it has the largest number of annual deaths from leukemias in the US. Around 21,450 people will be diagnosed with AML in 2019, and 10,920 patients will die from the condition. The median age at diagnosis is 67 years. Over one-half and approximately one-third of patients receive the diagnosis at ≥ 65 and ≥ 75 years of age, respectively. The incidence of AML, along with myelodysplastic syndrome (MDS) is rising as patients become older. Environmental factors play a role and include prolonged exposure to petrochemicals; solvents such as benzene; pesticides; and ionizing radiation. Also, two cytotoxic agents that are associated with therapy-related MDS/AML are alkylating agents (e.g., cyclophosphamide) and topoisomerase inhibitors (e.g., doxorubicin). Antimetabolite therapy, notably fludarabine, has also been associated with MDS/AML in patients with lymphoproliferative disorders, especially when given in combination with alkylating agents. Molecular or karyotypic abnormalities can also be identified. Treatment of AML can involve the following modalities at various stages: chemotherapy, radiation therapy, chemotherapy with stem cell transplant, and other drug therapy.

Clinical Efficacy

The efficacy of Daurismo in combination with low-dose cytarabine was assessed in a multicenter, open-label, randomized study called BRIGHT AML 1003.[1,3] The trial included 115 patients ≥ 55 years of age with newly-diagnosed AML who met at least one of the following criteria: 1) age ≥ 75 years, 2) severe cardiac disease, 3) baseline Eastern Cooperative Oncology Group (ECOG) performance status, or 4) baseline serum creatinine > 1.3 mg/dL. Patients were randomized (2:1) to receive Daurismo 100 mg QD with low-dose cytarabine 20 mg SC BID on Days 1 to 10 of a 28-day cycle (n = 77) or low-dose cytarabine alone (n = 38) in 28-day cycles until disease progression or unacceptable toxicity. Patients were stratified by cytogenetic risk (good/intermediate or poor). Efficacy was evaluated on the basis of overall survival from the date of randomization to death from any cause. With a median follow-up of approximately 20 months, Daurismo used with low-dose cytarbine (n = 77) was superior compared with the cytarbine alone arm (n = 38) as the median overall survival was 8.3 months and 4.3 months, respectively.[1] Other data are also available.[4-6]

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for AML (version 2.2020 – September 2, 2019) are extensive. For patients ≥ 60 years of age who are not candidates for intensive remission induction therapy or declines intensive therapy, therapeutic options for patients without actionable mutations include 1) lower intensity therapy (azacitibine, decitabine [preferred]); 2) Venclexta™ (venetoclax tablets) with either intravenous (IV) decitabine, SC or IV azacitidine, or SC low-dose cytarabine; 3) Daurismo plus low-dose cytarabine; 4) low-dose cytarbine; 5) Mylotarg® (gemtuzumab ozogamicin injection for IV use) [CD33-positive]; or 6) best supportive care. Other recommendations are made in this clinical scenario based on the specific mutation. Daurismo can also be continued, along with low-dose cytarabine, as AML post-induction therapy for patients ≥ 60 years of age who had a response to previous low-intensity therapy.

Safety

Daurismo has a Boxed Warning regarding embryofetal toxicity.[1] Also, patients receiving Daurismo may develop QTc prolongation and ventricular arrhythmias. Serious adverse reactions were reported in 79% of patients given Daurismo plus low-dose cytarabine and the most common were febrile neutropenia (29%), pneumonia (23%), hemorrhage

(12%), anemia (7%), and sepsis (7%). Consider specific drug interactions among patients given Daurismo (e.g., strong cytochrome P450 [CYP]3A4 inhibitors, strong CYP3A4 inducers, QTc prolonging medications).

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Daurismo. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Daurismo is recommended in those who meet the following criteria:

FDA-Approved Indications

135. Acute Myeloid Leukemia (AML). Approve for 3 years if the patient meets the following criteria (A and B):
- **A)** The patient is using Daurismo in combination with cytarabine; AND
- **B)** The patient must meet one of the following criteria (i or ii):
  - **i.** The patient is using Daurismo for treatment induction and meets one of the following (a or b)
    - **a)** The patient is ≥ 75 years of age; OR
    - **b)** According to the prescriber the patient has comorbidities that preclude the use of intensive induction chemotherapy; OR
  - **ii.** The patient is continuing Daurismo as post-induction therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Daurismo has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

131. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available Condition.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Erivedge® (vismodegib capsules – Genentech)

REVIEW DATE: 10/16/2019

OVERVIEW

Erivedge is indicated for the treatment of adults with metastatic basal cell carcinoma (BCC), or with locally advanced BCC that has recurred following surgery or who are not candidates for surgery, and who are not candidates for radiation.[1] It is an inhibitor of the hedgehog signaling pathway, where it binds to and inhibits Smoothened, a transmembrane protein involved in Hedgehog signal transduction.

Disease Overview

Localized BCC is most commonly treated with surgery or radiation therapy (RT) and BCC is usually cured by local therapy.[2] Few options exist in the scenario of disease progression; however, hedgehog pathway inhibitors have provided a new option for patients with advanced disease and in those who are not amenable to local therapy. The sonic hedgehog signaling pathway has emerged as playing a pivotal role in the parthenogenesis of BCC. Mutations in the patched (PTCH) gene on chromosome 9q, which codes for the sonic hedgehog receptor, are the underlying cause of nevoid BCC syndrome and are frequently present in sporadic BCC.

Guidelines

National Comprehensive Cancer Network (NCCN) guidelines for BCC (version 1.2019 – August 31, 2018) note that surgical approaches offer the most effective and efficient means for accomplishing a cure; radiation therapy may be chosen as the primary treatment in order to achieve optimal overall results.[2] For residual disease when surgery and radiation therapy are contraindicated and for recurrent disease with nodal or distant metastases, a hedgehog pathway inhibitor or clinical trials should be considered.

For central nervous system cancers, NCCN guidelines (version 2.2019 – September 16, 2019) list Erivedge as a treatment option for ceratin patients with recurrent disease, if chemotherapy has been tried and if there is a mutation of the sonic hedgehog pathway.

Safety

Erivedge has a Boxed Warning stating that it may cause fetal harm when administered to a pregnant woman.[1] Pregnancy status should be verified prior to initiation of therapy. Female patients should use contraception during and for 24 months after the final dose. Male patients should use contraception to avoid exposure to a partner of childbearing potential during and for 3 months after the final dose.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Erivedge. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Erivedge is recommended in those who meet the following criteria:

FDA-Approved Indications

49. Basal Cell Carcinoma (BCC), Metastatic. Approve for 3 years.

50. Basal Cell Carcinoma (BCC), Locally Advanced. Approve for 3 years if the patients meets ONE of the following conditions (A or B):

~~77.~~ Initial Therapy. Approve if the patient meets ONE of the following (i or ii):

i. The patient's basal cell carcinoma has recurred following surgery or radiation therapy; OR

ii. The patient meets BOTH of the following (a and b):

a) The patient is not a candidate for surgery; AND

~~a.~~ According to the prescribing physician, the patient is not a candidate for radiation therapy.

78. Patients Currently Receiving Erivedge. Approve.

Other Uses with Supportive Evidence

51. Central Nervous System Cancer. (Note: This includes brain and spinal cord tumors.) Approve for 3 years if the patient meets BOTH of the following (A and B):

A) The patient has tried at least one chemotherapy agent.
Note: Examples of chemotherapy include etoposide, carboplatin, cisplatin; AND

B) According to the prescriber, the patient has a mutation of the sonic hedgehog pathway.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Erivedge has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

8. Basal Cell Carcinoma (Locally Advanced or Metastatic), in Patients with Disease Progression While on Odomzo® (sonidegib capsules). [Note: This does not apply to patients already started on Erivedge. Refer to criteria for BCC, Locally Advanced for Patients Currently Receiving Erivedge.] There are no data to support the use of Erivedge in patients who have experienced disease progression on Odomzo. Previous use of a hedgehog inhibitor was not allowed in the pivotal study for Odomzo.[3] Patients who develop resistance to one of the hedgehog pathway inhibitors are not expected to respond to another hedgehog pathway inhibitor. There is an open-label study which evaluated patients (n = 9) with advanced BCC who had progressed on Erivedge that showed resistance to Odomzo, another hedgehog signaling pathway used in BCC.[7] This criterion was developed based on the professional opinion of specialized physicians.

9. Metastatic Colorectal Cancer (mCRC). Erivedge is not recognized in the treatment recommendations for colon cancer from the NCCN (version 2.2019 – May 15, 2019).[4] In combination with standard of care treatment for first-line mCRC, Erivedge did not confer incremental clinical benefit as measured by progression-free survival (PFS) compared with standard care therapy alone. A Phase II study was designed to assess whether Erivedge would prolong PFS when combined with standard of care therapy (FOLFOX [leucovorin, fluorouracil, oxaliplatin] or FOLFIRI [leucovorin, fluorouracil, irinotecan] in combination with Avastin® [bevacizumab injection]) in patients requiring first-line treatment for mCRC.[3] Adults with histologically confirmed mCRC and Eastern Cooperative Oncology Group (ECOG) performance score (PS) of 0 or 1 were randomized 1:1 to Erivedge or placebo (n = 199). Median PFS was 9.3 months vs. 10.1 months, respectively (hazard ratio [HR] 1.25; 95% confidence interval [CI]: 0.89, 1.76; P = 0.28). At data cutoff, 45 patients had died, yielding a 12-month Kaplan Meier overall survival (OS) rate of 81.4% and 80.1% for Erivedge and placebo, respectively.

10. Ovarian Cancer. The NCCN guidelines for Ovarian Cancer (version 2.2019 – September 17, 2019) do not address the use of Erivedge for the management of ovarian cancer.[6] The prespecified magnitude of PFS was not achieved in a Phase II, randomized, double-blind, placebo-controlled trial in adults with histologically confirmed epithelial ovarian carcinoma, primary peritoneal carcinoma, or fallopian tube carcinoma. The study was conducted to determine an estimate of clinical benefit of maintenance therapy with Erivedge in the setting of second or third complete remission as measured by PFS using radiographic assessment.[5] Eligible patients had received chemotherapy (platinum based and/or non-platinum based) for recurrent disease and had achieved complete response (CR) after their most recent chemotherapy regimen; all patients had baseline ECOG PS of 1 or less (n = 104). PFS from time of randomization for patients treated with Erivedge was 7.5 months compared with 5.8 months for placebo (HR 0.79; 95% CI: 0.46, 1.35; P = 0.39). When assessed by remission status, a similar non-statistically significant improvement in PFS was noted among patients in second CR (n = 84); the median PFS in patients treated with Erivedge was 7.5 months vs. 5.6 months for placebo (HR 0.44; 95% CI: 0.36, 1.20; P = 0.17). For patients in third CR (n = 20), median PFS was shorter with Erivedge (5.6 months) than placebo (7.5 months) [HR 1.79; 95% CI: 0.50, 6.48; P = 0.37).

11. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Erleada (apalutamide tablets – Janssen Pharmaceuticals)

DATE REVIEWED: 03/04/2020

OVERVIEW

Erleada is indicated for the treatment of patients with non-metastatic, castration-resistant prostate cancer (nmCRPC).[1] It is also indicated in patients with metastatic castration-sensitive prostate cancer (CSPC). Patients should also receive a gonadotropin-releasing hormone (GnRH) analog concurrently or the patient should have had a bilateral orchiectomy. Erleada is an androgen receptor inhibitor that binds directly to the ligand-binding domain of the androgen receptor.

GUIDELINES

According to the National Comprehensive Cancer Network (NCCN) guidelines for prostate cancer, (version 4.2019 – August 19, 2019) for nmCRPC, androgen deprivation therapy (ADT) is continued to maintain castrate serum levels of testosterone (< 50 ng/dL).[2] Erleada, Xtandi® (enzalutamide capsules), and Nubeqa® (darolutamide tablets) are all category 1 recommended options especially if the PSADT is ≤ 10 months. Other secondary hormone therapy is recommended if PSADT is ≤ 10 months (category 2A): for non-metastatic (M0) CRPC, the options are nilutamide, flutamide, bicalutamide, ketoconazole, corticosteroids. For metastatic, castration-naïve disease, ADT in combination with abirateron + prednisone, Erleada, and Xtandi are all category 1 recommended options. Yonsa (abiraterone acetate) with methylprednisolone is a category 2B recommendation.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Erleada. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Erleada is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Prostate Cancer – Non-Metastatic, Castration-Resistant.** Approve Erleada for 3 years if the patient meets one of the following criteria (A or B):
   - **A)** The medication is used in combination with a gonadotropin-releasing hormone (GnRH) analog.
     Note: Examples are Lupron (leuprolide acetate for injection), Lupron Depot (leuprolide acetate for depot suspension), Trelstar (triptorelin pamoate for injectable suspension), Zoladex (goserelin acetate implant), Vantas (histrelin acetate subcutaneous implant), Firmagon (degarelix for injection); OR
   - **B)** The patient has had a bilateral orchiectomy.
2. **Prostate Cancer – Metastatic, Castration-Sensitive.** Approve for 3 years if the patient meets one of the following criteria (A or B):
   - **A)** The medication is used in combination with a gonadotropin-releasing hormone (GnRH) analog.
     Note: Examples are Lupron (leuprolide acetate for injection), Lupron Depot (leuprolide acetate for depot suspension), Trelstar (triptorelin pamoate for injectable suspension), Zoladex (goserelin acetate implant), Vantas (histrelin acetate subcutaneous implant), Firmagon (degarelix for injection); OR
   - **B)** The patient has had a bilateral orchiectomy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Erleada has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

12. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Erlotinib (Tarceva® tablets – Genentech/Astellas/OSI Pharmaceuticals; generics)

DATE REVIEWED: 03/11/2020

OVERVIEW

Erlotinib, a kinase inhibitor, is indicated for the treatment of patients with metastatic non-small cell lung cancer (NSCLC) whose tumors have epidermal growth factor receptor (EGFR) exon 19 deletions or exon 21 (L858R) substitution mutations as detected by an FDA-approved test receiving first-line, maintenance, or second or greater line treatment after progression following at least one prior chemotherapy regimen.[1] Erlotinib continues to be indicated for the first-line treatment of patients with locally advanced, unresectable, or metastatic pancreatic cancer, in combination with gemcitabine. In patients with NSCLC, erlotinib is not recommended for use in combination with platinum-based chemotherapy. The safety and efficacy of erlotinib have not been established in patients with NSCLC whose tumors have other EGFR mutations.

Guidelines

FDA-Approved Indications

The National Comprehensive Cancer Network (NCCN) guidelines for NSCLC (version 3.2020 – February 11, 2020) recommend *EGFR* mutation testing in patients with nonsquamous NSCLC (i.e., adenocarcinoma, large cell) or in NSCLC not otherwise specified (NOS).[2] Erlotinib, Iressa® (gefitinib tablets), Gilotrif™ (afatinib tablets) Vizimpro® (dacomitinib tablets), and Tagrisso™ (osimertinib tablets) [preferred] are all category 1 recommended for the first-line treatment in patients with sensitizing *EGFR*-mutation positive NSCLC discovered before first-line chemotherapy. Erlotinib + Cyramza (ramucirumab injection) is a category 2A recommended option. Upon disease progression, T790M testing is recommended in guidelines. Tagrisso is a category 1 recommended option if T790M mutation-positive. Patients with symptomatic progression to the brain can consider local therapy, Tagrisso (if T790M mutation-positive) [category 1], or continue on erlotinib (± Cyramza or bevacizumab), Iressa, or Gilotrif (category 2A). Tagrisso (regardless of T790M status) or pulse erlotinib can be considered for progressive leptomeningeal disease.

The NCCN guidelines for central nervous system cancers (version 3.2019 – October 18, 2019) recommend erlotinib as weekly pulse therapy for leptomeningeal metastases from NSCLC with an *EGFR* exon 19 deletion or exon 21 (L858R) mutation in patients with positive cerebrospinal fluid (CSF) cytology and progression after receiving intra-CSF chemotherapy (category 2B).[3] Erlotinib, Gilotrif, and Iressa are

recommended for brain metastases due to NSCLC; Tagrisso is recommended for T790M mutation-positive NSCLC (all category 2A).

NCCN guidelines for pancreatic adenocarcinoma (version 1.2020 – November 26, 2019) recommend erlotinib and gemcitabine combination for systemic therapy in patients with locally advanced unresectable disease with good performance status (category 2A).[4] Gemcitabine + erlotinib is also recommended for metastatic disease in this population (category 1). The guidelines state that although this combination significantly improved survival, the actual benefit was small, suggesting that only a subset of patients benefit. Erlotinib and gemcitabine is also recommended for second-line therapy for recurrent disease if prior fluoropyrimidine-based therapy is given (category 2A).

Other Uses with Supportive Evidence

The NCCN guidelines for Kidney Cancer (version 2.2020 – August 5, 2019) recommend erlotinib as one of the first-line therapies for relapse or surgically unresectable Stage IV disease with non-clear cell histology (category 2A).[5] The NCCN panel lists clinical trial and Sutent® (sunitinib capsules) as the preferred options for this indication. Erlotinib, either as monotherapy or in combination with bevacizumab (combination therapy for selected patients with advanced papillary RCC), are category 2A recommended options.

The NCCN bone cancer guidelines (version 1.2020 – August 12, 2019) list single-agent erlotinib as one of the systemic treatment options for patients with recurrent chordoma.[6] Other systemic therapy options include imatinib with or without cisplatin or sirolimus, Sutent® (sunitinib capsules), Tykerb® (lapatinib tablets) [for patients with EGFR-positive disease], or Nexavar® (sorafenib tablets).

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of erlotinib. All approvals are provided for 3 years in duration as noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of erlotinib is recommended in those who meet the following criteria:

FDA-Approved Indications

52. Non-Small Cell Lung Cancer (NSCLC) – Epidermal Growth Factor Receptor (EGFR) Mutation-Positive. Approve for 3 years if the patient meets the following criteria (A and B):
- ~~**79.**~~ The patient has *metastatic* NSCLC; AND
- ~~**80.**~~ The patient meets ONE of the following criteria (i or ii):
  - **i.** The patient has epidermal growth factor receptor (EGFR) exon 19 deletions as detected by an approved test; OR
  - **ii.** The patient has exon 21 (L858R) substitution mutations as detected by an approved test.

53. Pancreatic Cancer, Locally Advanced, Unresectable, or Metastatic. Approve for 3 years if prescribed in combination with gemcitabine.

Other Uses with Supportive Evidence

3. Renal Cell Carcinoma (RCC), Advanced – Non-Clear Cell Histology. Approve for 3 years.

4. Bone Cancer – Chordoma. Approve for 3 years in patients who have tried at least one previous therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Erlotinib has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

13. **Biliary Cancer.** There were no differences in PFS and OS between gemcitabine/oxaliplatin and gemcitabine/oxaliplatin with the addition of erlotinib in patients with metastatic biliary-tract cancer (cholangiocarcinoma, gallbladder cancer, or ampulla of Vater cancer) in one Phase III, open-label, randomized study (n = 268); however, in a subgroup of patients with cholangiocarcinoma, the addition of erlotinib to chemotherapy resulted in a significantly prolonged PFS (5.9 months vs. 3.0 months; P = 0.049).[7,8] In patients with advanced (unresectable or metastatic) cholangiocarcinoma or gallbladder cancer, combination therapy with bevacizumab and erlotinib showed clinical activity in one Phase II study (n = 56).[9] Among six patients with confirmed PRs, the median duration of response was 8.4 months (95% CI: 6.0, 11.7). Eighty-seven percent of patients progressed with a median time to disease progression of 4.4 months (95% CI: 3.0, 7.8). Median OS was 9.9 months (95% CI: 7.2, 13.6). As single-agent therapy in one Phase II study, erlotinib showed benefit in patients with unresectable or metastatic biliary cancer previously treated with not more than one prior systemic or locoregional therapy (n = 42).[10] In all, 17% (n = 1/7) of patients (95% CI: 7% to 31%) were progression free at 6 months. One Phase II trial evaluated the efficacy of erlotinib and docetaxel in patients with refractory (up to two prior systemic therapies) hepatocellular (n = 14) and biliary (n = 11) cancers.[11] The 16-week PFS rate was 64% for biliary tract cancer (95% CI: 29.7, 84.5), meeting the 16-week PFS endpoint of ≥ 30%. Median OS was 5.7 months and similar to historical data with single-agent erlotinib therapy.

2. **Breast Cancer.** One Phase II, non-randomized, open-label, bi-institutional trial did not support beneficial effect of erlotinib plus bevacizumab in patients with metastatic breast cancer with stage IV disease that was stable or had progressed after treatment with one or two chemotherapy regimens; if the patient's tumor was human epidermal growth factor receptor-2 (HER-2) positive, prior therapy with trastuzumab was required (n = 38).[12] As single-agent therapy, erlotinib had minimal activity in unselected, previously treated women with locally advanced or metastatic breast cancer in one multicenter, Phase II study (n = 69).[13] Metronomic (frequent low-dose) capecitabine tablets and cyclophosphamide plus Bevacizumab and erlotinib was effective in patients with untreated advanced metastatic HER-2 negative, estrogen receptor-negative, and progesterone receptor-poor advanced breast cancer (n = 26).[14] Among 24 patients assessable for response, 4% of patients has a CR [n = 1], 58% of patients had PR (n = 14), 21% of patients had stable disease (SD) > 9 weeks duration (n = 5) and 4% of patients (n = 1) had early progression of disease. The overall clinical benefit (CR + PR + SD > 24 weeks) was 75% (95% CI: 53, 90). Median time to progression was 43 weeks (95% CI: 21, 69). OS was 108 months (95% CI: 70, 110).

3. **Colorectal Cancer, Metastatic (mCRC).** In Phase II studies in patients with untreated mCRC, efficacy has not been demonstrated.[15-18] In one Phase III trial, patients with mCRC received doublet chemotherapy plus bevacizumab as initial therapy.[19] Patients without tumor progression were randomized to maintenance therapy with bevacizumab plus erlotinib (n = 80) or bevacizumab alone (n = 79). Median PFS was 5.7 months with the combination and 4.2 months with bevacizumab alone (HR 0.79; 95% CI: 0.55, 1.12; P = 0.19). The rate of any Grade 3/4 toxicity was 53% with bevacizumab/erlotinib vs. 13% with bevacizumab alone. Another Phase III trial, OPTIMOX3, assessed the efficacy of maintenance bevacizumab plus erlotinib therapy (n = 224) after induction chemotherapy compared with bevacizumab alone (n = 228) in patients with unresectable metastatic colorectal cancer.[20] The median PFS from maintenance was 5.4 months in the bevacizumab plus erlotinib group

compared with 4.9 months in the bevacizumab group (HR 0.81; 95% CI: 0.66, 1.01; P = 0.059). The median OS from maintenance was 24.9 months compared with 22.1 months for bevacizumab plus erlotinib and bevacizumab alone, respectively. The Phase III Nordic ACT2 trial demonstrated that the addition of erlotinib to bevacizumab as maintenance therapy in patients with KRAS wild-type mCRC did not significantly improve PFS or OS.[21]

4. **Glioblastoma Multiforme (GBM).** In one Phase II study, concurrent radiation therapy (RT) and temozolomide in combination with erlotinib in patients newly diagnosed with glioblastoma (n = 27) was not efficacious.[22] In two Phase II studies, erlotinib plus temozolomide given during and after RT produced favorable median survival, and PFS, as well as 12- or 14-month survival rates in patients with newly diagnosed GBM or gliosarcoma.[23,24] In patients with newly diagnosed (untreated; could have had resection) GBM or gliosarcoma who received erlotinib plus temozolomide during and after radiation, median survival was longer with erlotinib plus temozolomide vs. historical controls (19.3 months vs. 14.1 months, respectively; HR for survival 0.64; 95% CI: 0.45, 0.91; P = 0.01) in one open-label, single-center, Phase II trial (n = 65).[23] The historical controls were comparable patients from two prospective, Phase II trials (n = 128); the first trial included the use of Thalomid® (thalidomide capsules) in combination with temozolomide during and after radiotherapy; the second that included the use of *cis*-retinoic acid with temozolomide during and after radiotherapy. In one open-label, Phase I/II trial, treatment with erlotinib plus temozolomide during and after RT resulted in favorable survival rate (61% of patients were alive at 1 year) and median PFS (7.2 months) in patients with newly diagnosed GBM (following resection); however, there was no significant difference in OS with the addition of erlotinib compared with the temozolomide/RT arm of a historical control trial (15.3 months vs. 15 months, respectively).[24] Erlotinib has failed to demonstrate benefit in patients with recurrent glioblastomas.[25-28]

5. **Head and Neck Cancer, Squamous Cell, Recurrent and/or Metastatic.** Two Phase II studies assessed the use of erlotinib and bevacizumab in different settings and showed promising results.[29,30] One multicenter, Phase II trial assessed the addition of bevacizumab and erlotinib to chemoradiation as first-line treatment for previously untreated patients with locally advanced squamous cell carcinoma of the head and neck (SCCHN) [n = 60].[29] After a median follow-up of 32 months the estimated 3-year PFS and OS rates were 71% and 82%, respectively. After induction therapy, 65% of patients had major responses; after completion of therapy 95% of patients had either partial or complete radiographic responses. One multi-institutional Phase I/II study enrolled patients with recurrent or metastatic SCCHN (previously treated with ≤ 1 prior regimen for recurrent disease) to receive erlotinib and bevacizumab (n = 56).[30] The median OS and PFS durations were 7.1 months (95% CI: 5.7, 9.0) and 4.1 months (95% CI: 2.8, 4.4), respectively. Treatment with erlotinib monotherapy produced few PRs in unselected (EGFR status not known at baseline) patients with locally recurrent and/or metastatic SCCHN in one open-label, Phase II clinical trial (n = 115); 38.3% of patients achieved SD for a median of 16.1 weeks.[31] In one Phase II study, 204 patients with locally advanced SCCHN were randomized to receive cisplatin in combination with RT with or without erlotinib.[32] Complete response rates evaluated by central review were reported in 40% of patients (n = 42/105) on cisplatin/RT vs. 52% of patients (n = 51/99) on cisplatin/RT/erlotinib (P = 0.08). At a median follow-up of 26 months and 54 progression events, there was no difference in PFS between the two treatment arms (HR 0.0; P = 0.71). In a Phase II study, patients with recurrent SCCHN were treated with erlotinib for 12 months (n = 31). The OS was 61% at 1 year and 56% at 2 years.[33] Disease-free survival was 54% at 1 year and 45% at 2 years. The mean time to recurrence (n = 16) was 8.7 months. Only 8 patients completed the full 12-month course of erlotinib; the median duration of erlotinib therapy was 5 months.

6. **Hepatocellular Carcinoma (HCC), Advanced.** Some Phase II studies have reported activity of erlotinib in patients with HCC while others have not.[34-36] In one Phase III trial, patients with advanced HCC were randomized to Nexavar/erlotinib (n = 362) or Nexavar/placebo (n = 358).[37] Median OS, the primary endpoint, was similar in both groups: 9.5 vs. 8.5 months for Nexavar/erlotinib and Nexavar/placebo, respectively (HR 0.929; P = 0.408). A network meta-analysis of 11 randomized controlled trials with 6,594 patients with advanced hepatocellular carcinoma concluded that Nexavar in combination with erlotinib demonstrated better short-term and long-term efficacy compared with other drugs.[38]

7. **Occult Primary/Cancer of Unknown Primary Site (CUP).** The combination of bevacizumab and erlotinib (alone or combined with paclitaxel and carboplatin) had activity as first- or second-line therapy in patients with occult primary tumors (adenocarcinoma, poorly differentiated carcinoma, poorly differentiated adenocarcinoma, poorly differentiated squamous carcinoma).

8. **Renal Cell Carcinoma (RCC), Advanced – Clear Cell Histology.** Efficacy with erlotinib has not been demonstrated in patients with clear cell histology.[5]

9. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Farydak® (panobinostat capsules – Novartis Pharmaceuticals)

DATE REVIEWED: 04/22/2020

OVERVIEW

Farydak is a histone deacetylase (HDAC) inhibitor, which, in combination with Velcade® (bortezomib injection) and dexamethasone, is indicated for the treatment of patients with multiple myeloma who have received at least two prior regimens, including Velcade and an immunomodulatory drug (IMiD) [i.e., Thalomid® {thalidomide capsules}, Revlimid® {lenalidomide capsules}, Pomalyst® {pomalidomide capsules}).[1] The recommended starting dose of Farydak is 20 mg, taken orally once every other day (QOD) for three doses per week in Weeks 1 and 2 of each 21-day cycle for up to eight cycles. Treatment may be continued for an additional eight cycles in patients with clinical benefit who do not experience unresolved severe or medically significant toxicity, up to a maximum of 16 cycles (48 weeks).

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines, which address diagnosis, treatment, and follow-up for patients with multiple myeloma (version 3.2020 – March 10, 2020), note that Farydak/Velcade/dexamethasone (category 1) is an Other Regimen for patients who have tried at least two previous therapies, including Velcade and an IMiD, for treatment of previously treated disease.[2] Although not approved combinations, Farydak/Kyprolis® (carfilzomib injection) and Farydak/Revlimid/dexamethasone are also listed as potential Other Regimens for previously treated multiple myeloma (both category 2A). While there are small studies evaluating these combinations in previously treated multiple myeloma, there are multiple other regimens that NCCN classifies as Preferred Regimens for previously treated multiple myeloma. These regimens have a more established place in therapy and a stronger recommendation by NCCN.

Safety

There is a Farydak Risk Evaluation and Mitigation Strategy (REMS) program which consists of a communication plan to inform healthcare professionals of risks of cardiotoxicity and diarrhea and how to minimize these events.[3]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Farydak. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

FDA-Approved Indications

54. Multiple Myeloma. Approve for 1 year if the patient meets the following conditions (A and B):
- **81.** Farydak will be taken in combination with Velcade® (bortezomib injection) and dexamethasone; AND
- **82.** The patient has previously tried Velcade and one immunomodulatory drug (i.e., Thalomid [thalidomide capsules], Revlimid [lenalidomide capsules], or Pomalyst [pomalidomide capsules]).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Farydak has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

14. Pancreatic Cancer. A Phase II study evaluating Farydak + Velcade in patients with pancreatic cancer who were progressing on gemcitabine-based therapy was discontinued early due to toxicity and a lack of response.[4]

15. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Gavreto Prior Authorization Policy
- Gavreto™ (pralsetinib capsules – Blueprint Medicines Corporation)

REVIEW DATE: 09/09/2020

OVERVIEW

Gavreto, a kinase inhibitor, is indicated for the treatment of non-small cell lung cancer (NSCLC) in adult patients with metastatic rearranged during transfection (RET) fusion-positive disease as detected by an FDA approved test.[1] This indication is approved under accelerated approval based on overall response rate and duration of response. Continued approval for this indication may be contingent upon verification and description of clinical benefit in confirmatory trial(s).

Guidelines

The National Comprehensive Cancer Network (NCCN) has not addressed the use of Gavreto for the treatment of NSCLC.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Gavreto. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Gavreto as well as the monitoring required for adverse events and long-term efficacy, approval requires Gavreto to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Gavreto is recommended in those who meet the following criteria:

FDA-Approved Indications

136. Non-Small Cell Lung Cancer. Approve for 1 year if the patient meets the following criteria (A, B, C, and D):

- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has metastatic disease; AND
- **C)** Patient has rearranged during transfection (RET) fusion-positive disease detected by an Food and Drug Administration (FDA) approved test; AND
- **D)** The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Gavreto is not recommended in the following situations:

132. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Gilotrif™ (afatinib tablets – Boehringer Ingelheim)

DATE REVIEWED: 12/04/2019

OVERVIEW

Gilotrif is a tyrosine kinase inhibitor (TKI) indicated for the first-line treatment of patients with metastatic non-small cell lung cancer (NSCLC) whose tumors have non-resistant epidermal growth factor receptor (EGFR) mutations as detected by a FDA-approved test.[1] The safety and efficacy of Gilotrif have not been established in patients whose tumors have resistant *EGFR* mutations. Gilotrif is also indicated for the treatment of patients with metastatic squamous NSCLC progressing after platinum-based chemotherapy.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for NSCLC (version 1.2020 – November 6, 2019) recommend Tarceva® (erlotinib tablets), Iressa® (gefitinib tablets), Gilotrif, Vizimpro® (dacomitinib tablets), and Tagrisso™ (osimertinib tablets) as Category 1 recommended options for the first-line treatment in patients with sensitizing *EGFR*-mutation positive NSCLC.[3] Tagrisso is noted as an "preferred" option in the first-line setting. Upon disease progression, T790M testing is recommended in guidelines. Tagrisso is a category 1 recommended option if the NSCLC is T790M mutation-positive. If T790M mutation-negative, initial cytotoxic therapy options listed for adenocarcinoma, or squamous cell carcinoma (e.g., doublet chemotherapy) can be considered in this setting (category 2A). NCCN added a footnote to this recommendation to also consider Gilotrif and Erbitux® (cetuximab for injection) combination regimen in patients with disease progression (T790M-negative multiple systemic lesions) on EGFR-TKI therapy (category 2A). This is based on data demonstrating similar response rates with this combination therapy in patients with T790M mutation-positive or mutation-negative tumors in pre-treated patients with NSCLC. NCCN notes that for squamous cell carcinoma, Gilotrif is not used in the second-line setting at NCCN institutions for these indications related to the efficacy and safety of these agents compared to the efficacy and safety of other available agents.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Gilotrif. All approvals are provided for 3 years in duration as noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Gilotrif is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Non-Small Cell Lung Cancer (NSCLC) – Epidermal Growth Factor Receptor (EGFR) Mutation-Positive.** Approve for 3 years if the patient meets the following criteria (A and B):
   ~~**83.**~~ The patient has *metastatic* NSCLC; AND
   ~~**84.**~~ The patient has non-resistant *EGFR* mutation-positive NSCLC as detected by an approved test.

2. **Non-Small Cell Lung Cancer (NSCLC) – Squamous Cell Carcinoma.** Approve for 3 years if the patient meets the following criteria (A and B):
   A) The patient has metastatic squamous cell carcinoma; AND
   B) The patient has disease progression after treatment with platinum-based chemotherapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Gilotrif has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

16. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Ibrance® (palbociclib capsules and tablets – Pfizer Labs)

DATE REVIEWED: 04/15/2020

OVERVIEW
Ibrance, a cyclin-dependent kinase (CDK) 4/6 inhibitor, is indicated for the treatment of adult patients with hormone receptor positive (HR+), human epidermal growth factor receptor 2 (HER2)-negative advanced or metastatic breast cancer in combination with:
1. An aromatase inhibitor (AI) as initial endocrine-based therapy in postmenopausal women or in men[1-3]; or
2. Fulvestrant in patients with disease progression following endocrine therapy.[1,4-5]

Disease Overview
Based on molecular profiling, breast cancer is classified as HR+ (estrogen receptor positive [ER+] and/or progesterone receptor positive [PgR+]), HER2+, or triple negative (ER-negative, PgR-negative, and HER2-negative).[6-7] Most breast cancers in women (71%) are HR+, HER2-negative; these cancers tend to be slow-

growing and less aggressive than other subtypes.[7] HR+, HER2-negative tumors are associated with the most favorable prognosis compared with other subtypes, particularly in the short-term, in part because expression of hormone receptors is predictive of a favorable response to hormonal therapy. In men, about 85% of breast cancers are ER+ and 70% are PgR+.[8] About 12% of breast cancers are HR+ and HER2+, and tend to be higher grade and more aggressive than HR+ cancers.[7] About 5% of breast cancers are HER2+ and do not express hormone receptors. These cancers tend to be more aggressive than other breast cancers and have a poorer short-term prognosis compared with ER+ breast cancers. About 12% of breast cancers in women are triple negative and have a poorer short-term prognosis than other subtypes.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on breast cancer (version 3.2020 – March 6, 2020) recommend any of the CDK4/6 inhibitors in combination with an AI or fulvestrant as a first-line treatment option for recurrent or Stage IV HR+ and HER2-negative disease in postmenopausal women or premenopausal patient receiving ovarian ablation or suppression (category 1).[9,12] The compendium recommend that men with breast cancer be treated similarly to postmenopausal women, except that the use of an AI is ineffective without concomitant suppression of testicular steroidogenesis.[10] The NCCN guidelines state in a footnote that if there is disease progression on CDK4/6 inhibitor therapy, there are limited data to support an additional line of therapy with another CDK4/6-containing regimen.[9] The limited data are based on a multicenter analysis which evaluated clinical outcomes in patients (n = 58) with HR+/HER2-negative metastatic breast cancer who received Verzenio after disease progression on Ibrance or Kisqali.[13] At data cutoff, 34% of patients (n = 20/58) had progressive disease, while 36% of patients (n = 21/58) had treatment duration exceeding 6 months. The median PFS was 5.8 months. There are no published data with additional line of therapy with Ibrance or Kisqali, if the patient has progressed on Verzenio.

In men with breast cancer, tamoxifen is generally used rather than an AI, because the data supporting use of an AI in men are limited.[8-9] The use of AI therapy with LHRH has been reported. Only limited data are available with Kisqali use in men with breast cancer as first-line endocrine therapy in combination with anastrozole, exemestane, or letrozole or for combination use with fulvestrant. However, available real-world data suggest comparable efficacy and safety profiles in men as in women; it is reasonable to recommend CDK4/6 inhibitors in combination with an aromatase inhibitor or fulvestrant, everolimus, and PIK3CA inhibitors to men based on extrapolation of data from studies comprised largely of female participants with advanced breast cancer.

The NCCN guidelines on soft tissue sarcoma (version 6.2019 – February 10, 2020) recommend Ibrance as single-agent therapy for the treatment of WD-DDLS for retroperitoneal sarcomas (category 2A).[11]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Ibrance. All approvals are provided for 3 years in duration unless otherwise noted below. In the clinical criteria, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: a woman is defined as an individual with the biological traits of a woman, regardless of the individual's gender identity or gender expression; men are defined as individuals with the biological traits of a man, regardless of the individual's gender identity or gender expression.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Ibrance is recommended in those who meet the following criteria:

FDA-Approved Indications

55. Breast Cancer in Postmenopausal Women*. Approve for 3 years if the patient meets the following criteria (A, B, C, and D):
- **85.** Patient has advanced or metastatic hormone receptor positive (HR+) [i.e., estrogen receptor positive {ER+} and/or progesterone receptor positive {PR+}] disease; AND
- **86.** Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND
- **87.** The patient meets ONE of the following criteria (i or ii):
  - **i.** Ibrance will be used in combination with anastrozole, exemestane, or letrozole; OR
  - **ii.** Ibrance will be used in combination with fulvestrant; AND
- **D)** The patient has not had disease progression while on Ibrance, Kisqali (ribociclib tablets), or Verzenio (abemaciclib tablets).

***** Refer to the Policy Statement.

2. Breast Cancer in Pre/Perimenopausal Women*. Approve for 3 years if the patient meets the following criteria (A, B, C, D, and E):
- **A)** Patient has advanced or metastatic hormone receptor positive (HR+) [i.e., estrogen receptor positive {ER+} and/or progesterone receptor positive {PR+}] disease; AND
- **B)** Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND
- **C)** The patient is receiving ovarian suppression/ablation with a gonadotropin-releasing hormone (GnRH) agonist (e.g., Lupron [leuprolide], Trelstar [triptorelin], Zoladex (goserelin]), or has had surgical bilateral oophorectomy or ovarian irradiation; AND
- **D)** Patient meets ONE of the following conditions (i or ii):
  - **i.** Ibrance will be used in combination with anastrozole, exemestane, or letrozole; OR
  - **ii.** Ibrance will be used in combination with fulvestrant; AND
- **E)** Patient has not had disease progression while on Ibrance, Kisqali (ribociclib tablets), or Verzenio (abemaciclib tablets).

***** Refer to the Policy Statement.

3. Breast Cancer in Men*. Approve for 3 years if the patient meets the following criteria (A, B, C, and D):
- **A)** Patient has advanced or metastatic hormone receptor positive (HR+) [i.e., estrogen receptor positive {ER+} and/or progesterone receptor positive {PR+}] disease; AND
- **B)** Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND
- **C)** Patient meets ONE of the following criteria (i or ii):
  - **i.** Patient meets BOTH of the following criteria (a and b):
    - **a)** Patient is receiving a gonadotropin-releasing hormone (GnRH) agonist (e.g., Lupron [leuprolide], Trelstar [triptorelin], Zoladex (goserelin]); AND
    - **b)** Ibrance will be used in combination with anastrozole, exemestane, or letrozole; OR
  - **ii.** Ibrance will be used in combination with fulvestrant; AND
- **D)** Patient has not had disease progression while on Ibrance, Kisqali (ribociclib tablets), or Verzenio (abemaciclib tablets).

***** Refer to the Policy Statement.

Other Uses With Supportive Evidence

4. **Liposarcoma**. Approve for 3 years if the patient has well-differentiated/dedifferentiated liposarcoma (WD-DDLS).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Ibrance has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below.

17. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes*	Date Reviewed
Annual revision	Breast Cancer in Women: • The word "initial" was added to first-line endocrine therapy.	03/07/2018

	• LHRH agonist was replaced with GnRH agonist. • Prior endocrine therapy that was previously a list of examples, was revised to be a list of at least one of the listed endocrine therapies. Afinitor plus Faslodex or tamoxifen and exemestane plus Afinitor were added to the list and "high-dose" was removed from ethinyl estradiol. Ibrance, Kisqali and Verzenio are endocrine therapies not included in this list. • Added a criterion that applies to all of the indications in women that the patient has not had disease progression while on Ibrance, Kisqali, or Verzenio. Breast Cancer in Men: • LHRH agonist was replaced with GnRH agonist. • The word "initial" was added to first-line endocrine therapy. Tamoxifen was added to the list of first-line (initial) endocrine therapies. • Added a criterion that the patient has not had disease progression while on Ibrance, Kisqali, or Verzenio.	
Selected revision	Separated out criteria for Postmenopausal and Pre/Perimenopausal women for clarity. Under Breast Cancer in Men criteria, deleted tamoxifen from list of endocrine therapy agents that can be used as combination therapy with Ibrance. Added Ibrance plus Faslodex combination therapy as option for men if progressed on at least one endocrine therapy.	09/12/2018
Annual revision	Deleted criteria in all approval conditions which require patient to try a prior endocrine therapy before approving for Ibrance + Faslodex. Likewise, deleted criteria that required Ibrance + aromatase inhibitors use (e.g., letrozole) only as initial therapy. NCCN guidelines support first-line or subsequent therapy use.	04/03/2019
Annual revision	Added Ibrance "tablets" to drug targets. Use of Ibrance in men is an FDA approved use, so moved it under "FDA-approved Indications".	04/15/2020

LHRH – Luteinizing hormone-releasing hormone; GnRH – gonadotropin-releasing hormone;

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Iclusig (ponatinib tablets – ARIAD/Takeda)

DATE REVIEWED: 04/01/2020

OVERVIEW

Iclusig, a tyrosine kinase inhibitor (TKI), is indicated for the treatment of adults with T315I-positive chronic myeloid leukemia (CML) [chronic phase {CP}, accelerated phase {AP}, or blast phase {BP}] and T135I-positive Philadelphia chromosome positive (Ph+) acute lymphoblastic leukemia (ALL).[1] Iclusig is also indicated for the treatment of adults with CP, AP, or BP CML or Ph+ ALL for whom no other TKI therapy is indicated. A limitation of use is that Iclusig is not indicated and is not recommended for the treatment of patients with newly-diagnosed chronic phase CML. There are four other TKIs approved for the treatment of Ph+ CML: Gleevec® (imatinib tablets, generic), Sprycel® (dasatinib tablets), Tasigna® (nilotinib capsules), and Bosulif® (bosutinib tablets).[5-8] These agents are indicated for the treatment of Ph+ CML in various phases; some TKIs are indicated after resistance or intolerance to prior therapy. Sprycel and Gleevec are also indicated for use in patients with Ph+ ALL.[5,6]

Clinical Efficacy

The PACE (Ponatinib Ph+ ALL and CML Evaluation) trial was a Phase II, open-label, multinational study that assessed Iclusig in patients with CML or Ph+ ALL (n = 449) who were heavily pretreated with resistance to or unacceptable adverse effects with Sprycel® (dasatinib tablets) or Tasigna® (nilotinib capsules) or who had the BCR-ABL T315I mutation.[1,2] Benefits (e.g., major cytogenetic response, complete cytogenetic response) were noted in many patients.[2] A Phase I, dose-escalation trial (n = 81) investigated Iclusig in patients with resistant hematologic cancer including CML and Ph+ ALL.[3] Results suggest that Iclusig was highly active in heavily pretreated patients with Ph+ leukemias with resistance to TKI inhibitors, including patients with the BCR-ABL T315I mutation, other mutations, or no mutations. Other data are also available.[11,12]

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for CML (version 3.2020 – January 30, 2020) state that for patients with CP CML with a low-risk score, the primary treatment recommended includes a first-generation TKI (Gleevec or generic imatinib 400 mg QD [Category 1]), or a second-generation TKI (Bosulif 400 mg QD [Category 1], Sprycel 100 mg QD [Category 1], or Tasigna 300 mg BID [Category 1]).[9] For patients with CP CML with an intermediate- or high-risk score, a second-generation TKI is preferred (Bosulif 400 mg QD [Category 1], Sprycel 100 mg QD [Category 1], or Tasigna 300 mg BID [Category 1]). A first-generation TKI (Gleevec or generic imatinib 400 mg QD) is an alternative [Category 2A]. Iclusig is an option for patients with a T315I mutation and for with disease that has not responded to multiple TKIs or in whom another TKI is not indicated. The NCCN guidelines for ALL (adult and adolescent young adults) [version 1.2020 – January 15, 2020] recommend Iclusig as an option for patients with relapsed or refractory ALL and note its activity against T315I mutations.[10]

Safety

Iclusig has a Boxed Warning regarding arterial occlusion, venous thromboembolism, heart failure and hepatotoxicity.[1] The dosage and administration section notes that the optimal dose of Iclusig has not been identified. In clinical trials, the initial dose of Iclusig was 45 mg once daily (QD). However, many patients (68%) required dose reductions to 30 mg to 15 mg QD during the therapy course. Consideration should be given to discontinue Iclusig if a response has not occurred by 3 months (90 days). Iclusig has a Risk Evaluation and Mitigation Strategy (REMS) program.[4]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Iclusig. All approvals are provided for 3 years in duration.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Iclusig is recommended in those who meet the following criteria:

FDA-Approved Indications

56. Chronic Myeloid Leukemia (CML) That is Philadelphia Chromosome Positive. Approve for 3 years if the patient meets one of the following criteria (A or B):

- **A)** The patient is T315I-positive, OR
- **B)** The patient has tried at least two other tyrosine kinase inhibitors indicated for use in Philadelphia chromosome positive CML.
  Note: Examples include Gleevec® (imatinib tablets), Sprycel® (dasatinib tablets), and Tasigna® (nilotinib capsules).

57. Acute Lymphoblastic Leukemia (ALL) That is Philadelphia Chromosome Positive (Ph+). Approve for 3 years if the patient meets ONE of the following criteria (A or B):

- **C)** The patient is T315I-positive; OR
- **D)** The patient has tried at least two other tyrosine kinase inhibitors that are used for Philadelphia chromosome positive ALL.
  Note: Examples include Gleevec® (imatinib tablets), and Sprycel® (dasatinib tablets).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Iclusig has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

18. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Idhifa® (enasidenib tablets – Celgene/Agios)

DATE REVIEWED: 02/05/2020

OVERVIEW

Idhifa, an isocitrate dehydrogenase-2 (IDH2) inhibitor, is indicated for the treatment of adult patients with relapsed or refractory acute myeloid leukemia (AML) with an IDH2 mutation as detected by an FDA-approved test.[1] The recommended dose is 100 mg orally once daily (QD) until disease progression or unacceptable toxicity. Inhibition of the mutant IDH2 enzyme by Idhifa led to decreased 2-hydroxyglutarate (2-HG) levels and induced myeloid differentiation.

Disease Overview

AML is a heterogeneous hematologic malignancy characterized by clonal expansion of myeloid blasts in the peripheral blood, bone marrow, and/or other tissues.[2] Undifferentiated blast cells proliferate in bone marrow instead of maturing into normal blood cells. Among adults, it is the most common form of acute leukemia and accounts for the largest number of annual deaths from leukemias in the US. An estimated 21,450 individuals will be diagnosed with AML in 2019 and 10,920 are projected to die from the condition. The median age at diagnosis is 67 years. Diagnosis occurs at ≥ 65 years of age for 54% of patients with around one-third of patients diagnosed at ≥ 75 years of age. The incidence of AML increase as the population ages. Environmental factors such as prolonged exposure to petrochemicals, solvents such as benzene, pesticides, and ionizing radiation have been established to increase the risks for AML, as well as myelodysplastic syndrome (MDS).[2] The cure rates of AML have improved with this outcome noted in

35% to 40% of adult patients who are ≤ 60 years of age and 5% to 15% for patients who are > 60 years of age.[3] However, among patients who are older and unable to receive intensive chemotherapy the survival rates are dismal with a median survival of only 5 to 10 months. Various gene mutations are present in adults with AML. The incidence of IDH2 mutations increase with advancing age.[3] IDH2 mutations have been reported in up to 12% of patients with AML.[2] Mutations have been identified in R172 and R140 of the IDH2 gene with the R140 mutation more frequently occurring.

Clinical Efficacy

The efficacy of Idhifa was assessed in an open-label, single-arm, multicenter, two-cohort clinical study involving 199 adult patients with relapsed or refractory AML that had an IDH2 mutation.[1] Patients were assigned to receive Idhifa 100 mg QD. The median patient age was 68 years and patients had received a median of two prior therapies. Approximately 79% of patients were transfusion dependent at baseline. Of the IDH2 mutations, 78% of patients had R140 and 22% of patients had R172. The median follow-up was 6.6 months. In total, 19% of patient attained complete remission (defined as < 5% blasts in the bone marrow, no evidence of disease and full recovery of peripheral blood counts [platelets > 100,000/microliter and absolute neutrophil counts > 1,000/microliter]). Approximately 4% of patients obtained complete remission with partial hematological recovery (defined as < 5% of blasts in the bone marrow, no evidence of disease, and partial recovery of peripheral blood counts [platelets > 50,000/microliter and absolute neutrophil count > 500/microliter]). For patients who obtained complete remission or complete remission with partial hematologic recovery, the median time to first response was 1.9 months (range, 0.5 to 7.5 months); the median time to best response among these patients was 3.7 months (range, 0.6 to 11.2 months). For the 157 patients who were dependent upon red blood cell (RBC) and/or platelet transfusions at baseline, 34% of patients (n = 53/157) became independent of RBC and platelet transfusions.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on AML (version 3.2020 – December 23, 2019) note Idhifa as an alternative for IDH2 mutated AML in a variety of clinical scenarios. Idhifa is recommended for patients who have relapsed or refractory disease who have the IDH2 mutation. Another clinical scenario is for treatment induction among patients ≥ 60 years of age who are not a candidate for intensive remission induction therapy or declines such therapy. In patients ≥ 60 years of age who had a response to previous lower intensity therapy, Idhifa can be continued. Both clinical scenarios apply to patients who are IDH2 mutation positive.

Safety

Idhifa has a Boxed Warning regarding differentiation syndrome.[1] Other more common adverse events (AEs) include nausea (50%), diarrhea (43%), vomiting (34%), and decreased appetite (34%). Elevated bilirubin levels were reported in 81% of patients, of which 15% were Grade ≥ 3 in severity.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Idhifa. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Idhifa is recommended in those who meet the following criteria:

FDA-Approved Indication

58. Acute Myeloid Leukemia (AML). Approve for 3 years if the disease is isocitrate dehydrogenase-2 (IDH2)-mutation positive as detected by an approved test.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Idhifa has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

19. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Imatinib (Gleevec) [imatinib mesylate tablets for oral use – Novartis, generic]

DATE REVIEWED: 04/01/2020

OVERVIEW

Imatinib, a tyrosine kinase inhibitor (TKI), is indicated for the treatment of: newly-diagnosed adult and pediatric patients with Philadelphia chromosome positive (Ph+) chronic myeloid leukemia (CML) in chronic phase (CP); Ph+ CML in blast crisis (BC), accelerated phase (AP) or in CP after failure of interferon-alpha therapy; adult patients with relapsed or refractory Ph+ acute lymphoblastic leukemia (ALL); pediatric patients with newly-diagnosed Ph+ positive ALL in combination with chemotherapy, adults with myelodysplastic/myeloproliferative disease (MDS/MPD) associated with platelet-derived growth factor receptor (PDGFR) gene rearrangements; adults with aggressive systemic mastocytosis (ASM); adults with hypereosinophilic syndrome (HES) and/or chronic eosinophilic leukemia (CEL); adults with unresectable, recurrent, and/or metastatic dermatofibrosarcoma protuberans (DFSP); patients with Kit (CD 117) positive unresectable and/or metastatic gastrointestinal stromal tumors (GIST); and as adjuvant treatment of adults following resection of Kit (CD117) positive GIST.[1] Imatinib is also available as a generic but it does not have any indications regarding GIST, now the indication for use in pediatric patients with ALL.[2] Currently, there are four other tyrosine kinase inhibitors (TKIs) approved for the treatment of Ph+ CML: Tasigna® (nilotinib capsules), Sprycel® (dasatinib tablets), Bosulif® (bosutinib tablets), and Iclusig® (ponatinib tablets).[3-6] These agents are indicated for the treatment of Ph+ CML in various phases. Iclusig is approved for patients with T315I-positive CML and in adult patients with CML for whom no other TKI therapy is indicated.[6] Sprycel also has FDA-approved indications regarding ALL.[3]

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for CML (version 3.2020 – January 30, 2020) state that for patients with CP CML with a low-risk score, the primary treatment recommended includes a first-generation TKI (Gleevec or generic imatinib 400 mg QD [Category 1]), or a second-generation TKI (Bosulif 400 mg QD [Category 1], Sprycel 100 mg QD [Category 1], or Tasigna 300 mg BID [Category 1]).[7] For patients with CP CML

with an intermediate- or high-risk score, a second-generation TKI is preferred (Bosulif 400 mg QD [Category 1], Sprycel 100 mg QD [Category 1], or Tasigna 300 mg BID [Category 1]). A first-generation TKI (Gleevec or generic imatinib 400 mg QD) is an alternative [Category 2A]. Iclusig is an option for patients with a T315I mutation and for with disease that has not responded to multiple TKIs or in whom another TKI is not indicated.

The NCCN guidelines for ALL (adults and adolescent young adults) [version 1.2020 – January 15, 2020][8] and Pediatric ALL (pediatric and adolescent young adults) [version 2.2020 – November 25, 2019][9] recommend imatinib in a variety of clinical scenarios including induction therapy, maintenance, relapsed or refractory ALL and for use in specific mutations.

The NCCN guidelines on dermatofibrosarcoma protuberans (version 1.2020 – October 2, 2019)[10] recommend to consider imatinib in certain cases such as where disease is unresectable, or unacceptable functional or adverse cosmetic outcomes may occur with resection. Of note, the guidelines state that because tumors lacking the t(17;22) translocation may not respond to imatinib, molecular analysis of a tumor using cytogenetics may be useful before initiating imatinib therapy.

The NCCN guidelines on soft tissue sarcoma (version 6.2019 – February 10, 2020) address GIST.[11] GISTs can occur anywhere along the gastrointestinal (GI) tract, but most commonly occur in the stomach and small intestine due to activating mutations in KIT (CD117). Surgery is the primary treatment for patients with resectable GIST; however, this is not always curative or cannot be done. Imatinib is recommended in various clinical settings, including preoperatively, postoperatively, as a primary therapy, as well as for patients with locally advanced or previously unresectable tumors. Imatinib is considered a primary therapy for metastatic GIST.

The NCCN guidelines on myelodysplastic syndromes (MDS) [version 2.2020 – February 28, 2020] note that data have demonstrated that patients with chronic myelomonocytic leukemia (CMML)/myeloproliferative disease (MPD) who have PDGFRβ fusion genes may respond well to imatinib.[12]

The NCCN guidelines for systemic mastocytosis (version 2.2019 – September 20, 2018) recommend imatinib (only if KITD816V mutation negative or unknown or if eosinophilia is present with FIP1L1-PDGFRA fusion gene).[13]

The NCCN guidelines for acquired immune deficiency syndrome (AIDS)-Related Kaposi Sarcoma (version 1.2020 – February 12, 2020) recommended imatinib for subsequent systemic therapy options for relapsed/refractory therapy.[14] First-line systemic therapy options include liposomal doxorubicin (preferred), and paclitaxel. Other subsequent systemic therapy options for relapsed/refractory therapy are also cited (e.g., Pomalyst® [pomalidomide capsules] {preferred], Revlimid® [lenalidomide capsules], Thalomid [thalidomide capsules]).

The NCCN guidelines on bone cancer (version 1.2020 – August 12, 2019) state that imatinib, either as monotherapy or in combination with cisplatin or Rapamune® (sirolimus tablets), is recommended for treatment of chordoma.[15]

The NCCN guidelines on soft tissue sarcoma (version 6.2019 – February 10, 2020) have included non-steroidal anti-inflammatory drugs (NSAIDs), hormonal or biologic agents (tamoxifen, Fareston® [toremifene tablets], or low-dose interferon), chemotherapy (methotrexate and vinorelbine, doxorubicin-based regimens), and TKIs (imatinib and Nexavar® [sorafenib tablets]) as options for systemic therapy for patients with advanced or unresectable desmoid tumors (aggressive fibromatosis).[11]

The NCCN has guidelines regarding hematopoietic cell transplantation (version 1.2020 – October 30, 2019) that address GVHD.[16] Imatinib is cited as one of many therapies recommended for steroid-refractory, chronic GVHD. Some other agents include Imbruvica® (ibrutinib tablets and capsules), low-dose methotrexate, sirolimus, mycophenoate mofetil, Jakafi® (ruxolitinib tablets).

The NCCN guidelines on cutaneous melanoma (version 1.2020 – December 19, 2019) cite imatinib as useful in certain scenarios as systemic therapy for metastatic or resectable disease such as for tumors with activating mutations of KIT.[17]

The NCCN guidelines on soft tissue sarcoma (version 6.2019 – February 10, 2020) cite Turalio (pexidartinib capsules) [category 1] and imatinib (category 2A) as systemic therapies with activity in PVNS/TGCT.[11]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Gleevec and generic imatinib mesylate tablets. If the patient does not meet the criteria regarding brand Gleevec, auto-approvals will be given for generic imatinib mesylate tablets when patients meet conditions for coverage of imatinib as defined in this policy.

Automation: None.

Documentation: In the imatinib (Gleevec) PA, documentation is required for use of generic imatinib as noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes, prescription claims records, prescription receipts and/or other information.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Gleevec and generic imatinib mesylate tablets are recommended in those who meet the following criteria:

FDA-Approved Indications

3. **Acute Lymphoblastic Leukemia (ALL) That is Philadelphia Chromosome Positive (Ph+).** Approve for 3 years if the patient meets one of the following criteria (A or B):
   - **A)** Generic imatinib mesylate tablets are requested; OR
   - **B)** If brand Gleevec is prescribed, the patient has tried generic imatinib mesylate tablets AND cannot take generic imatinib mesylate tablets due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the bioequivalent generic product which, per the prescribing physician, would result in a significant allergy or serious adverse reaction **[documentation required]**.

4. **Chronic Myeloid Leukemia (CML) That is Philadelphia Chromosome Positive (Ph+).** Approve for 3 years if the patient meets one of the following criteria (A or B):
   - **A)** Generic imatinib mesylate tablets are requested; OR
   - **B)** If brand Gleevec is prescribed, the patient has tried generic imatinib mesylate tablets AND cannot take generic imatinib mesylate tablets due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the bioequivalent generic product which, per the prescribing physician, would result in a significant allergy or serious adverse reaction **[documentation required]**.

5. **Dermatofibrosarcoma Protuberans (DFSP).** Approve for 3 years if the patient meets one of the following criteria (A or B):
   - **A)** Generic imatinib mesylate tablets are requested; OR
   - **B)** If brand Gleevec is prescribed, the patient has tried generic imatinib mesylate tablets AND cannot take generic imatinib mesylate tablets due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the bioequivalent generic product which, per the prescribing physician, would result in a significant allergy or serious adverse reaction **[documentation required]**.

6. **Gastrointestinal Stromal Tumors (GIST).** Approve for 3 years if the patient meets one of the following criteria (A or B):
   - **A)** Generic imatinib mesylate tablets are requested; OR
   - **B)** If brand Gleevec is prescribed, the patient has tried generic imatinib mesylate tablets AND cannot take generic imatinib mesylate tablets due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the bioequivalent generic product which, per the

prescribing physician, would result in a significant allergy or serious adverse reaction **[documentation required]**.

7. **Hypereosinophilic Syndrome (HES) and/or Chronic Eosinophilic Leukemia (CEL).** Approve for 3 years if the patient meets one of the following criteria (A or B):
   - **A)** Generic imatinib mesylate tablets are requested; OR
   - **B)** If brand Gleevec is prescribed, the patient has tried generic imatinib mesylate tablets AND cannot take generic imatinib mesylate tablets due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the bioequivalent generic product which, per the prescribing physician, would result in a significant allergy or serious adverse reaction **[documentation required]**.

8. **Aggressive Systemic Mastocytosis (ASM).** Approve for 3 years if the patient meets one of the following criteria (A or B):
   - **A)** Generic imatinib mesylate tablets are requested; OR
   - **B)** If brand Gleevec is prescribed, the patient has tried generic imatinib mesylate tablets AND cannot take generic imatinib mesylate tablets due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the bioequivalent generic product which, per the prescribing physician, would result in a significant allergy or serious adverse reaction **[documentation required]**.

9. **Myelodysplastic/Myeloproliferative Disease (MDS/MPD) [e.g., polycythemia vera, myelofibrosis].** Approve for 3 years if the patient meets the following criteria (A and B):
   - **A)** The condition is associated with platelet-derived growth factor receptor (PDGFR) gene rearrangements; AND
   - **B)** The patient meets one of the following criteria (i or ii):
     - **i.** Generic imatinib mesylate tablets are requested; OR
     - **ii.** If brand Gleevec is prescribed, the patient has tried generic imatinib mesylate tablets AND cannot take generic imatinib mesylate tablets due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the bioequivalent generic product which, per the prescribing physician, would result in a significant allergy or serious adverse reaction **[documentation required]**.

Other Uses with Supportive Evidence

10. **Acquired Immune Deficiency Syndrome (AIDS)-Related Kaposi's Sarcoma.** Approve for 3 years if the patient meets the following criteria (A, B and C):
    - **A)** The patient has tried at least one regimen or therapy; AND
      Note: Examples include liposomal doxorubicin, paclitaxel, Pomalyst® (pomalidomide capsules), Revlimid® (lenalidomide capsules), etoposide, and Thalomid® (thalidomide capsules).
    - **B)** The patient has relapsed or refractory disease; AND
    - **C)** The patient meets one of the following criteria (i or ii):
      - **i.** Generic imatinib mesylate tablets are requested; OR
      - **ii.** If brand Gleevec is prescribed, the patient has tried generic imatinib mesylate tablets AND cannot take generic imatinib mesylate tablets due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the bioequivalent generic product which, per the prescribing physician, would result in a significant allergy or serious adverse reaction **[documentation required]**.

11. **Chordoma.** Approve for 3 years if the patient meets one of the following criteria (A or B)
    - **A)** Generic imatinib mesylate tablets are requested; OR
    - **B)** If brand Gleevec is prescribed, the patient has tried generic imatinib mesylate tablets AND cannot take generic imatinib mesylate tablets due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the bioequivalent generic product which, per the prescribing physician, would result in a significant allergy or serious adverse reaction **[documentation required]**.

12. **Fibromatosis (Desmoid Tumors).** Approve for 3 years if the patient meets the following criteria (A and B).
    - **A)** The patient has advanced or unresectable fibromatosis (desmoid tumors); AND
    - **B)** The patient meets one of the following criteria (i or ii):
      - **i.** Generic imatinib mesylate tablets are requested; OR
      - **ii.** If brand Gleevec is prescribed, the patient has tried generic imatinib mesylate tablets AND cannot take generic imatinib mesylate tablets due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the bioequivalent generic product which, per the prescribing physician, would result in a significant allergy or serious adverse reaction **[documentation required]**.

13. **Graft Versus Host Disease (GVHD), Chronic.** Approve for 1 year if the patient meets the following criteria (A and B).
    - **A)** The patient has tried at least one conventional systemic treatment for graft versus host disease; AND
      Note: Examples include corticosteroids (methylprednisolone, prednisone); cyclosporine; tacrolimus; mycophenolate mofetil; Imbruvica® (ibrutinib capsules and tablets); low-dose methotrexate; sirolimus; and Jakafi® (ruxolitinib tablets).
    - **B)** The patient meets one of the following criteria (i or ii):
      - **i.** Generic imatinib mesylate tablets are requested; OR
      - **ii.** If brand Gleevec is prescribed, the patient has tried generic imatinib mesylate tablets AND cannot take generic imatinib mesylate tablets due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the bioequivalent generic product which, per the prescribing physician, would result in a significant allergy or serious adverse reaction **[documentation required]**.

14. **Metastatic Melanoma:** Approve for 3 years if the patient meets the following criteria (A and B).
    - **A)** The patient has c-Kit-positive advanced/recurrent or metastatic melanoma; AND
    - **B)** The patient meets one the following criteria (i or ii):
      - **i.** Generic imatinib mesylate tablets are requested; OR
      - **ii.** If brand Gleevec is prescribed, the patient has tried generic imatinib mesylate tablets AND cannot take generic imatinib mesylate tablets due to a formulation difference in the inactive ingredient(s) [e.g.,

difference in dyes, fillers, preservatives] between the Brand and the bioequivalent generic product which, per the prescribing physician, would result in a significant allergy or serious adverse reaction **[documentation required]**.

15. Pigmented Villonodular Synovitis/Tenosynovial Giant Cell Tumor (PVNS/TGCT). Approve for 3 years if the patient meets both of the following criteria (A and B):

A) The patient meets one of the following (i or ii):
- **i.** The patient has tried Turalio (pexidartinib capsules); OR
- **ii.** According to the prescriber, the patient cannot take Turalio.

Note: Examples of reasons for not being able to take Turalio include patients with elevated liver enzymes or concomitant use of medications that are associated with hepatotoxicity; AND

B) The patient meets one of the following (i or ii):
- **i.** Generic imatinib mesylate tablet are requested; OR
- **ii.** If brand Gleevec is prescribed, the patient has tried generic imatinib mesylate tablets AND cannot take generic imatinib mesylate tablets due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the bioequivalent generic product which, per the prescribing physician, would result in a significant allergy or serious adverse reaction **[documentation required]**.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Imatinib has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

20. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Imbruvica® (ibrutinib tablets and capsules – Pharmacyclics/Janssen)

DATE REVIEWED: 06/03/2020

OVERVIEW

Imbruvica, a Bruton kinase inhibitor, is indicated for the treatment mantle cell lymphoma in adults with who have received at least one prior therapy.[1] Accelerated approval for this indication was granted based on overall response rate. Continued approval for this condition may be contingent on verification of clinical benefit in confirmatory trials. Imbruvica is also indicated for the treatment chronic lymphocytic leukemia (CLL) and small lymphocytic lymphoma (SLL) in adults. Regarding CLL and SLL, Imbruvica is also indicated for the treatment of 17p deletion CLL and SLL in adults. Imbruvica is also indicated for the treatment Waldenström's macroglobulinemia in adults. Imbruvica is indicated for the treatment of marginal zone lymphoma in adults with who require systemic therapy and have received at least one prior anti-CD20-based therapy. Accelerated approval was granted for this indication was based on the overall response rate. Continued approval may be based contingent upon verification and description of clinical benefit in a confirmatory trial. Imbruvica is also indicated for the treatment of chronic graft-versus-host disease (GVHD) in adults with after failure of one or more lines of systemic therapy.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for CLL/SLL (version 4.2020 – December 20, 2019) recommend Imbruvica as a treatment option in various scenarios (e.g., first-line therapy for patients with or without deletion 17p/TP53 mutation; and as relapsed/refractory therapy [category 1 recommendations for many scenarios]).[2] Imbruvica plays a vital role in the management of CLL/SLL and many trials describe its efficacy.

The NCCN guidelines for B-Cell Lymphomas (version 1.2020 – January 22, 2020) address mantle cell lymphoma.[3] Imbruvica is recommended as a one of the preferred second-line therapies, with or without rituximab (category 2A).

The NCCN guidelines for B-Cell Lymphomas (version 1.2020 – January 22, 2020) address marginal zone lymphoma.[3] Preferred first-line regimens include use of rituximab with other agents. Imbruvica is cited as an option as a second-line and subsequent therapy.

The NCCN guidelines for Waldenstrom's macroglobulinemia/lymphoplasmacytic lymphomas (version 2.2020 – April 15, 2020) recommend Imbruvica, with or without rituximab, as a primary therapy option as one of several preferred regimens (category 2).[4] For previously treated patients Imbruvica, with or without rituximab, is also cited as a preferred regimen.

The NCCN guidelines for Central Nervous System (CNS) Cancers B-Cell Lymphomas (version 2.2020 – April 30, 2020) recommend Imbruvica as one of the options for patients with relapsed or refractory disease.[5] In some clinical scenarios it is used with rituximab.

The NCCN guidelines for Hairy Cell Leukemia (version 1.2020 – August 23, 2019) recommend Imbruvica as one of the options for patients with relapsed or refractory disease following progression.[6]

The NCCN guidelines for B-Cell Lymphomas (version 1.2020 – January 22, 2020) address diffuse large B-cell lymphoma.[3] Imbruvica is cited as a second-line and subsequent therapy. Other therapy regimens are recommended first-line, many of which are rituximab-based.

The NCCN has guidelines regarding hematopoietic cell transplantation (version 1.2020 – October 30, 2019) that address GVHD.[8] Imbruvica is cited as one of many therapies recommended for steroid-refractory, chronic GVHD. Some other agents include imatinib, low-dose methotrexate, sirolimus, mycophenoate mofetil, Jakafi® (ruxolitinib tablets). Data are also available for Imbruvica.[9]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Imbruvica. All approvals are provided for 3 years in duration unless otherwise noted below.

Automation: When available, the ICD-9/ICD-10 codes for chronic lymphocytic leukemia (CLL) (ICD-9: 204.1* [lymphoid leukemia chronic] and ICD-10: C91.1* [chronic lymphocytic leukemia of B-cell type]), Mantle Cell Lymphoma (ICD-9: 200.4* and ICD-10: C83.1*), Small Lymphocytic Lymphoma (ICD-10: C83.0* [small cell B-cell lymphoma]) and Waldenström's macroglobulinemia (ICD-9: 273.3* [macroglobulinemia] and ICD-10: C88.0*) will be used as part of automation to allow approval of the requested medication.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Imbruvica is recommended in those who meet the following criteria:

FDA-Approved Indications

59. **Chronic Lymphocytic Leukemia (CLL).** Approve for 3 years.

60. **Mantle Cell Lymphoma.** Approve for 3 years.

61. **Marginal Zone Lymphoma.** Approve for 3 years.

62. **Small Lymphocytic Lymphoma (SLL).** Approve for 3 years.

63. **Waldenström's Macroglobulinemia.** Approve for 3 years.

64. **Graft versus Host Disease, Chronic:** Approve for 1 year if the patient has tried at least one conventional systemic treatment for graft versus host disease.
    Note: Examples include corticosteroids (methylprednisolone, prednisone), imatinib, low-dose methotrexate, sirolimus, mycophenolate mofetil, and Jakafi® (ruxolitinib tablets).

Other Uses with Supportive Evidence

21. **Central Nervous System (CNS) Lymphoma (Primary).** Approve for 3 years if according to the prescribing physician the patient has relapsed or refractory disease.

22. **B-Cell Lymphoma.** Approve for 3 years if according to the prescribing physician the patient is using the agent as second-line or subsequent therapy.
    Note: Examples of B-Cell Lymphomas include follicular lymphoma, diffuse large B-cell lymphomas, gastric mucosa-associated lymphoid tissue (MALT) lymphoma, nongastric MALT lymphoma, Acquired Immune Deficiency Syndrome (AIDS)-related, and post-transplant lymphoproliferative disorders.

23. **Hairy Cell Leukemia.** Approve for 3 years if the according to the prescribing physician the patient has relapsed or refractory disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Imbruvica has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Inlyta® (axitinib tablets – Pfizer)

DATE REVIEWED: 05/20/2020

OVERVIEW

Inlyta, a kinase inhibitor, is indicated for the treatment of advanced renal cell carcinoma (RCC) after failure of one prior systemic therapy.[1]

Guidelines

The NCCN clinical practice guidelines on kidney cancer (version 2.2020 – August 5, 2019) recommend Inlyta + Keytruda (pembrolizumab for intravenous use) as a "preferred regimen" (category 2A) for favorable risk and poor/intermediate risk patients as first-line therapy for clear cell histology.[2] Inlyta + Imfinzi (avelumab for intravenous use) is recommended as one of the "Other recommended regimens" (category 2A) in the same populations. Inlyta as a monotherapy is a category 2B recommended regimen for first-line therapy. Inlyta is a category 1 recommended therapy under "other recommended regimens" for subsequent therapy. Inlyta + Keytruda is another category 2A option in this setting; Inlyta + Imfinzi is a category 3 option. It is one of the systemic therapy options listed under "useful under certain circumstances" for relapse or Stage IV RCC with *non-clear cell histology* (category 2A).

The NCCN thyroid carcinoma guidelines (version 2.2019 – September 16, 2019) recommend Inlyta as one of the kinase inhibitors to be considered if clinical trials or other systemic therapies are not available or appropriate for the treatment of progressive and/or symptomatic iodine refractory thyroid cancer.[3] This recommendation is for follicular, Hürthle cell, and papillary cancer subtypes (all category 2A).

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Inlyta. All approvals are provided for 3 years.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Inlyta is recommended in those who meet the following criteria:

FDA-Approved Indications

65. **Renal Cell Carcinoma – Clear Cell or Non-Clear Cell Histology.** Approve for 3 years for relapsed or Stage IV disease.

Other Uses with Supportive Evidence

66. **Differentiated (i.e., papillary, follicular, and Hürthle cell) Thyroid Carcinoma.** Approve for 3 years if refractory to radioactive iodine therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Inlyta has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below.

24. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Inqovi Prior Authorization Policy
- Inqovi® (decitabine and cedazuridine tablets – Taiho Oncology/Otsuka Pharmaceutical)

REVIEW DATE: 07/22/2020

OVERVIEW
Inqovi, a combination of decitabine (a nucleoside metabolic inhibitor) and cedazuridine (a cytidine deaminase inhibitor), is indicated for the following:[1]
- **Myelodysplastic syndrome (MDS),** in adults, including previously treated and untreated, de novo and secondary MDS with the following French-American-British (FAB) subtypes (refractory anemia, refractory anemia with ringed sideroblasts, refractory anemia with excess blasts, and chronic myelomonocytic leukemia [CMML]) and intermediate-1, intermediate-2, and high-risk International Prognostic Scoring System (IPSS) groups.

Decitabine is available as a parenteral product (Dacogen® [decitabine injection for intravenous {IV} use]; generic) and possesses the same FDA-approved indication as Inqovi.[2] The oral bioavailability of decitabine is limited due to rapid degradation by cytidine deaminase in the gut and liver.[1] As a cytidine deaminase inhibitor, cedazuridine increases decitabine concentrations to therapeutic levels. Oral decitabine has systemic exposure equivalent to the IV form with similar clinical response rates in the population in which Inqovi is FDA-approved.[1,2] The recommended dose of Inqovi is one tablet taken orally once daily on Days 1 through 5 of each 28-day cycle for a minimum of four cycles until disease progression or unacceptable toxicity. A complete or partial response may take longer than four cycles. In the two pivotal trials, the median treatment duration was up to 8 months. Do not substitute Inqovi for the IV decitabine product within a cycle.

Guidelines
Inqovi is not addressed in the guidelines. Dacogen is incorporated into the National Comprehensive Cancer Network (NCCN) guidelines for myelodysplastic syndromes (version 2.2020 – February 28, 2020) and is recommended in various clinical scenarios in patients with MDS (e.g., treatment of lower risk disease, high-risk disease) and CMML (as a single agent or with Jakafi® [ruxolitinib tablets]).[3] In Phase III studies

hypomethylating agents (e.g., decitabine, Vidaza® [azacitidine injection for intravenous or subcutaneous use [generic]) have favorable data regarding hematological response and improvement, as well as a decrease in the progression to AML; survival benefits have also been noted.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Inqovi. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Inqovi is recommended in those who meet the following criteria:

FDA-Approved Indications

137. Chronic Myelomonocytic Leukemia. Approve for 1 year.

138. Myelodysplastic Syndromes. Approve for 1 year.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Inqovi is not recommended in the following situations:

133. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Inrebic Prior Authorization Policy

- Inrebic® (fedratinib capsules – Celgene)

REVIEW DATE: 08/26/2020

OVERVIEW

Inrebic, a Janus Associated Kinase 2 (JAK2)-selective kinase inhibitor, is indicated for the treatment of adult patients with intermediate-2 or high-risk primary or secondary (post-polycythemia vera or post-essential thrombocythemia) myelofibrosis. Inrebic labeling includes a Boxed Warning regarding risk of encephalopathy, including Wernicke's encephalopathy, and states that thiamine (vitamin B1) levels should be assessed prior to starting Inrebic and periodically during treatment.

Disease Overview

Myelofibrosis, polycythemia vera, and essential thrombocythemia are a group of uncommon heterogeneous disorders involving the hematopoietic system.[2-4] In the US, the prevalence of myelofibrosis, essential thrombocythemia, and polycythemia vera were approximately 13,000, 134,000, and 148,000 cases respectively.[2] It is a cancer that impacts the normal production of red blood cells and involves the replacement of bone marrow by fibrous scare tissue. There is a lack of red blood cells, and an overabundance of white blood cells. The symptom profile in myeloproliferative neoplasms is complex and symptoms vary among the subtype. Patients may experience fatigue, pruritus, weight loss, splenomegaly, and various laboratory abnormalities (e.g., erythrocytosis, thrombocytosis, and leukocytosis). The disease can be slowly progressive and early in the disease process patients may be asymptomatic. However, some patients with this condition may have the disease transform into acute myeloid leukemia which is associated with a poor prognosis. The management of myeloproliferative neoplasms involves identification of specific mutations which

guide targeted therapies and have resulted in improvement of disease symptoms. Other treatments are symptom-based.

Guidelines

The National Comprehensive Cancer Network has guidelines regarding myeloproliferative neoplasms (version 1.2020 – May 31, 2020) include Inrebic.[2] Inrebic is recommended for higher risk patients with a platelet count $\geq 10 \times 10^9$/L (category 2B). In this clinical scenario, Jakafi® (ruxolitinib capsules), another kinase inhibitor, has a higher recommendation (category 2A). Inrebic is also recommended in patients who have tried Jakafi with no response or who have loss of response. Jakafi is also recommended among patients with lower-risk myelofibrosis.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Inrebic. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Inrebic is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Myelofibrosis (MF), including Primary MF, Post-Polycythemia Vera MF, and Post-Essential Thrombocythemia MF.** Approve Inrebic for 3 years if the patient has intermediate-2 or high-risk disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Inrebic is not recommended in the following situations:

134. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Iressa Prior Authorization Policy

- Iressa® (gefitinib tablets – AstraZeneca)

REVIEW DATE: 09/02/2020

OVERVIEW

Iressa is a tyrosine kinase inhibitor (TKI) indicated for the first-line treatment of patients with metastatic non-small cell lung cancer (NSCLC) whose tumors have epidermal growth factor receptor (*EGFR*) exon 19 deletions or exon 21 (L858R) substitution mutations as detected by an FDA-approved test.[1] The safety and efficacy of Iressa have not been established in patients whose tumors have other *EGFR* mutations. Iressa binding affinity for *EGFR* exon 19 deletion or exon 21 point mutation L858R mutations is higher than its affinity for the wild-type *EGFR*.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for NSCLC (version 6.2020 – June 15, 2020) recommend Tarceva® (erlotinib tablets), Iressa, Gilotrif™ (afatinib tablets), Tagrisso™ (osimertinib tablets), and Vizimpro® (dacomitinib tablets) as first-line treatment in patients with sensitizing *EGFR*-mutation positive NSCLC (all category 1).[2] Tagrisso is noted as a "preferred" option. Tagrisso is the only agent specifically FDA-approved and recommended in guidelines (category 1) for T790M-positive tumors as subsequent therapy, after progression on first-line Tarceva, Iressa, Vizimpro, or Gilotrif.

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of Iressa. All approval durations are noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Iressa is recommended in those who meet the following criteria:

FDA-Approved Indications

67. Non-Small Cell Lung Cancer (NSCLC). Approve for 3 years if the patient meets the following criteria (A and B):
- **A)** Patient has metastatic non-small cell lung cancer; AND
- **B)** Patient meets ONE of the following conditions (i or ii):
  - **i.** Patient has epidermal growth factor receptor (*EGFR*) exon 19 deletions as detected by an approved test; OR
  - **ii.** Patient has exon 21 (L858R) substitution mutations as detected by an approved test.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Coverage of Iressa is not recommended in the following situations:

25. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES
324. Iressa® tablets [prescribing information]. Wilmington, DE: AstraZeneca; July 2018.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Jakafi® (ruxolitinib tablets – Incyte)

DATE REVIEWED: 03/25/2020

OVERVIEW
Jakafi, a kinase inhibitor, is indicated for treatment of patients with 1) intermediate or high-risk myelofibrosis, including primary myelofibrosis, post-polycythemia vera myelofibrosis, and post-essential thrombocythemia myelofibrosis in adults; 2) polycythemia vera in adults who have had an inadequate response to or are intolerant of hydroxyurea; and 3) steroid-refractory acute graft-vs.-host disease in adult and pediatric patients ≥ 12 years of age.[1] Jakafi specifically inhibits Janus Associated Kinases (JAKs) JAK1 and JAK2 which mediate the signaling of various cytokinase and growth factors that are vital for hematopoiesis and immune function.

Disease Overview

Myelofibrosis, polycythemia vera, and essential thrombocythemia are a group of uncommon heterogeneous disorders involving the hematopoietic system.[2-4] In the US, the prevalence of myelofibrosis, essential thrombocythemia, and polycythemia vera were approximately 13,000, 134,000, and 148,000 cases respectively.[2] It is a cancer that impacts the normal production of red blood cells and involves the replacement of bone marrow by fibrous scare tissue. There is a lack of red blood cells, and an overabundance of white blood cells. The symptom profile in myeloproliferative neoplasms is complex and symptoms vary among the subtype. Patients may experience fatigue, pruritis, weight loss, splenomegaly, and various laboratory abnormalities (e.g., erythrocytosis, thrombocytosis, and leukocytosis). The disease can be slowly progressive and early in the disease process patients may be asymptomatic. However, some patients with this condition may have the disease transform into acute myeloid leukemia which is associated with a poor prognosis. The management of myeloproliferative neoplasms involves identification of specific mutations which guide targeted therapies and have resulted in improvement of disease symptoms. Other treatment are symptom-based.

Guidelines

The National Comprehensive Cancer Network (NCCN) has guidelines regarding myeloproliferative neoplasms (version 3.2019 – September 4, 2019) that include Jakafi.[2] Jakafi is recommended among patients with low-, intermediate-, and high-risk myelofibrosis. It is also a recommended therapy for patients with high-risk polycythemia vera.

The NCCN has guidelines regarding hematopoietic cell transplantation that discuss graft-versus-host disease (version 1.2020 – October 30, 2019) that include Jakafi.[7] Jakafi is recommended among patients with steroid-refractory chronic graft-vs.-host disease.[7] Supportive data are available.[8,9] A variety of other agents are also recommended such as cyclosporine, tacrolimus, mycophenolate mofetil, Imbruvica® (ibrutinib capsules and tablets), and imatinib.

The NCCN guidelines for pediatric acute lymphoblastic leukemia (ALL) [version 2.2020 – November 25, 2019] recommend Jakafi in a variety of regimens for pediatric patients and young adults with ALL.[10] The utility of Jakafi is described primarily in patients in which the mutation/pathway is Janus Associated Kinase (JAK)-related.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Jakafi. All approvals are provided for the durations noted below.

Automation: The ICD-9/ICD-10 codes for myelofibrosis (ICD-9: 289.83 and ICD-10: D75.81) will be used as part of automation to allow approval of the requested medication.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Jakafi is recommended in those who meet the following criteria:

FDA-Approved Indications

68. **Graft versus Host Disease, Acute.** Approve for 1 year if the patient has tried one systemic corticosteroid.

69. **Myelofibrosis (MF), including Primary MF, Post-Polycythemia Vera MF, and Post-Essential Thrombocythemia MF.** Approve for 3 years.

70. Polycythemia Vera. Approve for 3 years if the patient has tried hydroxyurea.

Other Uses with Supportive Evidence

71. Acute Lymphoblastic Leukemia. Approve for 1 year if the patient meets the following criteria (A and B)
- **A)** The patient is < 21 years of age; AND
- **B)** The mutation/pathway is Janus Associated Kinase (JAK)-related.

72. Graft versus Host Disease, Chronic. Approve for 1 year if the patient has tried one conventional systemic treatment for graft versus host disease.
Note: Examples include systemic corticosteroids [methylprednisolone, prednisone], cyclosporine, tacrolimus, mycophenolate mofetil, Imbruvica® (ibrutinib capsules and tablets), and imatinib.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Jakafi has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

26. Other Refractory Leukemias. Limited data have investigated Jakafi in adults with relapsed and/or refractory acute myeloid leukemia (AML), myelodysplastic syndromes (MDS) [including chronic myelomonocytic leukemia {CMML}], or chronic myelocytic leukemia (CML).[5,6] Further studies are needed to determine the place in therapy of Jakafi for the treatment of refractory leukemias.

27. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Kisqali® (ribociclib tablets – Pfizer Labs); Kisqali® Femara® Co-Pack (ribociclib tablets; letrozole tablets, co-packaged for oral use – Pfizer Labs)

DATE REVIEWED: 04/15/2020

OVERVIEW

Kisqali, a cyclin-dependent kinase (CDK) 4/6 inhibitor, is indicated in combination with an aromatase inhibitor (AI) as initial endocrine-based therapy for the treatment of pre/perimenopausal or postmenopausal women with hormone receptor-positive (HR+), human epidermal growth factor receptor 2 (HER2)-negative advanced or metastatic breast cancer.[1-3] Kisqali Femara Co-Pack has the same indication with the AI, letrozole being provided.[4] Kisqali (not Co-Pack) is also indicated in combination with fulvestrant for the treatment of postmenopausal women with HR+, HER2-negative advanced or metastatic breast cancer, as initial endocrine based therapy or following disease progression on endocrine therapy.

Disease Overview

Based on molecular profiling, breast cancer is classified as HR+ (estrogen receptor positive [ER+] and/or progesterone receptor positive [PgR+]), HER2+, or triple negative (ER-negative, PgR-negative, and HER2-negative).[5-6] Most breast cancers in women (71%) are HR+, HER2-negative; these cancers tend to be slow-growing and less aggressive than other subtypes.[6] HR+, HER2-negative tumors are associated with the most favorable prognosis compared with other subtypes, particularly in the short-term, in part because expression of hormone receptors is predictive of a favorable response to hormonal therapy. In men, about 85% of breast cancers are ER+ and 70% are PgR+.[7] About 12% of breast cancers are HR+ and HER2+, and tend to be higher grade and more aggressive than HR+ cancers.[6] About 5% of breast cancers are HER2+ and do not express hormone receptors. These cancers tend to be more aggressive than other breast cancers and have a poorer short-term prognosis compared with ER+ breast cancers. About 12% of breast cancers in women are triple negative and have a poorer short-term prognosis than other subtypes.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on breast cancer (version 3.2020 – March 6, 2020) recommend any of the CDK4/6 inhibitors in combination with an AI or fulvestrant as a first-line treatment option for recurrent or Stage IV HR+ and HER2-negative disease in postmenopausal women or premenopausal patient receiving ovarian ablation or suppression (category 1).[8] The compendium recommend that men with breast cancer be treated similarly to postmenopausal women, except that the use of an AI is ineffective without concomitant suppression of testicular steroidogenesis.[9] The NCCN guidelines state in a footnote that if there is disease progression on CDK4/6 inhibitor therapy, there are limited data to support an additional line of therapy with another CDK4/6-containing regimen.[8] The limited data are based on a multicenter analysis which evaluated clinical outcomes in patients (n = 58) with HR+/HER2-negative metastatic breast cancer who received Verzenio after disease progression on Ibrance or Kisqali.[10] At data cutoff, 34% of patients (n = 20/58) had progressive disease, while 36% of patients (n = 21/58) had treatment duration exceeding 6 months. The median PFS was 5.8 months. There are no published data with additional line of therapy with Ibrance or Kisqali, if the patient has progressed on Verzenio.

In men with breast cancer, tamoxifen is generally used rather than an AI, because the data supporting use of an AI in men are limited.[7] The use of AI therapy with LHRH has been reported.[8-9] Only limited data are available with Kisqali use in men with breast cancer as first-line endocrine therapy in combination with anastrozole, exemestane, or letrozole or for combination use with fulvestrant. However, available real-world data suggest comparable efficacy and safety profiles in men as in women; it is reasonable to recommend CDK4/6 inhibitors in combination with an aromatase inhibitor or fulvestrant, everolimus, and PIK3CA inhibitors to men based on extrapolation of data from studies comprised largely of female participants with advanced breast cancer.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Kisqali and Kisqali Femara Co-Pack. All approvals are provided for 3 years in duration unless otherwise noted below. In the clinical criteria, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: a woman is defined as an individual with the biological traits of a woman, regardless of the individual's gender identity or gender expression; men are defined as individuals with the biological traits of a man, regardless of the individual's gender identity or gender expression.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

I. Coverage of Kisqali is recommended in those who meet the following criteria:

FDA-Approved Indications

73. Breast Cancer in Postmenopausal Women*. Approve for 3 years if the patient meets the following criteria (A, B, C, and D):

88. Patient has advanced or metastatic hormone receptor positive (HR+) [i.e., estrogen receptor positive {ER+} and/or progesterone receptor positive {PR+}] disease; AND

89. Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND

90. The patient meets ONE of the following criteria (i or ii):

i. Kisqali will be used in combination with anastrozole, exemestane, or letrozole; OR

ii. Kisqali will be used in combination with fulvestrant ; AND

D) The patient has not had disease progression while on Kisqali, Ibrance (palbociclib capsules), or Verzenio (abemaciclib tablets).

***** Refer to the Policy Statement.

2. Breast Cancer in Pre/Perimenopausal Women*. Approve for 3 years if the patient meets the following criteria (A, B, C, and D):

A) Patient has advanced or metastatic hormone receptor positive (HR+) [i.e., estrogen receptor positive {ER+} and/or progesterone receptor positive {PR+}] disease; AND

B) Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND

C) Patient meets one of the following criteria (i or ii):

i. The patient meets both of the following criteria (a and b):

a) Kisqali will be used in combination with anastrozole, exemestane, or letrozole; AND

b) Patient is receiving ovarian suppression/ablation with a gonadotropin-releasing hormone (GnRH) agonist (e.g., Lupron [leuprolide], Trelstar [triptorelin], Zoladex (goserelin]), or has had surgical bilateral oophorectomy or ovarian irradiation; OR

ii. Kisqali will be used in combination with fulvestrant; AND

D) Patient has not had disease progression while on Kisqali, Ibrance (palbociclib capsules), or Verzenio (abemaciclib tablets).

***** Refer to the Policy Statement.

Other Uses With Supportive Evidence

(1)Breast Cancer in Men*. Approve for 3 years if the patient meets the following criteria (A, B, C, and D):

E) Patient has advanced or metastatic hormone receptor positive (HR+) [i.e., estrogen receptor positive {ER+} and/or progesterone receptor positive {PR+}] disease; AND

F) Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND

G) Patient meets ONE of the following criteria (i or ii):

i. Patient meets BOTH of the following criteria (a and b):

a) Patient is receiving a gonadotropin-releasing hormone (GnRH) agonist (e.g., Lupron [leuprolide], Trelstar [triptorelin], Zoladex (goserelin]); AND

b) Kisqali will be used in combination with anastrozole, exemestane, or letrozole; OR

ii. Kisqali will be used in combination with fulvestrant ; AND

H) Patient has not had disease progression while on Kisqali, Ibrance (palbociclib capsules), or Verzenio (abemaciclib tablets).

***** Refer to the Policy Statement.

II. Coverage of Kisqali Femara Co-Pack is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Breast Cancer in Women***. Approve for 3 years if the patient meets the following criteria (A, B, C, and D):

74. Patient has advanced or metastatic hormone receptor positive (HR+) [i.e., estrogen receptor positive {ER+} and/or progesterone receptor positive {PR+}] disease; AND

75. Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND

76. If the patient is premenopausal or perimenopausal, then the patient is receiving ovarian suppression/ablation with a gonadotropin-releasing hormone (GnRH) agonist (e.g., Lupron [leuprolide], Trelstar [triptorelin], Zoladex (goserelin]), or has had surgical bilateral oophorectomy or ovarian irradiation; AND

D) The patient has not had disease progression while on Kisqali, Ibrance (palbociclib capsules), or Verzenio (abemaciclib tablets).

***** Refer to the Policy Statement.

Other Uses With Supportive Evidence

1. **Breast Cancer in Men*.** Approve for 3 years if the patient meets the following criteria (A, B, C, and D):
   - **A)** Patient has advanced or metastatic hormone receptor positive (HR+) [i.e., estrogen receptor positive {ER+} and/or progesterone receptor positive {PR+}] disease; AND
   - **B)** Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND
   - **C)** The patient is receiving a gonadotropin-releasing hormone (GnRH) agonist (e.g., Lupron [leuprolide], Trelstar [triptorelin], Zoladex (goserelin]); AND
   - **D)** The patient has not had disease progression while on Kisqali, Ibrance (palbociclib capsules), or Verzenio (abemaciclib tablets).

   ***** Refer to the Policy Statement.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Kisqali or Kisqali Femara has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

28. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Koselugo™ (selumetinib capsules – AstraZeneca Pharmaceuticals)

DATE REVIEWED: 04/15/2020

OVERVIEW

Koselugo (selumetinib), a kinase inhibitor, is indicated for the treatment of pediatric patients 2 years of age and older with neurofibromatosis type 1 (NF1) who have symptomatic, inoperable plexiform neurofibromas.[1]

Koselugo is a mitogen-activated protein kinase kinases 1 and 2 (MEK1/2) inhibitor.[1]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Koselugo. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Koselugo is recommended in those who meet the following criteria:

FDA-Approved Indications

139. Neurofibromatosis Type 1. Approve for 3 years if the patient meets the following criteria (A and B):

A) The patient meets ONE of the following (i or ii):
- **i.** Patient is 2 to 18 years of age; OR
- **ii.** Patient is ≥ 19 years of age AND has been previously started on therapy with Koselugo prior to becoming 19 years of age; AND

B) Prior to starting Koselugo, the patient has symptomatic, inoperable plexiform neurofibromas, according to the prescriber.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Koselugo has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

135. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Lenvima™ (lenvatinib capsules – Eisai)

DATE REVIEWED: 05/13/2020

OVERVIEW

Lenvima, a kinase inhibitor, is indicated for the treatment of patients with locally recurrent or metastatic, progressive, radioactive iodine (RAI)-refractory differentiated thyroid cancer (DTC).[1] Lenvima is also indicated, in combination with Afinitor® (everolimus tablets), for the treatment of patients with advanced renal cell carcinoma (RCC) following one prior anti-angiogenic therapy. In addition, it is also indicated for the first-line treatment of patients with unresectable hepatocellular carcinoma (HCC). Lenvima, in combination with Keytruda (pembrolizumab for injection), is indicated for the treatment of patients with advanced endometrial carcinoma that is not microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR), who have disease progression following prior systemic therapy and are not candidates for curative surgery or radiation. This indication is approved under accelerated approval based on tumor response rate and durability of response.

Guidelines

According to the National Comprehensive Cancer Network (NCCN) guidelines on thyroid carcinoma (version 2.2019 – September 16, 2019), first-line treatment for DTC is surgery, whenever possible, followed by RAI therapy in selected patients, and levothyroxine therapy in all patients.[2] Systemic therapy options include cytotoxic chemotherapy and kinase inhibitors. Multitargeted kinase inhibitors are recommended in current guidelines for select patients with DTC. The guidelines state that for progressive and/or symptomatic disease, Lenvima (preferred) or Nexavar® (sorafenib tablets) should be considered (Category 2A). It is noted that the majority of the NCCN panel considered Lenvima to be preferred agent in this patient population based on the response rate observed in clinical trials. Lenvima can be considered for treatment of progressive or symptomatic medullary thyroid disease if clinical trials, Caprelsa, or Cometriq are not available or appropriate, or if there is progression on Caprelsa or Cometriq.[2] Lenvima is also listed as "useful under certain circumstances" for anaplastic thyroid carcinoma if there is no curative option and if the patient is not tolerating or has no response to recommended therapies.[4] The compendium notes that Lenvima can be used either first-line for aggressive metastatic disease or as subsequent therapy.

The NCCN kidney cancer guidelines (version 2.2020 – August 5, 2019) recommends Lenvima + everolimus as one of the "other recommended regimens" (category 1) for relapse or stage IV subsequent therapy for clear cell histology. It is also a recommended combination therapy (category 2A) listed as "useful under certain circumstances" for non-clear cell histology.

The NCCN hepatobiliary cancers (version 2.2020 – May 8, 2020) recommends Lenvima as preferred first-line systemic therapy (Child-Pugh Class A only) for hepatocellular carcinoma. It is also recommended as subsequent-line therapy upon disease progression (category 2A).

The NCCN uterine neoplasms guidelines (version 1.2020 – March 6, 2020) recommends Lenvima with Keytruda combination therapy for recurrent, metastatic, or high-risk endometrial carcinoma. This combination is a category 2A recommendation under "Other Recommended Regimens".

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of Lenvima. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Lenvima is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Differentiated (i.e., Papillary, Follicular, and Hürthle) Thyroid Carcinoma.** Approve for 3 years if the disease is refractory to radioactive iodine therapy.

2. **Renal Cell Carcinoma (Clear Cell or Non-Clear Cell).** Approve for 3 years if the patient meets the following criteria (A, B, and C):
   A) The patient has relapsed or Stage IV disease; AND
   B) If disease is predominant clear-cell histology, then the patient has tried one antiangiogenic therapy. Note: Examples are Inlyta® [axitinib tablets], Votrient® [pazopanib tablets], Sutent® [sunitinib capsules], or Cabometyx® [cabozantinib tablets]; AND
   C) Lenvima is used in combination with everolimus /Afinitor® Disperz™ (everolimus tablets for oral suspension) therapy.

3. **Hepatocellular Carcinoma, Unresectable.** Approve for 3 years.

4. **Endometrial Carcinoma.** Approve for 3 years if the patient meets the following criteria (A, B, C, and D):
   A) The patient has advanced endometrial carcinoma that is not microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR); AND
   B) The medication is used in combination with Keytruda (pembrolizumab for intravenous injection); AND
   C) The disease has progressed on at least one prior systemic therapy.
   Note: Examples of systemic therapy are carboplatin, paclitaxel, docetaxel, cisplatin, doxorubicin, ifosfamide, everolimus, letrozole; AND
   D) The patient is not a candidate for curative surgery or radiation.

Other Uses with Supportive Evidence

5. **Medullary Thyroid Carcinoma.** Approve for 3 years if the patient has tried Caprelsa (vandetanib tablets) or Cometriq (cabozantinib capsules).

6. **Anaplastic Thyroid Carcinoma.** Approve for 3 years if the disease does not have a curative option.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Lenvima has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

29. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Lonsurf® (trifluridine and tipiracil tablets – Taiho Oncology Inc)

DATE REVIEWED: 02/26/2020

OVERVIEW

Lonsurf is a combination of trifluridine, a nucleoside metabolic inhibitor, and tipiracil, a thymidine phosphorylase inhibitor, indicated for the treatment of adult patients with metastatic colorectal cancer (mCRC) who have been previously treated with fluoropyrimidine-, oxaliplatin-, and irinotecan-based chemotherapy, an anti-vascular endothelial growth factor (VEGF) biological therapy, and if *RAS* wild-type, an anti-epidermal growth factor receptor (EGFR) therapy.[1] Fluoropyrimidines include 5-fluorouracil (5-FU) intravenous (IV) injection and capecitabine tablets. Anti-VEGF therapies for mCRC include Avastin® (bevacizumab solution for IV injection) and Cyramza® (ramucirumab injection for IV use). Anti-EGFR therapies for mCRC include Erbitux® (cetuximab injection for IV infusion) and Vectibix® (panitumumab injection for IV infusion).

Lonsurf is indicated for the treatment of adult patients with metastatic gastric or gastroesophageal junction adenocarcinoma previously treated with at least two lines of chemotherapy that included a fluoropyrimidine, a platinum, either a taxane or irinotecan, and if appropriate, human epidermal growth factor receptor 2 (HER2)/neu-targeted therapy.[1]

Guidelines

Colon and/or Rectal Cancer

The National Comprehensive Cancer Network (NCCN) colon cancer (version 1.2020 – December, 19, 2019) and rectal cancer (version 1.2020 – December 19, 2019) guidelines recommend Lonsurf as subsequent therapy as a single agent for unresectable advanced or metastatic disease not previously treated with Lonsurf for the following uses:[2-3] for first progression (*KRAS/NRAS* mutant only) or second

progression for disease previously treated with FOLFOXIRI (5-FU/leucovorin, irinotecan, oxaliplatin) with or without Avastin, for second progression for disease previously treated with irinotecan- and oxaliplatin-based regimens, or for progression for disease that progressed through all available regimens, including Stivarga® (regorafenib tablets). Lonsurf may be given before or after Stivarga.

Gastric Cancer and/or Esophageal and Esophagogastric Junction Cancer
The NCCN gastric cancer (version 4.2019 – December 20, 2019), and the esophageal and esophagogastric cancer (version 4.2019 – December 20, 2019) guidelines recommend Lonsurf as a single agent for the third line or subsequent therapy for unresectable locally advanced, recurrent, or metastatic gastric and esophagogastric junction adenocarcinoma following prior fluoropyrimidine-, platinum-, taxane-, or irinotecan-based chemotherapy.[4-6]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Lonsurf. All approvals are provided for 3 years in duration unless otherwise noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Lonsurf is recommended in those who meet the following criteria:

FDA-Approved Indications

77. Colon and Rectal Cancer. Approve for 3 years if the patient meets the following criteria (A, B, C, and D):[1]
- **A)** The patient has been previously treated with a fluoropyrimidine (e.g., capecitabine, 5-fluorouracil [5-FU]); AND
- **B)** The patient has been previously treated with oxaliplatin; AND
- **C)** The patient has been previously treated with irinotecan; AND
- **D)** If the patient's tumor or metastases are wild-type *RAS* (*KRAS* wild-type and/or *NRAS* wild-type) [that is, the tumors or metastases are *KRAS* and/or *NRAS* mutation negative], Erbitux (cetuximab injection for intravenous infusion) or Vectibix (panitumumab injection for intravenous infusion) has been tried.

2. **Gastric or Gastroesophageal Junction Adenocarcinoma.** Approve for 3 years if the patient has been previously treated with at least two chemotherapy regimens for gastric or gastroesophageal junction adenocarcinoma (e.g., regimens containing one or more of the following agents: capecitabine, 5-fluorouracil [5-FU]), oxaliplatin. paclitaxel, docetaxel, and irinotecan).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Lonsurf has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

30. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Lorbrena® (lorlatinib tablets – Pfizer)

DATE REVIEWED: 11/13/2019

OVERVIEW
Lorbrena, a kinase inhibitor, is indicated for the treatment of patients with anaplastic lymphoma kinase (*ALK*)-positive metastatic non-small cell lung cancer (NSCLC), whose disease has progressed on: Xalkori® (crizotinib capsules) and at least one other ALK inhibitor for metastatic disease; or Alecensa® (alectinib capsules) as the first ALK inhibitor therapy for metastatic disease; or Zykadia® (ceritinib capsules) as the first ALK inhibitor therapy for metastatic disease. This indication is approved under accelerated approval based on tumor response rate and duration of response. Continued approval for this indication may be contingent upon verification and description of clinical benefit in a confirmatory trial.

GUIDELINES
According to the National Comprehensive Cancer Network (NCCN) NSCLC guidelines (version 1.2020 – November 6, 2019), Alecensa is noted as a category 1 preferred regimen.[2] Other category 1 recommended regimens are Alunbrig™ (brigatinib tablets) and Zykadia. Xalkori is listed as useful in certain circumstances, but it's also a category 1 option. Lorbrena is recommended as subsequent therapy upon progression on Alecensa, Alunbrig, or Zykadia (category 2A). If Xalkori is used first-line, then Lorbrena is used for subsequent therapy after progression on Alecensa, Alunbrig, or Zykadia (category 2A). Lorbrena is also recommended as subsequent therapy after progression on Xalkori (preferred) or Zykadia [both category 2A] for ROS1 rearrangement-positive NSCLC. Zykadia is noted as "other recommended" agent in the first-line setting for ROS1 rearrangement.

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of Lorbrena. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Lorbrena is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Non-Small Cell Lung Cancer (NSCLC).** Approve for 3 years if the patient meets the following criteria (A and B):
   A) The patient has anaplastic lymphoma kinase (*ALK*)-positive metastatic NSCLC; AND
   B) The patient meets one of the following criteria (i, ii, or iii):
      i. The patient has disease progression on Xalkori (crizotinib capsules) and at least one other ALK inhibitor (e.g., Zykadia [ceritinib capsules], Alecensa [alectinib capsules], Alunbrig [brigatinib tablets]); OR
      ii. The patient has disease progression on Alecensa (alectinib capsules) as the first ALK inhibitor therapy; OR
      iii. The patient has disease progression on Zykadia (ceritinib capsules) as the first ALK inhibitor therapy.

Other uses With Supportive Evidence

2. **Non-Small Cell Lung Cancer – ROS1 Rearrangement-Positive.** Approve for 3 years if the patient has disease progression on Xalkori (crizotinib capsules) or Zykadia (ceritinib capsules).

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Lorbrena has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

31. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Lynparza™ (olaparib capsules and tablets – AstraZeneca)

DATE REVIEWED: 01/15/2020; 05/27/2020 selected revision

OVERVIEW
Lynparza, a poly (ADP-ribose) polymerase (PARP) inhibitor, is indicated for the following[1]:
1) In adult patients with deleterious or suspected deleterious germline BReast CAncer (g*BRCA*)-mutated advanced **ovarian cancer** who have been **treated** with three or more prior lines of chemotherapy.

2) Maintenance treatment of adult patients with **recurrent** epithelial **ovarian,** fallopian tube, or primary peritoneal cancer, who are in a complete or partial response to platinum-based chemotherapy.
3) Maintenance treatment of adult patients with deleterious or suspected deleterious g*BRCA* or somatic *BRCA*-mutated advanced epithelial **ovarian,** fallopian tube, or primary peritoneal cancer who are in complete or partial response to **first-line** platinum-based chemotherapy.
4) Indicated in combination with bevacizumab for the maintenance treatment of adult patients with advanced epithelial ovarian, fallopian tube or primary peritoneal cancer who are in complete or partial response to first-line platinum-based chemotherapy and whose cancer is associated with homologous recombination deficiency (HRD)-positive status defined by either: **a)** a deleterious or suspected deleterious BRCA mutation, and/or **b)** genomic instability.
5) In patients with deleterious or suspected deleterious g*BRCA* mutated, HER2-negative metastatic **breast cancer**, who have been treated with chemotherapy in the neoadjuvant, adjuvant, or metastatic setting. Patients with hormone receptor (HR)-positive breast cancer should have been treated with a prior endocrine therapy or be considered inappropriate for endocrine therapy.
6) Maintenance treatment of adult patients with deleterious or suspected deleterious gBRCA mutated metastatic **pancreatic adenocarcinoma** whose disease has not progressed on at least 16 weeks of a first-line platinum-based chemotherapy regimen.
7) For the treatment of adult patients with deleterious or suspected deleterious germline or somatic homologous recombination repair (HRR) gene-mutated metastatic castration-resistant prostate cancer (mCRPC) who have progressed following prior treatment with Xtandi (enzalutamide tablets) or abiraterone.

Lynparza tablets and capsules are not interchangeable; they have different dosing and bioavailability. The tablet formulation yields a lower daily pill burden than the capsule formulation.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on ovarian cancer (version 3.2019 – November 26, 2019) recommend Lynparza for maintenance therapy after primary treatment in patients who have had a complete or partial response.[2] Lynparza is recommended for *BRCA* 1/2 mutations (category 1 for germline mutations; category 2A for somatic mutations). The guidelines recommend use of Zejula™ (niraparib capsules), Rubraca™ (rucaparib tablets), or Lynparza as maintenance therapy options in patients with platinum-sensitive disease who have completed two or more lines of platinum-based therapy. note that the therapy options for patients with recurrent disease are primarily dependent on whether the patient is considered *platinum-resistant* (patients who relapse < 6 months after initial platinum chemotherapy) or *platinum-sensitive* (patients who relapse ≥ 6 months after initial platinum chemotherapy). The guidelines recommend Lynparza as one of the preferred single-agent targeted therapies for patients with deleterious germline *BRCA* mutated advanced (persistent disease or recurrence) ovarian cancer-following three or more lines of therapy (category 2A).

The NCCN breast cancer guidelines (version 3.2019 – September 6, 2019) recommend Lynparza as one of the preferred single agents for HER2-negative, *BRCA* 1/2 positive tumors, in the recurrent or metastatic setting (category 1).[3]

The NCCN pancreatic adenocarcinoma guidelines (version 1.2020 – November 26, 2019) recommend Lynparza for maintenance therapy after the patient has tried first-line systemic therapy.[4] It is specifically recommended in patients who have germline *BRCA* 1/2 mutations and who have not had disease progression after at least 4 to 6 months of chemotherapy.

The NCCN prostate cancer guidelines (version 2.2020 – May 21, 2020) recommends Lynparza for HRRm in the second-line setting (category 1), after first-line treatment with Xtandi or abiraterone. In patients who have received first-line docetaxel, Lynparza is a category 2B recommended therapy in the second-line setting for HRRm. In a footnote it is noted that Lynparza is a treatment option for patients with mCRPC and a pathogenic mutation (germline and/or somatic) in a HRR gene (*BRCA1*, *BRCA2*, *ATM*, *BARD1*, *BRIP1*, *CDK12*, *CHEK1*, *CHEK2*, *FANCL*, *PALB2*, *RAD51B*, *RAD51C*, *RAD51D*, or *RAD54L)*, who have been treated with androgen receptor-directed therapy. Patients with PPP2R2A mutation in the PROfound trial experienced an unfavorable risk-benefit profile. Therefore, Lynparza is not recommended in patients with a PPP2R2A mutations.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Lynparza. All approvals are provided for 3 years in duration.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Lynparza is recommended in those who meet the following criteria:

FDA-Approved Indications

78. Ovarian Cancer – Treatment.

A) Initial Therapy. Approve for 3 years if the patient meets the following criteria (i and ii):
- **i.** The patient has a germline *BRCA*-mutation as confirmed by an approved test; AND
- **ii.** The patient has progressed on three or more prior lines of chemotherapy.

B) Patient is Currently Receiving Lynparza. Approve for 3 years if the patient has a *BRCA* mutation (germline) as confirmed by an approved test.

79. Ovarian, Fallopian Tube, or Primary Peritoneal Cancer – Maintenance, Monotherapy. Approve for 3 years if the patient meets one of the following criteria (A or B):

A) The patient meets both of the following criteria for first-line maintenance therapy (i and ii):
- **i.** The patient has a germline or somatic *BRCA* mutation-positive disease as confirmed by an approved test; AND
- **ii.** The patient is in complete or partial response to first-line platinum-based chemotherapy regimen (e.g., carboplatin with paclitaxel, carboplatin with doxorubicin, docetaxel with carboplatin); OR

B) The patient is in complete or partial response after at least two platinum-based chemotherapy regimens.

Note: Examples of platinum-based chemotherapy are carboplatin with gemcitabine, carboplatin with paclitaxel, cisplatin with gemcitabine.

3. Ovarian, Fallopian Tube, or Primary Peritoneal Cancer – Maintenance, Combination Therapy. Approve for 3 years if the patient meets one of the following criteria (A, B, and C):

A) The medication is used in combination with bevacizumab; AND

B) The patient has homologous recombination deficiency (HRD)-positive disease as confirmed by an approved test.

Note: HRD-positive disease includes patients with *BRCA* mutation-positive disease; AND

C) The patient is in complete or partial response to first-line platinum-based chemotherapy regimen
Note: Examples of chemotherapy regimens are carboplatin with paclitaxel, carboplatin with doxorubicin, docetaxel with carboplatin.

4. Breast Cancer. Approve for 3 years if the patient meets the following criteria (A, B, C, and D):
A) The patient has metastatic, germline *BRCA* mutation-positive breast cancer; AND
B) The patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND
C) The patient meets ONE of the following criteria (i or ii):
i. The patient meets BOTH of the following criteria (a and b):
a) The patient has hormone receptor positive (HR+) [i.e., estrogen receptor positive {ER+} and/or progesterone receptor positive {PR+}] disease; AND
b) The patient meets ONE of the following criteria (1 or 2):
(1) The patient has been treated with prior endocrine therapy; OR
(2) The patient is considered inappropriate for endocrine therapy; OR
ii. Patient has triple negative disease (i.e., ER-negative, PR-negative, and HER2-negative); AND
D) The patient has been treated with chemotherapy in the neoadjuvant, adjuvant, or metastatic setting.

5. Pancreatic Cancer – Maintenance Therapy. Approve for 3 years if the patient meets the following criteria (A and B):
A) The patient has a germline *BRCA* mutation-positive metastatic disease; AND
B) The disease has not progressed on at least 16 weeks of treatment with a first-line platinum-based chemotherapy regimen.

6. Prostate Cancer – Castration-Resistant. Approve for 3 years if the patient meets the following criteria (A, B, C, D, and E):
A) The patient has metastatic disease; AND
B) The patient meets one of the following criteria (i or ii):
i. The medication is used concurrently with a gonadotropin-releasing hormone (GnRH) analog; OR
Note: Examples are Lupron (leuprolide for injection), Lupron Depot (leuprolide acetate for depot suspension), Trelstar (triptorelin pamoate for injectable suspension), Zoladex (goserelin acetate implant), Vantas (histrelin acetate subcutaneous implant), Firmagon (degarelix for injection).
ii. The patient has had a bilateral orchiectomy; AND
C) The patient has germline or somatic homologous recombination repair (HRR) gene-mutated disease, as confirmed by an approved test; AND
Note: HRR gene mutations include *BRCA1*, *BRCA2*, *ATM*, *BARD1*, *BRIP1*, *CDK12*, *CHEK1*, *CHEK2*, *FANCL*, *PALB2*, *RAD51B*, *RAD51C*, *RAD51D*, or *RAD54L*.
D) The patient does not have a *PPP2R2A* mutation; AND
E) The patient has been previously treated with abiraterone or Xtandi (enzalutamide capsules).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Lynparza has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below.

32. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Mekinist Prior Authorization Policy
- Mekinist™ (trametinib tablets – GlaxoSmithKline)

REVIEW DATE: 07/15/2020

OVERVIEW

Mekinist, a kinase inhibitor, is indicated for the treatment of patients with the following conditions:[1]

- **Melanoma**, in the following situations:
  - As a single agent for unresectable or metastatic disease with a BRAF V600E or V600K mutation as detected by an FDA-approved test; AND
  - In combination with Tafinlar® (dabrafenib tablets), for treatment of unresectable or metastatic disease with a BRAF V600E or V600K mutation as detected by an FDA-approved test; AND
  - In combination with Tafinlar for adjuvant treatment of patients with a BRAF V600E or V600K mutation as detected by an FDA-approved test, and involvement of lymph nodes, following complete resection.
- **Non-small cell lung cancer**, in combination with Tafinlar, for treatment of disease that has the BRAF V600E mutation as detected by an FDA-approved test.
- **Thyroid cancer**, in combination with Tafinlar, for treatment of patients with locally advanced or metastatic anaplastic disease with BRAF V600E mutation and with no satisfactory locoregional treatment options.

Guidelines

National Comprehensive Cancer Network (NCCN) guidelines support use of Mekinst in multiple cancers.

- **Melanoma:** Guidelines (version 3.2020 – May 18, 2020) recommend BRAF/MEK inhibitor combinations for first-line (preferred if clinically needed for early response) and subsequent treatment of metastatic or unresectable melanoma with a *V600* activating mutation.[2] While combination BRAF/MEK inhibition is preferred, if a combination is contraindicated, monotherapy with a BRAF inhibitor (Tafinlar or Zelboraf® [vemurafenib tablets]) is a recommended option, particularly if the patient is not a candidate for checkpoint immunotherapy. Following resection of limited metastatic disease with a *BRAF V600*-activating mutation, BRAF/MEK combination therapy is among the treatment options for patients with no evidence of disease. Tafinlar + Mekinist® (trametinib tablets) is also recommended in guidelines as adjuvant therapy (including for nodal recurrence) in some patients with Stage III disease, including use post-surgery or use after complete lymph node dissection. If unacceptable toxicity to Tafinlar/Mekinist, other BRAF/MEK

combinations can be considered. NCCN guidelines for uveal melanoma (version 1.2020 – May 21, 2020) list Mekinist as a treatment option for distant metastatic disease.[3]

- **NSCLC:** Guidelines (version 6.2020 – June 25, 2020) list Tafinlar + Mekinist among the first-line therapy and subsequent therapy options for tumors with a *BRAF* mutation.[4] NCCN also notes that monotherapy with a BRAF inhibitor (Tafinlar or Zelboraf) is a treatment option when combination therapy is not tolerated.
- **Thyroid Cancer:** Guidelines (version 1.2020 – June 12, 2020) list Tafinlar + Mekinist as a treatment option for metastatic anaplastic thyroid cancer with a *BRAF* mutation.[5] Tafinlar and Zelboraf are also treatment options for the treatment of iodine-refractory differentiated thyroid cancer (follicular, Hürthle cell, and papillary cancer subtypes) with a *BRAF V600* mutation.
- **Ovarian, Including Fallopian Tube and Primary Peritoneal Cancer:** Guidelines (version 1.2020 – March 11, 2020) recommend Mekinist among the targeted therapy options for recurrent low-grade serous disease.[6]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Mekinist. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Mekinist is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Melanoma.** Approve for 3 years if the patient meets BOTH of the following (A and B):
   - **A)** Patient has unresectable, advanced (including Stage III or Stage IV disease), or metastatic melanoma; AND
     Note: This includes adjuvant treatment in patients with Stage III disease with no evidence of disease post-surgery.
   - **B)** Patient has *BRAF V600* mutation-positive disease.

2. **Non-Small Cell Lung Cancer.** Approve for 3 years if the patient meets BOTH of the following (A and B):
   - **A)** Patient has *BRAF V600E* mutation-positive disease; AND
   - B) The agent is being used in combination with Tafinlar (dabrafenib capsules).

3. **Thyroid Cancer, Anaplastic.** Approve for 3 years if the patient meets ALL of the following (A, B, and C):
   - **A)** Patient has locally advanced or metastatic anaplastic disease; AND
   - **B)** Mekinist will be taken in combination with Tafinlar, unless intolerant; AND
   - **C)** Patient has *BRAF V600* mutation-positive disease.

Other Uses with Supportive Evidence

4. **Ovarian/Fallopian Tube/Primary Peritoneal Cancer**. Approve for 3 years if the patient meets the following criteria (A and B):

A) Patient has recurrent disease; AND
B) The medication is used for low-grade serous carcinoma.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Coverage of Mekinist is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Mektovi Prior Authorization Policy
- Mektovi® (binimetinib tablets – Array BioPharma)

REVIEW DATE: 07/15/2020

OVERVIEW
Mektovi, a kinase inhibitor, is indicated in combination with Braftovi® (encorafenib capsules) for treatment of unresectable or metastatic melanoma with a *BRAF V600E* or *V600K* mutation as detected by an FDA-approved test.[1]

Guidelines
Guidelines (version 3.2020 – May 18, 2020) recommend BRAF/MEK inhibitor combinations for first-line (preferred if clinically needed for early response) and subsequent treatment of metastatic or unresectable melanoma with a *V600* activating mutation.[2] While combination BRAF/MEK inhibition is preferred, if a combination is contraindicated, monotherapy with a BRAF inhibitor (Tafinlar® [dabrafenib capsules] or Zelboraf® [vemurafenib tablets]) is a recommended option, particularly if the patient is not a candidate for checkpoint immunotherapy. Following resection of limited metastatic disease with a *BRAF V600*-activating mutation, BRAF/MEK combination therapy is among the treatment options for patients with no evidence of disease. Tafinlar + Mekinist® (trametinib tablets) is also recommended in guidelines as adjuvant therapy (including for nodal recurrence) in some patients with Stage III disease, including use post-surgery or use after complete lymph node dissection. If unacceptable toxicity to Tafinlar/Mekinist, other BRAF/MEK combinations can be considered.

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of Mektovi. All approvals are provided the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Mektovi is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Melanoma.** Approve for 3 years if the patient meets ALL of the following (A, B, and C):
   C) Patient has unresectable, advanced, or metastatic melanoma; AND
   D) Patient has *BRAF V600* mutation-positive disease; AND
   E) Mektovi will be used in combination with Braftovi (encorafenib capsules).

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Coverage of Mektovi is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Nerlynx™ (neratinib tablets – Puma Biotechnology)

DATE REVIEWED: 09/25/2019; selected revision 03/04/2020

OVERVIEW
Nerlynx is indicated for the extended adjuvant treatment of adult patients with early-stage human epidermal growth factor receptor 2 (HER2) overexpressed/amplified (i.e., HER2 positive [HER2+]) breast cancer, to follow adjuvant trastuzumab -based therapy.[1] It is also indicated in combination with capecitabine for the treatment of adult patients with advanced or metastatic HER2-positive breast cancer who have received two or more prior anti-HER2-based regimens in the metastatic setting. Nerlynx is a kinase inhibitor that irreversibly binds to epidermal growth factor receptors (EGFR), HER2, and HER4. *In vitro* studies showed Nerlynx has antitumor activity in EGFR and/or HER2 expressing carcinoma cell lines.

Clinical Efficacy
The efficacy of Nerlynx was established in one Phase III, randomized, double-blind, placebo-controlled, multicenter, pivotal study (ExteNET, Extended Adjuvant Treatment of Breast Cancer with Neratinib) in women with early stage HER2+ breast cancer (n = 2,840).[1,2] Patients had completed adjuvant treatment

with Herceptin and were without evidence of recurrence. Placebo or Nerlynx was given continuously for 12 months. The ExteNET trial underwent multiple amendments, and was a time driven analysis rather than event driven. Invasive disease-free survival (iDFS) within 2 years and 28 days was 94.2% (95% confidence interval [CI]: 92.6%, 95.4%) on Nerlynx vs. 91.9% (95% CI: 90.2%, 93.2%) on placebo (stratified hazard ratio [HR] 0.66; 95% CI: 0.49, 0.90; P =0.008). In a prespecified exploratory subgroup analysis of iDFS, Nerlynx was more beneficial in patients with HR+ breast cancer (unstratified hazard ratio 0.49; 95% 0.31, 0.75) than in patients with HR-negative disease (unstratified hazard ratio 0.93; 95% CI: 0.60, 1.43). In another analysis after a median follow-up of 5.2 years (interquartile range 2.1-5.3), patients who received Nerlynx had significantly fewer iDFS events than those in the placebo group (116 vs. 163 events; stratified HR 0·73; 95% CI: 0.57, 0.92; P = 0.0083).[3] The 5-year iDFS survival was 90·2% (95% CI: 88.3%, 91.8%) in the Nerlynx group and 87·7% ((95% CI: 85.7%, 89.4%) in the placebo group.

An exploratory analysis was conducted to understand why the subgroup of patients with HR-negative disease did not show statistical significance for efficacy in the ExteNET trial.[5] It is hypothesized that the risk of disease recurrence is highest during the first 6 months following completion of trastuzumab therapy in patients with HR-negative, HER2+ disease; so the greatest benefit with Nerlynx would likely also be in this subgroup of patients completing trastuzumab within 6 months of initiating Nerlynx in the study. The 5-year iDFS for patients with interval 0 to 6 months between prior trastuzumab therapy and Nerlynx randomization in the study was 88.9% for Nerlynx and 86.1% for placebo (HR 0.73; 95% CI: 0.47, 1.14). For interval duration > 6 months, the iDFS for Nerlynx at 5 years was 88.7% compared with 92.7% for placebo (HR 1.52; 95% CI: 0.82, 2.88).

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on breast cancer (version 2.2020 – February 5, 2020) notes that Nerlynx can be considered as extended adjuvant therapy following adjuvant trastuzumab-containing therapy in patients with HR+, HER2+ disease with a perceived high risk of recurrence (such as Stage II or III breast cancer) [category 2A].[4] The benefits or toxicities associated with extended Nerlynx in patients who have received Perjeta is unknown. The guidelines do not include recommendations for using Nerlynx extended adjuvant therapy in patients with HR-negative, HER2+. For the treatment of recurrent or metastatic disease, Nerlynx + capecitabine is listed as a category 2B recommended option.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Nerlynx. Coverage with Nerlynx is recommended for 1 year (total) of a patient's lifetime.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Nerlynx is recommended in those who meet the following criteria:

FDA-Approved Indications

80. Breast Cancer – Adjuvant Therapy. Approve for 1 year (total) if the patient meets the following criteria (A and B):
- **A)** Patient has human epidermal growth factor receptor 2 (HER2)-positive breast cancer; AND
- **B)** The patient meets ONE of the following criteria (i or ii):

ii. The medication is requested for extended adjuvant therapy after the patient has completed 1 year of adjuvant therapy with trastuzumab intravenous products; OR

iii. The patient has tried adjuvant therapy with trastuzumab intravenous products and could not tolerate 1 year of therapy, according to the prescriber.

2. **Breast Cancer – Advanced or Metastatic Disease.** Approve for 3 years if the patient meets the following criteria (A, B, and C):
   A) The patient has human epidermal growth factor receptor 2 (HER-2)-positive breast cancer; AND
   B) The medication is used in combination with capecitabine; AND
   C) The patient has tried at least two prior anti-HER2 based regimens in the metastatic setting.
   Note: Examples include Perjeta (pertuzumab injection for intravenous use) + trastuzumab + docetaxel, Perjeta + trastuzumab + paclitaxel; Kadcyla (ado-trastuzumab emtansine for intravenous use), trastuzumab + capecitabine, Tykerb (lapatinib tablets) + capecitabine, trastuzumab + Tykerb.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Nerlynx has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

33. **Concurrent Use of Nerlynx with Other Medications for Adjuvant or Neoadjuvant Treatment of HER2-Positive Breast Cancer:** Nerlynx is not indicated in combination with other medications for adjuvant or neoadjuvant (preoperative) HER2 positive breast cancer (e.g., Herceptin, Perjeta). Studies are not available for this use. Patients with HR+ early breast can receive concurrent adjuvant endocrine therapy.[2]

34. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology - Nexavar® (sorafenib tablets – Bayer/Onyx)

DATE REVIEWED: 05/20/2020

OVERVIEW

Nexavar, a kinase inhibitor, is indicated for the treatment of patients with unresectable hepatocellular carcinoma (HCC), treatment of patients with advanced renal cell carcinoma (RCC), and for the treatment of patients with locally recurrent or metastatic, progressive, differentiated thyroid carcinoma (DTC) that is refractory to radioactive iodine treatment.[1] Nexavar decreases tumor cell proliferation *in vitro*, and was shown to inhibit multiple intracellular and cell surface kinases, several of which are thought to be involved in tumor cell signaling, angiogenesis, and apoptosis.

Guidelines

The National Comprehensive Cancer Network (NCCN) Compendium recommends Nexavar use for acute myeloid leukemia, for hepatobiliary cancer, kidney cancer, thyroid cancer, ovarian cancer, bone cancer, and soft tissue sarcoma.[2]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Nexavar. All approvals are provided for 3 years.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Nexavar is recommended in those who meet the following criteria:

FDA-Approved Indications

81. Renal Cell Carcinoma (RCC). Approve for 3 years in patients who meet the following criteria (A and B):
- **A)** The patient has relapsed or Stage IV clear cell histology RCC; AND
- **B)** The patient has tried at least one prior systemic therapy.
  Note: Examples include Inlyta (axitinib tablets), Votrient (pazopanib tablets), Sutent (sunitinib capsules), Cabometyx (cabozantinib tablets).

82. Differentiated (i.e. papillary, follicular, and Hürthle cell) Thyroid Carcinoma. Approve for 3 years if refractory to radioactive iodine therapy.

83. Hepatocellular Carcinoma (HCC), Unresectable. Approve for 3 years.

Other Uses with Supportive Evidence

~~84.~~ **Acute Myeloid Leukemia (AML).** Approve for 3 years if disease is *FLT3*-ITD mutation-positive as detected by an approved test.

85. Angiosarcoma. Approve for 3 years.

86. Chordoma. Approve for 3 years in patients with recurrent disease.

87. Desmoid Tumors (aggressive fibromatosis). Approve for 3 years.

88. Gastrointestinal Stromal Tumor (GIST). Approve for 3 years if the patient meets the following criteria (A, B, and C):
- **A)** Patient has previously tried imatinib (Gleevec® tablets, generics); AND
- **B)** Patient has previously tried Sutent (sunitinib capsules); AND
- **C)** Patient has previously tried Stivarga® (regorafenib tablets).

89. Medullary Thyroid Carcinoma. Approve for 3 years if the patient has tried Caprelsa® (vandetanib tablets) or Cometriq® (cabozantinib capsules).

90. Ovarian, Fallopian Tube, Primary Peritoneal Cancer. Approve for 3 years if the patient meets the following criteria (A and B):
- **A)** The patient has platinum-resistant disease; AND
- **B)** Nexavar is used in combination with topotecan.

91. Osteosarcoma. Approve for 3 years if the patient meets the following criteria (A and B):
- **C)** Patient has tried chemotherapy; AND
- **D)** Patient has relapsed/refractory or metastatic disease.

92. Solitary Fibrous Tumor and Hemangiopericytoma. Approve for 3 years.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Nexavar has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

35. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Nilutamide (Nilandron tablets – Concordia Pharmaceuticals Inc., generic)

DATE REVIEWED: 12/18/2019

OVERVIEW

Nilutamide, in combination with surgical castration, is indicated for the treatment of metastatic prostate cancer (Stage D_2).[1] For maximum benefit, nilutamide treatment must begin on the same day as or on the day after surgical castration.

GUIDELINES

The National Comprehensive Cancer Network (NCCN) guidelines for prostate cancer (version 4.2019 – August 19, 2019) recommend nilutamide in combination with luteinizing hormone-releasing hormone (LHRH) agonists [Lupron® (leuprolide for injection), Lupron Depot® (leuprolide acetate for depot suspension), Trelstar® (triptorelin pamoate for injectable suspension), Zoladex® (goserelin acetate implant), Vantas® (histrelin acetate subcutaneous implant)] with or without external beam radiation therapy for androgen deprivation therapy.[2,3]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of nilutamide tablets. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of nilutamide is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Prostate Cancer.** Approve for 3 years if nilutamide is used concurrently with a luteinizing hormone-releasing hormone (LHRH) agonist.
   Note: Examples are Lupron (leuprolide for injection), Lupron Depot (leuprolide acetate for depot suspension), Trelstar (triptorelin pamoate for injectable suspension), Zoladex (goserelin acetate implant), Vantas (histrelin acetate subcutaneous implant).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Nilutamide has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

36. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Ninlaro® (ixazomib capsules – Takeda)

DATE REVIEWED: 02/26/2020

OVERVIEW

Ninlaro is an oral proteasome inhibitor (PI) indicated in combination with Revlimid® (lenalidomide capsules) and dexamethasone for treatment of patients with multiple myeloma who have received at least one prior therapy.[1] Ninlaro should be taken once a week on the same day and at approximately the same time for the first 3 weeks of a 4-week cycle. There are dose modification guidelines which are recommended to manage treatment-related adverse events, including platelet count, absolute neutrophil count (ANC), and other toxicities (e.g., rash, peripheral neuropathy). Treatment should be continued until disease progression or unacceptable toxicity. Safety and efficacy is not established in patients < 18 years of age.

Disease Overview

Multiple myeloma is a cancer formed by malignant plasma cells.[5] Often there are no symptoms of disease until it reaches an advanced stage. The most common signs and symptoms include: bone problems (e.g., pain, bone weakness, broken bones), decreased blood counts, hypercalcemia, nervous system symptoms due to spinal cord compression, nerve damage, hyperviscosity, kidney problems, and infections. A monoclonal immunoglobulin (M protein) is produced by myeloma cells and may be found in the blood or excreted in the urine of patients with multiple myeloma. If symptoms are suggestive of multiple myeloma, a diagnosis is made based on blood and urine testing, bone x-rays, and a bone marrow biopsy. Ninlaro is a reversible inhibitor of the chymotrypsin-like activity of the 20S proteasome.[1] Cancer cells have higher levels of proteasome activity vs. normal cells, making cancer cells more sensitive to the effects of Ninlaro.[2]

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines, which address diagnosis, treatment, and follow-up for patients with multiple myeloma (version 2.2020 – October 9, 2019), list multiple therapeutic regimens that may be used for primary therapy and previously treated multiple myeloma.[6] Ninlaro/Revlimid/dexamethasone is an Other recommended regimen (transplant and non-transplant candidates). Maintenance with Ninlaro is also listed among the alternatives for transplant candidates. For previously treated disease, multiple regimens are listed, including Ninlaro/Revlimid/dexamethasone (Preferred), Ninlaro/cyclophosphamide/dexamethasone, Ninlaro/dexamethasone, and Ninlaro/Pomalyst/dexamethasone. NCCN guidelines for systemic light chain amyloidosis (version 1.2020, December 6, 2019) list Ninlaro ± dexamethasone among the treatment options for patients who have relapsed/refractory disease.[7] NCCN guidelines for Waldenstrom macroglobulinemia/lymphoplasmacytic lymphoma list Ninlaro/rituximab/dexamethasone among the treatment options for primary therapy.[8]

Safety

As a class, the PIs are distinct in their specificities and affinities; thus, safety profiles differ within the class. Looking at the Warnings/Precautions for the PIs, thrombocytopenia and embryofetal toxicity are a concern for all of these agents (Ninlaro, Velcade® [bortezomib injection], and Kyprolis® [carfilzomib intravenous

{IV} infusion]).[1,3-4] However, peripheral edema and cutaneous reactions are specific to Ninlaro, gastrointestinal toxicities and peripheral neuropathy are a concern for Ninlaro and Velcade, and hepatotoxicity is listed for Ninlaro and Kyprolis.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Ninlaro. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Ninlaro is recommended in those who meet the following criteria:

FDA-Approved Indications

93. Multiple Myeloma. Approve for 3 years if the patient meets at least ONE of the following conditions (A, B, or C):
- **91.** Ninlaro will be taken in combination with Revlimid (lenalidomide capsules) and dexamethasone; OR
- **92.** The patient has received at least ONE prior regimen for multiple myeloma.
  Note: Examples include regimens containing Velcade (bortezomib injection), Kyprolis (carfilzomib infusion), Revlimid (lenalidomide capsules), Darzalex (daratumumab injection).); OR
- **93.** The agent will be used following autologous stem cell transplantation (ASCT).

Other Uses with Supportive Evidence

94. Systemic Light Chain Amyloidosis. Approve for 3 years if the patient has tried at least one other regimen for this condition.
Note: Examples of agents used in other regimens include Velcade (bortezumab injection), Revlimid (lenalidomide capsules), cyclophosphamide, and melphalan.

95. Waldenstrom Macroglobulinemia/Lymphoplasmacytic Lymphoma. Approve for 3 years if used in combination with a rituximab product and dexamethasone.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Ninlaro has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

37. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Nubeqa Prior Authorization Policy
- Nubeqa (darolutamide tablets – Bayer HealthCare Pharmaceuticals Inc.)

REVIEW DATE: 08/26/2020

OVERVIEW
Nubeqa, an androgen receptor inhibitor, is indicated for the treatment of patients with non-metastatic, castration-resistant prostate cancer (nmCRPC).[1]

GUIDELINES
According to the National Comprehensive Cancer Network (NCCN) guidelines for prostate cancer, (version 2.2020 – May 21, 2020) for nmCRPC, androgen deprivation therapy (ADT) is continued to maintain castrate serum levels of testosterone (< 50 ng/dL).[2] Nubeqa, Erleada™ (apalutamide tablets) and Xtandi® (enzalutamide capsules) are all category 1 preferred regimens especially if the prostate specific antigen doubling time (PSADT) is ≤ 10 months. Observation is noted as an option especially if the PSADT is > 10 months.

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of Nubeqa. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Nubeqa is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Prostate Cancer – Non-Metastatic, Castration-Resistant.** Approve for 3 years if the patient meets the following criteria (A or B):
   A) The medication is used concurrently with a gonadotropin-releasing hormone (GnRH) analog; OR

Note: Examples are Lupron (leuprolide for injection), Lupron Depot (leuprolide acetate for depot suspension), Trelstar (triptorelin pamoate for injectable suspension), Zoladex (goserelin acetate implant), Firmagon (degarelix for injection), Vantas (histrelin acetate subcutaneous implant).

B) Patient has had a bilateral orchiectomy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Coverage of Nubeqa is not recommended in the following situations:

38. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Odomzo® (sonidegib capsules – Novartis)

REVIEW DATE: 10/16/2019

OVERVIEW
Odomzo, a hedgehog pathway inhibitor, is indicated for the treatment of adults with locally advanced basal cell carcinoma (BCC) that has recurred following surgery or radiation therapy, or those who are not candidates for surgery or radiation therapy.[1] It is an inhibitor of the hedgehog signaling pathway, where it binds to and inhibits Smoothened, a transmembrane protein involved in Hedgehog signal transduction.

Disease Overview
Localized BCC is most commonly treated with surgery or radiation therapy and is usually cured by local therapy.[2] Few options exist in the scenario of disease progression; however, hedgehog pathway inhibitors have provided another option for patients with advanced disease and in those who are not amenable to local therapy. The sonic hedgehog signaling pathway has emerged as playing a pivotal role in the parthenogenesis of BCC.[2] Mutations in the patched (PTCH) gene on chromosome 9q, which codes for the sonic hedgehog receptor, are the underlying cause of nevoid BCC syndrome, and are frequently present in sporadic BCC.

Guidelines
National Comprehensive Cancer Network (NCCN) guidelines for BCC (version 1.2019 – August 31, 2018) note that surgical approaches offer the most effective and efficient means for accomplishing a cure; radiation therapy may be chosen as the primary treatment in order to achieve optimal overall results.[2] For residual disease when surgery and radiation therapy are contraindicated and for recurrent disease with distant metastases, a hedgehog pathway inhibitor] or clinical trials should be considered.

Other Uses with Supportive Evidence

Although Odomzo is not indicated in metastatic BCC, the pivotal study enrolled adults with histologically confirmed metastatic basal cell carcinoma for which all existing treatment options had been exhausted.[1] In this study, an objective response was obtained by 15% of patients (n = 2/13) patients who were treated with Odomzo 200 mg.[3] In the 12-month analysis, response rates by central review were 7.7% and 17.4% in the Odomzo 200 mg and 800 mg groups, respectively. Disease control rate was 92% in patients treated with either dose of Odomzo. Guidelines for BCC list hedgehog pathway inhibitors (i.e., Erivedge, Odomzo) as treatment options for patients with metastatic BCC.[2]

Safety

Odomzo has a Boxed Warning stating that it may cause fetal harm when administered to a pregnant woman.[1] Pregnancy status should be verified prior to initiation of therapy. Female patients should use contraception during and for 24 months after the final dose. Male patients should use contraception to avoid exposure to a partner of childbearing potential during and for 8 months after the final dose.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Odomzo. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Odomzo is recommended in those who meet the following criteria:

FDA-Approved Indications

96. Basal Cell Carcinoma (BCC), Locally Advanced. Approve for 3 years if the patients meets ONE of the following conditions (A or B):

~~**94.**~~ Initial Therapy. Approve if the patient meets ONE of the following (i or ii):

- **i.** The patient's basal cell carcinoma has recurred following surgery or radiation therapy; OR
- **ii.** The patient meets BOTH of the following (a and b):
  - ~~**a)**~~ The patient is not a candidate for surgery; AND
  - ~~**b)**~~ According to the prescribing physician, the patient is not a candidate for radiation therapy.

95. Patients Currently Receiving Odomzo. Approve.

Other Uses with Supportive Evidence

97. Basal Cell Carcinoma (BCC), Metastatic. Approve for 3 years.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Odomzo has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

39. Basal Cell Carcinoma (Locally Advanced or Metastatic), in Patients with Disease Progression While on Erivedge (vismodegib capsules). [Note: This does not apply to patients already started on

Odomzo. Refer to criteria for BCC, Locally Advanced for Patients Currently Receiving Odomzo.] Results from an open-label study (n = 9) showed resistence to Odomzo in patients with advanced BCC who had progressed while taking Erivedge.[6] There are no data to support the use of Odomzo in patients who have experienced disease progression on Erivedge. Previous use of a hedgehog inhibitor was not allowed in the pivotal study for Odomzo.[3] Patients who develop resistance to one of the hedgehog pathway inhibitors are not expected to respond to another hedgehog pathway inhibitor.

40. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Pemazyre™ (pemigatinib tablets – Incyte Corporation)

DATE REVIEWED: 04/22/2020

OVERVIEW

Pemazyre is indicated for the treatment of adults with previously treated, unresectable locally advanced or metastatic cholangiocarcinoma with a fibroblast growth factor receptor 2 (FGFR2) fusion or other rearrangement as detected by an FDA-approved test.[1] This indication is approved under accelerated approval based on overall response rate and duration of response. Continued approval for this indication may be contingent upon verification and description of clinical benefit in a confirmatory trial(s).

Guidelines

Pemazyre is not addressed in the guidelines. According to the National Comprehensive Cancer Network (NCCN) hepatobiliary guidelines (version 1.2020 – March 23, 2020), for primary treatment of unresectable and metastatic disease, gemcitabine + cisplatin is the category 1 preferred regimen. Upon disease progression, FOLFOX is the preferred subsequent therapy regimen (category 2A). Other recommended regimens are FOLFIRI (category 2B) or Stivarga (regorafenib tablets) [category 2B]. For neurotrophic receptor tyrosine kinase (*NTRK*) gene fusion-positive tumors, Vitrakvi (larotrectinib capsules) and Rozlytrek (entrectinib capsules) are recommended (both category 2A); Keytruda (pembrolizumab for injection) is recommended for microsatellite instability high (MSI-H) and mismatch repair-deficient (dMMR) tumors (category 2A).

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of Pemazyre. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Pemazyre is recommended in those who meet the following criteria:

FDA-Approved Indications

16. Cholangiocarcinoma. Approve for 3 years if the patient meets the following criteria (A and B):
- **A)** The patient has unresectable locally advanced or metastatic disease with a fibroblast growth factor receptor 2 (*FGFR2*) fusion or other rearrangement, as detected by an approved test; AND
- **B)** The patient has been previously treated with at least one systemic therapy regimen.
  Note: Examples are gemcitabine + cisplatin, 5-fluorouracil + oxaliplatin or cisplatin, capecitabine + oxaliplatin or cisplatin, gemcitabine + Abraxane or capecitabine or oxaliplatin, FOLFOX (5-fluorouracil, leucovorin, and oxaliplatin).

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Pemazyre has not been shown to be effective or there are limited or preliminary data that are not supportive of general approval for the following conditions.

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES
3. Pemazyre™ tablets [prescribing information]. Wilmington, DE: Incyte Corporation; April 2020.
4. The NCCN Hepatobiliary Cancers Clinical Practice Guidelines in Oncology (Version 1.2020 – March 23, 2020). © 2020 National Comprehensive Cancer Network, Inc. Available at: http://www.nccn.org. Accessed on April 19, 2020.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Piqray® (alpelisib tablets – Novartis Pharmaceuticals Corporation)

DATE REVIEWED: 06/10/2020

OVERVIEW
Piqray is indicated in combination with fulvestrant injection for the treatment of postmenopausal women and men with hormone receptor (HR)-positive, human epidermal growth factor receptor 2 (HER2)-negative, phosphatidylinositol-3-kinase (*PIK3CA*)-mutated, advanced or metastatic breast cancer as detected by an FDA-approved test following progression on or after an endocrine-based regimen.[1] Patients treated with Piqray should have one or more *PIK3CA* mutations in tumor tissue or plasma specimens. If no mutation is detected in a plasma specimen, tumor tissue should be tested. Information on FDA-approved tests for the detection of *PIK3CA* mutations in breast cancer is available on the FDA website.[2]

Guidelines
The National Comprehensive Cancer Network (NCCN) guidelines on breast cancer (version 4.2020 – May 8, 2020) recommend Piqray, in combination with fulvestrant, as a preferred regimen (category 1) for *PIK3CA*-mutated tumors in postmenopausal or premenopausal patients (receiving ovarian ablation or suppression, if premenopausal) with HR+/HER2-negative, recurrent or Stage IV disease.[3] It is noted that

the safety of Piqray in patients with Type 1 or uncontrolled Type 2 diabetes has not been established. Other preferred regimens for HR+/HER2-negative disease include the following: fulvestrant, aromatase inhibitor (i.e., letrozole, anastrozole, exemestane) + CDK4/6 inhibitor (i.e., Ibrance® [palbociclib capsules], Kisqali® [ribociclib tablets], Verzenio™ [abemaciclib tablets]), fulvestrant + CDK4/6 inhibitor (all category 1), aromatase inhibitor monotherapy, tamoxifen or toremifene, exemestane + Afinitor® (everolimus tablets), fulvestrant + Afinitor, and tamoxifen + Afinitor (all category 2A). Of note, men with breast cancer are treated similarly to postmenopausal women.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Piqray. All approvals are provided for the duration noted below. In the clinical criteria, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: a woman is defined as an individual with the biological traits of a woman, regardless of the individual's gender identity or gender expression; men are defined as individuals with the biological traits of a man, regardless of the individual's gender identity or gender expression.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Piqray is recommended in those who meet the following criteria:

FDA-Approved Indications

17. Breast Cancer. Approve for 3 years if the patient meets the following criteria (A, B, C, D, E, and F):
- **A)** The patient meets one of the following criteria (i or ii):
  - **i.** The patient is a postmenopausal female* or a male*; OR
  - **ii.** The patient is premenopausal* and is receiving ovarian suppression with a gonadotropin-releasing hormone (GnRH) analog or has had surgical bilateral oophorectomy or ovarian irradiation.
    Note: Examples include Lupron/Lupron Depot (leuprolide acetate injectable suspension), Trelstar (triptorelin pamoate injectable suspension), Zoladex (goserelin acetate implant); AND
- **B)** The patient has advanced or metastatic hormone receptor (HR)-positive disease; AND
- **C)** The patient has human epidermal growth factor receptor 2 (HER2)-negative disease; AND
- **D)** The patient has *PIK3CA*-mutated breast cancer as detected by an approved test; AND
- **E)** The patient has progressed on or after at least one prior endocrine-based regimen; AND
  Note: Examples include anastrozole, letrozole, exemestane, tamoxifen, toremifene.
- **F)** Piqray will be used in combination with fulvestrant injection.

* Refer to Policy Statement

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Piqray has not been shown to be effective or there are limited or preliminary data that are not supportive of general approval for the following conditions.

3. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Pomalyst® (pomalidomide capsules – Celgene)

DATE REVIEWED: 04/01/2020; selected revision 05/27/2020

OVERVIEW
Pomalyst, a thalidomide analogue, is indicated for the treatment of multiple myeloma in combination with dexamethasone in adults who have received at least two prior therapies including Revlimid® (lenalidomide

capsules) and a proteasome inhibitor and have demonstrated disease progression on or within 60 days of completion of the last therapy.[1] Pomalyst is also indicated for the treatment of Acquired Immune Deficiency Syndrome (AIDS)-related Kaposi sarcoma in adults after failure of highly active antiretroviral therapy (HAART) or in patients with Kaposi sarcoma who are Human Immunodeficiency Virus (HIV)-negative.

Disease Overview

Multiple myeloma is a cancer formed by malignant plasma cells which are found in the bone marrow.[2] Normally, B cells responding to an infection change into plasma cells that make the antibodies to help the body attack and kill pathogens. In multiple myeloma, these plasma cells grow out of control and become cancerous. Often, there are no symptoms of disease until it reaches an advanced stage. The most common signs and symptoms include: bone problems (e.g., pain, bone weakness, broken bones), decreased blood counts (e.g., anemia, leukopenia, thrombocytopenia), hypercalcemia, nervous system symptoms due to spinal cord compression, nerve damage, hyperviscosity, kidney problems, and infections. A monoclonal immunoglobulin (M protein) is produced by myeloma cells and may be found in the blood or excreted in the urine of patients with multiple myeloma. Beta-2 microglobulin is another protein made by myeloma cells, with high levels associated with more advanced disease.

Kaposi's sarcoma is a multifocal malignancy that impacts endothelial cells which manifest with red or brown papules.[3] The skin is the site most commonly involved, but the oral mucosa, lymph nodes, and viscera may also be impacted.[4] The risk of Kaposi's sarcoma is very high among patients who are HIV-positive but is also more common in other patient populations with altered cellular immunity (e.g., patients who have undergone transplants).[3,4] Kaposi's sarcoma is usually associated with human herpes virus 8 (HHV-8) infection.[3] In patients with Kaposi's sarcoma related to HIV, HAART is the foundation of therapy.[4] For patients who do not attain an adequate response with HAART, Kaposi's sarcoma-specific systemic therapies include liposomal anthracyclines (doxorubicin) and paclitaxel which have led to response rates between 46% to 76%.[4] Patients who are not HIV-positive have a less established treatment course but cytotoxics are used. Local therapies are also utilized for patients with limited disease (e.g., Panretin® [alitretinoin gel 0.1%], imiquimod 5%, intralesional chemotherapy with vinblastine).[3,4]

Clinical Efficacy

An open-label, single-center, single-arm clinical trial evaluated the efficacy of Pomalyst in patients with Kaposi'sarcoma.[4] Among the 28 patients, 18 patients were HIV-positive and 10 patients were HIV-negative. Patients received Pomalyst 5 mg once daily (QD) on Days 1 through 21 of each 28 day cycle until disease progression or unacceptable toxicity. All patients who were HIV-positive continued HAART. At the time of enrollment, 75% of patients had advanced disease and 75% of patients had previously received chemotherapy. The overall response rate among all patients was 71%; overall response rates were 67% and 80% among HIV-positive and HIV-negative patients, respectively. The time to first response was approximately 2 months. The duration of response was approximately 1 year.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on multiple myeloma (version 3.2020 – March 10, 2020) include Pomalyst.[5] Pomalyst is recommended in various clinical regimens in varying scenarios and with different agents among patients with multiple myeloma that has been previously treated. It can be used as a monotherapy for patients who are steroid-intolerant.

The NCCN has guidelines regarding AIDS-related Kaposi Sarcoma (version 1.2020 – February 12, 2020).[3] Pomalyst is cited as the preferred subsequent system therapy option for relapsed/refractory therapy. First-line systemic therapy options include liposomal doxorubicin (preferred) and paclitaxel. Of note, the clinical

trial with Pomalyst used a dose of 5 mg QD. However, Pomalyst is provided as a 4 mg dose and the NCCN Panel believed that this dose is sufficient.

The NCCN has guidelines regarding Central Nervous System (CNS) Cancers (version 1.2020 – March 10, 2020).[6] Pomalyst is listed as a recommended regimen for patients with relapsed or refractory disease.

The NCCN has guidelines for systemic light chain amyloidosis (version 1.2020 – December 6, 2019).[7] The guidelines list Pomalyst plus dexamethasone as one of several treatment options for patients with previously treated disease.

Safety

Pomalyst has a Boxed Warning regarding embryofetal toxicity and venous arterial thromboembolism.[1] The availability of Pomalyst is through a restricted program called Pomalyst Risk Evaluation and Mitigation Strategy (REMS). Warnings and Precautions include hematologic toxicity, hepatotoxicity, hypersensitivity reactions, and tumor lysis syndrome.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Pomalyst. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Pomalyst is recommended in those who meet the following criteria:

FDA-Approved Indications

98. Multiple Myeloma. Approve for 3 years.

99. Kaposi Sarcoma. Approve for 3 years if the patient meets both of the following (A and B):
- **A)** The patient is ≥ 18 years of age; AND
- **B)** The patient meets one of the following (i or ii):
  - **i.** The patient is Human Immunodeficiency Virus (HIV)-negative; OR
  - **ii.** The patient meets both of the following (a and b):
    - **a)** The patient is Human Immunodeficiency Virus (HIV)-positive; AND
    - **b)** The patient continues to receive highly active antiretroviral therapy (HAART).

Other Uses with Supportive Evidence

100. Central Nervous System (CNS) Lymphoma. Approve for 3 years if the patient has relapsed or refractory disease.

101. Systemic Light Chain Amyloidosis. Approve for 3 years.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Pomalyst has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

41. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Qinlock™ (ripretinib tablets – Deciphera Pharmaceuticals, LLC)

REVIEW DATE: 05/20/2020

OVERVIEW

Qinlock, a kinase inhibitor, is indicated for the treatment of adult patients with advanced gastrointestinal stromal tumor (GIST) who have received prior treatment with three or more kinase inhibitors, including imatinib. Qinlock inhibits KIT proto-oncogene receptor tyrosine kinase (KIT) and platelet derived growth factor receptor A (PDGFRA) kinase including wild type, primary, and secondary mutations.

Guidelines

According to the National Comprehensive Cancer Network (NCCN) soft tissue sarcoma guidelines (version 2.2020 – May 28, 2020), Qinlock is recommended as a "Preferred Regimen" for fourth-line therapy for unresectable or metastatic disease, after progressive disease on imatinib, Sutent (sunitinib tablets), and Stivarga (regorafenib tablets). Imatinib is a category 1 recommended option for primary treatment. Ayvakit™ (avapritinib tablets) is recommended first-line for platelet-derived growth factor receptor alpha (*PDGFRA*) exon 18 mutation, including *PDGFRA* D842V mutations. Upon disease progression on imatinib, Sutent is a category 1 recommended option. For disease progression on Sutent, Stivarga is the recommended option (category 1). Based on limited data, the guidelines recommend other small molecule inhibitors such as Nexavar® (sorafenib tablets), Votrient® (pazopanib tablets), Tasigna® (nilotinib tablets), Ayvakit, and everolimus + TKI (all category 2A) as "useful in certain circumstances" as fourth-line therapy for unresectable or metastatic disease.

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of Qinlock. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Qinlock is recommended in thse who meet the following criteria:

FDA-Approved Indications

18. Gastrointestinal stromal tumor (GIST). Approve for 3 years if the patient meets the following criteria (A, B, and C):
- **A)** The patient has advanced GIST; AND
- **B)** The patient has been previously treated with imatinib; AND
- **C)** The patient has been previously treated with at least two other kinase inhibitors, in addition to imatinib.
  Note: Examples of kinase inhibitors are Sutent (sunitinib capsules), Stivarga (regorafenib tablets), Nexavar (sorafenib tablets), Votrient (pazopanib tablets), Tasigna (nilotinib capsules), Sprycel (dasatinib tablets).

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Qinlock has not been shown to be effective or there are limited or preliminary data that are not supportive of general approval for the following conditions.

4. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

8. Qinlock™ tablets [prescribing information]. Waltham, MA: Deciphera Pharmaceuticals, LLC; May 2020.
9. The NCCN Soft Tissue Sarcoma Clinical Practice Guidelines in Oncology (Version 1.2020 – May 15, 2020). © 2020 National Comprehensive Cancer Network, Inc. Available at: http://www.nccn.org. Accessed on May 15, 2020.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Retevmo™ (selpercatinib capsules – Eli Lilly and Company)

DATE REVIEWED: 05/13/2020

OVERVIEW
Retevmo, a kinase inhibitor, is indicated for the treatment of:
1. Adult patients with metastatic *RET* fusion-positive non-small cell lung cancer (NSCLC);[1]
2. Adult and pediatric patients ≥ 12 years of age with advanced or metastatic *RET*-mutant medullary thyroid cancer who require systemic therapy;

3. Adult and pediatric patients ≥ 12 years of age with advanced or metastatic *RET* fusion-positive thyroid cancer who require systemic therapy and who are radioactive iodine-refractory (if radioactive iodine is appropriate).

Guidelines

Retevmo is not addressed in the guidelines. The National Comprehensive Cancer Network (NCCN) non-small cell lung cancer guidelines (version 3.2020 – February 11, 2020) recommend Cometriq (cabozantinib capsules) and Caprelsa (vandetanib tablets) for *RET* rearrangements.[2]

Retevmo is not addressed in the guidelines. The National Comprehensive Cancer Network (NCCN) thyroid carcinoma guidelines (version 2.2019 – September 16, 2019) recommend Cometriq (cabozantinib capsules) and Caprelsa (vandetanib tablets) for germline *RET* proto-oncogene mutations in locoregional, asymptomatic or symptomatic medullary carcinoma that is recurrent or persistent (both category 1, preferred).[3]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Retevmo. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Retevmo is recommended in those who meet the following criteria:

FDA-Approved Indications

19. Non-Small Cell Lung Cancer (NSCLC). Approve for 3 years if the patient meets the following criteria (A and B):
- **A)** The patient has metastatic disease; AND
- **B)** The tumor is *RET* fusion-positive.

2. **Medullary Thyroid Cancer.** Approve for 3 years if the patient meets the following criteria (A, B, and C):
   Note: For other types of thyroid cancer see criteria below for "Thyroid Cancer".
   A) The patient is greater than or equal to 12 years of age; AND
   B) The patient has advanced or metastatic *RET*-mutant disease; AND
   C) The disease requires treatment with systemic therapy.

3. **Thyroid Cancer.** Approve for 3 years if the patient meets the following criteria (A, B, C, and D):
   Note: For "Medullary Thyroid Cancer" see above criteria.
   A) The patient is greater than or equal to 12 years of age; AND
   B) That patient has advanced or metastatic *RET* fusion-positive disease; AND
   C) The disease is radioactive iodine-refractory (if radioactive iodine is appropriate); AND
   D) The disease requires treatment with systemic therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Retevmo has not been shown to be effective or there are limited or preliminary data that are not supportive of general approval for the following conditions.

5. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Revlimid® (lenalidomide capsules – Celgene)

DATE REVIEWED: 04/01/2020

OVERVIEW
Revlimid, a thalidomide analogue, is indicated in combination with dexamethasone for the treatment of patients with multiple myeloma.[1] It is also indicated as maintenance therapy in patients with multiple myeloma following autologous hematopoietic stem cell transplantation (auto-HSCT). Revlimid is also indicated for the treatment of patients with transfusion-dependent anemia due to low- or intermediate-1-risk myelodysplastic syndromes (MDS) associated with a 5q cytogenetic abnormality with or without additional cytogenetic abnormalities. Revlimid is also indicated for the treatment of patients with mantle cell lymphoma whose disease has relapsed or progressed after two prior therapies, one of which included Velcade® (bortezomib injection). Revlimid is indicated in combination with a rituximab product for the treatment of adults with previously treated follicular lymphoma. Revlimid is indicated in combination with a rituximab product for the treatment of adults with previously-treated marginal zone lymphoma. A

limitation of use with Revlimid is that it is not indicated and is not recommended for the treatment of patients with chronic lymphocytic leukemia (CLL) outside of controlled clinical trials.

Guidelines
The NCCN guidelines for acquired immune deficiency syndrome (AIDS)-Related Kaposi Sarcoma (version 1.2020 – February 12, 2020) recommended Revlimid as an Other Recommended Regimen for subsequent systemic therapy options for relapsed/refractory therapy.[2] First-line systemic therapy options include liposomal doxorubicin (preferred), and paclitaxel. Other subsequent systemic therapy options for relapsed/refractory therapy are also cited (e.g., Pomalyst® [pomalidomide capsules] {preferred}, Thalomid® [thalidomide capsules], imatinib).

The National Comprehensive Cancer Network (NCCN) guidelines for B-Cell Lymphomas (version 1.2020 – January 22, 2020) discuss therapeutic options for mantle cell lymphoma.[3] Revlimid, in combination with rituximab, is recommended as a preferred less-aggressive induction therapy (category 2A). Revlimid with or without rituximab is recommended as a preferred second-line therapy (Category 2A). Other recommended second line therapy regimens include Imbruvica, Revlimid, plus rituximab. The NCCN guidelines cited many treatments and medications regimens for mantle cell lymphoma in various clinical scenarios.

The NCCN guidelines for multiple myeloma (version 3.2020 – March 10, 2020) recommend Revlimid in a variety of scenarios.[4] Revlimid is use in various regimens and Revlimid combined with low-dose dexamethasone is cited as a Category 1 agent for primary therapy for non-transplant candidates. As a maintenance therapy, Revlimid also has a Category 1 recommendation. Revlimid, combined with other agents, is also part of a category 1 recommended therapy (preferred) for previously treated multiple myeloma.

The NCCN guidelines for MDS (version 2.2020 – February 28, 2020) recommend Revlimid in a variety of clinical scenarios among patients with symptomatic anemia both with and without 5q deletion abnormalities.[5]
The NCCN guidelines for B-Cell Lymphomas (version 1.2020 – January 22, 2020) recommend Revlimid as an option as subsequent therapy, with or without rituximab, for multi-centric Castleman's disease that has progressed after treatment of relapsed/refractory or progressive disease.[3]

NCCN guidelines for B-Cell Lymphomas (version 1.2020 – January 22, 2020) discuss therapeutic options for diffuse large B-cell lymphoma.[3] Revlimid, with or without rituximab, is mentioned as a second-line therapy. Many examples of first-line therapies are recommended (e.g., RCHOP [Rituximab cyclophosphamide, doxorubicin, vincristine, prednisone] {Category 1}, dose-adjusted EPOCH [etoposide, prednisone, vincristine, cyclophosphamide, doxorubicin] + rituximab {Category 2A}). One examples of a first-line therapy for patients with poor left ventricular function or in those who are frail include RCEPP (rituximab, cyclophosphamide, etoposide, prednisone, procarbazine). NCCN also recommends optional first-line consolidation therapy of Revlimid maintenance (Category 2B) for patients aged 60 to 80 years.

NCCN guidelines for B-Cell Lymphomas (version 1.2020 – January 22, 2020) discuss therapeutic options for follicular lymphoma.[3] Revlimid plus rituximab is a first-line recommended therapy (Category 2A). Many second-line and subsequent therapies are listed, which include Revlimid, with or without rituximab.

The NCCN Hodgkin Lymphoma clinical practice guidelines (version 1.2020 – January 30, 2020) recommend Revlimid as an additional therapy option for treatment of classical Hodgkin lymphoma as a single agent for refractory or relapsed disease.[6]

The NCCN guidelines for B-Cell Lymphomas (version 1.2020 – January 22, 2020) discuss marginal zone lymphomas.[3] Revlimid plus rituximab has a Category 2B recommendation for first-line therapy. Revlimid with or without rituximab is also recommended as a second-line and subsequent therapy.

The NCCN has guidelines regarding myeloproliferative neoplasms (version 2.2019 – October 29, 2018) that discuss myelofibrosis with related anemia.[7] Revlimid is recommended, with or without prednisone, for patients with serum epoetin alfa levels > 500 mU/mL.

The NCCN guidelines for T-Cell Lymphomas (version 1.2020 – January 6, 2020) makes several recommendations that include Revlimid.[8] For peripheral T-cell lymphomas, Revlimid is recommended as second-line and subsequent therapy as a monotherapy. Similarily, Revlimid is recommended as a second-line and subsequent therapy for adult T-cell leukemia/lymphoma.

NCCN guidelines for systemic light chain amyloidosis (version 1.2020 – December 6, 2019) cite Revlimid as a therapeutic option used in combination with other agents in several clinical scenarios, including newly diagnosed disease.[9] The NCCN guidelines state that Phase II studies have noted that Revlimid in combination with dexamethasone is active in the treatment of patients with systemic light chain amyloidosis, including patients with relapsed/refractory disease.

The NCCN guidelines for Central Nervous System (CNS) Cancers (version 1.2020 – March 10, 2020) recommend Revlimid, with or without rituximab, as one of the options for patients with relapsed or refractory disease.[10]

Safety

In a prospective randomized clinical study in the first-line treatment of patients with CLL, use of Revlimid as a single agent increased the risk of death compared with chlorambucil given as a single agent.[1] The trial was stopped for safety in July 2013. In an interim analysis, 34 deaths occurred in 210 patients in the Revlimid treatment arm compared with 18 deaths among the 211 patients in the chlorambucil treatment arm (hazard ratio for overall survival was 1.92 [95% confidence interval {CI}: 1.08, 3.41]), which was consistent with a 92% increase in the risk of death. Also, serious adverse cardiovascular (CV) events, including atrial fibrillation, myocardial infarction, and cardiac failure, occurred more frequently in patients receiving Revlimid. Revlimid has a Boxed Warning regarding embryofetal toxicity, hematologic toxicity, and venous thromboembolism. Revlimid is only available through a restricted distribution program called the Revlimid Risk Evaluation Mitigation Strategy (REMS®). Males and females must follow the required reproductive precautions.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Revlimid. All approvals are provided for 3 years in duration.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Revlimid is recommended in those who meet the following criteria:

FDA-Approved Indications

102. Follicular Lymphoma. Approve for 3 years if the patient meets one of the following (A or B):
- **A)** The patient is using Revlimid in combination with rituximab; OR
- **B)** The patient has tried at least one prior therapy.
  Note: Examples include Treanda® (bendamustine injection) plus rituximab; Treanda plus Gazyva® (obinutuzumab injection for intravenous use); CHOP (cyclophosphamide, doxorubicin, vincristine, prednisone) plus Gazyva or rituximab; CVP (cyclophosphamide, vincristine, prednisone) plus Gazyva or rituximab; chlorambucil with or without rituximab; cyclophosphamide with or without rituximab; Gazyva; Copiktra™ (duvelisib capsules); Aliqopa® (copanlisib injection for intravenous use); or Zydelig® (idelalisib capsules).

103. Mantle Cell Lymphoma. Approve for 3 years.

104. Marginal Zone Lymphoma. Approve for 3 years.

105. Multiple Myeloma. Approve for 3 years.

106. Myelodysplastic Syndrome (MDS). Approve for 3 years if the patient meets ONE of the following (A, B, or C):
- **A)** The patient has symptomatic anemia; OR
- **B)** The patient has transfusion-dependent anemia; OR
- **C)** The patient has anemia that is not controlled with an erythroid stimulating agent (ESA) [e.g., Epogen®/Procrit® {epoetin alfa injection}, Aranesp® {darbepoetin alfa injection}].

Other Uses with Supportive Evidence

107. Acquired Immune Deficiency Syndrome (AIDS)-Related Kaposi's Sarcoma. Approve for 3 years if the patient meets the following (A and B):
A) The patient has tried at least one regimen or therapy; AND
B) The patient has relapsed or refractory disease.
Note: Examples include liposomal doxorubicin, paclitaxel, Pomalyst® (pomalidomide capsules), Thalomid® [thalidomide capsules], and imatinib.

108. Castleman's Disease. Approve for 3 years in patients with relapsed/refractory or progressive disease.

109. Central Nervous System (CNS) Cancer (Primary). Approve for 3 years if according to the prescriber the patient has relapsed or refractory disease.

110. Diffuse, Large B Cell Lymphoma (DLBCL) [Non-Hodgkin's Lymphoma]. Approve for 3 years if the patient has tried at least one prior therapy
Note: Examples include RCHOP (rituximab, cyclophosphamide, doxorubicin, vincristine, predisone); dose-adjusted EPOCH (etoposide, prednisone, vincristine, cyclophosphamide, doxorubicin) + rituximab; RCEPP (rituximab, cyclophosphamide, etoposide, prednisone, procarbazine); DHAP (dexamethasone, cisplatin, cytarabine) ± rituximab; ICE (Ifex, carboplatin, etoposide) ± rituximab; or Treanda ± rituximab.

111. Hodgkin Lymphoma, Classical (nodular sclerosis, mixed cellularity, lymphocyte depleted, and lymphocyte-rich subtypes of Hodgkin lymphoma). Approve for 3 years in patients with relapsed or refractory disease.

112. Myelofibrosis. Approve for 3 years if the patient meets the following criteria (A and B):
A) According to the prescriber the patient has anemia; AND
B) The patient has serum erythropoietin levels ≥ 500 mU/mL.

113. Peripheral T-Cell Lymphomas. Approve for 3 years if the patient has tried at least one other therapy or regimen.
Note: Examples of therapies or regimens include Beleodaq® (belinostat injection for intravenous infusion); Adcetris® (brentuximab vedotin injection for intravenous use); DHAP (dexamethasone, cisplatin, cytarabine); ESHAP (etoposide, methylprednisolone, cytarabine, cisplatin); GDP (gemcitabine, dexamethasone, cisplatin); GemOX (gemcitabine, oxaliplatin); ICE (ifosfamide, carboplatin, etoposide); or Istodax® (romidepsin injection for intravenous infusion). Indications regarding peripheral T-cell lymphomas include peripheral T-cell lymphoma not otherwise specified (PTCL-NOS), angioimmunoblastic T-cell lymphoma (AITL); enteropathy-associated T-cell lymphoma (EATL); monomorphic epitheliotropic intestinal T-cell lymphoma (MEITL); nodal peripheral T-cell lymphoma (nodal PTCL) with TFH phenotype (TFH); follicular T-cell lymphoma (FTCL); and hepatosplenic gamma-delta T-cell lymphomas.

114. Systemic Light Chain Amyloidosis. Approve for 3 years.

115. T-Cell Leukemia/Lymphoma. Approve for 3 years if the patient has tried at least one other therapy or regimen.

Note: Examples include Adcetris® (brentuximab vedotin injection for intravenous use) plus CHP (cyclophosphamide, doxorubicin, and prednisone); CHOP (cyclophosphamide, doxorubicin, vincristine, and prednisone); CHOEP (cyclophosphamide, doxorubicin, vincristine, etoposide, and prednisone); dose-adjusted EPOCH (etoposide, prednisone, vincristine, cyclophosphamide, and doxorubicin); HyperCVAD (cyclophosphamide, vincristine, doxorubicin, and dexamethasone) alternating with high-dose methotrexate and cytarabine; or Beleodaq® (belinostat injection for intravenous infusion).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Revlimid has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

42. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Rozlytrek Prior Authorization Policy

- Rozlytrek™ (entrectinib capsules – Genentech)

REVIEW DATE: 08/26/2020

OVERVIEW

Rozlytrek, a kinase inhibitor, is indicated for the following uses:[1]

- **Non-small cell lung cancer (NSCLC)**, for the treatment of adults with metastatic ROS1-positive disease.
- **Solid tumors**, treatment of adult and pediatric patients ≥ 12 years of age that a) have a neurotrophic tyrosine receptor kinase (*NTRK*) gene fusion without a known acquired resistance mutation, b) are metastatic or where surgical resection is likely to result in severe morbidity, and c) have either progressed following treatment or have no satisfactory alternative therapy.

Guidelines

The National Comprehensive Cancer Network (NCCN) Compendium recommends the use of Rozlytrek for *NTRK* gene fusion-positive tumors in the following disease states:[2] pancreatic cancer, colon and rectal cancer, breast cancer, cutaneous melanoma, cervical cancer, squamous cell carcinoma, endometrial cancer, uterine sarcoma, several types of soft tissue sarcoma, hepatocellular/biliary tract/gallbladder carcinoma, brain metastases, NSCLC, ovarian cancer, salivary gland tumors, esophageal/esophagogastric junction cancers, gastric cancer, and thyroid cancer. It is also recommended for ROS1 rearrangement-positive NSCLC. Rozlytrek is a category 2A recommendation for most cancers.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Rozlytrek. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Rozlytrek is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Solid Tumors.** Approve for 3 years if the patient meets the following criteria (A, B, C, and D):
   - **A)** Patient is ≥ 12 years of age; AND
   - **B)** Patient's tumor has neurotrophic receptor tyrosine kinase (*NTRK*) gene fusion without a known acquired resistance mutation; AND
   - **C)** Patient meets one of the following criteria (i or ii):
     - **i.** The tumor is metastatic; OR
     - **ii.** Surgical resection of tumor will likely result in severe morbidity; AND
   - **D)** Patient meets one of the following criteria (i or ii):
     - **i.** Patient has progressed following treatment; OR
     - **ii.** There are no satisfactory alternative therapies.

2. **Non-Small Cell Lung Cancer.** Approve for 3 years if the patient has *ROS1*-positive metastatic disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Rozlytrek is not recommended in the following situations:

43. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Rubraca™ (rucaparib tablets – Clovis Oncology)

DATE REVIEWED: 02/19/2020; 05/27/2020 selected revision

OVERVIEW

Rubraca, a poly (ADP-ribose) polymerase (PARP) inhibitor, is indicated[1]:

A) For the **treatment** of adult patients with deleterious *BReast CAncer (BRCA)* mutation (germline and/or somatic) associated epithelial **ovarian, fallopian tube, or primary pertitoneal cancer** who have been treated with two or more chemotherapies;

B) For the **maintenance treatment** of adult patients with recurrent **epithelial ovarian, fallopian tube, or primary peritoneal cancer** who are in a complete or partial response to platinum-based chemotherapy;

C) Treatment of adult patients with a deleterious *BRCA* mutation (germline and/or somatic)-associated **metastatic castration-resistant prostate cancer** (mCRPC) who have been treated with androgen receptor-directed therapy and a taxane-based chemotherapy.

Guidelines

According to the National Comprehensive Cancer Network (NCCN) guidelines for ovarian cancer (version 3. 2019 – November 26, 2019), therapy options for patients with recurrent disease are primarily dependent on whether the patient is considered platinum-resistant or platinum-sensitive (patients who relapse ≥ 6 months after initial chemotherapy).[3] NCCN Panel recommends single-agent Rubraca as recurrence therapy for patients with platinum-sensitive or platinum-resistant ovarian cancer that has been treated with two or more lines of chemotherapy and have *BRCA* mutations. The Panel feels that Rubraca is preferred for patients with platinum-resistant disease, because there are fewer good options for this setting. In patients with platinum-sensitive disease who have completed two or more lines of platinum-based therapy and are in a partial or complete response, bevacizumab can be continued as maintenance therapy; or Zejula™ (niraparib capsules), Lynparza™ (olaparib tablets), or Rubraca can be considered as maintenance therapy options (all category 2A).

The NCCN prostate cancer guidelines (version 2.2020 – May 21, 2020) recommend Rubraca for *BRCA1* or *BRCA2* mutation (germline and/or somatic) for its FDA-approved use in mCRPC, either as second-line or subsequent therapy (category 2A). It is listed under "useful in certain circumstances". The guidelines note that if the patient is not fit for chemotherapy, Rubraca can be considered even if taxane-based therapy has not been given.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Rubraca. All approvals are provided for 3 years in duration unless otherwise noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Rubraca is recommended in those who meet the following criteria:

FDA-Approved Indications

116. Ovarian, Fallopian Tube, or Primary Peritoneal Cancer – Treatment.
- **A)** Initial Therapy. Approve for 3 years if the patient meets the following criteria (i and ii):
  - **i.** The patient has a *BRCA*-mutation (germline or somatic) as confirmed by an approved test; AND
  - **ii.** The patient has progressed on two or more prior lines of chemotherapy.
- **B)** Patient is Currently Receiving Rubraca. Approve for 3 years if the patient has a *BRCA* mutation (germline or somatic) as confirmed by an approved test.

2. Ovarian, Fallopian Tube, or Primary Peritoneal Cancer –Maintenance Therapy. Approve for 3 years if the patient is in complete or partial response after at least two platinum-based chemotherapy regimens.
Note: Examples are carboplatin with gemcitabine, carboplatin with paclitaxel, cisplatin with gemcitabine.

3. Prostate Cancer – Castration-Resistant. Approve for 3 years if the patient meets the following criteria (A, B, C, and D):
- **A)** The patient has metastatic disease that is *BRCA*-mutation positive (germline and/or somatic); AND
- **B)** The patient meets one of the following criteria (i or ii):
  - **i.** The medication is used concurrently with a gonadotropin-releasing hormone (GnRH) analog.
    Note: Examples are Lupron (leuprolide for injection), Lupron Depot (leuprolide acetate for depot suspension), Trelstar (triptorelin pamoate for injectable suspension), Zoladex (goserelin acetate implant), Vantas (histrelin acetate subcutaneous implant), Firmagon (degarelix for injection); OR
  - **ii.** The patient has had a bilateral orchiectomy; AND
- **C)** The patient has been previously treated with at least one androgen receptor-directed therapy.
  Note: Examples are abiraterone, Xtandi (enzalutamide tablets), Yonsa® (abiraterone acetate tablets); AND
- **D)** The patient meets one of the following criteria (i or ii):
  - **i.** The patient has been previously treated with at least one taxane-based chemotherapy.
    Note: Examples are docetaxel, cabazitaxel; OR
  - **ii.** The patient is not a candidate or is intolerant to taxane-based chemotherapy, according to the prescriber.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Rubraca has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

44. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Rydapt® (midostaurin capsules – Novartis)

DATE REVIEWED: 02/05/2020

OVERVIEW
Rydapt is a tyrosine kinase inhibitor (TKI) indicated in combination with standard cytarabine + daunorubicin induction and cytarabine consolidation chemotherapy, for the treatment of adults with newly diagnosed acute myeloid leukemia (AML) who are FMS-like tyrosine kinase 3 (*FLT3*) mutation-positive, as detected by an FDA-approved test.[1] Rydapt is not indicated as a single-agent induction therapy for the treatment of patients with AML. Rydapt is also indicated for the treatment of adults with aggressive systemic mastocytosis (ASM), systemic mastocytosis with associated hematological neoplasm (SM-AHN), or mast cell leukemia (MCL).

AML
FLT3 Mutation
The prognosis of AML is worse for patients with *FLT3* mutations which comprise approximately 30% to 40% of AML cases.[4] Two major classes of activating *FLT3* mutations have been identified in patients with AML which include the ITD and TKD point mutations. *FLT3*/ITD mutations occur in approximately 30% of cases and are more common than *FLT3*/TKD mutations, which occur in approximately 10% of patients.

General Treatment of AML
Treatment of acute leukemia is divided into induction chemotherapy and post-remission (consolidation) therapy.[4] Most initial treatment decisions for AML are based on age (≥ 60 years of age vs. < 60 years of age), history of prior myelodysplasia or cytotoxic therapy, and performance status. The standard induction chemotherapy used for the treatment of AML (in patients < 60 years of age) consists of cytarabine and an anthracycline (either daunorubicin or idarubicin) administered via intravenous infusion (IV) infusion; Rydapt is the first oral targeted therapy indicated for *FLT3*-mutated AML. Many different therapies are recommended.

Guidelines
The Comprehensive Cancer Network (NCCN) guidelines on AML (version 3.2020 – December 23, 2019), recommend Rydapt + IV chemotherapy among the treatment options for induction, re-induction, and post-remission therapy.[4] For treatment indication for patients < 60 years of age, a recommended regimen includes standard-dose cytarabine (200 mg/m^2 continuous infusion) x 7 days + daunorubicin (60 mg/m^2) x 3 days + Rydapt (50 mg Q12H) on Days 8 to 21 in FLT3-mutated AML (category 2A). It was noted that while Rydapt was not FDA-approved for maintenance therapy, the pivotal trial was designed for

consolidation and maintenance Rydapt for a total of 12 months. After standard-dose cytarabine induction/re-induction in patients < 60 years of age, treatment is based on the results of follow-up bone marrow biopsy. In patients with significant residual disease without hypocellular marrow a recommended regimen includes standard-dose cytarabine + daunorubicin + Rydapt. In patients with significant cytoreduction, the guidelines recommend various regimens including standard-dose cytarabine + daunorubicin + Rydapt. In patients < 60 years of age with intermediate-risk cytogenetics and/or molecular abnormalities, or treatment-related disease other than core binding factor and/or poor risk cytogenetics and/or molecular abnormalities, an option cited is high-dose cytarabine (HiDAC) 1.5 to 3 g/m^2 over 3 hours once every 12 hours on Days 1, 3, 5, or 1, 2, 3 with Rydapt 50 mg once every 12 hours on Days 8 to 21 (FLT3-mutatated AML. Patients ≥ 60 years of age who are candidates for intensive remission induction therapy, for those with intermediate risk cytogenetics and FLT3 mutant, cytarabine + daunorubicin _ In patients ≥ 60 years of age, after standard-dose cytarabine one of the recommended regimens is standard-dose cytarabine + daunorubicin + Rydapt. Post-remission therapy in patients ≥ 60 years of age is based on the type of prior therapy received. For patients who previously received intensive therapy, and who are in remission with a complete response one cited regimens includes intermediate-dose cytarabine + Rydapt.

Systemic Mastocytosis (SM)

Mastocytosis describes a rare group of disorders that are caused by too many mast cells in the body.[4-10] c-Kit mutations are implicated in some types of mastocytosis, including SM.[9] There are four major subtypes of SM: indolent SM (ISM), SM-AHN, ASM, and MCL.[8]

The prognosis of ASM is highly variable, with a median survival of 3.5 to 7 years depending on the study. The only definitive therapy for ASM remains hematopoietic stem cell transplant (HSCT).[7] In general, the prognosis and treatment of SM-AHN is governed by the associated hematologic disorder while controlling the symptoms of mastocytosis. In SM-AHN, HSCT confers the greatest survival benefit in all forms of advanced SM, with a 3-year survival probability of 74% according to a large global retrospective study. The prognosis of SM-AHN remains poor, with a median survival estimated to be 2 to 4.4 years, depending on the study. MCL is by far the most aggressive form of SM, with median survival of approximately 6 months. HSCT offers a potentially curative role in appropriate patients with MCL, yet reports have failed to demonstrate reproducible evidence of durable eradication of the disease.

The NCCN has guidelines for systemic mastocytosis (version 2.2019 – September 20, 2018).[11] Rydapt is recommended for the treatment of aggressive systemic mastocytosis (category 2A), for the treatment of systemic mastocytosis with an associated hematologic neoplasm (category 2A), and for mast cell leukemia (category 2A).

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Rydapt. Because of the specialized skills required for evaluation and diagnosis of patients treated with Rydapt approval requires Rydapt to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for 3 years.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Rydapt is recommended in those who meet the following criteria:

FDA-Approved Indications

117. Acute Myeloid Leukemia (AML). Approve for 3 years if the patient meets the following criteria (A and B)
- **A)** The patient is *FLT3*-mutation positive AML as detected by an approved test; AND
- **B)** The patient is receiving Rydapt in one of the following settings (i, ii, iii, or iv):
  - **i.** Induction therapy in combination with cytarabine and daunorubicin; OR
  - **ii.** After standard-dose cytarabine induction/reinduction, along with cytarabine and daunorubicin; OR
  - **iii.** Post remission or consolidation therapy in combination with cytarabine; OR
  - **iv.** Maintenance therapy.

118. Aggressive Systemic Mastocytosis (ASM). Approve for 3 years.

119. Systemic Mastocytosis Associated with Acute Hematologic Neoplasm (SM-AHN). Approve for 3 years.

120. Mast Cell Leukemia (MCL). Approve for 3 years.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Rydapt has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

45. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Sprycel® (dasatinib tablets – Bristol-Myers Squibb)

DATE REVIEWED: 04/01/2020

OVERVIEW

Sprycel, a tyrosine kinase inhibitor (TKI), is indicated for the treatment of adults with: newly diagnosed Philadelphia chromosome-positive (Ph+) chronic myeloid leukemia (CML) in chronic phase (CP); chronic, accelerated, or myeloid or lymphoid blast phase Ph+ CML with resistance or intolerance to prior therapy including imatinib; and Ph+ acute lymphoblastic leukemia (ALL) with resistance or intolerance to prior therapy.[1] Additionally, Sprycel is indicated for the treatment of pediatric patients ≥ 1 year of age with Ph+ CML in CP and newly diagnosed Ph+ ALL in combination with chemotherapy. Currently, there are four other TKIs approved for the treatment of CP Ph+ CML: imatinib, Sprycel® (dasatinib tablets), Bosulif® (bosutinib tablets), Tasigna® (nilotinib capsules), and Iclusig® (ponatinib tablets).[2-5] These agents are indicated for the treatment of CP Ph+ CML in various phases; some TKIs are indicated after resistance or intolerance to prior therapy. Iclusig is approved for patients with T315I-positive CML and in adult patients with CML for whom no other TKI therapy is indicated.[5] Imatinib also has indications related to use in ALL.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for CML (version 3.2020 – January 30, 2020) state that for patients with CP CML with a low-risk score, the primary treatment recommended includes a first-generation TKI (Gleevec or generic imatinib 400 mg QD [Category 1]), or a second-generation TKI (Bosulif 400 mg QD [Category 1], Sprycel 100 mg QD [Category 1], or Tasigna 300 mg BID [Category 1]).[6] For patients with CP CML with an intermediate- or high-risk score, a second-generation TKI is preferred (Bosulif 400 mg QD [Category 1], Sprycel 100 mg QD [Category 1], or Tasigna 300 mg BID [Category 1]). A first-generation TKI (Gleevec or generic imatinib 400 mg QD) is an alternative [Category 2A]. Iclusig is an option for patients with a T315I mutation and for with disease that has not responded to multiple TKIs or in whom another TKI is not indicated.

The NCCN guidelines for ALL (version 1.2020 – January 15, 2020)[7] and Pediatric ALL (version 1.2020 – November 25, 2019)[8] recommend Sprycel in a variety of clinical scenarios including induction therapy, maintenance, relapsed or refractory ALL and for use in specific mutations.

The NCCN soft tissue sarcoma guidelines (version 6.2019 – February 10, 2020) indicate that Sprycel is a treatment option for patients with GIST as an additional option for patients who are no longer experiencing benefit from imatinib, Sutent® (sunitinib capsules), or Stivarga® (regorafenib tablets).[9] It is noted that data are limited with Sprycel (e.g., unpublished, Phase II, small numbers, retrospective). However, it was suggested that Sprycel may be a more effective option for patients with the D842V mutation.[8]

The NCCN guidelines on bone cancer (version 1.2020 – August 12, 2019) recommend Sprycel for patients with chondrosarcoma or chordoma.[10]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Sprycel. All approvals are provided for 3 years in duration.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Sprycel is recommended in those who meet the following criteria:

FDA-Approved Indications

20. Acute Lymphoblastic Leukemia (ALL) That is Philadelphia Chromosome Positive (Ph+). Approve for 3 years.

21. Chronic Myeloid Leukemia (CML) That is Philadelphia Chromosome Positive (Ph+). Approve for 3 years.

Other Uses with Supportive Evidence

3. Gastrointestinal Stromal Tumor (GIST). Approve for 3 years if the patient meets the following criteria (A, B, and C):
- **A)** Patient has tried imatinb; AND
- **B)** Patient has tried Sutent® (sunitinib capsules); AND
- **C)** The patient has tried Stivarga® (regorafenib tablets).

4. Chondrosarcoma or chordoma. Approve for 3 years.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Sprycel has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

46. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Stivarga® (regorafenib tablets – Bayer HealthCare Pharmaceuticals, Inc.)

DATE REVIEWED: 01/29/2020

OVERVIEW

Stivarga, a kinase inhibitor, is indicated for the treatment of patients with the following conditions:[1]

1. Metastatic colorectal cancer (mCRC) who have been previously treated with fluoropyrimidine-, oxaliplatin-, and irinotecan-based chemotherapy, an anti-vascular endothelial growth factor (VEGF) therapy, and, if *RAS* wild-type, an anti-epidermal growth factor receptor (EGFR) therapy;
2. Locally advanced, unresectable or metastatic gastrointestinal stromal tumor (GIST) who have been previously treatment with Gleevec® (imatinib mesylate tablets) and Sutent® (sunitinib malate capsules);
3. Hepatocellular carcinoma (HCC) who have been previously treated with Nexavar® (sorafenib tablets).

Stivarga is a small molecule inhibitor of multiple membrane-bound and intracellular kinases involved in normal cellular functions and in pathologic processes such as oncogenesis, tumor angiogenesis, metastasis, and tumor immunity. In *in vitro* biochemical or cellular assays, Stivarga (or its major active metabolites) inhibited the activity of various receptors, some of which include vascular endothelial growth factor receptor (VEGFR)1, VEGFR2, VEGFR3, platelet-derived growth factor receptor (PDGFR)-alpha, PDGFR-beta, fibroblast growth factor receptor (FGFR)1, FGFR2, BRAF, $BRAF^{V600E}$, and Abl at concentrations of Stivarga that have been achieved clinically.

Guidelines

Colon and/or Rectal Cancer

The National Comprehensive Cancer Network (NCCN) guidelines on colon cancer (version 4.2019 – November 8, 2019) and rectal cancer (version 3.2019 – September 26, 2019) recommend Stivarga as subsequent therapy as a single agent for unresectable advanced or metastatic disease not previously treated with Stivarga for the following uses: for first progression (*KRAS/NRAS* mutant only) or second progression for disease previously treated with FOLFOXIRI (5-fluorouracil/leucovorin, irinotecan, oxaliplatin) regimen with or without bevacizumab, for second progression for disease previously treated with fluoropyrimidine-, irinotecan- and oxaliplatin-based regimens, or for progression for disease that progressed through all available regimens, including Lonsurf® (trifluridine and tipiracil tablets). Stivarga may be given before or after Lonsurf.[2,3]

Hepatocellular Carcinoma

The NCCN clinical practice guidelines on hepatobiliary cancers (version 3.2019 – August 1, 2019) recommend Stivarga for subsequent treatment as a single agent for patients with hepatocellular carcinoma (adenocarcinoma) [Child-Pugh Class A only] and disease progression for the following uses (all are category 1): 1) in patients who are not transplant candidates with unresectable disease, 2) in patients who are inoperable by performance status or comorbidity (local disease or local disease with minimal extrahepatic disease only), or in patients who have extensive liver tumor burden or metastatic disease.[5,6]

Soft Tissue Sarcoma

The NCCN soft tissue sarcoma guidelines (version 4.2019 – September 12, 2019) recommend Stivarga (category 1) for treatment of progressive GIST disease when the patient is no longer receiving benefit from Gleevec or Sutent.[4] If disease is progressing despite prior therapy with imatinib (Gleevec® tablets, generics) or Sutent® (sunitinib capsules), the following options may be considered: Stivarga (category 1), clinical trial, or best supportive care. Discontinuing tyrosine kinase inhibitor (TKI) therapy (i.e., imatinib, Sutent, or Stivarga) even with progressive disease may accelerate the pace of disease progression and worsen symptoms. In patients with GIST progressing despite imatinib, Sutent, and Stivarga, other options may be considered or a previously tolerated and effective TKI may be restarted for palliation of symptoms. Stivarga, imatinib, or Sutent can be used in combination with Afinitor® (everolimus tablets). Continuation of life-long TKI therapy should be considered for palliation of symptoms as part of best supportive care.

The NCCN soft tissue sarcoma guidelines (version 4.2019 – September 12, 2019) recommend Stivarga (all category 2A) as single-agent palliative therapy for patients with: 1) non-adipocytic extremity/superficial

trunk, head/neck sarcoma with stage IV or recurrent disease with disseminated metastases, 2) non-adipocytic retroperitoneal/intra-abdominal sarcoma with unresectable or progressive disease, or 3) pleomorphic rhabdomyosarcoma.[4,6]

The NCCN bone cancer guidelines (version 1.2020 – August 12, 2019) recommend Stivarga as a single agent for second-line therapy for relapsed/refractory or metastatic disease for patients with osteosarcoma (category 1), dedifferentiated chrondrosarcoma, and high-grade undifferentiated pleomorphic sarcoma (category 2B).[6,7]

Safety

Stivarga has Boxed Warnings concerning risks of hepatotoxicity.[1] Hepatic function should be monitored prior to and during treatment. Depending on severity and persistence, therapy with Stivarga should be interrupted and then reduced or discontinued for hepatotoxicity manifested by elevated liver function tests or hepatocellular necrosis.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Stivarga. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Stivarga is recommended in those who meet the following criteria:

FDA-Approved Indications

121. Colon and Rectal Cancer. Approve for 3 years if the patient meets the following criteria (A, B, C, D, and E):
- **96.** Patient has metastatic disease; AND
- **97.** Patient has been previously treated with a fluoropyrimidine (e.g., capecitabine, 5-fluorouracil [5-FU]); AND
- **98.** Patient has been previously treated with oxaliplatin; AND
- **99.** Patient has been previously treated with irinotecan; AND
- **100.** If the patient's tumor or metastases are wild-type *RAS* (*KRAS* wild-type and/or *NRAS* wild-type) [that is, the tumors or metastases are *KRAS* and/or *NRAS* mutation negative], Erbitux (cetuximab injection for intravenous infusion) or Vectibix (panitumumab injection for intravenous infusion) has been tried.

2. Gastrointestinal Stromal Tumor (GIST). Approve for 3 years if the patient meets the following criteria (A, B, and C):
- **A)** Patient has metastatic or unresectable disease; AND
- **B)** Patient has been previously treated with imatinib ; AND
- **C)** Patient has been previously treated with Sutent (sunitinib malate capsules).

3. Hepatocellular Carcinoma. Approve for 3 years if the patient has been previously treated with at least one tyrosine kinase inhibitor. Note: Tyrosine kinase inhibitors include Nexavar® (sorafenib tablets) and Lenvima® (lenvatinib capsules).

Other Uses with Supportive Evidence

4. Soft Tissue Sarcoma. Approve for 3 years if the patient meets one of the following criteria (A or B):
- **A)** The patient has non-adipocytic extremity/superficial trunk, head/neck, or retroperitoneal/intra-abdominal sarcoma, OR
- **B)** The patient has pleomorphic rhabdomyosarcoma.

5. Osteosarcoma. Approve for 3 years if the patient meets one of the following criteria (A and B):
- **A)** The patient has relapsed/refractory or metastatic disease; AND
- **B)** Stivarga is used as subsequent therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Stivarga has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

47. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Sutent® (sunitinib malate capsules – Pfizer)

DATE REVIEWED: 05/27/2020

OVERVIEW

Sutent, a multi-kinase inhibitor, is indicated for the treatment of gastrointestinal stromal tumor (GIST) after disease progression on or intolerance to imatinib mesylate (Gleevec® tablets, generics); for the treatment of advanced renal cell carcinoma (RCC); for the adjuvant treatment of adult patients at high risk of recurrent RCC following nephrectomy; and for the treatment of progressive, well-differentiated pancreatic neuroendocrine tumors (PNET) in patients with unresectable locally advanced or metastatic disease.[1]

Guidelines

Sutent features prominently in the National Comprehensive Cancer Network (NCCN) compendium for all of the indications listed in the FDA-approved and Other Uses with Supportive Evidence.[2]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Sutent. All approvals are provided for 3 years in duration.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Sutent is recommended in those who meet the following criteria:

FDA-Approved Indications

15. **Gastrointestinal Stromal Tumor (GIST).** Approve for 3 years if the patient has tried imatinib (Gleevec tablets, generics).

122. **Renal Cell Carcinoma (RCC) –Clear Cell or Non-Clear Cell Histology.** Approve for 3 years if the patient meets ONE of the following criteria (A or B):
   - **A)** The patient is at high risk of recurrent clear cell RCC following nephrectomy and Sutent is used for adjuvant therapy; OR
   - **B)** The patient has relapsed or Stage IV disease.

3. **Neuroendocrine Tumors of the Pancreas.** Approve for 3 years for advanced or metastatic disease.

Other Uses with Supportive Evidence

4. **Alveolar Soft Part Sarcoma (ASPS).** Approve for 3 years.

5. **Angiosarcoma.** Approve for 3 years.

6. **Chordoma.** Approve for 3 years in patients with recurrent disease.

7. **Differentiated (i.e., papillary, follicular, and Hürthle cell) Thyroid Carcinoma.** Approve for 3 years if refractory to radioactive iodine therapy.

8. **Medullary Thyroid Carcinoma.** Approve for 3 years if the patient has tried Caprelsa® (vandetanib tablets) or Cometriq® (cabozantinib capsules).

9. **Meningioma.** Approve for 3 years if the patient has recurrent or progressive disease.

10. **Solitary Fibrous Tumor/Hemangiopericytoma.** Approve for 3 years.

11. **Thymic Carcinoma.** Approve for 3 years if the patient has tried chemotherapy (e.g., carboplatin/paclitaxel) or radiation therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Sutent has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below.

48. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Tabrecta™ (capmatinib tablets – Novartis.)

DATE REVIEWED: 05/11/2020

OVERVIEW
Tabrecta, a kinase inhibitor, is indicated for the treatment of adult patients with metastatic non-small cell lung cancer (NSCLC) whose tumors have a mutation that leads to mesenchymal-epithelial transition (MET) exon 14 skipping as detected by an FDA-approved test.[1]

Guidelines
Tabrecta is not addressed in the guidelines. The National Comprehensive Cancer Network (NCCN) non-small cell lung cancer guidelines (version 3.2020 – February 11, 2020) recommend Xalkori (crizotinib capsules) in patients with high-level *MET* amplification or *MET* exon 14 skipping mutation (category 2A).

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of Tabrecta. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Tabrecta is recommended in those who meet the following criteria:

FDA-Approved Indications

22. Non-Small Cell Lung Cancer (NSCLC). Approve for 3 years if the patient meets the following criteria (A and B):
A) The patient has metastatic disease; AND

B) The tumor is positive for a mutation that leads to mesenchymal-epithelial transition (MET) exon 14 skipping, as detected by an approved test.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Tabrecta has not been shown to be effective or there are limited or preliminary data that are not supportive of general approval for the following conditions.

6. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

References

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Tafinlar Prior Authorization Policy
- Tafinlar® (dabrafenib capsules – GlaxoSmithKline)

REVIEW DATE: 07/15/2020

OVERVIEW
Tafinlar, a BRAF inhibitor, is indicated for the following uses:[1]
- **Melanoma**, in the following situations:[1]
  - As a single agent for the treatment of patients with unresectable or metastatic disease with *BRAF V600E* mutation as detected by an FDA-approved test; AND
  - In combination with Mekinist® (trametinib tablets), for the treatment of patients with unresectable or metastatic disease with *BRAF V600E* or *V600K* mutations as detected by an FDA-approved test; AND
  - As adjuvant treatment of *BRAF V600E* or *V600K* mutation-positive disease as detected by an FDA-approved test, and involvement of the lymph node(s), following complete resection.
- **Non-small cell lung cancer**, in combination with Mekinist for treatment of disease that has the *BRAF V600E* mutation as detected by an FDA-approved test.
- **Thyroid cancer**, in combination with Mekinist, for treatment of patients with locally advanced or metastatic anaplastic disease with *BRAF V600E* mutation and with no satisfactory locoregional treatment options.

Tafinlar is not indicated for the treatment of patients with wild-type BRAF disease.

Guidelines

National Comprehensive Cancer Network (NCCN) guidelines support use of Tafinlar in multiple cancers.
- **Melanoma:** Guidelines (version 3.2020 – May 18, 2020) recommend BRAF/MEK inhibitor combinations for first-line (preferred if clinically needed for early response) and subsequent treatment of metastatic or unresectable melanoma with a *V600* activating mutation.[2] While

combination BRAF/MEK inhibition is preferred, if a combination is contraindicated, monotherapy with a BRAF inhibitor (Tafinlar or Zelboraf® [vemurafenib tablets]) is a recommended option, particularly if the patient is not a candidate for checkpoint immunotherapy. Following resection of limited metastatic disease with a *BRAF V600*-activating mutation, BRAF/MEK combination therapy is among the treatment options for patients with no evidence of disease. Tafinlar + Mekinist is also recommended in guidelines as adjuvant therapy (including for nodal recurrence) in some patients with Stage III disease, including use post-surgery or use after complete lymph node dissection. If unacceptable toxicity to Tafinlar/Mekinist, other BRAF/MEK combinations can be considered.

- **Non-Small Cell Lung Cancer:** Guidelines (version 6.2020 – June 25, 2020) list Tafinlar + Mekinist among the first-line therapy and subsequent therapy options for tumors with a *BRAF* mutation.[3] NCCN also notes that monotherapy with a BRAF inhibitor (Tafinlar or Zelboraf) is a treatment option when combination therapy is not tolerated.
- **Thyroid Cancer:** Guidelines (version 1.2020 – June 12, 2020) list Tafinlar + Mekinist as a treatment option for metastatic anaplastic thyroid cancer with a *BRAF* mutation.[4] Tafinlar and Zelboraf are also treatment options for the treatment of iodine-refractory differentiated thyroid cancer (follicular, Hürthle cell, and papillary cancer subtypes) with a *BRAF V600* mutation.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Tafinlar. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tafinlar is recommended in those who meet the following criteria:

FDA-Approved Indications

3. **Melanoma.** Approve for 3 years if the patient meets BOTH of the following (A and B):
   - **A)** Patient has unresectable, advanced (including Stage III or Stage IV disease), or metastatic melanoma; AND
     Note: This includes adjuvant treatment in patients with Stage III disease with no evidence of disease post-surgery.
   - **B)** Patient has *BRAF V600* mutation-positive disease.

4. **Non-Small Cell Lung Cancer.** Approve for 3 years if the patient has *BRAF V600E* mutation-positive disease.

5. **Thyroid Cancer, Anaplastic.** Approve for 3 years if the patient meets ALL of the following (A, B, and C):
   - **D)** Patient has locally advanced or metastatic anaplastic disease; AND
   - **E)** Tafinlar will be taken in combination with Mekinist, unless intolerant; AND
   - **F)** Patient has *BRAF V600* mutation-positive disease.

Other Uses with Supportive Evidence

6. **Thyroid Cancer, Differentiated.** Approve for 3 years if the patient meets ALL of the following conditions (A, B, and C):
   - **A)** Patient has differentiated thyroid carcinoma; AND

Note: Examples of differentiated thyroid carcinoma include papillary, follicular, or Hürthle cell thyroid cancers.

B) Patient has disease that is refractory to radioactive iodine therapy; AND

C) Patient has *BRAF* mutation-positive disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tafinlar is not recommended in the following situations:

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Tagrisso® (osimertinib tablets – AstraZeneca)

DATE REVIEWED: 12/18/2019

OVERVIEW

Tagrisso, a kinase inhibitor, is indicated for the treatment of patients with metastatic epidermal growth factor receptor (*EGFR*) T790M mutation-positive non-small cell lung cancer (NSCLC), as detected by an FDA-approved test.[1] It is specifically approved for patients who have progressed on or after EGFR tyrosine kinase inhibitor (TKI) therapy (EGFR-TKI). Tagrisso is also indicated for the first-line treatment of patients with metastatic NSCLC whose tumors have *EGFR* exon 19 deletions or exon 21 L858R mutations, as detected by an FDA-approved test.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for NSCLC (version 1.2020 – November 6, 2019) recommend *EGFR* mutation testing in patients with nonsquamous NSCLC (i.e., adenocarcinoma, large cell) or in NSCLC not otherwise specified (NOS).[2] Tarceva® (erlotinib tablets), Iressa® (gefitinib tablets), Gilotrif™ (afatinib tablets), Vizimpro® (dacomitinib tablets), and Tagrisso (all category 1) are all recommended for the first-line treatment of patients with sensitizing *EGFR*-mutation positive NSCLC. Tagrisso is noted as the "preferred" first-line option by NCCN. Upon disease progression, T790M testing is recommended in guidelines. For systemic multiple lesions that are T790M mutation-positive, Tagrisso, if not previously given, is the category 1 recommended option. If T790M mutation-negative, initial cytotoxic therapy options listed for adenocarcinoma, or squamous cell carcinoma (e.g., doublet chemotherapy) can be considered in this setting (category 2A). NCCN notes that in patients with actionable mutations. Immunotherapy is less effective in the second-line setting, irrespective of PD-L1 expression.

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of Tagrisso. All approvals are provided for 3 years in duration unless otherwise noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Tagrisso is recommended in those who meet the following criteria:

FDA-Approved Indications

123. Non-Small Cell Lung Cancer (NSCLC) – Epidermal Growth Factor Receptor (*EGFR*) Mutation-Positive. Approve for 3 years if the patient meets ONE of the following criteria (A or B):
- **A)** The patient meets BOTH of the following criteria (i and ii):
  - **i.** The patient has metastatic *EGFR* T790M mutation-positive NSCLC as detected by an approved test; AND
  - **ii.** The patient has progressed on one of the EGFR-tyrosine kinase inhibitors (e.g., Tarceva® [erlotinib tablets], Iressa® [gefitinib tablets], Vizimpro® [dacomitinib tablets], Gilotrif® [afatinib tablets]); OR
- **B)** The patient has metastatic NSCLC and meets ONE of the following criteria (i or ii):
  - **i.** The patient has *EGFR* exon 19 deletions as detected by an approved test; OR
  - **ii.** The patient has *EGFR* exon 21 L858R mutations as detected by an approved test.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Tagrisso has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

49. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Talzenna™ (talazoparib capsules – Pfizer)

REVIEW DATE: 10/30/2019

OVERVIEW
Talzenna, a poly (ADP-ribose) polymerase (PARP) inhibitor, is indicated in adult patients with deleterious or suspected deleterious germline BReast CAncer susceptibility gene (g*BRCA*)-mutated human epidermal growth factor receptor 2 (HER2)-negative locally-advanced or metastatic breast cancer.[1] Talzenna was approved with an FDA-approved companion diagnostic test.

GUIDELINES
The National Comprehensive Cancer Network (NCCN) guidelines on breast cancer (version 3.2019 – September 6, 2019) recommends Talzenna as a category 1 preferred regimen for patients with recurrent or

metastatic breast cancer which are HER2-negative and have germline *BRCA*1/2 mutation.[2] Lynparza® (olaparib tablets) is another category 1 recommended option in this setting.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Talzenna. All approvals are provided for 3 years in duration.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Talzenna is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Breast Cancer.** Approve for 3 years if the patient meets the following criteria (A, B, and C):
   - **A.** The patient has locally-advanced or metastatic breast cancer; AND
   - **B.** The patients has germline *BRCA* mutation-positive disease; AND
   - **C.** The patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Talzenna has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

50. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Targretin® (bexarotene capsule – Valeant, generics)

REVIEW DATE: 09/25/2019

OVERVIEW

Bexarotene capsule is indicated for the treatment of cutaneous manifestations of cutaneous T-cell lymphoma (CTCL) in patients who are refractory to at least one prior systemic therapy.[1] Bexarotene capsule has a Boxed Warning about birth defects and bexarotene must not be administered to a pregnant patient.

Disease Overview

T-cell lymphoma accounts for approximately 15% of all non-Hodgkin lymphoma (NHL) in the US.[2] CTCL is one of the most common forms of T-cell lymphoma.[2,3]

The most common type of CTCL is mycosis fungoides and its variants, which accounts for approximately 50% to 70% of all CTCLs.[4] Skin symptoms associated with mycosis fungoides include patches, plaques, or tumors and treatment is directed at the skin or the entire body (systemic).[2,3] Sézary syndrome is an advanced, variant form of mycosis fungoides and is characterized by the presence of lymphoma cells in the blood. Patients with Sézary syndrome will have extensive thin, red, itchy rashes usually covering over 80% of the body and treatment will generally include systemic therapies since the use of skin- directed therapies alone is typically inadequate. Skin-directed therapies are useful for patch and limited plaque disease. Systemic therapies are reserved for more advanced disease and initiation of systemic therapy is usually deferred until patients have not responded to topical therapies.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on Primary Cutaneous Lymphomas (version 2.2019 – December 17, 2018) provide treatment recommendations for the different types of CTCLs.[2] Bexarotene capsules are listed as one of the therapies within the Systemic Category A drugs. The Systemic Category A drugs are typically used before Systemic Category B or C drugs.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of bexarotene capsules. Because of the specialized skills required for evaluation and diagnosis of patients treated with bexarotene capsules as well as the monitoring required for adverse events, approval requires bexarotene capsules to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for 3 years in duration unless otherwise noted below.

Automation: None.

Recommended Authorization Criteria
Coverage of bexarotene capsule is recommended in those who meet the following criteria:

FDA-Approved Indications

124. Cutaneous T-Cell Lymphoma (CTCL) – Cutaneous Manifestations. Approve bexarotene capsule for 3 years if the patient meets the following criteria (A and B):
- **X)** Bexarotene capsule is prescribed by, or in consultation with, an oncologist or a dermatologist; AND
- **Y)** If brand Targretin is requested, the patient has tried AND cannot take generic bexarotene capsules due to a formulation difference in the inactive ingredient(s) (e.g., difference in dyes, fillers, preservatives) between the brand and the bioequivalent generic product which, per the prescribing physician, would result in a significant allergy or a serious adverse reaction **[documentation required]**.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Bexarotene capsules have not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for conditions not included in the Recommended Authorization Criteria.

51. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Targretin® (bexarotene gel 1% – Valeant)

REVIEW DATE: 09/25/2019

OVERVIEW
Targetin gel is indicated for the topical treatment of cutaneous lesions in patients with cutaneous T-cell lymphoma (CTCL) [Stage 1A and 1B] who have refractory or persistent disease after other therapies or who have not tolerated other therapies.[1] Targretin gel is contraindicated in pregnant patients and it should not be given to a pregnant patient or a patient who intends to become pregnant. If a patient becomes pregnant while using Targetin gel, it must be discontinued immediately.

Disease Overview

T-cell lymphoma accounts for approximately 15% of all non-Hodgkin lymphoma (NHL) in the US.[2] CTCL is one of the most common forms of T-cell lymphoma.[2,3]

The most common type of CTCL is mycosis fungoides and its variants, which accounts for approximately 50% to 70% of all CTCLs.[4] Skin symptoms associated with mycosis fungoides include patches, plaques, or tumors and treatment is directed at the skin or the entire body (systemic).[2,3] Sézary syndrome is an advanced, variant form of mycosis fungoides and is characterized by the presence of lymphoma cells in the blood. Patients with Sézary syndrome will have extensive thin, red, itchy rashes usually covering over 80% of the body and treatment will generally include systemic therapies since the use of skin- directed therapies alone is typically inadequate. Skin-directed therapies are useful for patch and limited plaque disease. Systemic therapies are reserved for more advanced disease and initiation of systemic therapy is usually deferred until patients have not responded well to topical therapies.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on Primary Cutaneous Lymphomas (version 2.2019 – December 17, 2018) provide treatment recommendations for the different types of CTCLs.[2] Targretin gel is listed as an option for skin-directed therapies (as initial therapy and for patients who have tried other skin-directed therapies).

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Targretin gel. Because of the specialized skills required for evaluation and diagnosis of patients treated with Targretin gel as well as the monitoring required for adverse events and long-term efficacy, approval requires Targretin gel to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for 3 years in duration unless otherwise noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Targretin gel is recommended in those who meet the following criteria:

FDA-Approved Indications

125. Cutaneous T-Cell Lymphoma (CTCL) – Cutaneous Manifestations. Approve Targretin gel for 3 years if Targretin is prescribed by, or in consultation with, an oncologist or a dermatologist

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Targretin gel has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for conditions not included in the Recommended Authorization Criteria.

52. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Tasigna® (nilotinib capsules – Novartis)

DATE REVIEWED: 04/01/2020

OVERVIEW

Tasigna, a kinase inhibitor, is indicated for the treatment of adult and pediatric patients ≥1 year of age with newly diagnosed Philadelphia positive (Ph+) chronic myeloid leukemia (CML) in chronic phase (CP).[1] Tasigna is also indicated for the treatment of CP and accelerated phase (AP) Ph+ CML in adult patients resistant or intolerant to prior therapy that included imatinib. Tasigna is also indicated for use in pediatric patients ≥ 1 year of age with Ph+ CML-CP resistant or intolerant to prior TKI therapy.[1] Currently, there are four other tyrosine kinase inhibitors (TKIs) approved for the treatment of Ph+ CML: imatinib, Sprycel® (dasatinib tablets), Bosulif® (bosutinib tablets), and Iclusig® (ponatinib tablets).[2-5] These agents are indicated for the treatment of Ph+ CML in various phases; some TKIs are indicated after resistance or intolerance to prior therapy. Iclusig is approved for patients with T315I-positive CML and in adult patients with CML for whom no other TKI therapy is indicated.[5] Imatinib, Sprycel and Iclusig are also indicated for patients with Ph+ acute lymphoblastic leukemia (ALL).

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for CML (version 3.2020 – January 30, 2020) state that for patients with CP CML with a low-risk score, the primary treatment recommended includes a first-generation TKI (Gleevec or generic imatinib 400 mg QD [Category 1]), or a second-generation TKI (Bosulif 400 mg QD [Category 1], Sprycel 100 mg QD [Category 1], or Tasigna 300 mg BID [Category 1]).[6] For patients with CP CML with an intermediate- or high-risk score, a second-generation TKI is preferred (Bosulif 400 mg QD [Category 1], Sprycel 100 mg QD [Category 1], or Tasigna 300 mg BID [Category 1]). A first-generation TKI (Gleevec or generic imatinib 400 mg QD) is an alternative [Category 2A]. Iclusig is an option for patients with a T315I mutation and for with disease that has not responded to multiple TKIs or in whom another TKI is not indicated.[6]

NCCN guidelines for (ALL [adults and adolescent young adults] {version 1.2020 – January 15, 2020} and Pediatric ALL [pediatric and adolescent young adults] {version 2.2020 – November 25, 2019}recommend Tasigna for patients with in various induction regimens, as well as in relapsed or refractory ALL.[11,12] Tasigna is also recommended for patients with specific mutations and in certain maintenance regimens. Data are also available regarding use of Tasigna in ALL.[13-15]

The NCCN soft tissue sarcoma guidelines (version 6.2019 – February 10, 2020) indicate that Tasigna is a treatment option for patients with gastrointestinal stroma tumor (GIST) who have disease progression after imatinib, Stivarga® (regorafenib tablets), and Sutent® (sunitinib capsules).[7]

Other Uses with Supportive Evidence

Data are available regarding use of Tasigna in GIST. In one Phase III study (n = 248) Tasigna was compared with best supportive care (BSC) [BSC without TKI therapy; BSC plus imatinib; BSC plus Sutent) in patients with GIST resistant to or intolerant of imatinib and Sutent.[8] Median progression-free survival (PFS) was similar between arms (109 days with Tasigna vs. 111 days with BSC; P = 0.56). A trend in longer overall survival (OS) was noted with Tasigna vs. BSC (332 days vs. 280 days; P = 0.29). Tasigna also demonstrated modest activity in one Phase II study (n = 13) in patients with GIST previously treated with imatinib and Sutent.[9] In a randomized, open-label, multicenter, Phase III trial involving patients (aged ≥ 18 years) with histologically-confirmed unresectable or metastatic GIST (n = 647) showed that PFS was higher with imatinib overall compared with Tasigna and that Tasigna is not an ideal first-line treatment for GIST.[10]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Tasigna. All approvals are provided for 3 years in duration.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tasigna is recommended in those who meet the following criteria:

FDA-Approved Indications

23. Chronic Myeloid Leukemia (CML) That is Philadelphia Chromosome Positive (Ph+). Approve for 3 years.

Other Uses with Supportive Evidence

24. Acute Lymphoblastic Leukemia (ALL) That is Philadelphia Chromosome Positive (Ph+). Approve for 3 years if the patient has tried at least one other tyrosine kinase inhibitor that is used for Philadelphia chromosome positive ALL.
Note: Examples include Gleevec® (imatinib tablets) and Sprycel® (dasatinib tablets).

25. Gastrointestinal Stromal Tumor (GIST). Approve for 3 years if the patient meets the following criteria (A, B, and C):
D) Patient has tried Gleevec® (imatinib tablets); AND
E) Patient has tried Sutent® (sunitinib capsules); AND
F) Patient has tried Stivarga® (regorafenib tablets).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Tasigna has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

53. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Tazverik Prior Authorization Policy
- Tazverik™ (tazemetostat tablets – Epizyme)

REVIEW DATE: 01/29/2020; selected revision 06/24/2020

OVERVIEW
Tazverik, an EZH2 inhibitor, is approved in the following conditions:[1]
- **Epithelioid sarcoma**, in patients ≥ 16 years of age with a metastatic or locally advanced disease not eligible for complete resection.
- **Follicular lymphoma**, in the following situations:
  - In adults with relapsed or refractory disease, whose tumors are positive for an EZH2 mutation as detected by an approved test and who have received at least two prior systemic therapies.
  - In adults with relapsed or refractory disease who have no satisfactory alternative treatment options.

These indications are approved under accelerated approval based on overall response rate and duration of response. Continued approval may be contingent upon verification and description of clinical benefit in confirmatory trial(s).

Guidelines
The National Comprehensive Cancer Network (NCCN) guidelines for soft tissue sarcoma (version 6.2019 – February 10, 2020) have been updated to recommend Tazverik for treatment of metastatic or locally advanced epithelioid sarcoma not eligible for complete resection.[2] No other therapies are listed for this specific subtype of soft tissue sarcoma. Generally for soft tissue sarcomas, treatment recommendations are based on anatomic site of primary disease (e.g., extremities, trunk, visceral, retroperitoneum, or head and neck).

NCCN guidelines for B-cell lymphomas (version 2.2020 – July 9, 2020) recommend Tazverik be used according to the approved indication.[3] This includes use of Tazverik as a subsequent therapy for follicular lymphoma, in patients with EZH2 mutation positive disease after two prior therapies, or in relapsed or refractory disease in patients who have no satisfactory alternative treatment options.[3]

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of Tazverik. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Tazverik is recommended in those who meet the following criteria:

FDA-Approved Indications

140. Epithelioid Sarcoma. Approve for 3 years if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 16 years of age; AND
- **B)** Patient has metastatic or locally advanced disease; AND
- **C)** Patient is not eligible for complete resection.

141. Follicular Lymphoma. Approve for 3 years if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has relapsed or refractory disease; AND
- **C)** Patient meets ONE of the following (i or ii):
  - **i.** Both of the following apply (a and b):
    - **a)** Patient's tumor is positive for an EZH2 mutation; AND
    - **b)** Patient has tried at least two prior systemic therapies; OR
  - **ii.** According to the prescriber, there are no appropriate alternative therapies.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tazverik is not recommended in the following situations:

136. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Temozolomide Prior Authorization Policy
- Temozolomide capsules (Temodar® – Merck & Co, generic)

REVIEW DATE: 08/12/2020

OVERVIEW

Temozolomide, an alkylating agent, is indicated in adults for the following uses:[1]
- **Anaplastic astrocytoma**, that is refractory, in patients who have experienced disease progression on a drug regimen containing nitrosourea (i.e., BiCNU® [carmustine {BCNU} for injection] or lomustine [CCNU] capsules) and Matulane® (procarbazine capsules).
- **Glioblastoma**, newly diagnosed, concomitantly used with radiotherapy and then as maintenance therapy.

Guidelines

- **Anaplastic Astrocytoma, Glioblastoma, and Other Central Nervous System (CNS) Tumors:** The National Comprehensive Cancer Network (NCCN) CNS cancers clinical practice guidelines (version 2.2020 – April 30, 2020) note temozolomide as a treatment option for the treatment of glioblastoma and anaplastic astrocytoma.[2] Temozolomide is listed for use as monotherapy or as adjuvant therapy (i.e., to be used concurrently with radiation or other chemotherapeutic agents). The guidelines note temozolomide as an option for a myriad of CNS cancers, including anaplastic gliomas (includes mixed anaplastic oligoastrocytoma, anaplastic oligodendroglioma, and other rare anaplastic glioma); intracranial or spinal ependymoma; gliosarcoma; primary CNS lymphoma; low-grade glioma/pilocytic and infiltrative supratentorial astrocytoma/oligodendroglioma; medulloblastoma (as recurrence therapy in patients who have tried other chemotherapeutic agents); and brain metastases from solid tumors (in patients for whom radiation therapy is not an option and who have tried other chemotherapeutic drugs that penetrate the CNS).
- **Ewing's sarcoma or mesenchymal chondrosarcoma:** The NCCN bone cancer guidelines (version 1.2020 – August 12, 2019) note temozolomide as a treatment option in patients with relapsed, refractory, or metastatic disease.[3]
- **Melanoma:** The NCCN cutaneous melanoma guidelines (version 3.2020 – May 18, 2020) note temozolomide as a treatment option in patients with metastatic melanoma.[4]
- **Neuroendocrine tumors**: The NCCN guidelines (version 2.2020 – July 24, 2020) recommends use of temozolomide for neuroendocrine tumors of the gastrointestinal tract, lung or thymus (carcinoid tumors), pancreas, pheochromocytomas/paragangliomas, and poorly differentiated carcinomas/large or small cell.[5]
- **Mycosis fungoides (MF)/Sezary Syndrome:** The NCCN primary cutaneous lymphomas guidelines (version 2.2020 – April 10, 2020) note temozolomide as a treatment option for this condition in patients who have tried other chemotherapeutic agents; and for primary cutaneous anaplastic large cell lymphoma with multifocal lesions or regional nodes (in patients with CNS involvement).[6,7]
- **Small cell lung cancer:** The NCCN small cell lung cancer guidelines (version 1.2021 – August 4, 2020) note temozolomide as one of the subsequent therapy options for patients with relapsed disease ≤ 6 months.[8] It may be useful in patients with brain metastases.
- **Soft tissue sarcomas:** The NCCN soft tissue sarcoma guidelines (version 2.2020 – May 28, 2020) note temozolomide as a treatment option for angiosarcoma, rhabdomyosarcoma, solitary fibrous tumor; soft tissue sarcomas (in patients with advanced, unresectable, or metastatic disease who have tried other chemotherapeutic agents).[9]
- **Uterine sarcoma:** The NCCN uterine neoplasms guidelines (version 2.2020 – July 24, 2020) note temozolomide as a treatment option for patients with metastatic, recurrent, or medically inoperable uterine sarcoma.[10]
- **Uveal melanoma:** The NCCN uveal melanoma guidelines (version 1.2020 – May 21, 2020) note temozolomide as a treatment option for patients with metastatic or unresectable uveal melanoma.[11]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of temozolomide capsules. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of temozolomide capsules is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Anaplastic Astrocytoma.** Approve for 3 years.

2. **Glioblastoma multiforme (GBM, Glioblastoma, Grade IV Astrocytoma).** Approve for 3 years.

Other Uses with Supportive Evidence

3. **Anaplastic Gliomas (Includes Mixed Anaplastic Oligoastrocytoma, Anaplastic Oligodendroglioma, and Other Rare Anaplastic Gliomas).** Approve for 3 years.

4. **Angiosarcoma.** Approve for 3 years.

5. **Brain Metastases from Solid Tumors.** Approve for 3 years if the patient meets the following criteria (A and B):
   A) Radiation therapy is not an option; AND
   B) At least one chemotherapy drug that penetrates the central nervous system has already been tried.
   Note: Examples of chemotherapy are cyclophosphamide/methotrexate/fluorouracil for breast cancer, carboplatin and etoposide for non-small cell lung cancer.

6. **Ependymoma, Intracranial or Spinal.** Approve for 3 years.

7. **Ewing's Sarcoma or Mesenchymal Chondrosarcoma.** Approve for 3 years in patients with relapsed, refractory or metastatic disease.

8. **Gliosarcoma.** Approve for 3 years.

9. **Low-Grade (WHO Grade I or II) Glioma/ Pilocytic and Infiltrative Supratentorial Astrocytoma/Oligodendroglioma in Adults.** Approve for 3 years.

10. **Medulloblastoma.** Approve for 3 years for recurrence therapy in patients who have received prior chemotherapy.

11. **Melanoma.** Approve for 3 years if the patient has metastatic melanoma.

12. **Mycosis Fungoides/Sézary Syndrome.** Approve for 3 years in patients who have received one prior therapy.

13. **Neuroendocrine Tumors of the Gastrointestinal Tract, Lung or Thymus (Carcinoid Tumors).** Approve for 3 years.

14. **Neuroendocrine Tumors of the Pancreas (Islet Cell Tumors), Pancreatic Neuroendocrine Tumors.** Approve for 3 years.

15. **Neuroendocrine Carcinoma – Poorly Differentiated, Large or Small Cell (Other than Lung), Unknown Primary.** Approve for 3 years.

16. **Pheochromocytoma or Paragangliomas.** Approve for 3 years in patients with metastases.

17. **Primary Central Nervous System Lymphoma.** Approve for 3 years.

18. **Primary Cutaneous Anaplastic Large Cell Lymphoma** Approve for 3 years in patients with relapsed/refractory disease with central nervous system involvement.

19. **Rhabdomyosarcoma.** Approve for 3 years.

20. **Small Cell Lung Cancer.** Approve for 3 years if the patient has tried one chemotherapy regimen.

21. **Soft Tissue Sarcomas.** Approve for 3 years in patients with advanced, unresectable, or metastatic disease.

22. **Solitary Fibrous Tumor.** Approve for 3 years.

23. **Uterine Sarcomas**. Approve for 3 years in patients with metastatic, recurrent or medically inoperable disease.

24. **Uveal Melanoma.** Approve for 3 years for metastatic or unresectable disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of temozolomide capsules is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Thalomid® (thalidomide capsules – Celgene)

DATE REVIEWED: 04/01/2020

OVERVIEW

Thalomid is indicated for use in combination with dexamethasone for the treatment of patients with newly diagnosed multiple myeloma.[1] It is also indicated for the acute treatment of the cutaneous manifestations of moderate to severe erythema nodosum leprosum (ENL). It is not indicated as monotherapy for such ENL treatment in the presence of moderate to severe neuritis. Thalomid is also indicated as maintenance therapy for prevention and suppression of the cutaneous manifestations of ENL recurrence.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for multiple myeloma (version 3.2020 – March 10, 2020) recommend use of Thalomid in various scenarios.[2] It is considered useful in certain circumstances among patients with previously treated multiple myeloma, as well as for primary therapy for transplant candidates.

The National Comprehensive Cancer Network (NCCN) has guidelines regarding myeloproliferative neoplasms (version 3.2019 – September 4, 2019) that discuss myelofibrosis.[3] Thalomid is recommended in the management of anemia associated with myelofibrosis, with or without prednisone, for patients with erythropoietin levels ≥ 500 mU/mL.

The NCCN guidelines for acquired immune deficiency syndrome (AIDS)-Related Kaposi Sarcoma (version 1.2020 – February 12, 2020) recommended Thalomid as an agent useful under certain conditions for subsequent systemic therapy options for relapsed/refractory therapy.[4] First-line systemic therapy options include liposomal doxorubicin (preferred), and paclitaxel. Other subsequent systemic therapy options for relapsed/refractory therapy are also cited (e.g., Pomalyst® [pomalidomide capsules] {preferred}, Revlimid® [lenalidomide], imatinib).

The National Comprehensive Cancer Network (NCCN) guidelines for B-Cell Lymphomas (version 1.2020 – January 22, 2020) recommend use of Thalomid, with or without rituximab, for patients with Castleman's disease who have relapsed/refractory or progressive disease.[5] Thalomid is cited as an other recommended therapy (when given with cyclophosphamide and prednisone) for hyaline vascular histology for patients with multicentric Castleman's disease who are negative for the human immunodeficiency virus (HIV) and human herpesvirus-8 (HHV-8).

Other Uses with Supportive Evidence

Some data support the use of Thalomid for ENL, although the condition is not common and data are limited.[6,7] Data indicates that Thalomid does successfully and quickly improve the cutaneous manifestations of ENL and in some patients the steroid requirement was reduced.

Thalomid has been used for discoid lupus erythematosus and cutaneous lupus erythematosus. Patients usually had refractory disease after trial of other therapies and good responses were achieved for many patients given Thalomid.[8-17] A retrospective medical review was done and involved 29 patients with refractory cutaneous manifestations of cutaneous lupus erythematosus who received Thalomid. Of the 23 patients who took Thalomid for 1 month, 74% of patients (n = 17/23) had complete resolution of the

cutaneous manifestations and 13% of patients (n = 3/23) had a 75% or greater partial improvement.[11] Another report involving patients with discoid lupus (n = 18), subacute cutaneous lupus (n = 6), and systemic lupus erythematosus with skin involvement (n = 24) who had been resistant to at least two other treatments found a response rate of 81% (n = 39/48) with use of Thalomid with 60% of patients (n = 29/48) achieving a complete cutaneous remission.[12] Other therapies used for these conditions include antimalarial agents (e.g. hydroxychloroquine), corticosteroids (oral, topical, intralesional), methotrexate, azathioprine, cyclosporine, dapsone, mycophenolate mofetil, topical calcineurin inhibitors (e.g., Elidel, Protopic) and Soriatane.[10,15]

Thalomid has been studied in patients with prurigo nodularis, most of whom were refractory to other treatments or with adverse events (AEs) from the other therapies.[8,18,19] A retrospective review assessed the medical records of 42 patients with prurigo nodularis who were refractory to other therapy and who received Thalomid.[18] Patients received Thalomid for an average of 105 weeks. Previous therapies tried included topical steroids, intralesional steroids, systemic steroids, topical tar, macrolides, cyclosporine, azathioprine, methotrexate, calcineurnin inhibitors, antihistamines, dapsone, capsaicin, laser therapy, PUVA, UVB, retinoids, hydroxyzine, and macrolides. With Thalomid, improvement was noted in approximately one-third of patients.

Recurrent aphthous ulcers and recurrent aphthous stomatitis are associated with frequent and recurring symptoms that are painful and can lead to difficulty in speaking, eating, and swallowing.[20-23] Ulcers are larger and may persist for weeks to months. The conditions are noted in certain disease states such as in patients who are human immunodeficiency virus (HIV)-positive and Bechet's disease. In general, few adequately powered trials have assessed the efficacy of therapeutic agents for aphthous ulcers or aphthous stomatitis.[20] Although the data are older and limited, Thalomid has led to rapid resolution of symptoms in patients with recurrent aphthous ulcers or aphthous stomatitis.[24-29] A double-blind, randomized, placebo-controlled study assessed Thalomid as a therapy for oral aphthous ulcers in patients infected with HIV. In total, 55% of patients (n = 16/29) given Thalomid had complete healing of their aphthous ulcers after 4 weeks compared with only 7% of patients (n = 2/28) who received placebo. Patients given Thalomid had symptom improvements in regards to discomfort that occurred while eating.[25] A retrospective cohort study involving patients with recurrent aphthous stomatitis found that Thalomid was rapidly effective as 85% of patients (n = 78/92) achieved a complete remission of the condition within 14 days.[29] Many other agents have been used for recurrent aphthous ulcers or stomatitis including topical or intralesional corticosteroids, systemic corticosteroids, topical anesthetics/analgesics (lidocaine 2% viscous solution, benzocaine lozenges), antimicrobial mouth washes (tetracycline, chlorhexidine), topical sucralfate, acyclovir, pentoxifylline, dapsone, colchicine, and azathioprine.[20-23] Due to toxicities, use of Thalomid is generally reserved for patients who have not obtained satisfactory results with other agents.[30,31]

Safety

Thalomid has a Boxed Warning regarding embryofetal toxicity and venous thromboembolism. The safety and effectiveness in pediatric patients < 12 years of age have not been established. Thalomid is available only through the THALOMID Risk Evaluation Mitigation Strategy (REMS™) program. Males and females must follow the required reproductive precautions.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Thalomid. All approvals are provided for 3 years in duration.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Thalomid is recommended in those who meet the following criteria:

FDA-Approved Indications

2. **Erythema Nodosum Leprosum (ENL).** Approve for 3 years.

3. **Multiple Myeloma.** Approve for 3 years.

Other Uses with Supportive Evidence

3. **Acquired Immune Deficiency Syndrome (AIDS)-Related Kaposi's Sarcoma.** Approve for 3 years if the patient meets the following (A and B):
   A) The patient has tried at least one regimen or therapy; AND
   Note: Examples include liposomal doxorubicin, paclitaxel, Pomalyst® (pomalidomide capsules), Revlimid® [lenalidomide], and imatinib.
   B) The patient has relapsed or refractory disease.

4. **Castleman's Disease.** Approve for 3 years if the patient meets one of the following (A or B):
   A) The patient has relapsed/refractory or progressive disease; OR
   B) The patient meets all of the following (i, ii, and iii):
      i. The patient has multicentric Castleman's disease; AND
      ii. The patient is negative for the human immunodeficiency virus (HIV) and human herpesvirus-8 (HHV-8); AND
      iii. The patient has hyaline vascular histology.

5. **Discoid Lupus Erythematosus or Cutaneous Lupus Erythematosus.** Approve for 3 years if the patient has tried at least two other therapies.
   Note: Examples of therapies include corticosteroids (oral, topical, intralesional), antimalarial agents (e.g., hydroxychloroquine), topical calcineurin inhibitors (e.g., Protopic® [tacrolimus ointment], Elidel® [pimecrolimus cream]), azathioprine, cyclosporine, mycophenolate mofetil, methotrexate, dapsone, and Soriatane® (acitretin capsules).

6. **Myelofibrosis.** Approve for 3 years if the patient meets the following criteria (A and B):
   A) According to the prescriber the patient has anemia; AND
   B) The patient has serum erythropoietin levels ≥ 500 mU/mL.

7. **Prurigo Nodularis.** Approve for 3 years if the patient has tried at least two other therapies.
   Note: Examples of therapies include topical steroids, intralesional steroids, systemic steroids, topical tar, cyclosporine, macrolides, azathioprine, methotrexate, topical calcineurin inhibitors (Elidel, Protopic), retinoids, antihistamines, hydroxyzine, dapsone, capsaicin, psoralen plus ultraviolet A (PUVA) therapy, and ultraviolet B (UVB) therapy.

8. **Recurrent Aphthous Ulcers or Aphthous Stomatitis.** Approve for 3 years if the patient has tried at least two other therapies.

Note: Examples include topical or intralesional corticosteroids, systemic corticosteroids, topical anesthetics/analgesics (e.g., lidocaine 2% viscous solution, benzocaine lozenges), antimicrobial mouthwashes (e.g., tetracycline, chlorhexidine), topical sucralfate, acyclovir, pentoxifylline, dapsone, colchicine, and azathioprine.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Thalomid has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

54. Cancer Cachexia. Several small studies are available that have investigated Thalomid in the management of cancer cachexia related to various cancers.[32-36] A single center double-blind, controlled trial randomized patients with pancreatic cancer who had lost at least 10% of their body weight to receive Thalomid or placebo for 24 weeks (n = 50).[33] Of the 33 patients evaluable at 4 weeks, patients given Thalomid had gained an average of 0.37 kg compared with a loss of 2.21 kg in the patients given placebo.[33] A published review of data regarding use of Thalomid for the management of cancer cachexia concluded that there is inadequate evidence to recommend Thalomid in clinical practice.[36]

55. Crohn's Disease. Several publications report use of Thalomid in patients with Crohn's disease.[37-53] Thalomid was used as an adjunctive therapy, or in those refractory to other therapy, and usually involved children. The data were not of high quality and primarily consisted of open-label designs or retrospective reviews, without a placebo control, and involved very few patients.[37-53] Guidelines from the American College of Gastroenterology (2018) for the management of Crohn's disease in adults do not mention Thalomid as a therapeutic alternative.[48] Although some improvements were noted in published data with Thalomid, more definite data from randomized, controlled trials are required before this is a recommended therapy.[48] Consensus guidelines of the European Crohn's and Colitis Organization (ECCO) and the European society of Pediatric Gastroenterology, Hepatology and Nutrition (ESOGGAN) [2014] state that even though some data are available that suggest efficacy of Thalomid in refractory pediatric Crohn's disease, there are insufficient data to recommended Thalomid therapy at this juncture.[53] Many other therapies are available for the management of Crohn's disease.

56. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Tibsovo® (ivosidenib tablets – Agios)

DATE REVIEWED: 02/05/2020

OVERVIEW

Tibsovo, an isocitrate dehydrogenase-1 (IDH1) inhibitor, is indicated for the treatment of acute myeloid leukemia (AML) with a susceptible IDH1 mutation as detected by an FDA-approved test in adults with newly diagnosed AML who are ≥ 75 years old or who have comorbidities that preclude use of intensive induction chemotherapy and in adults with relapsed or refractory AML.[1] The recommended dose is 500 mg orally once daily (QD) with or without food until disease progression or unacceptable toxicity. Do not administer with a high-fat meal.

Disease Overview

AML is a heterogeneous hematologic malignancy hallmarked by clonal expansion of myeloid blasts in the peripheral blood, bone marrow, and/or other tissues.[2] Undifferentiated blast cells proliferate in bone marrow instead of maturing into normal blood cells. Among adults, it is the most common form of acute leukemia and accounts for the largest number of annual deaths from leukemias in the US. An estimated 21,450 individuals will be diagnosed with AML in 2019 and 10,920 are projected to die from the condition. The median age at diagnosis is 67 years. Diagnosis occurs at ≥ 65 years of age for 54% of patients with around one-third of patients diagnosed at ≥ 75 years of age. The incidence of AML increases as the population ages. Environmental factors such as prolonged exposure to petrochemicals, solvents such as benzene, pesticides, and ionizing radiation have been established to increase the risks for AML, as well as myelodysplastic syndrome (MDS).[2] The cure rates of AML have improved with this outcome noted in 35% to 40% of adult patients who are ≤ 60 years of age and 5% to 15% for patients who are > 60 years of

age.[3] However, among patients who are older and unable to receive intensive chemotherapy the survival rates are dismal with a median survival of only 5 to 10 months.[3] Various gene mutations are present in adults with AML.[2,3] The incidence of IDH1 mutations have been reported in 6% to 9% of AML cases.[2]

Clinical Efficacy

The efficacy of Tibosovo was assessed in an open-label, single-arm, multicenter, clinical study involving 174 adult patients with relapsed or refractory AML that had an IDH1 mutation.[1,4] Patients were assigned to receive Tibosovo 500 mg QD. The median patient age was 67 years.[1,4] The most common types of IDH1 mutation were R132C and R132H.[1] Patients had received a median of two prior therapies (range, 1 to 6).[4] Approximately 70% and 64% of patients had received prior intensive chemotherapy and non-intensive chemotherapy, respectively.[4] Efficacy was based on the rate of complete remission (CR) plus complete remission with partial hematologic recovery (CRh), the duration of CR+CRh, and the rate of conversion from transfusion dependence to transfusion independence.[1] The median follow-up was 8.3 months (range, 0.2 to 39.5 months) and the median treatment duration was 4.1 months (range, 0.1 to 39.5 months). CR (defined as < 5% blasts in the bone marrow, no evidence of disease and full recovery of peripheral blood counts [platelets > 100,000/microliter and absolute neutrophil counts > 1,000/microliter]) was achieved by 24.7% of patients (n = 43/174). Approximately 8% of patients (n = 14/174) obtained complete remission with partial hematological recovery (defined as < 5% of blasts in the bone marrow, no evidence of disease, and partial recovery of peripheral blood counts [platelets > 50,000/microliter and absolute neutrophil count > 500/microliter]). For patients who obtained CR or CRh, the median time first response was 2 months (range, 0.6 to 5.6 months). For the 110 patients who were dependent upon red blood cell (RBC) and/or platelet transfusions at baseline, 37.3% of patients (n = 41/110) became independent of RBC and platelet transfusions during any 56-day post-baseline period. The efficacy of Tibsovo was assessed in an open-label, single-arm, multicenter trial that included patients (n = 28) with newly-diagnosed AML and an IDH1 mutation.[1] The cohort included patients ≥ 75 years old who had comorbidities that precluded the use of intensive induction chemotherapy based on a variety of reasons (e.g., severe cardiac or pulmonary disease). The median follow-up was 8.1 months (range, 0.6 to 40.9 months) and the median treatment duration was 4.3 months (range, 0.3 to 40.9 months). The complete remission rate was 28.6%.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on AML (version 3.2020 – December 23, 2019), are extensive.[2] Tibsovo is recommended for patients who have relapsed or refractory disease who have the IDH1 mutation. Another clinical scenario is for treatment induction among patients ≥ 60 years of age who are not a candidate for intensive remission induction therapy or declines such therapy with the IHD1 mutation. In patients ≥ 60 years of age who had a response to previous lower intensity therapy, Tibsovo can be continued. Both clinical scenarios apply to patients who are IDH1 mutation positive.

Safety

Tibsovo has a Boxed Warning regarding differentiation syndrome.[1] Other more common adverse events (AEs) were fatigue (39%), leukocytosis (38%), arthralgia (36%), diarrhea (34%), dyspnea (33%), edema (32%), nausea (31%), mucositis (28%), electrocardiogram QT prolongation (26%), rash (26%), pyrexia (23%), cough (22%), and constipation (20%). Warnings and Precautions include QTc interval prolongation and Guillain-Barre Syndrome.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Tibsovo. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Tibsovo is recommended in those who meet the following criteria:

FDA-Approved Indication

126. Acute Myeloid Leukemia (AML). Approve for 3 years if the disease is isocitrate dehydrogenase-1 (IDH1) mutation positive as detected by an approved test.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Tibsovo has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

57. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Tukysa™ (tucatinib tablets – Seattle Genetics, Inc.)

DATE REVIEWED: 04/22/2020

OVERVIEW
Tukysa is indicated in combination with trastuzumab and capecitabine for the treatment of adult patients with advanced unresectable or metastatic human epidermal growth factor receptor 2 (HER2)-positive breast cancer, including patients with brain metastases, who have received one or more prior anti-HER2-based regimens in the metastatic setting.[1]

Guidelines
Tukysa is not addressed in the guidelines. According to the National Comprehensive Cancer Network (NCCN) breast cancer guidelines (version 3.2020 – March 6, 2020), Enhertu is a recommended therapy, as per its FDA-approved indication after two or more prior HER2-targeted therapies, for the treatment of recurrent or Stage IV metastatic disease that is HER2-positive.[2] Trastuzumab + Perjeta + docetaxel is

category 1, preferred regimen; or trastuzumab + Perjeta + paclitaxel (category 2A, preferred). Other recommended regimens include: Kadcyla; trastuzumab + vinorelbine, trastuzumab + capecitabine, Tykerb (lapatinib tablets) + capecitabine, and trastuzumab + Tykerb. For HR+, HER2-positive disease, endocrine therapy options include aromatase inhibitor ± trastuzumab; aromatase inhibitor + trastuzumab ± Tykerb; fulvestrant ± trastuzamab, tamoxifen ± trastuzumab (all category 2A). For premenopausal patients, ovarian ablation or suppression is recommended in addition to endocrine therapy ± trastuzumab.

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of Tukysa. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Tukysa is recommended in those who meet the following criteria:

FDA-Approved Indications

26. Breast Cancer. Approve for 3 years if the patient meets ALL of the criteria (A, B, and C):
- **A)** The patient has advanced unresectable or metastatic human epidermal growth factor receptor 2 (HER2)-positive disease; AND
- **B)** The patient has received at least one prior anti-HER2-based regimen in the metastatic setting. Note: Examples of anti-HER2-based regimens include Perjeta (pertuzumab injection for intravenous use) + trastuzumab + docetaxel, Perjeta + trastuzumab + paclitaxel; Kadcyla (ado-trastuzumab emtansine for intravenous use), trastuzumab + capecitabine, trastuzumab + Tykerb (lapatinib tablets); AND
- **C)** The medication is used in combination with trastuzumab and capecitabine.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Tukysa has not been shown to be effective or there are limited or preliminary data that are not supportive of general approval for the following conditions.

7. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Turalio Prior Authorization Policy
- Turalio® (pexidartinib capsules – Daiichi Sankyo)

REVIEW DATE: 07/29/2020

OVERVIEW
Turalio, a kinase inhibitor, is indicated for the treatment of adult patients with symptomatic tenosynovial giant cell tumor (TGCT) associated with severe morbidity or functional limitations and not amenable to improvement with surgery.[1] Turalio targets the colony stimulating factor 1 (CSF1) receptor ; it also inhibits KIT proto-oncogene receptor tyrosine kinase ,as well as FMS-like tyrosine kinase 3 with an internal tandem duplication mutation. Due to the risk of hepatotoxicity, Turalio is only available through a restricted Risk Evaluation and Mitigation Strategy (REMS) program.

Disease Overview
TGCTs are rare, benign tumors of the synovium (joint lining), bursae, and tendon sheath.[2] Tumors cause thickening and overgrowth of the affected tissues, leading to pain, swelling, and reduced mobility. Disease

is caused by a chromosomal translocation resulting in CSF1 overexpression, leading to macrophage recruitment and inflammation. The exact incidence is unknown but is estimated at approximately 43 cases per 1 million in the general population, of which approximately 10% are the diffuse subtype (also known as pigmented villonodular synovitis).[2,3] Diffuse TGCTs have a high recurrence rate after surgery of up to 50%, often with multiple recurrences.[4] Untreated or recurrent disease can lead to damage and degeneration of the affected joint. Disease typically affects a single joint, most commonly the knee or hip.

Guidelines

According to the National Comprehensive Cancer Network (NCCN) guidelines for soft tissue sarcoma (version 2.2020 – May 28, 2020), Turalio (category 1) and imatinib (category 2A) are preferred regimens for systemic therapy in TGCT.[5]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Turalio. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Turalio is recommended in those who meet the following criteria:

FDA-Approved Indications

1) **Tenosynovial Giant Cell Tumor (Pigmented Villonodular Synovitis).** Approve for 3 years if, according to the prescriber, the tumor is not amenable to improvement with surgery.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Turalio is not recommended in the following situations:

58. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Tykerb® (lapatinib ditosylate tablets – Novartis Pharmaceuticals)

REVIEW DATE: 12/18/2019

OVERVIEW

Tykerb is indicated in combination with capecitabine tablets for the treatment of patients with advanced or metastatic breast cancer whose tumors overexpress human epidermal growth factor receptor 2 (HER2) and who have received prior therapy including an anthracycline, a taxane, and Herceptin® (trastuzumab intravenous injection).[1] *Limitation of use*. Patients should have disease progression on Herceptin prior to initiation of treatment with Tykerb in combination with capecitabine tablets. Tykerb is also indicated in combination with letrozole tablets for the treatment of postmenopausal women with hormone receptor-positive (HR+) metastatic breast cancer that overexpresses HER2 for whom hormonal therapy is indicated. Tykerb in combination with an aromatase inhibitor (AI) has not been compared to a Herceptin-containing chemotherapy regimen for the treatment of metastatic breast cancer. Tykerb is a kinase inhibitor of the intracellular tyrosine kinase domains of both epidermal growth factor receptor (*EGFR*) and of HER2 (ErbB2) receptors. Tykerb inhibits ErbB-driven tumor cell growth *in vitro* and in various animal models.

Guidelines

The National Comprehensive Cancer Network (NCCN) clinical practice guidelines on breast cancer (version 3.2019 – September 6, 2019) recommend Tykerb in combination with trastuzumab (without cytotoxic therapy) or capecitabine for HER2-positive (HER2+) recurrent or metastatic trastuzumab-exposed disease with symptomatic visceral disease or visceral crisis OR that is hormone receptor-negative or HR+ and endocrine therapy refractory (category 2A).[2]

Tykerb is also recommended in combination with an AI with or without trastuzumab for the treatment of recurrent or Stage IV HR+, HER2+ disease in postmenopausal women.[2] Premenopausal women with HR+ disease should have ovarian ablation/suppression and follow the guidelines for postmenopausal patients. Men with breast cancer should be treated similarly to postmenopausal women except that using an AI is ineffective without suppression of testicular steroidogenesis (category 2A).

The NCCN guidelines for bone cancer (version 1.2020 – August 12, 2019) and the compendium recommends the use of Tykerb for *EGFR*-positive recurrent disease.[3,5]

The NCCN clinical practice guidelines on central nervous system (CNS) cancers (version 3.2019 – October 18, 2019) recommend treatments for patients with brain metastases from breast cancer.[3,4] Capecitabine with or without Tykerb is recommended for recurrent disease in patients with limited (one to three) metastatic lesions or treatment for recurrent stable systemic disease in patients with multiple (> three) metastatic lesions if Tykerb is active against the primary tumor (breast).

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Tykerb. All approvals are provided for 3 years in duration unless otherwise noted below. In the clinical criteria, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: a woman is defined as an individual with the biological traits of a woman, regardless of the individual's gender identity or gender expression; a man is defined as an individual with the biological traits of a man, regardless of the individual's gender identity or expression.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Tykerb is recommended in those who meet the following criteria:

FDA-Approved Indications

27. Breast Cancer, Human Epidermal Growth Factor Receptor 2 Positive (HER2+). Approve for 3 years if the patient meets one of the following criteria (A or B):
- **A)** Patient has advanced or metastatic breast cancer and the following criteria are met (i or ii):
  - **i.** The patient has received prior therapy with trastuzumab AND Tykerb will be used in combination with capecitabine; OR
  - **ii.** Tykerb will be used in combination with trastuzumab; OR
- **B)** Patient has hormone receptor-positive (that is, estrogen- and/or progesterone-positive) metastatic breast cancer and the following criteria are met (i and ii):
  - **i.** One of the following (a, b, or c) applies:
    - **a)** The patient is a postmenopausal woman;* OR
    - **b)** The patient is a premenopausal or perimenopausal woman* and is receiving ovarian suppression/ablation with a gonadotropin-releasing hormone (GnRH) agonist (e.g., Lupron® [leuprolide], Trelstar® [triptorelin], Zoladex® (goserelin]), surgical bilateral oophorectomy, or ovarian irradiation; OR
    - **c)** The patient is a man* and is receiving a gonadotropin-releasing hormone (GnRH) agonist (e.g., Lupron [leuprolide], Trelstar [triptorelin], Zoladex (goserelin]) AND
  - **ii.** Tykerb will be used in combination with an aromatase inhibitor (that is, letrozole, anastrozole, or exemestane).

***** Refer to the Policy Statement.

Other Uses with Supportive Evidence

2. Bone Cancer – Chordoma. Approve for 3 years if the patient has epidermal growth-factor receptor (*EGFR*)-positive recurrent disease.

3. Colon or Rectal Cancer. Approve for 3 years if the patient meets the following criteria (A, B, and C):
- **A)** The patient has unresectable advanced or metastatic disease that is human epidermal receptor2 (HER2)-amplified and with wild-type RAS; AND
- **B)** The medication is used as subsequent therapy in combination with trastuzumab; AND
- **C)** The patient has not been previously treated with a HER2-inhibitor.
  Note: Examples of HER2-inhibitors are Tykerb, trastuzumab products, Nerlynx (neratinib tablets), Kadcyla (ado-trastuzumab emtansine for injection), Perjeta (pertuzumab for injection).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Tykerb has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

59. **Cervical Cancer.** In one Phase II study (n = 228), Tykerb plus Votrient® (pazopanib tablets) was compared with Tykerb monotherapy or Votrient monotherapy in patients with advanced and recurrent cervical cancer.[6] At the interim analysis, the futility boundary was crossed for combination therapy vs. Tykerb monotherapy, and the combination arm was discontinued. The median PFS was shorter among Tykerb-treated patients vs. Votrient-treated patients (17.1 weeks vs. 18.1 weeks, respectively; HR 0.66; 90% CI: 0.48, 0.91; P < 0.013). On the clinical cutoff date, median OS was 11.6 weeks greater with Votrient vs. Tykerb (50.7 weeks vs. 39.1 weeks; HR: 0.67; 90% CI: 0.46, 0.99; P = 0.045). Patients were not preselected on the basis of EGFR or HER2 amplification.

60. **Gastric, Esophageal, or Gastroesophageal Adenocarcinoma Cancer.** In one Phase II study (n = 47), Tykerb demonstrated modest activity in patients with treatment-naïve advanced/metastatic gastric cancer.[7] A total of four patients had a confirmed partial response, one patient had an unconfirmed partial response, and 10 patients had stable disease. An exploratory analysis revealed gene expression of HER2, interleukin (IL)-8 and genomic polymorphisms IL-8, and vascular endothelial growth factor (VEGF) correlated with OS. In one Phase III, open-label trial conducted in China, Japan, South Korea, and Taiwan, Asian patients (n = 261) with HER2+ advanced gastric cancer were randomized to Tykerb 1,500 mg per day plus paclitaxel 80 mg/m^2 on Days 1, 8, and 15 of a 28-day cycle or to paclitaxel alone.[8] Patients had disease progression after prior therapy. The primary endpoint was OS. Median OS was 11.0 months in patients receiving Tykerb plus paclitaxel vs. 8.9 months with paclitaxel alone (P = 0.1044). There was no significant difference between Tykerb plus paclitaxel or paclitaxel alone in median PFS (5.4 vs. 4.4 months) or time to progression (5.5 vs. 4.4 months), respectively. Overall response rate (ORR) was higher with Tykerb plus paclitaxel vs. paclitaxel alone (27% vs. 9%, respectively; 95% CI: 1.80, 8.87; P <0.001). In one Phase III trial in patients (n = 545) with previously untreated HER2+ advanced gastroesophageal adenocarcinoma were randomized to receive CapeOx (capecitabine plus oxaliplatin) with either Tykerb or placebo.[9] Median OS was 12.2 months (95% CI: 10.6, 14.2) and 10.5 months (95% CI: 9.0, 11.3) for Tykerb and placebo, respectively (HR 0.91; 95% CI: 0.73, 1.12). Preplanned exploratory analysis showed OS in the Tykerb was prolonged in Asian and younger patients.

61. **Head and Neck, Squamous Cell Carcinoma.** In one Phase III study in 688 patients with SCCHN, adding Tykerb to chemoradiotherapy and as maintenance monotherapy was not more effective than placebo in improving disease-free survival or OS.[10]

62. **Renal Cell Carcinoma (RCC).** In one Phase III study in patients (n = 416) with advanced RCC who experienced disease progression through first-line cytokine therapy, Tykerb and hormone therapy (megestrol acetate or tamoxifen, selected by the investigator) demonstrated comparable efficacy: the median time to progression was 15.3 weeks and 15.4 weeks for Tykerb and hormone therapy, respectively (HR 0.94; P = 0.60).[11] The median OS was 46.9 weeks and 43.1 weeks for Tykerb and hormone therapy, respectively (HR 0.88; P = 0.29).

63. Urothelial Carcinoma. In one Phase III trial, 232 patients with HER1/HER2 metastatic urothelial bladder cancer who did not have progressive disease during chemotherapy were randomized to receive Tykerb or placebo after completing first-line or initial chemotherapy.[12] Median PFS, the primary endpoint, for Tykerb and placebo was 4.5 months (95% CI: 2.8, 5.4) and 5.1 months (95% CI: 3.0, 5.8), respectively (HR 1.07; 95% CI: 0.81, 1.43; P = 0.63).

64. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Valchlor (mechlorethamine gel for topical use – Helsinn Therapeutics)

REVIEW DATE: 10/16/2019

OVERVIEW

Valchlor, a nitrogen mustard, is indicated for the topical treatment of stage IA and IB mycosis fungoides-type cutaneous T-cell lymphoma in patients who have received prior skin-directed therapy.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for primary cutaneous lymphomas (Version 2.2019 – December 17, 2018) recommend Valchlor for the topical treatment of primary cutaneous B-cell lymphoma, mycosis fungoides/Sezary syndrome, and primary cutaneous CD30+ T-cell lymphoproliferative disorders.[2,3]

The NCCN guidelines for T-cell lymphomas (Version 2.2019 – December 17, 2018) recommends Valchlor for the topical treatment of adult T-cell leukemia/lymphoma – chronic/smoldering subtype.[2,4]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Valchlor. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Valchlor is recommended in those who meet the following criteria:

FDA-Approved Indications

142. Cutaneous Lymphomas (Note: Includes mycosis fungoides/Sezary syndrome, primary cutaneous B-cell lymphoma, primary cutaneous CD30+ T-cell lymphoproliferative disorders). Approve for 3 years.

Other Uses with Supportive Evidence

143. Adult T-Cell Leukemia/Lymphoma. Approve for 3 years if the patient has chronic/smoldering subtype of adult T-cell leukemia/lymphoma.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Valchlor has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

137. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

POLICY: Oncology – Venclexta® (venetoclax tablets – AbbVie and Genentech)

DATE REVIEWED: 06/03/2020

OVERVIEW

Venclexta, a B-cell lymphoma-2 (BCL-2) inhibitor, is indicated for the treatment of adults with chronic lymphocytic leukemia (CLL) or small lymphocytic lymphoma (SLL).[1] Additionally, Venclexta is indicated for use in combination with azacitidine or decitabine or low-dose cytarabine for the treatment of newly diagnosed acute myeloid leukemia (AML) in adults who are ≥ 75 years of age or who have comorbidities that preclude use of intensive induction chemotherapy. This indication is approved under accelerated approval based on response rates. Continued approval for this indication may be contingent upon verification and description of clinical benefit in confirmatory trials.

Disease Overview

CLL is one of the most prevalent adult leukemias in the Western world.[2] In 2019, an estimated 20,720 patients will be diagnosed with CLL in the US, and approximately 3,930 patients will die from the disease. The condition usually is diagnosed in older adults (≥ 70 years of age) and occurs more frequently in men. The leukemic cells appear as small, mature lymphocytes. CLL and SLL are different manifestations of the same condition and are managed similarly. In CLL, many of the abnormal lymphocytes are found in the blood, as well as in the bone marrow and lymphoid tissue. In SLL, there are few, if any, abnormal lymphocytes circulating in blood and most of the disease is in the lymph nodes, bone marrow, and other lymphoid tissue. The diagnosis requires the presence of at least 5×10^9/L monoclonal B-lymphocytes in the peripheral blood. SLL requires the presence of lymphadenopathy and/or splenomegaly with $< 5 \times 10^9$/L B-lymphocytes found in the peripheral blood.

AML is a heterogeneous hematologic malignancy that is hallmarked by clonal expansion of myeloid blasts in the peripheral blood, bone marrow, and/or other tissues.[3] It is a rather common form of acute leukemia in adults and it has the largest number of annual deaths from leukemias in the US. Around 21,450 people will be diagnosed with AML in 2019, and 10,920 patients will die from the condition. The median age at diagnosis is 67 years. Over one-half and approximately one-third of patients receive the diagnosis at ≥ 65 and ≥ 75 years of age, respectively. The incidence of AML, along with myelodysplastic syndrome (MDS) is rising as patients become older. Environmental factors play a role and include prolonged exposure to petrochemicals; solvents such as benzene; pesticides; and ionizing radiation. Also, two cytotoxic agents that are associated with therapy-related MDS/AML are alkylating agents (e.g., cyclophosphamide) and topoisomerase inhibitors (e.g., doxorubicin). Antimetabolite therapy, notably fludarabine, has also been associated with MDS/AML in patients with lymphoproliferative disorders, especially when given in combination with alkylating agents. Molecular or karyotypic abnormalities can also be identified. Treatment of AML can involve the following modalities at various stages: chemotherapy, radiation therapy, chemotherapy with stem cell transplant, and other drug therapy.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for CLL/SLL (version 4.2020 – December 20, 2019) cite Venclexta in several scenarios.[2] Venclexta plus Gazyva® (obinutuzumab injection for intravenous use) is listed as a first-line therapy (preferred regimen) in frail patients with comorbidities, patients ≥ 65 years, and in younger patients with significant comorbidities without 17p deletion/TP53 mutation (category 2A). This regimen is also cited as another recommended regimen (category 2B) in patients < 65 years of age without significant comorbidity. Venclexta plus rituximab is listed as preferred

regimen option for patients with relapsed/refractory therapy without 17p deletion (category 1).[3] The NCCN also cite Venclexta as an option for relapsed/refractory therapy among patients with CLL without deletion 17p/TP53 mutation (category 2A).[3] For patients with 17p deletion/TP53 mutation, Venclexta plus Gazyva is recommended as a preferred regimen first-line (category 2A). Also, among this population, Venclexta with rituximab (category 1) and Venclexta alone (category 2A) are recommended in patients with relapsed or refractory disease as preferred regimens. Many other first-line options are recommended. CLL and SLL are different manifestations of the same diseases which are managed similarly.[3]

NCCN guidelines for AML (version 3.2020 – December 23, 2019) recommend Venclexta (in combination with decitabine, azacitidine or low-dose cytarabine) for treatment induction in patients ≥ 60 years of age who are candidates for intensive remission induction therapy with unfavorable-risk cytogenetics.[3] It is also recommended in other induction therapy clinical scenarios in patients who are not candidates for intensive remission. . Venclexta (along with decitabine, azacitidine, or low-dose cytarabine) is also recommended as AML post-induction therapy for patients ≥ 60 years of age.

The NCCN guidelines for B-Cell Lymphomas (version 1.2020 – January 22, 2020) address mantle cell lymphoma. Venclexta is cited as a preferred second-line therapy regimen (category 2A) in patients with a short response duration to prior chemoimmunotherapy.[4] Other regimens recommended second-line are Venclexta plus Imbruvica (category 2B). Venclexta is recommended as an other recommended regimen in patients with an extended response duration to prior chemoimmunotherapy.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Venclexta.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Venclexta is recommended in those who meet the following criteria:

FDA-Approved Indications

127. Chronic Lymphocytic Leukemia (CLL). Approve for 3 years.

128. Small Lymphocytic Lymphoma (SLL). Approve for 3 years.

129. Acute Myeloid Leukemia (AML). Approve for 3 years if the patient is using Venclexta in combination with either azacitidine, decitabine, or cytarabine.

Other Uses with Supportive Evidence

130. Mantle Cell Lymphoma. Approve for 3 years if the patient has tried at least one prior therapy. Note: Examples of therapies include Imbruvica® (ibrutinib capsules and tablets) with or without rituximab; Calquence® (acalabrutinib capsules); Revlimid® (lenalidomide capsules) with or without rituximab; RDHAP (rituximab, dexamethasone, cytarabine, cisplatin); alternating RCHOP/RDHAP [rituximab, cyclophosphamide, doxorubicin, vincristine, prednisone/rituximab, dexamethasone, cytarabine, cisplatin]; HyperCVAD (cyclophosphamide vincristine, doxorubicin, and dexamethasone

alternating with high-dose methotrexate and cytarabine) plus rituximab; RCHOP; or Treanda® (bendamustine injection for intravenous use) plus rituximab.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Venclexta has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

65. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Verzenio™ (abemaciclib tablets – Eli Lilly and Company)

DATE REVIEWED: 04/15/2020

OVERVIEW

Verzenio, a cyclin-dependent kinase (CDK) 4/6 inhibitor, is indicated for the following uses:

1. In combination with an aromatase inhibitor (AI) as initial endocrine-based therapy for the treatment of postmenopausal women with hormone receptor positive (HR+), human epidermal growth factor receptor 2 (HER2)-negative advanced or metastatic breast cancer;[1-2]
2. In combination with fulvestrant for the treatment of women with HR+, HER2-negative advanced or metastatic breast cancer with disease progression following endocrine therapy.[1,3] Pre/perimenopausal women treated with Verzenio plus Faslodex should be treated with a gonadotropin-releasing hormone (GnRH) agonist according to current clinical practice standards.
3. As monotherapy for the treatment of adult patients with HR+, HER2-negative advanced or metastatic breast cancer with disease progression following endocrine therapy and prior chemotherapy in the metastatic setting.[1,4]

Disease Overview

Based on molecular profiling, breast cancer is classified as HR+ (estrogen receptor positive [ER+] and/or progesterone receptor positive [PgR+]), HER2+, or triple negative (ER-negative, PgR-negative, and HER2-negative).[5-6] Most breast cancers in women (71%) are HR+, HER2-negative; these cancers tend to be slow-growing and less aggressive than other subtypes.[6] HR+, HER2-negative tumors are associated with the most favorable prognosis compared with other subtypes, particularly in the short-term, in part because

expression of hormone receptors is predictive of a favorable response to hormonal therapy. In men, about 85% of breast cancers are ER+ and 70% are PgR+.[7] About 12% of breast cancers are HR+ and HER2+, and tend to be higher grade and more aggressive than HR+ cancers.[6] About 5% of breast cancers are HER2+ and do not express hormone receptors. These cancers tend to be more aggressive than other breast cancers and have a poorer short-term prognosis compared with ER+ breast cancers. About 12% of breast cancers in women are triple negative and have a poorer short-term prognosis than other subtypes.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on breast cancer (version 3.2020 – March 6, 2020) recommend CDK 4/6 inhibitor in combination with fulvestrant for first-line therapy (category 1, preferred regimen) in HR+/HER2-negative recurrent or Stage IV (metastatic) disease.[8] This combination can also be used as second/subsequent-line preferred therapy if CDK4/6 inhibitor was not used previously (category 1). CDK 4/6 inhibitors + aromatase inhibitor is also a preferred regimen in guidelines (category 1, preferred). Verzenio is also recommended as "useful in certain circumstances" as a single agent in HR+, HER2-negative breast cancer after progression on prior endocrine therapy and prior chemotherapy in the metastatic setting (category 2A). The above recommendations for CDK4/6 inhibitors is for use in postmenopausal women or premenopausal women receiving ovarian ablation or suppression. The guidelines recommend that men with breast cancer be treated similarly to postmenopausal women, except that the use of an AI is ineffective without concomitant suppression of testicular steroidogenesis. In men with breast cancer, tamoxifen is generally used rather than an AI, because the data supporting use of an AI in men are limited.[5] The use of AI therapy with LHRH has been reported. Information is not available using Verzenio in men with breast cancer. However, available real-world data suggest comparable efficacy and safety profiles in men as in women; it is reasonable to recommend CDK4/6 inhibitors in combination with an aromatase inhibitor or fulvestrant, everolimus, and PIK3CA inhibitors to men based on extrapolation of data from studies comprised largely of female participants with advanced breast cancer.

The NCCN guidelines state in a footnote that if there is disease progression on CDK4/6 inhibitor therapy, there are limited data to support an additional line of therapy with another CDK4/6-containing regimen.[8] The limited data are based on a multicenter analysis which evaluated clinical outcomes in patients (n = 58) with HR+/HER2-negative metastatic breast cancer who received Verzenio after disease progression on Ibrance or Kisqali.[9] At data cutoff, 34% of patients (n = 20/58) had progressive disease, while 36% of patients (n = 21/58) had treatment duration exceeding 6 months. The median PFS was 5.8 months. There are no published data with additional line of therapy with Ibrance or Kisqali, if the patient has progressed on Verzenio.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Verzenio. All approvals are provided for 3 years in duration unless otherwise noted below. In the clinical criteria, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: a woman is defined as an individual with the biological traits of a woman, regardless of the individual's gender identity or gender expression; men are defined as individuals with the biological traits of a man, regardless of the individual's gender identity or gender expression.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Verzenio is recommended in those who meet the following criteria:

FDA-Approved Indications

131. Breast Cancer in Postmenopausal Women*. Approve for 3 years if the patient meets the following criteria (A, B, C, and D):

101. Patient has advanced or metastatic hormone receptor positive (HR+) [i.e., estrogen receptor positive {ER+} and/or progesterone receptor positive {PR+}] disease; AND

102. Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND

103. The patient meets ONE of the following criteria (i, ii, or iii):

i. Verzenio will be used in combination with anastrozole, exemestane, or letrozole; OR

ii. Verzenio will be used in combination with fulvestrant ; OR

iii. The patient meets the following conditions (a, b, and c):

a) Verzenio will be used as monotherapy; AND

b) The patient's breast cancer has progressed on at least one prior endocrine therapy. Note: Examples are anastrozole, exemestane, letrozole, tamoxifen, Fareston® [toremifene], exemestane plus everolimus, fulvestrant, everolimus plus fulvestrant or tamoxifen, megestrol acetate, fluoxymesterone, ethinyl estradiol; AND

c) The patient has tried chemotherapy for metastatic breast cancer; AND

D) The patient has not had disease progression while on Verzenio.

***** Refer to the Policy Statement.

2. Breast Cancer in Pre/Perimenopausal Women.* Approve for 3 years if the patient meets the following criteria (A, B, C, D, and E):

E) Patient has advanced or metastatic hormone receptor positive (HR+) [i.e., estrogen receptor positive {ER+} and/or progesterone receptor positive {PR+}] disease; AND

F) Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND

G) The patient is receiving ovarian suppression/ablation with a gonadotropin-releasing hormone (GnRH) agonist (e.g., Lupron [leuprolide], Trelstar [triptorelin], Zoladex (goserelin]), or has had surgical bilateral oophorectomy or ovarian irradiation; AND

H) Patient meets ONE of the following conditions (i, ii, or iii):

i. Verzenio will be used in combination with anastrozole, exemestane, or letrozole; OR

ii. Verzenio will be used in combination with fulvestrant; OR

iii. Patient meets the following conditions (a, b, and c):

a) Verzenio will be used as monotherapy; AND

b) The patient's breast cancer has progressed on at least one prior endocrine therapy Note: Examples are anastrozole, exemestane, letrozole, tamoxifen, Fareston® [toremifene], exemestane plus everolimus, fulvestrant, everolimus plus fulvestrant or tamoxifen, megestrol acetate, fluoxymesterone, ethinyl estradiol; AND

c) The patient has tried chemotherapy for metastatic breast cancer; AND

E) Patient has not had disease progression while on Verzenio.

***** Refer to the Policy Statement.

Other Uses With Supportive Evidence

3. Breast Cancer in Men*. Approve for 3 years if the patient meets the following criteria (A, B, C, and D):

I) Patient has advanced or metastatic hormone receptor positive (HR+) [i.e., estrogen receptor positive {ER+} and/or progesterone receptor positive {PR+}]disease; AND
J) Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND
K) The patient meets ONE of the following criteria (i, ii, or iii):
- **i.** The patient meets BOTH of the following conditions (a and b):
  - **a)** The patient is receiving a gonadotropin-releasing hormone (GnRH) agonist (e.g., Lupron [leuprolide], Trelstar [triptorelin], Zoladex [goserelin]); AND
  - **b)** Verzenio will be used in combination with anastrozole, exemestane, or letrozole; OR
- **ii.** Verzenio will be used in combination with fulvestrant; OR
- **iii.** The patient meets the following conditions (a, b, and c):
  - **a)** Verzenio will be used as monotherapy; AND
  - **b)** The patient's breast cancer has progressed on at least one prior endocrine therapy Note: Examples are anastrozole, exemestane, letrozole, tamoxifen, Fareston (toremifene), exemestane plus everolimus, fulvestrant, everolimus plus fulvestrant or tamoxifen, megestrol acetate, fluoxymesterone, ethinyl estradiol; AND
  - **c)** The patient has tried chemotherapy for metastatic breast cancer; AND

D) The patient has not had disease progression while on Verzenio.

***** Refer to the Policy Statement.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Verzenio has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

66. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Vistogard Prior Authorization Policy
- Vistogard® (uridine triacetate oral granules – Wellstat Therapeutics)

REVIEW DATE: 07/29/2020

OVERVIEW

Vistogard, a pyrimidine analog, is indicated for the emergency treatment of adult and pediatric patients:
- Following a fluorouracil or capecitabine overdose regardless of the presence of symptoms; or
- Who exhibit early-onset, severe or life-threatening toxicity affecting the cardiac or central nervous system, and/or early-onset, unusually severe adverse reactions (e.g., gastrointestinal toxicity, neutropenia) within 96 hours following the end of fluorouracil or capecitabine administration.[1]

As a limitation of use, Vistogard is not recommended for the non-emergent treatment of adverse events associated with fluorouracil or capecitabine because it may diminish the efficacy of these drugs.[1] Additionally, the safety and efficacy of Vistogard initiated more than 96 hours following the end of fluorouracil or capecitabine administration have not been established. Vistogard is supplied in 10 gram packets. For adults, the dose is 10 grams (1 packet) every 6 hours for 20 doses. For pediatric patients, the dose is 6.2 grams/m^2 of body surface area (not to exceed 10 grams per dose) every 6 hours for 20 doses. Any unused portion of a packet must be discarded; it should not be saved for subsequent doses.

Disease Overview

Fluorouracil and capecitabine (a fluorouracil prodrug) are widely used chemotherapeutic agents with potential for significant toxicity. Exaggerated sensitivity to capecitabine or fluorouracil may occur due to genetic variations in certain enzymes, renal impairment, or other causes.[2] Toxicity results in tissue damage, often manifesting as ulcerative mucositis with neutropenia leading to sepsis, shock, and organ failure. Additionally, central neurotoxicity and cardiac toxicity may occur without any identifiable predisposing factors. Exogenous uridine competes with the toxic metabolite fluorouridine triphosphate for incorporation into RNA in normal tissues, thereby protecting the tissues from toxicity.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Vistogard. All approvals are provided for the duration noted below.

Automation: None

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Vistogard is recommended in those who meet the following criteria:

FDA-Approved Indications

26. Capecitabine or Fluorouracil Overdose. Approve for 7 days.

27. Capecitabine or Fluorouracil Toxicity, Severe or Life-Threatening. Approve for 7 days.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Coverage of Vistogard is not recommended in the following situations:

6. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Vitrakvi® (larotrectinib capsules and oral solution – Loxo Oncology/Bayer)

DATE REVIEWED: 12/04/2019

OVERVIEW
Vitrakvi, a kinase inhibitor, is indicated for the treatment of adult and pediatric patients with solid tumors that: have a neurotrophic receptor tyrosine kinase (NTRK) gene fusion without a known acquired resistance mutation; are metastatic or where surgical resection is likely to result in severe morbidity; and have no satisfactory alternative treatments or that have progressed following treatment.[1]

The National Comprehensive Cancer Network (NCCN) Compendium lists the following cancers as recommended uses for Vitrakvi[2]: small bowel adenocarcinoma, angiosarcoma, rhabdomyosarcoma, retroperitoneal/intra-abdominal sarcoma, salivary gland tumors, cutaneous melanoma, central nervous system cancers, thyroid carcinoma, rectal cancer, non-small cell lung cancer, colon cancer, ovarian cancer, and pancreatic cancer.

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of Vitrakvi. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Vitrakvi is recommended in those who meet the following criteria:

FDA-Approved Indications

2. Solid Tumors. Approve for 3 years if the patient meets the following criteria (A, B, and C):

A) The patient's tumor has a neurotrophic receptor tyrosine kinase (*NTRK*) gene fusion without a known acquired resistance mutation; AND
B) The patient meets one of the following criteria (i or ii):
  i. The tumor is metastatic; OR
  ii. Surgical resection of tumor will likely result in severe morbidity; AND
C) The patient meets one of the following criteria (i or ii):
  i. There are no satisfactory alternative treatments; OR
  ii. The patient has disease progression following treatment.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Vitrakvi has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

67. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Vizimpro® (dacomitinib tablets – Pfizer Labs)

REVIEW DATE: 10/02/2019

OVERVIEW
Vizimpro, a kinase inhibitor, is indicated for the first-line treatment of patients with metastatic non-small cell lung cancer (NSCLC) with epidermal growth factor receptor (EGFR) exon 19 deletion or exon 21 (L858R) substitution mutations as detected by an FDA-approved test.[1]

Guidelines
The National Comprehensive Cancer Network (NCCN) guidelines for NSCLC (version 7.2019 – August 30, 2019) recommends Vizimpro, Tarceva® (erlotinib tablets), Iressa® (gefitinib tablets), Gilotrif™ (afatinib tablets) and Tagrisso™ (osimertinib tablets) [all category 1] for the first-line treatment of patients with sensitizing *EGFR*-mutation positive NSCLC discovered before first-line chemotherapy. Tagrisso is noted as the "preferred" option. Upon disease progression, T790M testing is recommended. Tagrisso is a category 1 recommended option if T790M mutation-positive. Patients can also continue Vizimpro, Tarceva, Gilotrif, or Iressa (category 2A). NCCN added a footnote to this recommendation to also consider Gilotrif and Erbitux® (cetuximab for injection) combination regimen in patients with disease progression (T790M-negative multiple systemic lesions) on EGFR-TKI therapy (category 2A).

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of Vizimpro. All approvals are provided for 3 years in duration as noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Vizimpro is recommended in those who meet the following criteria:

FDA-Approved Indications

132. Non-Small Cell Lung Cancer (NSCLC) – Epidermal Growth Factor Receptor (EGFR) Mutation-Positive. Approve for 3 years if the patient meets the following criteria (A and B):
~~**104.**~~ The patient has *metastatic* NSCLC; AND
~~**105.**~~ The patient meets ONE of the following criteria (i or ii):
i. The patient has epidermal growth factor receptor (EGFR) exon 19 deletion as detected by an approved test; OR
ii. The patient has exon 21 (L858R) substitution mutations as detected by an approved test.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Vizimpro has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Votrient® (pazopanib tablets – GlaxoSmithKline)

DATE REVIEWED: 05/27/2020

OVERVIEW
Votrient, a multi-tyrosine kinase inhibitor, is indicated for the treatment of patients with advanced renal cell carcinoma (RCC), and for the treatment of patients with advanced soft tissue sarcoma (STS) who have received prior chemotherapy.[1] Limitation of Use. The efficacy of Votrient for the treatment of patients with adipocytic STS or gastrointestinal stromal tumors (GIST) has not been demonstrated.

Guidelines
Votrient features prominently in the National Comprehensive Cancer Network (NCCN) guidelines for soft tissue sarcomas and kidney cancer and others. The indications listed in the FDA-approved and Other Uses

with Supportive Evidence sections are supported by the prescribing information and/or the NCCN Compendium/Guidelines.

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of Votrient. All approvals are provided for 3 years in duration unless otherwise noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Votrient is recommended in those who meet the following criteria:

FDA-Approved Indications

133. Renal Cell Carcinoma (Clear Cell or Non-Clear Cell Histology). Approve for 3 years for relapsed or Stage IV disease.

2. Soft Tissue Sarcoma (STS). Approve for 3 years if the patient meets the following criteria (A, B, and C):
- **A)** The soft tissue sarcoma is advanced or metastatic; AND
- **B)** The patient has ONE of the following (i, ii, iii, iv, v, or vi):[3]
  - **i.** Angiosarcoma; OR
  - **ii.** Pleomorphic rhabdomyosarcoma; OR
  - **iii.** Retroperitoneal/intra-abdominal soft tissue sarcoma that is unresectable or progressive; OR
  - **iv.** Soft tissue sarcoma of the extremity/superficial trunk or head/neck, including synovial sarcoma; OR
  - **v.** Solitary fibrous tumor/hemangiopericytoma; OR
  - **vi.** Alveolar soft part sarcoma; OR
- **C)** The patient does not have gastrointestinal stromal tumor (GIST) [see Criterion 4].

Other Uses with Supportive Evidence

3. Differentiated (i.e., papillary, follicular, and Hürthle cell) Thyroid Carcinoma. Approve for 3 years if refractory to radioactive iodine therapy.

4. Gastrointestinal Stromal Tumor (GIST). Approve for 3 years if the patient meets the following criteria (A, B, and C):
- **G)** Patient has previously tried imatinib (Gleevec® tablets, generics); AND
- **H)** Patient has previously tried Sutent® (sunitinib capsules); AND
- **I)** Patient has previously tried Stivarga® (regorafinib tablets).

5. Medullary Thyroid Carcinoma. Approve for 3 years if the patient has tried Caprelsa® (vandetanib tablets) or Cometriq® (cabozantinib capsules).

6. Ovarian Cancer (i.e., Epithelial Ovarian, Fallopian Tube, or Primary Peritoneal Cancer). Approve for 3 years if the patient has persistent or recurrent disease.

7. **Uterine Sarcoma (e.g., endometrial stromal sarcoma, undifferentiated uterine sarcoma, uterine leiomyosarcomas).** Approve for 3 years in patients with recurrent, advanced, or metastatic disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Votrient has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below.

68. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Xalkori® (crizotinib capsules – Pfizer)

DATE REVIEWED: 12/18/2019

OVERVIEW

Xalkori, an oral kinase inhibitor, is indicated for the treatment of patients with metastatic non-small cell lung cancer (NSCLC) whose tumors are anaplastic lymphoma kinase (ALK)-positive as detected by an FDA-approved test.[1] Xalkori is also FDA-approved for the treatment of patients with metastatic NSCLC whose tumors are ROS1-positive.

Rearrangements involving the ALK locus on chromosome 2p33 have been documented in approximately 50% of inflammatory myofibroblastic tumors (IMTs).[7] IMTs occur primarily during the first two decades of life and typically arise in the lung, retroperitoneum, or abdominal region. Local recurrence may occur after initial surgery, with a low risk of distant metastases. Sustained partial response to Xalkori in a patient *with* ALK-translocated IMT, and no observed activity in a patient *without* ALK translocation have been reported. In another case report, a 45-year old Hispanic female was eventually diagnosed to have IMT with systemic involvement and ALK gene rearrangement.[8] The patient was treated with Xalkori and had a successful resolution of her lesions and symptoms. After a 27-month follow-up, the patient remained in complete clinical and radiologic remission.

Guidelines

According to the National Comprehensive Cancer Network (NCCN) NSCLC guidelines (version 1.2020 – November 6, 2019), Alecensa® (alectinib capsules) is the preferred therapy (category 1).[2,5] Other recommended therapies include Zykadia™ (ceritinib capsules) and Alunbrig™ (brigatinib tablets) [both also category 1]. Xalkori (category 1 as well) is listed as Useful in Certain Circumstances. For subsequent therapy with progression on Xalkori, therapy can be switched to Zykadia, Alecensa, or Alunbrig (if not previously given) [all category 2A]. For progression on Alecensa, Alunbrig, or Zykadia, Lorbrena (lorlatinib tablets) is recommended (category 2A). Xalkori (Preferred) or Zykadia (Other Recommended therapy) are recommended as first-line therapy for ROS1 rearrangement-positive NSCLC (both category

2A). Lorbrena can be used as subsequent therapy for ROS1 rearrangement. Xalkori is also recommended as an emerging targeted therapy in patients with high level *MET* amplification or *MET* exon 14 skipping mutation in lung cancer (category 2A).

The NCCN guidelines for soft tissue sarcoma (version 4.2019) recommend Xalkori as single-agent therapy for the treatment of IMT with ALK translocation (category 2A recommendation).[3,5]

The NCCN T-Cell lymphoma guidelines (version 2.2019) recommend Xalkori use in ALK-positive ALCL as a second-line and subsequent therapy option (category 2A) in patients with intent to proceed to transplant and in those who do not intend to proceed to transplant.[4,5]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Xalkori. All approvals are provided for 3 years unless otherwise noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Xalkori is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Non-Small Cell Lung Cancer (NSCLC).** Approve for 3 years if the patient has metastatic anaplastic lymphoma kinase (ALK)-positive NSCLC as detected by an approved test.

2. **Non-Small Cell Lung Cancer (NSCLC) with ROS1 Rearrangement.** Approve for 3 years if the patient has recurrent or metastatic disease as detected by an approved test.

Other Uses with Supportive Evidence

3. **Non-Small Cell Lung Cancer (NSCLC) with High Level *MET* Amplification or MET Exon 14 Skipping Mutation.** Approve for 3 years.

4. **Soft Tissue Sarcoma Inflammatory Myofibroblastic Tumor (IMT) with ALK Translocation.** Approve for 3 years.

5. **Peripheral T-Cell Lymphoma – Anaplastic Large Cell Lymphoma (ALCL), ALK-Positive.** Approve for 3 years if Xalkori is used as subsequent therapy for relapsed or refractory disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Xalkori has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

69. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Xermelo™ (telotristat ethyl tablets – Lexicon Pharmaceuticals)

DATE REVIEWED: 05/13/2020

OVERVIEW

Xermelo is indicated for the treatment of carcinoid syndrome diarrhea in combination with somatostatin analog (SSA) therapy in adults inadequately controlled by SSA therapy.[1] Telotristat, the active metabolite, inhibits tryptophan hydroxylase, which mediates the rate limiting step in serotonin biosynthesis. Serotonin plays a role in mediating secretion, motility, inflammation, and sensation of the gastrointestinal tract and is overproduced in patients with carcinoid syndrome. Xermelo specifically reduces the production of peripheral serotonin and decreases the frequency of carcinoid syndrome diarrhea. The inclusion criteria for the TELESTAR pivotal study required all patients randomized to Xermelo or placebo groups to have at least four bowel movements per day while on SSA therapy.[2] The study also required patients to be receiving a stable-dose of SSA therapy for at least 3 months prior to trial enrollment.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Xermelo. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Xermelo is recommended in those who meet the following criteria:

FDA-Approved Indications

134. Carcinoid Syndrome Diarrhea.

A) Initial Therapy. Approve for 3 years if the patient meets all of the following criteria (i, ii, and iii):
- **i.** The patient has been on a long-acting somatostatin analog (SSA) therapy for at least 3 consecutive months.
  Note: Examples of long-acting SSA therapy are Somatuline® Depot (lanreotide for injection), Sandostatin® LAR Depot (octreotide for injection); AND
- **ii.** While on a long-acting somatostatin analog therapy (prior to starting Xermelo), the patient continues to have at least four bowel movements per day; AND
- **iii.** Xermelo will be used concomitantly with a long-acting somatostatin analog therapy.

B) Patient is Currently Receiving Xermelo. Approve for 3 years if the patient is continuing to take Xermelo concomitantly with a long-acting somatostatin analog therapy for carcinoid syndrome diarrhea.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Xermelo has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

70. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Xospata® (gilteritinib tablets – Astellas)

DATE REVIEWED: 12/04/2019

OVERVIEW

Xospata, an inhibitor of tyrosine kinases including FMS-like tyrosine-kinase 3 (FLT3), is indicated for the treatment of adults who have relapsed or refractory acute myeloid leukemia (AML) with a FLT3 mutation as detected by an FDA-approved test.[1] The recommended initial dose is 120 orally once daily (QD). Response may be delayed. In the absence of disease progression or unacceptable toxicity, treatment for a minimum of 6 months is recommended to allow time for a clinical response. Dosage modifications are recommended for patients who experience toxicities related to Xospata.

Disease Overview

AML is a heterogeneous hematologic malignancy that is hallmarked by clonal expansion of myeloid blasts in the peripheral blood, bone marrow, and/or other tissues.[2] It is a rather common form of acute leukemia in adults and it has the largest number of annual deaths from leukemias in the US. Around 21,450 people will be diagnosed with AML in 2019, and 10,920 patients will die from the condition. The median age at diagnosis is 67 years. Over one-half and approximately one-third of patients receive the diagnosis at ≥ 65 and ≥ 75 years of age, respectively. The incidence of AML, along with myelodysplastic syndrome (MDS) is rising as patients become older. Environmental factors play a role and include prolonged exposure to petrochemicals; solvents such as benzene; pesticides, and ionizing radiation. Also, two cytotoxic agents that are associated with therapy-related MDS/AML are alkylating agents (e.g., cyclophosphamide) and topoisomerase inhibitors (e.g., doxorubicin). Antimetabolite therapy, notably fludarabine, has also been associated with MDS/AML in patients with lymphoproliferative disorders, especially when given in combination with alkylating agents. Treatment of AML can involve the following modalities at various stages: chemotherapy, radiation therapy, chemotherapy with stem cell transplant, and other drug therapy. Molecular or karyotypic abnormalities can also be identified, of which FLT3 is noted. The two major classes of activating FLT3 mutations are internal tandem duplications (ITD) and tyrosine kinase domain (TKD) point mutations. FLT3-ITD mutations occur in around 30% of cases and are more common than FLT3-TKD mutations, which occur in approximately 10% of patients. Prognosis can be worse in patients with certain types of FLT3 mutations (e.g. shorter remissions, decreased overall survival).

Clinical Efficacy

The efficacy of Xospata was evaluated in a trial called ADMIRAL, which involved adults with relapsed or refractory AML having a FLT3, ITD, D835, or 1836 mutation.[1,3] The first interim analysis of the trial involved 138 patients.[1]

The median follow-up was 4.6 months. Among the 106 patients who were dependent on red blood cell and/or platelet transfusions at baseline, approximately 31% of patients became independent of RBC and platelet transfusions during any 56-day post-baseline period. The rate of complete remission (CR)/complete remission with partial hematologic recovery (CR/CRh) was 21% (n = 29/138). The final analysis involved 371 patients who received Xospata 120 mg QD (n = 247) over continuous 28-day cycles or a prespecified chemotherapy regimen (n = 124) which included high intensity combinations (MEC [mitoxantrone, etoposide, and cytarabine] and FLAG-IDA [fludarabine, cytarabine, granulocyte colony-stimulating factor, and idarubicin) and low intensity regimens (LDAC [low-dose cytarabine] and AZA [azacitidine]). At the time of analysis, the median follow-up was 17.8 months. Patients who received Xospata had a significant longer survival compared with patients given chemotherapy (hazard ratio 0.64; 95% confidence interval: 0.49, 0.83; P = 0.0004).

Guidelines
The National Comprehensive Cancer Network (NCCN) has guidelines for AML (version 2.2020 – September 3, 2019) are extensive.[2] Many medications are utilized at various stages of patients with AML. For relapsed or refractory disease, Xospata is a recommended therapy for AML among patients with an FLT3-ITD mutation (category 1). Hypomethylating agents (azacitidine or decitabine) plus Nexavar® (sorafenib tablets) are also recommended for patients with an FLT3-ITD mutation (category 2A). For patients with AML with an FLT3-TKD mutation, Xospata is recommended (category 1).

Safety
Xospata has a Boxed Warning regarding differential syndrome, which can be fatal if not treated. If differentiation syndrome is suspected, initiate corticosteroid therapy and hemodynamic monitoring until resolution of symptoms.

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of Xospata. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Xospata is recommended in those who meet the following criteria:

FDA-Approved Indications

144. Acute Myeloid Leukemia (AML). Approve for 3 years if the patient meets the following criteria (A and B).
- **A)** The patient has relapsed or refractory disease; AND
- **B)** The disease is *FLT3*-mutation positive as detected by an approved test.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Xopsata has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

138. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available Condition.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Xpovio Prior Authorization Policy
- Xpovio™ (selinexor tablets – Karyopharm Therapeutics, Inc.)

REVIEW DATE: 07/01/2020

OVERVIEW
Xpovio, a nuclear export inhibitor, is indicated for treatment of the following conditions:[1]
- **Diffuse large B-cell lymphoma** (DLBCL), not otherwise specified (including DLBCL arising from follicular lymphoma), for treatment of adults with relapsed or refractory disease, after at least two lines of systemic therapy.
- **Multiple myeloma**, in combination with dexamethasone for adults with relapsed or refractory disease who have received at least four prior therapies and whose disease is refractory to at least two proteasomes inhibitors, at least two immunomodulatory agents, and an anti-CD38 monoclonal antibody.

For both of these indications, Xpovio was approved under accelerated approval based on response rate. Continued approval may be contingent upon verification in a confirmatory trial.

Guidelines
Guidelines from the National Comprehensive Cancer Network (NCCN) [version 4.2020 – May 8, 2020] recommend various regimens as primary therapy (transplant eligible and non-transplant candidates), maintenance therapy, and previously treated multiple myeloma.[2] Xpovio/dexamethasone is among the regimens considered useful in certain circumstances for previously treated multiple myeloma, specifically for the approved indication.

NCCN guidelines for B-cell lymphomas (version 2.2020 – July 9, 2020) recommend Xpovio as third-line and subsequent therapy of DLBCL, after at least two lines of systemic therapy.[3] This includes use in patients with disease progression after transplant or chimeric antigen receptor (CAR) T-cell therapy.

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of Xpovio. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Xpovio is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Diffuse Large B-Cell Lymphoma.** Approve for 3 years if the patient meets BOTH of the following (A and B):
   A) Patient is ≥ 18 years of age; AND
   B) Patient has been treated with at least two prior systemic therapies.

2. **Multiple Myeloma.** Approve for 3 years if the patient meets ALL of the following (A, B, C, D, and E):
   5. Patient is ≥ 18 years of age; AND
   6. Patient has tried at least two proteasome inhibitors; AND
   Note: Examples include Velcade (bortezomib injection), Kyprolis (carfilzomib infusion), Ninlaro (ixazomib capsules).
   7. Patient has tried at least two immunomodulatory drugs; AND
   Note: Examples include Revlimid (lenalidomide capsules), Pomalyst (pomalidomide capsules), Thalomid (thalidomide capsules).
   8. Patient has tried an anti-CD38 monoclonal antibody; AND
   Note: For example, Darzalex (daratumumab infusion), Darzalex Faspro (daratumumab and hyaluronidase-fihj subcutaneous injection), or Sarclisa (isatuximab-irfc infusion).
   9. The agent will be taken in combination with dexamethasone.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Coverage of Xpovio is not recommended in the following situations:

139. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Xtandi® (enzalutamide capsules – Astellas Pharma/Catalent Pharma Solutions/Medivation)

DATE REVIEWED: 03/04/2020

OVERVIEW
Xtandi is an androgen receptor inhibitor indicated for the treatment of patients with castration-resistant prostate cancer (CRPC).[1] It is also indicated for the treatment of patients with metastatic castration-sensitive prostate cancer (mCSPC). Patients should receive Xtandi with a concurrent gonadotropin-releasing hormone (GnRH) analog or should have had a bilateral orchiectomy.

Guidelines

According to the NCCN guidelines on prostate cancer (version 4.2019 – August 19, 2019), all patients with mCRPC should maintain castrate levels of serum testosterone (< 50 ng/dL) and receive best supportive care.[2] Erleada™ (apalutamide tablets), Nubeqa (darolutamide tablets), and Xtandi are all category 1 recommended options for non-metastatic CRPC (M0) especially if the prostate specific antigen doubling time (PSADT) ≤ 10 months.

- For patients who progress to CRPC and are positive for distant metastasis, M1, and there are no visceral metastases, Zytiga® (abiraterone acetate tablets) and prednisone, docetaxel, Xtandi, and Xofigo® (radium Ra 223 dichloride injection, for intravenous use) [for symptomatic bone metastases] are all category 1 recommended options.
  - If there are visceral metastases, and if it is adenocarcinoma (majority), Xtandi and docetaxel are category 1 recommended options. Zytiga and prednisone, mitoxantrone with prednisone, or other secondary hormone therapies are other options (all category 2A).
  - For no visceral metastases, if patients had received prior therapy with Xtandi or Zytiga, then docetaxel and Xofigo are the category 1 options for subsequent therapy. If patients received prior docetaxel therapy, then Xtandi, Zytiga, Xofigo, and cabazitaxel are the category 1 options. For subsequent therapy with visceral metastases, docetaxel is the recommended category 1 option, if either Xtandi or Zytiga were used as prior therapies. For prior therapy with docetaxel, Xtandi, Zytiga, cabazitaxel are the recommended category 1 options.
  - For metastatic, castration-naïve disease, ADT in combination with abirateron + prednisone, Erleada, and Xtandi are all category 1 recommended options. Yonsa (abiraterone acetate) with methylprednisolone is a category 2B recommendation.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Xtandi. All approvals are provided for 3 years in duration unless otherwise noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Xtandi is recommended in those who meet the following criteria:

FDA-Approved Indication

135. Prostate Cancer –Castration-Resistant (CRPC) [Metastatic or Non-Metastatic]. Approve for 3 years if the patient meets the following criteria (A or B):
- **A)** The medication is used concurrently with a gonadotropin-releasing hormone (GnRH) analog. Note: Examples are Lupron (leuprolide for injection), Lupron Depot (leuprolide acetate for depot suspension), Trelstar (triptorelin pamoate for injectable suspension), Zoladex (goserelin acetate implant), Vantas (histrelin acetate subcutaneous implant), Firmagon (degarelix for injection); OR
- **B)** The patient has had a bilateral orchiectomy.

2. Prostate Cancer – Metastatic, Castration-Sensitive. Approve for 3 years if the patient meets one of the following criteria (A or B):
- **A)** The medication is used concurrently with a gonadotropin-releasing hormone (GnRH) analog. Note: Examples are Lupron (leuprolide for injection), Lupron Depot (leuprolide acetate for depot suspension), Trelstar (triptorelin pamoate for injectable suspension), Zoladex (goserelin acetate implant), Vantas (histrelin acetate subcutaneous implant), Firmagon (degarelix for injection); OR
- **B)** The patient has had a bilateral orchiectomy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Xtandi has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval).

71. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES
320. Xtandi® [prescribing information]. Northbrook, IL: Astellas Pharma US, Inc.; December 2019.
2. The NCCN Prostate Cancer Clinical Practice Guidelines in Oncology (Version 4.2019 – August 19, 2019). © 2019 National Comprehensive Cancer Network, Inc. Available at: http://www.nccn.org. Accessed February 25, 2020.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Yonsa® (abiraterone acetate tablets – Sun Pharmaceutical Industries, Inc.)

DATE REVIEWED: 06/10/2020

OVERVIEW
Yonsa is an androgen biosynthesis inhibitor that inhibits the enzyme 17 α-hydroxylase/C17,20-lyase (CYP17).[1] This enzyme is expressed in testicular, adrenal, and prostatic tumor tissues and is required for androgen biosynthesis. Yonsa, in combination with methylprednisolone, is indicated for the treatment of patients with metastatic castration-resistant prostate cancer (mCRPC). Inhibition of CYP17 by Yonsa can

also result in increased mineralocorticoid production by the adrenal glands; the use of methylprednisolone with Yonsa is to counteract this mineralocorticoid excess.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on prostate cancer (version 2.2019 – April 17, 2019) have the following recommendations for Zytiga® [abiraterone acetate tablets] and Yonsa.[2]

- At initial diagnosis, for patients classified in the regional risk group (metastases in regional nodes [N1] with no distant metastases [M0]) and with a > 5 year expected patient survival, external beam radiation therapy (EBRT) + androgen deprivation therapy (ADT) [category 1] + Zytiga and prednisone (category 2A) or Yonsa and methylprednisolone (category 2B) are recommended options. ADT (without EBRT) ± Zytiga and prednisone is a category 2A recommended option in this setting; ADT + Yonsa and methylprednisolone is a category 2B recommendation.
- If patients are positive for distant metastasis (M1) and have castration-naïve disease, ADT + Zytiga and prednisone and ADT + docetaxel are both category 1 recommended options. ADT + Yonsa and methylprednisolone is a category 2B recommendation in this setting.
- For patients who progress to CRPC and are positive for distant metastasis, M1 and there are no visceral metastases, Zytiga and prednisone, docetaxel, Xtandi, and Xofigo® (radium Ra 223 dichloride injection, for intravenous use) [for symptomatic bone metastases] are all category 1 recommended options. Yonsa + methylprednisolone is a category 2A recommendation for mCRPC either as first-line or subsequent therapy option.
  - If there are visceral metastases, Xtandi and docetaxel are category 1 recommended options. Zytiga and prednisone, Yonsa and methylprednisolone are category 2A recommendations for first-line or second-line treatment after Xtandi. If docetaxel was used previously, Zytiga and prednisone is a category 1 recommendation; Yonsa and methylprednisolone is a category 2A recommendation.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Yonsa. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Yonsa is recommended in those who meet the following criteria:

FDA-Approved Indication

4. **Prostate Cancer – Metastatic, Castration-Resistant (mCRPC).** Approve for 3 years if the patient meets the following criteria (A and B):
   A) The medication is used in combination with methylprednisolone; AND
   B) The patient meets ONE of the following criteria (i or ii):
      i. The medication is concurrently used with a gonadotropin-releasing hormone (GnRH) analog. Note: Examples are Lupron (leuprolide for injection), Lupron Depot (leuprolide acetate for depot suspension), Trelstar (triptorelin pamoate for injectable suspension), Zoladex (goserelin acetate implant), Vantas (histrelin acetate subcutaneous implant), Firmagon (degarelix for injection); OR
      ii. The patient has had a bilateral orchiectomy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Yonsa has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

72. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Zejula™ (niraparib capsules – Tesaro, Inc.)

DATE REVIEWED: 11/20/2019; selected revision 05/13/2020

OVERVIEW
Zejula, a poly (ADP-ribose) polymerase (PARP) inhibitor, is indicated[1]:
1) For the maintenance treatment of adult patients with advanced epithelial ovarian, fallopian tube, or primary peritoneal cancer who are in a complete or partial response to first-line platinum-based chemotherapy;
2) For the maintenance treatment of adult patients with recurrent epithelial ovarian, fallopian tube, or primary peritoneal cancer who are in a complete or partial response to platinum-based chemotherapy;
3) Zejula For the treatment of adult patients with advanced ovarian, fallopian tube, or primary peritoneal cancer who have been treated with three or more prior chemotherapy regimens and whose cancer is associated with homologous recombination deficiency (HRD) positive status defined by either: a) a

deleterious or suspected deleterious *BRCA* mutation OR b) genomic instability and who have progressed more than six months after response to the last platinum-based chemotherapy.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for ovarian cancer (version 1.2020 – March 11, 2020) has the following recommendations[2]:

Recurrent Disease – Treatment

Therapy options for patients with recurrent disease are primarily dependent on whether the patient is considered platinum-resistant or platinum-sensitive (patients who relapse ≥ 6 months after initial chemotherapy). For recurrent disease, Lynparza™ (olaparib capsules), Rubraca™ (rucaparib tablets), and Zejula are among the preferred targeted therapy agents for both platinum-sensitive and platinum-resistant disease (all category 2A). All are recommended following two or more lines of chemotherapy (Lynparza and Rubraca) or three or more lines of chemotherapy (Zejula) are are otherwise recommended as per their FDA-approved use in the treatment of patients with advanced ovarian cancer. Zejula + bevacizumab (category 2A) is also an Other Recommended targeted therapy regimen for platinum-sensitive disease. NCCN lists several other potentially active agents for recurrence therapy.

First-Line Maintenance

Maintenance recommendations following primary treatment (first-line maintenance) apply to stage II, III, or IV ovarian cancer after primary treatment if the patient is in complete or partial remission. In patients with a germline or somatic *BRCA* mutation, both Lynparza and Zejula have a category 1 recommendation if no bevacizumab was used during primary therapy. If bevacizumab was used during primary therapy for patients with a germline or somatic *BRCA* mutation, Lynparza + bevacizumab is a category 1 recommendation for maintenance, whereas monotherapy with Lynparza or Zejula have category 2A recommendations. For patients with *BRCA* wild-type or unknown mutation status, Zejula (if no bevacizumab during primary therapy and Lynparza + bevacizumab (if bevacizumab was used during primary therapy) are among the recommendations for maintenance (category 2A for both).

Recurrent Disease – Maintenance

In patients with platinum-sensitive disease who have completed at least two lines of platinum-based therapy for persistent disease or recurrence and have achieved a complete or partial response, Zejula, Rubraca, or Lynparza (all category 2A) can be considered for maintenance therapy.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Zejula. All approvals are provided for 3 years in duration unless otherwise noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zejula is recommended in those who meet the following criteria:

FDA-Approved Indications

136. Ovarian, Fallopian Tube, or Primary Peritoneal Cancer –Maintenance Therapy. Approve for 3 years if the patient is in complete or partial response after platinum-based chemotherapy regimen.
Note: Examples of chemotherapy regimens are carboplatin with gemcitabine, carboplatin with paclitaxel, cisplatin with gemcitabine.

2. Ovarian, Fallopian Tube, or Primary Peritoneal Cancer –Treatment. Approve for 3 years if the patient meets the following criteria (A and B):
A) The patient has tried at least three prior chemotherapy regimens.
Note: Examples of chemotherapy regimens are carboplatin/gemcitabine, carboplatin/liposomal doxorubicin, carboplatin/paclitaxel, cisplatin/gemcitabine, capecitabine, irinotecan; AND
B) The patient has homologous recombination deficiency (HRD)-positive disease as confirmed by an approved test.
Note: HRD-positive disease includes patients with *BRCA* mutation-positive disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Zejula has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

73. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Zelboraf® (vemurafenib tablets – Genentech/Daiichi Sankyo)

REVIEW DATE: 06/18/2019

OVERVIEW

Zelboraf, a BRAF inhibitor, is indicated for the following indications:
1. Erdheim-Chester disease, for treatment of patients with the *BRAF V600* mutation; AND
2. Melanoma, for treatment of unresectable or metastatic disease with *BRAF V600E* mutation as detected by a Food and Drug Administration (FDA)-approved test (Note that Cotellic® (cobimetinib tablets) is a MEK inhibitor that is indicated to be given in combination with Zelboraf in a similar patient population with melanoma);[1] AND

Zelboraf is not recommended for use in patients with wild-type BRAF melanoma.

Disease Overview

Mutations in the BRAF gene are common in several types of cancer.[2] The BRAF protein is normally switched on and off in response to signals that control cell growth and development; however, mutations cause the BRAF protein to be continuously active. This over activity may contribute to the growth of

cancers by allowing abnormal cells to grow and divide uncontrollably. The V600E mutation is the most common *BRAF* gene mutation identified in cancers, particularly in melanoma.

ECD is a rare non-Langerhans histiocytosis. There is a *BRAF V600* mutation estimated in between 38% and 100% of patients with ECD.[8] Although multiple systems may be affected, clinical findings most often exhibit in the CNS or as bone pain.

Guidelines

Prior to approval of Zelboraf guidelines for ECD (2014) list Zelboraf as a first- or second-line treatment option.[8] The National Comprehensive Cancer Network (NCCN) also supports use of Mekinst in multiple cancers.

FDA-Approved Indications

- Melanoma: Guidelines (version 2.2019 – March 12, 2019) recommend BRAF + MEK inhibitor combinations (e.g., Zelboraf + Cotellic, Tafinlar + Mekinist, Braftovi + Mektovi) for first-line (preferred if clinically needed for early response) and subsequent treatment of metastatic or unresectable melanoma with a V600 activating mutation.[3] While combination BRAF/MEK inhibition is preferred, NCCN notes that if contraindicated, monotherapy with a BRAF inhibitor (Tafinlar or Zelboraf) are recommended options, particularly for patients who are not appropriate candidates for checkpoint immunotherapy. Tafinlar + Mekinist is also recommended in guidelines as adjuvant therapy (including for nodal recurrance) in some patients with Stage III disease, including use post-surgery or use after complete lymph node dissection.

Other Uses With Supportive Evidence

- Colon Cancer: NCCN guidelines for colon cancer (version 2.2019 – May 15, 2019) recommend BRAF/MEK inhibitor combinations for *BRAF V600E*-mutated disease.[4] For primary treatment (following adjuvant chemotherapy) or as subsequent use, Zelboraf + ironotecan + Erbitux (cetuximab IV infusion) or Vectibix (panitumumab IV infusion) is a recommended treatment option. Subsequent use of either Braftovi + Mektovi or Tafinlar + Mekinist are also treatment options recommended in combination with Erbiux or Vectibix.
- Hairy Cell Leukemia: NCCN guidelines for hairy cell leukemia (version 3.2019 – January 31, 2019) state that a purine analog (e.g., cladribine, Nipent) is recommended as initial therapy.[4] Zelboraf ± rituximab is listed as an option for patients with relapsed or refractory disease following one of these regimens.
- Non-Small Cell Lung Cancer: NCCN guidelines for NSCLC (version 4.2019 – April 29, 2019) list Tafinlar + Mekinist as a first-line therapy for tumors with a *BRAF* mutation.[5] NCCN also notes that monotherapy with a BRAF inhibitor (Tafinlar or Zelboraf) is a treatment option when combination therapy is not tolerated.
- Thyroid Cancer: NCCN guidelines for thyroid cancer (version 1.2019 – May 28, 2019) list Tafinlar and Zelboraf as treatment options for iodine-refractory differentiated thyroid cancer with a *BRAF V600E* mutation.[6] This recommendation is for follicular, Hürthle cell, and papillary cancer subtypes.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Zelboraf. All approvals are provided for 3 years unless otherwise noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zelboraf is recommended in those who meet the following criteria:

FDA-Approved Indications

7. **Erdheim-Chester Disease (ECD).** Approve for 3 years if the patient has *BRAF V600* mutation-positive disease.

8. **Melanoma.** Approve Zelboraf for 3 years if the patient meets BOTH of the following (A and B):
   - **A)** The patient has unresectable, advanced, or metastatic melanoma; AND
   - **B)** The patient has *BRAF V600* mutation-positive disease.

Other Uses with Supportive Evidence

9. **Colon or Rectal Cancer.** Approve for 3 years if the patient meets the following (A, B, and C):
   - **10.** The patient has *BRAF V600E* mutation-positive disease; AND
   - **11.** The patient has previously received a chemotherapy regimen for colon or rectal cancer.
     NOTE: This includes previous adjuvant use of chemotherapy. Examples of previous chemotherapy regimens include a fluoropyrimidine such as 5-fluorouracil (5-FU), capecitabine;

oxaliplatin, irinotecan, or an adjunctive chemotherapy regimen such as FOLFOX (5-FU, leucovorin, and oxaliplatin) or CapeOX (capecitabine and oxaliplatin); AND

12. The agent is prescribed as part of a combination regimen for colon or rectal cancer. NOTE: examples of combination regimens include: Zelboraf/ironotecan/Erbitux (cetuximab IV infusion), Zelboraf/ironotecan/Vectibix (panitumumab IV infusion). .

10. Hairy Cell Leukemia. Approve for 3 years if the patient meets BOTH of the following conditions (A and B):
- **A)** The patient has relapsed/refractory hairy cell leukemia; AND
- **B)** The patient has tried at least one other therapy for hairy cell leukemia (e.g., cladribine, Nipent™ [pentostatin injection], rituximab injection, Intron® A [interferon alpha-2b injection]).

11. Non-Small Cell Lung Cancer (NSCLC). Approve for 3 years if the patient has *BRAF V600E* mutation-positive disease.

12. Thyroid Cancer, Differentiated. Approve Zelboraf for 3 years if the patient meets ALL of the following conditions (A, B, and C):
- **D)** The patient has differentiated thyroid carcinoma (i.e., papillary, follicular, or Hürthle cell); AND
- **E)** The patient has disease that is refractory to radioactive iodine therapy; AND
- **F)** The patient has *BRAF* mutation-positive disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Zelboraf has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Zelboraf Prior Authorization Policy
- Zelboraf® (vemurafenib tablets – Genentech/Daiichi Sankyo)

REVIEW DATE: 07/15/2020

OVERVIEW

Zelboraf, a BRAF inhibitor, is indicated for the following indications:[1]

- **Erdheim-Chester disease**, for treatment of patients with the *BRAF V600* mutation.
- **Melanoma**, for treatment of unresectable or metastatic disease with *BRAF V600E* mutation as detected by an FDA-approved test.

Of note, Cotellic® (cobimetinib tablets) is a MEK inhibitor that is indicated to be given in combination with Zelboraf in a similar patient population with melanoma). Zelboraf is not recommended for use in patients with wild-type BRAF melanoma.

Guidelines

National Comprehensive Cancer Network (NCCN) guidelines support use of Zelboraf in multiple cancers.

- **Melanoma:** Guidelines (version 3.2020 – May 18, 2020) recommend BRAF/MEK inhibitor combinations for first-line (preferred if clinically needed for early response) and subsequent treatment of metastatic or unresectable melanoma with a *V600* activating mutation.[2] While combination BRAF/MEK inhibition is preferred, if a combination is contraindicated, monotherapy with a BRAF inhibitor (Tafinlar® [dabrafenib capsules] or Zelboraf) is a recommended option, particularly if the patient is not a candidate for checkpoint immunotherapy. Following resection of limited metastatic disease with a *BRAF V600*-activating mutation, BRAF/MEK combination therapy is among the treatment options for patients with no evidence of disease. Tafinlar + Mekinist® (trametinib tablets) is also recommended in guidelines as adjuvant therapy (including for nodal recurrence) in some patients with Stage III disease, including use post-surgery or use after complete lymph node dissection. If unacceptable toxicity to Tafinlar/Mekinist, other BRAF/MEK combinations can be considered.
- **Hairy Cell Leukemia:** NCCN guidelines for hairy cell leukemia (version 1.2020 – August 23, 2019) list Zelboraf ± rituximab among the treatment options for relapsed or refractory disease.[3]
- **Non-Small Cell Lung Cancer:** NCCN guidelines (version 6.2020 – June 25, 2020) list Tafinlar + Mekinist among the first-line therapy and subsequent therapy options for tumors with a *BRAF* mutation.[4] NCCN also notes that monotherapy with a BRAF inhibitor (Tafinlar or Zelboraf) is a treatment option when combination therapy is not tolerated.
- **Thyroid Cancer:** Guidelines (version 1.2020 – June 12, 2020) list Tafinlar + Mekinist as a treatment option for metastatic anaplastic thyroid cancer with a *BRAF* mutation.[5] Tafinlar and Zelboraf are also treatment options for the treatment of iodine-refractory differentiated thyroid cancer (follicular, Hürthle cell, and papillary cancer subtypes) with a *BRAF V600* mutation.

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of Zelboraf. All approvals are provided for 3 years unless otherwise noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Zelboraf is recommended in those who meet the following criteria:

FDA-Approved Indications

13. **Erdheim-Chester Disease.** Approve for 3 years if the patient has *BRAF V600* mutation-positive disease.

14. **Melanoma.** Approve Zelboraf for 3 years if the patient meets BOTH of the following (A and B):
    A) Patient has unresectable, advanced, or metastatic melanoma; AND
    B) Patient has *BRAF V600* mutation-positive disease.

Other Uses with Supportive Evidence

15. **Hairy Cell Leukemia.** Approve for 3 years if the patient has tried at least one other systemic therapy for hairy cell leukemia.
    Note: Examples of other systemic therapies include cladribine, Nipent (pentostatin injection), rituximab injection, Intron A (interferon alpha-2b injection).

16. **Non-Small Cell Lung Cancer.** Approve for 3 years if the patient has *BRAF V600E* mutation-positive disease.

17. **Thyroid Cancer, Differentiated.** Approve Zelboraf for 3 years if the patient meets ALL of the following conditions (A, B, and C):
    G) Patient has differentiated thyroid carcinoma; AND
    Note: Examples of differentiated thyroid carcinoma include papillary, follicular, or Hürthle cell thyroid cancers.
    H) Patient has disease that is refractory to radioactive iodine therapy; AND
    I) Patient has *BRAF* mutation-positive disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Coverage of Zelboraf is not recommended in the following situations:

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Zolinza Prior Authorization Policy
- Zolinza® (vorinostat capsules – Merck)

REVIEW DATE: 07/22/2020

OVERVIEW
Zolinza, a histone deacetylase inhibitor, is indicated for the treatment of cutaneous manifestations in patients with cutaneous T-cell lymphoma who have progressive, persistent or recurrent disease on or following two systemic therapies.[1]

Guidelines
The National Comprehensive Cancer Network (NCCN) clinical practice guidelines for primary cutaneous lymphomas (Version 2.2020 – April 10, 2020) list Zolinza as a preferred systemic therapy for mycosis fungoides/Sezary syndrome.[2,3] Zolinza can be used for primary treatment or for relapsed, persistent, or refractory disease.

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of Zolinza. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Zolinza is recommended in those who meet the following criteria:

FDA-Approved Indications

145. Cutaneous T-Cell Lymphoma including Mycosis Fungoides/Sezary Syndrome. Approve for 3 years.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Coverage of Zolinza is not recommended in the following situations:

140. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Zydelig® (idelalisib tablets – Gilead)

DATE REVIEWED: 06/03/2020

OVERVIEW

Zydelig, an inhibitor of phosphatidylinositol 3-kinase, is indicated for the treatment of patients with 1) relapsed chronic lymphocytic leukemia (CLL), in combination with rituximab, in patients for whom rituximab alone would be considered appropriate therapy due to other comorbidities; 2) relapsed follicular B-cell non-Hodgkin lymphoma in patients who have received at least two prior systemic therapies; and 3) relapsed small lymphocytic lymphoma (SLL) in patients who have received at least two prior systemic therapies.[1] Accelerated approval was given for the relapsed follicular B-cell non-Hodgkin lymphoma and SLL indications based on overall response rate (ORR). Improvement in patient survival or disease-related symptoms has not been established. A limitation of use for all three indications is that Zydelig is not indicated and is not recommended for first-line treatment.

Disease Overview

CLL is one of the most prevalent adult leukemias in the Western world.[5] In 2019, an estimated 20,720 patients will be diagnosed with CLL in the US, and approximately 3,930 patients will die from the disease. The condition usually is diagnosed in older adults (≥ 70 years of age) and occurs more frequently in men. The leukemic cells appear as small, mature lymphocytes. CLL and SLL are different manifestations of the same condition and are managed similarly. In CLL, many of the abnormal lymphocytes are found in the blood, as well as in the bone marrow and lymphoid tissue. In SLL, there are few, if any, abnormal lymphocytes circulating in blood and most of the disease is in the lymph nodes, bone marrow, and other lymphoid tissue. The diagnosis requires the presence of at least 5 x 10^9/L monoclonal B-lymphocytes in the peripheral blood. SLL requires the presence of lymphadenopathy and/or splenomegaly with < 5 x 10^9/L B-lymphocytes found in the peripheral blood.

Follicular lymphoma is the most common subtype of indolent non-Hodgkin's lymphoma accounts for approximately 22% of all newly diagnosed cases of non-Hodgkin lymphoma.[8] Most cases (90%) of follicular lymphoma have a t(14;18) translocation, which results in the deregulated expression of BCL-2 protein. Pediatric type follicular lymphoma may occur, albeit rare.[8] Many patients with follicular lymphoma present with asymptomatic lymphadenopathy and bone marrow involvement is present. Some patients also have increased serum lactate dehydrogenase (LDH) is present. Patients with early stage disease generally receive radiation therapy as good responses have been achieved. Although further study is required, chemoimmunotherapy or systemic therapy plus radiation therapy may improve outcomes. Most patients present with advanced disease at diagnoses. Patients who are asymptomatic may not require immediate treatment. Rituximab, used with or without other therapies, has dramatically changed the course of treating follicular lymphoma, with noted improvement in survival. Autologous or allogeneic stem cell

transplantations may be considered in some clinical scenarios but are generally reserved for patients with relapsed or refractory disease.

Guidelines

The National Comprehensive Cancer Network (NCCN) clinical practice guidelines for CLL/SLL (version 4.2020 – December 20, 2019) address CLL. Zydelig is recommended with or without rituximab for relapsed or refractory therapy for CLL in various scenarios.[5] Many other agents have a more prominent role in the first-line management of CLL.[5,6] The guidelines note that CLL and SLL are different manifestations of the same condition and are treated similarly.

The NCCN clinical practice guidelines for B-cell Lymphomas (version 1.2020 – January 22, 2020) recommend Zydelig as second-line and subsequent therapy in patients with follicular lymphoma (grade 1-2) among patients refractory to two prior therapies.[8]

The NCCN clinical practice guidelines for B-Cell Lymphomas (version 1.2020 – January 22, 2020) recommend Zydelig as second-line and subsequent therapy for marginal zone lymphomas that are relapsed/refractory to two prior therapies.[8] Other regimens are recommended first line that are primarily rituximab-based.

Safety

Zydelig has a Boxed Warning regarding fatal and serious toxicities such as hepatotoxicity, fatal and/or serious and severe diarrhea or colitis, fatal and serious pneumonitis, fatal and/or serious infections, and fatal and serious intestinal perforation.[1] Zydelig was approved with a Risk Evaluation and Mitigation Strategy (REMS) program to highlight toxicities noted in the Boxed Warning.[2] The REMS program involves a communication plan. In March 2016, the FDA issued a healthcare professionals alert regarding studies with Zydelig which revealed an increased rate of adverse events (AEs), including deaths, in clinical trials when Zydelig was used in combination with other cancer medications.[3] The manufacturer is halting six clinical trials in patients with CLL, SLL and indolent non-Hodgkin lymphomas.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Zydelig. All approvals are provided for 3 years in duration unless otherwise noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zydelig is recommended in those who meet the following criteria:

FDA-Approved Indications

137. Chronic Lymphocytic Leukemia (CLL). Approve for 3 years if the patient has tried at least two prior therapies.

Note: Examples include Imbruvica® (ibrutinib capsules and tablets); chlorambucil plus Gazyva® (obinutuzumab injection for intravenous use); chlorambucil plus rituximab; FCR (fludarabine, cyclophosphamide and rituximab); FR (fludarabine plus rituximab); PCR (pentostatin, cyclophosphamide, rituximab); Treanda® (bendamustine injection) with or without rituximab; high-dose methylprednisolone (HDMP) plus rituximab; Campath® (alemtuzumab injection for intravenous

use) with or without rituximab; Venclexta® (venetoclax tablets) with or without rituximab; Calquence® (acalabrutinib capsules); Gazyva; rituximab; Arzerra® (ofatumumab injection for intravenous use); chlorambucil; Venclexta plus Gazyva; or Copiktra (duvelisib capsules).

138. Follicular Lymphoma. Approve for 3 years if the patient has tried at least two prior therapies.
Note: Examples include Treanda® (bendamustine injection) plus rituximab; Treanda plus Gazyva® (obinutuzumab injection for intravenous use); CHOP (cyclophosphamide, doxorubicin, vincristine, prednisone) plus Gazyyva or rituximab; CVP (cyclophosphamide, vincristine, prednisone) plus Gazyva or rituximab; chlorambucil with or without rituximab; cyclophosphamide with or without rituximab; Gazyva; Revlimid® (lenalidomide capsules); Copiktra™ (duvelisib capsules); or Aliqopa® (copanlisib injection for intravenous use).

139. Small Lymphocytic Lymphoma (SLL). Approve for 3 years if the patient has tried at least two prior therapies.
Note: Examples include Imbruvica® (ibrutinib capsules or tablets); chlorambucil plus Gazyva® (obinutuzumab injection for intravenous use); chlorambucil plus rituximab; FCR (fludarabine, cyclophosphamide and rituximab); FR (fludarabine plus rituximab); PCR (pentostatin, cyclophosphamide, rituximab); Treanda® (bendamustine injection) with or without rituximab; high-dose methylprednisolone (HDMP) plus rituximab; Venclexta® (venetoclax tablets) with or without rituximab; Calquence® (acalabrutinib capsules); Gazyva; rituximab; Arzerra® (ofatumumab injection for intravenous use); chlorambucil; Venclexta plus Gazyva; or Copiktra (duvelisib capsules).

Other Uses with Supportive Evidence

74. Marginal Zone Lymphoma. Approve for 3 years if the patient has tried at least two other therapies.
Note: Examples include rituximab; Treanda® (bendamustine injection for intravenous use) plus rituximab; RCHOP (rituximab, cyclophosphamide, vincristine, prednisone); RCVP (rituximab, cyclophosphamide, vincristine, prednisone); chlorambucil with or without rituximab; cyclophosphamide with or without rituximab; Imbruvica® (ibrutinib tablets and capsules); Copiktra™ (duvelisib capsules); Revlimid® (lenalidomide capsules) with or without rituximab; or Aliqopa® (copanlisib injection for intravenous use).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Zydelig has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Date Reviewed
Early annual revision	Alternatives for CLL revised (agents removed or added) based on NCCN guidelines. For Follicular B-Cell Non-Hodgkin Lymphoma changed the requirement that patients have tried two prior therapies instead of one therapy, to make it in-line with FDA-approved labeling; therapy alternatives were slightly revised based on NCCN guidelines. For SLL changed the requirement that patients have tried two prior therapies instead of one therapy to make it in-line with FDA-approved labeling; therapy alternatives were slightly revised based on NCCN guidelines. Criteria added regarding approval for marginal zone lymphoma if the patient had tried two other prior therapies based on NCCN guidelines.	05/16/2018
Annual revision	For clarity, the reference to Rituxan when listing previous required therapies was changed to "rituximab". The following changes were also made: 1. **Chronic Lymphocytic Leukemia:** The number of therapies required prior to approval of Zydelig was changed from one to two. Also, Venclexta plus Gazyva and Copiktra were added to the list of examples of agents that count toward this requirement. 2. **Follicular Lymphoma:** The wording "B-Cell Non-Hodgkin" was removed from the cited condition. The RCHOP regimen was removed from the listing of alternatives and the regimen that cited "CHOP plus Gazyva" was the changed to "CHOP plus Gazyva or rituximab". Likewise, the RCVP alternative was changed to state "CVP plus Gazyva or rituximab". Copiktra was also listed as an alternative that counts as the requirement to try two prior therapies. 3. **Small Lymphocytic Lymphoma:** Venclexta plus Gazyva and Copiktra were added to the list of examples of agents that count toward the requirement of a trial of two prior therapies. 4. **Marginal Zone Lymphoma:** Copiktra and Revlimid (with or without rituximab) were added as alternatives that count towards the requirement of two prior therapies.	06/05/2019
Annual revision	**The following changes were made:** 1. **Chronic Lymphocytic Leukemia:** The wording of "at least" was added to the requirement that patients try two therapies. Also, the examples of therapies were removed from the criteria and placed into a note. Chlorambucil plus Arzerra® (ofatumumab injection for intravenous use) was removed from the list of examples. 2. **Follicular Lymphoma:** The wording of "at least" was added to the requirement that patients try two therapies. Also, the examples of therapies were removed from the criteria and placed into a note. 3. **Small Lymphocytic Lymphoma:** The wording of "at least" was added to the requirement that patients try two therapies. Also, the examples of therapies were removed from the criteria and placed into a note. Chlorambucil plus Arzerra® (ofatumumab injection for intravenous use) was removed from the list of examples. 4. **Marginal Zone Lymphoma:** The wording of "at least" was added to the requirement that patients try two therapies. Also, the examples of therapies were removed from the criteria and placed into a note.	06/03/2020

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Zykadia™ (ceritinib capsules and tablets – Novartis Pharmaceuticals)

DATE REVIEWED: 06/10/2020

OVERVIEW

Zykadia, a kinase inhibitor, is indicated for the treatment of patients with anaplastic lymphoma kinase (*ALK*)-positive metastatic non-small cell lung cancer (NSCLC), as detected by an FDA-approved test.[1] Using biochemical or cellular assays at clinically relevant concentrations, it has been noted that Zykadia

inhibits *ALK*, insulin-like growth factor 1 receptor (IGF-1R), insulin receptor (InsR), and c-ros oncogene 1 (ROS1). Among these, Zykadia is most effective against *ALK*.

A multicenter, open-label, Phase II study evaluated the efficacy of Zykadia in patients with ROS1-rearranged NSCLC (n = 32).[5] All patients, except two, were Xalkori treatment-naïve. Patients received Zykadia at the recommended dose of 750 mg/day. The overall objective response rate (ORR) was 62% (95% CI: 45%, 77%); in Xalkori-naïve patients the ORR was 67%. The median PFS was 9.3 months and the median PFS for Xalkori-naïve patients was 19.3 months (95% CI: 1, 37). The median OS was 24 months (95% CI: 5, 43) with a 6-month OS rate of 84% and a 12-month OS rate of 56%. Only eight patients had brain metastases at baseline. The overall intracranial ORR was 25% (n = 2/8) and the DCR was 63% (n = 5/8). The NCCN NSCLC guidelines recommend Xalkori (preferred) or Zykadia as first-line options for ROS1-positive NSCLC (both category 2A).

GUIDELINES

According to the National Comprehensive Cancer Network (NCCN) NSCLC guidelines (version 5.2020 – May 27, 2020), Alecensa® (alectinib capsules) is the "preferred" first-line therapy for ALK-positive NSCLC. Zykadia and Alunbrig® (brigatinib tablets) are "Other Recommended" first-line therapies. Xalkori® (crizotinib capsules) is a category 1 agent under "Useful in Certain Circumstances". and [[2] For progression on Alecensa, Alunbrig, or Zykadia, for multiple systemic lesions, Lorbrena (lorlatinib tablets) is a recommended option or initial systemic therapy options can be considered (both category 2A). Xalkori (preferred) or Zykadia are recommended as first-line therapy for ROS1 rearrangement-positive NSCLC (both category 2A). Lorbrena is recommended for subsequent therapy.

The NCCN guidelines for soft tissue sarcoma (version 2.2019 – February 4, 2019) recommend Zykadia as a single-agent therapy for the treatment of IMT with ALK translocation (category 2A recommendation).[4-5]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Zykadia. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zykadia is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Non-Small Cell Lung Cancer (NSCLC).** Approve for 3 years if the patient has metastatic anaplastic lymphoma kinase (*ALK*)-positive NSCLC as detected by an approved test.

Other Uses with Supportive Evidence

2. **Non-Small Cell Lung Cancer (NSCLC) with ROS1 Rearrangement – First-Line Therapy.** Approve for 3 years.

3. **Soft Tissue Sarcoma Inflammatory Myofibroblastic Tumor (IMT) with ALK Translocation.** Approve for 3 years.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Zykadia has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

75. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Adcetris® (brentuximab injection for intravenous use – Seattle Genetics, Inc.)

REVIEW DATE: 09/25/2019

OVERVIEW

Adcetris is a CD30-directed antibody, produced in Chinese hamster ovary cells, conjugated with monomethyl auristatin E (MMAE).[1] CD30 is expressed on systemic anaplastic large cell lymphoma cells and on Hodgkin Reed-Sternberg cells in classical Hodgkin lymphoma and MMAE is a microtubule-

disrupting agent. The anticancer activity is due to the binding of Adcetris to the CD30 receptor, followed by internalization and release of MMAE. MMAE then binds to tubulin disrupting the microtubule network leading to cell cycle arrest and apoptosis.

Adcetris is FDA-approved for the treatment of adults with:

- Previously untreated Stage III or IV classical Hodgkin lymphoma, in combination with doxorubicin, vinblastine, and dacarbazine.
- Classical Hodgkin lymphoma at high risk of relapse or progression as post-autologous hematopoietic stem cell transplantation consolidation.
- Classical Hodgkin lymphoma after failure of autologous hematopoietic stem cell transplantation or after failure of at least two prior multi-agent chemotherapy regimens in patients who are not autologous hematopoietic stem cell transplantation candidates.
- Previously untreated systemic anaplastic large cell lymphoma or other CD30-expressing peripheral T-cell lymphomas, including angioimmunoblastic T-cell lymphoma and peripheral T-cell lymphomas not otherwise specified, in combination with cyclophosphamide, doxorubicin, and prednisone.
- Systemic anaplastic large cell lymphoma after failure of at least one prior multi-agent chemotherapy regimen.
- Primary cutaneous anaplastic large cell lymphoma or CD30-expressing mycosis fungoides who have received prior systemic therapy.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) Hodgkin Lymphoma Clinical Practice Guidelines (version 2.2019 – July 15, 2019) recommend Adcetris for the treatment of classical Hodgkin Lymphoma in combination with chemotherapy, as second-line or subsequent therapy for relapsed or refractory disease, as maintenance therapy following high-dose therapy and autologous stem cell rescue for relapsed or refractory disease, or as palliative therapy.[2,3]

The NCCN T-Cell Lymphomas Clinical Practice Guidelines (version 2.2019 – December 17, 2018) recommend Adcetris as a preferred first-line therapy in combination with CHP (cyclophosphamide, doxorubicin, prednisone) for the treatment of CD30+ anaplastic large cell lymphoma (ALCL), CD30+ peripheral T-cell lymphoma, CD30+ angioimmunoblastic T-cell lymphoma, CD30+ enteropathy-associated T-cell lymphoma, CD30+ monomorphic epitheliotropic intestinal T-cell lymphoma, CD30+ nodal peripheral T-cell lymphoma with TFH phenotype, CD30+ hepatosplenic gamma-delta T-cell lymphoma, or CD30+ follicular T-cell lymphoma.[2,4] As a single agent for subsequent therapy for relapsed/refractory ALCL, CD30+ peripheral T-cell lymphoma, CD30+ hepatosplenic gamma-delta T-cell lymphoma, CD30+ extranodal NK/T-cell lymphoma – nasal type, or CD30+ angioimmunoblastic T-cell lymphoma. As a component of CHP for the treatment of CD30+ adult T-cell leukemia/lymphoma. As a single agent or in combination with CHP for the adjuvant treatment of CD30+ breast implant-associated ALCL.

The NCCN Primary Cutaneous Lymphomas Clinical Practices Guidelines (version 2.2019 – December 17, 2018) recommend Adcetris for the systemic therapy of CD30+: mycosis fungoides/Sezary syndrome, primary cutaneous anaplastic large cell lymphoma, and lymphomatoid papulosis.[2,5]

The NCCN B-Cell Lymphomas Clinical Practice Guidelines (version 4.2019 – June 18,2019) recommend Adcetris for the second-line or subsequent treatment of histologic transformation of follicular lymphoma to CD30+ diffuse large B-cell lymphoma (DLBCL), histologic transformation of marginal zone lymphoma to CD30+ DLBCL, CD30+ DLBCL, CD30+ high-grade B-cell lymphoma, CD30+ AIDS-related B-cell lymphoma, and CD30+ post-transplant lymphoproliferative disorders.[2,6]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Adcetris. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Adcetris as well as the monitoring required for adverse events and long-term efficacy, approval requires Adcetris to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Adcetris is recommended in those who meet the following criteria:

FDA-Approved Indications

146. Hodgkin Lymphoma. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** The patient is ≥ 18 years of age; AND
- **B)** The patient has classical Hodgkin lymphoma; AND
- **C)** Adcetris is prescribed by or in consultation with an oncologist.

147. T-Cell Lymphoma. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** The patient is ≥ 18 years of age; AND
- **B)** Adcetris is used for CD30+ T-cell lymphoma.
  (Note: Examples include CD30+ systemic anaplastic large cell lymphoma, CD30+ angioimmunoblastic T-cell lymphoma, CD30+ peripheral T-cell lymphoma not otherwise specified, CD30+ mycosis fungoides/Sezary syndrome, CD30+ cutaneous anaplastic large cell lymphoma, CD30+ lymphomatoid papulosis, CD30+ breast implant-associated anaplastic large cell lymphoma, CD30+ T-cell leukemia/lymphoma);[1,2,4] AND
- **C)** Adcetris is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

148. B-Cell Lymphoma. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** The patient is ≥ 18 years of age; AND
- **B)** Adcetris is used as second-line or subsequent therapy for CD30+ B-cell lymphoma. (Note: Examples include CD30+ diffuse large B-cell lymphoma, CD30+ post-transplant lymphoproliferative disorders, CD30+ AIDS-related B-cell lymphoma, CD30+ high-grade B-cell lymphoma);[2,6] AND
- **C)** Adcetris is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Adcetris has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

141. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Aliqopa Prior Authorization Policy
- Aliqopa™ (copanlisib injection for intravenous use – Bayer)

REVIEW DATE: 09/02/2020

OVERVIEW

Aliqopa, a kinase inhibitor, is indicated for the treatment of adults with relapsed follicular lymphoma who have received at least two prior systemic therapies.[1] This indication was granted accelerated approval based on overall response rate. Continued approval may be dependent on verification and description of clinical benefit in a confirmatory trial.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on B-Cell Lymphomas (version 4.2020 – August 13, 2020) recommend Aliqopa as subsequent therapy for relapsed/refractory follicular lymphoma (grade 1 or 2), gastric and nongastric MALT, splenic marginal zone lymphoma, and nodal marginal zone lymphoma after ≥ 2 prior therapies.[2,3]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Aliqopa. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Aloqopa as well as the monitoring required for adverse events and long-term efficacy, approval requires Aliqopa to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Aliqopa is recommended in those who meet the following criteria:

FDA-Approved Indications

149. Follicular Lymphoma. Approve for 1 year if the patient meets the following criteria (A, B, and C):

A) Patient is ≥ 18 years of age; AND

B) Patient has received ≥ 2 prior systemic therapies; AND
Note: Examples of systemic therapies include bendamustine, cyclophosphamide, doxorubicin, vincristine, rituximab product (e.g., Rituxan, Truxima), Gazyva® (obinutuzumab injection for intravenous use).

C) Aliqopa is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

150. Marginal Zone Lymphoma (NOTE: Includes Gastric MALT, Nongastric MALT, Nodal Marginal Zone Lymphoma, and Splenic Marginal Zone Lymphoma). Approve for 1 year if the patient meets the following criteria (A, B, and C):

A) Patient is ≥ 18 years of age; AND

B) Patient has received ≥ 2 prior systemic therapies; AND
Note: Examples of systemic therapies include bendamustine, cyclophosphamide, doxorubicin, vincristine, rituximab product (e.g., Rituxan, Truxima), Gazyva® (obinutuzumab injection for intravenous use).

C) Aliqopa is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Aliqopa is not recommended in the following situations:

142. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Arsenic Trioxide injection for intravenous use (Trisenox® – Teva Pharmaceuticals, generics)

REVIEW DATE: 09/25/2019

OVERVIEW

The mechanism of action of arsenic trioxide has not been entirely elucidated, however it has been demonstrated *in vitro* that it causes morphologic changes and DNA fragmentation characteristic of apoptosis in NB4 human promyelocytic leukemia cells.[1] In addition, arsenic trioxide has been shown to damage or degrade the fusion protein promyelocytic leukemia (PML)-retinoic acid receptor (RAR)-alpha.

Arsenic trioxide is indicated:

- In combination with tretinoin for the treatment of adults with newly-diagnosed low-risk acute promyelocytic leukemia (APL) whose APL is characterized by the presence of the t(15;17) translocation or PML/RAR-alpha gene expression,
- For induction of remission and consolidation in patients with APL who are refractory to, or have relapsed from, retinoid and anthracycline chemotherapy, and whose APL is characterized by the presence of the t(15;17) translocation or PML/RAR-alpha gene expression.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) Clinical Practice Guidelines for Acute Myeloid Leukemia (version 2.2020 – September 3, 2019) recommends arsenic trioxide for induction and consolidation therapy in low-risk (white blood cell [WBC] count < 10,000/µL) and in high risk (WBC > 10,000/µL) APL with or without cardiac issues.[2,3] NCCN also recommends arsenic trioxide for the first relapse (either morphologic or molecular) and as single agent consolidation therapy in patients that are not transplant candidates and are polymerase chain reaction (PCR) negative following second remission (morphologic).

The NCCN Clinical Practice Guidelines for T-Cell Lymphoma (version 2.2019 – December 17, 2018) recommends arsenic trioxide in combination with interferon alfa-2b for the second-line or subsequent treatment of nonresponders to first-line therapy for adult T-cell leukemia/lymphoma, acute or lymphoma subtypes.[4]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of arsenic trioxide. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with arsenic trioxide as well as the monitoring required for adverse events and long-term efficacy, approval requires arsenic trioxide to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of arsenic trioxide is recommended in those who meet the following criteria:

FDA-Approved Indications

151. Acute Promyelocytic Leukemia. Approve for 1 year if arsenic trioxide is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

152. Adult T-Cell Leukemia/Lymphoma. Approve for 1 year if the patient meets the following criteria (A, B, C, D, and E):

A) Patient is ≥ 18 years of age; AND
B) The patient has acute or lymphoma subtype; AND
C) Patient has tried chemotherapy.
(Note: Examples include CHOP [cyclophosphamide, doxorubicin, vincristine, and prednisone], CHOEP [cyclophosphamide, doxorubicin, vincristine, etoposide, and prednisone]); AND
D) Arsenic trioxide will be used in combination with interferon alfa-2b.
(Note: Includes Intron A); AND
E) Arsenic trioxide is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Arsenic trioxide has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

143. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Arzerra® (ofatumumab injection for intravenous use – Novartis)

REVIEW DATE: 10/09/2019

OVERVIEW

Arzerra is a human IgG1 monoclonal antibody that binds to the large and small extracellular loops of the CD20 molecule.[1] The Fab domain of the antibody binds to the CD20 molecule while the Fc domain mediates immune effector function which result in B-cell lysis. Potential mechanisms of cell lysis include complement-mediated cytotoxicity and antibody-dependent, cell-mediated cytotoxicity.

Arzerra is indicated:

- In combination with chlorambucil, for the treatment of previously untreated patients with chronic lymphocytic leukemia (CLL) for whom fludarabine-based therapy is considered inappropriate;
- In combination with fludarabine and cyclophosphamide for the treatment of relapsed CLL;
- For extended treatment of patients who are in complete or partial response after at least two lines of therapy for recurrent or progressive CLL;
- For the treatment of patients with CLL refractory to fludarabine and alemtuzumab.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on Chronic Lymphocytic Leukemia/Small Lymphocytic Lymphoma (version 1.2020 – August 23, 2019) recommends Arzerra in combination with bendamustine for the first-line treatment of CLL/small lymphocytic lymphoma (SLL) without del(17p)/TP53 mutation; as a single agent, or in combination with fludarabine and cyclophosphamide for relapsed or refractory CLL/SLL without del(17p)/TP53 mutation; as a single agent for relapsed or refractory disease with del(17p)/TP53 mutation in patients with lymph nodes < 5 cm; and post second-line maintenance therapy following complete or partial response to treatment for relapsed or refractory disease.[2,3]

The NCCN guidelines on Waldenstrom Macroglobulinema/Lymphoplasmacytic Lymphoma (version 2.2019 – September 14, 2018) recommends Arzerra as a single agent or in combination therapy in rituximab (Rituxan, Truxima) intolerant patients for previously treated disease that does not response to primary treatment or for relapsed or progressive disease.[2,4]

The NCCN guidelines on B-Cell Lymphomas (version 4.2019 – June 18, 2019) recommends Arzerra as a substitute for rituximab products and Gazyva (obinutuzumab injection) in patients with B-cell lymphomas experiencing rare complications such as paraneoplastic pemphigus, Stevens-Johnson syndrome, lichenoid dermatitis, vesiculobullous dermatitis, and toxic epidermal necrolysis.[2,5]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Arzerra. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Arzerra as well as the monitoring required for adverse events and long-term efficacy, approval requires Arzerra to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Arzerra is recommended in those who meet the following criteria:

FDA-Approved Indications

153. Chronic Lymphocytic Leukemia/Small Lymphocytic Lymphoma. Approve for 6 months if the patient meets the following criteria (A and B):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Arzerra is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

154. Waldenstrom Macroglobulinemia/Lymphoplasmacytic Lymphoma. Approve for 6 months if the patient meets the following criteria (A, B, C, and D):

A) Patient is ≥ 18 years of age; AND
B) The patient is intolerant to a rituximab product; AND
C) The patient has relapsed or progressive disease; AND
D) Arzerra is prescribed by or in consultation with an oncologist.

155. B-Cell Lymphoma. (Note: Examples include follicular lymphoma, MALT lymphoma, marginal zone lymphoma, mantle cell lymphoma, diffuse large B-cell lymphoma, high-grade B-cell lymphoma). Approve for 6 months if the patient meets the following criteria (A, B, and C):
A) Patient is ≥ 18 years of age; AND
B) The patient experienced an adverse event or intolerance to a rituximab product or Gazyva® (obinutuzumab injection).
(NOTE: Examples of adverse events or intolerance include paraneoplastic pemphigus, Stevens-Johnson syndrome, lichenoid dermatitis, vesiculobullous dermatitis, toxic epidermal necrolysis]; AND
C) Arzerra is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Arzerra has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

144. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Asparlas™ (calaspargase pegol mknl injection, for intravenous use)

DATE REVIEWED: 12/11/2019

OVERVIEW

Asparlas is a conjugate of L-asparaginase, produced by *E. coli*, and monomethoxypolyethylene glycol (mPEG) with a succinimidyl carbonate (SC) linker.[1] The SC linker forms a stable chemical bond between mPEG and L-asparaginase. Asparlas catalyzes the conversion of L-asparagine into aspartic acid and

ammonia. Leukemia cells with low expression of asparagine synthetase cannot make L-asparagine and require exogenous sources for survival. Asparlas kills leukemia cells by depleting the plasma of exogenous L-asparagine.

Asparlas is indicated as a component of a multi-agent chemotherapy regimen for the treatment of acute lymphoblastic leukemia (ALL) in pediatric and young adults, age 1 month to 21 years.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) clinical practice guidelines for ALL (version 2.2019 – May 15, 2019) and Pediatric ALL (version 2.2020 – November 25, 2019) state that Asparlas can be substituted for pegaspargase in patients aged 1 month to 21 years for more sustained asparaginase activity.[2-4]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Asparlas. All approvals are provided for 1 year in duration as noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Asparlas as well as the monitoring required for adverse events and long-term efficacy, approval requires Asparlas to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Asparlas is recommended in those who meet the following criteria:

FDA-Approved Indications

13. Acute Lymphoblastic Leukemia. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** The patient is aged 1 month to 21 years; AND
- **B)** Asparlas is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Asparlas has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

145. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Azedra Prior Authorization Policy

- Azedra® (iobenguane I 131 injection, for intravenous use – Progenics Pharmaceuticals, Inc.)

REVIEW DATE: 09/02/2020

OVERVIEW

Azedra is a radioactive therapeutic agent indicated for the treatment of adult and pediatric patients 12 years of age and older with iobenguane scan positive, unresectable, locally advanced or metastatic pheochromocytoma or paraganglioma who require systemic anticancer therapy.[1]

Azedra, a high-specific iodine-131-metaiodobenzylguanidine (I-131 MIBG) product, is produced by a manufacturing process, Ultratrace®.[2] Compared with conventional I-131 MIBG, Azedra has little to no unlabeled MIBG. Theoretical advantages of using a high-specific activity product are improved targeting, greater tumor concentration, and decreased potential for side effects.[3,4]

The recommended Azedra regimen consists of one dosimetric dose and two therapeutic doses; the doses are administered via intravenous infusion.[1] Three scans are recommended after the dosimetric dose. Administration of the therapeutic doses may need to be reduced or delayed based on dosimetry data or adverse events (e.g., myelosuppression, pneumonitis). In one of the studies, patients received the first therapeutic dose 7 to 28 days after the dosimetric dose.[2] The two therapeutic doses should be separated by a minimum of 90 days.[1]

The administration of Azedra requires the use of pre- and concomitant medications.[1] Inorganic iodine therapy should be initiated before Azedra therapy and continued for 10 days after each Azedra dose. Fluid intake should be increased before Azedra therapy and continued for 1 week after each Azedra dose. Drugs that reduce catecholamine uptake or deplete catecholamine stores should be discontinued before Azedra therapy and should not be re-initiated for at least 7 days after each Azedra dose. Antiemetics are recommended before each Azedra dose.

DISEASE OVERVIEW

Pheochromocytoma is a rare tumor that develops in chromaffin cells in the central part of the adrenal glands. Paraganglioma also develops in chromaffin cells, but outside of the adrenal glands.[5-7] Most pheochromocytomas and paragangliomas are benign, but approximately 10% to 15% of pheochromocytomas and 20% to 50% of paragangliomas are malignant; cancer cells often migrate to the lymph nodes, bones, liver, or lungs.[5-8] Pheochromocytomas and paragangliomas release hormones, primarily adrenaline (epinephrine) and noradrenaline (norepinephrine) that cause episodic or persistent high blood pressure.[8] Hypertensive crisis can lead to cardiac arrhythmias, myocardial infarction, and death. Surgery is the standard of care for patients with localized or regional pheochromocytomas and paragangliomas.[5,6,8,9]

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for Neuroendocrine and Adrenal Tumors (version 2.2020 – July 24, 2020) note surgical resection as the mainstay of treatment for benign and malignant pheochromocytomas and paragangliomas.[10] Azedra or other I-131 MIBG therapy (requires

positive MIBG scan) is recommended (among other therapies) for unresectable tumors or in the presence of distant metastases.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Azedra. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Azedra, as well as the monitoring required for adverse events and long-term efficacy, approval requires Azedra to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Azedra is recommended in those who meet one of the following criteria:

FDA-Approved Indications

28. Pheochromocytoma. Approve Azedra for 6 months if the patient meets ALL of the following conditions (A, B, and C):
- **C)** Patient is ≥ 12 years of age; AND
- **D)** Patient has iobenguane scan positive, unresectable, locally advanced or metastatic pheochromocytoma; AND
- **E)** The medication is prescribed by, or in consultation with, an oncologist or radiologist.

29. Paraganglioma. Approve Azedra for 6 months if the patient meets ALL of the following conditions (A, B, and C):
- **B)** Patient is ≥ 12 years of age; AND
- **C)** Patient has iobenguane scan positive, unresectable, locally advanced or metastatic paraganglioma; AND
- **D)** The medication is prescribed by, or in consultation with, an oncologist or radiologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Azedra is not recommended in the following situations:

76. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Bavencio Prior Authorization Policy
- Bavencio® (avelumab injection for intravenous use – EMD Serono, Inc.)

REVIEW DATE: 07/15/2020

OVERVIEW

Bavencio, a programmed cell death ligand-1 (PD-L1) blocking antibody, is indicated for the treatment of the following:

- **Merkel cell carcinoma**, in adults and pediatric patients ≥ 12 years of age with metastatic disease.
- **Renal cell carcinoma**, in combination with Inlyta (axitinib tablets), for the first-line treatment of patients with advanced disease.
- **Urothelial carcinoma**, in patients with locally advanced or metastatic disease who have **a)** disease progression during or following platinum-containing chemotherapy; or **b)** have disease progression within 12 months of neoadjuvant or adjuvant treatment with platinum-containing chemotherapy; and for **c)** first-line maintenance treatment of locally advanced or metastatic disease that has not progressed with first-line platinum-containing chemotherapy.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on bladder cancer (version 5.2020 – May 12, 2020) recommends Bavencio as one of the "alternative preferred regimens" for subsequent therapy (category 2A) for locally advanced or metastatic disease (Stage IV, post-platinum).[2] It is recommended as second-line therapy for locally advanced or metastatic disease (stage IV) [post-platinum]. Bavencio can be used regardless of PD-L1 expression levels. The new indication in the maintenance setting after platinum therapy is not yet addressed in the guidelines. The NCCN Compendium[3] recommends Bavencio for urothelial carcinoma of the bladder; for upper genitourinary tract tumors (metastatic disease); urothelial carcinoma of the prostate (metastatic disease); and for primary carcinoma of the urethra (recurrent or metastatic disease).

The NCCN guidelines on Merkel cell carcinoma (version 1.2020 – October 2, 2019) recommends Bavencio as one of the options for disseminated disease (category 2A).[4] Clinical trial is preferred in this setting; but other PD-1/PD-L1 inhibitor options for disseminated disease include Keytruda® (pembrolizumab for injection) and Opdivo® (nivolumab for injection) [all category 2A].

The NCCN guidelines for kidney cancer (version 2.2020 – August 5, 2019) recommends Bavencio in combination with Inlyta for first-line treatment in all risk group patients (favorable and poor/intermediate)

for relapsed or Stage IV disease. It is one of the "other recommended regimens" for clear cell histology renal cell carcinoma with a category 2A recommendation. For subsequent therapy, Bavencio + Inlyta is a category 3 recommendation.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Bavencio. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Bavencio, as well as the monitoring required for adverse events and long-term efficacy, approval requires Bavencio to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Bavencio is recommended in those who meet the following criteria:

FDA-Approved Indication

5. Merkel Cell Carcinoma. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 12 years of age; AND
- **B)** Patient has metastatic (disseminated) Merkel cell carcinoma; AND
- **C)** The medication is prescribed by or in consultation with an oncologist.

2. Renal Cell Carcinoma. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Patient has relapsed or Stage IV clear cell disease; AND
- **B)** The medication will be used in combination with Inlyta (axitinib tablets); AND
- **C)** The medication is prescribed by or in consultation with an oncologist.

3. Urothelial Carcinoma. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Patient has locally advanced or metastatic urothelial carcinoma; AND
- **B)** Patient has tried platinum-containing chemotherapy (cisplatin or carboplatin); AND
- **C)** The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Bavencio is not recommended in the following situations:

77. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Beleodaq Prior Authorization Policy
- Beleodaq® (belinostat injection for intravenous use – Spectrum Pharmaceuticals)

REVIEW DATE: 09/02/2020

OVERVIEW
Beleodaq, a histone deacetylase inhibitor, is indicated for the treatment of patients with relapsed or refractory peripheral T-cell lymphoma.[1]

Guidelines
The National Comprehensive Cancer Network (NCCN) guidelines on T-Cell Lymphomas (version 1.2020 – January 6, 2020) recommends Beleodaq as a single-agent for second-line and subsequent therapy of peripheral T-cell lymphoma, adult T-cell leukemia/lymphoma, extranodal NK/T-cell lymphoma – nasal type, and hepatosplenic gamma – delta T-cell lymphoma.[2,3]

NCCN guidelines on Primary Cutaneous Lymphomas (version 2.2020 – April 10, 2020) recommend Beleodaq for systemic therapy of mycosis fungoides/Sezary syndrome and for primary cutaneous CD30+ T-cell lymphoproliferative disorders.[3,4]

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of Beleodaq. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Beleodaq as well as the monitoring required for adverse events and long-term efficacy, approval requires Beleodaq to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Beleodaq is recommended in those who meet the following criteria:

FDA-Approved Indications

3. T-Cell Lymphoma. Approve for 1 year if Beleodaq is prescribed by or in consultation with an oncologist or a dermatologist.
Note: Examples include Peripheral T-Cell Lymphoma, Mycosis Fungoides/Sezary Syndrome, Primary Cutaneous CD30+ T-Cell Lymphoproliferative Disorders, Adult T-Cell Leukemia/Lymphoma, Hepatosplenic Gamma-Delta T-Cell Lymphoma, Extranodal NK/T-Cell Lymphoma – Nasal Type

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Coverage of Beleodaq is not recommended in the following situations:

146. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Bendamustine Products Prior Authorization Policy

- Belrapzo™ (bendamustine injection for intravenous use – Eagle Pharmaceuticals)
- Bendeka® (bendamustine injection for intravenous use – Teva Pharmaceuticals, Inc.)
- Treanda® (bendamustine injection for intravenous use – Cephalon, Inc.)
- Bendamustine injection for intravenous use – various manufacturers

REVIEW DATE: 07/15/2020

Overview

Bendamustine, an alkylating agent, is indicated for the treatment of patients with:

- **B-cell non-Hodgkin lymphoma, indolent**, that has progressed during or within 6 months of treatment with rituximab or a rituximab containing regimen.
- **Chronic lymphocytic leukemia**. Efficacy compared to first-line agents other than chlorambucil has not been established.[1-3]

Guidelines

B-Cell Lymphomas

The National Comprehensive Cancer Network (NCCN) guidelines for B-cell lymphomas (version 2.2020 – July 9, 2020) recommend bendamustine for the treatment of a variety B-cell lymphomas, including follicular lymphoma (grade 1 and 2), gastric MALT lymphoma, nongastric MALT lymphoma, nodal marginal zone lymphoma, splenic marginal zone lymphoma, histologic transformation of marginal zone lymphoma to diffuse large B-cell lymphoma (DLBCL), mantle cell lymphoma, DLBCL, high-grade B-cell lymphoma, acquired immunodeficiency syndrome (AIDS)-related B-cell lymphoma, and post-transplant lymphoproliferative disorders.[4,6] Bendamustine is recommended as monotherapy, or in combination with rituximab, Polivy™ (polatuzumab vedotin-piiq injection for intravenous use), or Gazyva depending on the lymphoma type and previous treatment history.

Chronic Lymphocytic Leukemia/Small Lymphocytic Lymphoma

The NCCN guidelines for chronic lymphocytic leukemia/small lymphocytic lymphoma (version 4.2020 – December 20, 2019) recommend bendamustine, in combination with rituximab (e.g., Rituxan, Truxima), Gazyva® (obinutuzumab injection for intravenous [IV] use), or Arzerra® (ofatumumab injection for IV use), for the first-line treatment of patients ≥ 65 years of age without del(17p)/TP53 mutation, or younger patients with or without significant comorbidities.[4,5] Bendamustine in combination with rituximab is recommended for the treatment of relapsed or refractory disease without del(17p)/TP53 mutation in patients ≥ 65 years of age, or in patients < 65 years of age with or without significant comorbidities.

Hodgkin Lymphoma

The NCCN guidelines for Hodgkin lymphoma (version 2.2020 – April 17, 2020) recommend bendamustine for the treatment of recurrent or refractory classic Hodgkin Lymphoma.[4,7] In patients ≥ 18 years of age, bendamustine in

combination with gemcitabine and vinorelbine, or in combination with Adcetris® (brentuximab injection for IV use) is recommended for second-line or subsequent therapy (if not previously used), or in combination with carboplatin and etoposide for third-line or subsequent therapy, or as a single agent for subsequent therapy. In patients > 60 years of age, bendamustine is recommended as a single agent for palliative therapy of relapsed or refractory disease.

Multiple Myeloma

Bendamustine is recommended in the NCCN guidelines for multiple myeloma (version 4.2020 – May 8, 2020) as a treatment option for relapsed or progressive multiple myeloma.[4,8] Bendamustine is recommended as a single agent, or in combination with dexamethasone and Revlimid® (lenalidomide capsules) or with dexamethasone and Velcade® (bortezomib injection for IV and subcutaneous use).

Primary Cutaneous Lymphomas

The NCCN guidelines for primary cutaneous lymphomas (version 2.2020 – April 10, 2020) recommend bendamustine for the systemic treatment of mycosis fungoides/Sezary syndrome with or without skin-directed or radiation therapy, and as a single agent for the treatment of relapsed/refractory primary cutaneous CD30+ T-cell lymphoproliferative disorders.[4,9]

T-Cell Lymphomas

The NCCN guidelines for T-cell lymphomas (version 1.2020 – January 6, 2020) recommend bendamustine as a single agent for the treatment of relapsed or refractory peripheral T-cell lymphomas, adult T-cell leukemia/lymphoma, and refractory hepatosplenic gamma-delta T-cell lymphoma as subsequent therapy.[4,10]

Waldenstrom Macroglobulinemia/Lymphoplasmacytic Lymphoma

Bendamustine is recommended in the NCCN guidelines for Waldenstrom macroglobulinemia/lymphoplasmacytic lymphoma (version 2.2020 – April 15, 2020) as a single agent or in combination with rituximab for primary treatment, for the treatment of previously treated disease that did not respond, or for progressive or relapsed disease.[4,11]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of bendamustine. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with bendamustine as well as the monitoring required for adverse events and long-term efficacy, approval requires bendamustine to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of bendamustine is recommended in those who meet the following criteria:

FDA-Approved Indications

14. **B-Cell Non-Hodgkin Lymphoma.** Approve for 6 months if bendamustine is prescribed by or in consultation with an oncologist.

15. **Chronic Lymphocytic Leukemia/Small Lymphocytic Lymphoma.** Approve for 6 months if bendamustine is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

16. **Hodgkin Lymphoma.** Approve for 6 months if the patient meets the following criteria (A, B, and C):
    A) Patient is ≥ 18 years of age; AND
    B) Bendamustine is used as second-line or subsequent therapy; AND
    C) Bendamustine is prescribed by or in consultation with an oncologist.

17. **Multiple Myeloma.** Approve for 6 months if the patient meets the following criteria (A and B):
    A) Patient has relapsed or refractory disease; AND
    B) Bendamustine is prescribed by or in consultation with an oncologist.

18. **T-Cell Lymphoma.** (Note: Examples include Peripheral T-Cell Lymphoma, Mycosis Fungoides/Sezary Syndrome, Primary Cutaneous CD30+ T-Cell Lymphoproliferative Disorders, Adult T-Cell Leukemia/Lymphoma, Hepatosplenic Gamma-Delta T-Cell Lymphoma). Approve for 6 months if bendamustine is prescribed by or in consultation with an oncologist.

19. **Waldenstrom Macroglobulinemia/Lymphoplasmacytic Lymphoma.** Approve for 6 months if bendamustine is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of bendamustine is not recommended in the following situations:

147. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Besponsa Prior Authorization Policy

- Besponsa™ (inotuzumab ozogamicin injection for intravenous use – Pfizer)

REVIEW DATE: 07/15/2020

OVERVIEW

Besponsa, an antibody-drug conjugate directed against human CD22, is indicated for the treatment of adults with relapsed or refractory B-cell precursor acute lymphoblastic leukemia (ALL).[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for ALL (version 1.2020 – January 15, 2020) recommend Besponsa for the treatment of relapsed/refractory Philadelphia chromosome negative (Ph-) B-cell ALL, or relapsed/refractory Philadelphia chromosome positive (Ph+) B-cell ALL with tyrosine kinase inhibitor intolerant or refractory disease, as a single agent or in combination with mini-hyper CVD (cyclophosphamide, dexamethasone, vincristine, methotrexate, cytarabine).[2,3]

The NCCN guidelines on pediatric ALL (version 2.2020 – November 25, 2019) recommend Besponsa as a single-agent for the treatment of pediatric patients with relapsed/refractory Ph- B-cell ALL, or relapsed/refractory Ph+ B-cell ALL with tyrosine kinase inhibitor intolerant or refractory disease.[4]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Besponsa. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Besponsa as well as the monitoring required for adverse events and long-term efficacy, approval requires Besponsa to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Besponsa is recommended in those who meet the following criteria:

FDA-Approved Indications

4. **Acute Lymphoblastic Leukemia.** (Note: This applies to Philadelphia chromosome positive and negative acute lymphoblastic leukemia.) Approve for 6 months if the patient meets the following criteria (A and B):

D) Patient has relapsed or refractory, B-cell precursor acute lymphoblastic leukemia; AND

E) Besponsa is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Besponsa is not recommended in the following situations:

148. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Bevacizumab Products

- Avastin® (bevacizumab injection for intravenous injection – Genentech, Inc.)
- Mvasi™ (bevacizumab-awwb injection for intravenous infusion – Amgen)
- Zirabev™ (bevacizumab-bvzr injection for intravenous infusion – Pfizer)

DATE REVIEWED: 04/01/2020; 06/10/2020 selected revision

OVERVIEW

Bevacizumab is a recombinant humanized monoclonal antibody that binds to and inhibits the biologic activity of human vascular endothelial growth factor (VEGF), a key mediator of angiogenesis.[1] Bevacizumab is indicated for the following uses:

1) cervical cancer (persistent, recurrent, or metastatic), in combination with paclitaxel and cisplatin OR paclitaxel and topotecan;
2) metastatic colorectal cancer (mCRC), in combination with intravenous 5-fluorouracil [5-FU]-based chemotherapy for first- or second-line treatment; or for mCRC, in combination with fluoropyrimidine (5-FU, capecitabine)-irinotecan-based or fluoropyrimidine-oxaliplatin-based chemotherapy for second-line treatment in patients who have progressed on a first-line bevacizumab-containing regimen; Limitation of use: Bevacizumab is not indicated for adjuvant treatment of colon cancer;
3) treatment of recurrent glioblastoma in adults;
4) non-squamous non-small cell lung cancer (NSCLC), in combination with carboplatin and paclitaxel for first-line treatment of unresectable, locally advanced, recurrent or metastatic disease;
5) recurrent epithelial ovarian, fallopian tube, or primary peritoneal cancer that is platinum-resistant in combination with paclitaxel, Doxil® (doxorubicin liposome intravenous infusion; i.e., pegylated liposomal doxorubicin), or topotecan for the treatment of patients who received no more than two prior chemotherapy regimens, OR disease that is platinum-sensitive in combination with carboplatin and paclitaxel or in combination with carboplatin and gemcitabine, followed by Avastin as a single agent; or in combination with carboplatin and paclitaxel, followed by Bevacizumab as a single agent, in patients with stage III or IV disease following initial surgical resection;
6) metastatic renal cell carcinoma (mRCC) in combination with interferon alfa subcutaneous injection;
7) Hepatocellular carcinoma (HCC): Bevacizumab in combination with Tecentriq (atezolizumab injection for intravenous use) is indicated for the treatment of patients with unresectable or metastatic HCC who have not received prior systemic therapy.

Bevacizumab is available as a solution and is supplied in 100 mg and 400 mg preservative-free, single-use vials that deliver 4 mL and 16 mL of bevacizumab (25 mg/mL), respectively.[1] The dose of bevacizumab is diluted in a total volume of 100 mL of 0.9% sodium chloride injection. The first dose is given as an intravenous infusion over 90 minutes. The second dose is infused over 60 minutes if the first dose was tolerated, and the third and all subsequent doses are given over 30 minutes, if the 60 minute infusion was tolerated.

Guidelines

The National Comprehensive Cancer Network (NCCN) clinical practice guidelines on **cervical cancer** (version 3.2019 – December 17, 2018) recommend bevacizumab for treatment of local/regional recurrence or Stage IVB or distant metastases in patients with cervical cancer (squamous cell carcinoma or adenocarcinoma) as first-line preferred combination regimen with paclitaxel and cisplatin (category 1), or with carboplatin and paclitaxel (category 2A), or with topotecan and paclitaxel (category 1).[2] It is also recommended for second-line, single-agent therapy (category 2B).

The NCCN clinical practice guidelines on **colon cancer** (version 2.2020 – March 3, 2020) recommendations for bevacizumab treatment are as follows:[3,4]

- In combination with capecitabine or with FOLFOX, FOLFIRI, CapeOX, FOLFOXIRI, OR 5-FU/LV as one of the following (category 2A):
  - As primary treatment for advanced or metastatic disease;
  - For unresectable synchronous metastases to liver and/or lung and other sites;
  - As primary treatment for synchronous abdominal/peritoneal metastases that are non-obstructing, or following local therapy for patients with imminent or existing obstruction;
  - As primary treatment for unresectable metachronous metastases in combination with FOLFIRI or irinotecan.;
- Primary treatment for unresectable synchronous liver and/or lung metastases in combination with one of the following: FOLFOX, FOLFIRI, FOLFOXIRI, or CapeOX (category 2A);
- The preferred anti-angiogenic therapy* as primary treatment for patients with unresectable metachronous metastases and previous adjuvant FOLFOX or CapeOX within the past 12 months in combination with irinotecan or FOLFIRI (category 2A);
- As subsequent therapy for advanced or metastatic disease (category 2A):
  - As the preferred anti-angiogenic agent* in combination with irinotecan or FOLFIRI in patients previously receiving oxaliplatin-based therapy without irinotecan;
  - In combination with FOLFOX or CapeOX in patients previously receiving irinotecan-based therapy without oxaliplatin;
  - As the preferred anti-angiogenic agent* in combination with irinotecan or FOLFIRI for patients previously treated with fluoropyrimidine therapy without irinotecan or oxaliplatin; or in combination with FOLFOX or CAPEOX in this population; or irinotecan + oxaliplatin.

The NCCN clinical practice guidelines on **rectal cancer** (version 2.2020 – March 3, 2020) recommendations for bevacizumab treatment are as follows:[4,5]

- In combination with capecitabine or with a FOLFOX, FOLFIRI, FOLFOXIRI, CapeOX or 5-FU/LV regimen for one of the following (All of these are category 2A except adjuvant therapy which is 2B.):
  - Primary therapy for T3, N0, any T, N1-2, or T4 and/or locally unresectable or medically inoperable disease if resection is contraindicated after neoadjuvant therapy;
  - Primary therapy for unresectable synchronous metastases or for medically inoperable disease;
  - After primary treatment with chemoradiation or local therapy for symptomatic unresectable synchronous metastases or medically inoperable disease;
  - Adjuvant therapy after resection and/or local therapy of resectable metachronous metastases for patients who received previous chemotherapy or had growth on neoadjuvant chemotherapy;
  - Primary treatment for unresectable metachronous metastases in patients who have not received previous adjuvant FOLFOX or CapeOX within the past 12 months;

  - Adjuvant therapy for unresectable metachronous metastases that converted to resectable disease after primary treatment;
  - For unresectable metachronous metastases that remain unresectable after primary treatment;
- As the preferred anti-angiogenic therapy* as primary treatment, in combination with irinotecan or FOLFIRI in patients with unresectable metachronous metastases and previous adjuvant FOLFOX or CapeOX within the past 12 months (category 2A);
- As subsequent therapy after first progression of unresectable advanced or metastatic disease in combination with chemotherapy (category 2A).

The NCCN clinical practice guidelines on **central nervous system (CNS) cancers** (version 1.2020 – March 10, 2020) recommend bevacizumab as a preferred single-agent therapy for recurrent anaplastic gliomas (category 2A).[6] Anaplastic gliomas includes the classification of mixed anaplastic oligoastrocytoma (AOA), anaplastic astrocytoma (AA), anaplastic oligodendroglioma (A), and other rare anaplastic gliomas. Bevacizumab is also recommended as a preferred single-agent therapy for glioblastoma (category 2A) and in combination with chemotherapy (carmustine or lomustine, TMZ, carboplatin) [category 2B]. The NCCN guidelines recommend that bevacizumab be considered as a single-agent treatment for recurrence therapy in adults with *intracranial and spinal ependymoma* (excluding subependymoma) [category 2A]. It is also recommended for meningiomas either as monotherapy (category 2A) or in combination with Afinitor (everolimus tablets) [category 2B]. Patients with good performance status who have evidence of radiographic progression may benefit from continuing bevacizumab alone to prevent rapid neurologic deterioration. In patients with glioblastoma or anaplastic gliomas, Bevacizumab plus chemotherapy can be considered in patients who have failed bevacizumab monotherapy.

The NCCN clinical practice guidelines on **NSCLC** (version 3.2020 – February 11, 2020)[4,7] recommend bevacizumab therapy in combination with carboplatin and paclitaxel (category 1), carboplatin and Alimta (category 2A), cisplatin and Alimta (category 2A) for recurrence or metastases in patients with performance status 0 to 1 for tumors of non-squamous cell histology (i.e., adenocarcinoma (with mixed subtypes), large cell carcinoma) and no history of recent hemoptysis for the following uses:

1) initial systemic therapy if *EGFR*, *ALK*, *ROS1*, *BRAF* negative or unknown, and PD-L1 < 50 or unknown;
2) first-line or subsequent therapy for *BRAF V600E*-mutation positive tumors;
3) subsequent therapy for sensitizing *EGFR* mutation-positive tumors after prior targeted therapy (e.g., Tarceva® [erlotinib tablets], Tagrisso® [osimertinib tablets]);
4) subsequent therapy for *ALK* rearrangement-positive tumors after previous targeted therapy (e.g., Xalkori® [crizotinib capsules], Alecensa® [alectinib capsule]);
5) subsequent therapy for *ROS1* rearrangement-positive tumors and prior Xalkori or Zykadia therapy;
6) First-line or subsequent therapy for PD-L1 expression-positive (≥ 50%) tumors and.

Bevacizumab is also recommended in the NCCN guidelines as *continuation maintenance* therapy if given first line with chemotherapy for recurrence or metastasis.[7] This is in patients who achieve tumor response or stable disease following initial cytotoxic therapy.

The NCCN clinical practice guidelines on **ovarian cancer** including fallopian tube or primary peritoneal cancer (version 1.2020 – March 11, 2020) recommendations for bevacizumab treatment of ***epithelial*** ovarian cancer/fallopian tube cancer/primary peritoneal cancer are as follows:[8]

- Therapy for persistent disease or recurrence for one of the following (category 2A):
  - As preferred therapy if *platinum-sensitive*, in combination with chemotherapy.
  - As preferred therapy if *platinum-resistant*, in combination with chemotherapy; or
  - As preferred targeted therapy as a single agent for both platinum-sensitive and platinum-resistant disease.
- Maintenance therapy for *platinum-sensitive* persistent disease or recurrence following response.

- Consider as neoadjuvant chemotherapy in combination with paclitaxel and carboplatin for bulky Stage II to IV disease or poor surgical candidates (category 2A). Bevacizumab can also be used with this combination (paclitaxel and carboplatin) for primary adjuvant treatment in stage I to IV disease.
- Bevacizumab is also recommended (mostly in combination with chemotherapy, but sometimes as single agent) for treatment of Other Less Common Histopathologies such as carcinosarcoma, clear-cell carcinoma, mucinous carcinoma, serous/endometrioid epithelial carcinoma, and malignant sex cord stromal tumors either either for adjuvant therapy or for treatment of systemic disease.

For **kidney cancer**, bevacizumab's efficacy was established using Roferon®-A (interferon alfa-2a injection)[9] which is no longer available. Subsequently, bevacizumab was studied in combination with Intron A.[10] The NCCN clinical practice guidelines on **kidney cancer**[11] (version 2.2020 – August 5, 2019) recommend bevacizumab as therapy for relapse or Stage IV disease as follows: 1) in combination with interferon alfa-2 (Roferon A, Intron A) in favorable risk and poor/intermediate risk patients as first-line therapy for disease with predominant clear cell histology (category 1). This combination is listed as agents useful under certain circumstances; 2) as a single-agent subsequent therapy for predominant clear cell histology as "useful under certain circumstances" (category 2B); 3) as single-agent systemic therapy for non-clear cell histology, useful under certain circumstances (category 2A); and 4) in combination with erlotinib (for selected patients with advanced papillary renal cell carcinoma including hereditary leiomyomatosis and renal cell cancer) or everolimus/Afinitor® Disperz™ (everolimus tablets for oral suspension) (category 2A).

The NCCN clinical practice guidelines on **breast cancer** (version 3.2020 – March 6, 2020) recommend bevacizumab in combination with paclitaxel as "useful in certain circumstances" for recurrent or metastatic (stage IV) HER2-negative disease and endocrine therapy refractory (category 2A).[12] The guidelines note that sequential single agents are preferred options, but chemotherapy cmbinations may be used in select patients with high tumor burden, rapidly progressing disease, and visceral crisis. Regarding bevacizumab, the guidelines state that randomized trials in metastatic breast cancer document that adding bevacizumab to some first- or second-line chemotherapy agents modestly improves time to progression and response rates but does not improve overall survival or quality of life. The time to progression impact may vary among cytotoxic agents used with bevacizumab and appears greatest with bevacizumab in combination with weekly paclitaxel.

The NCCN clinical practice guidelines on **malignant pleural mesothelioma** (version 1.2020 – November 27, 2019) recommend bevacizumab in combination with cisplatin and Alimta (category 1) or with carboplatin and Alimta (category 2A) followed by single-agent maintenance bevacizumab as treatment for 1) unresectable clinical Stage I to III disease and tumors of epithelial histology, or 2) clinical Stage IV disease, tumors of sarcomatoid or mixed histology, or medically inoperable tumors in patients with performance status 0 to 2.[13] The NCCN guidelines recommend intravenous bevacizumab 15 mg per kg on Day 1 given every 3 weeks for 6 cycles in combination with Alimta with cisplatin or carboplatin for first-line combination therapy. This combination therapy may be followed by maintenance bevacizumab 15 mg per kg given every 3 weeks until disease progression.

The NCCN Compendium for bevacizumab recommends its use in endometrial carcinoma as a single agent or in combination with other chemotherapy upon progression on prior chemotherapy (category 2A).[4] It is also recommended for small bowel adenocarcinoma in combination with other chemotherapy for initial therapy (category 2A). For soft tissue sarcoma, bevacizumab is recommended for use in combination with temozolomide for the treatment of solitary fibrous tumor and hemangiopericytoma. It is also recommended as single agent therapy for angiosarcoma (category 2A for both).

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of bevacizumab in patients with conditions other than ophthalmic. The intent of this policy is to provide recommendations for uses other than ophthalmic conditions.. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with bevacizumab as well as the monitoring required for adverse events (AEs) and long-term efficacy, approval requires bevacizumab to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of bevacizumab is recommended in those who meet one of the following criteria:

FDA-Approved Indications

25. Cervical Cancer. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** The medication is prescribed by or in consultation with an oncologist; AND
- **B)** The patient has recurrent or metastatic cervical cancer.

26. Colon or Rectal Cancer. Approve for 1 year if the patient meets the following criteria (A, B, C, and D):
- **A)** Bevacizumab is prescribed by or in consultation with an oncologist; AND
- **B)** The patient has advanced or metastatic colon or rectal cancer [Stage IV]; AND
- **C)** Bevacizumab is used in combination with a chemotherapy regimen.
  Note: Examples of chemotherapy regimens are 5-fluorouracil with leucovorin, and may include one or both of oxaliplatin, irinotecan; capecitabine with or without oxaliplatin; irinotecan with or without oxaliplatin; AND
- **D)** Bevacizumab is not being used for adjuvant treatment of colon cancer.

27. Central Nervous System Tumors – Glioblastoma (glioblastoma multiforme [GBM], Grade IV astrocytoma), Anaplastic Gliomas, Meningiomas, Intracranial and Spinal Ependymoma (Excludes Subependymoma) in Adults. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** The medication is prescribed by or in consultation with an oncologist; AND
- **B)** The patient has tried at least one other therapy.
  Note: Examples of other therapies are temozolomide capsules or injection, radiotherapy.

28. Hepatocellular Carcinoma (HCC). Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Bevacizumab is prescribed by or in consultation with an oncologist; AND
- **B)** The medication is used in combination with Tecentriq (atezolizumab injection); AND
- **C)** The patient has not received prior systemic therapy.

29. Non-Small Cell Lung Cancer (NSCLC). Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** Bevacizumab is prescribed by or in consultation with an oncologist; AND
- **B)** The patient has advanced or metastatic non-squamous NSCLC (i.e., adenocarcinoma, large cell, or NSCLC not otherwise specified) and meets ONE of the following criteria (i, ii, iii, or iv):
  - **i.** The NSCLC tumor is positive for epidermal growth factor receptor (*EGFR*) mutation and bevacizumab is used in combination with erlotinib for first-line treatment; OR
  - **ii.** If the NSCLC tumor is positive for any one of the targetable mutations (i.e., epidermal growth factor receptor (*EGFR*) mutations, anaplastic lymphoma kinase (*ALK*) fusions, ROS proto-oncogene 1 [*ROS1*]) at least one of the targeted therapy agents has been tried and bevacizumab is used as subsequent therapy; OR
  - **iii.** If the NSCLC tumor is *BRAF V600E* mutation-positive, bevacizumab is used as either first-line or subsequent therapy; OR
  - **iv.** The NSCLC tumor is negative or unknown for targetable mutations (e.g., *EGFR, ALK, ROS1, BRAF*) and the patient meets ONE of the following criteria (a or b):
    - **a)** Bevacizumab is used as initial therapy in combination with platinum chemotherapy (cisplatin or carboplatin); OR
    - **b)** Bevacizumab is used as subsequent therapy and is used either as a single agent or in combination with other agents.

6. Ovarian, Fallopian Tube, or Primary Peritoneal Cancer. Approve for 1 year if the medication is prescribed by or in consultation with an oncologist.

7. Renal Cell Cancer. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** The medication is prescribed by or in consultation with an oncologist; AND
- **B)** The patient has advanced (e.g., relapsed, metastatic, or Stage IV) renal cell cancer.

Other Uses with Supportive Evidence

8. Breast Cancer. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Bevacizumab is prescribed by or in consultation with an oncologist; AND
- **B)** The patient has recurrent or metastatic human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND
- **C)** Bevacizumab is used in combination with paclitaxel.

9. Endometrial Carcinoma. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** The medication is prescribed by or in consultation with an oncologist; AND
- **B)** The patient has progressed on prior chemotherapy.
  Note: Examples of chemotherapy are carboplatin, cisplatin, paclitaxel, docetaxel, doxorubicin.

10. Neovascular or Vascular Ophthalmic Conditions. Approve for 3 years.
Note: Examples of neovascular or vascular ophthalmic conditions include diabetic macular edema (includes patients with diabetic retinopathy and diabetic macular edema), macular edema following retinal vein occlusion, myopic choroidal neovascularization, neovascular (wet) age-related macular degeneration, other neovascular diseases of the eye (e.g., neovascular glaucoma, retinopathy of prematurity, sickle cell neovascularization, choroidal neovascular conditions).

11. Malignant Pleural Mesothelioma. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Bevacizumab is prescribed by or in consultation with an oncologist; AND
- **B)** The patient has unresectable malignant pleural mesothelioma; AND
- **C)** One of the following applies (i or ii):
  - **i.** Bevacizumab will be used in combination with a chemotherapy regimen.
    Note: Examples of chemotherapy regimens are Alimta [pemetrexed injection], cisplatin, carboplatin; OR
  - **ii.** Bevacizumab is being used as a single agent for maintenance therapy after the patient has received combination chemotherapy regimen.
    Note: Examples of chemotherapy regimens are Alimta [pemetrexed injection], cisplatin, carboplatin.

12. Small Bowel Adenocarcinoma. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** The medication is prescribed by or in consultation with an oncologist; AND
- **B)** The medication is used in combination with chemotherapy.

Note: Examples of chemotherapy are fluorouracil, leucovorin, and oxaliplatin (FOLFOX), capecitabine and oxaliplatin (CapeOX), fluorouracil, leucovorin, oxaliplatin, and irinotecan (FOLFOXIRI).

13. Soft Tissue Sarcoma – Angiosarcoma and Solitary Fibrous Tumor/Hemangiopericytoma. Approve for 1 year if the medication is prescribed by or in consultation with an oncologist.

14. Vulvar Cancer (Squamous Cell Carcinoma). Approve for 1 year if the patient meets the following criteria (Aand B):
- **A)** The medication is prescribed by or in consultation with an oncologist; AND
- **B)** Bevacizumab is used in combination with a chemotherapy regimen.
  Note: Examples of chemotherapy regimens are cisplatin and paclitaxel, carboplatin and paclitaxel.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Bevacizumab has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval).

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Blenrep Prior Authorization Policy
- Blenrep™ (belantamab mafodotin-blmf intravenous infusion – GlaxoSmithKline)

REVIEW DATE: 08/13/2020

OVERVIEW

Blenrep, a B-cell maturation antigen-directed antibody and microtubule inhibitor conjugate, is indicated for treatment of adults with relapsed or refractory multiple myeloma, in those who have received at least four prior therapies, including an anti-CD38 monoclonal antibody, a proteasome inhibitor, and an immunomodulatory agent. This indication was approved under accelerated approval based on response rate. Continued approval may be contingent upon verification and description of clinical benefit in confirmatory trial(s). It is administered as a 2.5 mg/kg intravenous infusion given once every 3 weeks.

Guidelines

Blenrep has not yet been addressed in guidelines for multiple myeloma. National Comprehensive Cancer Network (NCCN) guidelines for multiple myeloma (version 4.2020 – May 8, 2020) recommend various regimens as primary therapy (transplant eligible and non-transplant candidates), maintenance therapy, and previously treated multiple myeloma.[2] The choice of regimen takes into account patient factors as well as response and tolerability to previous regimens. Triplet regimens (e.g., with a proteasome inhibitor, immunomodulatory drug, and corticosteroid) are standard therapy for multiple myeloma. Blenrep is an other recommended regimen for its approved use in relapsed/refractory disease. Other available therapies used as monotherapy or in combination regimens include agents from the following drug classes:

- Proteasome inhibitors (e.g., Velcade® [bortezomib injection], Kyprolis® [carfilzomib injection], Ninlaro® [ixazomib capsules]);
- Immunomodulatory drugs (e.g., Thalomid® [thalidomide capsules], Revlimid® [lenalidomide capsules], Pomalyst® [pomalidomide capsules]);
- Steroids (e.g., dexamethasone, prednisone);
- CD38-directed monoclonal antibodies (Darzalex® [daratumumab intravenous infusion], Darzalex Faspro™ [daratumumab and hyaluronidase-fihj subcutaneous injection], Sarclisa® (isatuximab-irfc intravenous infusion]);
- Histone deacetylase inhibitor (Farydak® [panobinostat capsules]);
- Signaling Lymphocytic Activation Molecule Family member 7-directed immunostimulatory antibody (Empliciti® [elotuzumab injection]);
- Nuclear export inhibitor (Xpovio™ [selinexor tablets]);
- Alkylating agents (e.g., cyclophosphamide, melphalan); and
- Other cytotoxic drugs (e.g., vincristine, doxorubicin, liposomal doxorubicin).

Safety

Blenrep may cause changes in the corneal epithelium resulting in vision changes, including severe vision loss and corneal ulcer. The patient may experience symptoms such as blurred vision and dry eyes. Ophthalmic examinations should be conducted at baseline and prior to each dose, and promptly upon worsening of symtoms. Blenrep should be withheld until improvement and resumed or permanently discontinued based on the severity. Due to risks of ocular toxicity, there is a Risk Evaluation and Mitigation Strategy (REMS) program for Blenrep. Included in the program is a requirement for prescribers to be certified and counsel patients regarding ocular toxicity and the need for ophthalmic examinations prior to each dose. Patients must also be enrolled in the REMS and comply with monitoring.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Blenrep. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Blenrep as well as the monitoring required for adverse events and long-term efficacy, approval requires Blenrep to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Blenrep is recommended in those who meet the following criteria:

FDA-Approved Indications

5. Multiple Myeloma. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- **20.** Patient is ≥ 18 years of age; AND
- **21.** Patient has tried at least four prior systemic lines of therapy; AND
- **22.** Among the previous therapies tried, the patient has received at least one drug from each of the following classes (i, ii, and iii):
  - **i.** Proteasome inhibitor; AND
    Note: Examples include Velcade (bortezomib injection), Kyprolis (carfilzomib infusion), Ninlaro (ixazomib capsules).
  - **ii.** Immunomodulatory drug; AND
    Note: Examples include Revlimid (lenalidomide capsules), Pomalyst (pomalidomide capsules), Thalomid (thalidomide capsules).
  - **iii.** Anti-CD38 monoclonal antibody; AND
    Note: For example, Darzalex (daratumumab infusion), Darzalex Faspro (daratumumab and hyaluronidase-fihj subcutaneous injection), or Sarclisa (isatuximab-irfc infusion).
- **23.** The agent will be prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Blenrep is not recommended in the following situations:

149. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Blincyto Prior Authorization Policy

- Blincyto® (blinatumomab injection for intravenous use – Amgen)

REVIEW DATE: 09/02/2020

OVERVIEW

Blincyto, a bispecific CD19-directed CD3 T-cell engager, is indicated for the treatment of adults and children with:

- B-cell precursor acute lymphoblastic leukemia (ALL) in first or second complete remission with minimal residual disease (MRD) ≥ 0.1%.[1] Accelerated approval was granted for this indication

based on MRD response and hematologic relapse-free survival. Continued approval may be dependent on verification and description of clinical benefit in confirmatory trials.

- Relapsed or refractory B-cell ALL.[1]

Blincyto contains a boxed warning for Cytokine Release Syndrome which may be life-threatening or fatal and Neurologic toxicities which may be severe, life-threatening or fatal.[1] Stop or discontinue Blincyto as recommended for either toxicity.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on Acute Lymphoblastic Leukemia (version 1.2020 – January 15, 2020) and Pediatric Acute Lymphoblastic Leukemia (version 2.2020 – November 25, 2019) guidelines recommend Blincyto as single-agent therapy for relapsed/refractory B-cell ALL; consolidation therapy in adolescents, young adults, and adults with positive MRD after complete response to induction therapy; and for pediatric patients with MRD positive disease, less than complete response, or high-risk genetics.[2-4]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Blincyto. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Blincyto, as well as the monitoring required for adverse events and long-term efficacy, approval requires Blincyto to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Blincyto is recommended in those who meet the following criteria:

FDA-Approved Indications

156. Acute Lymphoblastic Leukemia. Approve for 1 year if the patient meets the following criteria (A, B, and C):

F) Patient has B-cell precursor disease; AND

G) Patient meets one of the following (i or ii):

- **a.** Patient is Philadelphia chromosome negative and meets one of the following (a or b):
  - **a)** Patient has relapsed or refractory disease; OR
  - **b)** Patient is minimal residual disease positive; OR
- **b.** Patient is Philadelphia chromosome positive and meets one of the following (a, b, c, or d):
  - **a)** Patient has tried at least one tyrosine kinase inhibitor (TKI) used for the treatment of acute lymphoblastic leukemia; OR
    Note: Examples of a TKI include Gleevec® (imatinib tablets), Sprycel® (dasatinib tablets), Tasigna® (nilotinib capsules).
  - **b)** Patient does not have a complete response to induction therapy; OR
  - **c)** Patient is minimal residual disease positive; OR
  - **d)** Patient has high-risk genetics; AND

H) Blincyto is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Blincyto is not recommended in the following situations:

150. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Carmustine Injection (BICNU® – Heritage Pharmaceuticals, generics)

DATE REVIEWED: 12/18/2019

OVERVIEW

Carmustine injection, a nitrosourea, is approved for the following uses as a palliative agent as a single agent or in established combination therapy in the following conditions:[1]

- Brain tumors, including glioblastoma, brainstem glioma, medulloblastoma, astrocytoma, ependymoma, and metastatic brain tumors; AND
- Multiple myeloma, in combination with prednisone; AND
- Hodgkin's lymphoma, in relapsed or refractory disease in combination with other approved drugs; AND
- Non-Hodgkin's lymphoma, in relapsed or refractory disease in combination with other approved drugs.

Guidelines

The National Comprehensive Cancer Network (NCCN) clinical practice guidelines on Central Nervous System Cancers (version 3.2019 – October 18, 2019) supports use of carmustine injection for certain adults with recurrent or progressive low-grade glioma/pilocytic and infiltrative supratentorial astrocytoma/oligodendroglioma, recurrent treatment of anaplastic glioma, glioblastoma, adult intracranial and spinal ependymoma (excluding subependymoma).[2,3] Carmustine injection is also part of a Preferred regimen (in combination with thiotepa) as consolidation therapy with stem cell rescue in patients with primary CNS lymphoma.[2,4]

The NCCN clinical practice guidelines on Hodgkin Lymphoma (version 2.2019 – July 15, 2019) recommend carmustine as part of a chemotherapy regimen (e.g., MiniBEAM [carmustine/cytarabine/etoposide/melphalan] for relapsed or refractory disease.[5]

The NCCN clinical practice guidelines on Multiple Myeloma (version 2.2020 – October 9, 2019) and B-Cell Lymphomas (version 5.2019 – September 23, 2019) do not provide recommendations on the use of carmustine for the treatment of multiple myeloma or non-Hodgkin's lymphoma.[6,7]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of carmustine products. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with carmustine products as well as the monitoring required for adverse events and long-term efficacy, approval requires carmustine products to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of carmustine products is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Central Nervous System Tumor** (Note: Includes Adult Low-Grade Infiltrative Supratentorial Astrocytoma/Oligodendroglioma, Anaplastic Gliomas, Glioblastoma, Adult Intracranial and Spinal Ependymoma, Primary Central Nervous System Lymphoma). Approve for 1 year if the patient meets the following criteria (A and B):
   - **A)** The patient meets ONE of the following (i or ii):
     - **i.** The patient has recurrent or progressive disease; OR
     - **ii.** The agent is being used in a regimen with stem cell rescue.
       Note: For example, as consolidation therapy in combination with thiotepa with stem cell rescue; AND
   - **B)** The agent is prescribed by or in consultation with an oncologist.

2. **Hodgkin Lymphoma.** Approve for 1 year if the patient meets the following criteria (A, B, C, and D):
   - **A)** The patient is ≥ 18 years of age; AND
   - **B)** The patient has relapsed or refractory disease; AND
   - **C)** The agent is being used as part of a chemotherapy regimen.
     Note: For example, as a component of MiniBEAM (carmustine/cytarabine/etoposide/melphalan); AND
   - **D)** The agent is prescribed by or in consultation with an oncologist.

3. **Non-Hodgkin's Lymphoma.** Approve for 1 year if the patient meets the following criteria (A, B, and C):
   - **A)** The patient has relapsed or refractory disease; AND
   - **B)** The agent is being used as part of a chemotherapy regimen; AND
   - **C)** The agent is prescribed by or in consultation with an oncologist.

4. **Multiple Myeloma.** Approve for 1 year if the patient meets the following criteria (A and B):
   - **A)** The agent is being used with prednisone: AND
   - **B)** The agent is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Carmustine has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

151. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Cyramza® (ramucirumab injection for intravenous use – Eli Lilly and Company)

DATE REVIEWED: 06/10/2020

OVERVIEW

Cyramza, a human vascular endothelial growth factor receptor 2 (VEGFR2) antagonist, is approved for the following indications:[1]

1) Gastric or gastroesophageal (GE) junction adenocarcinoma, as a single agent or in combination with paclitaxel injection for the treatment of patients with advanced or metastatic disease with disease progression on or after prior fluoropyrimidine- or platinum-containing chemotherapy;
2) Metastatic non-small cell lung cancer (NSCLC), in combination with docetaxel intravenous injection (Docefrez™, Taxotere®, generics) for the treatment of patients with disease progression on or after platinum-based chemotherapy. Patients with epidermal growth factor receptor (*EGFR*) or anaplastic lymphoma kinase (*ALK*) genomic tumor aberrations should have disease progression on FDA-approved therapy for these aberrations prior to receiving Cyramza.
3) Metastatic NSCLC, in combination with erlotinib for the first-line treatment of NSCLC with EGFR exon 19 deletions or exon 21 (L858R) mutations.
4) Metastatic colorectal cancer (mCRC), in combination with FOLFIRI (irinotecan, leucovorin, and 5-fluorouracil [5-FU]) for the treatment of patients with disease progression on or after prior therapy with Avastin® (bevacizumab intravenous injection), oxaliplatin, and a fluoropyrimidine.
5) Hepatocellular carcinoma (HCC), as a single agent in patients who have an alpha fetoprotein of ≥ 400 ng/mL and have been treated with sorafenib.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on colon cancer (version 3.2020 – May 6, 2020) and rectal cancer (version 4.2020 – May 21, 2020) recommend Cyramza as primary therapy and subsequent therapy for patients with unresectable advanced or metastatic disease, and as adjuvant treatment for unresectable metachronous metastases that converted to resectable disease after primary treatment, in combination with either irinotecan or FOLFIRI.[2-4]

The NCCN guidelines on gastric cancer (version 2.2020 – May 13, 2020) and esophageal and esophagogastric junction cancers (version 2.2020 – May 13, 2020) recommend Cyramza as palliative treatment for patients who are not surgical candidates or have unresectable locally advanced, recurrent, or metastatic disease.[4-6]

The NCCN guidelines on NSCLC (version 5.2020 – May 27, 2020) recommend Cyramza as subsequent therapy in combination with docetaxel for metastatic disease for patients who have not previously received docetaxel either following progression on initial cytotoxic therapy or for further progression on a systemic immune checkpoint inhibitor or other systemic therapy.[4,7] Cyramza is also recommended in combination with erlotinib for patients with EGFR mutation positive, recurrent, advanced, or metastatic disease as first-line therapy or as continuation therapy following disease progression on Cyramza and erlotinib.

The NCCN guidelines for hepatobiliary cancers (version 3.2020 – June 1, 2020) recommends Cyramza as a single agent for the treatment of patients with progressive disease with an alpha fetoprotein ≥ 400 ng/mL.[4,8]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Cyramza. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Cyramza as well as the monitoring required for adverse events and long-term efficacy, approval requires Cyramza to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Cyramza is recommended in those who meet the following criteria:

FDA-Approved Indications

6. **Colon or Rectal Cancer**. Approve for 1 year if the patient meets the following criteria (A, B, and C):
   - **A)** Cyramza is prescribed by or in consultation with an oncologist; AND
   - **B)** The patient has received oxaliplatin and a fluoropyrimidine (e.g., 5-fluorouracil [5-FU], capecitabine); AND
   - **C)** Cyramza will be used in combination with irinotecan or with FOLFIRI (irinotecan, folinic acid [leucovorin], and 5-fluorouracil [5-FU]).

7. **Gastric, Esophagogastric Junction, or Esophageal Cancer**. Approve for 1 year if the patient meets the following criteria (A, B, and C):
   - **A)** Cyramza is prescribed by or in consultation with an oncologist; AND
   - **B)** The patient meets one of the following criteria (i, ii, or iii):
     - **i.** Cyramza will be used alone; OR
     - **ii.** Cyramza will be used in combination with paclitaxel; OR
     - **iii.** Cyramza will be used in combination with fluorouracil and irinotecan; AND
   - **C)** The patient has received chemotherapy with at least ONE of the following (i or ii):
     - **i.** 5-Fluorouracil (5-FU) or capecitabine; OR
     - **ii.** Cisplatin, carboplatin, or oxaliplatin.

8. **Non-Small Cell Lung Cancer.** Approve for 1 year if the patient meets the following criteria (A and B):
   - **A)** Cyramza is prescribed by or in consultation with an oncologist; AND
   - **B)** The patient meets of the following criteria (i or ii):
     - **i.** Cyramza will be used as first-line therapy; AND
       - a) The patient has epidermal growth factor receptor (EGFR) positive disease; AND
       - b) Cyramza will be used in combination with erlotinib (Tarceva®, generics); OR
     - **ii.** Cyramza will be used as subsequent therapy; AND

a) Cyramza will be used in combination with docetaxel intravenous injection (Docefrez™, Taxotere®, generics); AND
b) The patient has received targeted drug therapy if the patient's tumor is positive for a targetable mutation (i.e., sensitizing epidermal growth factor receptor mutation, anaplastic lymphoma kinase fusions).

9. Hepatocellular Carcinoma. Approve for 1 year if the patient meets the following criteria (A, B, C, and D):
A) Cyramza is prescribed by or in consultation with an oncologist; AND
B) The patient has been treated with Nexavar® (sorafenib tablet); AND
C) Cyramza will be used as a single agent; AND
D) The patient has an alpha fetoprotein of ≥ 400 ng/mL.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Cyramza has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

152. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Darzalex Faspro Prior Authorization Policy

- Darzalex™ Faspro (daratumumab and hyaluronidase-fihj injection for subcutaneous use – Janssen Biotech, Inc.) Prior Authorization Policy

REVIEW DATE: 05/06/2020

OVERVIEW

Darzalex Faspro approved in multiple myeloma in the following situations:[1]

- in newly diagnosed patients, in combination with Revlimid (lenalidomide capsules) and dexamethasone, for the treatment of patients who are ineligible for autologous stem cell transplant and in relapsed/refractory disease, in combination with Revlimid and dexamethasone in patients who have received at least one prior therapy; AND
- in newly diagnosed patients, in combination with Velcade (bortezumab injection), melphalan, and prednisone in those ineligible for autologous stem cell transplant; AND
- in patients who have received at least one prior therapy, in combination with Velcade and dexamethasone; AND
- in patients who have received at least three prior lines of therapy (including a proteasome inhibitor and an immunomodulatory agent or who are double-refractory to a proteasome inhibitor and an immunomodulatory agent), as monotherapy.

In multiple myeloma, Darzalex Faspro binds to CD38 and inhibits the growth of CD38-expressing tumor myeloma cells. Darzalex Faspro is a fixed combination of daratumumab and hyaluronidase (recombinant human). It contains the identical molecular antibody of daratumumab available in Darzalex intravenous (IV), but hyaluronidase has been added to facilitate systemic delivery. Darzalex Faspro should be administered under the care of a healthcare as a 3 to

5 minute subcutaneous injection. The dose of Darzalex Faspro is fixed regardless of the patient's body surface area (BSA); dose reductions are not recommended. Safety and efficacy is not established in patients < 18 years of age.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for multiple myeloma (version 4.2020 – May 8, 2020) address the diagnosis, treatment, and follow-up for patients with multiple myeloma.[2,3] In the most recent update, a footnote was added to clarify that Darzalex Faspro is included in the recommendations for all of the daratumumab-containing regimens. NCCN does recommend Darzalex IV in multiple regimens both as primary treatment and in previously treated disease. Darzalex IV/Velcade/Thalomid/dexamethasone is recommended as primary therapy for transplant candidates. For patients who are non-transplant candidates, Darzalex IV/Revlimid/prednisone is a Preferred regimen, and Darzalex IV/Velcade/melphalan/prednisone is an Other regimen for primary treatment. For previously treated multiple myeloma, Darzalex IV/dexamethasone plus Velcade or Revlimid are among the Preferred regimens, whereas Darzalex IV monotherapy, Darzalex IV/Kyprolis/dexamethasone, are Darzalex IV/Pomalyst/dexamethasone are listed as other recommended regimens.

Dosing Information

Darzalex Faspro is available as a single-dose vial containing 1,800 mg of daratumumab and 30,000 units of hyaluronidase per 15 mL. Dosing schedule varies depending on regimen prescribed. Refer to the prescribing information for more specific FDA-approved regimens. Dose reductions are not recommended. In cases of myelosuppression, dose delay may be required to allow recovery of blood cell counts.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Darzalex Faspro. Because of the specialized skills required for evaluation and diagnosis of patients treated with Darzalex Faspro as well as the monitoring required for adverse events and long-term efficacy, approval requires Darzalex Faspro to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Darzalex Faspro is recommended in those who meet the following criteria:

FDA-Approved Indications

10. Multiple Myeloma. Approve for 1 year if the patient meets BOTH of the following (A and B):
- **24.** The patient meets ONE of the following (i or ii):
  - **A)** Darzalex Faspro is used in combination with at least one other agent.
    Note: Examples of agents that may be used in combination with Darzalex Faspro include Revlimid (lenalidomide capsules), melphalen, or Velcade (bortezumab injection); OR
  - **B)** The patient has tried at least three different regimens for multiple myeloma.
    Note: Examples of agents used in other regimens include Velcade (bortezumab injection), Kyprolis (carfilzomib injection), Revlimid (lenalidomide capsules), cyclophosphamide, Ninlaro (ixazomib capsules); AND
- **25.** Darzalex Faspro is prescribed by or in consultation with an oncologist or a hematologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Darzalex Faspro has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

153. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Update	06/16/2020: Update overview to include updated NCCN guidelines. No criteria changes.	NA

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Darzalex™ (daratumumab injection for intravenous use – Janssen Biotech, Inc.)

DATE REVIEWED: 02/26/2020

OVERVIEW

Darzalex is a CD38-directed cytolytic antibody.[1] It binds to CD38 and inhibits the growth of CD38-expressing tumor myeloma cells. It is approved adults with multiple myeloma who meet the following:

- in newly diagnosed patients, in combination with Revlimid (lenalidomide capsules) and dexamethasone, for the treatment of patients who are ineligible for autologous stem cell transplant and in relapsed/refractory disease, in combination with Revlimid and dexamethasone in patients who have received at least one prior therapy; AND
- in newly diagnosed patients, in combination with Velcade (bortezumab injection), melphalan, and prednisone in those ineligible for autologous stem cell transplant; AND
- in newly diagnosed patients, in combination with Velcade, Thalomid (thalidomide capsules), and dexamethasone, for treatment of patients who are eligible for autologous stem cell transplant; AND
- in patients who have received at least one prior therapy, in combination with Velcade and dexamethasone; AND
- in patients who have received at least two prior therapies (including Revlimid and a proteasome inhibitor), in combination with Pomalyst (pomalidomide capsules) and dexamethasone; AND
- in patients who have received at least three prior lines of therapy (including a proteasome inhibitor and an immunomodulatory agent or who are double-refractory to a proteasome inhibitor and an immunomodulatory agent), as monotherapy.

Safety and efficacy is not established in patients < 18 years of age.

Guidelines

The NCCN Multiple Myeloma clinical practice guidelines (version 2.2020 – October 9, 2020) recommend Darzalex in treatment regimens for primary therapy.[2-3] Darzalex/Velcade/Thalomid/dexamethasone is recommended as primary therapy for transplant candidates. For patients who are non-transplant candidates, Darzalex/Revlimid/prednisone is a Preferred regimen, and Darxalex/Velcade/melphalen/prednisone is an Other regimen for primary treatment. For previously treated multiple myeloma, Darzalex/dexamethasone plus Velcade or Revlimid are among the Preferred regimens, whereas Darzalex monotherapy and Darzalex/ dexamethasone plus Kyprolis (carfilzomib injection) or Pomalyst are listed as other recommended regimens. The NCCN systemic light chain amyloidosis guidelines (version 1.2020 – December 6, 2019) list Darzalex as a therapy for previously treated disease.[4]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Darzalex. Because of the specialized skills required for evaluation and diagnosis of patients treated with Darzalex as well as the monitoring required for adverse events and long-term efficacy, approval requires Darzalex to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Darzalex is recommended in those who meet the following criteria:

FDA-Approved Indications

11. Multiple Myeloma. Approve for 1 year if the patient meets BOTH of the following (A and B):
- **26.** The patient meets ONE of the following (i or ii):
  - **A)** Darzalex is used in combination with at least one other agent.
    Note: Examples of agents that may be used in combination with Darzalex includeRevlimid (lenalidomide capsules), Pomalyst (pomalidomide capsules), Thalomid (thalidomide capsules), melphalen, Velcade (bortezumab injection), or Kyprolis (carfilzomib injection); OR
  - **B)** The patient has tried at least three different regimens for multiple myeloma.
    Note: Examples of agents used in other regimens include Velcade (bortezumab injection), Kyprolis (carfilzomib injection), Revlimid (lenalidomide capsules), cyclophosphamide, Ninlaro (ixazomib capsules); AND
- **27.** Darzalex is prescribed by or in consultation with an oncologist or a hematologist.

Other Uses with Supportive Evidence

12. Systemic Light Chain Amyloidosis. Approve for 1 year if the patient meets BOTH of the following (A and B):
- **A)** The patient has received at least one other regimen for this condition.
  Note: Examples of agents used in other regimens include Velcade (bortezumab injection), Revlimid (lenalidomide capsules), cyclophosphamide, and melphalan; AND
- **B)** The agent is prescribed by or in consultation with an oncologist or a hematologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Darzalex has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

154. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Decitabine injection for intravenous use (Dacogen® – Otsuka America Pharmaceutical, generics)

REVIEW DATE: 10/16/2019

OVERVIEW

Decitabine (Dacogen), a hypomethylating agent, is indicated for the treatment of adults with myelodysplastic syndromes (MDS) including previously treated and untreated, *de novo* and secondary MDS of all French-American-British subtypes (refractory anemia, refractory anemia with ringed sideroblasts, refractory anemia with excess blasts, refractory anemia with excess blasts in transformation, and chronic myelomonocytic leukemia) and intermediate-1, intermediate-2, and high-risk International Prognostic Scoring System groups.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for Myelodysplastic Syndromes (Version 1.2020 – August 27, 2019) recommend decitabine for the treatment of lower risk and higher risk MDS, and for the treatment of myelodysplastic/myeloproliferative neoplasms.[2,3]

The NCCN guidelines for Acute Myeloid Leukemia (Version 2.2020 – September 3, 2019) recommend decitabine as a single agent, or in combination with Nexavar® (sorafenib tablet) or Venclexta® (venetoclax tablet) in patients ≥ 60 years of age, and as a single agent, or in combination with Nexavar or Venclaxta for the treatment of relapsed/refractory disease.[2,4] NCCN also recommends decitabine in combination with Venclaxta for relapsed/refractory blastic plasmacytoid dendritic cell neoplasm.

The NCCN guidelines for Myeloproliferative Neoplasms (Version 3.2019 – September 4, 2019) recommend decitabine for the treatment of myelofibrosis (MF)-accelerated phase or MF-blast/acute myeloid leukemia phase.[2,5]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of decitabine. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with decitabine as well as the monitoring required for adverse events and long-term efficacy, approval requires decitabine to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of decitabine is recommended in those who meet the following criteria:

FDA-Approved Indications

157. Myelodysplastic Syndromes. (Note: Includes Refractory Anemia, Refractory Anemia with Ringed Sideroblasts, Refractory Anemia with Excess Blasts, Refractory Anemia with Excess Blasts in Transformation, Chronic Myelomonocytic Leukemia). Approve for 1 year if the patient meets the following criteria (A and B):

A) The patient is ≥ 18 years of age; AND

B) Decitabine is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

158. Acute Myeloid Leukemia. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** The patient meets one of the following criteria (i or ii):
  - **i.** The patient is ≥ 60 years of age; OR
  - **ii.** The patient has relapsed or refractory disease; AND
- **B)** Decitabine is prescribed by or in consultation with an oncologist.

159. Blastic Plasmacytoid Dendritic Cell Neoplasm. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** The patient has relapsed or refractory disease; AND
- **B)** Decitabine is used in combination with Venclexta® (venetoclax tablet); AND
- **C)** Decitabine is prescribed by or in consultation with an oncologist.

160. Myelofibrosis. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** The patient has accelerate phase, or blast/acute myeloid leukemia phase; AND
- **B)** Decitabine is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Decitabine has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

155. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Elzonris™ (tagraxofusp-erzs injection for intravenous use – Stemline Therapeutics)

DATE REVIEWED: 12/11/2019

OVERVIEW

Elzonris is a CD-123 directed cytotoxin, consisting of recombinant human interleukin-3 (IL-3) fused with truncated diphtheria toxin and is produced by recombinant DNA technology in *Escherichia coli* cells.[1] Elzonris inhibits protein synthesis and causes cell death in cells expressing CD-123.

Elzonris is indicated for the treatment of blastic plasmacytoid dendritic cell neoplasm in adults and pediatric patients ≥ 2 years of age.[1]

Guidelines

The National Comprehensive Cancer Network clinical practice guidelines for Acute Myeloid Leukemia (Version 2.2020 – September 3, 2019) recommend Elzonris as a single agent for the treatment of blastic plasmacytoid dendritic cell neoplasm.[2,3]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Elzonris. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Elzonris as well as the monitoring required for adverse events and long-term efficacy, approval requires Elzonris to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Elzonris is recommended in those who meet the following criteria:

FDA-Approved Indications

161. Blastic Plasmacytoid Dendritic Cell Neoplasm. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** The patient is ≥ 2 years of age; AND
- **B)** Elzonris is prescribed by or consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Elzonris has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

156. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Empliciti™ (elotuzumab injection for intravenous use – Bristol-Myers Squibb)

DATE REVIEWED: 02/26/2020

OVERVIEW

Empliciti is a SLAMF7 (signaling lymphocytic activation molecule family member 7)-directed immunostimulatory antibody.[1] It attaches to SLAMF7 on myeloma cells and Natural Killer (NK) cells; therefore, it acts directly on myeloma cells plus enhances the activity of NK cells to kill the myeloma cells. In multiple myeloma, Empliciti is indicated for the following uses:

1. in patients with who have received one to three prior therapies, in combination with Revlimid (lenalidomide capsules) and dexamethasone; AND
2. in patients who have received at least two prior therapies (including Revlimid and a proteasome inhibitor), in combination with Pomalyst® (pomalidomide) and dexamethasone, .

If the dose of one drug in the regimen is delayed, interrupted, or discontinued, the treatment with the other drugs may continue as scheduled. However, if dexamethasone is delayed or discontinued, base the decision whether to administer Empliciti on clinical judgment (i.e., risk of hypersensitivity). Safety and efficacy have not been established in patients < 18 years of age.

Guidelines

The NCCN Multiple Myeloma clinical practice guidelines (version 2.2020 – October 9, 2019) recommend Empliciti in treatment regimens for patients who were previously treated for multiple myeloma.[3] In this population, Empliciti/Revlimid/dexamethasone is among the Preferred regimens, whereas Empliciti/Velcade (bortezomib injection)/dexamethasone and Empliciti/Pomalyst/dexamethasone are listed among the other recommended regimens.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Emplicti. Because of the specialized skills required for evaluation and diagnosis of patients treated with Emplicti as well as the monitoring required for adverse events and long-term efficacy, approval requires Emplicti to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Emplicti is recommended in those who meet the following criteria:

FDA-Approved Indications

13. Multiple Myeloma. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

28. The patient has tried at least one other regimen for multiple myeloma.
Note: Examples of agents used in other regimens include Velcade (bortezumab injection), Revlimid (lenalidomide capsules), cyclophosphamide, Darzalex (daratumumab injection); AND

29. Empliciti is used in combination with at least one other agent.
Note: Examples of agents that may be used in combination with Empliciti include Revlimid® (lenalidomide capsules), Velcade (bortezomib injection), and Pomalyst (pomalidomide capsules); AND

30. Empliciti is prescribed by or in consultation with an oncologist or a hematologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Empliciti has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

157. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Enhertu® (fam-trastuzumab deruxtecan-nxki injection for intravenous use – Daiichi Sankyo, Inc. and AstraZeneca Pharmaceuticals)

DATE REVIEWED: 12/20/2019

OVERVIEW

Enhertu is indicated for the treatment of adult patients with unresectable or metastatic human epidermal growth factor receptor 2 (HER2)-positive breast cancer who have received two or more prior anti-HER2-based regimens in the metastatic setting.[1] This indication is approved under accelerated approval based on tumor response rate and duration of response. Continued approval for this indication may be contingent upon verification and description of clinical benefit in a confirmatory trial. Enhertu cannot be substituted for or with trastuzumab or Kadcyla (ado-trastuzumab emtansine).

Guidelines

According to the National Comprehensive Cancer Network (NCCN) breast cancer guidelines (version 2.2020 – February 5, 2020), Enhertu is a recommended therapy, as per its FDA-approved indication after two or more prior HER2-targeted therapies, for the treatment of recurrent or Stage IV metastatic disease that is HER2-positive.[2] Trastuzumab + Perjeta + docetaxel is category 1, preferred regimen; or trastuzumab + Perjeta + paclitaxel (category 2A, preferred). Other recommended regimens include: Kadcyla; trastuzumab + vinorelbine, trastuzumab + capecitabine, Tykerb (lapatinib tablets) + capecitabine, and trastuzumab + Tykerb. For HR+, HER2-positive disease, endocrine therapy options include aromatase inhibitor ± trastuzumab; aromatase inhibitor + trastuzumab ± Tykerb; Faslodex® (fulvestrant for injection) ± trastuzamab, tamoxifen ± trastuzumab (all category 2A). For premenopausal patients, ovarian ablation or suppression is recommended in addition to endocrine therapy ± trastuzumab.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Enhertu. Because of the specialized skills required for evaluation and diagnosis of patients treated with Enhertu as well as the monitoring required for adverse events and long-term efficacy, approval requires Enhertu to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

Recommended Authorization Criteria

Coverage of Enhertu is recommended in those who meet the following criteria:

FDA-Approved Indications

30. Breast Cancer. Approve for 1 year if the patient meets ALL of the criteria (A, B, and C):
- **A)** The patient has unresectable or metastatic human epidermal growth factor receptor 2 (HER2)-positive disease; AND
- **B)** The patient has received at least two prior anti-HER2-based regimens in the metastatic setting.
  Note: Examples of anti-HER2-based regimens include Perjeta (pertuzumab injection for intravenous use) + trastuzumab + docetaxel, Perjeta + trastuzumab + paclitaxel; Kadcyla (ado-trastuzumab emtansine for intravenous use), trastuzumab + capecitabine, trastuzumab + Tykerb (lapatinib tablets); AND
- **C)** The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Enhertu has not been shown to be effective or there are limited or preliminary data that are not supportive of general approval for the following conditions.

8. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

POLICY: Oncology (Injectable) – Erbitux Prior Authorization Policy

- Erbitux® (cetuximab injection for intravenous infusion – ImClone LLC/Eli Lilly and Company)

REVIEW DATE: 07/22/2020

OVERVIEW

Erbitux, an epidermal growth factor receptor (EGFR) chimeric monoclonal antibody, is indicated for the treatment of the following conditions:

- **Colorectal cancer** (CRC), *KRAS* wild-type, EGFR-expressing, metastatic CRC as determined by FDA-approved tests for the following uses:
  - In combination with FOLFIRI (irinotecan, 5-fluorouracil [5-FU], leucovorin) for first-line treatment;
  - In combination with irinotecan in patients who are refractory to irinotecan-based chemotherapy; and
  - As a single agent in patients who have failed oxaliplatin- and irinotecan-based chemotherapy or who are intolerant to irinotecan.

  Limitation of use: Erbitux is not indicated for treatment of *RAS*-mutant CRC or when the results of the *RAS* mutation tests are unknown.
- **Squamous Cell Carcinoma of the Head and Neck**:
  - In combination with radiation therapy for the initial treatment of locally or regionally advanced SCCHN;
  - In combination with platinum-based therapy with 5-FU for the first-line treatment of patients with recurrent locoregional or metastatic disease; and
  - As a single agent in patients with recurrent or metastatic disease for whom prior platinum-based therapy has failed.[1]

Guidelines

Colon Cancer

The National Comprehensive Cancer Network (NCCN) colon cancer guidelines (version 4.2020 – June 15, 2020) recommend Erbitux as primary therapy for unresectable, advanced, or metastatic *KRAS/NRAS/BRAF* wild-type gene and left-sided tumors only, in combination with irinotecan, FOLFOX (5-FU, leucovorin, oxaliplatin), FOLFIRI, or FOLFOXIRI (5-FU, leucovorin, oxaliplatin, irinotecan) regimens in patients who can tolerate intensive therapy or as a single agent in patients who cannot tolerate intensive therapy.[2,7] Reference to left-sided only disease refers to a primary tumor that originated in the left side of the colon and only refers to use of Erbitux as first-line therapy for metastatic disease. Therapies recommended after first progression vary depending on the initial treatment regimen (i.e., 5-FU/leucovorin-based or capecitabine-based therapy) that was used. The NCCN guidelines recommend Erbitux, in combination with irinotecan, FOLFOX, or FOLFIRI for the subsequent treatment of *KRAS/NRAS/BRAF* wild-type tumors; or in combination with Braftovi (encorafenib capsules) for the subsequent treatment of *BRAF V600E* positive disease. The NCCN rectal cancer guidelines (version 6.2020 – June 25, 2020) make the same recommendations for Erbitux for the treatment of rectal cancer.[3,7]

Head and Neck Cancer
The NCCN head and neck cancers guidelines (version 2.2020 – June 9, 2020) recommend Erbitux in combination with radiation therapy, with a platinum agent (cisplatin or carboplatin) with or without 5-FU, with a platinum agent plus either docetaxel or paclitaxel, or as a single agent.[4,7]

Non-Small Cell Lung Cancer (NSCLC)
The NCCN guidelines on NSCLC (version 6.2020 – June 15, 2020) recommend Erbitux in combination with Gilotrif (afatinib tablets) as subsequent therapy for recurrent, advanced, or metastatic disease in patients with a known sensitizing *EGFR* mutation who are *EGFR T790M* negative, have progressed on EGFR tyrosine kinase inhibitor (TKI) therapy, and have multiple symptomatic systemic lesions; or with a known sensitizing EGFR mutation who have progressed on EGFR TKI therapy, and have asymptomatic disease, symptomatic brain lesions, or isolated symptomatic lesions.[5,7]

In one multicenter, Phase 1b trial conducted in the US and the Netherlands, patients (n = 126) with *EGFR*-mutant lung cancer with acquired resistance to Tarceva or Iressa received oral Gilotrif 40 mg daily plus Erbitux 500 mg/m^2 intravenously every 2 weeks.[6] Patients were heavily pretreated with 52% (n = 65/126) having received ≥ 2 lines of therapy; 79% of patients had received cytotoxic chemotherapy in addition to Tarceva or Iressa. At baseline, the *EGFR* mutation status was as follows: Deletion 19 positive (n = 78), L858R positive (n = 41); and other (n = 4). *T790M* mutation status was available in 124 patients with 71 patients being *T790M* positive and 53 patients being *T790M* negative. The rate of confirmed overall response was 29% (n = 37/126) with all being partial responses; 18% of patient had ≥ 50% tumor shrinkage from baseline. There was no significant difference in overall response rate between patients harboring *T790M*-positive and *T790M*-negative tumors (32% vs. 25%, respectively; P = 0.341). Median duration of response was 5.7 months.

Penile Cancer
The NCCN guidelines on penile cancer (version 1.2020 – January 14, 2020) recommend Erbitux as a single agent for the subsequent treatment of patients with metastatic disease.[7,8]

Squamous Cell Skin Cancer
The NCCN guidelines on squamous cell skin cancer (version 2.2020 – July 14, 2020) recommend Erbitux in combination with radiation therapy for inoperable or incompletely resected regional disease, or as systemic therapy alone in patients ineligible for checkpoint inhibitors with inoperable or incompletely resected regional disease, or regional recurrence or distant metastases.[7,10]

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of Erbitux. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Erbitux as well as the monitoring required for adverse events and long-term efficacy, approval requires Erbitux to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Erbitux is recommended in those who meet the following criteria:

FDA-Approved Indications

14. Colon and Rectal Cancer. Approve for 1 year if the patient meets the following criteria (A, B, C, D, and E):
- **31.** Patient has advanced or metastatic disease; AND
- **32.** Patient's tumor or metastases are wild-type *RAS* (*KRAS* wild-type and/or *NRAS* wild-type) [that is, the tumor or metastases are *KRAS* and/or *NRAS* mutation negative]; AND
- **33.** If Erbitux is being used for first-line treatment, the primary tumor originated on the left side of the colon (from splenic flexure to rectum); AND
- **34.** Patient meets ONE of the following criteria (i or ii):
  - **i.** Patient's tumor or metastases are wild-type *BRAF* (that is, the tumor or metastases are *BRAF V600E* mutation-negative); OR
  - **ii.** Patient's tumor or metastases are *BRAF V600E* mutation-positive and the patient meets the following (a and b):
    - **a)** Patient has previously received a chemotherapy regimen for colon or rectal cancer; AND
      Note: Examples of chemotherapy regimens include a fluoropyrimidine such as 5-fluorouracil (5-FU), capecitabine, oxaliplatin, irinotecan, or an adjunctive chemotherapy regimen such as FOLFOX (5-FU, leucovorin, and oxaliplatin) or CapeOX (capecitabine and oxaliplatin).
    - **b)** Erbitux is prescribed in combination with Braftovi (encorafenib capsules); AND

E) Erbitux is prescribed by or in consultation with an oncologist.

15. Head and Neck Squamous Cell Carcinoma (HNSCC). Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** Patient meets ONE of the following criteria (i, ii, or iii):
  - **i.** Erbitux will be used in combination with radiation therapy; OR
  - **ii.** Erbitux will be used in combination with platinum-based therapy; OR
    Note: Examples of platinum chemotherapy include cisplatin and carboplatin.
  - **iii.** Erbitux will be used as a single agent; AND
- **B)** Erbitux is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

16. Non-Small Cell Lung Cancer. Approve for 1 year if the patient meets the following criteria (A, B, C, D, and E):
- **A)** Patient has advanced, or metastatic non-small cell lung cancer; AND
- **B)** Patient has a known sensitizing epidermal growth factor receptor *(EGFR)* mutation; AND
- **C)** Patient has received at least ONE tyrosine kinase inhibitor; AND
  Note: Examples of tyrosine kinase inhibitors include Tarceva® (erlotinib tablets), Iressa® (gefitinib tablets), or Gilotrif® (afatinib tablets).
- **D)** Erbitux will be used in combination with Gilotrif (afatinib tablets).
- **E)** Erbitux is prescribed by or in consultation with an oncologist.

17. Penile Cancer. Approve for 1 year if the patient meets the following criteria (A, B, C, and D):
- **A)** Patient has metastatic disease; AND
- **B)** Erbitux will be used as subsequent therapy; AND
- **C)** Erbitux will be used as a single agent; AND
- **D)** Erbitux is prescribed by or in consultation with an oncologist.

18. Squamous Cell Skin Cancer. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** Patient meets one of the following (i, ii, or iii):

i. Patient has inoperable or incompletely resected regional disease; OR
ii. Patient has regional disease; OR
iii. Patient has distant metastases; AND

B) Erbitux is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Erbitux is not recommended in the following situations:

158. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Erwinaze® (asparaginase *Erwinia chrysanthemi* injection for intramuscular and intravenous use – Jazz Pharmaceuticals)

DATE REVIEWED: 06/03/2020

OVERVIEW

Erwinaze is *Erwinia chrysanthemi*-derived L-asparaginase.[1] Asparaginase reduces the plasma levels of asparagine by catalyzing the breakdown of asparagine to aspartic acid and ammonia. Leukemia cells have a deficiency of asparagine synthetase activity and rely on exogenous sources of L-asparagine for survival. Erwinaze depletes plasma L-asparagine levels leading to leukemia cell death.

Erwinaze is indicated as a component of a multi-agent chemotherapeutic regimen for the treatment of patients with acute lymphoblastic leukemia (ALL) who have developed hypersensitivity to *Escherichia coli*-derived asparaginase.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for ALL (Version 1.2020 – January 15, 2020) recommend *E. chrysanthemi*-derived asparaginase for patients who have systemic allergic reactions or anaphylaxis due to pegaspargase hypersensitivity, and for induction therapy for ALL in patients ≥ 65 years of age.[2,3]

The NCCN guidelines for Pediatric ALL (Version 2.2020 – November 25, 2019) recommend *E. chrysanthemi*-derived asparaginase for patients who have systemic reactions or anaphylaxis due to pegaspargase hypersensitivity.[3,4]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Erwinaze. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Erwinaze as well as the monitoring required for adverse events and long-term efficacy, approval requires Erwinaze to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Erwinaze is recommended in those who meet the following criteria:

FDA-Approved Indications

162. Acute Lymphoblastic Leukemia. Approve for 1 year if the patient meets the following criteria (A and B):

A) Erwinaze is used for one of the following (i or ii):

i. The patient has a systemic allergic reaction or anaphylaxis to a pegylated asparaginase product; OR

ii. Induction therapy in adults ≥ 65 years of age; AND

B) Erwinaze is prescribed by or consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Erwinaze has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

159. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Folotyn® (pralatrexate injection – Spectrum Pharmaceuticals)

DATE REVIEWED: 06/03/2020

OVERVIEW
Folotyn is an antineoplastic folate analog which competitively inhibits dihydrofolate reductase.[1]

Folotyn is indicated for the treatment of patients with relapsed or refractory peripheral T-cell lymphoma.[1] This indication is based on overall response rate. Continued approval for this indication may be contingent on verification and description of clinical benefit in a confirmatory trial.

Guidelines
The National Comprehensive Cancer Network (NCCN) Primary Cutaneous Lymphomas clinical practice guidelines (version 2.2020 – April 10, 2020) recommend Folotyn as systemic therapy for mycosis fungoides/Sezary syndrome with or without skin-directed therapy and as a single agent for primary cutaneous CD30+ T-cell lymphoproliferative disorders.[2,3]

The NCCN T-Cell Lymphomas clinical practice guidelines (version 1.2020 – January 6, 2020) recommend Folotyn as a single agent for the second-line or subsequent therapy of relapsed or refractory peripheral T-cell lymphomas including anaplastic large cell lymphoma, peripheral T-cell lymphoma not otherwise specified, angioimmunoblastic T-cell lymphoma; enteropathy-associated T-cell lymphoma, monomorphic epitheliotropic intestinal T-cell lymphoma, and nodal peripheral T-cell lymphoma with T-follicular helper (TFH) phenotype; follicular T-cell lymphoma; adult T-cell leukemia/lymphoma; extranodal NK/T-cell lymphoma – nasal type; and hepatosplenic gamma-delta T-cell lymphoma.[3,4]

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of Folotyn. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Folotyn as well as the monitoring required for adverse events and long-term efficacy, approval requires Folotyn to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Folotyn is recommended in those who meet the following criteria:

FDA-Approved Indications

163. T-Cell Lymphoma, Peripheral. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** The patient has relapsed or refractory disease; AND
- **B)** Folotyn is used as a single agent; AND
- **C)** Folotyn is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

164. Mycosis Fungoides/Sezary Syndrome. Approve for 1 year if Folotyn is prescribed by or in consultation with an oncologist or dermatologist.

165. Cutaneous CD30+ T-Cell Lymphoproliferative Disorders. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** The patient has one of the following diagnoses (i or ii):
  - **i.** Primary cutaneous anaplastic large cell lymphoma with multifocal lesions; OR
  - **ii.** Cutaneous anaplastic large cell lymphoma with regional nodes; AND
- **B)** Folotyn is used as a single agent; AND
- **C)** Folotyn is prescribed by or in consultation with an oncologist.

166. Adult T-Cell Leukemia/Lymphoma, Acute or Lymphoma Subtype. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Folotyn is used as second-line or subsequent therapy; AND
- **B)** Folotyn is used as a single agent; AND
- **C)** Folotyn is prescribed by or in consultation with an oncologist.

167. Extranodal NK/T-Cell Lymphoma, Nasal Type. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** The patient has relapsed/refractory disease following combination, asparaginase-based chemotherapy; AND
- **B)** Folotyn is used as a single agent; AND
- **C)** Folotyn is prescribed by or in consultation with an oncologist.

168. Hepatosplenic Gamma-Delta T-Cell Lymphoma. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Folotyn is used as second-line or subsequent therapy; AND
- **B)** Folotyn is used as a single agent; AND
- **C)** Folotyn is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Folotyn has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

160. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Fulvestrant (Faslodex injection for intramuscular use – AstraZeneca; generics)

DATE REVIEWED: 05/06/2020

OVERVIEW

Fulvestrant is an estrogen receptor (ER) antagonist that binds to the estrogen receptor in a competitive manner.[1] Its affinity to the ER is comparable to that of estradiol. By binding to the ER, Faslodex downregulates the ER protein in human breast cancer cells.

Fulvestrant is indicated for the following:

- As monotherapy, for the treatment of hormone receptor-positive (HR+) [i.e., ER+ or progesterone receptor (PR+)], human epidermal growth factor receptor 2 (HER2)-negative advanced breast cancer in postmenopausal women not previously treated with endocrine therapy; or
- As monotherapy, for the treatment of patients with HR+ advanced breast cancer in postmenopausal women with disease progression following endocrine therapy.[1]
- Fulvestrant is indicated in combination with Kisqali (ribociclib tablets) as initial endocrine based therapy or following disease progression on endocrine therapy for HR+, HER2-negative advanced or metastatic breast cancer in postmenopausal women.
- Fulvestrant is indicated in combination with Ibrance® (palbociclib capsules) or Verzenio™ (abemaciclib tablets) in women with disease progression after endocrine therapy for HR+, HER2-negative advanced or metastatic breast cancer.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on breast cancer (version 3.2020 – March 6, 2020) recommends fulvestrant in combination with cyclin dependent kinase 4/6 inhibitors (i.e., Ibrance, Kisqali, Verzenio) and non-steroidal aromatase inhibitors (i.e., anastrozole, letrozole) for the treatment of recurrent or metastatic HR+, HER2-negative disease (category 1 preferred regimen).[2] The guidelines note that CDK4/6 inhibitors or anastrozole/letrozole in combination with fulvestrant may be considered as a treatment option for first-line therapy for women who are postmenopausal or premenopausal (receiving ovarian suppression or ablation). If CDK4/6 inhibitor was not previously used, fulvestrant + CDK4/6 inhibitor is a category 1, preferred regimen as second/subsequent-line therapy. It is also recommended as a second/subsequent-line therapy, category 1, preferred regimen for *PIK3CA* mutated tumors in combination with Piqray (alpelisib tablets). Fulvestrant in combination with everolimus (category 2A) is another option for second/subsequent-line therapy. As monotherapy, fulvestrant is listed as one of the preferred options (category 2A) for second/subsequent-line therapy. Men with breast cancer should be treated similarly to postmenopausal women, except that use of an aromatase inhibitor is ineffective without concomitant suppression of testicular steroidogenesis.[2-3] Based on a review article, there are limited data to support the use of fulvestrant monotherapy in men; however, there are no randomized prospective or retrospective trial data with the use of everolimus or cyclin dependent kinase (CDK) 4/6 inhibitor in men.[4]

The NCCN compendium for fulvestrant and the respective guidelines support fulvestrant use for low-grade serous carcinoma (ovarian/fallopian tube/primary peritoneal cancer), uterine sarcoma, and endometrial carcinoma.[3]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of fulvestrant. All approvals are provided for the duration noted below. Because of the of the specialized skills required for evaluation and diagnosis of patients treated with fulvestrant, as well as the monitoring required for adverse events and long-term efficacy, approval requires fulvestrant to be prescribed by or in consultation with a physician who specializes in the condition being treated.

In the approval indication, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: men/males are defined as individuals with the biological traits of a man, regardless of the individual's gender identity or gender expression. Female/women are defined as individuals with the biological traits of a woman, regardless of the individual's gender identity or gender expression.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of fulvestrant is recommended in those who meet one of the following criteria:

FDA-Approved Indications

19. Breast Cancer – Fulvestrant Monotherapy. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **35.** The medication is prescribed by or in consultation with an oncologist; AND
- **36.** Patient has recurrent or metastatic hormone receptor (HR)-positive (i.e., estrogen receptor- [ER] or progesterone receptor [PR]-positive) disease; AND
- **37.** Patient meets one of the following criteria (i or ii):
  - **i.** Patient is a postmenopausal female* or a male*; OR
  - **ii.** Patient is premenopausal and is receiving ovarian suppression with a gonadotropin-releasing hormone (GnRH) agonist or has had ovarian ablation.
    Note: Examples of GnRH agonist are Zoladex (goserelin), Lupron (leuprolide), Trelstar (triptorelin). Examples of ovarian ablation are surgical bilateral oophorectomy, ovarian irradiation.

* Refer to the Policy Statement.

20. Breast Cancer – Fulvestrant Combination Therapy. Approve for 1 year if the patient meets the following criteria (A, B, C, and D):
- **I)** The medication is prescribed by or in consultation with an oncologist; AND
- **J)** Patient has recurrent or metastatic hormone receptor (HR)-positive (i.e., estrogen receptor- [ER] or progesterone receptor [PR]-positive) disease; AND
- **K)** Patient meets ONE of the following criteria (i or ii):
  - **A)** Patient is a postmenopausal female* or a male*; OR
  - **ii.** Patient is premenopausal and is receiving ovarian suppression with a gonadotropin- releasing hormone (GnRH) agonist or has had ovarian ablation.
    Note: Examples of GnRH agonist are Zoladex (goserelin), Lupron (leuprolide), Trelstar (triptorelin). Examples of ovarian ablation are surgical bilateral oophorectomy, ovarian irradiation; AND
- **L)** Patient meets one of the following criteria (i or ii):
  - **i.** Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer and meets one of the following criteria (a or b):

a) The patient meets both of the following criteria (1 and 2):
  (1) The patient has progressed on or after at least one prior endocrine-based therapy.
  Note: Examples of endocrine therapy are tamoxifen, anastrozole, letrozole, exemestane; AND
  (2) The patient has *PIK3CA*-mutated tumor and the medication is used in combination with Piqray (alpelisib tablets); OR
b) The medication will be used in combination with one of: a cyclin dependent kinase 4/6 (CDK 4/6) inhibitor, non-steroidal aromatase inhibitor (i.e., anastrozole or letrozole), or everolimus.
Note: Examples of CDK4/6 inhibitors are Kisqali (ribociclib tablets), Ibrance (palbociclib capsules), Verzenio (abemaciclib tablets); OR

ii. Patient has human epidermal growth factor receptor 2 (HER2)-positive breast cancer and the medication is used in combination with trastuzumab products.

* Refer to the Policy Statement.

Other Uses with Supportive Evidence

21. Ovarian/Fallopian Tube/Primary Peritoneal Cancer. Approve for 1 year if the patient meets the following criteria (A and B):
A) The medication is prescribed by or in consultation with an oncologist; AND
B) The medication is used as recurrence therapy for low-grade serous carcinoma.

22. Uterine Sarcoma. Approve for 1 year if the patient meets the following criteria (A and B):
A) The medication is prescribed by or in consultation with an oncologist; AND
B) Patient meets one of the following criteria (i or ii):
i. Patient has low-grade endometrial stromal sarcoma; OR
ii. Patient has hormone receptor-positive uterine leiomyosarcoma.

23. Endometrial Carcinoma. Approve for 1 year if the medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Fulvestrant has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

1. Other Indications (Non-Cancer). Coverage is not recommended for circumstances not listed in the Authorization Criteria (FDA-approved indications and Other Uses with Supportive Evidence). Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Gazyva® (obinutuzumab injection for intravenous use – Genentech, Inc.)

REVIEW DATE: 10/09/2019

OVERVIEW

Gazyva is indicated for use:

- In combination with chlorambucil for the treatment of patients with previously untreated chronic lymphocytic leukemia;
- In combination with bendamustine and followed by Gazyva monotherapy for the treatment of patients with follicular lymphoma who relapse or are refractory to a rituximab containing regimen;
- In combination with chemotherapy and followed by Gazyva monotherapy for patients achieving at least a partial remission, for the treatment of adult patients with previously untreated stage II bulky, III or IV follicular lymphoma.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on Chronic Lymphocytic Leukemia/Small Lymphocytic Lymphoma (CLL/SLL) (version 1.2020 – August 23, 2019) recommends Gazyva as a single agent (category 2B) or in combination with chlorambucil, bendamustine, venetoclax (Category 2A), or ibrutinib (category 2B) for the first-line treatment of CLL/SLL without del(17p)/TP53 mutation; as a single agent or in combination with venetoclax for the first-line treatment of CLL/SLL with del(17p)/TP53 mutation (category 2A); and as a single agent for relapsed or refractory CLL/SLL without del(17p)/TP53 mutation (category 2A).[2,3]

The NCCN guidelines on B-Cell Lymphomas (version 4.2019 – June 18, 2019) recommend Gazyva for the first-line and second-line treatment of follicular lymphoma (grade 1 or 2) in combination with CHOP (cyclophosphamide, doxorubicin, vincristine, and prednisone), CVP (cyclophosphamide, vincristine, and prednisone), or bendamustine; or as maintenance treatment.[2,4] The guidelines also recommend Gazyva as second-line or maintenance therapy for gastric and nongastric MALT lymphoma, nodal marginal zone lymphoma, and splenic marginal zone lymphoma. Gazyva is also recommended as a substitute for rituximab products (e.g., Rituxan, Truxima) in patients experiencing rare complications, regardless of histology.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Gazyva. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Gazyva as well as the monitoring required for adverse events and long-term efficacy, approval requires Gazyva to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Gazyva is recommended in those who meet the following criteria:

FDA-Approved Indications

169. Chronic Lymphocytic Leukemia/Small Lymphocytic Lymphoma. Approve for 6 months if the patient meets the following criteria (A and B):
- **A)** The patient is ≥ 18 years of age; AND
- **B)** Gazyva is prescribed by or in consultation with an oncologist.

170. Follicular Lymphoma. Approve for 6 months if the patient meets the following criteria (A, B, and C):
- **B)** The patient is ≥ 18 years of age; AND
- **C)** Gazyva will be used in ONE of the following situations (i, ii, or iii):
  - **i.** In combination with chemotherapy.
    (Note: Examples include CHOP [cyclophosphamide, doxorubicin, vincristine, and prednisone], CVP [cyclophosphamide, vincristine, and prednisone], or bendamustine); OR
  - **ii.** For maintenance treatment following Gazyva in combination with chemotherapy; OR
  - **iii.** The patient experienced an adverse event or intolerance to a rituximab product.
    (Note: Examples of adverse events or intolerance includes paraneoplastic pemphigus, Stevens-Johnson syndrome, Lichenoid Dermatitis, vesiculobullous dermatitis, toxic epidermal necrolysis);[2,4] AND
- **C)** Gazyva is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

171. Marginal Zone Lymphoma (Note: Includes Nodal Marginal Zone Lymphoma, Splenic Marginal Zone Lymphoma, Gastric MALT, or Nongastric MALT). Approve for 6 months if the patient meets the following criteria (A, B, and C):
- **A)** The patient is ≥ 18 years of age; AND
- **B)** Gazyva will be used in ONE of the following situations (i or ii):
  - **i.** Second-line or subsequent therapy for recurrent or progressive disease; OR
  - **ii.** The patient experienced an adverse event or intolerance to a rituximab product.
    (Note: Examples of adverse events or intolerance includes paraneoplastic pemphigus, Stevens-Johnson syndrome, Lichenoid Dermatitis, vesiculobullous dermatitis, toxic epidermal necrolysis];[2,4] AND
- **C)** Gazyva is prescribed by or in consultation with an oncologist.

172. Other B-Cell Lymphoma. (Note: Includes Diffuse Large B-Cell Lymphoma, Mantle Cell Lymphoma, High-Grade B-Cell Lymphoma, Burkitt Lymphoma, AIDS-Related B-Cell Lymphoma, Post-Transplant Lymphoproliferative Disorders, Castleman's Disease). Approve for 6 months if the patient meets the following criteria (A, B, and C):
- **A)** The patient is ≥ 18 years of age; AND
- **B)** The patient experienced an adverse event or intolerance to a rituximab product.
  (Note: Includes paraneoplastic pemphigus, Stevens-Johnson syndrome, Lichenoid Dermatitis, vesiculobullous dermatitis, toxic epidermal necrolysis);[2,4] AND
- **C)** Gazyva is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Gazyva has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

161. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Gonadotropin-Releasing Hormone Analogs

- Eligard® (leuprolide acetate for subcutaneous injection – Tolmar Pharmaceuticals Inc.)
- Firmagon® (degarelix for subcutaneous injection – Ferring Pharmaceuticals Inc.)
- Trelstar® (triptorelin pamoate for intramuscular injection – Allergan Inc.)

DATE REVIEWED: 12/04/2019

OVERVIEW

Eligard, Trelstar, and Firmagon are all indicated for the treatment of advanced prostate cancer.[1-3] Eligard and Trelstar are gonadotropin-releasing hormone (GnRH) agonists, whereas Firmagon is a GnRH antagonist. Table 1 has the approved doses for the three agents.

Table 1. Recommended FDA-Approved Dosages.[1-3]

Drug	Route of Administration	Dose and Frequency
Eligard	Subcutaneous	• 7.5 mg every month • 22.5 mg every 3 months • 30 mg every 4 months • 45 mg every 6 months
Firmagon	Subcutaneous	• Starting dose of 240 mg given as two injections of 120 mg • First maintenance dose (80 mg) given 28 days after the starting dose • Maintenance dose of 80 mg as one injection given every 28 days
Trelstar	Intramuscular	• 3.75 mg every 4 weeks • 11.25 mg every 12 weeks • 22.5 mg every 24 weeks

The National Comprehensive Cancer Network (NCCN) Guidelines for Head and Neck Cancer (version 3.2019 – September 16, 2019) recommend the use of androgen receptor therapy (i.e., leuprolide, bicalutamide) for androgen receptor (AR)-positive, recurrent salivary gland tumors with distant metastases.[4,5]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Eligard, Trelstar, and Firmagon. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Eligard, Trelstar, and Firmagon as well as the monitoring required for adverse events and long-term efficacy, approval requires these agents to be prescribed by, or in consultation with, a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Eligard, Firmagon, or Trelstar is recommended in those who meet the following criteria:

FDA-Approved Indications

173. Prostate Cancer. Approve Eligard, Firmagon, or Trelstar for 1 year if prescribed by, or in consultation with, an oncologist.[1-3,5]

Other Uses with Supportive Evidence

174. Head and Neck Cancer – Salivary Gland Tumors. Approve Eligard for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** The patient has recurrent disease with distant metastases; AND
- **B)** The patient has androgen receptor (AR)-positive disease; AND
- **C)** The medication is prescribed by, or in consultation with, an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Eligard, Trelstar, or Firmagon have not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

162. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Halaven® (eribulin mesylate injection for intravenous use – Eisai Inc.)

DATE REVIEWED: 02/26/2020

OVERVIEW

Halaven is a microtubule inhibitor indicated for the treatment of patients with metastatic breast cancer who have previously received at least two chemotherapeutic regimens for the treatment of metastatic disease.[1] Prior therapy should have included an anthracycline and a taxane in either the adjuvant or metastatic setting. Halaven is also indicated for the treatment of patients with unresectable or metastatic liposarcoma who have received a prior anthracycline-containing regimen.

Guidelines

The National Comprehensive Cancer Network (NCCN) breast cancer guidelines (version 2.2020 – February 5, 2020) lists Halaven as one of the preferred single-agent regimens for patients with human epidermal growth factor receptor-2 (HER2)-negative recurrent or metastatic breast cancer.[2,3] It can also be used in HER2-positive disease when used in combination with Herceptin (trastuzumab for intravenous use) for recurrent or metastatic disease.

The NCCN soft tissue sarcoma guidelines (version 6.2019 – February 10, 2020) lists Halaven as a single-agent therapy (most are category 2A) for a variety of subtypes with non-specific histologies.[3] For liposarcoma, Halaven is a category 1 recommended agent. The NCCN compendium[2] recommends Halaven for the following soft tissue sarcoma subtypes: extremity/superficial trunk, head/neck, retroperitoneal/intra-abdominal, angiosarcoma, and pleomorphic rhabdomyosarcoma. Halaven is a category 2B recommended therapy for uterine sarcoma.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Halaven. Because of the specialized skills required for evaluation and diagnosis of patients treated with Halaven as well as the monitoring required for adverse events and long-term efficacy, approval requires the medication to be prescribed by or in consultation with a prescriber who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Halaven is recommended in those who meet the following criteria:

FDA-Approved Indications

3. Breast Cancer. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** The patient has metastatic disease; AND
- **B)** The patient has been previously treated with at least two chemotherapy regimens.
  Note: Examples of chemotherapy include doxorubicin, epirubicin, paclitaxel, docetaxel, Abraxane (albumin-bound paclitaxel); AND
- **C)** The medication is prescribed by or in consultation with an oncologist.

2. Soft Tissue Sarcoma of the Extremity/Superficial Trunk, Head/Neck, Retroperitoneal/Intra-Abdominal, Angiosarcoma, Pleomorphic Rhabdomyosarcoma, and Liposarcoma. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** The patient has unresectable, progressive, or metastatic disease; AND
- **B)** The patient has been treated with at least one prior anthracycline-containing chemotherapy regimen.
  Note: Examples of chemotherapy regimen include doxorubicin and dacarbazine, doxorubicin with ifosfamide and mesna, epirubicin with ifosfamide and mesna; AND
- **C)** The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Halaven has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

78. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Herceptin Hylecta™ (trastuzumab and hyaluronidase-oysk for subcutaneous use – Genentech, Inc.)

DATE REVIEWED: 03/25/2020

OVERVIEW

Herceptin Hylecta is indicated in breast cancer for the following uses[1]:

1) Adjuvant treatment of adults with human epidermal growth factor receptor 2 (HER2) overexpressing node positive or node negative (estrogen receptor [ER]-/progesterone receptor [PR]-negative or with one high risk feature) breast cancer:
   a) As part of a treatment regimen consisting of doxorubicin, cyclophosphamide, and either paclitaxel or docetaxel.
   b) As part of a treatment regimen with docetaxel and carboplatin.
   c) As a single agent following multi-modality anthracycline based therapy.

2) Metastatic breast cancer in adults with HER2-overexpressing disease:
   a) In combination with paclitaxel for first-line treatment
   b) As a single agent for the treatment of patients who have received one or more chemotherapy regimens for metastatic disease.

Guidelines

The NCCN Breast Cancer clinical practice guidelines (version 3.2020 – March 6, 2020) recommend substitution of Herceptin Hylecta for trastuzumab intravenous (IV) in the treatment algorithm.[2,3] The guidelines note the different dose and dosage form of Herceptin Hylecta compared with trastuzumab. It is also noted that Herceptin Hylecta cannot be substituted for Kadcyla™ (ado-trastuzumab emtansine for intravenous injection). Trastuzumab is recommended as part of a preferred regimen in the preoperative/adjuvant therapy setting in HER2-positive disease. As part of a preferred regimen, it can be used in combination with doxorubicin/cyclophosphamide followed by paclitaxel plus trastuzumab ± Perjeta® (pertuzumab for injection); paclitaxel + trastuzumab; and docetaxel/carboplatin/trastuzumab ± Perjeta. Docetaxel + cyclophosphamide + trastuzumab is noted under "useful in certain circumstances." Other recommended regimens are doxorubicin/cyclophosphamide followed by docetaxel + trastuzumab ± Perjeta. If there is no residual disease after preoperative therapy or no preoperative therapy: complete up to one year of HER2-targeted therapy with trastuzumab (category 1) ± Perjeta. If there is residual disease after preoperative therapy: Kadcyla alone (category 1) is preferred. If Kadcyla is discontinued for toxicity, then trastuzumab (category 1) ± Perjeta can be used to complete 1 year of therapy. For systemic treatment of recurrent or stage IV (M1) disease that is hormone-receptor positive and HER2-positive, trastuzumab + Perjeta + taxane is preferred; or trastuzumab + chemotherapy; or Kadcyla can be used; or endocrine therapy ± HER2-targeted therapy. For HER2-positive disease and postmenopausal and premenopausal patients endocrine therapy options include, aromatase inhibitor ± trastuzumab; aromatase inhibitor + trastuzumab ± Tykerb® (lapatinib tablets); Faslodex® (fulvestrant for injection) ± trastuzamab, tamoxifen ± trastuzumab (all category 2A). For premenopausal patients, ovarian ablation or suppression is recommended in addition to endocrine therapy ± trastuzumab.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Herceptin Hylecta. Because of the specialized skills required for evaluation and diagnosis of patients treated with Herceptin Hylecta as well as the monitoring required for adverse events and long-term efficacy, approval requires Herceptin Hylecta to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Herceptin Hylecta is recommended in those who meet the following criteria:

FDA-Approved Indications

31. Breast Cancer. Approve for the duration noted below if the patient meets ALL of the criteria (A, B, and C):
- **A)** The patient has human epidermal growth factor receptor 2 (HER2)-positive disease; AND
- **B)** The patient meets one of the following criteria (i or ii):
  - **i.** Approve for up to 1 year (total) if the medication is used for adjuvant treatment; OR
  - **ii.** Approve for 1 year if the medication is used for metastatic disease; AND
- **C)** The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Herceptin Hylecta has not been shown to be effective or there are limited or preliminary data that are not supportive of general approval for the following conditions.

9. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

21. The NCCN Drugs and Biologics Compendium. © 2020 National Comprehensive Cancer Network, Inc. Available at: http://www.nccn.org. Accessed on March 16, 2020. Search term: trastuzumab hyaluronidase.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Imfinzi Prior Authorization Policy
- Imfinzi® (durvalumab injection for intravenous use – AstraZeneca)

REVIEW DATE: 07/15/2020

OVERVIEW
Imfinzi, a programmed cell death ligand 1 (PD-L1) blocking antibody, is indicated for the treatment of the following conditions:
- **Non-small cell lung cancer (NSCLC)**, in adult patients with unresectable Stage III disease that has not progressed following concurrent platinum-based chemotherapy and radiation therapy.
- **Small cell lung cancer**, in combination with etoposide and either carboplatin or cisplatin for the first-line treatment of adult patients with extensive-stage disease.

- **Urothelial carcinoma,** in adult patients with locally advanced or metastatic disease with a) disease progression during or following platinum-containing chemotherapy; or b) have disease progression within 12 months of neoadjuvant or adjuvant treatment with platinum-containing chemotherapy.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on bladder cancer (version 5.2020 – May 12, 2020) recommends Imfinzi as one of the options for subsequent therapy (category 2A), as an alternative preferred regimen for the treatment of locally advanced or metastatic urothelial carcinoma after progression on platinum-based chemotherapy or disease that has progressed within 12 months of neoadjuvant or adjuvant platinum-containing chemotherapy.[2,3] Imfinzi can be used regardless of PD-L1 expression levels.

The NCCN guidelines on NSCLC (version 6.2020 – June 15, 2020) recommends Imfinzi (category 1) as consolidation therapy for patients with unresectable Stage III disease with a performance status of 0 or 1.[3,4] Imfinzi can be used regardless of the PD-L1 status in patients who have not progressed after two or more cycles of definitive concurrent platinum-based chemoradiation therapy. Imfinzi is not recommended for patients following definitive surgical resection.

The NCCN guidelines for small cell lung cancer (version 4.2020 – July 7, 2020) recommends the use of Imfinzi in combination with etoposide and carboplatin/cisplatin as "preferred" first-line treatment option (category 1).[3,5] Imfinzi is used in maintenance setting, after 4 cycles in combination with chemotherapy, as single-agent once every 28 days until disease progression or unacceptable toxicity.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Imfinzi. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Imfinzi, as well as the monitoring required for adverse events and long-term efficacy, approval requires Imfinzi to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Imfinzi is recommended in those who meet the following criteria:

FDA-Approved Indications

6. Non-Small Cell Lung Cancer. Approve for 1 year (total) of therapy if the patient meets the following criteria (A, B, and C):
- **A)** Patient has unresectable Stage III disease; AND
- **B)** Patient has not had disease progression following treatment with concurrent platinum-based chemotherapy and radiation therapy; AND
- **C)** The medication is prescribed by or in consultation with an oncologist.

2. Small Cell Lung Cancer. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** Patient meets one of the following (i or ii):
  - **i.** The medication is used in combination with etoposide and platinum chemotherapy (cisplatin or carboplatin); OR

ii. The medication is used as single-agent for maintenance after chemotherapy; AND

B) The medication is prescribed by or in consultation with an oncologist.

3. Urothelial Carcinoma. Approve for 1 year if the patient meets the following criteria (A, B, and C):

A) Patient has locally advanced or metastatic urothelial carcinoma; AND

B) Patient has tried platinum-containing chemotherapy (cisplatin or carboplatin); AND

C) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Imfinzi is not recommended in the following situations:

79. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Imlygic® (talimogene laherparepvec intralesional injection – Amgen)

REVIEW DATE: 02/19/2020

OVERVIEW

Imlygic is an oncolytic viral therapy indicated for the local treatment of unresectable cutaneous, subcutaneous, and nodal lesions in patients with melanoma recurrent after initial surgery.[1] It is a limitation of use that Imlygic has not been shown to improve overall survival or have an effect on visceral metastases. Imlygic should be continued for at least 6 months, unless other treatment is required or there are no injectable lesions to treat and may also be reinitiated if new unresectable cutaneous, subcutaneous, or nodal lesions appear following a complete response. In the pivotal trial, adults with unresectable stage III (30%) or stage IV (70%) melanoma were treated for at least 6 months, or until no remaining injectable lesions. During the initial 6 months of the trial, treatment continued despite increased size or number of lesions. Following 6 months of treatment, patients could continue Imlygic until clinically relevant disease progression (i.e., disease progression associated with a decline in performance status and/or alternative therapy was needed, according to the prescriber). Imlygic requires specialized storage conditions (-130° to -94° F). Personal protective equipment (including a gown/laboratory coat, safety glasses or face shield, and gloves) while preparing or administering, and procedures for accidental exposure to Imlygic should be followed. Healthcare providers should be prepared to manage adverse events, including immune-mediated events (e.g., glomerulonephritis, vasculitis, pneumonitis) and plasmocytoma at the injection site. Safety and efficacy have not been established in patients < 18 years of age.

Disease Overview

Oncolytic virus immunotherapy is a form of cancer therapy which uses native or genetically modified viruses to selectively enter, replicate, and lyse tumor cells.[2] Oncolytic viruses are able to be engineered to deliver therapeutic genes to cancer cells, thus, causing additional antitumor effects through cytokine secretion and induction of antitumor immune response.[3] Of note, herpes simplex virus (HSV)-1 is an attractive option for oncolytic virus therapy because it can infect a wide range of host cells and causes lysis following viral replication.[2] Imlygic, previously referred to as T-VEC, is the first oncolytic virus immunotherapy approved in the US. It is genetically modified to attenuate HSV-1, increase selectivity for cancer cells, and secrete granulocyte macrophage colony-stimulating factor (GM-CSF). Secretion of GM-CSF is intended to enhance tumor antigen presentation to the immune system and induce systemic immune responses to the tumors.[3]

Clinical Efficacy

In the pivotal trial, the initial dose of Imlygic was administered at 10^6 PFU/mL (to seroconvert HSV-seronegative patients). Subsequent doses were 10^8 PFU/mL administered 3 weeks after the first dose, then every 2 weeks. Total volume of Imlygic was up to 4.0 mL per treatment session. It may not be possible to inject all lesions at each treatment visit or over the full course of treatment. Previously injected and/or uninjected lesions may be injected at subsequent treatment visits. Continue treatment for at least 6 months unless other treatment is required or until there are no injectable lesions to treat. Imlygic may be reinitiated if new unresectable cutaneous, subcutaneous, or nodal lesions appear after a complete response. Refer to the Appendix for injection volume associated with lesion size.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for melanoma (version 1.2020 – December 19, 2019) list Imlygic as an option in multiple treatment situations, including as primary and second-line treatment for Stage III melanoma; for recurrent disease (including nodal recurrence), and second-line or subsequent therapy; for disseminated metastatic disease; and in combination with Yervoy (ipilimumab injection), for metastatic or unresectable disease following disease progression or maximal clinical benefit from BRAF targeted therapy.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Imlygic. Because of the specialized skills required for evaluation and diagnosis of patients treated with Imlygic as well as the monitoring required for adverse events and long-term efficacy, approval requires Imlygic to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Imlygic is recommended in those who meet the following criteria:

FDA-Approved Indications

F) Melanoma. Approve for the duration noted if the patient meets ONE of the following (A or B):
- **A)** Initial Therapy (This includes reinitiation in patients with new lesions following a complete response). Approve for 6 months if the patient meets ALL of the following (i, ii, and iii):
  - **i.** The patient is ≥ 18 years of age; AND
  - **ii.** Imlygic will be directly injected into advanced, metastatic, recurrent, or unresectable cutaneous, subcutaneous, or nodal lesions; AND
  - **iii.** Imlygic will be administered by or under the supervision of an oncologist, dermatologist, or surgeon.
- **B)** Patient is Currently Receiving Imlygic. Approve for 1 year if the patient meets ALL of the following (i, ii, and iii):
  - **i.** The patient has remaining injectable lesions for treatment; AND

ii. According to the prescriber, the patient has not experienced clinically relevant disease progression (e.g., disease progression associated with a decline in performance status and/or alternative therapy was needed); AND

iii. Imlygic will be administered by or under the supervision of an oncologist, dermatologist, or surgeon.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Imlygic has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

1. **Concurrent Use with Anti-Herpetic Viral Agents.** Imlygic is a genetically modified, live, attenuated HSV-1 that is sensitive to acyclovir. Anti-herpetic viral agents (e.g., acyclovir, valacyclovir, famciclovir) may interfere with efficacy.

2. **Immoncompromised Patients.** Imlygic is contraindicated in patients who are immunocompromised, including those with a history of primary or acquired immunodeficient states, leukemia, lymphoma, acquired immunodeficiency syndrome (AIDS), or other clinical manifestations of infection with human immunodeficiency viruses, and those on immunosuppressive therapy.

3. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Ixempra® (ixabepilone injection for intravenous use – R-Pharm US)

DATE REVIEWED: 12/18/2019

OVERVIEW

Ixempra, a microtubule inhibitor, is indicated in combination with capecitabine for the treatment of patients with metastatic or locally advanced breast cancer resistant to treatment with an anthracycline and a taxane, or whose cancer

is taxane resistant and for whom further anthracycline therapy is contraindicated.[1] Ixempra is indicated as monotherapy for the treatment of metastatic or locally advanced breast cancer in patients whose tumors are resistant or refractory to anthracyclines, taxanes, and capecitabine.

Anthracycline resistance is defined as progression while on therapy or within 6 months in the adjuvant setting or 3 months in the metastatic setting.[1] Taxane resistance is defined as progression while on therapy or within 12 months in the adjuvant setting or 4 months in the metastatic setting.

Guidelines

The National Comprehensive Cancer Network (NCCN) breast cancer (Version 3.2019 – September 6, 2019) clinical practice guidelines recommend Ixempra as a single agent for recurrent or stage IV human epidermal growth factor receptor 2 (HER2)-negative disease and in combination with trastuzumab for HER2-positve disease.[2,3]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Ixempra. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Ixempra as well as the monitoring required for adverse events and long-term efficacy, approval requires Ixempra to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Ixempra is recommended in those who meet the following criteria:

FDA-Approved Indications

175. Breast Cancer. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** The patient has recurrent or metastatic disease; AND
- **B)** Ixempra is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Ixempra has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

163. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Jevtana® (cabazitaxel injection for intravenous use – Sanofi-Aventis LLC)

DATE REVIEWED: 02/26/2020

OVERVIEW

Jevtana is a microtubule inhibitor indicated in combination with prednisone for the treatment of patients with metastatic castration-resistant prostate cancer (CRPC) previously treated with a docetaxel-containing treatment regimen.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) prostate cancer guidelines (version 4.2019 – August 19, 2019) lists Jevtana as one of the category 1 recommended therapies in the post-docetaxel setting for metastatic CRPC.[2,3] The guidelines note that Jevtana (in combination with steroid) can be considered in patients who are not candidates for docetaxel or are intolerant to docetaxel; however, current data do not support greater efficacy of Jevtana over docetaxel.[2]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Jevtana. Because of the specialized skills required for evaluation and diagnosis of patients treated with Jevtana as well as the monitoring required for adverse events and long-term efficacy, approval requires the medication to be prescribed by or in consultation with a prescriber who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Jevtana is recommended in those who meet the following criteria:

FDA-Approved Indications

4. Prostate Cancer. Approve for 1 year if the patient meets the following criteria (A, B, C, and D):
- **A)** The patient has metastatic castration-resistant prostate cancer; AND
- **B)** The medication will be used in combination with a systemic corticosteroid (e.g., prednisone); AND
- **C)** The patient meets one of the following criteria (i or ii):
  - **i.** The patient has been previously treated with a docetaxel-containing treatment regimen; OR
  - **ii.** The patient is not a candidate or is intolerant to docetaxel therapy, according to the prescriber; AND
- **D)** The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Jevtana has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

80. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Kadcyla Prior Authorization Policy

- Kadcyla® (ado-trastuzumab emtansine for intravenous [IV] injection – Genentech)

REVIEW DATE: 08/12/2020

OVERVIEW

Kadcyla is indicated for the treatment of patients with human epidermal growth factor receptor 2 (HER2)-positive breast cancer in the following settings:[1]

- **Early breast cancer**, as a single agent, for the adjuvant treatment in patients who have residual invasive disease after neoadjuvant taxane and trastuzumab-based treatment.
- **Metastatic breast cancer**, in patients who previously received trastuzumab and a taxane, separately or in combination. Patients should have either received prior therapy for metastatic disease or developed disease recurrence during or within 6 months of completing adjuvant therapy.

Guidelines

- **Breast cancer:** The National Comprehensive Cancer Network (NCCN) breast cancer guidelines (version 5.2020 – July 15, 2020) recommend Kadcyla as a preferred adjuvant therapy in patients who have residual disease after receiving neoadjuvant (preoperative) therapy (category 1).[2,3] Kadcyla is also recommended for the treatment of HER2-positive recurrent or Stage IV metastatic disease (category 2A).
- **Non-small cell lung cancer:** The NCCN non-small cell lung cancer (NSCLC) guidelines (version 6.2020 – June 15, 2020) and Compendium recommend Kadcyla for HER2 mutation-positive NSCLC (category 2A).[3,4]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Kadcyla. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Kadcyla, as well as the monitoring required for adverse events and long-term efficacy, approval requires Kadcyla to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Kadcyla is recommended in those who meet the following criteria:

FDA-Approved Indications

32. Breast Cancer. Approve if the patient meets the following criteria (A, B, and C):
- **A)** Patient has human epidermal growth factor receptor 2 (HER2)-positive disease; AND
- **B)** Patient meets ONE of the following criteria (i or ii):
  - **i.** Approve for 1 year if Kadcyla is used for recurrent or metastatic breast cancer; OR
  - **ii.** Approve for 1 year (total) if Kadcyla will be used as adjuvant therapy; AND
- **C)** Kadcyla is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

2. Non-Small Cell Lung Cancer (NSCLC). Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** Patient has human epidermal growth factor receptor 2 (HER2) mutation-positive non-small cell lung cancer; AND
- **B)** The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Kadcyla is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Keytruda Prior Authorization Policy
- Keytruda® (pembrolizumab for injection, for intravenous use and injection for intravenous use – Merck & Co., Inc.)

REVIEW DATE: 06/17/2020

OVERVIEW

Keytruda, a human programmed death receptor-1 (PD-1) blocking antibody, is indicated for the treatment of the following indications:[1]

- **Melanoma**, for the treatment of patients with unresectable or metastatic disease. Keytruda is also indicated for the adjuvant treatment of patients with melanoma with involvement of lymph node(s) following complete resection.
- **Non-small cell lung cancer** (**NSCLC**), in the following situations:
  - As a single agent for the first-line treatment of patients whose tumors have high programmed death-ligand 1 (PD-L1) expression (tumor proportion score [TPS] ≥ 1%) as determined by an FDA-approved test, with no epidermal growth factor receptor (*EGFR*) or anaplastic lymphoma kinase (*ALK*) genomic tumor aberrations, and is stage III where patients are not candidates for surgical resection or definitive chemoradiation or for metastatic disease; AND
  - As a single agent for the treatment of patients with metastatic disease whose tumors express PD-L1 (TPS ≥ 1%) as determined by an FDA-approved test and with disease progression on or after platinum-containing chemotherapy. Patients with *EGFR* or *ALK* genomic tumor aberrations should have disease progression on FDA-approved therapy for these aberrations prior to receiving Keytruda; AND
  - In combination with Alimta® (pemetrexed intravenous injection) and platinum-based chemotherapy, for the first-line treatment of patients with metastatic nonsquamous NSCLC with no EGFR or ALK genomic tumor aberrations; AND
  - In combination with carboplatin and either paclitaxel or Abraxane® (nab-paclitaxel injection), for first-line treatment in metastatic squamous NSCLC.
- **Head and neck squamous cell carcinoma** (HNSCC), in the following situations:
  - As a single agent for the treatment of recurrent or metastatic disease with disease progression on or after platinum-containing chemotherapy; AND
  - In combination with platinum and fluorouracil (FU) for the first-line treatment of patients with metastatic or with unresectable, recurrent disease; AND
  - As a single agent, for the first line treatment of patients with metastatic or with unresectable, recurrent disease whose tumors express PD-L1 (combined positive score [CPS] ≥ 1) as determined by an FDA-approved test.
- **Classical Hodgkin lymphoma** (cHL), for treatment of adult and pediatric patients with refractory disease, or who have relapsed after three or more prior lines of therapy.*
- **Primary mediastinal large B-cell lymphoma** (PMBCL), for treatment of adult and pediatric patients with refractory disease, or who have relapsed after two or more prior lines of therapy.*
  Limitation of Use: Keytruda is not recommended for treatment of patients with PMBCL who require urgent cytoreductive therapy.
- **Urothelial carcinoma**, in the following situations:
  - Treatment of locally advanced or metastatic disease in patients who are not eligible for cisplatin-containing chemotherapy and whose tumors express PD-L1 (Combined Positive Score [CPS] ≥ 10) as determined by an FDA-approved test, or in patients who are not eligible for any platinum-containing chemotherapy regardless of PD-L1 status;* AND
  - Treatment of patients with locally advanced or metastatic urothelial carcinoma who have disease progression during or following platinum-containing chemotherapy or within 12 months of neoadjuvant or adjuvant treatment with platinum-containing chemotherapy; AND
  - Treatment of Bacillus Calmette-Guerin (BCG)-unresponsive, high-risk, non-muscle invasive bladder cancer with carcinoma in situ with or without papillary tumors who are ineligible for or have elected not to undergo cystectomy.
- **Microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR)**, for treatment of adult and pediatric patients with unresectable or metastatic disease, in the following situations:
  - solid tumors that have progressed following prior treatment and who have no satisfactory alternative treatment options;* OR

- colorectal cancer (CRC) that has progressed following treatment with a fluoropyrimidine, oxaliplatin, and irinotecan.*

Limitation of Use: The safety and effectiveness of Keytruda in pediatric patients with MSI-H central nervous system (CNS) cancers have not been established.

- **Gastric cancer**, for treatment of patients with recurrent locally advanced or metastatic gastric or gastroesophageal junction (GEJ) adenocarcinoma whose tumors express PD-L1 (Combined Positive Score [CPS] ≥ 1) as determined by an FDA-approved test, with disease progression on or after two or more lines of therapy including fluoropyrimidine- and platinum-containing chemotherapy and if appropriate, human epidermal growth factor receptor 2 (HER2)/neu-targeted therapy.*
- **Cervical cancer**, for treatment of patients with recurrent or metastatic disease with disease progression on or after chemotherapy whose tumors express PD-L1 (CPS ≥ 1) as determined by an FDA-approved test.*
- **Hepatocellular carcinoma**, for treatment of patients who have been previously treated with Nexavar® (sorafenib tablets).*
- **Merkel cell carcinoma**, for adult and pediatric patients with recurrent, locally advanced, or metastatic disease.*
- **Small cell lung cancer**, for treatment of metastatic disease and disease progression on or after platinum-based chemotherapy and at least one other prior line of therapy.*
- **Renal cell carcinoma**, in combination with Inlyta (axitinib tablets), for the first-line treatment of patients with advanced disease.
- **Esophageal cancer**, treatment of patients with recurrent locally advanced or metastatic squamous cell carcinoma of the esophagus whose tumors express PD-L1 (CPS ≥ 10) as determined by an FDA-approved test, with disease progression after one or more prior lines of systemic therapy.
- **Endometrial cancer**, in combination with Lenvima (lenvatinib capsules), for the treatment of patients with advanced disease that is not MSI-H or dMMR, who have disease progression following prior systemic therapy and are not candidates for curative surgery or radiation.

*This indication is approved under accelerated approval based on tumor response rate and durability of response. Continued approval for this indication may be contingent upon verification and description of clinical benefit in the confirmatory trials.

Dosing

The recommended dose of Keytruda is 200 mg (for pediatric patients, 2 mg/kg up to 200 mg) administered as an intravenous infusion once every 3 weeks or 400 mg given once every 6 weeks. It is given until disease progression or unacceptable toxicity, (or up to 24 months in patients with non-melanoma indications without disease progression). There are no recommended dose reductions in the prescribing information. Management of adverse events may require that Keytruda be withheld or permanently discontinued as determined by the prescribing physician.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Keytruda. Because of the specialized skills required for evaluation and diagnosis of patients treated with Keytruda as well as the monitoring required for adverse events and long-term efficacy, approval requires the medication to be prescribed by or in consultation with a prescriber who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Keytruda is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Cervical Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
   - **B)** Patient has tried chemotherapy; AND
     Note: Examples of chemotherapy are cisplatin, paclitaxel, bevacizumab, topotecan, carboplatin).
   - **C)** Patient's tumor expression for programmed death-ligand 1 (PD-L1), as determined by an approved test, has a combined positive score (CPS) ≥ 1; AND
   - **D)** The medication is prescribed by or in consultation with an oncologist.

   Note: Also see **Microsatellite Instability-High (MSI-H) or Mismatch Repair Deficient (dMMR) Solid Tumors.**

2. **Classic Hodgkin Lymphoma.** Approve for 1 year if the patient meets BOTH of the following (A and B):
   - **A)** ONE the following conditions apply (i, ii, or iii):
     - **i.** Patient has had a hematopoietic stem cell transplantation (HSCT); OR
     - **ii.** Patient has tried three or more systemic regimens; OR
       Note: Examples of systemic therapies include ABVD (doxorubicin, bleomycin, vinblastine, and dacarbazine), Sanford V [doxorubicin, vinblastine, mechlorethamine, etoposide, vincristine, bleomycin, and prednisone], escalated BEACOPP [bleomycin, etoposide, doxorubicin, cyclophosphamide, vincristine, procarbazine, and prednisone]). This includes an auto-HSCT as one line of therapy.
     - **iii.** Patient is not eligible for transplant according to the prescriber; AND
   - **B)** The medication is prescribed by or in consultation with an oncologist.

3. **Endometrial Carcinoma.** Approve for 1 year if the patient meets the following criteria (A, B, C, D, and E):
   - **A)** Disease is not microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR); AND
   - **B)** The medication is used in combination with Lenvima™ (lenvatinib capsules); AND
   - **C)** Patient has progressed on at least one prior systemic therapy; AND

Note: Examples of systemic therapy are carboplatin, paclitaxel, docetaxel, cisplatin, doxorubicin, ifosfamide, everolimus, letrozole.

D) Patient is not a candidate for curative surgery or radiation; AND

E) The medication is prescribed by or in consultation with an oncologist.

Note: Also see **Microsatellite Instability-High (MSI-H) or Mismatch Repair Deficient (dMMR) Solid Tumors.**

4. **Esophageal and Esophagogastric Junction Cancer.** Approve for 1 year if the patient meets the following (A and B):

A) Patient meets one of the following criteria (i or ii):

i. Patient meets BOTH of the following criteria (a and b):

a) Patient's tumor expression for programmed death-ligand 1 (PD-L1) as determined by an approved test has a combined positive score (CPS) ≥ 10; AND

b) Patient has tried at least one previous chemotherapy regimen; OR

Note: Examples of chemotherapy regimens are fluoropyrimidine (fluorouracil or capecitabine) and oxaliplatin, fluoropyrimidine and cisplatin, paclitaxel with cisplatin or carboplatin, docetaxel with cisplatin.

ii. Patient meets BOTH of the following criteria (a and b):

a) Patient's tumor expression for programmed death-ligand 1 (PD-L1) as determined by an approved test has a combined positive score (CPS) ≥ 1; AND

b) Patient has tried at least two previous chemotherapy regimens; AND

Note: Examples of chemotherapy regimens are fluoropyrimidine (fluorouracil or capecitabine) and oxaliplatin, fluoropyrimidine and cisplatin, paclitaxel with cisplatin or carboplatin, docetaxel with cisplatin.

B) The medication is prescribed by or in consultation with an oncologist.

Note: Also see **Microsatellite Instability-High (MSI-H) or Mismatch Repair Deficient (dMMR) Solid Tumors.**

5. **Gastric Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

C) Patient's tumor expression for programmed death-ligand 1 (PD-L1) as determined by an approved test has a combined positive score (CPS) ≥ 1; AND

D) Patient has tried at least two previous chemotherapy regimens; AND

Note: Examples of chemotherapy regimens are fluoropyrimidine (fluorouracil or capecitabine) and oxaliplatin, fluoropyrimidine and cisplatin, paclitaxel with cisplatin or carboplatin, docetaxel with cisplatin 5.

E) If the patient's tumor is human epidermal growth factor receptor 2 (HER2) or HER2/neu positive, targeted therapy with trastuzumab has been tried; AND

F) The medication is prescribed by or in consultation with an oncologist.

Note: Also see **Microsatellite Instability-High (MSI-H) or Mismatch Repair Deficient (dMMR) Solid Tumors.**

6. **Head and Neck Squamous Cell Carcinoma (HNSCC).** Approve for 1 year if the patients meets the following (A, B, and C):

A) Patient has recurrent or metastatic disease; AND

B) Patient meets one of the following criteria (i or ii):

i. If the medication is used for first-line treatment, patient has to meet one of the following criteria (a or b):

a) Keytruda is used in combination with chemotherapy; OR

Note: Examples of chemotherapy are cisplatin, carboplatin, fluorouracil.

b) Keytruda is used as a single agent if the tumors are PD-L1-positive (combined positive score ≥ 1), as determined by an approved test.

ii. For subsequent therapy, patient has tried at least one platinum-containing chemotherapy regimen.
Note: Examples of platinum-contain chemotherapy regimens are: cisplatin or carboplatin with Erbitux® [cetuximab intravenous infusion], gemcitabine, or 5-fluorouracil [5-FU]; AND

C) The medication is prescribed by or in consultation with an oncologist.

7. Hepatocellular Carcinoma, Including Hepatobiliary Cancers. Approve for 1 year if the patient meets the following conditions (A and B):

A) Patient has tried at least one tyrosine kinase inhibitor; AND
Note: Examples of tyrosine kinase inhibitors include Nexavar (sorafenib tablets) and Lenvima (levatinib capsules).

B) The medication is prescribed by or in consultation with an oncologist.

8. Melanoma [Note: This includes cutaneous melanoma, brain metastases due to melanoma and uveal melanoma]. Approve for the duration noted below if the patient meets BOTH of the following (A and B):

A) Patient meets ONE of the following (i or ii):

i. Approve for 1 year if the patient has unresectable, advanced, or metastatic melanoma; OR

ii. Approve for up to 1 year (total) if Keytruda will be used as adjuvant treatment; AND
Note: For example, in a patient with no evidence of disease following resection of node-positive disease, locoregional recurrence, or in transit recurrence.

B) The medication is prescribed by or in consultation with an oncologist.

9. Merkel Cell Carcinoma. Approve for 1 year if the patient meets BOTH of the following (A and B):

A) Patient has recurrent, locally advanced, or metastatic disease; AND

B) The medication is prescribed by or in consultation with an oncologist.

10. Microsatellite Instability-High (MSI-H) or Mismatch Repair Deficient (dMMR) Solid Tumors. Note**:** Examples of solid tumors with MSI-H or dMMR are breast, gastric, gastroesophageal or esophageal cancers, colon or rectal cancer, Ewing sarcoma, osteosarcoma, mesenchymal chondrosarcoma, poorly differentiated neuroendocrine tumor, pancreatic adenocarcinoma, endometrioid carcinomas, penile, adrenal gland, vulvar, cervical, ovarian, fallopian tube, primary peritoneal, small bowel adenocarcinoma, testicular cancer. Approve for 1 year if the patient meets BOTH of the following (A and B):

A) One of the following conditions apply (i, ii, or iii):

i. Patient has tried at least one prior systemic therapy for an MSI-H or dMMR solid tumor); OR

ii. Patient has unresectable or metastatic gallbladder cancer (including intra- and extra-hepatic cholangiocarcinoma); OR

iii. Patient has colon or rectal cancer, and ONE of the following apply (a or b):

a) Patient has tried chemotherapy; OR
Note: Examples of chemotherapy are a fluoropyrimadine such as fluorouracil (5-FU), capecitabine; an adjunctive chemotherapy regimen such as FOLFOX (5-FU, leucovorin, and oxaliplatin) or CapeOX (capecitabine and oxaliplatin).

b) Patient has metastatic disease and is not a candidate for intensive therapy, according to the prescriber; AND

B) The medication is prescribed by or in consultation with an oncologist.

11. Non-Small Cell Lung Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

A) Patient has advanced or metastatic disease; AND
B) The tumor proportion score (TPS) for PD-L1 as determined by an approved test is ≥ 1%; AND
C) If the patient has non-squamous cell carcinoma (that is, adenocarcinoma, large cell, or NSCLC not otherwise specified) and the tumor is positive for a targetable mutation, the patient has previously received targeted drug therapy for the specific mutation; AND
Note: Examples of targetable mutations include sensitizing epidermal growth factor receptor [*EGFR*] mutation, anaplastic lymphoma kinase [*ALK*] fusions, RET rearrangement positive, MET exon 14 skipping, NTRK gene fusion positive, BRAF V600E mutation positive, and ROS1 rearrangement positive.
D) Keytruda is prescribed by or in consultation with an oncologist.

12. Primary Mediastinal Large B-Cell Lymphoma. Approve for 1 year if the patient meets BOTH of the following (A and B):
A) Patient has relapsed after, or is refractory to, at least two previous regimens; AND
Note: Examples of previous regimens include autologous hematopoietic stem cell transplant (auto-HSCT), EPOCH-R (etoposide, prednisone, vincristine, cyclophosphamide, doxorubicin, rituximab), RCHOP (rituximab, cyclophosphamide, doxorubicin, vincristine, prednisone], RCEPP (rituximab, cyclophosphamide, doxorubicin, vincristine, prednisone).
B) The medication is prescribed by or in consultation with an oncologist.

13. Renal Cell Carcinoma. Approve for 1 year if the patient meets BOTH of the following (A, B, and C):
A) Patient has advanced disease; AND
B) Keytruda is used in combination with Inlyta (axitinib tablets); AND
C) The medication is prescribed by or in consultation with an oncologist.

14. Small Cell Lung Cancer. Approve for 1 year if the patient meets BOTH of the following criteria (A and B):
A) Patient has tried at least one other chemotherapy regimen; AND
Note: Examples of chemotherapy regimen are cisplatin, carboplatin, etoposide, irinotecan, topotecan, paclitaxel.
B) The medication is prescribed by or in consultation with an oncologist.

15. Urothelial Carcinoma. Approve for 1 year if the patient meets BOTH of the following (A and B):
A) Patient meets ONE of the following conditions (i, ii, iii, or iv):
i. Patient has tried at least one platinum-based chemotherapy; OR
Note: Cisplatin and carboplatin are platinum-based chemotherapies.
ii. Patient meets both of the following (a and b):
a) According to the prescriber, patient is not eligible for cisplatin-based chemotherapy, AND
b) The tumor expresses PD-L1, defined as a combined positive score (CPS) ≥ 10; OR
iii. According to the prescriber, patient is not eligible for platinum-based chemotherapy (i.e., with cisplatin and carboplatin); OR
Note: This is regardless of PD-L1 status.
iv. Patient meets both of the following (a and b):
a) Patient has non-muscle invasive bladder cancer; AND
b) Patient has tried Bacillus Calmette-Guerin (BCG) or intravesical chemotherapy.
Note: Examples of agents used as intravesical chemotherapy include mitomycin and gemcitabine.
B) The medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

16. Anal Carcinoma. Approve for 1 year if the patient meets BOTH of the following (A and B):
- **A)** Patient has received at least one other chemotherapy regimen; AND
  Note: Examples of chemotherapy regimens are 5-fluorouracil (5-FU), cisplatin, carboplatin, paclitaxel, FOLFOX (oxaliplatin, leucovorin, and 5-FU).
- **B)** The medication is prescribed by or in consultation with an oncologist.

17. Gestational Trophoblastic Neoplasia. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** The patient meets one of the following (i or ii):
  - **i.** Patient has tried at least one previous chemotherapy regimen for recurrent or progressive disease; OR
    Note: Examples of chemotherapy regimens contain etoposide, cisplatin/carboplatin, paclitaxel, bleomycin, ifosfamide, methotrexate.
  - **ii.** Patient has methotrexate-resistant high-risk disease; AND
- **B)** The medication is prescribed by or in consultation with an oncologist.

18. Malignant Pleural Mesothelioma. Approve for 1 year if the patient meets BOTH of the following (A and B):
- **A)** Patient has tried first-line chemotherapy; AND
  Note: Examples of chemotherapy are Alimta (pemetrexed intravenous injection) with or without cisplatin or carboplatin, gemcitabine plus cisplatin, vinorelbine.
- **B)** The medication is prescribed by or in consultation with an oncologist.

19. Mycosis Fungoides/Sezary Syndrome. Approve for 1 year if the medication is prescribed by or in consultation with an oncologist.

20. Extranodal NK/T-Cell Lymphoma, Nasal Type. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** The patient has received an asparaginase-based chemotherapy regimen; AND
  Note: Examples of asparaginase-based chemotherapy are dexamethasone, ifosfamide, pegaspargase, etoposide; and gemcitabine, pegaspargase, oxaliplatin).
- **B)** The medication is prescribed by or in consultation with an oncologist.

21. Thymic Carcinoma. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** Patient has tried at least one other chemotherapy regimen; AND
  Note: Examples of chemotherapy regimen are carboplatin, paclitaxel, cisplatin, doxorubicin, cyclophosphamide.
- **B)** The medication is prescribed by or in consultation with an oncologist.

22. Vulvar Cancer. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** The tumors are PD-L1-positive (combined positive score ≥ 1), as determined by an approved test; AND
- **B)** Patient has tried at least one other chemotherapy regimen.
  Note: Examples of chemotherapy regimen are cisplatin, carboplatin, fluorouracil, paclitaxel; AND
- **C)** The medication is prescribed by or in consultation with an oncologist.

Note: Also see **Microsatellite Instability-High (MSI-H) or Mismatch Repair Deficient (dMMR) Solid Tumors.**

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Keytruda is not recommended in the following situations:

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Kymriah® (tisagenlecleucel suspension for intravenous infusion – Novartis Oncology)

DATE REVIEWED: 04/29/2020

OVERVIEW

Kymriah, a CD19-directed genetically modified autologous T cell immunotherapy, is indicated for the treatment of patients up to 25 years of age with B-cell precursor acute lymphoblastic leukemia (ALL) that is refractory or in second or later relapse.[1] Kymriah is also indicated for adult patients with relapsed or refractory large B-cell lymphoma after two or more lines of systemic therapy including diffuse large B-cell lymphoma (DLBCL) not otherwise specified, high-grade B-cell lymphoma, and DLBCL arising from follicular lymphoma. Regarding this specific indication, Kyrmiah is not indicated for treatment of patients with primary central nervous system lymphoma.[1] Kymriah has a Boxed Warning regarding cytokine release syndrome (CRS) and neurological toxicities. Due to these risks, Kymriah is only available through a restricted program under a Risk Evaluation and Mitigation Strategy (REMS) called the Kymriah REMS.[1]

Kymriah is supplied as a frozen suspension of genetically modified autologous T cells in infusion bag(s) labeled for the specific recipient.[1] Kymriah is shipped directly to the cell laboratory associated with the infusion center in a liquid nitrogen Dewar. The product and patient-specific labels are found inside the Dewar. Store the infusion bag in the vapor phase of liquid nitrogen (less than or equal to minus 120°C) in a temperature-monitored system. Kymriah should be thawed prior to infusion.

Clinical Efficacy

The efficacy of Kymriah in pediatric and young adults with relapsed or refractory B-cell precursor ALL was assessed in an open-label, multicenter, single-arm study called ELIANA.[1-2] Therapy consisted of lymphodepleting chemotherapy (fludarabine 30 mg/m^2 daily for 4 days and cyclophosphamide 500 mg/m^2 daily for 2 days) followed by a single Kymriah dose.[1-2] Among the 63 patients who were evaluable for efficacy in the Kymriah prescribing information, 83% of patients achieved complete remission or complete remission with incomplete blood count recovery.[1] The published study evaluated 75 patients and the overall remission rate (the rate of complete remission or complete remission with incomplete hematologic recovery) within 3 months was 81%.[2] The efficacy of Kymriah was assessed in an open-label, multicenter, single-arm trial called JULIET.[1,3] Patients were ≥ 18 years of age with relapsed or refractory DLBCL who had previously received at least two lines of chemotherapy (including Rituxan® [rituximab injection for intravenous use] and an anathracycline), or relapsed following autologous hematopoietic stem cell transplantation (HSCT).[1] A single Kymriah infusion was administered after 2 to 11 days following the completion of lymphodepleting chemotherapy which involved fludarabine and cyclophosphamide, or

Treanda® (bendamustine injection for intravenous use). Lymphodepleting chemotherapy was not required if the patient's white blood cell count was < 1,000 cells/μL. In total, 160 patients were enrolled and 106 patients received Kymriah; 92 patients received product that was manufactured in the US. The efficacy evaluation population included 68 patients and the overall response rate was 50% (n = 34/68).

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for ALL (version 1.2020 – January 15, 2020) address Kymriah.[4,5] In Philadelphia chromosome-positive B-cell ALL, Kymriah is cited as a treatment option for patients < 26 years of age and with refractory disease or ≥ two relapses and failure of two tyrosine kinase inhibitors (TKIs) [category 2A]. For Philadelphia chromosome-negative B-cell ALL, Kymriah is listed as a therapy option for patients < 26 years of age and with refractory disease or ≥ two relapses (category 2A).

The NCCN guidelines for Pediatric ALL (version 2.2020 – November 25, 2019) recommends Kymriah for the treatment of patients with refractory or ≥ 2 relapses, TKI intolerant or refractory disease, or relapse post-hematopoietic stem cell transplantation (category 2A).[5,7] Kymriah is also recommended for patients who are minimal residual disease positive after consolidation therapy, and in Philadelphia chromosome-positive disease with less than complete response, or high-risk genetics.

The NCCN guidelines for B-cell lymphomas (version 1.2020 – January 22, 2020) recommend Kymriah for the treatment of the following relapsed or refractory disease after at least two course of systemic therapy: DLBCL following transformation from follicular lymphoma or nodal marginal zone lymphoma, DLBCL, primary mediastinal large B-cell lymphoma, high-grade B-cell lymphoma, AIDS-related B-cell lymphoma, human herpes virus 8 (HHV8)-positive DLBCL, and post-transplant lymphoproliferative disorders (category 2A).[5,6]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Kymriah. All approvals for initial therapy are provided for the initial approval duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Kymriah as well as the monitoring required for adverse events and long-term efficacy, approval requires Kymriah to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Kymriah is recommended in those who meet the following criteria:

FDA-Approved Indications

176. Acute Lymphoblastic Leukemia, B-Cell Precursor. Approve a single dose if the patient meets the following criteria (A, B, C, D, and E):

- **C)** The patient is < 26 years of age; AND
- **D)** Kymriah is prescribed by or in consultation with an oncologist; AND
- **E)** The patient meets one of the following (i, ii, or iii):
  - a. The patient has disease that is refractory, or in second or later relapse; OR
  - b. The patient is minimal residual disease positive after consolidation therapy; OR
  - c. The patient is Philadelphia chromosome-positive and one of the following (a, b, c, or d):
    - i. Less than complete response; OR
    - ii. High-risk genetics; OR
    - iii. Tyrosine kinase inhibitor intolerant or refractory;

Note: Tyrosine kinase inhibitors include Sprycel® (dasatinib tablets), imatinib tablets, Iclusig® (ponatinib tablets), Tasigna® (nilotinib capsules), and Bosulif® (bosutinib tablets); OR

iv. Relapse post-hematopoietic stem cell transplantation; AND

D) The patient received lymphodepleting chemotherapy prior to Kymriah infusion: AND

E) The patient has not been previously treated with Kymriah.

2. B-Cell Lymphoma. Approve a single dose if the patient meets the following criteria (A, B, C, D, E, and F):

A) The patient meets one of the following diagnoses (i, ii, iii, iv, v, vi, vii, viii, or ix):

i. Large B-cell lymphoma; OR

ii. Diffuse large B-cell lymphoma; OR

iii. Primary mediastinal large B-cell lymphoma; OR

iv. High-grade B-cell lymphoma; OR

v. Diffuse large B-cell lymphoma arising from follicular lymphoma; OR

vi. Diffuse large B-cell lymphoma arising from nodal marginal zone lymphoma; OR

vii. Acquired immune deficiency syndrome (AIDS)-related B-cell lymphoma; OR

viii. Human Herpes Virus 8-positive diffuse large B-cell lymphoma; OR

ix. Post-transplant lymphoproliferative disorders, B-cell type; AND

B) The patient is ≥ 18 years of age; AND

C) Kymriah is prescribed by or in consultation with an oncologist; AND

D) Kymriah is being used for disease that is relapsed or refractory after two or more lines of systemic therapy; AND

E) The patient must meet one of the following (i or ii):

i. The patient received lymphodepleting chemotherapy prior to Kymriah infusion; OR

ii. The patient's white blood cell count is less than or equal to 1 x 10^9/L within 1 week prior to Kymriah infusion; AND

F) The patient has not been previously treated with Kymriah or Yescarta® (axicabtagene ciloleucel injection).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Kymriah has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

164. Re-treatment with Kymriah. Kymriah is for one time use, repeat dosing is not approvable.

165. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Kyprolis (carfilzomib injection for intravenous use – Amgen/Onyx Pharmaceuticals)

DATE REVIEWED: 02/26/2020

OVERVIEW

Kyprolis is an irreversible proteasome inhibitor that inhibits proteasome activity in blood and tissue and delays tumor growth.[1] It is indicated for treatment of multiple multiple myeloma in the following situations:

1. for relapsed or refractory multiple myeloma, in combination with dexamethasome ± Revlimid® (lenalidomide capsules) in patients who have received one to three lines of previous therapy; AND
2. for relapsed or refractory multiple myeloma, as a single agent for the treatment of those who have received one or more lines of therapy.

Safety and efficacy is not established in patients < 18 years of age.

Guidelines

The NCCN Multiple Myeloma clinical practice guidelines (version 2.2020 – October 9, 2020) recommend Kyprolis in treatment regimens for patients who are transplant and non-transplant candidates.[3] Kyprolis/Revlimid/dexamethasone is recommended as an Other Recommended Regimen for primary treatment in transplant candidates. In non-transplant candidates, Kyprolis/dexamethasone plus Revlimid or cyclophosphamide is a recommended Other Recommended Regimen for primary treatment. For previously treated multiple myeloma, Kyprolis/dexamethasone/Revlimid is among the Preferred regimens, whereas Kyprolis/dexamethasone ± cyclophosphamide, Kyprolis/Farydak (panobinostat capsules), and Kyprolis/dexamethasone/Pomalyst (pomalidomide capsules) are listed as Other Recommended Regimens.

In NCCN guidelines for Waldenstrom's Macroglobulinemia/Lymphoplasmacytic Lympohoma (version 2.2019), Kyprolis/Rituxan (rituximab infusion)/dexamethasone is listed among other recommended regimens for primary treatment of Waldenstrom's Magroglobulinemia/lymphoplasmacytic lymphoma.[4]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Kyprolis. Because of the specialized skills required for evaluation and diagnosis of patients treated with Kyprolis as well as the monitoring required for adverse events and long-term efficacy, approval requires Kyprolis to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Kyprolis is recommended in those who meet the following criteria:

FDA-Approved Indications

24. Multiple Myeloma. Approve for 1 year if the patient meets BOTH of the following (A and B):
- **38.** The patient meets ONE of the following (i or ii):
  - **A)** Kyprolis will be used in combination with Revlimid (lenalidomide capsules) and dexamethazone OR
  - **B)** The patient has received at least ONE prior regimen for multiple myeloma.
    Note: Examples include regimens containing Velcade (bortezomib injection), Revlimid (lenalidomide capsules), Darzalex (daratumumab injection), Ninlaro (ixazomib capsules); AND
- **39.** The agent is prescribed by or in consultation with an oncologist or a hematologist.

Other Uses with Supportive Evidence

25. Waldenstrom's Macroglobulinemia/Lymphoplasmacytic Lymphoma. Approve for 1 year if the patient meets BOTH of the following (A and B):
- **A)** The agent will be used in combination with a rituximab product and dexamethasone; AND
- **B)** The agent is prescribed by or in consultation with an oncologist or a hematologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Kyprolis has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

166. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Lartruvo™ (olaratumab injection for intravenous use – Eli Lilly and Company)

REVIEW DATE: 10/09/2019

OVERVIEW

Lartruvo is a recombinant human IgG1 monoclonal antibody that binds to human platelet-derived growth factor receptor alpha (PDGFR-α).[1] PDGFR-α is a receptor tyrosine kinase that is involved in cell growth, chemotaxis, and mesenchymal stem cell differentiation. The receptor has been found on some tumors, including sarcomas, where signaling can contribute to cell proliferation, metastasis, and maintenance of the tumor microenvironment. Lartruvo prevents binding of PDGFR-α by the PDGF-AA and -BB ligands which prevents receptor activation and downstream PDGFR-α pathway signaling.

Lartruvo, is indicated, in combination with doxorubicin for the treatment of adults with soft tissue sarcoma with a subtype that an anthracycline-containing regimen is appropriate and which is not amenable to curative surgery or radiotherapy.[1]

The FDA granted accelerated approval to Lartruvo in October 2016 with the condition that a larger trial be conducted to confirm the safety and efficacy in patients with soft tissue sarcoma.[2] This study was completed and did not meet the primary endpoint of an improvement in overall survival for Lartruvo plus doxorubicin compared with placebo plus doxorubicin (the results are not currently available). In response to these results, the FDA recommends that Lartruvo not be started in new patients outside of a clinical trial and those currently receiving Lartruvo should discuss with their physician whether to remain on treatment.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on Soft Tissue Sarcoma (Version 2.2019 – February 4, 2019) removed Lartruvo in combination with doxorubicin as a treatment option for soft tissue sarcoma.[3]

The NCCN guidelines on Uterine Neoplasms (Version 3.2019 – February 11, 2019) removed Lartruvo in combination with doxorubicin as a treatment option for uterine sarcoma.[4]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Lartruvo. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Lartruvo as well as the monitoring required for adverse events and long-term efficacy, approval requires Lartruvo to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Lartruvo is recommended in those who meet the following criteria:

FDA-Approved Indications

177. Soft Tissue Sarcoma.[2,3] Approve for 6 months if the patient meets the following criteria (A, B, and C):

- **A)** The patient is currently receiving Lartruvo; AND
- **B)** The patient has soft tissue sarcoma of extremity/superficial trunk, head/neck, retroperitoneal/intra-abdominal, angiosarcoma, pleomorphic rhabdomyosarcoma, or uterine; AND
- **C)** Lartruvo is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Lartruvo has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

167. Initiating therapy on Lartruvo. The FDA recommends that Lartruvo not be started in new patients outside of a clinical trial.[2]

168. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Levoleucovorin Products Prior Authorization Policy

- Fusilev® (levoleucovorin injection for intravenous use – Spectrum Pharmaceuticals)
- Khapzory™ (levoleucovorin injection for intravenous use – Spectrum Pharmaceuticals)
- Levoleucovorin injection for intravenous use – various manufacturers

REVIEW DATE: 06/17/2020

OVERVIEW

Levoleucovorin (Fusilev, Khapzory, generics) is the pharmacologically active, levo-isomer of racemic *d,l*-leucovorin.[1,2] Levoleucovorin is a chemically reduced derivative of folic acid, which can counteract the toxic and therapeutic effects of folic acid antagonists, such as methotrexate. In addition, levoleucovorin can enhance the therapeutic and toxic effects of fluoropyrimidines used in oncology.

Levoleucovorin is indicated:

- For rescue after high-dose methotrexate therapy in osteosarcoma, and
- To diminish the toxicity of impaired methotrexate elimination or overdosage of folic acid antagonists, and
- For use in combination chemotherapy with 5-fluorouracil in the treatment of patients with advanced metastatic colorectal cancer.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) Drugs & Biologics Compendium recommends levoleucovorin use in combination with methotrexate for the treatment of gestational trophoblastic neoplasia, rhabdomyosarcoma, T-cell lymphomas, central nervous system cancers, B-cell lymphomas, chronic lymphocytic leukemia/small lymphocytic lymphoma, acute lymphoblastic leukemia, and osteosarcoma.[3] The NCCN Compendium recommends levoleucovorin use in combination with fluorouracil-based chemotherapy for the treatment of occult primary cancer, neuroendocrine

and adrenal tumors, hepatocellular carcinoma, ovarian/fallopian tube/primary peritoneal cancer, thymomas and thymic carcinomas, esophageal and esophagogastric junction cancer, anal cancer, colon cancer, gastric cancer, small bowel adenocarcinoma, cervical cancer, rectal cancer, pancreatic adenocarcinoma, and bladder cancer.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of levoleucovorin. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Because of the specialized skills required for evaluation and diagnosis of patients treated with levoleucovorin as well as the monitoring required for adverse events and long-term efficacy, approval requires levoleucovorin to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of levoleucovorin is recommended in those who meet the following criteria:

FDA-Approved Indications

178. Osteosarcoma. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** Levoleucovorin is used in combination with high-dose methotrexate; AND
- **B)** Levoleucovorin is prescribed by or in consultation with an oncologist.

179. Colon or Rectal Carcinoma. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** Levoleucovorin is used in combination with fluorouracil-based chemotherapy; AND
- **B)** Levoleucovorin is prescribed by or in consultation with an oncologist.

180. Methotrexate Overdosage, or Impaired Methotrexate Elimination. Approve for 1 month.

Other Uses with Supportive Evidence

181. Cancer Diagnosis Currently Being Treated With Methotrexate. (Note: Examples include T-cell lymphoma, B-cell lymphoma, gestational trophoblastic neoplasm, central nervous system cancer). Approve for 1 year if levoleucovorin is prescribed by or in consultation with an oncologist.

182. Cancer Diagnosis Currently Being Treated With 5-Fluorouracil. (Note: Examples include hepatocellular carcinoma, ovarian cancer, gastric cancer, cervical cancer). Approve for 1 year if levoleucovorin is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Levoleucovorin has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

169. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Libtayo® (cemiplimab-rwlc injection, for intravenous use – Regeneron/Sanofi Genzyme)

REVIEW DATE: 10/02/2019

OVERVIEW

Libtayo, a programmed death receptor-1 (PD-1) blocking antibody, is indicated for the treatment of patients with metastatic cutaneous squamous cell carcinoma (CSCC) or locally advanced CSCC who are not candidates for surgery or curative radiation.[1] Libtayo is a recombinant human immunoglobulin G4 (IgG4) monoclonal antibody that binds to PD-1 and blocks its interaction with PD-L1 and PD-L2, thereby releasing the PD-1 pathway-mediated inhibition of the immune response.

GUIDELINES

According to the National Comprehensive Cancer Network (NCCN) guidelines (version 2.2019 – October 23, 2018) on squamous cell carcinoma (SCC), the primary goals of treatment are the complete removal of the tumor and the maximal preservation of function and cosmesis.[2] Surgical excision offers the most effective and efficient means for curative therapy, but considerations of patient preference, preservation of function and cosmesis may lead to choosing radiation therapy as primary treatment to achieve optimal results. In a footnote, the guidelines note that Libtayo may be considered as a systemic therapy option for patients with locally advanced or metastatic cutaneous squamous cell carcinoma, who are not candidates for curative surgery or radiation therapy. Prior to Libtayo there were no systemic therapy options FDA-approved for the treatment of CSCC.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Libtayo. Because of the specialized skills required for evaluation and diagnosis of patients treated with Libtayo as well as the monitoring required for adverse events and long-term efficacy, approval requires Libtayo to be prescribed by, or in consultation with, a physician who specializes in the condition being treated. All approvals are provided for 1 year in duration unless otherwise noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Libtayo is recommended in those who meet the following criteria:

FDA-Approved Indications

140. Cutaneous Squamous Cell Carcinoma (CSCC). Approve for 1 year if the patient meets ALL of the following (A, B and C):

A) The patient has locally advanced or metastatic CSCC; AND

B) The patient is not a candidate for curative surgery or curative radiation; AND
C) The medication is prescribed by, or in consultation with, an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Libtayo has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

81. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Lumoxiti PA Policy (moxetumomab pasudotox-tdfk injection for intravenous use - AstraZeneca)

REVIEW DATE: 09/25/2019

OVERVIEW

Lumoxiti is a CD22-directed cytotoxin.[1] Lumoxiti is produced in *E. coli* via recombinant DNA technology and consists of a recombinant, murine immunoglobulin variable region fused to a shortened form of the *Pseudomonas* endotoxin, E38. Lumoxiti binds to the CD22 antigen on the cell surface and is internalized by the B-cell which results in ADP-ribosylation of elongation factor 2, inhibition of protein synthesis and apoptotic cell death.

Lumoxiti is indicated for the treatment of adult patients with relapsed or refractory hairy cell leukemia who received at least two prior systemic therapies, including treatment with a purine nucleoside analog.[1] Limitations of Use: Lumoxiti is not recommended for use in patients with a creatinine clearance ≤ 29 mL/min.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on Hairy Cell Leukemia (version 3.2019 – January 31, 2019) recommends purine nucleoside analogs (cladribine and/or pentostatin) as first-line agents and Lumoxiti as a single agent for progression of hairy cell leukemia after therapy for relapsed/refractory disease.[2,3]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Lumoxiti. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Lumoxiti as well as the monitoring required for adverse events and long-term efficacy, approval requires Lumoxiti to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Lumoxiti is recommended in those who meet the following criteria:

FDA-Approved Indications

26. Hairy Cell Leukemia.

Criteria. Approve for 6 months if the patient meets the following criteria (A, B, C, and D):
M) Patient is ≥ 18 years of age; AND
N) Patient has received ≥ 2 prior systemic therapies, including therapy with a purine analog. (Note: Purine analogs include cladribine and pentostatin); AND
O) Patient has an estimated creatinine clearance ≥ 30 mL/min; AND
P) Lumoxiti is prescribed by or in consultation with an oncologist.[1-3]

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Lumoxiti has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Monjuvi Prior Authorization Policy

- Monjuvi® (tafasitamab-cxix injection for intravenous use – MorphoSys US/Incyte)

REVIEW DATE: 08/05/2020

OVERVIEW

Monjuvi, a CD19-directed antibody-drug conjugate, is indicated in combination with Revlimid® (lenalidomide capsules) for adults with relapsed or refractory diffuse large B-cell lymphoma (DLBCL) not otherwise specified, including DLBCL arising from low grade lymphoma, and who are not eligible for autologous stem cell transplant.[1] Monjuvi is administered as a weight-based intravenous infusion. It should be given in combination with Revlimid for a maximum of 12 cycles, then as monotherapy until disease progression or unacceptable toxicity. Accelerated approval was granted for this indication based on overall response rate. Continued approval for this indication may be contingent upon verification and description of clinical benefit in a confirmatory trial.

Guidelines

Monjuvi is not yet addressed in guidelines from the National Comprehensive Cancer Network (NCCN).[2] For second-line or subsequent treatment of relapsed or refractory DLBCL in patients ineligible for transplantation, preferred regimens recommended by NCCN (version 3.2020 – August 4, 2020) include GemOx (gemcitabine/oxaliplatin) ±

rituximab and Polivy® (polatuzumab vedotin intravenous injection) ± bendamustine ± rituximab (after ≥ two prior therapies). A variety of other chemotherapy-based regimens ± rituximab are also included among the other recommended regimens. Xpovio® (selinexor tablets), a nuclear export inhibitor, is listed for third-line or subsequent use.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Monjuvi. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Monjuvi as well as the monitoring required for adverse events and long-term efficacy, approval requires Monjuvi to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Monjuvi is recommended in those who meet the following criteria:

FDA-Approved Indications

183. Diffuse Large B-Cell Lymphoma. Approve for 1 year if the patient meets the following criteria (A, B, C, D, and E):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has been treated with at least one prior chemotherapy regimen; AND
- **C)** According to the prescriber, the patient is not eligible for autologous stem cell transplant; AND
- **D)** Patient meets one of the following (i or ii):
  - **i.** Monjuvi will be used in combination with Revlimid (lenalidomide capsules); OR
  - **ii.** Patient has already received 12 cycles of Monjuvi; AND
- **E)** The agent is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Monjuvi is not recommended in the following situations:

170. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Mylotarg Prior Authorization Policy
- Mylotarg™ (gemtuzumab ozogamicin for injection – Pfizer)

REVIEW DATE: 07/15/2020; selected revisions 07/29/2020

OVERVIEW

Mylotarg, an antibody-drug conjugate directed towards the CD33 antigen, is indicated for the treatment of:

- **CD33-positive acute myeloid leukemia (AML)**, newly diagnosed, in adults and pediatric patients ≥ 1 month of age; AND
- **CD33-positive AML**, relapsed or refractory, in adults and in pediatric patients ≥ 2 years of age.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for AML (version 3.2020 – December 23, 2019) recommend Mylotarg for induction therapy, post-remission therapy, and for relapsed/refractory CD33-positive AML.[2,3] Mylotarg can be used as a single agent or in combination with cytarabine and daunorubicin. The NCCN guidelines for AML also recommend Mylotarg in patients ≥ 18 years of age for induction and consolidation therapy for high-risk (white blood cell count > 10,000/µL) acute promyelocytic leukemia, and for relapsed disease. Mylotarg can be used in combination with tretinoin and/or arsenic trioxide.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Mylotarg. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Mylotarg as well as the monitoring required for adverse events and long-term efficacy, approval requires Mylotarg to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Mylotarg is recommended in those who meet the following criteria:

FDA-Approved Indications

27. **Acute Myeloid Leukemia – Newly Diagnosed CD33-Positive.** Approve for 1 year if the patient meets the following criteria (A and B):
    - **F)** Patient is ≥ 1 month of age; AND
    - **G)** Mylotarg is prescribed by or in consultation with an oncologist.

28. Acute Myeloid Leukemia – Relapsed or Refractory CD33-Positive. Approve for 1 month if the patient meets the following criteria (A and B):
A) Patient is ≥ 2 years of age; AND
B) Mylotarg is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

29. Acute Promyelocytic Leukemia – High Risk. Approve for 6 months if the patient meets the following criteria (A, B, and C):
A) Patient is ≥ 18 years of age; AND
B) Patient has high risk disease, defined as white blood cell count > 10,000/mcL; AND
C) Mylotarg is prescribed by or in consultation with an oncologist.

30. Acute Promyelocytic Leukemia – First Relapse (Morphologic or Molecular). Approve for 6 months if the patient meets the following criteria (A and B):
A) Patient is ≥ 18 years of age; AND
B) Mylotarg is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Mylotarg is not recommended in the following situations:

171. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Oncaspar® (pegaspargase injection for intramuscular or intravenous use – Servier)

DATE REVIEWED: 06/03/2020

OVERVIEW

Oncaspar is a conjugate of *Escherichia coli*-derived L-asparaginase and monomethoxypolyethylene glycol (mPEG).[1] L-asparaginase catalyzes the breakdown of L-asparagine into aspartic acid and ammonia. Leukemia cells have a deficiency of asparagine synthetase and rely on exogenous sources of L-asparagine for survival. Oncaspar depletes plasma L-asparagine levels leading to leukemia cell death.

Oncaspar is indicated as a component of a multi-agent chemotherapy regimen for:

- The first-line treatment of pediatric and adult patients with acute lymphoblastic leukemia (ALL), and

- The treatment of pediatric and adult ALL patients with hypersensitivity to native forms of L-asparaginase.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for ALL (version 1.2020 – January 15, 2020) and the NCCN guidelines for Pediatric ALL (version 2.2020 – November 25, 2019) recommend pegaspargase as a component of a multiagent chemotherapeutic regimen for induction/consolidation therapy for ALL, for induction therapy in Philadelphia chromosome-negative ALL in patients ≥ 65 years of age, for relapsed/refractory Philadelphia chromosome-negative ALL, and relapsed/refractory Philadelphia chromosome-positive ALL.[2,3,5]

The NCCN guidelines for T-cell lymphomas (version 1.2020 – January 6, 2020) recommend pegaspargase as a component of therapy for extranodal NK/T-cell lymphoma, nasal type and as an alternative induction regimen if no response or progressive disease after primary treatment for hepatosplenic gamma-delta T-cell lymphoma.[3,4]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Oncaspar. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Oncaspar as well as the monitoring required for adverse events and long-term efficacy, approval requires Oncaspar to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Oncaspar is recommended in those who meet the following criteria:

FDA-Approved Indications

184. Acute Lymphoblastic Leukemia. Approve for 1 year if Oncaspar is prescribed by or consultation with an oncologist.

Other Uses with Supportive Evidence

185. Extranodal NK/T-cell Lymphoma, Nasal Type. Approve for 1 year if Oncaspar is prescribed by or in consultation with an oncologist.

186. Hepatosplenic Gamma-Delta T-cell Lymphoma. Approve for 1 year if the patient meets the following criteria (A and B):

A) The patient had no response or progressive disease after primary treatment; AND

B) Oncaspar is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Oncaspar has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

172. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Onivyde® (irinotecan liposome injection – Ipsen Biopharmaceuticals)

DATE REVIEWED: 04/22/2020

OVERVIEW
Onivyde is a topoisomerase 1 inhibitor formulated into a liposomal dispersion for intravenous (IV) use.[1] Topoisomerase 1 inhibitors prevent the repair of breaks in single-strands of DNA, eventually leading to double-strand damage to DNA and cell death.

Onivyde is indicated, in combination with fluorouracil and leucovorin, for the treatment of patients with metastatic adenocarcinoma of the pancreas after disease progression following gemcitabine-based therapy.[1] Limitation of use: Onivyde is not indicated as a single agent for the treatment of patients with metastatic adenocarcinoma of the pancreas.

Guidelines
The National Comprehensive Cancer Network (NCCN) Pancreatic Adenocarcinoma practice guidelines (Version 1.2020 – November 26, 2019) recommend Onivyde, in combination with fluorouracil and leucovorin, for the second-line treatment of locally advanced, or metastatic pancreatic adenocarcinoma in patients with Eastern Cooperative Oncology Group (ECOG) performance status of 0 to 2.[2,3]

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of Onivyde. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Onivyde as well as the monitoring required for adverse events and long-term efficacy, approval requires Onivyde to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Onivyde is recommended in those who meet the following criteria:

FDA-Approved Indications

187. Pancreatic Adenocarcinoma, Locally Advanced or Metastatic. Approve for 1 year if the patient meets the following criteria (A, B, and C):

A) Patient has tried at least one chemotherapy regimen for pancreatic adenocarcinoma, either gemcitabine-based chemotherapy, or fluoropyrimidine-based chemotherapy without irinotecan; AND

B) Onivyde will be used in combination with fluorouracil and leucovorin; AND

C) Onivyde is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Onivyde has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

173. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

657. The NCCN Drugs and Biologics Compendium. © 2020 National Comprehensive Cancer Network, Inc. Available at: http://www.nccn.org. Accessed on April 17, 2020. Search term: irinotecan liposome.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Opdivo Prior Authorization Policy

- Opdivo® (nivolumab injection for intravenous use – Bristol-Myers Squibb)

REVIEW DATE: 12/18/2019; selected revision 06/24/2020

OVERVIEW

Opdivo, a human programmed death receptor-1 (PD-1) blocking antibody, is indicated for the treatment of the following:[1]

- **Classical Hodgkin lymphoma**, for adults that have relapsed or progressed after** autologous hematopoietic stem cell transplantation (auto-HSCT) and Adcetris® (brentuximab vedotin intravenous injection) OR three or more lines of systemic therapy that includes auto-HSCT.
- **Colorectal cancer**, with or without Yervoy for patients ≥ 12 years of age with microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR) metastatic disease that has progressed following treatment with a fluoropyrimidine, oxaliplatin, and irinotecan.**
- **Esophageal squamous cell carcinoma**, for patients with unresectable advanced, recurrent, or metastatic disease after prior fluoropyrimidine- and platinum-based chemotherapy.
- **Head and neck squamous cell carcinoma**, in patients with recurrent or metastatic disease with disease progression on or after platinum-based therapy.
- **Hepatocellular carcinoma** (HCC), in patients who have been previously treated with Nexavar® (sorafenib tablets), with or without Yervoy.**
- **Melanoma**, in patients with:
  - Unresectable or metastatic disease as a single agent, OR
  - Unresectable or metastatic disease in combination with Yervoy® (ipilimumab intravenous injection) in patients with melanoma;* AND
  - Lymph node involvement or metastatic disease who have undergone complete resection, in the adjuvant setting.
- **Non-small cell lung cancer**:
  - As first-line treatment in combination with Yervoy, in adults with metastatic disease expressing programed death-ligand 1 (≥ 1%) as determined by an FDA-approved test, without epidermal

growth factor receptor (*EGFR*) or anaplastic lymphoma kinase (*ALK*) genomic tumor aberrations; AND
    - As first-line treatment in combination with Yervoy and two cycles of platinum-doublet chemotherapy, in adults with recurrent or metastatic disease without EGFR or ALK genomic tumor aberrations; AND
    - Patients with metastatic disease and progression on or after platinum-based chemotherapy. Patients with *EGFR* or *ALK* genomic tumor aberrations should have disease progression on FDA-approved therapy for these aberrations prior to receiving Opdivo.
- **Renal cell carcinoma** (RCC):
    - Patients with advanced disease who have received prior anti-angiogenic therapy; AND
    - In combination with Yervoy, for patients with intermediate or poor risk and previously untreated advanced RCC.
- **Small cell lung cancer**, in patients with metastatic disease with progression after platinum-based chemotherapy and at least one other line of therapy.[**]
- **Urothelial carcinoma**, in patients with advanced or metastatic disease who:[**]
    - Have disease progression during or following platinum-containing chemotherapy; OR
    - Who have disease progression within 12 months of neoadjuvant or adjuvant treatment with platinum-containing chemotherapy.

[*] This indication is approved under accelerated approval based on progression-free survival (PFS). Continued approval for this indication may be contingent upon verification and description of clinical benefit in the confirmatory trials.

[**] This indication is approved under accelerated approval based on overall response rate (ORR) and duration of response. Continued approval for this indication may be contingent upon verification and description of clinical benefit in the confirmatory trials.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Opdivo. Because of the specialized skills required for evaluation and diagnosis of patients treated with Opdivo as well as the monitoring required for adverse events and long-term efficacy, approval requires the medication to be prescribed by or in consultation with a prescriber who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Opdivo is recommended in those who meet the following criteria:

FDA-Approved Indications

4. **Classic Hodgkin Lymphoma (cHL).** Approve for 1 year if the patient meets BOTH of the following (A and B):
   A) ONE the following conditions applies (i, ii, or iii):[2]
   i. Patient has had a hematopoietic stem cell transplantation (HSCT); OR
   ii. Patient has tried three or more systemic regimens AND this includes an auto-HSCT as one line of therapy; OR
   Note: Examples are ABVD (doxorubicin, bleomycin, vinblastine, and dacarbazine), Sanford V (doxorubicin, vinblastine, mechlorethamine, etoposide, vincristine, bleomycin, and

prednisone), escalated BEACOPP (bleomycin, etoposide, doxorubicin, cyclophosphamide, vincristine, procarbazine, and prednisone).

iii. Patient is not eligible for transplant according to the prescriber; AND

B) The medication is prescribed by or in consultation with an oncologist.

5. **Colon or Rectal Cancer, Microsatellite Instability-High (MSI-H) or Mismatch Repair Deficient (dMMR).** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
   A) Patient is ≥ 12 years of age; AND
   B) One of the following applies (i or ii):
      i. Patient has tried chemotherapy; OR
      Note: Examples of chemotherapy are fluoropyrimidine such as 5-fluorouracil (5-FU), capecitabine; oxaliplatin, irinotecan, or an adjunctive chemotherapy regimen such as FOLFOX (5-FU, leucovorin, and oxaliplatin) or CapeOX (capecitabine and oxaliplatin).
      ii. The patient has unresectable or metastatic disease and is not a candidate for intensive therapy, according to the prescriber; AND
   C) The medication is prescribed by or in consultation with an oncologist.

6. **Esophageal Squamous Cell Carcinoma.** Approve for 1 year if the patient meets BOTH of the following (A and B):
   A) Patient has tried fluoropyrimidine- and platinum-based chemotherapy; AND
   Note: Examples of fluoropyrimidines are 5-fluorouracil (5-FU) and capecitabine. Examples of platinum medications are cisplatin, carboplatin, and oxaliplatin.
   B) The medication is prescribed by or in consultation with an oncologist.

7. **Head and Neck Squamous Cell Carcinoma.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
   A) Patient has non-nasopharyngeal disease; AND
   B) Patient meets ONE of the following conditions (i or ii):
      i. Patient has tried chemotherapy; OR
      Note: Examples of chemotherapy are cisplatin, carboplatin**,** Erbitux® (cetuximab intravenous infusion), 5-fluorouracil (5-FU), capecitabine, paclitaxel, docetaxel, methotrexate (MTX).
      ii. A platinum-containing chemotherapy regimen or other chemotherapy is contraindicated, according to the prescriber; AND
   C) The medication is prescribed by or in consultation with an oncologist.

8. **Hepatocellular Carcinoma, Including Hepatobiliary Cancers**. Approve for 1 year if the patient meets BOTH of the following (A and B):
   G) Patient has tried at least one tyrosine kinase inhibitor (TKI) [e.g., Nexavar {sorafenib tablets}, Lenvima {levatinib capsules}]; AND
   H) The medication is prescribed by or in consultation with an oncologist.

9. **Melanoma** [Note: This includes cutaneous melanoma, brain metastases due to melanoma, and uveal melanoma]. Approve for the duration noted if the patient meets BOTH of the following (A and B):
   A) Patient meets ONE of the following (i or ii):
      i. Approve for 1 year if the patient has unresectable, advanced, or metastatic melanoma; OR
      ii. Approve for up to 1 year of treatment (total) if Opdivo will be used as adjuvant treatment (e.g., in a patient with no evidence of disease following resection of node-positive disease, locoregional recurrence, or in-transit recurrence); AND
   B) The medication is prescribed by or in consultation with an oncologist.

10. Non-Small Cell Lung Cancer (NSCLC). Approve for 1 year if the patient meets ALL of the following (A, B, and C):
- **A)** The medication is prescribed by or in consultation with an oncologist; AND
- **B)** Patient has advanced or metastatic disease; AND
- **C)** Patient meets one of the following (i or ii):
  - **i.** Opdivo is used as first-line therapy and the patient meets all of the following (a, b, and c):
    - **a)** Patient's tumor expresses programmed death-ligand 1 (PD-L1) ≥ 1% as determined by an FDA-approved test; AND
    - **b)** Opdivo will be used in combination with Yervoy® (ipilimumab intravenous injection); AND
    - **c)** Patient's tumor is negative for a targetable mutation; OR
      Note: Examples of targetable mutations include sensitizing epidermal growth factor receptor (*EGFR*) mutation, anaplastic lymphoma kinase (*ALK*) fusions, *ROS1, BRAF, MET 14* skipping mutation, *RET* rearrangement.
  - **ii.** Opdivo is used as subsequent therapy and the patient meets all of the following (a, b, and c):
    - **a)** Patient has tried systemic chemotherapy; AND
      Note: Examples of systemic chemotherapy include cisplatin, carboplatin, Alimta (pemetrexed injection], Abraxane (paclitaxel albumin-bound injection), gemcitabine, paclitaxel.
    - **b)** Patient has not progressed on prior therapy with a programmed death-1 (PD-1)/PD-ligand 1 (PD-L1) inhibitor; AND
      Note: This includes previous therapy with either one of Opdivo, Keytruda (pembrolizumab for injection), or Tecentriq (atezolizumab for injection).
    - **c)** If non-squamous cell carcinoma (that is, adenocarcinoma, large cell, or NSCLC not otherwise specified) AND the patient's tumor is positive for a targetable mutation, the patient has received targeted drug therapy for the specific mutation.
      Note: Examples of targetable mutations include sensitizing epidermal growth factor receptor (*EGFR*) mutation, anaplastic lymphoma kinase (*ALK*) fusions, *ROS1, BRAF, MET 14* skipping mutation, *RET* rearrangement.

11. Renal Cell Carcinoma. Approve for 1 year if the patient meets BOTH of the following (A and B):
- **A)** Patient has advanced (e.g., relapsed, Stage IV, or metastatic) disease; AND
- **B)** The medication is prescribed by or in consultation with an oncologist.

12. Small Cell Lung Cancer. Approve for 1 year if the patient meets BOTH of the following (A and B):
- **A)** Patient has tried at least one other chemotherapy regimen; AND
  Note: Examples of chemotherapy are cisplatin, carboplatin, etoposide, irinotecan, topotecan, paclitaxel.
- **B)** The medication is prescribed by or in consultation with an oncologist.

13. Urothelial Carcinoma. Approve for 1 year if the patient meets BOTH of the following (A and B):
- **A)** Patient has tried at least one other chemotherapy regimen; AND
  Note: Examples of chemotherapy regimens are cisplatin, carboplatin, gemcitabine, Keytruda (pembrolizumab intravenous infusion), Tecentriq (atezolizumab intravenous infusion).
- **B)** The medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

14. **Anal Carcinoma.** Approve for 1 year if the patient meets BOTH of the following (A and B):
    C) Patient has received other chemotherapy; AND
    Note: Examples of chemotherapy are 5-fluorouracil (5-FU), cisplatin, carboplatin plus paclitaxel, FOLFOX (oxaliplatin, leucovorin, and 5-FU).
    D) The medication is prescribed by or in consultation with an oncologist.

15. **Extranodal NK/T-Cell Lymphoma, Nasal Type.** Approve for 1 year if the patient meets the following criteria (A and B):
    A) Patient has received an asparaginase-based chemotherapy regimen.
    Note: Examples of asparaginase-based chemotherapy are dexamethasone, ifosfamide, pegaspargase, etoposide; and gemcitabine, pegaspargase, oxaliplatin; AND
    B) The medication is prescribed by or in consultation with an oncologist.

16. **Gestational Trophoblastic Neoplasia.** Approve for 1 year if the patient meets both of the following (A and B):
    A) Patient meets one of the following (i or ii):
        i. Patient has tried at least one previous chemotherapy regimen for recurrent or progressive disease; OR
        Note: Examples of chemotherapy regimens contain etoposide, cisplatin/carboplatin, paclitaxel, bleomycin, ifosfamide, methotrexate.
        ii. Patient has methotrexate-resistant high-risk disease; AND
    B) The medication is prescribed by or in consultation with an oncologist.

17. **Malignant Pleural Mesothelioma.** Approve for 1 year if the patient meets BOTH of the following (A and B):
    A) Patient has tried first-line chemotherapy; AND
    Note: Examples of chemotherapy are Alimta (pemetrexed intravenous injection) plus cisplatin or carboplatin, Alimta with cisplatin and bevacizumab, gemcitabine plus cisplatin, Alimta alone, vinorelbine.
    B) The medication is prescribed by or in consultation with an oncologist.

18. **Merkel Cell Carcinoma**. Approve for 1 year if the patient meets BOTH of the following (A and B):
    A) Patient has disseminated Merkel cell carcinoma; AND
    B) The medication is prescribed by or in consultation with an oncologist.

19. **Small Bowel Adenocarcinoma.** Approve for 1 year if the patient meets the following criteria (A, B, and C):
    A) Patient has advanced or metastatic disease that is deficient mismatch repair/microsatellite instability-high (dMMR/MSI-H); AND
    B) Patient meets one of the following criteria (i or ii):
        i. If the medication is used as initial therapy, the patient has tried oxaliplatin in the adjuvant setting or has a contraindication to oxaliplatin; OR
        ii. The medication will be used as subsequent therapy; AND
    C) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Coverage of Opdivo is not recommended in the following situations:

82. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Padcev™ (enfortumab vedotin – ejfv injection for intravenous use – Astellas Pharma and Seattle Genetics)

DATE REVIEWED: 12/20/2019

OVERVIEW

Padcev is an antibody-drug conjugate which contains the fully human anti-Nectin-4 monoclonal antibody conjugated to the microtubule disrupting agent, monomethyl auristatin E.[1]

Padcev, an antibody-drug conjugate, is indicated for the treatment of adult patients with locally advanced or metastatic urothelial cancer who have previously received a programmed death receptor-1 (PD-1) or programmed death-ligand 1 (PD-L1) inhibitor, and a platinum-containing chemotherapy in the neoadjuvant/adjuvant, locally advanced or metastatic setting.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) bladder cancer guidelines (version 2.2020 – January 7, 2020) recommend Padcev for the subsequent treatment of locally advanced or metastatic urothelial carcinoma of the bladder, upper genitourinary tract, prostate, and urethra.[2,3] Patients should have previously received platinum-containing chemotherapy and a checkpoint inhibitor, if eligible.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Padcev. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Padcev as well as the monitoring required for adverse events and long-term efficacy, approval requires Padcev to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Padcev is recommended in those who meet the following criteria:

FDA-Approved Indications

188. Urothelial Carcinoma. Approve for 1 year if the patient meets the following criteria (A, B, C, D, and E):

- **A)** The patient is ≥ 18 years of age; AND
- **B)** The patient has locally advanced or metastatic disease; AND
- **C)** The patient has previously received a programmed death receptor-1 or programmed death-ligand 1 inhibitor (checkpoint inhibitors), unless the prescriber determines the patient is not eligible for checkpoint inhibitor therapy.
  Note: Programmed death receptor-1 and programmed death-ligand 1 inhibitors include: Opdivo® (nivolumab injection), Keytruda® (pembrolizumab injection), Tecentriq® (atezolizumab injection), Bavencio® (avelumab injection), and Imfimzi® (durvalumab injection); AND
- **D)** The patient has previously received platinum-containing chemotherapy, unless the prescriber determines the patient is not eligible for platinum chemotherapy.
  Note: Examples include cisplatin, carboplatin, and oxaliplatin; AND
- **E)** Padcev is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Padcev has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

174. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Perjeta Prior Authorization Policy
- Perjeta® (pertuzumab injection, for intravenous use – Roche/Genentech)

REVIEW DATE: 07/29/2020

OVERVIEW

Perjeta, a human epidermal growth factor receptor 2 (HER2) antagonist, is indicated for the treatment of HER2-positive breast cancer for the following uses:[1]

- **Neoadjuvant treatment,** of patients with locally advanced, inflammatory, or early stage disease (either greater than 2 cm in diameter or node positive) as part of a complete treatment regimen for early breast cancer, in combination with trastuzumab and chemotherapy.
- **Adjuvant treatment,** of patients with early disease at high risk of recurrence, in combination with trastuzumab and chemotherapy.
- **Metastatic disease,** in combination with trastuzumab and docetaxel in patients who have not received prior anti-HER2 therapy or chemotherapy for metastatic disease.

Guidelines

The National Comprehensive Cancer Network (NCCN) breast cancer guidelines (version 5.2020 – July 15, 2020) and Compendium has the following recommendations.[2,3] For preoperative (neoadjuvant)/adjuvant therapy in HER2-positive disease, doxorubicin/cyclophosphamide followed by paclitaxel plus trastuzumab and Perjeta is one of the preferred regimens (category 2A). Docetaxel/carboplatin/trastuzumab/Perjeta is another recommend regimen (category 2A). Under other recommended regimens, doxorubicin/cyclophosphamide followed by docetaxel + trastuzumab + Perjeta is also listed (category 2A). In the neoadjuvant/adjuvant setting, the chemotherapy agents in combination with trastuzumab + Perjeta are administered for usually four cycles, followed by trastuzumab ± Perjeta to complete 1 year of therapy. In the metastatic setting, the preferred regimens are Perjeta + trastuzumab + docetaxel (category 1) or Perjeta + trastuzumab + paclitaxel (category 2A). In this setting, chemotherapy + trastuzumab + Perjeta is continued until disease progression or unmanageable toxicity.

The NCCN guidelines and compendium recommends use of Perjeta in combination with trastuzumab in patients with HER2-amplified, *RAS* and *BRAF* wild-type, colon and rectal cancer.[3-5] Perjeta is recommended for use in a variety of therapy settings (e.g., adjuvant therapy, primary treatment, subsequent therapy) in combination with trastuzumab, in patients who are not appropriate for intensive therapy and with no previous treatment with a HER2 inhibitor. It is category 2A recommended for primary and subsequent therapy settings; category 2B recommended for adjuvant therapy.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Perjeta. All approvals are provided for the duration noted below. Because of the specialized skills required for the evaluation and diagnosis of patients treated with Perjeta, as well as the monitoring required for the adverse events and long-term efficacy, approval requires Perjeta to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Perjeta is recommended in those who meet the following criteria:

FDA-Approved Indications

33. Breast Cancer – Neoadjuvant or Adjuvant Therapy. Approve for 1 year (total) if the patient meets the following criteria (A, B, C, and D):
- **A)** Patient has human epidermal growth factor receptor 2 (HER2)-positive disease; AND
- **B)** Patient meets ONE of the following criteria (i or ii):
  - **i.** The medication will be used in combination with chemotherapy; OR
    Note: Examples include docetaxel, paclitaxel.
  - **ii.** The medication is continued after chemotherapy to complete 1 year of neoadjuvant or adjuvant therapy; AND
- **C)** Perjeta will be used in combination with a trastuzumab product; AND
- **D)** The medication is prescribed by or in consultation with an oncologist.

2. Breast Cancer – Metastatic Disease. Approve for 1 year if the patient meets all of the following (A, B, C, and D):
- **A)** Patient has human epidermal growth factor receptor 2 (HER2)-positive disease; AND
- **B)** Patient has not been previously treated with anti-HER2 therapy or chemotherapy for metastatic disease; AND
- **C)** The medication will be used in combination with trastuzumab and chemotherapy; AND
  Note: Examples of chemotherapy are docetaxel, paclitaxel.
- **D)** The medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

3. Colon or Rectal Cancer. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Patient has human epidermal growth factor receptor 2 (HER2)-positive disease; AND
- **B)** The medication is used in combination with trastuzumab; AND
- **C)** The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Perjeta is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Phesgo Prior Authorization Policy
- Phesgo™ (pertuzumab, trastuzumab, and hyaluronidase-zzxf injection for subcutaneous use – Genentech, Inc.)

REVIEW DATE: 07/08/2020

OVERVIEW
Phesgo, a combination of pertuzumab, trastuzumab, and hyaluronidase-zzxf, is indicated for the following uses:[1]
- **Early breast cancer**, for use in combination with chemotherapy for the neoadjuvant treatment of adult patients with human epidermal growth factor receptor 2 (HER2)-positive, locally advanced, inflammatory, or early stage breast cancer (either > 2 cm in diameter or node positive) as part of a complete treatment regimen for early breast cancer. It is also indicated for the adjuvant treatment of adult patients with HER2-positive early breast cancer at high risk of recurrence.
- **Metastatic breast cancer**, for use in combination with docetaxel for the treatment of adult patients with HER2-positive disease who have not received prior anti-HER2 therapy or chemotherapy for metastatic disease.

Patients should be selected for therapy based on an FDA-approved companion diagnostic test.

Guidelines
The National Comprehensive Cancer Network (NCCN) breast cancer guidelines (version 5.2020 – July 15, 2020) notes that Phesgo may be substituted anywhere that the combination of Perjeta IV and trastuzumab IV are given as part of systemic therapy.[2] The guidelines note that Phesgo has a different dosing and administration instructions compared with the IV products. For preoperative (neoadjuvant)/adjuvant therapy in HER2-positive disease, doxorubicin/cyclophosphamide followed by paclitaxel plus trastuzumab and Perjeta is one of the preferred regimens (category 2A). Docetaxel/carboplatin/trastuzumab/Perjeta is another recommend regimen (category 2A). Under other recommended regimens, doxorubicin/cyclophosphamide followed by docetaxel + trastuzumab + Perjeta is also listed (category 2A). In the neoadjuvant/adjuvant setting, the chemotherapy agents in combination with trastuzumab + Perjeta are administered for usually four cycles, followed by trastuzumab ± Perjeta to complete 1 year of therapy. In the metastatic setting, the preferred regimens are Perjeta + trastuzumab + docetaxel (category 1) or Perjeta + trastuzumab + paclitaxel (category 2A). In this setting, chemotherapy + trastuzumab + Perjeta is continued until disease progression or unmanageable toxicity.

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of Phesgo. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Phesgo, as well as the monitoring required for adverse events and long-term efficacy, approval requires Phesgo to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Phesgo is recommended in those who meet the following criteria:

FDA-Approved Indications

34. Breast Cancer – Neoadjuvant or Adjuvant Therapy. Approve for 1 year (total) if the patient meets all of the following (A, B, and C):
- **A)** Patient has human epidermal growth factor receptor 2 (HER2)-positive disease; AND
- **B)** Patient meets one of the following criteria (i or ii):
  - **i.** The medication will be used in combination with chemotherapy; OR
    Note: Examples of chemotherapy are doxorubicin, cyclophosphamide, docetaxel, paclitaxel, carboplatin.
  - **ii.** Phesgo is continued after chemotherapy to complete 1 year of neoadjuvant or adjuvant therapy; AND
- **C)** The medication is prescribed by or in consultation with an oncologist.

2. Breast Cancer – Metastatic Disease. Approve for 1 year if the patient meets all of the following (A, B, C, and D):
- **A)** Patient has human epidermal growth factor receptor 2 (HER2)-positive disease; AND
- **B)** Patient has not been previously treated with anti-HER2 therapy or chemotherapy for metastatic disease; AND
- **C)** The medication will be used in combination with chemotherapy; AND
  Note: Examples of chemotherapy are docetaxel, paclitaxel.
- **D)** The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Coverage of Phesgo is not recommended in the following situations:

10. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Polivy Prior Authorization Policy
- Polivy™ (polatuzumab vedotin – piiq injection for intravenous use – Genentech)

REVIEW DATE: 06/24/2020

OVERVIEW
Polivy, a CD79b-directed antibody-drug conjugate, is indicated in combination with bendamustine and a rituximab product is indicated for the treatment of adult patients with relapsed or refractory diffuse large B-cell lymphoma

(DLBCL), not otherwise specified, after at least two prior therapies.[1] Accelerated approval was granted for this indication based on complete response rate. Continued approval for this indication may be contingent upon verification and description of clinical benefit in a confirmatory trial.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on B-Cell Lymphomas (version 1.2020 – January 22, 2020) recommend Polivy for the second-line or subsequent treatment of DLBCL, follicular lymphoma, histologic transformation of nodal marginal zone lymphoma to DLBCL, mantle cell lymphoma, AIDS-related B-cell lymphoma, post-transplant lymphoproliferative disorders, and high-grade B-cell lymphoma after ≥ 2 prior therapies in non-candidates for transplant.[2,3]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Polivy. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Polivy as well as the monitoring required for adverse events and long-term efficacy, approval requires Polivy to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Polivy is recommended in those who meet the following criteria:

FDA-Approved Indications

189. Diffuse Large B-Cell Lymphoma. Approve for 6 months if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has been treated with at least two prior chemotherapy regimens; AND
- **C)** Polivy is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

190. B-Cell Lymphoma. (Note: Examples include follicular lymphoma, mantle cell lymphoma, high-grade B-cell lymphoma, AIDS-related B-cell lymphoma, post-transplant lymphoproliferative disorders, histologic transformation of nodal marginal zone lymphoma to diffuse large B-cell lymphoma). Approve for 6 months if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has been treated with at least two prior chemotherapy regimens; AND
- **C)** Polivy is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Polivy is not recommended in the following situations:

175. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Portrazza® (necitumumab injection for intravenous use – Eli Lilly)

DATE REVIEWED: 01/15/2020

OVERVIEW
Portrazza is indicated in combination with gemcitabine and cisplatin for the first-line treatment of patients with metastatic squamous non-small cell lung cancer (NSCLC).[1] It has a limitation of use noted that it is not indicated for the treatment of non-squamous NSCLC.

Guidelines
The National Comprehensive Cancer Network (NCCN) NSCLC cancer guidelines (version 2.2020 – December 23, 2019) notes that Portrazza/cisplatin/gemcitabine in the first-line setting is not used at NCCN member institutions due to the efficacy and safety of this agent compared to the efficacy/safety of other available agents.[2]

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of Portrazza. Because of the specialized skills required for evaluation and diagnosis of patients treated with Portrazza as well as the monitoring required for adverse events and long-term efficacy, approval requires the medication to be prescribed by or in consultation with a prescriber who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Portrazza is recommended in those who meet the following criteria:

FDA-Approved Indications

40. Non-Small Cell Lung Cancer (NSCLC). Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** The patient has metastatic squamous NSCLC; AND
- **B)** Portrazza will be used in combination with chemotherapy.
  Note: Examples of chemotherapy are gemcitabine, cisplatin; AND
- **C)** The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Portrazza has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

83. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Poteligeo Prior Authorization Policy
- Poteligeo® (mogamulizumab-kpkc injection, for intravenous use – Kyowa Kirin, Inc.)

REVIEW DATE: 09/02/2020

OVERVIEW
Poteligeo is indicated for the treatment of adult patients with relapsed or refractory mycosis fungoides or Sézary syndrome after at least one prior systemic therapy.[1]

GUIDELINES
The National Comprehensive Cancer Network (NCCN) guidelines on Primary Cutaneous Lymphomas (version 2.2020 – April 10, 2020) recommend Poteligeo for primary treatment and for treatment of relapsed/refractory mycosis fungoides/Sezary syndrome.[2,3]

The NCCN guidelines on T-Cell Lymphomas (version 1.2020 – January 6, 2020) recommend Poteligeo as a single agent for the treatment of relapsed/refractory adult T-cell leukemia/lymphoma, acute or lymphoma subtypes.[3,4]

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of Poteligeo. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Poteligeo as well as the monitoring required for adverse events and long-term efficacy, approval requires Poteligeo to be prescribed by, or in consultation with, a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Poteligeo is recommended in those who meet the following criteria:

FDA-Approved Indications

141. Mycosis Fungoides/Sezary Syndrome. Approve for 1 year if Poteligeo is prescribed by or in consultation with an oncologist or dermatologist.

Other Uses With Supportive Evidence

142. Adult T-cell Leukemia/Lymphoma. Approve for 1 year if the patient meets ALL of the following (A and B):
- **A)** Patient has relapsed or refractory disease; AND
- **B)** Poteligeo is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Poteligeo is not recommended in the following situations:

84. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Proleukin® (aldesleukin injection for intravenous use – Prometheus Laboratories)

REVIEW DATE: 12/18/2019

OVERVIEW

Proleukin, a human recombinant interleukin-2 product, is indicated for the treatment of adults with metastatic renal cell carcinoma (mRCC), and adults with metastatic melanoma.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on Kidney Cancer (Version 2.2020 – August 5, 2019) recommend Proleukin as a single agent for first-line (Category 2A) and subsequent (Category 2B) therapy for patients with relapsed or stage IV disease and clear cell histology.[2,3]

The NCCN guidelines on Cutaneous Melanoma (Version 3.2019 – October 22, 2019) recommend Proleukin for unresectable or metastatic disease as a single agent for second-line or subsequent therapy for disease progression or after maximum clinical benefit from BRAF targeted therapy (Category 2A).[2,4] Proleukin may be considered for patients with small brain tumors and without significant peritumoral edema (Category 2B) or for intralesional therapy

as primary or second-line treatment of unresectable stage III disease with clinical or satellite/in-transit metastases, or local satellite/in-transit recurrence (Category 2B).

The NCCN guidelines on Hematopoietic Cell Transplantation (Version 1.2020 – October 30, 2019) recommend Proleukin as additional therapy, in combination with systemic corticosteroids, for steroid-refractory chronic graft-vs-host disease.[2,5]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Proleukin. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Proleukin as well as the monitoring required for adverse events and long-term efficacy, approval requires Proleukin to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Proleukin is recommended in those who meet the following criteria:

FDA-Approved Indications

191. Kidney Cancer. Approve for 6 months if the patient meets the following criteria (A, B, C, D, and E):
- **A)** The patient is ≥ 18 years of age; AND
- **B)** The patient has relapsed or metastatic disease; AND
- **C)** The patient has clear cell histology; AND
- **D)** Proleukin will be used as a single agent; AND
- **E)** Proleukin is prescribed by or in consultation with an oncologist.

192. Cutaneous Melanoma. Approve for the duration noted if the patient meets ONE of the following (A or B):
- **A)** Intravenous Therapy. Approve for 6 months if the patient meets the following criteria (i, ii, iii, iv, and v):
  - **i.** The patient is ≥ 18 years of age; AND
  - **ii.** The patient has metastatic or unresectable disease; AND
  - **iii.** The patient has tried at least one other systemic therapy; AND
  - **iv.** Proleukin will be used as a single agent; AND
  - **v.** Proleukin is prescriber by or in consultation with an oncologist.
- **B)** Intralesional Therapy. Approve for 6 months if the patient meets the following criteria (i, ii, and iii):
  - **i.** The patient is ≥ 18 years of age; AND
  - **ii.** Proleukin will be directly injected into metastatic, recurrent, or unresectable cutaneous, subcutaneous, or nodal lesions; AND
  - **iii.** The agent is prescribed by or in consultation with an oncologist or dermatologist.

Other Uses with Supportive Evidence

193. Graft-versus-Host Disease. Approve for 1 year if the patient meets the following criteria (A, B, C, and D):

A) The patient has chronic graft-vs-host disease; AND
B) According to the prescriber, the patient has steroid-refractory disease; AND
C) Proleukin will be used in combination with systemic corticosteroids; AND
D) Proleukin will be prescribed by or in consultation with an oncologist or a physician associated with a transplant center.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Proleukin has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

176. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Rituxan Hycela™ (rituximab and hyaluronidase human injection for subcutaneous use – Biogen and Genentech/Roche)

REVIEW DATE: 10/16/2019

OVERVIEW

Rituxan Hycela is indicated for treatment of adults with the following indications:

1. **Follicular lymphoma** (FL), as a single agent for relapsed or refractory disease; in previously untreated FL in combination with first-line chemotherapy and, as single-agent maintenance therapy in patients achieving a complete or partial response to rituximab + chemotherapy; and as a single agent after first-line CVP (cyclophosphamide, vincristine, and prednisone) in non-progressing (including stable disease) FL;
2. **Diffuse large B-cell lymphoma** (DLBCL), in combination with CHOP (cyclophosphamide, doxorubicin, vincristine, and prednisone) or other anthracycline-based chemotherapy regimens in patients with previously untreated disease; and
3. **Chronic lymphocytic leukemia** (CLL), in combination with FC (fludarabine + cyclophosphamide) for previously treated and previously untreated disease.[1]

Rituxan Hycela is a combination of rituximab and hyaluronidase human. It contains the identical molecular antibody of rituximab available in Rituxan IV, but hyaluronidase has been added to facilitate systemic

delivery. Rituxan Hycela should be administered under the care of a healthcare professional with appropriate medical support to manage severe and potentially fatal reactions. The dose of Rituxan Hycela is fixed regardless of the patient's body surface area (BSA); dose reductions are not recommended. When given in combination with chemotherapy, reduce the dose of chemotherapeutic drugs to manage adverse events (AEs). Rituxan Hycela is not indicated for treatment of non-malignant conditions.

Disease Overview

Non-Hodgkin lymphoma (NHL) is a heterogeneous group of lymphoproliferative disorders originating in B-lymphocytes.[2] Major subtypes of NHL diagnosed in the US include DLBCL (33% of NHL cases), CLL/small lymphocytic lymphoma (SLL) [19% of NHL cases], and FL (17% of NHL cases). Cell-surface proteins, including CD20, are highly expressed on these B-cell malignancies.[3] Rituxan Hycela is an anti-CD20 monoclonal antibody that, upon binding to CD20 on B-lymphocytes, depletes B cells by several mechanisms, including direct antibody-dependent cellular toxicity, complement-mediated cell death, and signaling apoptosis.

Guidelines

Rituximab features prominently in the National Comprehensive Cancer Network (NCCN) guidelines for treatment of B-cell lymphomas (version 4.2019 – June 18, 2019) and CLL/small lymphocytic lymphoma (version 1.2020 – August 23, 2019) and is included in multiple treatment regimens across the spectrum of disease. In hairy cell leukemia, NCCN guidelines (version 1.2020 – August 23, 2019) recommend rituximab in multiple regimens for relapsed/refractory disease, including in patients with progressive disease after relapsed/refractory therapy. All of these guidelines have been updated to list Rituxan Hycela (noted as rituximab + hyaluronidase) in most clinical scenarios when the intravenous formulation is recommended, if the patient has received the first full dose with rituximab IV.

Safety

There is a higher risk of hypersensitivity and other acute reactions during the first infusion.[1] Therefore, all patients must receive at least one full dose of rituximab IV, which allows for management by slowing or stopping the IV infusion, before receiving Rituxan Hycela. Patients who are unable to complete one full IV infusion should continue to receive subsequent cycles with rituximab IV and should not switch to Rituxan Hycela until a full IV dose is successfully administered. Safety is otherwise comparable to rituximab IV and includes Boxed Warnings regarding severe mucocutaneous reactions, hepatitis B reactivation, and progressive multifocal leukoencephalopathy.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Rituxan Hycela. Because of the specialized skills required for evaluation and diagnosis of patients treated with Rituxan Hycela as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Rituxan Hycela to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Rituxan Hycela is recommended in those who meet the following criteria:

FDA-Approved Indications

143. Chronic Lymphocytic Leukemia (CLL) or Small Lymphocytic Lymphoma (SLL). Approve for 1 year if the patient meets the following criteria (A, B, and C):
A) The patient has already received at least one full dose of rituximab intravenous; AND
B) The agent is administered under the care of a healthcare professional; AND
C) The agent is being prescribed by or in consultation with an oncologist.

144. B-Cell Lymphoma (Note: Examples of B-Cell Lymphomas include Diffuse Large B-cell Lymphoma [DLBCL], Follicular Lymphoma, Acquired Immune Deficiency [AIDS]-Related B-Cell Lymphoma, Burkitt Lymphoma, Castleman's Disease, Marginal Zone Lymphoma [e.g., extranodal or MALT {gastric or nongastric}, nodal, or splenic marginal zone lymphoma], Primary Mediastinal Large B-Cell Lymphoma, Mantle Cell Lymphoma, Post-Transplant Lymphoproliferative Disorders, Gray Zone Lymphoma, Primary cutaneous B-cell lymphoma). Approve for 1 year if the patient meets the following criteria (A, B, and C):
A) The patient has already received at least one full dose of rituximab intravenous; AND
B) The agent is administered under the care of a healthcare professional; AND
C) The agent is being prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

7. **Hairy Cell Leukemia.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
   A) The patient has relapsed/refractory hairy cell leukemia; AND
   B) The patient has already received at least one full dose of rituximab intravenous; AND
   C) The agent is administered under the care of a healthcare professional; AND
   D) The agent is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Rituxan Hycela has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

85. **Granulomatosis with Polyangiitis (GPA) [Wegener's granulomatosis] or Microscopic Polyangiitis (MPA).** Rituximab IV is indicated for treatment of GPA or MPA.[5] Rituxan Hycela has not been evaluated and does not have established dosing for GPA or MPA.

86. **Pemphigus Vulgaris.** Rituximab IV is indicated for treatment of pemphigus vulgaris.[5] Rituxan Hycela has not been evaluated and does not have established dosing for pemphigus vulgaris.

87. **Rheumatoid Arthritis (RA).** Rituximab IV is indicated for treatment of RA.[5] Rituxan Hycela has not been evaluated and does not have established dosing for RA.

88. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Romidepsin Products (Istodax)

- Istodax® (romidepsin injection for intravenous use – Celegene)
- Romidepsin injection for intravenous use – authorized generics – various

DATE REVIEWED: 06/03/2020

OVERVIEW

Romidepsin (Istodax, authorized generics) is a histone deacetylase (HDAC) inhibitor which catalyzes the removal of acetyl groups from acetylated lysine residues in histones resulting in gene expression modulation.[1] Romidepsin also catalyzes the removal of acetyl groups from non-histone proteins. In vitro, romidepsin induces cell cycle arrest and death due to the accumulation of acetylated histones.

Romidepsin is indicated for the treatment of cutaneous T-cell lymphoma (CTCL) in patients who have received at least one prior systemic therapy and for the treatment of peripheral T-cell lymphoma (PTCL) in patients who have received at least one prior therapy.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) Primary Cutaneous Lymphomas practice guidelines (version 2.2020 – April 10, 2020) recommend romidepsin as systemic therapy for mycosis fungoides/Sezary syndrome with or without skin-directed therapy and as a single agent for relapsed or refractory primary cutaneous CD30+ T-cell lymphoproliferative disorders.[2,3]

The NCCN T-Cell Lymphomas practice guidelines (version 1.2020 – January 6, 2020) recommend romidepsin as a single agent for the second-line or subsequent therapy of relapsed or refractory peripheral T-cell lymphomas including anaplastic large cell lymphoma; peripheral T-cell lymphoma not otherwise specified, angioimmunoblastic T-cell lymphoma, enteropathy-associated T-cell lymphoma, monomorphic epitheliotropic intestinal T-cell lymphoma, and nodal peripheral T-cell lymphoma with T-follicular helper (TFH) phenotype; follicular T-cell lymphoma; extranodal NK/T-cell lymphoma – nasal type; and hepatosplenic gamma-delta T-cell lymphoma.[3,4]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of romidepsin. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with romidepsin as well as the monitoring required for adverse events and long-term efficacy, approval requires romidepsin to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of romidepsin is recommended in those who meet the following criteria:

FDA-Approved Indications

194. T-Cell Lymphoma, Peripheral. Approve for 1 year if the patient meets the following (A, B, and C):
- **A)** The patient has relapsed or refractory disease; AND
- **B)** Romidepsin is used as a single agent; AND
- **C)** Romidepsin is prescribed by or in consultation with an oncologist.

195. Cutaneous T-Cell Lymphoma – Mycosis Fungoides/Sezary Syndrome. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** The patient has received at least one prior systemic therapy, AND

B) Romidepsin is prescribed by or in consultation with an oncologist or dermatologist.

196. Cutaneous T-Cell Lymphoma – Cutaneous CD30+ T-Cell Lymphoproliferative Disorders. Approve for 1 year if the patient meets the following (A, B, C, and D):
A) The patient has relapsed or refractory disease; AND
B) The patient has one of the following diagnoses (i or ii):
i. Primary cutaneous anaplastic large cell lymphoma with multifocal lesions; OR
ii. Cutaneous anaplastic large cell lymphoma with regional nodes; AND
C) Romidepsin is used as a single agent; AND
D) Romidepsin is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

197. Extranodal NK/T-Cell Lymphoma, Nasal Type. Approve for 1 year if the patient meets the following (A, B, and C):
A) The patient has relapsed/refractory disease following combination (asparaginase-based) chemotherapy; AND
B) Romidepsin is used as a single agent; AND
C) Romidepsin is prescribed by or in consultation with an oncologist.

198. Hepatosplenic Gamma-Delta T-Cell Lymphoma. Approve for 1 year if the patient meets the following (A, B, and C):
A) Romidepsin is used as subsequent therapy after two primary treatment regimens; AND
B) Romidepsin is used as a single agent; AND
C) Romidepsin is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Romidepsin has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

177. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Sarclisa® (isatuximab-irfc injection, for intravenous use – Sanofi-Aventis)

DATE REVIEWED: 03/04/2020; selected revision 03/11/2020

OVERVIEW

Sarclisa, a CD38-directed monoclonal antibody, is indicated in combination with Pomalyst® (pomalidomide capsules) and dexamethasone for treatment of adults with multiple myeloma, for those who have received at least two previous therapies including with with Revlimid® (lenalidomide capsules) and a proteasome inhibitor.[1] In the pivotal study, the median number of prior lines of therapy was 3 lines (range, 2 to 11 prior lines of therapy). Safety and efficacy have not been established in patients < 18 years of age.

Disease Overview

Multiple myeloma is a cancer formed by malignant plasma cells which are found in the bone marrow.[2] Normally, B cells responding to an infection change into plasma cells that make antibodies to help attack and kill pathogens. In multiple myeloma, these plasma cells grow out of control and become cancerous. A monoclonal immunoglobulin (M protein) is produced by myeloma cells and may be found in the blood or excreted in the urine of patients with multiple myeloma. Beta-2 microglobulin is another protein made by myeloma cells, with high levels associated with more advanced disease. Sarclisa binds to CD38 and inhibits the growth of CD38-expressing tumor cells such as myeloma cells.

Guidelines

Sarclisa is not yet addressed in current guidelines for multiple myeloma.[3] Recently updated guidelines from the National Comprehensive Cancer Network (NCCN) [version 2.2020 – October 9, 2019] recommend various regimens as primary therapy (transplant eligible and non-transplant candidates), maintenance therapy, and previously-treated multiple myeloma. The relative efficacy and toxicity of each regimen, along with patient-specific factors (e.g., past therapies, renal disease), are considered for choice of primary and subsequent regimens.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Sarclisa. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Sarclisa as well as the monitoring required for adverse events and long-term efficacy, approval requires Sarclisa to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Sarclisa is recommended in those who meet the following criteria:

FDA-Approved Indications

31. Multiple Myeloma. Approve for 1 year if the patient meets ALL of the following (A, B, C, D, E and F):
- **41.** The patient is ≥ 18 years of age; AND
- **42.** The agent will be used in combination with Pomalyst (pomalidomide capsules)and dexamethasone; AND
- **43.** The patient has tried at least TWO prior regimens for multiple myeloma.
  Note: Examples include Velcade (bortezomib injection)/Revlimid (lenalidomide capsules) /dexamethasone, Kyprolis (carfilzomib infusion)/Revlimid/dexamethasone, Darzalex (daratumumab injection)/Velcade/melphalan/prednisone, Ninlaro (ixazomib capsules)/Revlimid/dexamethasone, and Darzalex/Revlimid/dexamethasone; AND
- **44.** A proteasome inhibitor was a component of at least one previous regimen.
  Note: Examples of proteasome inhibitors include Velcade (bortezomib injection), Kyprolis (carfilzomib infusion), Ninlaro (ixazomib capsules); AND
- **45.** Revlimid (lenalidomide capsules) was a component of at least one previous regimen; AND
- **46.** The agent is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Sarclisa has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

178. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Sylatron™ (peginterferon alfa-2b injection for subcutaneous use - Merck)

DATE REVIEWED: 12/18/2019

OVERVIEW

Sylatron, a pegylated interferon alfa-2b product, is indicated for adjuvant treatment of melanoma with microscopic or gross nodal involvement within 84 days of definitive surgical resection including complete lymphadenectomy.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) cutaneous melanoma (Version 3.2019 – October 22, 2019) clinical practice guidelines no longer recommend Sylatron for the treatment of melanoma.[2]

The NCCN systemic mastocytosis (Version 2.2019 – September 20, 2018) clinical practice guidelines recommend Sylatron alone or in combination with prednisone for the treatment of aggressive systemic mastocytosis and systemic

mastocytosis with an associated hematologic neoplasm when the systemic mastocytosis component needs more immediate treatment.[3,4] In addition, Sylatron is recommended for osteopenia/osteoporosis in patients with refractory bone pain and/or worsening bone mineral density on bisphosphonate therapy.

The NCCN myeloproliferative neoplasms (Version 3.2019 – September 4, 2019) clinical practice guidelines recommend Sylatron for the treatment of symptomatic low-risk myelofibrosis, polycythemia vera, and essential thrombocythemia.[4,5]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Sylatron. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Sylatron as well as the monitoring required for adverse events and long-term efficacy, approval requires Sylatron to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Sylatron is recommended in those who meet the following criteria:

FDA-Approved Indications

199. Melanoma. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** The patient has microscopic or gross nodal involvement; AND
- **B)** The patient had complete lymphadenectomy within the past 84 days; AND
- **C)** Sylatron will be prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

200. Systemic Mastocytosis. Approve for 1 year if the patient meets the following (A and B):
- **A)** The patient has one of the following (i, ii, or iii):
  - **i.** Aggressive systemic mastocytosis; OR
  - **ii.** Systemic mastocytosis with an associated hematologic malignancy; OR
  - **iii.** Osteopenia/osteoporosis with refractory bone pain and/or decreasing bone mineral density on bisphosphonate therapy; AND
- **B)** Sylatron is prescribed by or in consultation with an oncologist.

201. Myeloproliferative Neoplasms. Approve for 1 year if the patient meets the following (A and B):
- **A)** The patient has one of the following (i, ii, or iii):
  - **i.** Symptomatic low-risk myelofibrosis; OR
  - **ii.** Polycythemia vera; OR
  - **iii.** Essential thrombocythemia; AND
- **B)** Sylatron is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Sylatron has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

179. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Sylvant® (siltuximab intravenous infusion – Janssen Biotech, Inc.)

REVIEW DATE: 02/19/2020; selected revision 03/25/2020

OVERVIEW

Sylvant is an interleukin (IL)-6 antagonist indicated for treatment of patients with multicentric Castleman's disease (MCD) who are human immunodeficiency virus (HIV) negative and human herpesvirus-8 (HHV-8) negative.[1] Because Sylvant did not bind to virally produced interleukin (IL)-6 in a nonclinical study, Sylvant has not been studied in patients with MCD who are HIV positive or HHV-8 positive. Safety and efficacy has not been established in patients < 18 years of age.

Disease Overview

MCD affects approximately 1,000 patients in the US. It typically presents with lymphoid hyperplasia at multiple sites, including the peripheral lymph nodes, bone marrow, and multiple organs. Patients often have serious infections, fevers, weight loss, fatigue, night sweats, and nerve damage that can cause weakness and numbness. Persistent IL-6 production has been implicated in the development of various autoimmune, chronic, inflammatory diseases and cancers, including MCD.[2] Sylvant, a human-mouse chimeric monoclonal antibody that is produced by Chinese hamster ovary cells, binds human IL-6 and prevents the binding of IL-6 to both soluble and membrane-bound IL-6 receptors.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for B-cell lymphomas (version 1.2020 – January 22, 2020) list Sylvant as a treatment option for MCD and for refractory or relapsed unicentric disease.[3]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Sylvant. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Sylvant as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Sylvant to be prescribed by or in consultation with a physician who specializes in the condition being treated.

All reviews for use of Sylvant for COVID-19 and/or cytokine release syndrome associated with COVID-19 will be forwarded to the Medical Director.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Sylvant is recommended in those who meet the following criteria:

FDA-Approved Indications

G) Castleman's Disease. Approve for the duration noted if the patient meets ONE of the following (A or B):
- **F)** Initial Therapy. Approve for 6 months if the patient meets ALL of the following conditions (i, ii, iii, and iv):
  - **i.** The patient is ≥ 18 years of age; AND
  - **ii.** The patient is negative for the human immunodeficiency virus (HIV) and human herpesvirus-8 (HHV-8); AND
  - **iii.** The patient meets ONE of the following (a or b):
    - **a)** The patient has multicentric Castleman's disease; OR
    - **b)** Sylvant is being used for relapsed or refractory unicentric Castleman's disease; AND
  - **iv.** Sylvant is prescribed by or in consultation with an oncologist or hematologist.
- **E)** Patient is Currently Receiving Sylvant. Approve for 1 year if the patient has responded to Sylvant as determined by the prescriber.

  Note: Examples of a response include stabilized disease; tumor response; and resolution or stabilization of symptoms, such as fatigue and physical function.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Sylvant has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

1. **COVID-19 (Coronavirus Disease 2019).** Forward all requests to the Medical Director.
   Note: This includes requests for cytokine release syndrome associated with COVID-19.

2. **Multiple Myeloma**. Efficacy is not established. In a Phase II study (n = 286) evaluating patients with relapsed or refractory multiple myeloma, median progression-free survival was similar in patients treated with Velcade (bortezomib injection) + Sylvant (8.0 months) vs. in those treated with Velcade + placebo (7.6 months).[4] Following 24.5 months of follow-up, there was not a significant difference between the groups in median overall survival (30.8 months in the group that received Velcade + Sylvant vs. 36.8 months in the Velcade + placebo group). There was not a significant difference on overall response rate or other secondary endpoints. Another Phase II study evaluated Sylvant in patients (n = 106) with previously untreated symptomatic multiple myeloma who were transplant-ineligible. There was not a significant difference in complete response rate or overall response rate in patients treated with Velcade/melphalan/prednisone (VMP) vs. those treated with VMP + Sylvant. Progression-free survival and overall survival was the same in the two treatment groups. Another Phase II study in adults with relapsed or refractory multiple myeloma did not show any response with Sylvant monotherapy compared with 8% response rate in those who received Sylvant + dexamethasone.[7]

3. **Myelodysplastic Syndrome (MDS).** Efficacy is not established. A double-blind, placebo-controlled, Phase II study assigned adults with MDS (n = 76) to treatment with best supportive care in combination with Sylvant or placebo.[5] There was not a significant difference in the proportion of patients with reduced transfusions to treat anemia (primary endpoint). The study was terminated early due to lack of efficacy.

4. **Prostate Cancer.** Efficacy is not established. An open-label Phase II study did not demonstrate added efficacy with Sylvant added on to mitoxantrone/prednisone vs. mitoxantrone/prednisone.[8] Although the treatment groups were not balanced, progression-free survival was 97 days in the group that received Sylvant/mitoxantrone/prednisone vs. 228 days with mitoxantrone/prednisone. The study was stopped early.

5. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Synribo® (omacetaxine mepesuccinate injection for subcutaneous use – Teva)

REVIEW DATE: 09/04/2019

OVERVIEW

Synribo is indicated for the treatment of adult patients with chronic or accelerated phase chronic myeloid leukemia (CML) with resistance and/or intolerance to two or more tyrosine kinase inhibitors (TKIs).[1] Synribo can be administered by someone other than a healthcare professional (e.g., patient or a caregiver), if appropriate. The mechanism of action of Synribo has not been fully determined but involves inhibition of protein synthesis. The safety and efficacy of Synribo is pediatric patients have not been established.

Disease Overview

CML is a myeloproliferative neoplasm that comprises 15% of newly-diagnosed adult leukemias with an incidence of 1 to 2 cases per 100,000 adults.[2,3] In 2019, it was estimated that 8,990 patients would be diagnosed in the US, and 1,140 patients would die from the disease.[2] The median age at onset is 67 years; however, CML occurs in all age groups. CML is diagnosed by persistent unexplained leukocytosis with the presence of the Philadelphia chromosome abnormality characterized by a reciprocal translocation between chromosomes 9 and 22 that gives rise to the breakpoint cluster region (*BCR*) Abelson murine leukemia (*ABL*) 1 fusion gene which is believed to play a central role in the initial development of CML. Approximately 50% of patients with CML that are diagnosed in the US are asymptomatic.[3] Diagnosis often occurs following a routine physical examination or blood test.[2,3] CML occurs in three different phases (chronic phase [CP], accelerated phase [AP], or blast phase [BP]) and is usually diagnosed in CP. Common signs and symptoms of CP CML are related to anemia and splenomegaly. These include fatigue, weight

loss, malaise, and left upper quadrant pain or fullness. Untreated CP CML will eventually progress to advanced disease in 3 to 5 years. Certain mutations are associated with high rates of disease progression and relapse. The T315I mutation is a commonly noted example, which occurs in about 5% to 15% of cases.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on for CML (version 1.2020 – August 26, 2019) recommend Synribo as a treatment option for patients who have experienced disease progression to AP CML on TKI therapy.[2] It is not an option among patients who present with AP CML. Synribo is also a treatment option for patients with the T315I mutation. Synribo is stated as an option for patients with disease that is resistant and/or intolerant to two other TKIs.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Synribo. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Synribo as well as the monitoring required for adverse events and long-term efficacy, approval requires Synribo to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Synribo is recommended in those who meet the following criteria:

FDA-Approved Indications

202. Chronic Myeloid Leukemia (CML). Approve for 6 months if the patient meets the following criteria (A, B, and C):

- **A)** Synribo is prescribed by or in consultation with an oncologist; AND
- **B)** The patient is ≥ 18 years of age; AND
- **C)** The patient meets one of the following criteria (i or ii):
  - **i.** The patient if T315I positive; OR
  - **ii.** The patient has tried at least two tyrosine kinase inhibitors indicated for use in CML (e.g., Gleevec® [imatinib tablets], Sprycel® [dasatinib tablets], Tasigna® [nilotinib capsules], Bosulif® [bosutinib tablets], Iclusig® [ponatinib tablets]).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Synribo has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

180. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Tecartus Prior Authorization Policy
- Tecartus™ (brexucabtagene autoleucel suspension for intravenous injection – Kite Pharma)

REVIEW DATE: 08/05/2020

OVERVIEW

Tecartus, a CD19-directed genetically modified autologous T cell immunotherapy, is indicated for the treatment of adult patients with relapsed or refractory mantle cell lymphoma.[1] This indication was approved under accelerated approval based on the overall response rate and durability of response. Continued approval for this indication may be contingent upon verification and description of clinical benefit in a confirmatory trial.

Tecartus is supplied in infusion bag(s) containing frozen suspension of genetically modified autologous T cells in human serum albumin.[1] Each bag is supplied in a metal cassette stored in the vapor phase of liquid nitrogen. Store Tecartus frozen in the vapor phase of liquid nitrogen and thaw prior to administration.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for B-cell lymphomas (version 3.2020 – August 4, 2020) recommend Tecartus for the subsequent treatment of relapsed or refractory mantle cell lymphoma, following treatment with chemoimmunotherapy and bruton tyrosine kinase inhibitor therapy.[2,3]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Tecartus. All approvals for therapy are provided for the approval duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Tecartus as well as the monitoring required for adverse events and long-term efficacy, approval requires Tecartus to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tecartus is recommended in those who meet the following criteria:

FDA-Approved Indications

203. Mantle Cell Lymphoma. Approve a single dose if the patient meets the following criteria (A, B, C, and D):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has previously received the following (i, ii, and iii):
  - **i.** Anthracycline- or bendamustine-based chemotherapy; AND
  - **ii.** An anti-CD20 monoclonal antibody; AND
  - **iii.** A Bruton tyrosine kinase inhibitor; AND
    Note: Bruton tyrosine kinase inhibitors include Brukinsa™ (zanubrutinib capsules), Calquence® (acalabrutinib capsules), and Imbruvica® (ibrutinib capules and tablets).

C) Patient received lymphodepleting chemotherapy prior to Tecartus infusion; AND
D) Tecartus is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tecartus is not recommended in the following situations:

181. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Tecentriq Prior Authorization Policy
- Tecentriq® (atezolizumab injection for intravenous use – Genentech/Roche)

REVIEW DATE: 11/13/2019; selected revisions 06/24/2020

OVERVIEW

Tecentriq, a programmed death-ligand 1 (PD-L1) blocking antibody, is indicated for the treatment of the following indications:[1]

- **Breast cancer**, in combination with paclitaxel protein-bound (Abraxane) for the treatment of adult patients with unresectable locally advanced or metastatic triple-negative breast cancer whose tumors express PD-L1 (PD-L1 stained tumor-infiltrating immune cells of any intensity covering ≥ 1% of the tumor area), as determined by an FDA-approved test. This indication is approved under accelerated approval based on progression-free survival. Continued approval for this indication may be contingent upon verification and description of clinical benefit in confirmatory trials.
- **Hepatocellular carcinoma**, in combination with bevacizumab, for the treatment of patients with unresectable or metastatic hepatocellular carcinoma who have not received prior systemic therapy.
- **Metastatic non-small cell lung cancer** (NSCLC):
  - As a single agent, for the first-line treatment of patients with metastatic NSCLC whose tumors have high PD-L1 expression (PD-L1 staining ≥ 50% of tumor cells or PD-L1 staining of tumor infiltrating immune cells covering ≥ 10% of the tumor area), with no anaplastic lymphoma kinase (*ALK*) or epidermal growth factor receptor (*EGFR*) genomic tumor aberrations; OR
  - In combination with bevacizumab, paclitaxel, and carboplatin for the first-line treatment of patients with metastatic non-squamous NSCLC with no *ALK* or *EGFR* genomic tumor aberrations; OR
  - In combination with paclitaxel protein-bound and carboplatin, for the first-line treatment of adults with non-squamous metastatic NSCLC with no *ALK* or *EGFR* genomic tumor aberrations; OR
  - As a single-agent, in patients who have disease progression during or following platinum-containing chemotherapy. Patients with *EGFR* or *ALK* genomic tumor aberrations should have

disease progression on FDA-approved therapy for these aberrations prior to receiving Tecentriq.

- **Small cell lung cancer**, in combination with carboplatin and etoposide, for the first-line treatment of adult patients with extensive-stage SCLC.
- **Urothelial carcinoma**, in patients with locally advanced or metastatic disease who:
  - Are not eligible for cisplatin-based chemotherapy and whose tumors express PD-L1 (PD-L1 stained tumor infiltrating immune cells covering ≥ 5% of the tumor area); OR
  - Are not eligible for any platinum-containing chemotherapy regardless of the PD-L1 status; OR
  - Have disease progression during or following any platinum-containing chemotherapy, or within 12 months of neoadjuvant or adjuvant chemotherapy.

  This indication is approved under accelerated approval based on tumor response rate and duration of response. Continued approval for this indication may be contingent upon verification and description of clinical benefit in confirmatory trials.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Tecentriq. Because of the specialized skills required for evaluation and diagnosis of patients treated with Tecentriq as well as the monitoring required for adverse events and long-term efficacy, approval requires the medication to be prescribed by or in consultation with a prescriber who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tecentriq is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Breast Cancer.** Approve for 1 year if the patient meets the following criteria (A, B, C, and D):
   - **A)** Patient has unresectable locally advanced or metastatic triple-negative breast cancer; AND
   - **B)** The tumor is programmed death-ligand 1 (PD-L1)-positive; AND
   - **C)** The medication will be used in combination with Abraxane (paclitaxel albumin-bound for injection); AND
   - **D)** The medication is prescribed by or in consultation with an oncologist.

2. **Hepatocellular Carcinoma.** Approve for 1 year if the patient meets the following criteria (A, B, C, and D):
   - **A)** Patient has unresectable or metastatic hepatocellular carcinoma; AND
   - **B)** Patient has not received prior systemic therapy; AND
   - **C)** The medication will be used in combination with bevacizumab; AND
   - **D)** The medication is prescribed by or in consultation with an oncologist.

3. **Non-Small Cell Lung Cancer.** Approve for 1 year if the patient meets the following criteria (A, B, and C):
   - **C)** Tecentriq is prescribed by or in consultation with an oncologist; AND
   - **D)** Patient has advanced or metastatic disease; AND
   - **E)** Patient meets one of the following (i, ii, or iii):

~~**A)**~~ Patient has non-squamous NSCLC (i.e., adenocarcinoma, large cell, or NSCLC not otherwise specified) and the patient meets the following criteria (a and b):
- **a)** The tumor is negative for targetable mutations; AND
  Note: Examples of targetable mutations include epidermal growth factor receptor (*EGFR*) mutation, anaplastic lymphoma kinase (*ALK*) fusions, *ROS1*, *BRAF*, *MET exon 14* skipping mutation, *RET* rearrangement.
- **b)** Patient meets one of the following [(1) or (2)]:
  - **(1)** Patient's tumor expresses programmed death-ligand 1 (PD-L1) ≥ 50% as determined by an approved test; OR
  - **(2)** The patient's tumor expresses programmed death-ligand 1 (PD-L1) ≥ 1% to 49% as determined by an approved test and Tecentriq will be used in combination with chemotherapy; OR
    Note: Examples of chemotherapy include bevacizumab, paclitaxel, and carboplatin, or carboplatin and Abraxane (paclitaxel, albumin-bound for injection).

ii. Patient has squamous cell NSCLC and meets both of the following (a and b):
- **a)** The tumor is negative for targetable mutations; AND
  Note: Examples of targetable mutations include epidermal growth factor receptor (*EGFR*) mutation, anaplastic lymphoma kinase (*ALK*) fusions, *ROS1*, *BRAF*, *MET exon 14* skipping mutation, *RET* rearrangement.
- **b)** Patient's tumor expresses programmed death-ligand 1 (PD-L1) ≥ 50% as determined by an approved test; OR

iii. Patient's tumor is positive for targetable mutations and the patient meets both of the following (a and b):
Note: Examples of targetable mutations include epidermal growth factor receptor (*EGFR*) mutation, anaplastic lymphoma kinase (*ALK*) fusions, *ROS1*, *BRAF*, *MET exon 14* skipping mutation, *RET* rearrangement.
- **a)** Patient has tried at least one of the targeted therapy options; AND
- **b)** Tecentriq will be used as subsequent therapy.

4. Small Cell Lung Cancer. Approve for 1 year if Tecentriq is prescribed by or in consultation with an oncologist.

5. Urothelial Carcinoma. Approve for 1 year if the patient meets the following criteria (A and B):

I) Patient meets ONE of the following conditions (i, ii, or iii):

i. According to the prescribing physician, the patient meets both of the following (a and b):
- **a)** Patient is not eligible for cisplatin-based chemotherapy; AND
- **b)** Patient's tumor expresses PD-L1 (i.e., PD-L1 stained tumor infiltrating immune cells covering ≥ 5% of the tumor area); OR

ii. According to the prescribing physician, the patient is not eligible for platinum-containing chemotherapy (i.e., cisplatin and carboplatin) [Note: this is regardless of the PD-L1 status]; OR

iii. Patient has tried at least one platinum- (cisplatin or carboplatin) containing chemotherapy; AND

J) Tecentriq is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tecentriq is not recommended in the following situations:

89. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Thiotepa injection for intravenous, intracavitary, or intravesical use (Tepadina® - Adienne SA, generics)

REVIEW DATE: 10/16/2019

OVERVIEW

Thiotepa is an alkylating agent indicated:

- To reduce the risk of graft rejection when used in conjunction with high-dose busulfan and cyclophosphamide as a preparative regimen for allogeneic hematopoietic progenitor (stem) cell transplantation for pediatric patients with class 3 beta-thalassemia.[1]
- For the treatment of breast or ovarian adenocarcinoma.
- For controlling intracavitary effusions secondary to diffuse or localized neoplastic diseases of various serosal cavities.
- For the treatment of superficial papillary carcinoma of the urinary bladder.[1,2]

Guidelines

The National Comprehensive Cancer Network (NCCN) breast cancer guidelines (version 3.2019 – September 6, 2019) do not provide any recommendations on the use of thiotepa in the management of breast cancer.[3]

The NCCN ovarian cancer guidelines (version 2.2019 – September 17, 2019) do not provide any recommendations on the use of thiotepa in the management of ovarian cancer.[4]

The NCCN bladder cancer guidelines (version 4.2019 – July 10, 2019) state that intravesical thiotepa does not appear to be effective. NCCN recommends gemcitabine and mitomycin for intravesical chemotherapy.[5]

The NCCN central nervous system (CNS) cancers guidelines (version 2.2019 – September 16, 2019) recommend thiotepa, in combination with carmustine or busulfan and cyclophosphamide, with stem cell rescue for consolidation therapy of primary CNS lymphoma.[6] NCCN recommends intra-cerebrospinal fluid thiotepa for the treatment of leptomeningeal metastases.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of thiotepa. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Because of the specialized skills required for evaluation and diagnosis of patients treated with thiotepa as well as the monitoring required for adverse events and long-term efficacy, approval requires thiotepa to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of thiotepa is recommended in those who meet the following criteria:

FDA-Approved Indications

204. Beta-Thalassemia. Approve for 1 month if the patient meets the following criteria (A, B, C, D, and E):
- **A)** The patient is ≤ 18 years of age; AND
- **B)** The patient has class 3 beta-thalassemia; AND
- **C)** Thiotepa will be used prior to allogeneic hematopoietic stem cell transplantation; AND
- **D)** Thiotepa will be used in combination with high-dose busulfan and cyclophosphamide; AND
- **E)** Thiotepa is prescribed by or in consultation with an oncologist.

205. Breast Cancer. Approve for 6 months if thiotepa is prescribed by or in consultation with an oncologist.

206. Ovarian Cancer. Approve for 6 months if thiotepa is prescribed by or in consultation with an oncologist.

207. Bladder Cancer. Approve for 1 month if the patient meets the following criteria (A and B):
- **A)** The patient has superficial papillary carcinoma of the urinary bladder; AND
- **B)** Thiotepa is prescribed by or in consultation with an oncologist.

208. Malignant Effusions. Approve for 6 months if the patient meets the following criteria (A and B):
- **A)** The patient has intracavitary effusions secondary to diffuse or localized neoplastic disease; AND
- **B)** Thiotepa is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

209. Primary Central Nervous System Lymphoma. Approve for 3 months if the patient meets if the patient meets the following criteria (A and B):
- **A)** Thiotepa is used as a component of high-dose chemotherapy followed by hematopoietic stem cell transplantation; AND
- **B)** Thiotepa is prescribed by or in consultation with an oncologist.

210. Leptomeningeal Metastases. Approve for 6 months if thiopeta is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Thiotepa has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

182. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Topotecan Products

- Hycamtin® (topotecan capsule – Novartis)
- Topotecan injection for intravenous use (Hycamtin® – Novartis, generics)

DATE REVIEWED: 12/18/2019

OVERVIEW

Topotecan injection, a topoisomerase inhibitor, is indicated for the treatment of patients with:

- Metastatic ovarian cancer after disease progression on or after initial or subsequent chemotherapy, as a single agent;
- Small cell lung cancer (SCLC) platinum-sensitive disease who progressed at least 60 days after initiation of first-line chemotherapy, as a single agent;
- Stage IV-B, recurrent, or persistent cervical cancer which is not amenable to curative treatment, in combination with cisplatin.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) ovarian cancer (Version 2.2019 – September 17, 2019) clinical practice guidelines recommend topotecan, as a single agent or in combination with bevacizumab or Nexavar® (sorafenib tablet), for the treatment of recurrent or persistent platinum-resistant epithelial ovarian cancer, fallopian tube cancer, and peritoneal cancer.[2,3] Treatment of clinical relapse is a category 2A recommendation and immediate treatment of biochemical relapse is category 2B recommendation.

The NCCN SCLC (Version 2.2020 – November 15, 2019) clinical practice guidelines recommend topotecan as a single agent for patients with a performance status of 0-2 and relapse within 6 months following complete or partial response, or stable disease with initial treatment; or for primary progressive disease.[2,4]

The NCCN cervical cancer (Version 5.2019 – September 16, 2019) clinical practice guidelines recommend topotecan as first- or second-line therapy for patients with local/regional recurrence, stage IVB disease, or distant metastases.[2,5] Topotecan can be used in combination with paclitaxel with or without bevacizumab, in combination with cisplatin, or as a single agent for second-line therapy (category 2B recommendation).

The NCCN uterine cancer (Version 4.2019 – September 16, 2019) clinical practice guidelines recommend topotecan as a single agent for the treatment of recurrent, metastatic, or high-risk endometrial carcinoma.[2,6]

The NCCN bone cancer (Version 1.2020 – August 12, 2019) clinical practice guidelines recommend topotecan in combination with cyclophosphamide, as second-line therapy for patients with relapsed/refractory, or metastatic osteosarcoma and Ewing sarcoma (both category 2A), and dedifferentiated chondrosarcoma, high-grade undifferentiated pleomorphic sarcoma, and mesenchymal chondrosarcoma (category 2B).[2,7]

The NCCN central nervous system (CNS) cancers (Version 3.2019 – October 18, 2019) clinical practice guidelines recommend topotecan as a single agent for the treatment of relapsed or refractory primary CNS lymphoma and recurrent brain metastases in patients with small cell lung cancer.[2,8] In addition, the guidelines recommend intra-cerebrospinal fluid topotecan for the treatment of leptomeningeal metastases.

The NCCN Merkel cell carcinoma (Verison 1.2020 – October 2, 2019) clinical practice guidelines recommend topotecan as a treatment option for patients with distant metastatic disease who have contraindications to checkpoint immunotherapy (Bavencio® [avelumab injection for intravenous use], Keytruda® [injection for intravenous use], and Opdivo® [injection for intravenous use].[2,9]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of topotecan. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with topotecan as well as the monitoring required for adverse events and long-term efficacy, approval requires topotecan to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of topotecan is recommended in those who meet the following criteria:

FDA-Approved Indications

211. Ovarian, Fallopian Tube, and Primary Peritoneal Cancer. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** The patient has persistent or recurrent disease; AND
- **B)** The cancer is platinum-resistant; AND
- **C)** Topotecan is prescribed by or in consultation with an oncologist.

212. Small Cell Lung Cancer. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** The patient meets one of the following (i or ii):
  - **i.** The patient has relapsed disease; OR
  - **ii.** The patient has primary progressive disease; AND
- **B)** Topotecan will be used as a single agent; AND
- **C)** Topotecan is prescribed by or in consultation with an oncologist.

213. Cervical Cancer. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** The patient meets one of the following (i or ii):
  - **i.** The patient has local/regional recurrence; OR
  - **ii.** The patient has distant metastases; AND
- **B)** Topotecan is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

214. Endometrial Carcinoma. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** The patient has recurrent, metastatic, or high-risk disease; AND
- **B)** Topotecan will be used as a single agent; AND
- **C)** Topotecan is prescribed by or in consultation with an oncologist.

215. Rhabdomyosarcoma. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** The patient has non-pleomorphic rhabdomyosarcoma; AND
- **B)** Topotecan is prescribed by or in consultation with an oncologist.

216. Bone Cancer. Approve for 1 year if the patient meets the following criteria (A, B, C, D, and E):
- **A)** The patient has one of the following (i, ii, iii, iv, or v):
  - **i.** Osteosarcoma; OR
  - **ii.** Ewing sarcoma; OR
  - **iii.** Dedifferentiated chondrosarcoma; OR
  - **iv.** High-grade undifferentiated pleomorphic sarcoma; OR
  - **v.** Mesenchymal chondrosarcoma; AND
- **B)** The patient has relapsed, refractory, or metastatic disease; AND
- **C)** Topotecan is used second-line; AND
- **D)** Topotecan is used in combination with cyclophosphamide; AND
- **E)** Topotecan is prescribed by or in consultation with an oncologist.

217. Primary Central Nervous System Lymphoma. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** The patient has relapsed or refractory disease; AND
- **B)** Topotecan will be used as a single agent; AND
- **C)** Topotecan is prescribed by or in consultation with an oncologist.

218. Brain Metastatases. Approve for 1 year if the patient meets the following criteria (A, B, C, and D):
- **A)** The patient has recurrent disease; AND
- **B)** The patient has small cell lung cancer; AND
- **C)** Topotecan will be used as a single agent; AND
- **D)** Topotecan is prescribed by or in consultation with an oncologist.

219. Leptomeningeal and Spinal Metastatases. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** Topotecan will be administered intraventricularly; AND
- **B)** Topotecan is prescribed by or in consultation with an oncologist.

220. **Merkel Cell Carcinoma**. Approve for 1 year if the patient meets the following criteria (A, B, C, and D):
- **A)** The patient has distant metastatic disease; AND
- **B)** The patient has contraindications to checkpoint immunotherapy.
  Note: Checkpoint immunotherapy includes Bavencio® (avelumab injection for intravenous use), Keytruda® (injection for intravenous use), and Opdivo® (injection for intravenous use); AND
- **C)** Topotecan is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Topotecan has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

183. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Torisel (temsirolimus injection for intravenous use – Wyeth Pharmaceuticals)

REVIEW DATE: 10/16/2019

OVERVIEW

Torisel, an inhibitor of mammalian target of rapamycin (mTOR), is indicated for the treatment of advanced renal cell carcinoma.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for kidney cancer (Version 2.2020 – August 5, 2019) recommend Torisel as a single agent for the treatment of relapsed or stage IV renal cell carcinoma.[2,3]

The NCCN guidelines for soft tissue sarcoma (Version 4.2019 – September 12, 2019) recommend Torisel for the treatment of perivascular epithelioid cell tumors (PEComas), and lymphangioleiomyomatosis or angiomyolipomas.[2,4]

The NCCN guidelines for uterine neoplasms (Version 4.2019 – September 16, 2019) recommend Torisel as a single-agent for the treatment of recurrent, metastatic, or high-risk endometrial cancer.[2,5]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Torisel. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Torisel as well as the monitoring required for adverse events and long-term efficacy, approval requires Torisel to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Torisel is recommended in those who meet the following criteria:

FDA-Approved Indications

221. Renal Cell Carcinoma. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** The patient has relapsed, advanced, or metastatic disease; AND
- **B)** Torisel will be used as a single-agent; AND
- **C)** Torisel is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

222. Soft Tissue Sarcoma. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** The patient has one of the following (i, ii, or iii):
  - **i.** Perivascular epithelioid cell tumors (PEComas); OR
  - **ii.** Lymphangioleiomyomatosis; OR
  - **iii.** Recurrent angiomyolipoma; AND
- **B)** Torisel will be used as a single-agent; AND
- **C)** Torisel is prescribed by or in consultation with an oncologist.

223. Endometrial Carcinoma. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** The patient has recurrent, metastatic, or high-risk disease; AND
- **B)** Torisel will be used as a single-agent; AND
- **C)** Torisel is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Torisel has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

184. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Trastuzumab Products

- Herceptin® (trastuzumab intravenous infusion – Genentech, Inc.)
- Herzuma® (trastuzumab-pkrb injection for intravenous infusion – Celltrion)
- Ogivri™ (trastuzumab-dkst injection for intravenous infusion – Mylan)
- Ontruzant® (trastuzumab-dttb injection for intravenous infusion – Merck)
- Trazimera™ (trastuzumab-qyyp injection for intravenous infusion – Pfizer)
- Kanjinti™ (trastuzumab-anns injection for intravenous infusion – Amgen)

DATE REVIEWED: 06/10/2020

OVERVIEW

Herceptin is indicated for adjuvant treatment of human epidermal growth factor receptor 2 (HER2) overexpressing node positive or node negative (estrogen receptor [ER]/progesterone receptor [PR] negative or with one high risk feature) breast cancer 1) as part of a treatment regimen consisting of doxorubicin, cyclophosphamide, and either paclitaxel or docetaxel; 2) with docetaxel and carboplatin; or 3) as a single agent following multi-modality anthracycline based therapy.[1] Herceptin is also indicated for the treatment of HER2 overexpressing metastatic breast cancer, either in combination with paclitaxel for first-line treatment, or as a single agent in patients who have received one or more chemotherapy regimens. In addition, Herceptin is indicated, in combination with cisplatin and capecitabine or 5-fluorouracil (5-FU), for the treatment of patients with HER2 overexpressing metastatic gastric or gastroesophageal (GE) junction adenocarcinoma, who have not received prior treatment for metastatic disease. For all indications, patients must be selected for therapy based on an FDA-approved companion diagnostic for Herceptin. Tests are specific for breast cancer or gastric cancer.

Guidelines

The National Comprehensive Cancer Network (NCCN) breast cancer guidelines (version 4.2020 – May 8, 2020) recommend trastuzumab in combination with chemotherapy and endocrine therapy for adjuvant treatment of HER2-positive breast cancer (category 1).[2] Perjeta® (pertuzumab intravenous injection) can also be added to this treatment regimen (category 2A). The preferred first-line agents for HER2-positive *recurrent or metastatic disease* (either hormone receptor-negative or hormone receptor-positive and refractory to endocrine therapy) include: Perjeta plus trastuzumab plus docetaxel (category 1) or paclitaxel (category 2A). The guidelines list other trastuzumab-containing regimens for HER2-positive metastatic disease.

The NCCN clinical practice guidelines on gastric cancer (version 2.2020 – May 13, 2020) and on esophageal and esophagogastric junction cancers (version 2.2020 – May 13, 2020) state that for metastatic or locally advanced disease (where local therapy is not indicated) trastuzumab should be added to first-line systemic chemotherapy for HER2-overexpressing adenocarcinoma.[3,4] The recommended regimens for metastatic or locally advanced HER2-positive gastric, esophageal, or esophagogastric junction adenocarcinoma are trastuzumab in combination with cisplatin and a fluoropyrimidine (5-FU or capecitabine) [category 1] or trastuzumab in combination with other chemotherapy agents (category 2B) [various regimens based on individual patient variability]. Trastuzumab is not recommended for use in combination with anthracyclines.

Uterine serous carcinoma is a rare, aggressive histology of endometrial cancer. The NCCN guidelines for uterine neoplasms (version 1.2020 – March 6, 2020) lists the combination chemotherapy regimen of carboplatin/paclitaxel/trastuzumab as one of the recommended therapies for patients with HER2-positive uterine serous carcinoma (category 2A).[6]

The NCCN Compendium recommends use of trastuzumab for endometrial carcinoma and rectal or colon cancer.[5]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of trastuzumab products. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with trastuzumab products, as well as the monitoring required for adverse events and long-term efficacy, approval requires trastuzumab products to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of trastuzumab products is recommended in those who meet the following criteria:

FDA-Approved Indications

35. Breast Cancer. Approve if the patient meets the following criteria (A, B, and C):
- **A)** The medication is prescribed by or in consultation with an oncologist; AND
- **B)** The patient has human epidermal growth factor receptor 2 (HER2)-positive disease; AND
- **C)** The patient meets ONE of the following criteria (i or ii):

  i. Approve for 1 year (total) if trastuzumab is used for neoadjuvant (preoperative)/adjuvant therapy; OR

  ii. Approve for 1 year if trastuzumab is used for recurrent or metastatic disease.

36. Gastric, Esophageal, or Gastroesophageal Junction Cancer. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** The medication is prescribed by or in consultation with an oncologist; AND
- **B)** The patient has human epidermal growth factor receptor 2 (HER2)-positive locally advanced or metastatic disease; AND
- **C)** Trastuzumab will be used first-line in combination with chemotherapy.
  Note: Examples of chemotherapy are cisplatin, oxaliplatin, capecitabine, 5-fluorouracil (5-FU).

Other Uses with Supportive Evidence

3. Endometrial Carcinoma. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** The medication is prescribed by or in consultation with an oncologist; AND
- **B)** The patient has human epidermal growth factor receptor 2 (HER2)-positive advanced or recurrent uterine serous carcinoma; AND
- **C)** Trastuzumab will be used in combination with chemotherapy.
  Note: Examples of chemotherapy are carboplatin, paclitaxel.

4. Colon or Rectal Cancer. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** The medication is prescribed by or in consultation with an oncologist; AND
- B) The patient has human epidermal growth factor receptor 2 (HER2)-positive disease; AND
- **C)** The medication is used in combination with Perjeta® (pertuzumab for injection) or Tykerb® (lapatinib tablets).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Trastuzumab has not been shown to be effective or there are limited or preliminary data that are not supportive of general approval for the following conditions.

11. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Trodelvy™ (sacituzumab govitecan-hziy injection for intravenous use – Immunomedics, Inc.)

DATE REVIEWED: 04/23/2020

OVERVIEW

Trodelvy, a Trop-2-directed antibody and topoisomerase inhibitor conjugate, is indicated for the treatment of adult patients with metastatic triple-negative breast cancer (mTNBC) who have received at least two prior therapies for metastatic disease.[1] This indication is approved under accelerated approval based on

tumor response rate and duration of response. Continued approval for this indication maybe contingent upon verification and description of clinical benefit in trials.

Guidelines

Trodelvy is not addressed in the guidelines. According to the National Comprehensive Cancer Network (NCCN) breast cancer guidelines (version 3.2020 – March 6, 2020), systemic therapy options for metastatic disease include a variety of chemotherapy agents such as carboplatin or cisplatin (specified for TNBC and germline BRCA 1/2 mutation), Tecentriq (atezolizumab for injection) + Abraxane (albumin-bound paclitaxel for injection) [for programmed death ligand-1 {PD-L1} expression ≥ 1%], paclitaxel, cyclophosphamide, doxorubicin, Doxil (liposomal doxorubicin for injection), capecitabine, gemcitabine, docetaxel, epirubicin, vinorelbine, eribulin.[2] Single agents are preferred; however, chemotherapy combinations may be used in patients with high tumor burden, rapidly progressing disease, and visceral crisis.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Trodelvy. All approvals are provided for the duration noted below. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Trodelvy, as well as the monitoring required for adverse events and long-term efficacy, approval requires Trodelvy to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Trodelvy is recommended in those who meet the following criteria:

FDA-Approved Indications

37. Breast Cancer. Approve for 1 year if the patient meets ALL of the criteria (A, B, C, and D):
- **A)** The patient is ≥ 18 years of age; AND
- **B)** The patient has metastatic triple-negative breast cancer; AND
- **C)** The patient has been previously treated with at least two systemic therapy regimens for metastatic disease.
  Note: Examples are cisplatin, carboplatin, doxorubicin, cyclophosphamide, paclitaxel, docetaxel, capecitabine, gemcitabine, ixabepilone, vinorelbine, eribulin, epirubicin, Doxil (liposomal doxorubicin for injection), Tecentriq (atezolizumab for injection) + Abraxane (albumin-bound paclitaxel for injection); AND
- **D)** The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Trodelvy has not been shown to be effective or there are limited or preliminary data that are not supportive of general approval for the following conditions.

12. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

30. The NCCN Breast Cancer Clinical Practice Guidelines in Oncology (Version 3.2020 – March 6, 2020). © 2020 National Comprehensive Cancer Network, Inc. Available at: http://www.nccn.org. Accessed on April 22, 2020.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Vectibix Prior Authorization Policy
- Vectibix® (panitumumab solution for intravenous infusion – Amgen Inc.)

REVIEW DATE: 07/22/2020

OVERVIEW
Vectibix, an epidermal growth factor receptor monoclonal antibody, is indicated for the treatment of wild-type *RAS* (defined as wild-type in both KRAS and NRAS as determined by an FDA-approved test for this use) metastatic colorectal cancer (mCRC) as a) first-line therapy in combination with FOLFOX (5-fluorouracil [5-FU], leucovorin, oxaliplatin) or b) monotherapy following disease progression after prior treatment with fluoropyrimidine-, oxaliplatin-, and irinotecan-containing chemotherapy.[1] It is a limitation of use that Vectibix is not indicated for the treatment of patients with *RAS*-mutant mCRC or for whom *RAS* mutation status is unknown.

Guidelines
Colon Cancer

The National Comprehensive Cancer Network (NCCN) colon cancer guidelines (version 4.2020 – June 15, 2020) recommend Vectibix as primary therapy for unresectable, advanced, or metastatic *KRAS/NRAS/BRAF* wild-type gene and left-sided tumors only in combination with irinotecan, FOLFOX, FOLFIRI (5-FU, leucovorin, irinotecan), or FOLFOXIRI (5-FU, leucovorin, oxaliplatin, irinotecan) regimens in patients who can tolerate intensive therapy or as a single agent in patients who cannot tolerate intensive therapy.[2,4] Reference to left-sided only disease refers to a primary tumor that originated in the left side of the colon and only refers to use of Vectibix as first-line therapy for metastatic disease. Therapies recommended after first progression vary depending on the initial treatment regimen (i.e., 5-FU/leucovorin-based or capecitabine-based therapy) that was used. The NCCN guidelines recommend Vectibix, in combination with irinotecan, FOLFOX, or FOLFIRI for the subsequent treatment of *KRAS/NRAS/BRAF* wild-type tumors; or in combination with Braftovi (encorafenib capsules) for the subsequent treatment of *BRAF V600E* positive disease. The NCCN rectal cancer guidelines (version 6.2020 – June 25, 2020) make the same recommendations for Vectibix for the treatment of rectal cancer.[3,4]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Vectibix. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Vectibix as well as the monitoring required for adverse events and long-term efficacy, approval requires Vectibix to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Vectibix is recommended in those who meet the following criteria:

FDA-Approved Indications

32. Colon and Rectal Cancer. Approve for 1 year if the patient meets the following criteria (A, B, C, D, and E):

- **A)** Patient has advanced or metastatic disease; AND
- **B)** Patient's tumor or metastases are wild-type *RAS* (*KRAS* wild-type and/or *NRAS* wild-type) [that is, the tumor or metastases are *KRAS* and/or *NRAS* mutation negative]; AND
- **C)** If Vectibix is being used for first-line treatment, the primary tumor originated on the left side of the colon (from splenic flexure to rectum); AND
- **D)** Patient meets ONE of the following criteria (i or ii):
  - **i.** Patient's tumor or metastases are wild-type *BRAF* (that is, the tumor or metastases are *BRAF V600E* mutation negative); OR
  - **ii.** Patient's tumor or metastases are *BRAF V600E* mutation-positive and the patient meets the following (a and b):
    - **a)** Patient has previously received a chemotherapy regimen for colon or rectal cancer; AND
      Note: Examples of chemotherapy regimens include a fluoropyrimidine such as 5-fluorouracil (5-FU), capecitabine, oxaliplatin, irinotecan, or an adjunctive chemotherapy regimen such as FOLFOX (5-FU, leucovorin, and oxaliplatin) or CapeOX (capecitabine and oxaliplatin).
    - **b)** Vectibix is prescribed in combination with Braftovi (encorafenib capsules).
- **E)** Vectibix is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Vectibix is not recommended in the following situations:

185. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Vyxeos (daunorubicin and cytarabine liposome for injection – Jazz Pharmaceuticals)

REVIEW DATE: 10/16/2019

OVERVIEW

Vyxeos is a liposomal combination of daunorubicin, an anthracycline topoisomerase inhibitor, and cytarabine, a nucleoside metabolic inhibitor, is indicated for the treatment of adults with newly-diagnosed therapy-related acute myeloid leukemia (AML) or AML with myelodysplasia-related changes.[1]

Guidelines

The National Comprehensive Cancer Network guidelines for acute myeloid leukemia recommend Vyxeos for induction and post-remission therapy for patients with therapy-related AML, antecedent myelodysplastic syndrome/chronic myelomonocytic leukemia, and AML with myelodysplasia-related changes.[2,3]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Vyxeos. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Vyxeos as well as the monitoring required for adverse events and long-term efficacy, approval requires Vyxeos to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Vyxeos is recommended in those who meet the following criteria:

FDA-Approved Indications

224. Acute Myeloid Leukemia. Approve for 6 months if the patient meets the following criteria (A, B, and C):
- **A)** The patient is ≥ 18 years of age; AND
- **B)** The patient meets one of the following (i or ii):
  - **i.** The patient has therapy-related acute myeloid leukemia; OR
  - **ii.** The patient has secondary acute myeloid leukemia.
    (Note: Examples include antecedent myelodysplastic syndrome/chronic myelomonocytic leukemia and acute myeloid leukemia with myelodysplasia-related changes); AND
- **C)** Vyxeos is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Vyxeos has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

186. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Yervoy® (ipilimumab injection for intravenous use – Bristol-Myers Squibb)

REVIEW DATE: 09/25/2019

OVERVIEW

Yervoy, a human cytotoxic T-lymphocyte antigen 4 (CTLA-4)-blocking antibody, is indicated for the following conditions:

1) Unresectable or metastatic melanoma in adults and pediatric patients (≥ 12 years).
2) Adjuvant treatment of patients with cutaneous melanoma with pathologic involvement of regional lymph nodes of > 1 mm who have undergone complete resection, including total lymphadenectomy.
3) In combination with Opdivo® (nivolumab for intravenous injection) for the treatment of patients with intermediate or poor risk, previously untreated advanced renal cell carcinoma (RCC).
4) In combination with Opdivo for the treatment of adult and pediatric patients ≥ 12 years of age with microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR) metastatic colorectal

cancer (CRC) that has progressed following treatment with a fluoropyrimidine, oxaliplatin, and irinotecan.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) Compendium recommends Yervoy for the following indications: melanoma (uveal, cutaneous, and brain metastases), small bowel adenocarcinoma, kidney cancer, small cell lung cancer, malignant pleural mesothelioma, colon and rectal cancer, and non-small cell lung cancer (NSCLC).[2] The indication for NSCLC is not addressed below since it is for activity against tumor mutational burden (TMB) in combination with Opdivo. The NCCN NSCLC guidelines note TMB as an evolving biomarker that may be helpful in selecting patients for immunotherapy.[3] There is no consensus on how to measure TMB.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Yervoy. Because of the specialized skills required for evaluation and diagnosis of patients treated with Yervoy as well as the monitoring required for adverse events and long-term efficacy, approval requires the medication to be prescribed by or in consultation with a prescriber who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Yervoy is recommended in those who meet the following criteria:

FDA-Approved Indications

20. Colon or Rectal Cancer, Microsatellite Instability-High (MSI-H) or Mismatch Repair Deficient (dMMR). Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- **A)** The patient is 12 years of age or greater; AND
- **B)** The patient meets ONE of the following criteria (i or ii):
  - **i.** The patient has tried chemotherapy.
    Note: Examples of chemotherapy are fluoropyrimidine such as 5-fluorouracil [5-FU], capecitabine~~,~~ oxaliplatin, irinotecan, or an adjunctive chemotherapy regimen such as FOLFOX [5-FU, leucovorin, and oxaliplatin] or CapeOX [capecitabine and oxaliplatin]); OR
  - **ii.** The patient has unresectable or metastatic disease and is not a candidate for intensive therapy, according to the prescriber; AND
- **C)** The medication will be used in combination with Opdivo (nivolumab intravenous injection); AND
- **D)** The medication is prescribed by or in consultation with an oncologist.

21. Melanoma [Note: This includes cutaneous melanoma, brain metastases due to melanoma, and uveal melanoma]. Approve if the patient meets ALL of the following (A, B, and C):
- **A)** The patient is 12 years of age or greater; AND
- **B)** The patient meets ONE of the following (i or ii):
  - **i.** Approve for 4 months if the patient has unresectable or metastatic melanoma; OR
  - **ii.** Approve for 1 year if Yervoy will be used as adjuvant treatment.
    Note: For example, in patients with cutaneous melanoma who have undergone complete resection, including total lymphadenectomy; AND
- **C**) The medication is prescribed by or in consultation with an oncologist.

22. Renal Cell Carcinoma. Approve for 4 months if the patient meets the following criteria (A, B, and C):
- **K)** The patient has advanced (e.g., relapsed, Stage IV, metastatic) disease; AND
- **L)** The medication will be used in combination with Opdivo (nivolumab for intravenous injection); AND
- **M)** The medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

4. Small Cell Lung Cancer. Approve for 1 year if the patient meets all of the following (A, B, and C):
- **C)** The patient has tried at least one other systemic chemotherapy regimen within the past 6 months.
  Note: Examples of chemotherapy are cisplatin and etoposide, carboplatin and etoposide; AND
- **D)** The medication will be used in combination with Opdivo (nivolumab for intravenous injection); AND
- **C)** The medication is prescribed by or in consultation with an oncologist.

5. Malignant Pleural Mesothelioma. Approve for 1 year if the patient meets the following (A, B, and C):
A) The patient has tried at least one other chemotherapy regimen.
Note: Examples of chemotherapy are cisplatin, gemcitabine, Alimta (pemetrexed for injection), carboplatin, bevacizumab; AND
B) The medication will be used in combination with Opdivo (nivolumab for intravenous injection); AND
C) The medication is prescribed by or in consultation with an oncologist.

6. Small Bowel Adenocarcinoma, Microsatellite Instability-High (MSI-H) or Mismatch Repair Deficient (dMMR). Approve for 1 year if the patient meets the following (A, B, and C):
A) The patient has advanced or metastatic disease; AND
B) The medication will be used in combination with Opdivo (nivolumab for intravenous injection); AND
C) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Yervoy has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

90. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Yescarta® (axicabtagene ciloleucel suspension for intravenous infusion – Kite Pharma)

DATE REVIEWED: 04/29/2020

OVERVIEW

Yescarta, a CD19-directed genetically modified autologous T cell immunotherapy, is indicated for the treatment of adult patients with relapsed or refractory large B-cell lymphoma after two or more lines of systemic therapy, including diffuse B-cell lymphoma (DLBCL) not otherwise specified, primarily mediastinal large B-cell lymphoma, high-grade B-cell lymphoma, and DLBCL arising from follicular lymphoma.[1] Yescarta has a Boxed Warning regarding cytokine release syndrome (CRS) and neurological toxicities. Due to these risks, Yescarta is only available through a restricted program under a Risk Evaluation and Mitigation Strategy (REMS) called Yescarta REMS.[1]

Yescarta is supplied as an infusion bag containing approximately 68 mL of frozen suspension of genetically modified autologous T cells in 5% DMSO and 2.5% albumin (human).[1] Yescarta is stored in the vapor phase of liquid nitrogen (less than or equal to minus 150°C) and supplied in a liquid nitrogen dry shipper.

Clinical Efficacy

The efficacy of Yescarta was established in one single-arm, open-label, Phase II, multicenter trial that included adult patients with relapsed or refractory aggressive B-cell non-Hodgkin lymphoma (NHL) [ZUMA-1].[1-2] Yescarta was given as a single infusion after lymphodepleting chemotherapy. In total, 101 of 111 patients who underwent leukapheresis received Yescarta and most (76%) had DLBCL, 16% of patients had transformed follicular lymphoma, and 8% of patients had primary mediastinal large B-cell lymphoma. The median number of prior therapies was three. The median dose was 2.0×10^6 CAR-positive viable T cells.[1-2]

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for B-cell lymphoma (version 1.2020 – January 22, 2020) recommend Yescarta for the treatment of a variety of B-cell lymphomas in patients with relapsed or refractory disease and after at least two chemotherapy regimens.[3,4] Recommended indications include DLBCL which transformed from follicular lymphoma or nodal marginal zone lymphoma, DLBCL, primary mediastinal large B-cell lymphoma, high-grade B-cell lymphoma, AIDS-related B-cell lymphoma, human herpes virus 8 (HHV8)-positive DLBCL, and post-transplant lymphoproliferative disorders (category 2A).

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Yescarta. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Yescarta as well as the monitoring required for adverse events and long-term efficacy, approval requires Yescarta to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Yescarta is recommended in those who meet the following criteria:

FDA-Approved Indications

33. B-Cell Lymphoma. Approve a single dose if the patient meets the following criteria (A, B, C, D, E, and F):

C) The patient meets one of the following diagnoses (i, ii, iii, iv, v, vi, vii, viii, or ix):

i. Large B-cell lymphoma; OR
ii. Diffuse large B-cell lymphoma; OR
iii. Primary mediastinal large B-cell lymphoma; OR
iv. High-grade B-cell lymphoma; OR
v. Diffuse large B-cell lymphoma arising from follicular lymphoma; OR
vi. Diffuse large B-cell lymphoma arising from nodal marginal zone lymphoma; OR
vii. Acquired immune deficiency syndrome (AIDS)-related B-cell lymphoma; OR
viii. Human herpes virus 8-positive diffuse large B-cell lymphoma; OR
ix. Post-transplant lymphoproliferative disorders; AND

D) The patient is ≥ 18 years of age; AND

E) Yescarta is prescribed by or in consultation with an oncologist; AND

F) Yescarta is being used for disease that is relapsed or refractory after two or more lines of systemic therapy; AND
G) The patient received lymphodepleting chemotherapy prior to Yescarta infusion; AND
H) The patient has not been previously treated with Yescarta or Kymriah® (tisagenlecleucel injection).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Yescarta has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

187. Re-treatment with Yescarta. Yescarta is for one time use, repeat dosing is not approvable.

188. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Zaltrap® (ziv-aflibercept injection for intravenous infusion – Regeneron Pharmaceuticals, Inc./Sanofi-Aventis)

REVIEW DATE: 09/25/2019

OVERVIEW

Zaltrap is a recombinant fusion protein consisting of vascular endothelial growth factor (VEGF) receptors 1 and 2 fused to the Fc portion of the human immunoglobulin G1 (IgG1).[1] Zaltrap acts as a soluble receptor that binds to human VEGF-A, VEGF-B, and placental growth factor (PIGF). By binding to these endogenous ligands, Zaltrap can inhibit the binding and activation of their cognate receptors, resulting in decreased neovascularization and decreased vascular permeability.

Zaltrap, in combination with FOLFIRI (5-fluorouracil [5-FU], leucovorin, and irinotecan), is indicated for patients with metastatic colorectal cancer (mCRC) that is resistant to or has progressed following an oxaliplatin-containing regimen.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) colon cancer guidelines (version 2.2019 – May 15, 2019)[2] and rectal cancer guidelines (version 2.2019 – May 15, 2019)[3] recommend Zaltrap as 1) primary treatment for patients with unresectable metachronous metastases and previous adjuvant FOLFOX (5-FU, leucovorin, and oxaliplatin) or CapeOX (capecitabine and oxaliplatin) regimens within the past 12 months

in combination with irinotecan OR with FOLFIRI, or 2) subsequent therapy after first progression of unresectable advanced or metastatic disease in combination with irinotecan or with FOLFIRI for disease not previously treated with an irinotecan-based regimen.[2-4] Both of these uses have a category 2A recommendation. In patients with advanced or metastatic disease, Zaltrap is not listed as an option for initial therapy. Zaltrap should not be used as adjuvant therapy for patients with Stage III or IV colon cancer outside of a clinical trial.

Zaltrap has only been effective when given with FOLFIRI in FOLFIRI naïve patients.[2-3] There are no data suggesting activity of Zaltrap plus FOLFIRI in patients who progressed on FOLFIRI plus Avastin or vice versa. No data suggest that single-agent Zaltrap has therapeutic activity. The NCCN panel includes Zaltrap as a second-line option in combination with FOLFIRI or irinotecan only after progression on therapy that does not include irinotecan. The NCCN panels on colon and rectal cancers prefer Avastin over Zaltrap and Cyramza® (ramucirumab injection for intravenous use) as an anti-angiogenic agent based on toxicity and cost.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Zaltrap. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Zaltrap as well as the monitoring required for adverse events and long-term efficacy, approval requires Zaltrap to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zaltrap is recommended in those who meet the following criteria:

FDA-Approved Indications

225. Colon and Rectal Cancer. Approve for 1 year if the patient meets the following criteria (A, B, C, D, and E):

- **47.** Zaltrap is prescribed by or in consultation with an oncologist; AND
- **48.** The patient has advanced or metastatic disease; AND
- **49.** Patient has been previously treated with an oxaliplatin- or fluoropyrimidine-containing regimen. (Note: Fluoropyrimidines include 5-fluorouracil [5-FU], capecitabine); AND
- **50.** The patient has not previously been treated with FOLFIRI. (Note: FOLFIRI includes 5-fluorouracil [5-FU], leucovorin, and irinotecan); AND
- **51.** Zaltrap will be used in combination with 5-fluorouracil (5-FU) or capecitabine and/or irinotecan.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Zaltrap has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

189. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Zepzelca Prior Authorization Policy
- Zepzelca™ (lurbinectedin injection – Jazz Pharmaceuticals)

REVIEW DATE: 07/01/2020

OVERVIEW
Zepzelca, an alkylating drug, is indicated for the treatment of metastatic small cell lung cancer in adults with disease progression on or after platinum-based chemotherapy.[1]

Guidelines
The National Comprehensive Cancer Network (NCCN) Small Cell Lung Cancer guidelines recommend Zepzelca as a single agent for the treatment of relapsed disease following a complete or partial response, or stable disease with initial treatment, or for the treatment of primary progressive disease.[2,3]

POLICY STATEMENT
Prior Authorization is recommended for prescription benefit coverage of Zepzelca. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Zepzelca as well as the monitoring required for adverse events and long-term efficacy, approval requires Zepzelca to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Zepzelca is recommended in those who meet the following criteria:

FDA-Approved Indications

226. Small Cell Lung Cancer. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Patient has metastatic disease; AND
- **B)** Patient has previously received platinum-based chemotherapy; AND
  Note: Examples of platinum medications include cisplatin and carboplatin.
- **C)** Zepzelca is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Zepzelca is not recommended in the following situations:

190. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Other) – Jelmyto™ (mitomycin solution for pyelocalyceal administration – UroGen Pharma)

DATE REVIEWED: 05/20/2020

OVERVIEW

Jelmyto, an alkylating agent, is indicated for the treatment of adult patients with low-grade upper tract urothelial cancer (LG-UTUC).[1]

Dosing Information

Jelmyto is for pyelocalyceal use only.[1] The recommended dose is 4 mg/mL of mitomycin administered by ureteral catheter or a nephrostomy tube, with total instillation volume determined on volumetric measurements using pyelography, not to exceed 15 mL (60 mg of mitomycin). The dose is instilled once weekly for 6 weeks and in patients with a complete response 3 months after initiating Jelmyto, therapy can continue once a month for an additional 11 instillations.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for Bladder Cancer (Version 4.2020 – April 28, 2020) recommend Jelmyto as a primary treatment for upper urinary tract tumors.[2,3] Jelmyto is recommended following complete or near complete endoscopic resection or ablation of a low-grade, low volume, solitary tumor in patients not a candidate for or seeking definitive treatment with nephroureterectomy.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Jelmyto. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Jelmyto as well as the monitoring required for adverse events and long-term efficacy, approval requires Jelmyto to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Jelmyto is recommended in those who meet the following criteria:

FDA-Approved Indications

227. Upper Tract Urothelial Cancer, Low-Grade. Approve for 1 year if the patient meets the following criteria (A, B, C, and D):
- **A)** The patient is ≥ 18 years of age; AND
- **B)** The patient has non-metastatic disease; AND
- **C)** The patient has undergone endoscopic resection or ablation; AND
- **D)** Jelmyto is prescribed by or in consultation with an oncologist or urologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Jelmyto has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

191. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Other) – Valrubicin solution for intravesical use (Valstar – Endo Pharmaceuticals Solution, generics)

REVIEW DATE: 10/16/2019

OVERVIEW

Valrubicin (Valstar), an anthracycline topoisomerase inhibitor, is indicated for intravesical therapy of BCG-refractory carcinoma *in situ* (CIS) of the urinary bladder in patients for whom immediate cystectomy would be associated with unacceptable morbidity or mortality.[1]

Guidelines

The National Comprehensive Cancer Network guidelines for bladder cancer (Version 4.2019 – July 10, 2019) recommend intravesical valrubicin in the event of a Bacillus Calmette-Guerin (BCG) shortage and for recurrent or persistent BCG-refractory carcinoma *in situ* (Tis) disease.[2,3]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of valrubicin. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Because of the specialized skills required for evaluation and diagnosis of patients treated with valrubicin as well as the monitoring required for adverse events and long-term efficacy, approval requires valrubicin to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of valrubicin is recommended in those who meet the following criteria:

FDA-Approved Indications

228. Bladder Cancer. Approve for 2 months if the patient meets the following criteria (A, B, and C):

- **A)** The patient is ≥ 18 years of age; AND
- **B)** The patient meets one of the following (i or ii):
  - **i.** The patient has recurrent or persistent Bacillus Calmette-Guerin (BCG)-refractory carcinoma; OR
  - **ii.** According to the prescriber, valrubicin will be used due to a Bacillus Calmette-Guerin (BCG) shortage; AND
- **C)** Valrubicin is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Valrubicin has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

192. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmic for Dry Eye Disease – Cyclosporine Products Prior Authorization Policy

- Cequa™ (cyclosporine topical solution – Sun Pharmaceuticals)
- Restasis and Restasis Multidose™ (cyclosporine topical emulsion – Allergan)

REVIEW DATE: 08/19/2020

OVERVIEW

Restasis (cyclosporine topical emulsion), an immunosuppressive agent, is indicated to increase tear production in patients whose tear production is presumed to be suppressed due to ocular inflammation associated with keratoconjunctivitis sicca.[1,2] The safety and efficacy of Restasis have not been established in pediatric patients < 16 years of age.

Cequa is a topical solution of cyclosporine, with the same active ingredient and mechanism as Restasis.[3] Although Cequa is approved for patients ≥ 18 years of age per product labeling, it has the same active chemical moiety as Restasis, which is approved in patients ≥ 16 years of age.[1-3] Cequa has a novel formulation in which the hydrophobic cyclosporine molecules are encased in nanomicelles with a hydrophilic exterior.[4] This facilitates crossing of the corneal barrier and penetration of the aqueous humor to reach ocular tissues.

Other Uses with Supportive Evidence

Systemic Inflammatory Diseases

Patients with primary Sjögren syndrome have nonclassifiable systemic disease, whereas patient with secondary Sjögren syndrome have a distinct autoimmune disease such as rheumatoid arthritis, systemic lupus erythematosus, or scleroderma. A 2010 systematic review of randomized controlled trials for the treatment of primary Sjögren syndrome found topical cyclosporine to be effective for moderate or severe dry eye symptoms.[7]

Ocular Surface Diseases

There are some efficacy data to support the off-label use of topical cyclosporine in the treatment of immune-mediated ocular surface diseases such as ocular rosacea and atopic keratoconjunctivitis.[6,8-11] A review article noted that dosing of Restasis at a frequency greater than twice daily (BID) regimen may be beneficial for patients with severe dry eye disease, such as ocular graft versus host disease (GVHD), if they do not initially respond to the BID regimen.[12] Also, it has been suggested that initiation of topical cyclosporine prior to bone marrow transplantation may reduce inflammatory response in the lacrimal gland and could reduce dry eye symptoms post-transplant.

Guidelines

The American Academy of Ophthalmology (AAO) published Preferred Practice Pattern® (2018) for the treatment of dry eye syndrome.[5] The AAO classifies dry eye as mild, moderate, or severe, based on signs and symptoms of the disease. Treatment recommendations of dry eye disease are listed in a four step progression but specific therapies may be chosen from any category regardless of the level of disease severity, depending on provider experience and patient preference. Topical nonglucocorticoid immunomodulatory drugs (such as cyclosporine) are staged as a Step 2 recommendation within the guidelines. The AAO recommends the use of topical cyclosporine as one of the treatment options for Sjögren syndrome. The AAO states that topical cyclosporine may be useful in some patients with posterior blepharitis, in active ocular GVHD, and as adjunctive treatment in atopic/vernal conjunctivitis.[13-14]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Restasis and Cequa. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Restasis and Cequa is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Dry Eye Conditions due to Ocular Inflammation Associated with Keratoconjunctivitis Sicca (e.g., dry eye syndrome or dry eye disease).** Approve for 3 years if the patient is ≥ 16 years of age.

Other Uses with Supportive Evidence

2. **Dry Eye Conditions due to Systemic Inflammatory Diseases (e.g., Sjögren syndrome, rheumatoid arthritis, systemic lupus erythematosus).** Approve for 3 years if the patient is ≥ 16 years of age.

3. **Dry Eye Conditions due to Ocular Surface Diseases (e.g., ocular rosacea, atopic keratoconjunctivitis, acute corneal graft rejection, blepharitis, herpetic stromal keratitis, conjunctival graft versus host disease).** Approve for 3 years if the patient is ≥ 16 years of age.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Restasis and Cequa is not recommended in the following situations:

193. **Concomitant use with Xiidra™ (lifitegrast ophthalmic solution).** There are no data to support the concomitant use of Restasis or Cequa and Xiidra.

194. **Concomitant use of Cyclosporine Products.** There is no evidence to support additive efficacy of combining Restasis and Cequa.

195. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmic for Dry Eye Disease – Xiidra Prior Authorization Policy

- Xiidra™ (lifitegrast ophthalmic solution – Novartis)

REVIEW DATE: 08/19/2020

OVERVIEW

Xiidra, a lymphocyte function-associated antigen-1 (LFA-1) antagonist, is indicated for the treatment of the signs and symptoms of dry eye disease.[1]

Guidelines

The American Academy of Ophthalmology (AAO) published Preferred Practice Pattern® (2018) for the treatment of dry eye syndrome.[2] The AAO classifies dry eye as mild, moderate, or severe, based on signs and symptoms of the disease. Treatment recommendations of dry eye disease are listed in a four step progression but specific therapies may be chosen from any category regardless of the level of disease severity, depending on provider experience and patient preference. Topical LFA-1 antagonist drugs (such as lifitegrast) are staged as a Step 2 recommendation within the guidelines.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Xiidra. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Xiidra is recommended in those who meet the following criteria:

FDA-Approved Indications

145. Dry Eye Disease (e.g., dry eye syndrome). Approve for 3 years if the patient is ≥ 18 years of age.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Xiidra is not recommended in the following situations:

196. Concomitant use with an ophthalmic cyclosporine product (Restasis®, Cequa™). There are no data to support the concomitant use of Restasis or Cequa and Xiidra.

197. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

- Xelpros™ (latanoprost 0.005% ophthalmic emulsion – Sun Pharmaceuticals)
- Zioptan® (tafluprost 0.0015% ophthalmic solution – Merck)

REVIEW DATE: 04/22/2020

OVERVIEW

Ophthalmic prostanoids include prostaglandin analogues (latanoprost, travoprost 0.004% ophthalmic solution (generic to Travatan Z), Vyzulta, and Zioptan,) and prostamides (Lumigan and bimatoprost 0.03% [generic to discontinued Lumigan 0.03%]). All of the ophthalmic products included in this policy are single-entity products, except Rocklatan, which contains netarsudil, a Rho kinase inhibitor, and latanoprost. All of these are indicated for the reduction of elevated intraocular pressure (IOP) in patients with open angle glaucoma or ocular hypertension.[1-8] Bimatoprost 0.03% ophthalmic solution is also marketed as Latisse®, indicated to treat hypotrichosis of the eyelashes by increasing their growth including length, thickness, and darkness.[9] (Note: Latisse is not included in this PA Policy).

Glaucoma, a disease that damages the eye's optic nerve, is the leading cause of blindness in people > 60 years old.[10] Reduction of IOP, regardless of the pretreatment IOP, reduces the risk of disease progression.[11] In addition, IOP reduction may prevent the onset to early glaucoma in patients with ocular hypertension.

Normal-tension glaucoma is a form of open-angle glaucoma (OAG) characterized by glaucomatous optic neuropathy in patients with IOP measurements consistently < 21 mmHg.[12] According to the Glaucoma Research Foundation, normal-tension glaucoma is also referred to as low-tension glaucoma or normal-pressure glaucoma.[13] Additionally, the American Academy of Ophthalmology (AAO) guidelines on primary open-angle glaucoma include normal-tension glaucoma in the recommendations for care, stating that lowering IOP reduces the risk of developing primary open-angle glaucoma and slows the progression of primary open-angle glaucoma, including normal-tension open-angle glaucoma.[11]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of ophthalmic prostaglandins. An age edit for patients < 60 years of age is used to monitor for appropriate use and to screen for cosmetic use. Prescription benefit coverage of these products for cosmetic conditions is not recommended. All approvals are provided for 3 years unless otherwise noted below. Prior authorization and prescription benefit coverage is not recommended for Latisse.

Automation: If the patient is < 60 years of age and does not have a history of one ophthalmic glaucoma agent within the 130-day look-back period, coverage will be determined by prior authorization criteria.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of ophthalmic prostaglandins is recommended in those who meet the following criteria:

FDA-Approved Indication

38. **Reduction of Intraocular Pressure (IOP) in Patients with Open Angle Glaucoma or Ocular Hypertension.** Approve.
    Note: Open angle glaucoma includes normal-tension glaucoma, which is also referred to as low-tension glaucoma or normal-pressure glaucoma.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of the ophthalmic prostaglandins is not recommended in the following circumstances. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

91. **Cosmetic Conditions** (e.g., eyelash growth). Cosmetic use is not recommended for coverage as this indication is excluded from coverage in a typical pharmacy benefit.

92. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Durysta™ (bimatoprost implant, for intracameral administration – Allergan)

REVIEW DATE: 04/22/2020

OVERVIEW

Durysta, a prostaglandin analog, is indicated for the reduction of intraocular pressure (IOP) in patients with open-angle glaucoma or ocular hypertension.[1]

Glaucoma, a disease that damages the eye's optic nerve, is the leading cause of blindness in people > 60 years of age.[2] Reduction of IOP, regardless of the pretreatment IOP, reduces the risk of disease progression.[3] In addition, IOP reduction may prevent the onset of early glaucoma in patients with ocular hypertension.

Ophthalmic prostaglandins, beta-blockers, alpha-agonist (brimonidine), carbonic anhydrase inhibitors, rho kinase inhibitor (netarsudil), and fixed combination products are used to treat glaucoma.[3,4] The choice of product is influenced by potential cost, adverse event profile, dosing schedule, and the degree of pressure lowering needed.[3]

Dosing Considerations

Durysta, a biodegradable implant, is given as a single intracameral administration.[1] Durysta should not be re-administered to an eye that was previously treated with Durysta.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Durysta. Because of the specialized skills required for evaluation and diagnosis of patients treated with Durysta, as well as the monitoring required for adverse events and long-term efficacy, approval requires Durysta to be prescribed by, or in consultation with, a physician who specializes in the condition being treated. All approvals are provided for one implant per treated eye (i.e., one implant per treated eye; maximum of two implants per patient). Note that a 1-month (30 days) approval duration is applied to allow for the one-time treatment of one or both eye(s).

Automation: None

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Durysta is recommended in those who meet the following criteria:

FDA-Approved Indications

6. **Reduction of Intraocular Pressure (IOP) in Patients with Open-Angle Glaucoma or Ocular Hypertension.** Approve for a one-time use in each treated eye (i.e., one implant per treated eye; a total of two implants per patient) if the patient meets ALL of the following criteria (A, B, C, D, and E):

A) The patient is ≥ 18 years of age; AND
B) The patient is not receiving re-treatment of eye(s) previously treated with Durysta; AND
C) The patient meets the following criteria (i and ii):
- **i.** The patient has tried at least two ophthalmic prostaglandins (either as monotherapy or as concomitant therapy) for the treatment of open-angle glaucoma or ocular hypertension.
  Note: Examples of ophthalmic prostaglandins include bimatoprost 0.03% ophthalmic solution, latanoprost 0.005% ophthalmic solution, travoprost 0.004% ophthalmic solution; Lumigan® (bimatoprost 0.01% ophthalmic solution), Vyzulta® (latanoprostene bunod 0.024% ophthalmic solution), Xelpros™ (latanoprost 0.005% ophthalmic emulsion), and Zioptan® (tafluprost 0.0015% ophthalmic solution); AND
- **ii.** The patient has tried at least two ophthalmic products (either as monotherapy or as concomitant therapy) from two different pharmacological classes for the treatment of open-angle glaucoma or ocular hypertension.
  Note: Examples of pharmacological classes of ophthalmic products for the treatment of open-angle glaucoma or ocular hypertension include beta-blockers, alpha-agonist (brimonidine), carbonic anhydrase inhibitors, and rho kinase inhibitor (netarsudil); AND

D) For each of the ophthalmic medications that were tried, the patient meets ONE of the following criteria (i or ii):
- **i.** The patient has had inadequate efficacy to the previously-tried ophthalmic products, according to the prescriber; OR
- **ii.** The patient has experienced adverse event(s) severe enough to warrant discontinuation of the previously-tried ophthalmic products, according to the prescriber; AND

E) Durysta is prescribed by, or in consultation with, an ophthalmologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Durysta has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

198. Re-Treatment of Previously-Treated Eye(s). Durysta is approved for a one-time use in each treated eye. Repeat administration in previously treated eye(s) is not approvable.

199. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Luxturna™ (voretigene neparvovec-rzyl intraocular suspension for subretinal injection – Spark Therapeutics)

REVIEW DATE: 02/19/2020

OVERVIEW

Luxturna, an adeno-associated virus vector-based gene therapy, is indicated for the treatment of patients with confirmed biallelic human retinal pigment epithelial 65 kDa protein (RPE65) mutation-associated retinal dystrophy.[1] Patients must have viable retinal cells as determined by the treating physician(s). Luxturna is made up of a live, non-replicating adeno-associated virus serotype 2 (AAV2) which has been genetically modified to express the human RPE65 gene. Luxturna is designed to deliver a normal copy of the gene encoding RPE65 to cells of the retina in patients with reduced or absent levels of biologically active RPE65.

The recommended dose of Luxturna for each eye is 1.5×10^{11} vector genomes (vg) administered once per eye by subretinal injection.[1] After completing a vitrectomy (removal of the vitreous gel that fills the eye cavity) and under direct visualization, a small amount of Luxturna is injected slowly until an initial subretinal bleb is observed; the remaining volume is then injected slowly until the total 0.3 mL is delivered. Luxturna should be injected into each eye on separate days within a close interval, but no less than 6 days apart. Luxturna is not recommended for patients < 12 months of age, because the retinal cells are still undergoing cell proliferation, and Luxturna would potentially be diluted or lost during cell proliferation. Luxturna is available as a single-dose vial containing 0.5 mL (extractable volume) of a 5×10^{12} vg/mL concentration of Luxturna, which requires a 1:10 dilution prior to administration with the supplied diluent.

Disease Overview

Inherited retinal dystrophies (IRDs) are a broad group of genetic retinal disorders that are associated with progressive visual dysfunction.[2] RPE65 mutation-associated retinal dystrophy is associated with at least 125 discrete gene mutations and affects 1,000 to 2,000 patients in the US.[2,3] Mutations in the RPE65 gene lead to reduced or absent levels of RPE65 isomerohydrolase activity.[1] The absence of RPE65 blocks the visual cycle. This leads to the accumulation of toxic precursors, damage to RPE-producing cells, and, over time, damage to photoreceptors, progressing to near total blindness in most patients. The deficiency in the RPE65 protein mainly affects rod photoreceptors that mediate peripheral vision and night vision.[3] The retinal anatomy is preserved for a relatively long period, and supplying the missing enzyme can result in restoration of the visual cycle and improvement in vision. Injection of Luxturna into the subretinal space results in transduction of some retinal pigment epithelial cells with a complementary deoxyribonucleic acid (cDNA) encoding normal human RPE65 protein, thereby providing the potential to restore the visual cycle.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Luxturna. Because of the of the specialized skills required for evaluation and diagnosis of patients treated with Luxturna as well as the specialized training required for administration of Luxturna, approval requires Luxturna to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for one injection per eye. Note that a 1-month (30 days) approval duration is applied to allow for the one-time treatment of both eyes.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Luxturna is recommended in those who meet the following criteria:

FDA-Approved Indications

3. **Biallelic Human Retinal Pigment Epithelial 65 kDa Protein (RPE65) Mutation-Associated Retinal Dystrophy.** Approve for one-time treatment course (i.e., a total of two injections, one injection in each eye) if the patient meets the following criteria (A, B, C, and D):
   - **G)** According to the prescribing physician, the patient has a genetically-confirmed diagnosis of biallelic RPE65 mutation-associated retinal dystrophy; AND
   - **H)** Patient is ≥ 12 months of age; AND
   - **I)** Luxturna is administered by a retinal specialist; AND
   - **J)** Patient must have viable retinal cells as determined by the treating physician; AND
   - **K)** Patient is not receiving re-treatment of eye(s) previously treated with Luxturna.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Luxturna has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

93. Re-treatment of previously treated eye(s). Luxturna is for one time use in each eye. Repeat dosing in previously treated eye(s) is not approvable.

94. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Oxervate™ (cenegermin-bkbj ophthalmic solution – Dompé farmaceutici S.p.A)

REVIEW DATE: 11/06/2019

OVERVIEW

Oxervate, a recombinant human nerve growth factor, is indicated for the treatment of neurotrophic keratitis.[1] Oxervate was designated as a Breakthrough Therapy and an Orphan Drug by the FDA.[2,3]

Disease Overview

Neurotrophic keratitis, a rare degenerative disease, is characterized by corneal epithelium breakdown, impairment of corneal healing, and development of corneal ulceration, melting, and perforation.[2,4,5] Corneal epithelial cells release various neurotrophic growth factors, including nerve growth factors, which are important in maintaining the integrity and function of the ocular surface and in stimulating both epithelial and nerve fiber proliferation and survival.[6,7] When corneal sensory innervation is impaired, reduction of both protective reflexes and trophic neuromodulators essential for the vitality, metabolism, and wound healing of the ocular surface tissues results. *In vivo* studies have shown that increasing nerve growth factor concentration after injury can accelerate healing.[4,7]

Guidelines/Recommendations

Prior to the approval of Oxervate, there are no approved pharmacologic therapies for the treatment of neurotrophic keratitis.[2] If neurotrophic keratitis is left untreated, the condition can progress to anatomical loss of the eye; even with treatment, loss of vision is common.[6] Current treatment options are supportive and do not improve the speed of healing. Treatment should target corneal sensory innervation impairment to restore corneal integrity; treatment goals are to stop progression and reverse damage from neurotrophic keratitis.

Regardless of disease severity/stage, all topical medications should be discontinued to avoid topical drug toxicity on the corneal epithelium.[4,5] Additionally, preservative-free artificial tears should be used to improve lubrication. Prophylactic topical antibiotics can be considered to prevent superinfections. Associated ocular surface disease, such as exposure keratitis, dry eye, or limbal stem cell deficiency, should be treated to improve the prognosis of neurotrophic keratitis. Therapeutic contact lenses can be used to promote corneal healing.[7] Surgical interventions are reserved for refractory cases.[4,5,7]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Oxervate. Because of the specialized skills required for evaluation and diagnosis of patients treated with Oxervate as well as the monitoring required for adverse events and long-term efficacy, approval requires Oxervate to be prescribed by, or in consultation with, a physician who specializes in the condition being treated. All approvals are provided for 1 year in duration unless otherwise noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Oxervate is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Neurotrophic keratitis.** Approve for 2 months if Oxervate is prescribed by, or in consultation with, an ophthalmologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Oxervate has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

9. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Tepezza™ (teprotumumab injection for intravenous use – Horizon Therapeutics)

REVIEW DATE: 01/29/2020

OVERVIEW

Tepezza, an insulin-like growth factor-1 receptor (IGF-1R) antagonist antibody, is indicated for the treatment of patients with thyroid eye disease (TED).[1] The safety and efficacy have not been established in patients who are pregnant or pediatric patients. Tepezza is a fully human immunoglobulin G monoclonal antibody that binds IGF-1R, a tyrosine kinase cell surface receptor that is overexpressed in the orbital fibroblasts of TED patients.[2,3] Tepezza targets and binds to IGF-1R, inhibits IGF-1R autophosphorylation, decreases cell surface expression of IGF-1R and prevents downstream signaling. Based on the mechanism of action, Tepezza is theorized to decrease inflammation and tissue growth, thus reducing the signs and symptoms of TED. The recommended dose is 10 mg/kg administered by intravenous (IV) infusion for the initial dose, followed by 20 mg/kg by IV infusion administered once every 3 weeks for seven additional doses.

Disease Overview

TED is a progressive, vision-threatening autoimmune inflammatory disease of the eye and orbital tissues with predominant features of fibrosis and adipogenesis.[4] It is also recognized in literature as Graves' ophthalmopathy, Graves' orbitopathy, thyroid-associated ophthalmopathy, and thyroid orbitopathy. TED is most commonly related with Graves' disease, it can also develop in patients with other thyroid diseases (e.g., Hashimoto's thyroiditis) and has a higher prevalence in women than men (16 per 100,000 vs. 3 per 100,000, respectively).[5] Orbital fibroblasts appear responsible for soft tissue enlargement by expressing potential pathogenic autoantigens, such as thyrotropin receptor and IGF-1R.[6] Activation of orbital fibroblasts leads to increased hyaluronic acid production, proinflammatory cytokine synthesis, and enhanced differentiation into either myofibroblasts or adipocytes. These processes result in inflammation, enlargement of extraocular muscles and expansion of orbital tissue and fat, which in turn cause forward displacement of the eye, resulting in proptosis and inflammation.[4] The degree of severity can be staged as mild, moderate-to-severe, or sight-threatening, following quantitative assessment of lid aperture width, proptosis

measurement, diplopia score, degrees of abduction in eye muscle movement, examination of the cornea for evidence of exposure keratitis or ulceration, and assessment of optic nerve function.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Tepezza. All approvals are provided for the duration noted below. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Tepezza as well as the monitoring required for adverse events and long-term efficacy, approval requires Tepezza to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tepezza is recommended in those who meet the following criteria:

FDA-Approved Indications

229. Thyroid Eye Disease. (Note: Thyroid Eye Disease is also recognized as Graves' ophthalmopathy, Graves' orbitopathy, thyroid-associated ophthalmopathy, and thyroid orbitopathy.) Approve for 6 months if the patient meets the following criteria (A, B, and C):

A) The patient is ≥ 18 years of age; AND

B) According to the prescriber, the patient has been assessed as having active disease of at least moderate severity based on signs and symptoms (e.g., the degree of inflammation, degree of proptosis, presentation of diplopia, etc.); AND

C) Teppeza is prescribed by or in consultation with an ophthalmologist, endocrinologist, or a physician who specializes in thyroid eye disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Tepezza not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

200. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Upneeq Prior Authorization Policy

- Upneeq™ (oxymetazoline hydrochloride 0.1% ophthalmic solution – Osmotica/RVL Pharmaceuticals)

REVIEW DATE: 08/19/2020

OVERVIEW

Upneeq, an alpha-adrenergic agonist, is indicated for the treatment of acquired blepharoptosis in adults.[1]

Disease Overview and Clinical Efficacy

Blepharoptosis, also known as ptosis, is an abnormal low-lying upper eyelid margin, which can decrease or even completely occlude vision.[2] Two vehicle-controlled pivotal studies were conducted; results are not published at this time.[3,4] The primary outcome of change in Leicester Peripheral Field Test (a measurement of superior peripheral vision) was assessed up to Day 14. Statistically significant, but numerically small, improvements vs. vehicle were noted. As a secondary endpoint, marginal reflex distance of the upper lid (MRD_1) was assessed up to Day 42. The relative improvement in MRD_1 was statistically significant favoring Upneeq over vehicle, but the treatment difference vs. vehicle was small (approximately 0.5 mm). Both pivotal trials were 6 weeks in duration; long-term efficacy beyond 6 weeks has not been evaluated.

Guidelines

Upneeq is not addressed in guidelines. The American Academy of Ophthalmology issued a report in 2011 detailing functional indications for upper eyelid ptosis and blepharoplasty surgery.[5] Ptosis and upper eyelid blepharoplasty surgery were found to be functionally beneficial under the following circumstances:

- $MRD_1 \leq 2$ mm measured in primary gaze; or
- Superior visual field loss of 12 degrees or 24%; or
- Down-gaze ptosis impairing reading documented by $MRD_1 \leq 2$ mm measured in down gaze; or
- Self-reported functional impairment from upper eyelid droop; or
- Chin-up backward head tilt induced by visual field impairment caused by lids; or
- Interference with occupational duties and safety resulting from visual impairment caused by the upper lids; or
- Symptoms of discomfort, eye strain, or visual interference due to upper eyelid position.

POLICY STATEMENT

Due to insufficient clinical efficacy data, **approval is not recommended** for Upneeq.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

None.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Upneeq is not recommended in the following situations:

201. Blepharoptosis. Due to insufficient clinical efficacy data, approval is not recommended for Upneeq.

202. Conjunctivitis. A lower strength of oxymetazoline solution (0.025%) has been evaluated for treatment of allergic and non-infectious conjunctivitis and was previously marketed over-the-counter under the name Visine® Long Lasting (no longer marketed). Oxymetazoline solution 0.1% has not been evaluated for conjunctivitis. Other over-the-counter alpha-adrenergic agonists are available as eye drops, including Visine® (tetrahydrolozine hydrochloride 0.05%) and Naphcon-A® (naphazoline hydrochloride 0.025%).

203. Cosmetic uses. Coverage of Upneeq for cosmetic uses (i.e., blepharoptosis when functional limitation is absent) is not recommended as cosmetic uses are excluded from coverage in a typical pharmacy benefit.

204. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Vascular Endothelial Growth Factor Inhibitors – Beovu® (brolucizumab intravitreal injection – Novartis)

REVIEW DATE: 10/23/2019

OVERVIEW

Beovu, a vascular endothelial growth factor (VEGF) inhibitor, is indicated for the treatment of neovascular (wet) age-related macular degeneration (AMD).[1] The recommended dose for Beovu is 6 mg administered by intravitreal (IVT) injection every monthly (every 25 to 31 days) for the first 3 doses, followed by 6 mg IVT injection once every 8 to 12 weeks.

Other Uses with Supportive Evidence

Overproduction of VEGF may lead to other eye conditions, including neovascular glaucoma, retinopathy of prematurity, and other retinal and choroidal neovascular conditions affecting the eye, the VEGF inhibitors also have the potential to be used off-label and reduce vision loss associated with other eye conditions related to increased VEGF production.[2,3] The use of anti-VEGF agents have been shown to stop the angiogenic process and maintain visual acuity and improve vision in patients with certain neovascular ophthalmic conditions; therefore, research is rapidly evolving on the use of VEGF inhibitors in other neovascular ophthalmic conditions which threaten vision.[4,5] Anti-VEGF therapy has the potential to be used off-label in other neovascular conditions affecting the eye and may prevent or slow visual impairment.[2,4,5]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Beovu. Because of the specialized skills required for evaluation and diagnosis, the injection technique required, and the monitoring required for adverse events and long-term efficacy, approval requires Beovu to be prescribed by or in consultation with an ophthalmologist. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Beovu is recommended in those who meet the following criteria.

FDA-Approved Indications

230. Neovascular (Wet) Age-Related Macular Degeneration. Approve for 1 year if administered by or under the supervision of an ophthalmologist.

Other Uses with Supportive Evidence

231. Other Neovascular Diseases of the Eye (e.g., neovascular glaucoma, retinopathy of prematurity, sickle cell neovascularization, choroidal neovascular conditions, etc.). Approve for 1 year if administered by or under the supervision of an ophthalmologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Beovu has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

205. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Vascular Endothelial Growth Factor Inhibitors – Eylea® (aflibercept intravitreal injection – Regeneron)

REVIEW DATE DATE: 11/06/2019

OVERVIEW

Eylea, a vascular endothelial growth factor (VEGF) inhibitor, is indicated for the treatment of neovascular (wet) age-related macular degeneration, macular edema following retinal vein occlusion, diabetic macular edema, and diabetic retinopathy.[1] The recommended dose for Eylea is 2 mg administered by intravitreal injection. Frequency of the dose

does vary depending on the condition, although all conditions state some patients may need upper limit dosing of once every 4 weeks (approximately every 25 days, monthly).

Other Uses with Supportive Evidence

Overproduction of VEGF may lead to other eye conditions, including neovascular glaucoma, retinopathy of prematurity, and other retinal and choroidal neovascular conditions affecting the eye, the VEGF inhibitors also have the potential to be used off-label and reduce vision loss associated with other eye conditions related to increased VEGF production.[2,3] The use of anti-VEGF agents have been shown to stop the angiogenic process and maintain visual acuity and improve vision in patients with certain neovascular ophthalmic conditions; therefore, research is rapidly evolving on the use of VEGF inhibitors in other neovascular ophthalmic conditions which threaten vision.[4,5] Anti-VEGF therapy has the potential to be used off-label in other neovascular conditions affecting the eye and may prevent or slow visual impairment.[2,4,5]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Eylea. Because of the specialized skills required for evaluation and diagnosis, the injection technique required, and the monitoring required for adverse events and long-term efficacy, approval requires Eylea to be prescribed by or in consultation with an ophthalmologist. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Eylea is recommended in those who meet the following criteria.

FDA-Approved Indications

232. Neovascular (Wet) Age-Related Macular Degeneration. Approve for 1 year if administered by or under the supervision of an ophthalmologist.

233. Macular Edema Following Retinal Vein Occlusion. Approve for 1 year if administered by or under the supervision of an ophthalmologist.

3. Diabetic Macular Edema. Approve for 1 year if administered by or under the supervision of an ophthalmologist.

4. Diabetic Retinopathy. Approve for 1 year if administered by or under the supervision of an ophthalmologist.

Other Uses with Supportive Evidence

5. Other Neovascular Diseases of the Eye (e.g., neovascular glaucoma, retinopathy of prematurity, sickle cell neovascularization, choroidal neovascular conditions, etc.). Approve for 1 year if administered by or under the supervision of an ophthalmologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Eylea has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

206. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY (DRAFT)

POLICY: Ophthalmology – Vascular Endothelial Growth Factor Inhibitors – Lucentis® (ranibizumab intravitreal injection – Genentech)

REVIEW DATE: 11/06/2019

OVERVIEW
Lucentis, a vascular endothelial growth factor (VEGF) inhibitor, is indicated for the treatment of neovascular (wet) age-related macular degeneration (AMD), macular edema following retinal vein occlusion (RVO), diabetic macular edema (DME), diabetic retinopathy (DR), and myopic choroidal neovascularization (mCNV).[1] The recommended dose for Lucentis in DME and DR is 0.3 mg administered by intravitreal injection once every month (approximately 28 days). The recommended dose for Lucentis in wet AMD, macular edema following RVO, and mCNV is 0.5 mg administered by intravitreal injection once every month (approximately 28 days).

Other Uses with Supportive Evidence
Overproduction of VEGF may lead to other eye conditions, including neovascular glaucoma, retinopathy of prematurity, and other retinal and choroidal neovascular conditions affecting the eye, the VEGF inhibitors also have the potential to be used off-label and reduce vision loss associated with other eye conditions related to increased VEGF production.[2,3] The use of anti-VEGF agents have been shown to stop the angiogenic process and maintain visual acuity and improve vision in patients with certain neovascular ophthalmic conditions; therefore, research is rapidly evolving on the use of VEGF inhibitors in other neovascular ophthalmic conditions which threaten vision.[4,5] Anti-VEGF therapy has the potential to be used off-label in other neovascular conditions affecting the eye and may prevent or slow visual impairment.[2,4,5]

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of Lucentis. Because of the specialized skills required for evaluation and diagnosis, the injection technique required, and the monitoring required for adverse events and long-term efficacy, approval requires Lucentis to be prescribed by or in consultation with an ophthalmologist. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Lucentis is recommended in those who meet the following criteria.

FDA-Approved Indications

234. Neovascular (Wet) Age-Related Macular Degeneration. Approve for 1 year if administered by or under the supervision of an ophthalmologist.

235. Macular Edema Following Retinal Vein Occlusion. Approve for 1 year if administered by or under the supervision of an ophthalmologist.

5. Diabetic Macular Edema. Approve for 1 year if administered by or under the supervision of an ophthalmologist.

6. Diabetic Retinopathy. Approve for 1 year if administered by or under the supervision of an ophthalmologist.

7. Myopic Choroidal Neovascularization. Approve for 1 year if administered by or under the supervision of an ophthalmologist.

Other Uses with Supportive Evidence

6. Other Neovascular Diseases of the Eye (e.g., neovascular glaucoma, retinopathy of prematurity, sickle cell neovascularization, choroidal neovascular conditions, etc.). Approve for 1 year if administered by or under the supervision of an ophthalmologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Lucentis has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

207. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Vascular Endothelial Growth Factor Inhibitors – Macugen® (pegaptanib sodium intravitreal injection – Valeant)

REVIEW DATE: 11/06/2019

OVERVIEW

Macugen, a vascular endothelial growth factor (VEGF) inhibitor, is indicated for the treatment of neovascular (wet) age-related macular degeneration.[1] The recommended dose for Macugen is 0.3 mg administered by intravitreal injection once every 6 weeks.

Other Uses with Supportive Evidence

Overproduction of VEGF may lead to other eye conditions, including neovascular glaucoma, retinopathy of prematurity, and other retinal and choroidal neovascular conditions affecting the eye, the VEGF inhibitors also have the potential to be used off-label and reduce vision loss associated with other eye conditions related to increased VEGF production.[2,3] The use of anti-VEGF agents have been shown to stop the angiogenic process and maintain visual acuity and improve vision in patients with certain neovascular ophthalmic conditions; therefore, research is rapidly evolving on the use of VEGF inhibitors in other neovascular ophthalmic conditions which threaten vision.[4,5] Anti-VEGF therapy has the potential to be used off-label in other neovascular conditions affecting the eye and may prevent or slow visual impairment.[2,4,5]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Macugen. Because of the specialized skills required for evaluation and diagnosis, the injection technique required, and the monitoring required for adverse events and long-term efficacy, approval requires Macugen to be prescribed by or in consultation with an ophthalmologist. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Macugen is recommended in those who meet the following criteria.

FDA-Approved Indications

236. Neovascular (Wet) Age-Related Macular Degeneration. Approve for 1 year if administered by or under the supervision of an ophthalmologist.

Other Uses with Supportive Evidence

7. **Other Neovascular Diseases of the Eye (e.g., neovascular glaucoma, retinopathy of prematurity, sickle cell neovascularization, choroidal neovascular conditions, etc.).** Approve for 1 year if administered by or under the supervision of an ophthalmologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Macugen has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

208. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Opioids – Fentanyl Transmucosal Drugs

- Abstral® (fentanyl sublingual tablet – Novartis/ProStrakan)
- Actiq® (oral transmucosal fentanyl citrate – Cephalon, generics)
- Fentora® (fentanyl buccal tablet – Cephalon, authorized generic)
- Lazanda® (fentanyl nasal spray – Depomed)
- Subsys® (fentanyl sublingual spray – Insys)

REVIEW DATE: 10/23/2019

OVERVIEW

Actiq (generics), Abstral, Fentora, and Subsys are immediate-release oral transmucosal formulations of fentanyl citrate.[1-5] Lazanda is a nasal spray intended for intranasal transmucosal administration.[6] The transmucosal fentanyl products are indicated only for the management of breakthrough pain in patients with cancer who are already receiving and who are tolerant to opioid therapy for their underlying persistent cancer pain.[1-6] Patients considered opioid tolerant are those who are taking at least 60 mg of oral morphine daily, at least 25 mcg of transdermal fentanyl/hour, at least 30 mg of oxycodone daily, at least 8 mg oral hydromorphone daily, at least 25 mg oral oxymorphone daily, or an equianalgesic dose of another opioid for a week or longer. The appropriate dosing and safety of Actiq (generics) in opioid tolerant children with breakthrough cancer pain have not been established in those below 16 years of age.[1,3] The safety and

efficacy of Abstral, Fentora, Subsys, and Lazanda have not been established in pediatric patients below 18 years of age.[2,4-6]

The transmucosal fentanyl products are contraindicated in the management of acute or postoperative pain and in patients with known intolerance or hypersensitivity to any components or the drug fentanyl.[1-6] In addition, these products must not be used in opioid non-tolerant patients (contraindicated). The transmucosal fentanyl products are approved for use only in the care of cancer patients and only by healthcare professionals[1-5] (oncologists and pain specialists)[2-3,6] who are knowledgeable of and skilled in the use of Schedule II opioids to treat cancer pain. Because of the risk of misuse, abuse, addition, and overdose, these products are available only through a restricted program under a Risk Evaluation and Mitigation Strategy (REMS) called the Transmucosal Immediate-Release Fentanyl (TIRF) REMS ACCESS program. Under the TIFR REMS ACCESS program, outpatients, prescribers who prescribe to outpatients, pharmacies, and distributors must enroll in the program.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of fentanyl transmucosal drugs. All approvals are provided for the duration noted below.

Automation: If the patient has a prescription for a cancer medication (see Appendix A) within a 180-day period, the claim will adjudicate. When available, the ICD-9/ICD-10 codes for cancer will be used as part of automation to allow approval of the requested medication (see Appendix B).

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of fentanyl transmucosal drugs is recommended for those who meet one of the following criteria:

Food and Drug Administration (FDA)-Approved Indications

1. **Breakthrough Pain in Patients with Cancer:** Approve for 1 year if the patient meets the following criteria (**A and B**):
   - **A)** Patient meets ONE of the following conditions (i or ii):
     - **i.** Patient is unable to swallow, has dysphagia, esophagitis, mucositis,[7] or uncontrollable nausea/vomiting (In the professional opinion of specialist physicians reviewing the data, we have adopted this criterion); OR
     - **ii.** Patient is unable to take two other short-acting narcotics (e.g., oxycodone, morphine sulfate, hydromorphone, etc.) secondary to allergy or severe adverse events (In the professional opinion of specialist physicians reviewing the data, we have adopted this criterion); AND
   - **B)** Patient is on or will be on an oral or transdermal long-acting narcotic (e.g., Duragesic, OxyContin, morphine extended-release), or the patient is on intravenous, subcutaneous, or spinal (intrathecal, epidural) narcotics (e.g., morphine sulfate, hydromorphone, fentanyl citrate).

   Actiq (generics), Abstral, Fentora, Lazanda, and Subsys are indicated for the management of breakthrough pain in patients with cancer who are already receiving and who are tolerant to opioid therapy for their underlying persistent cancer pain.[1-6]

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Fentanyl transmucosal drugs have not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

1. **Acute and/or Postoperative Pain** including surgery/post-surgery, trauma/post-trauma, acute medical illness (acute abdominal pain, pelvic pain, muscle spasm): Actiq (generics), Abstral, Fentora, Lazanda, and Subsys are contraindicated for use in the management of acute or postoperative pain.[1-6] A case series reported the efficacious outpatient use (75% reduction in pain intensity at 2 hours; n = 18) of Actiq for the management of treating an acute, refractory migraine headache in 20 patients.[8] Actiq was used as a rescue medication for management of a moderate to severe migraine after ineffective treatment with the patients' usual antimigraine therapy. All of these patients were managed by a headache clinic and had undergone a full evaluation of their medical history, vital signs, and physical and neurological examinations. In addition, all 20 patients had been previously treated with multiple other therapies (e.g., 5-hydroxytryptamine $[5\text{-HT}]_1$ receptor agonists, ergots, antiemetics, prescription and over-the-counter analgesics, and anti-inflammatory drugs) and all had previously received outpatient opioid therapies in an attempt to manage their migraine pain. All patients were also known responders to use of parenteral opioid therapy. Side effects reported included nausea (n = 3), vomiting (n = 1), somnolence (n = 2), itching (n = 1), and dry mouth (n = 1). Controlled research is needed to fully determine the role of Actiq for the management of acute, refractory migraine.

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Opioids – Long-Acting Products

Note: This is not an inclusive list. As new products become available, they will roll into this policy and the list will be updated periodically.

- Buprenorphine (i.e., Belbuca®, Butrans®)
- Fentanyl transdermal (Duragesic®, generics)
- Hydrocodone extended-release (e.g., Hysingla™ ER, Zohydro® ER)
- Hydromorphone extended-release (e.g., Exalgo® [brand discontinued 2019], generics)
- Methadone (e.g., Diskets®, Dolophine®, Methadose™, generics)
- Morphine sulfate extended-release (e.g., Arymo® ER, Embeda® [brand discontinued 2019], Kadian®, MS Contin®, generics)
- Oxycodone extended-release (e.g., Xtampza® ER, OxyContin®)
- Oxymorphone extended-release (e.g., generics [generics are not AB-rated to the discontinued Opana® ER formulation])
- Tapentadol extended-release (e.g., Nucynta® ER)
- Tramadol extended-release (e.g., Conzip®, Ultram® ER, generics)

DATE REVIEWED: 04/29/2020

OVERVIEW

Opioid analgesics are commonly used for the management of pain.[1] An estimated 20% of patients presenting to physician offices with pain symptoms or pain-related diagnoses (including acute and chronic pain) unrelated to cancer receive an opioid prescription.

The currently available long-acting (due to either an extended-release formulation or a long half-life [i.e., methadone]) opioids are buprenorphine, fentanyl, hydrocodone, hydromorphone, methadone, morphine sulfate, oxycodone, oxymorphone, tapentadol, and tramadol.[2-17] All of the long-acting opioids are indicated for the management of pain severe enough to require daily, around-the-clock, long-term opioid treatment and for which alternative treatment options are inadequate. Extended-release opioid dosage forms offer a long duration of effect, reduce severity of end-of-dose pain, and allow many patients to sleep through the night. OxyContin is the only product specifically indicated in pediatric patients 11 years to 18 years of age.[7] Nucynta ER is the only product also indicated for the management of neuropathic pain associated with diabetic peripheral neuropathy in adults.[2]

These medications produce the majority of their effects by binding to μ, κ, and δ receptors in the central nervous system.[3-17] However, Nucynta ER and Ultram ER/Conzip have a unique dual mechanism of

action.[2,14] They demonstrate μ-opioid agonist activity and inhibition of norephinephrine reuptake (and serotonin reuptake for tramadol). Methadone has additional indications for the treatment and maintenance treatment of opioid addiction (i.e., heroin or other morphine-like drugs).[17] Note that methadone products when used for the treatment of opioid addiction in detoxification or maintenance programs, shall be dispensed only by opioid treatment programs (and agencies, practitioners or institutions by formal agreement with the program sponsor) certified by the Substance Abuse and Mental Health Services Administration and approved by the designated state authority.

Since the 1990s, opioid use and abuse have risen markedly in the US.[18] An estimated 3.3 million people aged ≥ 12 years in 2016 were current misusers of pain relievers, which represents 1.2% of the population aged ≥ 12 years.[19] In 2016, an estimated 239,000 adolescents aged 12 years to 17 years (1%), 631,000 young adults aged 18 years to 25 years (1.8%), and 2.5 million adults aged ≥ 26 years (1.2%) were current misusers of pain relievers.

In 2016, the Centers for Disease Control (CDC) published a guideline for prescribing opioids for chronic pain.[1,20] The guideline provides recommendations for primary care providers who are prescribing opioids for chronic pain outside of active cancer treatment, palliative care, and end-of-life care. In the guideline, chronic pain is defined as pain that typically lasts greater than 3 months or past the time of normal tissue healing, resulting from an underlying medical disease or condition, injury, medical treatment, inflammation, or an unknown cause. To support the guideline an updated review of long-term opioid therapy for chronic pain outside of end-of-life care was undertaken and the results revealed that evidence remains limited, with insufficient evidence to determine long-term benefits of chronic opioid therapy versus no opioid therapy. However, the evidence did suggest a risk for serious harms with long-term opioid therapy that appears to be dose-dependent.

The CDC guideline recommendations are grouped into three areas: when to initiate or continue opioids for chronic pain; opioid selection, dosage, duration, follow-up, and discontinuation; and assessing risk and addressing harms of opioid use.[1] Nonpharmacologic therapy and non-opioid pharmacologic therapy are preferred for chronic pain; if opioids are used, they should be combined with nonpharmacologic therapy and non-opioid pharmacologic therapy, as appropriate. Before starting and periodically during opioid therapy, healthcare providers should discuss with their patient the risks and realistic benefits of opioid therapy and also the shared responsibilities for managing therapy. When starting opioid therapy for chronic pain, immediate-release opioids should be prescribed at the lowest effective dosage instead of initiating therapy with extended-release/long-acting opioids. Carefully reassess individual benefits and risks when increasing opioid dosages to ≥ 50 morphine milligram equivalents (MME)/day and avoid increasing dosage to ≥ 90 MME/day whenever possible. Healthcare providers should evaluate benefits and harms with patients within 1 to 4 weeks of starting opioid therapy or of dose escalation and evaluate continued therapy with patients at least every 3 months. If benefits do not outweigh harms of continued opioid therapy, other therapies should be optimized and opioid doses tapered to lower dosages and/or discontinued. Before starting and periodically during continuation of opioid therapy, healthcare providers should evaluate risk factors for opioid-related harms and incorporate strategies into the management plan to mitigate risk, including offering naloxone. The patient's history of controlled substance prescriptions should be periodically reviewed using state prescription drug monitoring program (PDMP) data to determine whether the patient is receiving opioid dosages or dangerous combinations putting them at high risk for overdose. Urine drug testing is recommended before starting opioid therapy and at least annually to assess for prescribed medications as well as other controlled prescription drugs and illicit drugs; treatment should be offered to and/or arranged for patients with opioid use disorder.

The CDC guideline states that long-term opioid use often begins with treatment of acute pain.[1] When opioids are used for acute pain, clinicians should prescribe the lowest effective dose of immediate-release opioids and should prescribe no greater quantity than needed for the expected duration of pain severe enough to require opioids (i.e., ≤ 3 days and only rarely > 7 days).

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of long-acting opioids. Long-acting opioids are controlled substances (CII with the exception of tramadol-containing products which are CIV) which can be misused and abused. This policy includes long-acting formulations of the medications listed on page 1; the list is not inclusive. As new products become available, they will roll into this policy and the list will be updated periodically. All approvals are provided for 1 year in duration unless otherwise noted below.

Automation: Patients with a history of a long-acting opioid within the 130-day look-back period are excluded from prior authorization. If the patient has a prescription for a cancer medication (see Appendix A) within a 180-day period, the claim will adjudicate. When available, the ICD-10 codes for cancer will be used as part of automation to allow approval of the requested medication (see Appendix B).

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of long-acting opioids is recommended in those who meet the following criteria:

A. Coverage of all long-acting opioids, except fentanyl transdermal products, is recommended in those who meet the following criteria:

FDA-Approved Indications

106. Pain Severe Enough to Require Daily, Around-the-Clock, Long-Term Opioid Treatment. Approve for 1 year if the patient meets ONE of the following criteria (A, B or C):

- **A)** The patient has a cancer diagnosis; OR
- **B)** The patient is in a hospice program, end-of-life care, or palliative care; OR
- **C)** The patient has chronic pain but does not have a cancer diagnosis. Approve for 1 year if the patient meets ALL of the following criteria (i, ii, iii, iv, and v):
  - **i.** Patient is not opioid naïve; AND
  - **ii.** Non-opioid therapies (e.g., non-opioid medications [e.g., nonsteroidal anti-inflammatory drugs {NSAIDs}, tricyclic antidepressants, serotonin and norepinephrine reuptake inhibitors {SNRIs}, anticonvulsants], exercise therapy, weight loss, cognitive behavioral therapy) have been optimized and are being used in conjunction with opioid therapy according to the prescribing physician; AND
  - **iii.** The patient's history of controlled substance prescriptions has been checked using the state prescription drug monitoring program (PDMP), unless unavailable in the state (see note below), according to the prescribing physician; AND
  - **iv.** Risks (e.g., addiction, overdose) and realistic benefits of opioid therapy have been discussed with the patient according to the prescribing physician; AND
  - **v.** Treatment plan (including goals for pain and function) is in place and reassessments (including pain levels and function) are scheduled at regular intervals according to the prescribing physician.

Note: As of 04/24/2020, the state of Missouri is the only state in the US that does not have a statewide PDMP program in place.

2. **Opioid Addiction (Dependence)** [methadone products only]. Approve methadone for 1 year if ONE of the following criteria (A or B) is met:
   A) Methadone is dispensed by an opioid treatment program certified by the Substance Abuse and Mental Health Services Administration and approved by the designated state authority; OR
   B) Methadone is being prescribed during an emergency period of ≤ 3 days while definitive care for the addiction is being sought in an appropriately licensed facility.

B. Coverage of fentanyl transdermal products is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Pain Severe Enough to Require Daily, Around-the-Clock, Long-Term Opioid Treatment.** Approve for 1 year if the patient has a cancer diagnosis.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Long-acting opioids have not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

95. Acute pain. According to the CDC guideline for prescribing opioids for chronic pain, clinicians should not prescribe extended-release/long-acting opioids for the treatment of acute pain due to the longer half-lives and longer duration of effects (e.g., respiratory depression) with extended-release/long-acting opioids.[1]

96. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Opioids – Tramadol Extended-Release Prior Authorization Policy

- ConZip® (tramadol hydrochloride extended-release capsules – Vertical)
- Tramadol extended-release capsules – various (brand products)
- Tramadol hydrochloride extended-release tablets – generics to the discontinued product Ultram® ER
- Tramadol hydrochloride extended-release tablets – generics to the discontinued product Ryzolt

REVIEW DATE: 08/19/2020

OVERVIEW

Tramadol extended-release tablets, tramadol extended-release capsules, and ConZip are indicated for the management of pain severe enough to require daily around-the-clock, long-term opioid treatment and for which alternative treatment options are inadequate.[1-3]

Tramadol is a centrally acting synthetic opioid analgesic.[1-3] The extended-release tramadol products differ in their extended-release mechanism. ConZip contains a total dose of tramadol in a combination of immediate-release and extended-release components. However, ConZip is bioequivalent to a reference extended-release tramadol product under fasting conditions. Therefore, clinical efficacy was based on a reference extended-release tramadol product.

Guidelines

In 2016, the Centers for Disease Control (CDC) published a guideline for prescribing opioids for chronic pain.[4,5] The guideline provides recommendations for primary care providers who are prescribing opioids for chronic pain outside of active cancer treatment, palliative care, and end-of-life care. In the guideline, chronic pain is defined as pain that typically lasts greater than 3 months or past the time of normal tissue healing, resulting from an underlying medical disease or condition, injury, medical treatment, inflammation, or an unknown cause. To support the guideline an updated review of long-term opioid therapy for chronic pain outside of end-of-life care was undertaken and the results revealed that evidence remains limited, with insufficient evidence to determine long-term benefits of chronic opioid therapy versus no opioid therapy. However, the evidence did suggest a risk for serious harms with long-term opioid therapy that appears to be dose-dependent.

The CDC guidelines recommend non-pharmacologic therapy and non-opioid pharmacologic therapy for chronic pain; if opioids are used, they should be combined with non-pharmacologic therapy and non-opioid pharmacologic therapy, as appropriate.[4] Before starting and periodically during opioid therapy, healthcare providers should discuss with their patient the risks and realistic benefits of opioid therapy and also the shared responsibilities for managing therapy. When starting opioid therapy for chronic pain, immediate-release opioids should be prescribed at the lowest effective dosage instead of initiating therapy with

extended-release/long-acting opioids. Before starting and periodically during continuation of opioid therapy, healthcare providers should evaluate risk factors for opioid-related harms and incorporate strategies into the management plan to mitigate risk, including offering naloxone. The patient's history of controlled substance prescriptions should be periodically reviewed using state prescription drug monitoring program (PDMP) data to determine whether the patient is receiving opioid dosages or dangerous combinations putting them at high risk for overdose. Urine drug testing is recommended before starting opioid therapy and at least annually to assess for prescribed medications as well as other controlled prescription drugs and illicit drugs; treatment should be offered to and/or arranged for patients with opioid use disorder.

The CDC guideline states that long-term opioid use often begins with treatment of acute pain.[4] When opioids are used for acute pain, clinicians should prescribe the lowest effective dose of immediate-release opioids and should prescribe no greater quantity than needed for the expected duration of pain severe enough to require opioids, i.e., ≤ 3 days and only rarely > 7 days.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of tramadol extended-release products. Tramadol extended-release products are controlled substances (C-IV) which can be misused and abused. Additionally, due to the availability of generic tramadol extended-release tablets, approval of a branded tramadol extended-release product requires a previous trial of the generic. All approvals are provided for the duration noted below.

Automation: If a generic tramadol extended-release product is requested and the patient has history of a generic tramadol extended-release product within the 130-day look-back period, a prescription for a cancer medication (see Appendix A) within a 180-day period, or an ICD-10 code for cancer (see Appendix B), the claim will adjudicate.

RECOMMENDED CRITERIA

Coverage of a tramadol extended-release product is recommended in those who meet the following criteria:

FDA-Approved Indications

107. Pain Severe Enough to Require Daily, Around-the-Clock, Long-Term Opioid Treatment. Approve for 1 year if the patient meets ONE of the following criteria (A, B or C) AND D:

- **D)** Patient has a cancer diagnosis; OR
- **E)** Patient is in hospice program, end-of-life care, or palliative care; OR
- **F)** Patient has chronic pain but does not have a cancer diagnosis. Approve for 1 year if the patient meets ALL of the following criteria (i, ii, iii, iv, and v):
  - **vi.** Patient is not opioid naïve; AND
  - **vii.** Non-opioid therapies have been optimized and are being used in conjunction with opioid therapy according to the prescriber; AND
    Note: Examples of non-opioid therapies include non-opioid medications (e.g., nonsteroidal anti-inflammatory drugs, tricyclic antidepressants, serotonin and norepinephrine reuptake inhibitors, anticonvulsants), exercise therapy, weight loss, and cognitive behavioral therapy.
  - **viii.** Patient's history of controlled substance prescriptions has been checked using the state prescription drug monitoring program (PDMP), unless unavailable in the state (see note below), according to the prescriber; AND

Note: As of 08/19/2020, the state of Missouri is the only state in the US that does not have a statewide PDMP program in place.

ix. Risks (e.g., addiction, overdose) and realistic benefits of opioid therapy have been discussed with the patient according to the prescriber; AND

x. Treatment plan (including goals for pain and function) is in place and reassessments (including pain levels and function) are scheduled at regular intervals according to the prescriber.

G) If a branded tramadol extended-release product is requested, the patient has tried generic tramadol extended-release tablets.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of a tramadol extended-release product is not recommended in the following situations:

97. Acute pain. According to the CDC guideline for prescribing opioids for chronic pain, clinicians should not prescribe extended-release/long-acting opioids for the treatment of acute pain due to the longer half-lives and longer duration of effects (e.g., respiratory depression) with extended-release/long-acting opioids.[4]

98. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Parkinson's Disease – Apokyn Prior Authorization Policy

- Apokyn® (apomorphine hydrochloride for subcutaneous injection)

REVIEW DATE: 08/19/2020

OVERVIEW

Apokyn, a non-ergoline dopamine agonist, is indicated for the acute, intermittent treatment of hypomobility, "off" episodes ("end-of-dose wearing off" and unpredictable "on/off" episodes) associated with advanced Parkinson's disease.[1]

Guidelines

The American Academy of Neurology published guidelines in 2006 on the treatment of Parkinson's disease with motor fluctuations and dyskinesia.[2] The guidelines are dated and do not include more recently approved medications. It is recommended to offer entacapone and rasagiline to reduce "off" time (Level A). Pergolide (withdrawn from the market in 2007 due to risk of valvular fibrosis), pramipexole, ropinirole, and tolcapone (used with caution; requires monitoring for hepatotoxicity) should be considered to reduce "off" time (Level B). Apokyn® (apomorphine hydrochloride injection), cabergoline, and selegiline may be used to reduce "off" time (Level C). According to the guidelines, the available evidence does not establish superiority of one medication over another in reducing "off" time (Level B). Sustained-release levodopa/carbidopa and bromocriptine should not be considered to reduce "off" time (Level C). Amantadine may be used to reduce dyskinesia (Level C).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Apokyn. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Apokyn as well as the monitoring required for adverse events and long-term efficacy, approval requires Apokyn to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Apokyn is recommended in those who meet the following criteria:

FDA-Approved Indications

108. Parkinson's Disease. Approve for 1 year if the patient meets the following criteria (A, B, C, D, and E):

i. Patient is diagnosed with advanced Parkinson's disease; AND

ii. Patient is experiencing "off" episodes such as muscle stiffness, slow movements, or difficulty starting movements; AND

iii. Patient is currently receiving carbidopa/levodopa therapy; AND

iv. Patient has previously tried one other treatment for "off" episodes and meets ONE of the following criteria (i or ii):

a) Patient had significant intolerance, according to the prescriber; OR

b) Patient had inadequate efficacy, according to the prescriber; AND

Note: Examples of treatment for "off" episodes include entacapone, rasagiline, pramipexole, ropinirole, tolcapone, cabergoline, selegiline, Kynmobi™ (apomorphine hydrochloride sublingual film), Ongentys® (opicapone capsules), or Xadago® (safinamide tablets).

E) Apokyn is being prescribed by, or in consultation with, a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Apokyn is not recommended in the following situations:

209. Concurrent Use with a Serotonin 5-HT3 Antagonist. Administration of Apokyn in conjunction with a serotonin 5-HT3 antagonist (e.g., ondansetron, granisetron, dolasetron, palonosetron, alosetron) can result in extreme lowering of blood pressure and loss of consciousness and is considered an absolute contraindication.[1]

210. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

PRIOR AUTHORIZATION POLICY

POLICY: Parkinson's Disease – Duopa Prior Authorization Policy

- Duopa™ (carbidopa and levodopa enteral suspension – AbbVie)

REVIEW DATE: 08/19/2020

OVERVIEW

Duopa, a combination of carbidopa (an aromatic amino acid decarboxylation inhibitor) and levodopa (an aromatic amino acid), is indicated for the treatment of motor fluctuations in patients with advanced Parkinson's disease.[1] Duopa is administered over a 16 hours/day infusion period through a naso-jejunal tube (short-term administration) or a percutaneous endoscopic gastrostomy-jejunostomy (long-term administration) using a CADD-Legacy® 1400 pump.

Guidelines

The American Academy of Neurology published guidelines in 2006 on the treatment of Parkinson's disease with motor fluctuations and dyskinesia.[2] The guidelines are dated and do not include more recently approved medications. It is recommended to offer entacapone and rasagiline to reduce "off" time (Level A). Pergolide (withdrawn from the market in 2007 due to risk of valvular fibrosis), pramipexole, ropinirole, and tolcapone (used with caution; requires monitoring for hepatotoxicity) should be considered to reduce "off" time (Level B). Apokyn® (apomorphine hydrochloride injection), cabergoline, and selegiline may be used to reduce "off" time (Level C). According to the guidelines, the available evidence does not establish superiority of one medication over another in reducing "off" time (Level B). Sustained-release levodopa/carbidopa and bromocriptine should not be considered to reduce "off" time (Level C). Amantadine may be used to reduce dyskinesia (Level C).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Duopa. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Duopa as well as the monitoring required for adverse events and long-term efficacy, approval requires Duopa to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Duopa is recommended in those who meet the following criteria:
FDA-Approved Indications

237. Parkinson's Disease. Approve for 1 year if the patient meets the following criteria (A, B, C, D, and E):

- **A)** Patient is diagnosed with advanced Parkinson's disease; AND
- **B)** Patient is experiencing "off" episodes such as muscle stiffness, slow movements, or difficulty starting movements; AND
- **C)** Patient has tried an oral extended-release carbidopa/levodopa therapy and meets one of the following criteria (i or ii):
  - **i.** Patient had significant intolerance, according to the prescriber; OR
  - **ii.** Patient had inadequate efficacy, according to the prescriber; AND
- **D)** Patient has previously tried three other treatments for "off" episodes; AND
  Note: Examples of treatment for "off" episodes include entacapone, rasagiline, pramipexole, ropinirole, tolcapone, cabergoline, selegiline, Kynmobi™ (apomorphine hydrochloride sublingual film), Ongentys® (opicapone capsules), or Xadago® (safinamide tablets).
- **E)** Duopa is being prescribed by, or in consultation with, a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Duopa is not recommended in the following situations:

211. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Parkinson's Disease – Inbrija Prior Authorization Policy

- Inbrija™ (levodopa inhalation powder for oral inhalation use – Acorda)

REVIEW DATE: 08/19/2020

OVERVIEW

Inbrija, an aromatic amino acid, is indicated for the intermittent treatment of "off" episodes in patients with Parkinson's disease treated with carbidopa-levodopa.[1] Inbrija should be taken when symptoms of an "off" period start to return. The recommended dosage of Inbrija is 84 mg (two 42 mg capsules) as needed, up to five times daily. Inbrija capsules are for oral inhalation only and should be used only with the Inbrija inhaler. Inbrija capsules must not be swallowed. Patients are instructed to load one capsule into the inhaler and breathe in; then remove the used capsule and load the second capsule into the inhaler and breathe in. The Inbrija inhaler is breath-actuated by the patient.

Guidelines

The American Academy of Neurology published guidelines in 2006 on the treatment of Parkinson's disease with motor fluctuations and dyskinesia.[2] The guidelines are dated and do not include more recently approved medications. It is recommended to offer entacapone and rasagiline to reduce "off" time (Level A). Pergolide (withdrawn from the market in 2007 due to risk of valvular fibrosis), pramipexole, ropinirole, and tolcapone (used with caution; requires monitoring for hepatotoxicity) should be considered to reduce "off" time (Level B). Apokyn® (apomorphine hydrochloride injection), cabergoline, and selegiline may be used to reduce "off" time (Level C). According to the guidelines, the available evidence does not establish superiority of one medication over another in reducing "off" time (Level B). Sustained-release levodopa/carbidopa and bromocriptine should not be considered to reduce "off" time (Level C). Amantadine may be used to reduce dyskinesia (Level C).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Inbrija. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Inbrija as well as the monitoring required for adverse events and long-term efficacy, approval requires Inbrija to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Inbrija is recommended in those who meet the following criteria:

FDA-Approved Indications

238. Parkinson's Disease. Approve for 1 year if the patient meets the following criteria (A, B, C, D, and E):

- **A)** Patient is currently taking carbidopa-levodopa; AND
- **B)** Patient is experiencing "off" episodes such as muscle stiffness, slow movements, or difficulty starting movements; AND
- **C)** Patient has previously tried one other treatment for "off" episodes and meets ONE of the following criteria (i or ii):
  - **i.** Patient had significant intolerance, according to the prescriber; OR
  - **ii.** Patient had inadequate efficacy, according to the prescriber; AND

  Note: Examples of treatments for "off" episodes are entacapone, rasagiline, pramipexole, ropinirole, tolcapone, Apokyn, cabergoline, selegiline, Ongentys, Kynmobi, or Xadago.
- **D)** Patient does not have asthma, chronic obstructive pulmonary disease, or other chronic underlying lung disease; AND
- **E)** Inbrija is prescribed by or in consultation with a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Inbrija is not recommended in the following situations:

212. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Parkinson's Disease – Lodosyn Prior Authorization Policy

- Lodosyn® (carbidopa tablets, generics)

REVIEW DATE: 08/19/2020

OVERVIEW

Lodosyn, an aromatic amino acid decarboxylation inhibitor, indicated for use with carbidopa-levodopa or with levodopa in the treatment of the symptoms of idiopathic Parkinson's disease (paralysis agitans), postencephalitic parkinsonism, and symptomatic parkinsonism, which may follow injury to the nervous system by carbon monoxide intoxication and/or manganese intoxication.[1]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Lodosyn. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Lodosyn as well as the monitoring required for adverse events and long-term efficacy, approval requires Lodosyn to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Lodosyn is recommended in those who meet the following criteria:

FDA-Approved Indications

239. Parkinson's Disease. Approve for 1 year if the patient meets both of the following criteria (A and B):
A) Patient is currently receiving carbidopa/levodopa therapy; AND
B) Lodosyn is being prescribed by, or in consultation with, a neurologist.

240. Postencephalitic Parkinsonism. Approve for 1 year if the patient meets both of the following criteria (A and B):
A) Patient is currently receiving carbidopa/levodopa therapy; AND
B) Lodosyn is being prescribed by, or in consultation with, a neurologist.

241. Symptomatic Parkinsonism. Approve for 1 year if the patient meets both of the following criteria (A and B):
A) Patient is currently receiving carbidopa/levodopa therapy; AND
B) Lodosyn is being prescribed by, or in consultation with, a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Coverage of Lodosyn is not recommended in the following situations:

213. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Parkinson's Disease – Nourianz Prior Authorization Policy
- Nourianz™ (istradefylline tablets – Kyowa Kirin)

REVIEW DATE: 08/19/2020

OVERVIEW
Nourianz, an adenosine receptor antagonist, is indicated as adjunctive treatment to levodopa/carbidopa in adult patients with Parkinson's disease experiencing "off" episodes.[1]

Guidelines
The American Academy of Neurology published guidelines in 2006 on the treatment of Parkinson's disease with motor fluctuations and dyskinesia.[2] The guidelines are dated and do not include more recently approved medications. It is recommended to offer entacapone and rasagiline to reduce "off" time (Level A). Pergolide (withdrawn from the market in 2007 due to risk of valvular fibrosis), pramipexole, ropinirole, and tolcapone (used with caution; requires

monitoring for hepatotoxicity) should be considered to reduce "off" time (Level B). Apokyn® (apomorphine hydrochloride injection), cabergoline, and selegiline may be used to reduce "off" time (Level C). According to the guidelines, the available evidence does not establish superiority of one medication over another in reducing "off" time (Level B). Sustained-release levodopa/carbidopa and bromocriptine should not be considered to reduce "off" time (Level C). Amantadine may be used to reduce dyskinesia (Level C).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Nourianz. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Nourianz as well as the monitoring required for adverse events and long-term efficacy, approval requires Nourianz to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Nourianz is recommended in those who meet the following criteria:

FDA-Approved Indications

242. Parkinson's Disease. Approve Nourianz for 1 year if patient meets both of the following (A and B):

- **F)** Patient is currently taking carbidopa-levodopa; AND
- **G)** Patient is experiencing "off" episodes such as muscle stiffness, slow movements, or difficulty starting movements; AND
- **H)** Nourianz is prescribed by or in consultation with a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Nourianz is not recommended in the following situations:

214. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

PRIOR AUTHORIZATION POLICY

POLICY: Parkinson's Disease – Nuplazid Prior Authorization Policy

- Nuplazid® (pimavanserin capsules and tablets – Acadia)

REVIEW DATE: 08/19/2020

OVERVIEW

Nuplazid, a selective serotonin 5-HT_{2A} inverse agonist, is indicated for the treatment of hallucinations and delusions associated with Parkinson's disease psychosis.[1]

Safety

Nuplazid has a Boxed Warning regarding increased mortality in elderly patients with dementia-related psychosis.[1] Nuplazid is not approved for the treatment of patients with dementia-related psychosis unrelated to the hallucinations and delusions associated with Parkinson's disease psychosis.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Nuplazid. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Nuplazid as well as the monitoring required for adverse events and long-term efficacy, approval requires Nuplazid to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Nuplazid is recommended in those who meet the following criteria:

FDA-Approved Indications

146. Parkinson's Disease Psychosis. Approve for 1 year if the patient meets all of the following criteria (A, B, and C):
- **1.** Patient has hallucinations and delusions associated with Parkinson's disease pychosis; AND
- **2.** Patient does not have dementia-related psychosis unrelated to the hallucinations and delusions associated with Parkinson's disease psychosis; AND
- **3.** Nuplazid is prescribed by or in consultation with a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Nuplazid is not recommended in the following situations:

215. Dementia-Related Psychosis. Nuplazid prescribing information has a Boxed Warning regarding increased mortality in elderly patients with dementia-related psychosis.[1] Elderly patients with dementia-related psychosis treated with antipsychotic drugs are at an increased risk of death.

216. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Parkinson's Disease – Tolcapone Products Prior Authorization Policy
- Tasmar® (tolcapone tablets, generics [100 mg strength only])

REVIEW DATE: 08/19/2020

OVERVIEW

Tolcapone, an inhibitor of catechol-O-methyltransferase, is used in the treatment of Parkinson's disease as an adjunct to levodopa/carbidopa therapy.[1]

Guidelines

The American Academy of Neurology published guidelines in 2006 on the treatment of Parkinson's disease with motor fluctuations and dyskinesia.[2] The guidelines are dated and do not include more recently approved medications. It is recommended to offer entacapone and rasagiline to reduce "off" time (Level A). Pergolide (withdrawn from the market in 2007 due to risk of valvular fibrosis), pramipexole, ropinirole, and tolcapone (used with caution; requires monitoring for hepatotoxicity) should be considered to reduce "off" time (Level B). Apokyn® (apomorphine hydrochloride injection), cabergoline, and selegiline may be used to reduce "off" time (Level C). According to the guidelines, the available evidence does not establish superiority of one medication over another in reducing "off" time (Level B). Sustained-release levodopa/carbidopa and bromocriptine should not be considered to reduce "off" time (Level C). Amantadine may be used to reduce dyskinesia (Level C).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of tolcapone products. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with tolcapone products as well as the monitoring required for adverse events and long-term efficacy, approval requires tolcapone products to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of tolcapone products is recommended in those who meet the following criteria:

FDA-Approved Indications

243. Parkinson's Disease. Approve for 1 year if the patient meets all of the following criteria (A, B, and C):

- **A)** Patient is currently receiving carbidopa/levodopa therapy; AND
- **B)** Patient has tried an entacapone product and meets ONE of the following criteria (i or ii):
  - **i.** Patient had significant intolerance, according to the prescriber; OR
  - **ii.** Patient had inadequate efficacy, according to the prescriber; AND
- **C)** Tolcapone is being prescribed by, or in consultation with, a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of tolcapone products is not recommended in the following situations:

217. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

763. Tasmar® oral tablets [prescribing information] Bridgewater, NJ: Valeant Pharmaceuticals; December 2018.

764. Pahwa R, Factor SA, Lyons KE, et al. Practice parameter: Treatment of Parkinson disease with motor fluctuations and dyskinesia (an evidence-based review). Report of the quality standards subcommittee of the American Academy of Neurology. Neurology. 2006;66:983-995.

PRIOR AUTHORIZATION POLICY

POLICY: Parkinson's Disease – Zelapar Prior Authorization Policy
- Zelapar® (selegiline hydrochloride tablets, orally disintegrating)

REVIEW DATE: 08/19/2020

OVERVIEW

Zelapar, an irreversible inhibitor of monoamine oxidase, is indicated as an adjunct in the management of patients with Parkinson's disease being treated with levodopa/carbidopa who exhibit deterioration in the quality of their response to this therapy.[1] Zelapar is an oral disintegrating tablet that dissolves in the mouth seconds after placement on the tongue and is rapidly absorbed.

Guidelines

The American Academy of Neurology published guidelines in 2006 on the treatment of Parkinson's disease with motor fluctuations and dyskinesia.[2] The guidelines are dated and do not include more recently approved medications. It is recommended to offer entacapone and rasagiline to reduce "off" time (Level A). Pergolide (withdrawn from the market in 2007 due to risk of valvular fibrosis), pramipexole, ropinirole, and tolcapone (used with caution; requires monitoring for hepatotoxicity) should be considered to reduce "off" time (Level B). Apokyn® (apomorphine hydrochloride injection), cabergoline, and selegiline may be used to reduce "off" time (Level C). According to the guidelines, the available evidence does not establish superiority of one medication over another in reducing "off" time (Level B). Sustained-release levodopa/carbidopa and bromocriptine should not be considered to reduce "off" time (Level C). Amantadine may be used to reduce dyskinesia (Level C).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Zelapar. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Zelapar as well as the monitoring required for adverse events and long-term efficacy, approval requires Zelapar to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zelapar is recommended in those who meet the following criteria:

FDA-Approved Indications

244. Parkinson's Disease. Approve for 1 year if the patient meets all of the following criteria (A, B, C, and D):
- **A)** Patient is experiencing "off" episodes such as muscle stiffness, slow movements, or difficulty starting movements; AND
- **B)** Patient is currently receiving carbidopa/levodopa therapy; AND
- **C)** Patient has tried one of the oral selegiline tablets, selegiline capsules, or rasagiline tablets and meets ONE of the following criteria (i or ii):

i. Patient had significant intolerance, according to the prescriber; OR
ii. Patient has difficulty swallowing tablets or capsules; AND

D) Zelapar is being prescribed by, or in consultation with, a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Coverage of Zelapar is not recommended in the following situations:

218. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES
765. Zelapar® orally disintegrating tablets [prescribing information] Bridgewater, NJ: Valeant Pharmaceuticals; February 2020.
766. Pahwa R, Factor SA, Lyons KE, et al. Practice parameter: Treatment of Parkinson disease with motor fluctuations and dyskinesia (an evidence-based review). Report of the quality standards subcommittee of the American Academy of Neurology. Neurology. 2006;66:983-995.

PRIOR AUTHORIZATION POLICY

POLICY: Parkinson's Disease – Amantadine Extended-Release Drugs
- Gocovri™ (amantadine extended-release capsules – Adamas Pharma)
- Osmolex ER™ (amantadine extended-release tablets – Vertical Pharmaceuticals)

DATE REVIEWED: 12/18/2019

OVERVIEW
Gocovri is indicated for the treatment of dyskinesia in patients with Parkinson's disease (PD) receiving levodopa-based therapy, with or without concomitant dopaminergic medications.[1] The initial daily dosage of Gocovri is 137 mg once daily (QD) at bedtime. After one week, increase to the recommended dosage of 274 mg (equivalent to 340 mg amantadine hydrochloride) QD at bedtime. Gocovri is available in 68.5 mg and 137 mg strengths (as 85 mg or 170 mg amantadine hydrochloride, respectively).

Osmolex ER is indicated for the treatment of Parkinson's disease and for the treatment of drug-induced extrapyramidal reactions in adult patients.[2] The recommended initial dosage of Osmolex ER is 129 mg QD in the morning. The dosage may be increased in weekly intervals to a maximum daily dose of 322 mg (administered as a 129 mg and 193 mg tablet), taken in the morning. For patients unable to tolerate more than 100 mg/day of immediate-release (IR) amantadine, there is no equivalent dose or dosing regimen of Osmolex ER. Osmolex ER is available in 129 mg, 193 mg, and 258 mg strengths (as 160 mg, 240 mg, or 320 mg amantadine hydrochloride, respectively).

Amantadine hydrochloride is available as an IR 100 mg capsule, 100 mg tablet, and 50 mg/5 mL oral solution. The amantadine IR products are indicated for the prophylaxis and treatment of signs and symptoms of infection caused by various strains of influenza A virus; idiopathic PD [Paralysis Agitans], postencephalitic parkinsonism, symptomatic parkinsonism which may follow injury to the nervous system by carbon monoxide intoxication, and in those elderly patients believed to develop parkinsonism in association with cerebral arteriosclerosis; and drug-induced extrapyramidal reactions.[3-5] For the treatment of PD, the usual dose of amantadine IR is 100 mg twice daily (BID) when used alone. An initial dose of amantadine IR is 100 mg daily for patients with serious associated medical illnesses or who are receiving

high doses of other antiparkinson drugs; the dose may be increased to 100 mg BID, if necessary. Patients initially deriving benefit from amantadine may experience a fall-off of effectiveness after a few months; benefit may be regained by increasing the dose to 300 mg/day in divided doses. Occasionally, patients whose responses are not optimal with amantadine IR 200 mg daily may benefit from an increase up to 400 mg/day in divided doses. For the treatment of drug-induced extrapyramidal reactions, the usual dose of amantadine IR is 100 mg BID. Occasionally, patients whose responses are not optimal with amantadine IR 200 mg/day may benefit from an increase up to 300 mg/day in divided doses.

Disease Overview

PD is a common neurodegenerative disease and is a chronic, progressive disorder of the extrapyramidal nervous system affecting the mobility and control of the skeletal muscular system.[6,7] Approximately 50,000 Americans are diagnosed each year with PD and it is estimated that 1 million people in the US have the condition. PD typically affects patients who are greater than 60 years of age.[8] Its characteristic features include resting tremor, rigidity, bradykinetic movements, and postural instability.[6,7] As these symptoms become more pronounced, patients with PD may have difficulty walking, talking, or completing other simple tasks. Early symptoms of PD are subtle and occur gradually. The disease course varies considerably as well as the intensity of symptoms. While some patients become severely disabled, others experience only minor motor disruptions. Resting tremor is the major symptom for some individuals, while for others tremor is only a minor complaint and other manifestations may be more troublesome. It is not possible to predict which symptoms will affect an individual. PD symptoms are thought to be related to depletion of dopamine in the corpus striatum. Use of dopamine is ineffective in the treatment of PD because it does not penetrate the blood-brain barrier. However, levodopa, the metabolic precursor of dopamine, does cross the blood-brain barrier and is believed to be converted to dopamine in the brain. This is thought to be the mechanism whereby levodopa relieves PD symptoms. Other medications are also utilized to improve mobility.

Although initially effective, dopaminergic therapies are eventually complicated by motor fluctuations, including “off” time (periods during which PD symptoms return when the medication effect wears off) and dyskinesia (drug-induced involuntary movements, e.g., chorea and dystonia) in most patients.[9] These motor complications can impair patient quality of life and cause substantial disability. Risk factors for motor complications include younger age at the onset of PD, increased disease severity, higher levodopa dosage, and longer disease duration. These problems are often addressed with levodopa adjustments and the addition of adjunctive medications. According to a review of the treatment of motor symptoms in advanced PD, amantadine is currently the most effective medication approved for the treatment of levodopa-induced dyskinesias.[10]

Clinical Efficacy

Gocovri was assessed in two randomized, double-blind, placebo-controlled efficacy trials, EASE LID (n = 121) and EASE LID 3 (n = 75), in patients with PD and dyskinesia.[1] In both studies, the primary efficacy endpoint was the change in total score of the Unified Dyskinesia Rating Scale (UDysRS) between baseline and Week 12. Patients in EASE LID and EASE LID 3 were treated with a stable dose of levodopa, with 32% of patients on levodopa monotherapy; 54% of patients and 44% of patients were treated with concomitant dopamine agonists and/or MAO-B inhibitors, respectively. In EASE LID and EASE LID 3, a significant decrease in mean UDysRS total score (reduction in dyskinesia) was observed at Week 12 in patients treated with Gocovri compared with placebo (EASE LID treatment difference: -7.9; $P = 0.0009$ and EASE LID 3 treatment difference: -14.4; $P < 0.0001$). Gocovri has not been compared with amantadine IR or other active treatments in clinical trials.

No clinical efficacy studies were undertaken for approval of Osmolex ER.[2] The efficacy of Osmolex ER is based upon bioavailability studies comparing Osmolex ER with IR amantadine.

Guidelines

The 2006 American Academy of Neurology (AAN) guideline on the treatment of PD with motor fluctuations and dyskinesia recommends considering the use of amantadine in patients with PD and motor fluctuations to reduce dyskinesia (Level C).[9] The authors concluded that amantadine IR (given as 100 mg BID) is possibly effective in reducing dyskinesia based on one Class II study. The guidelines have not been updated to include Gocovri or Osmolex ER.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of amantadine extended-release products. Because of the specialized skills required for evaluation and diagnosis of patients treated with amantadine extended-release as well as the monitoring required for adverse events and long-term efficacy, initial approval requires amantadine extended-release to be prescribed by or in consultation with a physician who specializes in patients with PD. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

I. Coverage of Gocovri is recommended in those who meet the following criteria:

FDA-Approved Indications

147. Dyskinesia in Parkinson's Disease (PD). Approve for the duration noted below if patient meets ONE of the following (A or B):

A) Initial Therapy. Approve Gocovri for 3 months if the patient meets the following criteria (i, ii, and iii):
- **i.** Gocovri is prescribed by or in consultation with a neurologist; AND
- **ii.** Patient is currently receiving levodopa-based therapy (e.g., carbidopa/levodopa); AND
- **iii.** Patient has tried immediate-release amantadine capsules, tablets, or oral solution and meets ONE of the following criteria (a or b):
  - **a)** Patient derived benefit from IR amantadine but had intolerable adverse events, as determined by the prescriber; OR
  - **b)** Patient could not achieve a high enough dosage to gain adequate benefit, as determined by the prescriber.

B) Patients Currently Receiving Gocovri. Approve Gocovri for 1 year if the patient meets the following criteria (i, ii, iii, and iv):
- **i.** Gocovri is prescribed by or in consultation with a neurologist; AND
- **ii.** Patient is currently receiving levodopa-based therapy (e.g., carbidopa/levodopa); AND
- **iii.** Patient has tried immediate-release amantadine capsules, tablets, or oral solution and meets ONE of the following criteria (a or b):
  - **a)** Patient derived benefit from IR amantadine but had intolerable adverse events, as determined by the prescriber; OR

b) Patient could not achieve a high enough dosage to gain adequate benefit, as determined by the prescriber; AND

iv. Patient has had a response to therapy (e.g., decrease in dyskinesia), as determined by the prescriber.

II. Coverage of Osmolex ER is recommended in those who meet the following criteria:

FDA-Approved Indications

1. Parkinson's Disease (PD). Approve for the duration noted below if patient meets ONE of the following (A or B):

A) Initial Therapy. Approve Osmolex ER for 3 months if the patient meets the following criteria (i and ii):

i. Osmolex ER is prescribed by or in consultation with a neurologist; AND

ii. Patient has tried immediate-release amantadine capsules, tablets, or oral solution and meets ONE of the following criteria (a or b):

a) Patient derived benefit from IR amantadine but had intolerable adverse events, as determined by the prescriber; OR

b) Patient could not achieve a high enough dosage to gain adequate benefit, as determined by the prescriber.

B) Patients Currently Receiving Osmolex ER. Approve Osmolex ER for 1 year if the patient meets the following criteria (I, ii, and iii):

i. Osmolex ER is prescribed by or in consultation with a neurologist; AND

ii. Patient has tried immediate-release amantadine capsules, tablets, or oral solution and meets ONE of the following criteria (a or b):

a) Patient derived benefit from IR amantadine but had intolerable adverse events, as determined by the prescriber; OR

b) Patient could not achieve a high enough dosage to gain adequate benefit, as determined by the prescriber; AND

iii. Patient has had a response to therapy (e.g., decrease in dyskinesia), as determined by the prescriber.

148. Drug-Induced Extrapyramidal Reactions. Approve for the duration noted below if patient meets ONE of the following (A or B):

A) Initial Therapy. Approve Osmolex ER for 3 months if the patient meets the following criteria (i and ii):

i. Osmolex ER is prescribed by or in consultation with a neurologist; AND

ii. Patient has tried immediate-release amantadine capsules, tablets, or oral solution and meets ONE of the following criteria (a or b):

a) Patient derived benefit from IR amantadine but had intolerable adverse events, as determined by the prescriber; OR

b) Patient could not achieve a high enough dosage to gain adequate benefit, as determined by the prescriber.

B) Patients Currently Receiving Osmolex ER. Approve Osmolex ER for 1 year if the patient meets the following criteria (i, ii, and iii):

i. Osmolex ER is prescribed by or in consultation with a neurologist; AND

ii. Patient has tried immediate-release amantadine capsules, tablets, or oral solution and meets ONE of the following criteria (a or b):

a) Patient derived benefit from IR amantadine but had intolerable adverse events, as determined by the prescriber; OR
b) Patient could not achieve a high enough dosage to gain adequate benefit, as determined by the prescriber; AND

iii. Patient has had a response to therapy (e.g., decrease in extrapyramidal reactions), as determined by the prescriber.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Amantadine extended-release products have not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

99. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Parkinson's Disease – Kynmobi Prior Authorization Policy

- Kynmobi™ (apomorphine sublingual film – Sunovion Pharmaceuticals)

REVIEW DATE: 07/15/2020; selected revision 08/19/2020

OVERVIEW

Kynmobi, a non-ergoline dopamine agonist, is indicated for the acute, intermittent treatment of "off" episodes in patients with Parkinson's disease.[1]

Guidelines

The American Academy of Neurology published guidelines in 2006 on the treatment of Parkinson's disease with motor fluctuations and dyskinesia.[2] The guidelines are dated and do not include more recently approved medications, including Kynmobi. It is recommended to offer entacapone and rasagiline to reduce "off" time (Level A). Pergolide

(withdrawn from the market in 2007 due to risk of valvular fibrosis), pramipexole, ropinirole, and tolcapone (used with caution; requires monitoring for hepatotoxicity) should be considered to reduce "off" time (Level B). Apokyn® (apomorphine hydrochloride injection), cabergoline, and selegiline may be used to reduce "off" time (Level C). According to the guidelines, the available evidence does not establish superiority of one medication over another in reducing "off" time (Level B). Sustained-release levodopa/carbidopa and bromocriptine should not be considered to reduce "off" time (Level C). Amantadine may be used to reduce dyskinesia (Level C).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Kynmobi. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Kynmobi as well as the monitoring required for adverse events and long-term efficacy, approval requires Kynmobi to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Kynmobi is recommended in those who meet the following criteria:

FDA-Approved Indications

245. Parkinson's Disease. Approve for 1 year if patient meets all of the following criteria (A, B, C, D, and E):

- **A)** Patient is diagnosed with advanced Parkinson's disease; AND
- **B)** Patient is experiencing "off" episodes such as muscle stiffness, slow movements, or difficulty starting movements; AND
- **C)** Patient is currently receiving carbidopa/levodopa therapy; AND
- **D)** Patient has previously tried one other treatment for "off" episodes and meets ONE of the following criteria (i or ii):
  - **i.** Patient had significant intolerance, according to the prescriber; OR
  - **ii.** Patient had inadequate efficacy, according to the prescriber; AND

  Note: Examples of treatment for "off" episodes include entacapone, rasagiline, pramipexole, ropinirole, tolcapone, cabergoline, Ongentys, selegiline, Xadago.
- **E)** Kynmobi is prescribed by or in consultation with a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Kynmobi is not recommended in the following situations:

219. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Parkinson's Disease – Ongentys Prior Authorization Policy
- Ongentys® (opicapone capsules – Neurocrine Biosciences)

REVIEW DATE: 07/15/2020; selected revision 08/19/2020

OVERVIEW
Ongentys, a peripheral, selective and reversible catechol-o-methyltransferase inhibitor, is indicated for adjunctive treatment to levodopa/carbidopa in patients with Parkinson's disease experiencing "off" episodes.[1]

Guidelines
The American Academy of Neurology published guidelines in 2006 on the treatment of Parkinson's disease with motor fluctuations and dyskinesia.[2] The guidelines are dated and do not include more recently approved medications, including Ongentys. It is recommended to offer entacapone and rasagiline to reduce "off" time (Level A). Pergolide (withdrawn from the market in 2007 due to risk of valvular fibrosis), pramipexole, ropinirole, and tolcapone (used with caution; requires monitoring for hepatotoxicity) should be considered to reduce "off" time (Level B). Apokyn® (apomorphine hydrochloride injection), cabergoline, and selegiline may be used to reduce "off" time (Level C). According to the guidelines, the available evidence does not establish superiority of one medication over another in reducing "off" time (Level B). Sustained-release levodopa/carbidopa and bromocriptine should not be considered to reduce "off" time (Level C). Amantadine may be used to reduce dyskinesia (Level C).

POLICY STATEMENT
Prior Authorization is recommended for prescription benefit coverage of Ongentys. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Ongentys as well as the monitoring required for adverse events and long-term efficacy, approval requires Ongentys to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Ongentys is recommended in those who meet the following criteria:

FDA-Approved Indications

246. Parkinson's Disease. Approve for 1 year if the patient meets all of the following criteria (A, B, and C):
- **A)** Patient is currently receiving carbidopa/levodopa therapy; AND
- **B)** Patient meets ONE of the following criteria (i or ii):
  - **i.** Patient has tried an entacapone product and meets ONE of the following criteria (a or b):
    - **a)** Patient had significant intolerance, according to the prescriber; OR
    - **b)** Patient had inadequate efficacy, according to the prescriber; OR
  - **ii.** Patient is currently receiving Ongentys; AND
- **C)** Ongentys is prescribed by or in consultation with a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Coverage of Ongentys is not recommended in the following situations:

220. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Pegylated Interferons
- Pegasys® (peginterferon alfa-2a injection for subcutaneous use – Hoffman-La Roche/Genentech)
- PegIntron® (peginterferon alfa-2b injection for subcutaneous use – Schering)

APPROVAL DATE: 08/28/2019

OVERVIEW
Pegasys and PegIntron are pegylated interferons (peginterferons) indicated for the treatment of chronic hepatitis C virus (HCV) infection in adults and children.[1-2] The standard of care in hepatitis C is rapidly evolving and the place in therapy for peginterferon very small. The approval of direct-acting antiviral agents (DAAs) has eliminated the need for peginterferon in the majority of patients. Because none of the DAAs are indicated in pediatric patients, peginterferons still have a role in the treatment of pediatric patients with HCV. In the past, the standard of care for patients with HCV consisted of peginterferon and ribavirin (PR) generally administered for 24 to 48 weeks depending on patient factors and genotype.

Clinical Efficacy Data
The clinical efficacy of peginterferon(in combination with ribavirin) has been demonstrated in a variety of clinical settings: treatment-naïve patients, patients previously treated with peginterferon or interferon for hepatitis C, pediatric patients with hepatitis C, and in other special populations including patients with human immunodeficiency virus (HIV) co-infection, cirrhosis/fibrosis, and in patients slow to respond to therapy. In addition, the peginterferons have also been studied in combination with the DAAs (these studies are detailed in the *Hepatitis C Direct-Acting Antiviral Therapy Class Summary*).

None of the DAAs are indicated in pediatric patients < 18 years of age. Pegasys (alone or in combination with ribavirin) and PegIntron (in combination with ribavirin) are indicated for the treatment of chronic HCV in patients ≥ 5 years and ≥ 3 years of age, respectively with compensated liver disease previously untreated with interferon alfa.[1-2] Limited data are available for retreatment in children.

Guidelines
For a summary of American Association for the Study of Liver Diseases (AASLD) guidelines please see *Hepatitis C Direct-Acting Antiviral Therapy Class Summary*. In summary, peginterferons are no longer recommended.[3]

The North American Society for Pediatric Gastroenterology, Hepatology and Nutrition (NASPGHAN) practice guidelines for the diagnosis and management of hepatitis C infection in infants, children and adolescents (2012) recommend that children with hepatitis C who demonstrate persistently elevated serum aminotransferases or those with progressive disease (i.e., liver fibrosis) should be considered for treatment.[4]

The NASPGHAN guidelines state that the recommended therapy for children ages 3 to 17 years of age is with PR. The recommended length of therapy is 48 weeks for children with genotype 1 or 4 CHC and 24 weeks for genotype 2 or 3 CHC. In children and adolescents, NASPGHAN recognizes that although rare in children, pediatric liver transplant recipients for end-stage liver disease (ESLD) due to chronic HCV demonstrate allograft survival rates of 72% and 55%, respectively, at 5 years.[4] Following re-transplantation, these rates decrease to 55% and 34%, respectively. The risk of HCV recurrence in pediatric orthotopic liver transplant recipients is high and is associated with a high rate of re-transplantation. If a decision is made to treat pediatric liver transplant recipients, very close monitoring is warranted.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Pegasys and PegIntron (collectively referred to as "peginterferons" in these criteria) for HCV infection. The intent of this policy is to provide recommendations for use in hepatitis C *only*. Because of the specialized skills required for evaluation and diagnosis of patients treated with the peginterferons as well as the monitoring required for adverse events (AEs) and efficacy, approval requires peginterferons to be prescribed by or in consultation with a gastroenterologist, hepatologist, infectious diseases physician, or liver transplant physician. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Pegasys and PegIntron ("peginterferon[s]") is recommended in patients who meet one of the criteria below (1 through 6).

FDA-Approved Indications

1. **Chronic Hepatitis C Virus (HCV) Genotype 1, 2, 3, 4, 5, or 6.** Approve peginterferon for up to 48 weeks in patients who meet ALL of the following criteria (A, B, and C):
   - **A)** The patient is ≥ 2 years of age; AND
   - **B)** Peginterferon is prescribed by or in consultation with a gastroenterologist, hepatologist, infectious diseases physician, or liver transplant physician; AND
   - **C)** Peginterferon is prescribed in combination with ribavirin.

Other Uses with Supportive Evidence (in the Treatment of Hepatitis C)

2. **Recurrent Hepatitis C Virus (HCV) Post-Liver Transplantation, Pediatric and Adolescent (≥ 2 years and ≤ 17 years of age).** Approve peginterferon for 48 weeks in patients who meet ALL of the following criteria (A, B, and C):
   - **A)** The patient is ≥ 2 years of age and < 17 years of age; AND
   - **B)** Peginterferon is prescribed by or in consultation with one of the following prescribers who is affiliated with a transplant center: a gastroenterologist, hepatologist, infectious diseases physician, or liver transplant physician; AND
   - **C)** Peginterferon is prescribed in combination with ribavirin unless there is a contraindication or intolerance to ribavirin according to the prescribing physician.

In the opinion of specialist physicians reviewing the data, we have adopted these criteria.

3. **Chronic Hepatitis C Virus (HCV) – Awaiting Liver Transplantation, Any Viral Genotype - Pediatric and Adolescents (≥ 2 years and ≤ 17 years of age).** Approve peginterferon for 12 months in patients who meet ALL of the following criteria (A, B, and C).
   A) The patient is ≥ 2 years of age and ≤ 17 years of age; AND
   B) Peginterferon is prescribed by or in consultation with one of the following prescribers who is affiliated with a liver transplant center: a gastroenterologist, hepatologist, infectious diseases physician, or liver transplant physician; AND
   C) Peginterferon is prescribed in combination with ribavirin unless there is a contraindication or intolerance to ribavirin according to the prescribing physician.

4. **Patient has Been Started on Pegasys.** Approve for an indication or condition addressed as an approval in the Recommended Authorization Criteria section (FDA-Approved Indications or Other Uses with Supportive Evidence). Authorization duration will vary based on the indication but should not exceed a total duration of 12 months.

5. **Patient has Been Started on PegIntron.** Approve for an indication or condition addressed as an approval in the Recommended Authorization Criteria section (FDA-Approved Indications or Other Uses with Supportive Evidence). Authorization duration will vary based on the indication but should not exceed a total duration of 12 months.

6. **Indications other than Hepatitis C.** Approve for 12 months. Pegasys and PegIntron have been used for many off-label indications in adults and for few indications in children.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

The peginterferons have not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

1. **Hepatitis C Virus (HCV), Maintenance Therapy.** Evidence does not support use. Major published trials have failed to demonstrate a consistent benefit of maintenance therapy in the prevention of hepatocellular carcinoma (HCC).[3-7]

   In the opinion of a specialist physician reviewing the data, we have adopted this criterion.

2. **Life Expectancy < 12 Months Due to Non-Liver Related Co-Morbidities.** Patients with a limited life expectancy that cannot be remediated by HCV treatment, liver transplantation, or another directed therapy do not require antiviral treatment.[3] Patients with a short life expectancy owing to liver disease should be managed in consultation with an expert. Little evidence exists to support initiation of HCV treatment in patients with a limited life expectancy (< 12 months) owing to non-liver-related comorbid conditions. For these patients, the benefits of HCV treatment are unlikely to be realized and palliative care strategies should take precedence.

PRIOR AUTHORIZATION POLICY

POLICY: Phenylketonuria – Kuvan® (sapropterin dihydrochloride tablets and powder for oral solution – BioMarin Pharmaceuticals) Prior Authorization Policy

REVIEW DATE: 06/17/2020

OVERVIEW

Kuvan is indicated to reduce blood phenylalanine (Phe) levels in patients with hyperphenylalaninemia (HPA) due to tetrahydrobiopterin-(BH4) responsive phenylketonuria (PKU).[1] The medication should be used with a Phe-restricted diet. Kuvan works by increasing phenylalanine hydroxylase (PAH). It is a synthetic preparation of naturally occurring BH4, which is a cofactor for the enzyme PAH. PAH hydroxylates Phe in an oxidative reaction to form tyrosine. In patients with PKU, PAH activity is deficient or absent. Treatment with BH4 can activate residual PAH enzyme, improve the normal oxidative metabolism of Phe, and decrease Phe levels in some patients.

PKU is the most prevalent disorder due to an inborn error in amino acid metabolism.[3] It is caused by mutations in the PAH gene.[3] The annual incidence is about 1:15,000 births in the US. Genotypes of the disease range from a mild increase in blood Phe concentrations to a severe classic phenotype with very pronounced increases in HPA, which if not treated, can result in profound and irreversible mental disability.[3] Dietary restrictions in Phe are a mainstay in PKU management. Patients with PKU have to intake Phe-free formula and avoid foods that are protein-rich (e.g., meats, fish, eggs, standard bread, most cheeses, nuts and seeds). Other foods and beverages that contain aspartame, flour, soy, beer, or cream should be avoided. Low-protein foods that are natural may be consumed in restricted amounts, such as potatoes, some vegetables, and most cereals. During infancy, adherence to dietary restrictions is more manageable but as children grow older and become adults the dietary limitations can become burdensome.

Dose Titration

In patients with PKU who are responsive to treatment, blood Phe levels decrease within 24 hours after administration, although maximal effect on Phe levels may take up to 1 month. Blood Phe levels should be checked after 1 week of treatment and periodically for 1 month. If blood Phe does not decrease from baseline at the 10 mg/kg/day dose, the dose may be increased to 20 mg/kg/day. Patients whose blood Phe does not decrease after 1 month of treatment at 20 mg/kg/day are non-responders and treatment with Kuvan

should be discontinued. Once responsiveness has been determined, the dose may be adjusted within the range of 5 to 20 mg/kg/day.

Guidelines/Recommendations

According to the European guidelines for phenylketonuria (2017), there is consensus in the literature that patients with blood phenylalanine concentration > 600 µmol/L should be treated.[8] There is also consensus that patients with blood Phe concentration < 360 µmol/L can remain untreated, but should be monitored. Patients with blood Phe concentration between 360 to 600 µmol/L should be treated until 12 years of age. Treatment for life is recommended for any patient with PKU; however, it is also noted that patients ≥ 12 years of age with blood Phe concentration < 600 µmol/L do not require treatment. All adults with PKU should have lifelong systematic follow-ups in specialized metabolic centers, due to specific risks which may occur during adulthood. With regards to target Phe levels, in treated PKU patients up to 12 years of age, the target Phe levels should be 120 to 360 µmol/L; in treated PKU patients ≥ 12 years of age, the target Phe levels should be 120 to 600 µmol/L.

The American College of Medical Genetics and Genomics (ACMG) published practice guidelines (2014) for the diagnosis and management of PAH deficiency.[9] The guidelines recommend initiating treatment as early as possible, preferably within the first week of life with a goal of having blood Phe levels in the treatment range within the first 2 weeks. Dietary restriction of Phe intake is the mainstay of therapy for PKU. Blood Phe levels in all patients should be maintained in the range of 120 to 360 µmol/L. Newly diagnosed infants should be monitored at least weekly for their levels at least until 1 year of age. For children 1 through 12 years of age, biweekly to monthly monitoring of levels is adequate and for adolescents and adults who are stable and well-controlled, monthly testing is usually adequate. The guidelines state that approximately 25% to 50% of patients with PAH deficiency are responsive to Kuvan. A significant decline in blood Phe level is expected in responders once treatment is initiated (with Phe-restricted diet); however, patients in the lower end of the treatment range (≤ 180 µmol/L) rarely show a decrease in blood Phe level even if they are responsive to Kuvan. In these patients, responsiveness is determined by adding Phe to the diet in a stepwise method. An improvement in neuropsychiatric symptoms or increase in Phe tolerance without a decrease in blood Phe levels is sufficient reasoning to continue therapy. According to the guidelines, there is strong evidence to support life-long treatment and maintenance of metabolic control in patients with PAH deficiency.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Kuvan tablets and powder for oral solution. Because of the specialized skills required for evaluation and diagnosis of patients treated with Kuvan as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Kuvan to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for 1 year in duration unless otherwise noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Kuvan tablets or Kuvan powder for oral solution is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Phenylketonuria.** Approve for the duration noted if the patient meets the following criteria (A or B):
   - **A)** Initial Therapy: Approve for 12 weeks if the patient meets the following criteria (i and ii):
     - **i.** Kuvan is prescribed in conjunction with a phenylalanine (Phe)-restricted diet; AND
     - **ii.** The medication is prescribed by or in consultation with a metabolic disease specialist (or specialist who focuses in the treatment of metabolic diseases).
   - **B)** Patients Continuing Therapy: Approve for 1 year if the patient meets the following criteria (i and ii):

     Note: Patients who have received < 12 weeks of therapy or those who are restarting therapy with Kuvan should be considered under criterion 1A (Phenylketonuria – Initial Therapy).
     - **i.** The patient meets one of the following (a, b, or c):
       - **a)** The patient has had a clinical response (e.g., cognitive and/or behavioral improvements) as determined by the prescriber; OR
       - **b)** The patient has achieved a ≥ 20% reduction in blood phenylalanine concentration from pre-treatment baseline (i.e., blood phenylalanine concentration before starting Kuvan therapy); OR
       - **c)** Treatment with Kuvan has resulted in an increase in dietary phenylalanine tolerance, according to the prescriber; AND
     - **ii.** The patient is not receiving concomitant Palynziq.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Kuvan has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

10. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

POLICY: Phenylketonuria – Palynziq® (pegvaliase-pqpz injection for subcutaneous use – BioMarin Pharmaceuticals) Prior Authorization Policy

REVIEW DATE: 06/17/2020

OVERVIEW

Palynziq is indicated to reduce blood phenylalanine concentrations in adult patients with phenylketonuria (PKU) who have uncontrolled blood phenylalanine concentrations greater than 600 micromol/L (µmol/L) on existing management.[1] Treatment with Palynziq should be managed by a healthcare provider experienced in the management of PKU. Baseline blood phenylalanine concentrations should be obtained before initiating treatment.

Dose Titration

Palynziq is titrated up over a period of 9 weeks to the maintenance dose of 20 mg administered subcutaneously (SC) once daily (QD). Therapeutic response may not be achieved until the patient is titrated to an effective maintenance dosage. Palynziq 20 mg SC QD should be maintained for at least 24 weeks. The dose can be increased to a maximum dose of Palynziq 40 mg SC QD in patients who have been maintained continuously on the 20 mg QD dose for at least 24 weeks and who have not achieved either a 20% reduction in blood phenylalanine concentration from pre-treatment baseline levels or a blood phenylalanine concentration ≤ 600 µmol/L. Palynziq should be discontinued in patients who have not achieved a response after 16 weeks of continuous treatment with the maximum dosage of 40 mg QD. In patients who experience blood phenylalanine concentrations < 30 µmol/L during the titration and maintenance phase, the dosage of Palynziq may be reduced and/or dietary protein and phenylalanine intake may be modified to maintain phenylalanine levels within a clinically acceptable range and above 30 µmol/L. Because of the risk of anaphylaxis Palynziq is available only through a restricted Risk Evaluation and Mitigation Strategy (REMS) program. It was unclear from the Palynziq clinical trials if all patients had tried and were non-responders to Kuvan.

Guidelines/Recommendations

The American College of Medical Genetics and Genomics (ACMG) published practice guidelines (2014) for the diagnosis and management of phenylalanine hydroxylase (PAH) deficiency.[2] The guidelines recommend initiating treatment as early as possible, preferably within the first week of life. Dietary restriction of phenylalanine intake is the mainstay of therapy for PKU. Blood phenylalanine levels in all patients should be maintained in the range of 120 to 360 µmol/L. The guidelines state that approximately 25% to 50% of patients with PAH deficiency are responsive to Kuvan™ (sapropterin dihydrochloride tablets and powder for oral solution). A significant decline in blood phenylalanine level is expected in responders once treatment is initiated (with phenylalanine-restricted diet). An improvement in neuropsychiatric symptoms or increase in phenylalanine tolerance without a decrease in blood levels is sufficient reasoning to continue therapy. According to the guidelines, there is strong evidence to support life-long treatment and maintenance of metabolic control in patients with PAH deficiency.

According to the European guidelines for phenylketonuria (2017), there is consensus in the literature that patients with blood phenylalanine concentration > 600 µmol/L should be treated.[3] There is also consensus that patients with blood Phe concentration < 360 µmol/L can remain untreated, but should be monitored. Patients with blood Phe concentration between 360 to 600 µmol/L should be treated until 12 years of age. Treatment for life is recommended for any patient with PKU; however, it is also noted that patients ≥ 12 years of age with blood Phe concentration < 600 µmol/L do not require treatment. All adults with PKU

should have lifelong systematic follow-ups in specialized metabolic centers, due to specific risks which may occur during adulthood. With regards to target Phe levels, in treated PKU patients up to 12 years of age, the target Phe levels should be 120 to 360 µmol/L; in treated PKU patients ≥ 12 years of age, the target Phe levels should be 120 to 600 µmol/L.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Palynziq. Because of the specialized skills required for evaluation and diagnosis of patients treated with Palynziq as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Palynziq to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for 1 year in duration unless otherwise noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Palynziq is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Phenylketonuria.** Approve for the duration noted if the patient meets one of the following (A or B):
   - **A)** Initial Therapy: Approve for 1 year if the patient meets the following criteria (i, ii, and iii):
     - **i.** The patient is ≥ 18 years of age; AND
     - **ii.** The patient has uncontrolled blood phenylalanine concentrations greater than 600 micromol/L on at least one existing treatment modality; AND
       Note: Examples of treatment modalities include restriction of dietary phenylalanine and protein intake and prior treatment with Kuvan (sapropterin dihydrochloride tablets and powder for oral solution).
     - **iii.** The medication is prescribed by or in consultation with a metabolic disease specialist (or specialist who focuses in the treatment of metabolic diseases).
   - **B)** Patients Continuing Therapy: Approve for 1 year if the patient meets the following criteria (i, ii, and iii):
     Note: Patients who have received < 1 year of therapy or those who are restarting therapy with Palynziq should be considered under criterion 1 (Phenylketonuria – Initial Therapy).
     - **i.** The patient is ≥ 18 years of age; AND
     - **ii.** The patient meets one of the following (a or b):
       - **a)** The patient's blood phenylalanine concentration is ≤ 600 micromol/L; OR
       - **b)** The patient has achieved a ≥ 20% reduction in blood phenylalanine concentration from pre-treatment baseline (i.e., blood phenylalanine concentration before starting Palynziq therapy); AND
     - **iii.** The patient is not receiving concomitant therapy with sapropterin dihydrochloride (Kuvan).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Palynziq has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-

coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

11. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Pheochromocytoma

- Demser® (metyrosine capsules – Pharmaceutics International/Valeant/Aton Pharma)
- Phenoxybenzamine capsules (Dibenzyline® – Concordia Pharmaceuticals, generics)

APPROVAL DATE: 08/28/2019

OVERVIEW

Demser, a tyrosine hydroxylate inhibitor, is indicated in the treatment of pheochromocytoma for: 1) preoperative preparation of patients for surgery; 2) management of patients when surgery is contraindicated; and 3) chronic treatment of patients with malignant pheochromocytoma.[1] Blocking tyrosine hydroxylase results in decreased endogenous levels of catecholamines (e.g., epinephrine, norepinephrine, and dopamine). The recommended initial dose of Desmer for adults and children aged ≥ 12 years is 250 mg four times daily. This may be increased by 250 to 500 mg every day to a maximum of 4.0 grams/day in divided doses. When used for preoperative preparation, the optimally effective dose of Demser should be administered for at least 5 to 7 days. Optimally effective dosages for Demser are usually between 2.0 and 3.0 grams/day, and the dose should be titrated by monitoring clinical symptoms and catecholamine excretion. In those who are hypotensive, the dosage should be titrated to achieve normalization of blood pressure and control of clinical symptoms. In those who are usually normotensive, the dose should be titrated to the amount that will reduce urinary metanephrines and/or vanillylmandelic acid by ≥ 50%. If patients are not adequately controlled by the use of Demser, an alpha-adrenergic blocking agent (e.g., phenoxybenazmine) should be added.

Phenoxybenzamine (Dibenzyline®, generics), a long-acting, adrenergic, alpha-receptor blocking agent, is indicated for the treatment of pheochromocytoma to control episodes of hypertension and sweating. If tachycardia is excessive, it may be necessary to use a beta-blocking agent concomitantly.[2] The dose should be adjusted to meet the needs of each patient. Small initial doses should be slowly increased until the desired effect is achieved or the adverse events (AEs) from blockage become troublesome. After each increase, the patient should be observed on that level before instituting another increase.

Disease Overview

Pheochromocytoma is a tumor that arises from adrenomedullary chromaffin cells that produce catecholamines such as epinephrine, norepinephrine, and dopamine.[3-5] Some of the tumors are malignant. This condition is uncommon and the reported prevalence is up to 0.6% of patients with general hypertension. The catecholamine secretion may cause hypertension, along with other symptoms such as diaphoresis, headache, palpitations, tachycardia, syncope, and anxiety. For some patients measures must be taken to avoid hypertensive crisis.[3-5] Some genetic syndromes associated with phenochromocytoma include multiple endocrine neoplasia type 2 (MEN2), von Hippel-Lindau syndrome, and neurofibromatosis type 1.[5] Certain foods and beverage contain tyramine which may exacerbate uncontrolled catecholamine release in patients with pheochromocytoma (e.g., chocolate, aged cheese, certain wines). Tumors may also be malignant and require surgical resection, radiation therapy, or chemotherapy.[5] Phenoxybenzamine and Demser are FDA-approved for use in pheochromocytoma.[1-2] Although not indicated, short-acting alpha adrenergic blockers (e.g., doxazosin, prazosin, and terazosin) have also been used.[5-7] Beta-blockers (e.g., atenolol, metoprolol, propranolol) are also utilized, especially in patients with tachycardia or hypertension following alpha-blockade therapy. Dihydropyridine calcium channel blockers (e.g., amlodipine, nifedipine or nicardipine) are also used for preoperative preparation as an adjunctive therapy to alpha-adrenergic blockers).[5] Although only available as an injection, phentolamine, an alpha-adrenergic blocker, is indicated for the prevention and control of hypertensive episodes that may occur in a patient with pheochromocytoma as a result of stress or manipulation during preoperative preparation and surgical excision.[8] Also, phentolamine injection is indicated for the diagnosis of pheochromocytoma by the phentolamine blocking test.

Guidelines

A clinical practice guideline was published in 2014 from the Endocrine Society regarding from pheochromocytoma and paraganglioma.[3] The guidelines recommend preoperative alpha$_1$-adrenergic receptor blockers as the first choice to control blood pressure and prevent a hypertensive crisis. Both selective and non-selective alpha-blockers have been used (e.g., phenoxybenzamine, doxazosin, prazosin, and terazosin). Calcium channel blockers are the most often used add-on drug class to further improve blood pressure control in patients already treated with alpha-adrenergic receptor blockers. Preoperative co-administration of beta-adrenergic receptor blockers (e.g., atenolol, metoprolol, and propranolol) is utilized to control tachycardia after administration of alpha-adrenergic receptor blockers. Demser may be used in combination with alpha-adrenergic receptor blockers for a short period before surgery to further stabilize blood pressure to reduce blood loss and volume depletion during surgery.

The National Comprehensive Cancer Network guidelines for Neuroendocrine and Adrenal Tumors (Version 1.2019 – March 5, 2019) address pheochromocytoma and paragangliomas.[9] Alpha blockade (e.g., terazosin, doxazosin, and prazosin) is recommended first-line for all hormonally-secreting pheochromocytomas and paragangliomas. After alpha blockade, if additional blood pressure support is required, the additional of dihydropyridine calcium channel blockers can be considered. Metyrosine can be used in addition to alpha blockage to stabilize blood pressure.

Safety

Demser is associated with AEs that include severe central nervous system (CNS) changes (e.g., sedation [moderate to severe], changes in sleep pattern with medication withdrawal), extrapyramidal effects (e.g., dropping, speech difficulty, and tremor), anxiety, psychic disturbances (e.g., hallucinations, depression, confusion), diarrhea, and crystalluria. User Demser cautiously if the patient is receiving phenothiazines or haloperidol because the extrapyramidal effects of these medications may be potentiated by inhibition of catecholamine synthesis. Also, use of Demser with alcohol or other CNS depressants may increase the sedative effects. The safety and effectiveness of Demser is pediatric patients below the age of 12 years have not been established. Demser is rated in Pregnancy Category C. AEs associated with

phenoxybenzamine include those of the autonomic nervous system (e.g., postural hypotension, tachycardia, nasal congestion and miosis).

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Demser and phenoxybenzamine. All approvals are provided for the duration noted below. Due to the specialized skills required for evaluation and diagnosis of patients treated with Demser and phenoxybenzamine, as well as the monitoring required for AEs and long-term efficacy, approval requires these agents to be prescribed by or in consultation with a prescriber who specializes in the condition being treated.

Automation: None.

Documentation: Documentation will be required where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes, prescription claims records, and prescription receipts.

RECOMMENDED AUTHORIZATION CRITERIA

I. Coverage of phenoxybenzamine is recommended in those who meet the following criteria:

FDA-Approved Indications

3. Pheochromocytoma. Approve phenoxybenzamine for 1 year if the patient meets the following criteria (A and B):

H) The agent is prescribed by, or in consultation with, an endocrinologist or a physician who specializes in the management of pheochromocytoma; AND

I) If brand Dibenzyline is requested, the patient has tried AND cannot take generic phenoxybenzamine due to a formulation difference in the inactive ingredient(s) (e.g., difference in dyes, fillers, preservatives) between the brand and the bioequivalent generic product which, according to the prescriber, would result in a significant allergy or a serious adverse reaction **[documentation required]**.

II. Coverage of Demser is recommended in those who meet the following criteria:

FDA-Approved Indications

1. Pheochromocytoma.

A) Initial therapy. Approve Demser for 1 year if the patient meets all of the following criteria (i, ii, and iii):

i. The patient has tried a selective alpha blocker (e.g., doxazosin, terazosin or prazosin); AND

ii. The patient has tried phenoxybenzamine (brand or generic); AND

iii. Demser is prescribed by, or in consultation with, an endocrinologist or a physician who specializes in the management of pheochromocytoma.

B) Patient is currently receiving Demser or has received Demser in the past. Approve for 1 year if Demser is prescribed by, or in consultation with, an endocrinologist or a physician who specializes in the management of pheochromocytoma.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Demser and phenoxybenzamine have not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below.

100. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

OVERVIEW OF DISEASE STATE FOR PRIOR AUTHORIZATION DOCUMENT

Subject: Biologics for Plaque Psoriasis

Date Reviewed: December 22, 2014

Psoriasis is a multisystem disease that affects the skin and joints.[1-2] It is a chronic inflammatory skin disease with scaly, erythematous patches, papules, and plaques and is often pruritic. It affects > 3% of persons in the US (> 5 million people).[3] The disease primarily affects adults and occurs equally in men and women.[1-2] In plaque psoriasis, the most common form of psoriasis (80% to 90% of patients), there are patches of thick, inflamed skin covered with a silvery scale that can cause significant pain and discomfort. These plaques usually occur on the elbows, knees, legs, scalp, lower back, trunk and buttocks. Psoriasis may also affect the fingernails, toenails, soft tissues of the genitals, and inside the mouth. About 80% of patients have mild to moderate disease and 20% have moderate to severe psoriasis affecting more than 5% of body surface area (BSA) or areas such as the palms of the hands, soles the feet, face or genitals.[1] About 1 million of the people with psoriasis also have psoriatic arthritis (PsA). Triggers that may cause flare-ups of psoriasis include infections, stress, medications (e.g., lithium, beta adrenergic blockers), and changes that dry the skin. Other forms of psoriasis besides plaque type include guttate, pustular, inverse, and erythrodermic. Psoriasis may be associated with considerable physical and/or psychological disabilities. Treatment of psoriasis depends on the severity of the disease; the extent of disease (BSA involved); type of psoriasis; location of the lesions; symptoms; the patient's response to previous therapy; accessibility to a

dermatologist, hospital, and ultraviolet (UV) light facilities; and co-morbid disease states. Since psoriasis is a chronic disease, long-term safety of medications must be considered.

For plaque psoriasis, if the disease is limited, topical therapies with corticosteroids, vitamin D analogs (e.g., calcipotriene calcitriol), Taclonex® (betamethasone diproprionate/calcipotriene), Tazorac® (tazarotene), anthralin, coal tar preparations, keratolytics (salicylic acid, lactic acid, urea), topical moisturizers and combinations or sequential use of these topical therapies are indicated.[2,5] However, for patients with chronic plaque psoriasis that does not respond to topical therapies or patients with more extensive disease, systemic therapy may be used. The traditional systemic agents for plaque psoriasis are methotrexate (MTX), Soriatane® (acitretin tablets), and cyclosporine.[5] These medications may have significant adverse effects (e.g., hepatotoxicity, nephrotoxicity, teratogenicity). Other systemic agents have been investigated in psoriasis (e.g., azathioprine, tacrolimus, and mycophenolate mofetil). Phototherapy (e.g., ultraviolet B [UVB]) and photochemotherapy (psoralen and ultraviolet A **[**UVA] light [PUVA]) may also be used.[6-7] Soriatane is a first-line systemic agent for patients with chronic palmoplantar or pustular psoriasis, but it has a limited role in patients with plaque psoriasis.[7] Cyclosporine is a fast-acting agent commonly used for certain types of pustular or erythrodermic psoriasis. Cyclosporine is also used intermittently (up to 12 weeks) to control psoriasis flares. MTX may be used for plaque psoriasis; compared to cyclosporine, MTX has a moderate effect but can be used long-term. The biologics have established efficacy in plaque psoriasis. Narrow band (NB) UVB can be used in the physician's office or at home and is slightly less effective than PUVA.[1,6] The injectable biologic agents, Enbrel® (etanercept for subcutaneous [SC] injection), Humira® (adalimumab for SC injection), Remicade® (infliximab for intravenous [IV] infusion), and Stelara® (ustekinumab for SC injection) are options for patients who are candidates for phototherapy or systemic therapy, especially those who are intolerant of or unresponsive to traditional systemic agents.[7] Another agent available is Otezla, an oral phosphodiesterase 4 (PDE4) inhibitor that is indicated for treatment patients with moderate to severe plaque psoriasis who are candidates for phototherapy or systemic therapy.[12]

Long-term safety is an important consideration.[7] The long-term risks of PUVA, MTX, and cyclosporine increase with cumulative dose. Safety concerns with the biologics include serious infections such as sepsis and tuberculosis, autoimmune conditions such as lupus and demyelinating disorders, and lymphoma. Patients with PsA, regardless of skin involvement, may require systemic therapy with MTX or a TNF antagonist such as Enbrel, Humira, or Remicade that are effective for both plaque psoriasis and PsA.[2] Of note, Simponi® (golimumab for SC injection) is a TNF blocker indicated for PsA, but not for plaque psoriasis.[8] Note that Otezla is also indicated in PsA, and it does not have warnings regarding serious infection and malignancy, which are listed for the biologic DMARDs approved for PsA, nor does Otezla have warnings for organ toxicity and laboratory monitoring that are noted with methotrexate (MTX) and leflunomide.[12] Warnings/Precautions for Otezla include depression, weight decrease, and drug interactions with strong cytochrome P450 inducers, and the most commonly observed adverse events (AEs) [incidence ≥ 5%] were diarrhea, nausea, and headache.

Almost all well-controlled clinical trials of psoriasis treatment include patients with chronic stable plaque psoriasis and exclude less common types of psoriasis and those involving the palms and soles, scalp, and intertriginous areas.[1]

One of the methods used to evaluate psoriasis in clinical trials is the psoriasis area-and-severity index (PASI) score.[1,9-10] The PASI ranges from 0 (no psoriasis) to 72 (the most severe disease possible) and combines the scores for the degree of erythema, induration, desquamation, and the percentage of BSA impacted. A primary endpoint in clinical trials is the PASI-75 which is ≥ 75% reduction from the baseline PASI score. Patients usually attain meaningful disease and quality of life improvements with at least a 50% decrease in PASI score.[10] Psoriasis severity (plaque, scaling, erythema) is also evaluated via global

assessments by the physician.[11] The static Physician Global Assessment (sPGA) is reported on a six- or seven-point scale (e.g., ranging from 5 = severe to 0 = none indicating the physician's overall assessment of psoriasis severity). Other dynamic PGA scales define the endpoint using scales such as "clear" or "minimal" or "almost clear". The Dermatology Life Quality Index (DLQI) has been used as a guide in patient management (e.g., for assessment of disease severity).[8]

PRIOR AUTHORIZATION POLICY

POLICY: Proprotein Convertase Subtilisin Kexin Type 9 Inhibitors – Praluent Prior Authorization Policy

- Praluent® (alirocumab injection for subcutaneous use – sanofi-aventis/Regeneron)

REVIEW DATE: 06/10/2020

OVERVIEW

Praluent, a proprotein convertase subtilisin kexin type 9 (PCSK9) inhibitor antibody, is indicated 1) to reduce the risk of myocardial infarction (MI), stroke, and unstable angina requiring hospitalization in adults with established cardiovascular disease; and 2) as an adjunct to diet, alone or in combination with other lipid-lowering therapies (e.g., statins, ezetimibe) for the treatment of adults with primary hyperlipidemia (including heterozygous familial hypercholesterolemia [HeFH]) to reduce low-density lipoprotein cholesterol (LDL-C).[1] The safety and efficacy of Praluent in children have not been established.

Clinical Data

The efficacy of Praluent was assessed in several studies which mainly involved patients at high risk (e.g., background atherosclerotic cardiovascular disease, HeFH) who received Praluent along with maximally tolerated doses of statins, with or without other lipid-modifying therapies. The LDL-C reductions when Praluent was added onto statin therapy ranged from approximately 50% to 60% at the time of the efficacy endpoint evaluations (e.g., 12 or 24 weeks). Longer-term follow-up, including extension studies, are also available.[1]

ODYSSEY Outcomes was a Phase III, multicenter, international, randomized, double-blind, placebo-controlled cardiovascular (CV) outcomes trial involving Praluent (75 or 150 mg SC once every 2 weeks [Q2W]) used in addition to maximally tolerated statin therapy (n = 18,924) for up to 5 years among patients who had experienced a recent acute coronary syndrome (ACS) event.[1,2] The trial included patients who were ≥ 40 years of age who had experienced an ACS event (acute MI [83%] or unstable angina [17%]) within 1 to 12 months prior to randomization. Those involved in the trial had inadequate control of lipids (e.g., LDL-C ≥ 70 mg/mL, non high-density lipoprotein cholesterol [non-HDL-C] ≥ 100 mg/dL) despite receipt of high-intensity statins (atorvastatin 40 mg or 80 mg daily or rosuvastatin 20 or 40 mg daily) or maximally tolerated statins, with or without other lipid-modifying therapy. The primary endpoint was the time to the first occurrence of one of the following: coronary heart disease (CHD) death, non-fatal MI, fatal or non-fatal ischemic stroke, or unstable angina that required hospitalization. Other secondary endpoints were also evaluated (CV death, all-cause death, major CHD event). The mean patients age at baseline was 59 years and the mean LDL-C was 93 mg/dL.[1,2] Most patients (89%) were receiving high-dose atorvastatin (40 to 80 mg once daily [QD]) or rosuvastatin (20 to 40 mg QD); 8.5% of patients were on low to moderate dose atorvastatin/rosuvastatin and 3% of patients were on ezetimibe (with or without statin therapy).[2] The follow-up was a median of 2.8 years. At 4 months post-randomization, the mean LDL-C levels were 37.6 mg/dL and 93.3 mg/dL (on-treatment analysis), respectively, representing an approximate 62.7% decrease in LDL-C levels with adding Praluent. The primary endpoint occurred in 9.5% of patients (n = 903/9.462) given Praluent compared with 11.1% of patients (n = 1,052/9,462) given placebo (P < 0.001).[1,2] The number needed to treat to prevent one event was 63 patients. The event rates for the percentages of patients that comprised the primary endpoint (Praluent vs. placebo) included CHD death (2.2% vs. 2.3%; P = 0.38), non-fatal MI (6.6% vs. 7.6%), ischemic stroke (1.2% vs. 1.6%), and unstable angina (0.4% vs. 0.6%). All-cause death was also lower among patients assigned to Praluent (3.5%; n = 334/9,462) compared with placebo (4.1%; n = 392/9,462).

Guidelines

Many guidelines are available regarding the treatment of patients with dyslipidemia.[3-9] For patients with elevated LDL-C, statins are the cornerstone of therapy and recommended first-line to be used at maximally tolerated doses due to the established benefits regarding the reduction of CV risks. Atorvastatin 40 mg to 80 mg QD and rosuvastatin 20 mg to 40 mg QD are considered high-intensity statins as they achieve LDL-C lowering of ≥ 50%. Other statin regimens, including atorvastatin and rosuvastatin at lower doses are classified as moderate-intensity (LDL-C reductions of 30% to 49%) products and low-intensity agents (LDL-C reductions < 30%). The American Heart Association (AHA)/American College of Cardiology (ACC) guidelines on the management of blood cholesterol (2018) defines ACSVD as ACS, those with a history of MI, stable or unstable angina or coronary or other revascularizations, stroke, transient ischemic attack (TIA), or peripheral arterial disease (PAD).[3,4] Although LDL-C thresholds are not always recognized, in general, an LDL-C < 70 mg/dL is recommended in for most patients with ASCVD to reduce CV risk. Use of a PCSK9 as an adjunct is justified if this goal is not met with maximally tolerated statins.

Additionally, guidelines and reviews have recognized that patients with a coronary artery calcium (CAC) score ≥ 300 Agatston units are at an increased risk of CV events.[10-13]

The National Lipid Association (NLA) published guidelines for the screening, diagnosis, and management of pediatric and adult patients with FH.[14] FH encompasses a group of genetic defects that cause severe elevations in LDL-C levels, as well as other lipid parameters. HeFH occurs in approximately 1 in 300 to 500 patients and is present in childhood. Total cholesterol (total-C) levels in HeFH range from 350 to 550 mg/dL, which can result in premature ASCVD. Aggressive lipid-lowering therapy is recommended to achieve LDL-C reductions of at least 50%. Both children and adults with LDL-C levels ≥ 190 mg/dL following lifestyle modifications will require medication therapy. Statins are the initial treatment for all adults with FH. High or moderate intensity statins are recommended; low potency statins are generally inadequate for patients with FH due to the markedly elevated LDL-C levels. In the pivotal trials for Praluent, HeFH was diagnosed utilizing Simon Broome criteria or Dutch Lipid Clinical Network criteria.[1] In an AHA scientific statement, it describes the Dutch Lipid Clinical Network Criteria and states that a score of > 5 on the scale makes the diagnosis of FH highly probable.[15] Also, genetic testing can reveal a diagnosis of HeFH and clinical manifestations (e.g., tendon xanthomata) are highly suggestive of the condition.[15,16] Also, patients with an untreated LDL-C ≥ 190 mg/dL suggest FH. In general, for patients with HeFH who have not yet manifested ASCVD, LDL-C levels ≤ 100 mg/dL are recommended. The addition of a PCSK9 inhibitor to statin therapy can be considered if this goal is not achieved.

In 2019 the AHA issued a scientific statement regarding statin safety and associated adverse events.[17] In general, statins are well-tolerated agents that have successfully led to decreased LDL-C levels which led to reductions in CV events (e.g., MI, ischemic stroke). The risk of serious statin-induced muscle injury (e.g., rhabdomyolysis) is low (< 0.01%). In US clinical practice, about 10% of patients stop taking statin therapy due to subjective complaints, of which muscle symptoms without significantly raised CK levels are noted. Data suggests that the muscle symptoms that occur among patients are not caused by the pharmacologic effects of the statin and restarting statin therapy for these patients is important, especially among patients at high risk of CV events, for whom CV event prevention is important. Several studies have shown that patients were believing that they were "statin intolerant". However, many patients were able to subsequently tolerate a statin upon rechallenge and receive the benefits provided with these agents. Other data supports this occurrence.[18-20]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Praluent. Because of the specialized skills required for evaluation and monitoring of this new therapy, approval requires Praluent to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for 3 years in duration.

Documentation: None required.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Praluent is recommended in those who meet the following criteria:

FDA-Approved Indications

149. Atherosclerotic Cardiovascular Disease (ASCVD) [Clinical].* Approve Praluent for 3 years if the patient meets the following criteria (A, B, C, and D):

G) The patient is ≥ 18 years of age; AND

H) The patient has had one of the following conditions or diagnoses (i, ii, iii, iv, or v):

- **i.** The patient has had a previous myocardial infarction (MI) or has a history of an acute coronary syndrome (ACS); OR
- **ii.** The patient has a diagnosis of angina (stable or unstable); OR
- **iii.** The patient has a past history of stroke or transient ischemic attack (TIA); OR
- **iv.** The patient has peripheral arterial disease (PAD); OR
- **v.** The patient has undergone a coronary or other arterial revascularization procedure in the past; AND
  Note: Examples include coronary artery bypass graft (CABG) surgery, percutaneous coronary intervention (PCI), angioplasty, and coronary stent procedures.

I) The patient meets one of the following criteria (i or ii):

- **i.** The patient meets both of the following criteria (a and b):
  - **a)** The patient has tried one high-intensity statin therapy (i.e., atorvastatin ≥ 40 mg daily; rosuvastatin ≥ 20 mg daily [as a single-entity or as a combination product]) for ≥ 8 weeks; AND
  - **b)** The low-density lipoprotein cholesterol (LDL-C) level after this treatment remains ≥ 70 mg/dL; OR
- **ii.** The patient has been determined to be statin intolerant by meeting one of the following criteria (a or b):
  - **a)** The patient experienced statin-related rhabdomyolysis; OR
    Note: Rhabdomyolysis is statin-induced muscle breakdown that is associated with markedly elevated creatine kinase (CK) levels (at least 10 times the upper limit of normal), along with evidence of end organ damage which can include signs of acute renal injury (noted by substantial increases in serum creatinine [Scr] levels [a ≥ 0.5 mg/dL increase in Scr or doubling of the Scr] and/or myoglobinuria [myoglobin present in urine]);
  - **b)** The patient meets all of the following [(1), (2), and (3)]:
    - **(1)** The patient experienced skeletal-related muscle symptoms; AND
      Note: Examples of skeletal-related muscle symptoms include myopathy (muscle weakness) or myalgia (muscle aches, soreness, stiffness, or tenderness).
    - **(2)** The skeletal-related muscle symptoms occurred while receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products); AND
    - **(3)** When receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products) the skeletal-related muscle symptoms resolved upon discontinuation of each respective statin therapy (atorvastatin and rosuvastatin); AND

J) Praluent is prescribed by, or in consultation with, a cardiologist; an endocrinologist; or a physician who focuses in the treatment of cardiovascular (CV) risk management and/or lipid disorders.

150. Heterozygous Familial Hypercholesterolemia [HeFH].* Approve Praluent for 3 years if the patient meets the following criteria (A, B, C, and D):

4. The patient is ≥ 18 years of age; AND

5. The patient meets one of the following criteria (i, ii, iii, iv, or v):

- **i.** The patient has an untreated low-density lipoprotein cholesterol (LDL-C) level ≥ 190 mg/dL (prior to treatment with antihyperlipidemic agents); OR

ii. The patient has genetic confirmation of HeFH by mutations in the low-density lipoprotein receptor (LDLR), apolipoprotein B (APOB), proprotein convertase subtilisin kexin type 9 (PCSK9) or low-density lipoprotein receptor adaptor protein 1 (LDLRAP1) gene; OR

iii. The patient has been diagnosed with HeFH meeting one of the following diagnostic criteria thresholds (a or b):

a) The prescriber used the Dutch Lipid Network criteria and the patient has a score > 5; OR

b) The prescriber used the Simon Broome criteria and the patient met the threshold for "definite" or "possible" familial hypercholesterolemia; OR

iv. The patient has a treated low-density lipoprotein cholesterol (LDL-C) level ≥ 100 mg/dL (after treatment with antihyperlipidemic agents but prior to PCSK9 inhibitor therapy such as Praluent [alirocumab injection for SC use] or Repatha [evolocumab injection for SC use]); OR

v. The patient has clinical manifestations of HeFH; AND
Note: Examples of clinical manifestations of HeFH include cutaneous xanthomas, tendon xanthomas, arcus cornea, tuberous xanthomas or xanthelasma.

6. The patient meets one of the following criteria (i or ii):

i. The patient meets both of the following criteria (a and b):

a) The patient has tried one high-intensity statin therapy (i.e., atorvastatin ≥ 40 mg daily; rosuvastatin ≥ 20 mg daily [as a single-entity or as a combination product]) for ≥ 8 continuous weeks; AND

b) The low-density lipoprotein cholesterol (LDL-C) level after this treatment remains ≥ 70 mg/dL; OR

ii. The patient has been determined to be statin intolerant by meeting one of the following criteria (a or b):

a) The patient experienced statin-related rhabdomyolysis; OR
Note: Rhabdomyolysis is statin-induced muscle breakdown that is associated with markedly elevated creatine kinase (CK) levels (at least 10 times the upper limit of normal), along with evidence of end organ damage which can include signs of acute renal injury (noted by substantial increases in serum creatinine [Scr] levels [a ≥ 0.5 mg/dL increase in Scr or doubling of the Scr] and/or myoglobinuria [myoglobin present in urine]);

b) The patient meets all of the following [(1), (2), and (3)]:

(1) The patient experienced skeletal-related muscle symptoms; AND
Note: Examples of skeletal-related muscle symptoms include myopathy (muscle weakness) or myalgia (muscle aches, soreness, stiffness, or tenderness).

(2) The skeletal-related muscle symptoms occurred while receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products); AND

(3) When receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products) the skeletal-related muscle symptoms resolved upon discontinuation of each respective statin therapy (atorvastatin and rosuvastatin); AND

7. Praluent is prescribed by, or in consultation with, a cardiologist; an endocrinologist; or a physician who focuses in the treatment of cardiovascular (CV) risk management and/or lipid disorders.

151. Primary Hyperlipidemia.* Approve Praluent for 3 years if the patient meets the following criteria (A, B, C, and D):

Note: This is not associated with atherosclerotic cardiovascular disease (ASCVD), heterozygous familial hypercholesterolemia (HeFH), or homozygous familial hypercholesterolemia (HoFH) and may be referred to as combined hyperlipidemia, hypercholesterolemia (pure, primary), dyslipidemia, or increased/elevated low-density lipoprotein cholesterol (LDL-C) levels.

A) The patient is ≥ 18 years of age; AND

B) The patient has a coronary artery calcium or calcification (CAC) score ≥ 300 Agatston units; AND

C) The patient meets one of the following criteria (i or ii):

- **i.** The patient meets all of the following criteria (a, b and c):
  - **a)** The patient has tried one high-intensity statin therapy (i.e., atorvastatin ≥ 40 mg daily; rosuvastatin ≥ 20 mg daily [as a single-entity or as a combination product]); AND
  - **b)** The patient has tried the one high-intensity statin therapy above along with ezetimibe (as a single-entity or as a combination product) for ≥ 8 continuous weeks; AND
  - **c)** The low-density lipoprotein cholesterol (LDL-C) level after this treatment regimen remains ≥ 100 mg/dL; OR
- **ii.** The patient has been determined to be statin intolerant by meeting one of the following criteria (a or b):
  - **a)** The patient experienced statin-related rhabdomyolysis; OR
    Note: Rhabdomyolysis is statin-induced muscle breakdown that is associated with markedly elevated creatine kinase (CK) levels (at least 10 times the upper limit of normal), along with evidence of end organ damage which can include signs of acute renal injury (noted by substantial increases in serum creatinine [Scr] levels [a ≥ 0.5 mg/dL increase in Scr or doubling of the Scr] and/or myoglobinuria [myoglobin present in urine]);
  - **b)** The patient meets all of the following [(1), (2), and (3)]:
    - **(1)** The patient experienced skeletal-related muscle symptoms; AND
      Note: Examples of skeletal-related muscle symptoms include myopathy (muscle weakness) or myalgia (muscle aches, soreness, stiffness or tenderness).
    - **(2)** The skeletal-related muscle symptoms occurred while receiving separate trials of both atorvastatin and rosuvastatin (as single-entity combination product); AND
    - **(3)** When receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products) the skeletal-related muscle symptoms (e.g., myopathy, myalgia) resolved upon discontinuation of each respective statin therapy (atorvastatin and rosuvastatin); AND

D) Praluent is prescribed by, or in consultation with, a cardiologist; an endocrinologist; or a physician who focuses in the treatment of cardiovascular (CV) risk management and/or lipid disorders.

Note:

* Patients may have a diagnoses that pertain to more than one FDA-approved indication, therefore, consider review under different approval conditions, if applicable. (e.g., patients with HeFH have had a clinical ASCVD event, patients with primary hyperlipidemia may have HeFH).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Praluent has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

101. Concurrent use of Praluent with Repatha® (evolocumab injection for SC use) or Juxtapid® (lomitapide capsules). Repatha is another PCSK9 inhibitor and should not be used with Praluent.[21] Juxtapid, a microsomal triglyceride transfer protein inhibitor, is indicated as an adjunct to lipid-lowering medications and diet to modify lipid parameters (e.g., reduce LDL-C levels) in patients with homozygous familial hypercholesterolemia (HoFH).[22] The efficacy and safety of Repatha or Juxtapid in combination with Praluent have not been established.

102. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

APPENDIX A.
Simon Broome Register Diagnostic Criteria[15]

Definite Familial Hypercholesterolemia:

a) Raised cholesterol
   (i) Total cholesterol greater than 6.7 mmol/L (260 mg/dL) or LDL-C > 4.0 mmol/L (155 mg/dL) in a child < 16 years;
   (ii) Total cholesterol > 7.5 mmol/L (290 mg/dL) or LDL-C > 4.9 mmol/L (190 mg/dL) in an adult (aged > 16 years);

b) AND
   (i) Tendon xanthomas in the patient or in a first (parent, sibling, or child) or second-degree relative (grandparent, aunt, or uncle);

c) OR
   (iii) DNA-based evidence of LDL-receptor, familial defective apo B-100, or PCSK9 mutation.

Possible Familial Hypercholesterolemia:

a) Raised cholesterol
   (i) Total cholesterol greater than 6.7 mmol/L (260 mg/dL) or LDL-C > 4.0 mmol/L (155 mg/dL) in a child < 16 years;
   (ii) Total cholesterol > 7.5 mmol/L (290 mg/dL) or LDL-C > 4.9 mmol/L (190 mg/dL) in an adult;

b) AND at least one of the following:
   (i) Family history of premature myocardial infarction younger than 50 years of age in second-degree relative or younger than 60 years of age in first-degree relative;

c) OR
   (i) Family history of raised cholesterol > 7.5 mmol (290 mg/dL) in adult first-degree or second-degree relative or > 6.7 mmol/L (260 mg/dL) in child or sibling aged < 16 years.

APPENDIX B.
Dutch Lipid Network Criteria for Familial Hypercholesterolemia[16]

Criteria	Score
Family History	
First-degree relative with known premature coronary and/or vascular disease (men < 55 years, women < 60 years)	1
First degree relative with known LDL-C > 95th percentile for age and sex	1
First-degree relative with tendon xanthomata and/or arcus cornealis, OR	2
Children aged < 18 years with LDL-C > 95th percentile for age and sex	2
Clinical History	
Patient with premature CAD (age as above)	2
Patient with premature cerebral or peripheral vascular disease (age as above)	1
Physical Examination	

Tendon xanthomas	6
Arcus cornealis at age < 45 years	4
LDL-C	
LDL-C ≥ 8.5 mmol/L (330 mg/dL)	8
LDL-C 6.5 to 8.4 mmol/L (250 to 329 mg/dL)	5
LDL-C 5.0 to 6.4 mmol/L (190 to 249 mg/dL)	3
LDL-C 4.0 to 4.9 mg/dL (155 to 189 mg/dL)	1
DNA analysis	
Functional mutation LDLR, APOB or PCSK9 gene	8
Stratification	**Total score**
Definite familial hypercholesterolemia	> 8
Probable familial hypercholesterolemia	6 to 8
Possible familial hypercholesterolemia	3 to 5
Unlikely familial hypercholesterolemia	< 3

LDL-C – Low-density lipoprotein cholesterol; CAD – Coronary artery disease; LDLR – Low-density lipoprotein receptor; APOB – Apolipoprotein B; PCSK9 – Proprotein convertase subtilisin kexin type 9.

PRIOR AUTHORIZATION POLICY

POLICY: Proprotein Convertase Subtilisin Kexin Type 9 Inhibitors – Repatha Prior Authorization Policy

- Repatha® (evolocumab injection for subcutaneous use [single-use prefilled syringes and Pushtronex™ system] – Amgen)

REVIEW DATE: 06/10/2020

OVERVIEW

Repatha, a proprotein convertase subtilisin kexin type 9 (PCSK9) inhibitor antibody, is indicated: 1) to reduce the risk of myocardial infarction (MI), stroke, and coronary revascularization in adults with established cardiovascular (CV) disease; 2) as an adjunct to diet, alone and in combination with other lipid-lowering therapies (e.g., statins, ezetimibe), for the treatment of adults with primary hyperlipidemia (including heterozygous familial hypercholesterolemia [HeFH]) to reduce low-density lipoprotein cholesterol (LDL-C); and 3) as an adjunct to diet and other low-density lipoprotein (LDL) therapies (e.g., statins, ezetimibe, LDL apheresis) in patients with homozygous familial hypercholesterolemia (HoFH) who require additional lowering of LDL-C.[1] The safety and effectiveness of Repatha have not been established in pediatric patients with primary hyperlipidemia or HeFH. The safety and effectiveness of Repatha have not been established in pediatric patients with HoFH aged < 13 years.

Clinical Efficacy

The efficacy of Repatha was assessed in several studies which mainly involved patients at high risk (e.g., background atherosclerotic cardiovascular disease, HeFH) who received Repatha along with maximally tolerated doses of statins, with or without other lipid-modifying therapies. The LDL-C reductions when Praluent was added onto statin therapy ranged from approximately 50% to 60% at the time of the efficacy endpoint evaluations (e.g., 12 or 24 weeks).[1] Longer-term follow-up, including extension studies, are also available.

Cardiovascular (CV) Outcomes Data

The FOURIER (Further cardiovascular OUtcomes Research with PCSK9 Inhibition in subjects with Elevated Risk) trial with Repatha was a randomized, double-blind, placebo-controlled event-driven trial involving over 27,000 patients with ASCVD with LDL-C levels ≥ 70 mg/dL.[1,2] Patients were between 40 and 85 years of age and had clinically evident ASCVD, defined as a history of MI, nonhemorrhagic stroke, or symptomatic peripheral arterial disease (PAD), as well as additional attributes that classified the patients at higher CV risk.[1,2] Patients were randomized to receive Repatha SC (either 140 mg Q2W or 420 mg QM) or placebo, in addition to background statin therapy (± ezetimibe). The primary efficacy endpoint was the composite of CV death, MI, stroke, hospitalization for unstable angina, or coronary revascularization. The average patient age was 62 years.[1,2] After 48 weeks of therapy, Repatha, in addition to background statin therapy, reduced LDL-C levels by 59% from a median baseline value of 92 mg/dL to 30 mg/dL.[2] The median duration of follow-up was 26 months. The primary endpoint occurred in 9.8% of patients (n = 1,344) randomized to Repatha plus background statin therapy compared with 11.3% of patients in the placebo group (n = 1,563) which received background statin therapy only, representing a statistically significant 15% reduction. The findings of this study suggest that lowering LDL-C levels with Repatha, in addition to continuing to receive background statin therapy, reduces the risk of adverse CV events among patients with background ASCVD. Death from any cause did not differ between the two groups (3.2% vs. 3.1%; P = 0.54).

Guidelines

Many guidelines are available regarding the treatment of patients with dyslipidemia.[3-10] For patients with elevated LDL-C, statins are the cornerstone of therapy and recommended first-line to be used at maximally tolerated doses due to the established benefits regarding the reduction of CV risks. Atorvastatin 40 mg to 80 mg QD and rosuvastatin 20 mg to 40 mg QD are considered high-intensity statins as they achieve LDL-C lowering of ≥ 50%. Other statin regimens, including atorvastatin and rosuvastatin at lower doses are classified as moderate-intensity (LDL-C reductions of 30% to 49%) products and low-intensity agents (LDL-C reductions < 30%). The American Heart Association (AHA)/American College of Cardiology (ACC) guidelines on the management of blood cholesterol (2018) defines ACSVD as ACS, those with a history of MI, stable or unstable angina or coronary or other revascularizations, stroke, TIA, or PAD.[10] Although LDL-C thresholds are not always recognized, in general, an LDL-C < 70 mg/dL is recommended in for most patients with ASCVD to reduce CV risk. Use of a PCSK9 as an adjunct is justified if this goal is not met with maximally tolerated statins.[10] Additionally, guidelines and reviews have recognized that patients with a CAC score ≥ 300 Agatston units are at an increased risk of CV events.[10-13]

In 2011, the NLA published guidelines for the screening, diagnosis, and management of pediatric and adult patients with FH.[14] FH encompasses a group of genetic defects that cause severe elevations in LDL-C levels, as well as other lipid parameters. HeFH occurs in approximately 1 in 300 to 500 patients and is present in childhood. Total cholesterol (total-C) levels in HeFH range from 350 to 550 mg/dL, which can result in premature ASCVD. Aggressive lipid-lowering therapy is recommended to achieve LDL-C reductions of at least 50%. Both children and adults with LDL-C levels ≥ 190 mg/dL following lifestyle modifications will require medication therapy. Statins are the initial treatment for all adults with FH. High or moderate intensity statins are recommended; low potency statins are generally inadequate for patients with FH due to the markedly elevated LDL-C levels. In the pivotal trials for Praluent, HeFH was diagnosed utilizing Simon Broome criteria or Dutch Lipid Clinical Network criteria.[1] In an AHA scientific statement, it describes the Dutch Lipid Clinical Network Criteria and states that a score of > 5 on the scale makes the diagnosis of FH highly probable.[15] Also, genetic testing can reveal a diagnosis of HeFH and clinical manifestations (e.g., tendon xanthomata) are highly suggestive of the condition.[23-24] Also, patients with an untreated LDL-C ≥ 190 mg/dL suggest FH.[15-17] In general, for patients with HeFH who have not yet

manifested ASCVD, LDL-C levels ≤ 100 mg/dL are recommended. The addition of a PCSK9 inhibitor to statin therapy can be considered if this goal is not achieved.

In 2019 the AHA issued a scientific statement regarding statin safety and associated adverse events.[18] In general, statins are well-tolerated agents that have successfully led to decreased LDL-C levels which led to reductions in CV events (e.g., MI, ischemic stroke). The risk of serious statin-induced muscle injury (e.g., rhabdomyolysis) is low (< 0.01%). In US clinical practice, about 10% of patients stop taking statin therapy due to subjective complaints, of which muscle symptoms without significantly raised CK levels are noted. Data suggests that the muscle symptoms that occur among patients are not caused by the pharmacologic effects of the statin and restarting statin therapy for these patients is important, especially among patients at high risk of CV events, for whom CV event prevention is important. Several studies have shown that patients were believing that they were "statin intolerant". However, many patients were able to subsequently tolerate a statin upon rechallenge and receive the benefits provided with these agents. Other data supports this occurrence.[19,20]

HoFH is a rare inherited condition in which LDL-C is not adequately removed from the body, resulting in high levels of circulating LDL-C.[14,17] The 2014 HoFH position paper from the Consensus Panel on FH of the European Atherosclerosis Society states the diagnosis of HoFH is made based on genetic or clinical criteria.[17] A definitive diagnosis can be made by genetic confirmation of two mutant alleles at the LDLR, APOB, PCSK9, or LDLRAP1 gene locus. However, in some patients genetic confirmation remains elusive. Historically, HoFH has been commonly diagnosed based on LDL-C levels such as an untreated LDL-C > 500 mg/dL, or a treated LDL-C ≥ 300 mg/dL. Also confirming the diagnosis is the presence of xanthomas (cutaneous or tendinous) before the age of 10 years or a family history of elevated LDL-C levels consistent with HeFH in both parents.[17] Other clinical manifestations of HoFH include arcus cornea or xanthelasma.[14,17]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Repatha. Due to the specialized skills required for evaluation and monitoring of this new therapy, approval requires Repatha to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for 3 years in duration.

Documentation: None required.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Repatha is recommended in those who meet the following criteria:

FDA-Approved Indications

152. Atherosclerotic Cardiovascular Disease (ASCVD) [Clinical].* Approve Repatha for 3 years if the patient meets the following criteria (A, B, C, and D):

- **K)** The patient is ≥ 18 years of age; AND
- **L)** The patient has had one of the following conditions or diagnoses (i, ii, iii, iv or v):
  - **i.** The patient has had a previous myocardial infarction (MI) or has a history of an acute coronary syndrome (ACS); OR

ii. The patient has a diagnosis of angina (stable or unstable); OR
iii. The patient has a past history of stroke or transient ischemic attack (TIA); OR
iv. The patient has peripheral arterial disease (PAD); OR
v. The patient has undergone a coronary or other arterial revascularization procedure in the past; AND
Note: Examples include coronary artery bypass graft (CABG) surgery, percutaneous coronary intervention (PCI), angioplasty, and coronary stent procedures.

M) The patient meets one of the following criteria (i or ii):
i. The patient meets both of the following criteria (a and b):
a) The patient has tried one high-intensity statin therapy (i.e., atorvastatin ≥ 40 mg daily; rosuvastatin tablets ≥ 20 mg daily [as a single-entity or as a combination product]) for ≥ 8 continuous weeks; AND
b) The LDL-C level after this treatment remains ≥ 70 mg/dL; OR
ii. The patient has been determined to be statin intolerant by meeting one of the following criteria (a or b):
a) The patient experienced statin-related rhabdomyolysis; OR
Note: Rhabdomyolysis is statin-induced muscle breakdown that is associated with markedly elevated creatine kinase (CK) levels (at least 10 times the upper limit of normal), along with evidence of end organ damage which can include signs of acute renal injury (noted by substantial increases in serum creatinine [Scr] levels [a ≥ 0.5 mg/dL increase in Scr or doubling of the Scr] and/or myoglobinuria [myoglobin present in urine]); OR
b) The patient meets all of the following [(1), (2), and (3)]:
(1) The patient experienced skeletal-related muscle symptoms; AND
Note: Examples of skeletal-related muscle symptoms include myopathy (muscle weakness) or myalgia (muscle aches, soreness, stiffness, or tenderness).
(2) The skeletal-related muscle symptoms occurred while receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products); AND
(3) When receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products) the skeletal-related muscle symptoms resolved upon discontinuation of each respective statin therapy (atorvastatin and rosuvastatin); AND

N) Repatha is prescribed by, or in consultation with, a cardiologist; an endocrinologist; or a physician who focuses in the treatment of cardiovascular (CV) risk management and/or lipid disorders.

153. Heterozygous Familial Hypercholesterolemia (HeFH).* Approve Repatha for 3 years if the patient meets the following criteria (A, B, C, and D):
8. The patient is ≥ 18 years of age; AND
9. The patient meets one of the following criteria (i, ii, iii, iv or v):
i. The patient has an untreated low-density lipoprotein cholesterol (LDL-C) ≥ 190 mg/dL (prior to treatment with antihyperlipidemic agents); OR
ii. The patient has genetic confirmation of HeFH by mutations in the low-density lipoprotein receptor (LDLR), apolipoprotein B (APOB), proprotein convertase subtilisin kexin type 9 (PCSK9) or low-density lipoprotein receptor adaptor protein 1 (LDLRAP1) gene; OR
iii. The patient has been diagnosed with HeFH meeting one of the following diagnostic criteria thresholds (a or b):
a) The prescriber used the Dutch Lipid Network criteria and the patient has a score > 5; OR

b) The prescriber used the Simon Broome criteria and the patient met the threshold for "definite" or "possible" familial hypercholesterolemia; OR

iv. The patient has a treated low-density lipoprotein cholesterol (LDL-C) level ≥ 100 mg/dL (after treatment with antihyperlipidemic agents but prior to PCSK9 inhibitor therapy such as Praluent® [alirocumab injection for SC use] or Repatha); OR

v. The patient has clinical manifestations of HeFH; AND
Note: Examples of clinical manifestations of HeFH include cutaneous xanthomas, tendon xanthomas, arcus cornea, tuberous xanthomas or xanthelasma.

10. The patient meets one of the following criteria (i or ii):

i. The patient meets both of the following criteria (a and b):

~~a)~~ The patient has tried one high-intensity statin therapy (i.e., atorvastatin ≥ 40 mg daily; rosuvastatin tablets ≥ 20 mg daily [as a single-entity or as a combination product]) for ≥ 8 continuous weeks; AND

~~b)~~ The low-density lipoprotein cholesterol (LDL-C) level after this treatment remains ≥ 70 mg/dL; OR

ii. The patient has been determined to be statin intolerant by meeting one of the following criteria (a or b):

a) The patient experienced statin-related rhabdomyolysis; OR
Note: Rhabdomyolysis is statin-induced muscle breakdown that is associated with markedly elevated creatine kinase (CK) levels (at least 10 times the upper limit of normal), along with evidence of end organ damage which can include signs of acute renal injury (noted by substantial increases in serum creatinine [Scr] levels [a ≥ 0.5 mg/dL increase in Scr or doubling of the Scr] and/or myoglobinuria [myoglobin present in urine]); OR

b) The patient meets all of the following [(1), (2), and (3)]:

(1) The patient experienced skeletal-related muscle symptoms; AND
Note: Examples of skeletal-related muscle symptoms include myopathy (muscle weakness) or myalgia (muscle aches, soreness, stiffness, or tenderness).

(2) The skeletal-related muscle symptoms occurred while receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products); AND

(3) When receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products) the skeletal-related muscle symptoms resolved upon discontinuation of each respective statin therapy (atorvastatin and rosuvastatin); AND

11. Repatha is prescribed by, or in consultation with, a cardiologist; an endocrinologist; or a physician who focuses in the treatment of cardiovascular (CV) risk management and/or lipid disorders.

154. Homozygous Familial Hypercholesterolemia (HoFH).* Approve Repatha for 3 years if the patient meets the following criteria (A, B, C, and D):

A) The patient is ≥ 13 years of age; AND

B) The patient meets one of the following (i, ii, iii or iv):

i. The patient has genetic confirmation of two mutant alleles at the low-density lipoprotein receptor (LDLR), apolipoprotein B (APOB), proprotein convertase subtilisin kexin type 9 (PCSK9) or low-density lipoprotein receptor adaptor protein 1 (LDLRAP1) gene locus; OR

ii. The patient has an untreated low-density lipoprotein (LDL-C) level > 500 mg/dL (prior to treatment with antihyperlipidemic agents); OR

iii. The patient has a treated low-density lipoprotein cholesterol (LDL-C) level ≥ 300 mg/dL (after treatment with antihyperlipidemic agents but prior to agents such as Repatha or Juxtapid® [lomitapide capsules]); OR

iv. The patient has clinical manifestations of HoFH; AND
Note: Examples of clinical manifestation of HoFH include cutaneous xanthomas, tendon xanthomas, arcus cornea, tuberous xanthomas or xanthelasma.

C) The patient meets one of the following criteria (i or ii):

i. The patient meets both of the following criteria (a and b):

a) The patient has tried one high-intensity statin therapy (i.e., atorvastatin ≥ 40 mg daily; rosuvastatin ≥ 20 mg daily [as a single-entity or as a combination product]) for ≥ 8 continuous weeks; AND

b) The low-density lipoprotein cholesterol (LDL-C) level after this treatment remains ≥ 70 mg/dL; OR

ii. The patient has been determined to be statin intolerant by meeting one of the following criteria (a or b):

a) The patient experienced statin-related rhabdomyolysis; OR
Note: Rhabdomyolysis is statin-induced muscle breakdown that is associated with markedly elevated creatine kinase (CK) levels (at least 10 times the upper limit of normal), along with evidence of end organ damage which can include signs of acute renal injury (noted by substantial increases in serum creatinine [Scr] levels [a ≥ 0.5 mg/dL increase in Scr or doubling of the Scr] and/or myoglobinuria [myoglobin present in urine]); OR

b) The patient meets all of the following criteria [(1), (2), and (3)]:

(1) The patient experienced skeletal-related muscle symptoms; AND
Note: Examples of skeletal-related muscle symptoms include myopathy (muscle weakness) or myalgia (muscle aches, soreness, stiffness, or tenderness).

(2) The skeletal-related muscle symptoms occurred while receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products); AND

(3) When receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products) the skeletal-related muscle symptoms resolved upon discontinuation of each respective statin therapy (atorvastatin and rosuvastatin); AND

D) Repatha is prescribed by, or in consultation with, a cardiologist; an endocrinologist; or a physician who focuses in the treatment of cardiovascular (CV) risk management and/or lipid disorders.

155. Primary Hyperlipidemia.* Approve Repatha for 3 years if the patient meets the following criteria (A, B, C, and D):
Note: This is not associated with atherosclerotic cardiovascular disease (ASCVD), heterozygous familial hypercholesterolemia (HeFH), or homozygous familial hypercholesterolemia (HoFH) and may be referred to as combined hyperlipidemia, hypercholesterolemia (pure, primary), dyslipidemia, or increased/elevated low-density lipoprotein cholesterol (LDL-C) levels.

E) The patient is ≥ 18 years of age; AND

F) The patient has a coronary artery calcium or calcification (CAC) score ≥ 300 Agatston units; AND

G) The patient meets one of the following criteria (i or ii):

i. The patient meets all of the following criteria (a, b, and c):

~~**a)**~~ The patient has tried one high-intensity statin therapy (i.e., atorvastatin ≥ 40 mg daily; rosuvastatin tablets ≥ 20 mg daily [as a single-entity or as a combination product]); AND

~~b)~~ The patient has tried one high-intensity statin therapy above along with ezetimibe (as a single-entity or as a combination product) for ≥ 8 continuous weeks; AND

~~c)~~ The low-density lipoprotein cholesterol (LDL-C) level after this treatment regimen remains ≥ 100 mg/dL; OR

ii. The patient has been determined to be statin intolerant by meeting one of the following criteria (a or b):

a) The patient experienced statin-related rhabdomyolysis; OR
Note: Rhabdomyolysis is statin-induced muscle breakdown that is associated with markedly elevated creatine kinase (CK) levels (at least 10 times the upper limit of normal), along with evidence of end organ damage which can include signs of acute renal injury (noted by substantial increases in serum creatinine [Scr] levels [a ≥ 0.5 mg/dL increase in Scr or doubling of the Scr] and/or myoglobinuria [myoglobin present in urine]); OR

b) The patient meets all of the following [(1), (2), and (3)]:

(1) The patient experienced skeletal-related muscle symptoms; AND
Note: Examples of skeletal-related muscle symptoms include myopathy (muscle weakness) or myalgia (muscle aches, soreness, stiffness, or tenderness);

(2) The skeletal-related muscle symptoms occurred while receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products); AND

(3) When receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products) the skeletal-related muscle symptoms resolved upon discontinuation of each respective statin therapy (atorvastatin and rosuvastatin); AND

H) Repatha is prescribed by, or in consultation with, a cardiologist; an endocrinologist; or a physician who focuses in the treatment of cardiovascular (CV) risk management and/or lipid disorders.

Note:
* Patients may have a diagnoses that pertain to more than one FDA-approved indication, therefore, consider review under different approval conditions, if applicable (e.g., patients with HeFH have had a clinical ASCVD event, patients with primary hyperlipidemia may have HeFH).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Repatha has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

103. Concurrent use of Repatha with Praluent® (alirocumab injection for SC use) or Juxtapid (lomitapide capsules). Praluent is another PCSK9 inhibitor and should not be used with Repatha.[21] Juxtapid, a microsomal triglyceride transfer protein inhibitor, is indicated as an adjunct to lipid-lowering medications and diet to modify lipid parameters (e.g., reduce LDL-C levels) in patients with HoFH.[22] The efficacy and safety of using Praluent or Juxtapid in combination with Repatha have not been established.

104. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

APPENDIX A

Simon Broome Register Diagnostic Criteria[15]

Definite Familial Hypercholesterolemia:
a) Raised cholesterol
   (i) Total cholesterol greater than 6.7 mmol/L (260 mg/dL) or LDL-C > 4.0 mmol/L (155 mg/dL) in a child < 16 years;
   (ii) Total cholesterol > 7.5 mmol/L (290 mg/dL) or LDL-C > 4.9 mmol/L (190 mg/dL) in an adult (aged > 16 years);
b) AND
   (i) Tendon xanthomas in the patient or in a first (parent, sibling, or child) or second-degree relative (grandparent, aunt, or uncle);
c) OR
   (iv) DNA-based evidence of LDL-receptor, familial defective apo B-100, or PCSK9 mutation.

Possible Familial Hypercholesterolemia:
a) Raised cholesterol
   (i) Total cholesterol greater than 6.7 mmol/L (260 mg/dL) or LDL-C > 4.0 mmol/L (155 mg/dL) in a child < 16 years;
   (ii) Total cholesterol > 7.5 mmol/L (290 mg/dL) or LDL-C > 4.9 mmol/L (190 mg/dL) in an adult;
b) AND at least one of the following:
   (i) Family history of premature myocardial infarction younger than 50 years of age in second-degree relative or younger than 60 years of age in first-degree relative;
c) OR
   (i) Family history of raised cholesterol > 7.5 mmol (290 mg/dL) in adult first-degree or second-degree relative or > 6.7 mmol/L (260 mg/dL) in child or sibling aged < 16 years.

APPENDIX B.
Dutch Lipid Network Criteria for Familial Hypercholesterolemia[16]

Criteria	Score
Family History	
First-degree relative with known premature coronary and/or vascular disease (men < 55 years, women < 60 years)	1
First degree relative with known LDL-C > 95th percentile for age and sex	1
First-degree relative with tendon xanthomata and/or arcus cornealis, OR	2
Children aged < 18 years with LDL-C > 95th percentile for age and sex	2
Clinical History	
Patient with premature CAD (age as above)	2
Patient with premature cerebral or peripheral vascular disease (age as above)	1
Physical Examination	
Tendon xanthomas	6
Arcus cornealis at age < 45 years	4
LDL-C	
LDL-C ≥ 8.5 mmol/L (330 mg/dL)	8
LDL-C 6.5 to 8.4 mmol/L (250 to 329 mg/dL)	5
LDL-C 5.0 to 6.4 mmol/L (190 to 249 mg/dL)	3
LDL-C 4.0 to 4.9 mg/dL (155 to 189 mg/dL)	1
DNA analysis	

Functional mutation LDLR, APOB or PCSK9 gene	8
Stratification	**Total score**
Definite familial hypercholesterolemia	> 8
Probable familial hypercholesterolemia	6 to 8
Possible familial hypercholesterolemia	3 to 5
Unlikely familial hypercholesterolemia	< 3

LDL-C – Low-density lipoprotein cholesterol; CAD – Coronary artery disease; LDLR – Low-density lipoprotein receptor; APOB – Apolipoprotein B; PCSK9 – Proprotein convertase subtilisin kexin type 9.

PRIOR AUTHORIZATION POLICY

POLICY: Psychiatry – Spravato Prior Authorization Policy
- Spravato™ (esketamine nasal spray – Janssen)

REVIEW DATE: 03/25/2020; selected revision 08/05/2020

OVERVIEW

Spravato, a non-competitive N-methyl D-aspartate (NMDA) receptor antagonist, is indicated in conjunction with an oral antidepressant for the treatment of:[1]

- **Treatment-resistant depression** (TRD) in adults.
- Depressive symptoms in adults with major depressive disorder (MDD) with **acute suicidal ideation or behavior**.

Limitation of Use: The effectiveness of Spravato in preventing suicide or in reducing suicidal ideation or behavior has not been demonstrated. Use of Spravato does not preclude the need for hospitalization if clinically warranted, even if patients experience improvement after an initial dose of Spravato. Spravato is not approved as an anesthetic agent. The safety and effectiveness of Spravato as an anesthetic agent have not been established.

Esketamine, the S-enantiomer of racemic ketamine, is a non-selective, non-competitive antagonist of the NMDA receptor, an ionotropic glutamate receptor.[1] The mechanism by which Spravato exerts its antidepressant effect is unknown.

Spravato should be administered in conjunction with an oral antidepressant.[1] For treatment-resistant depression, the recommended dose is 56 mg intranasally on Day 1, followed by 56 mg or 84 mg intranasally twice weekly for Weeks 1 to 4. On Weeks 5 to 8, Spravato should be administered once weekly at a dose of 56 mg or 84 mg intranasally. On Week 9 and thereafter, the dosing frequency should be individualized to the least frequent dosing to maintain remission/response (either every 2 weeks or once weekly) at a dose of 56 mg or 84 mg. If a patient misses treatment sessions and there is worsening of depression symptoms, per clinical judgement, consider returning to the patient's previous dosing schedule (i.e., every two weeks to once weekly, weekly to twice weekly). For acute suicidal ideation or behavior, the recommended dosage is 84 mg twice weekly for 4 weeks. The dosage may be reduced to 56 mg twice weekly based on tolerability. After 4 weeks of treatment, evidence of therapeutic benefit should be evaluated to determine need for continued treatment. The use of Spravato, in conjunction with an oral antidepressant, beyond 4 weeks has not been systematically evaluated in the treatment of depressive symptoms in patients with MDD with acute suicidal ideation or behavior. Spravato must be administered under the direct supervision of a healthcare provider. A treatment session consists of nasal administration of Spravato and post-administration observation under supervision. The nasal spray device delivers a total of 28 mg of esketamine (two sprays of 14 mg each). Do not prime the device before use. Use two devices (56 mg) or three devices (84 mg), with a 5-minute rest between administrations of each device to allow the medication to absorb. During and after Spravato administration at each treatment session, observe the patient for at least 2 hours until the patient is safe to leave.

Disease Overview

Major depressive disorder is a serious, life-threatening condition with high rates of morbidity and a chronic disease course.[2] Over 17 million people in the US and over 300 million people worldwide have depression.[3,4] Major depressive disorder is considered the leading cause of disability worldwide and is also associated with increased mortality rates. About 30% to 40% of patients with major depressive disorder fail to respond to first-line treatments including oral antidepressant medications of all classes (e.g., selective serotonin reuptake inhibitors [SSRIs], serotonin-norepinephrine reuptake inhibitors [SNRIs], tricyclic antidepressants [TCAs], bupropion) and/or psychotherapy.[2,5] In addition, the onset of treatment response for these modalities, even when effective, often takes at least four weeks, leading to greater suffering, expense, and risk. For regulatory purposes, the FDA considers patients to have treatment-resistant depression if they have major depressive disorder and they have not responded to treatment despite trials of at least two antidepressants given at adequate doses for an adequate duration in the current episode.[2]

The available treatments for treatment-resistant depression are limited.[2] Prior to the approval of Spravato, only one medication was FDA-approved for treatment-resistant depression, Symbyax® (olanzapine and fluoxetine capsules). Symbyax is indicated for treatment-resistant depression (major depressive disorder in patients who do not respond to two separate trials of different antidepressants of adequate dose and duration in the current episode) and acute depressive episodes in bipolar I disorder.[6]

Guidelines

According to the American Psychiatric Association practice guideline for the treatment of patients with major depressive disorder (2010), the effectiveness of antidepressants is generally comparable between classes and within classes.[7] Therefore, the initial selection of antidepressant will largely be based on the anticipated side effects, the safety or tolerability of these side effects for the individual patient, pharmacological properties of the medication (e.g., half-life, drug interactions), and additional factors such as medication response in prior episodes, cost, and patient preference. In patients with depression who either have not responded or have had trouble tolerating one SSRI agent, a trial of another SSRI (or another antidepressant) may be effective and/or better tolerated. Patients who have had a partial response to antidepressant monotherapy can be augmented with another antidepressant from a different pharmacological class or with another non-antidepressant medication, such as lithium, thyroid hormone, an anticonvulsant, a psychostimulant, or an atypical antipsychotic.

Abuse and Misuse

Spravato contains esketamine, a Schedule III controlled substance (CIII), which may be subject to abuse and diversion. Assess each patient's risk for abuse or misuse prior to prescribing Spravato. All patients receiving Spravato should be monitored for the development of these behaviors or conditions, including drug-seeking behavior, while on therapy. Patients with a history of drug abuse or dependence are at greater risk. Careful consideration should be given prior to prescribing Spravato to individuals with a history of substance use disorder.

Safety

Spravato labeling includes a Boxed Warning regarding sedation, dissociation, abuse and misuse, and suicidal thoughts and behaviors in pediatric and young adult patients.[1] Warnings/Precautions for Spravato also include dissociation. The most common psychological effects of Spravato were dissociative or perceptual changes (including distortion of time, space and illusions), derealization and depersonalization (61% to 84% of patients treated with Spravato developed dissociative or perceptual changes based on the Clinician-Administered Dissociative States Scale). Given its potential to induce dissociative effects, carefully assess patients with psychosis before administering Spravato; treatment should be initiated only if the benefit outweighs the risk.

Because of the risks of serious adverse outcomes resulting from sedation, dissociation, and abuse and misuse, Spravato is only available through a restricted program under a Risk Evaluation and Mitigation Strategy (REMS).[1] Healthcare settings must be certified in the program and ensure that Spravato is only dispensed in healthcare settings and administered to patients who are enrolled in the program, administered by patients under the direct observation of a healthcare provider, and that patients are monitored by a healthcare provider for at least 2 hours after administration of Spravato. Pharmacies must be certified in the REMS and must only dispense Spravato to healthcare settings that are certified in the program.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Spravato. Because of the specialized skills required for evaluation and diagnosis of patients treated with Spravato as well as the monitoring required for adverse events and efficacy, approval requires Spravato to be prescribed by a physician who specializes in the condition being treated. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Spravato is recommended in those who meet the following criteria:

FDA-Approved Indications

247. Treatment-Resistant Depression. Approve for 6 months if the patient meets the following criteria (A, B, C, D, E, and F):

A) Patient is ≥ 18 years of age; AND

B) Patient meets both of the following (i and ii):

i. Patient has demonstrated nonresponse (≤ 25% improvement in depression symptoms or scores) to at least two different antidepressants, each from a different pharmacologic class, according to the prescriber; AND

Note: Different pharmacologic classes of antidepressants include selective serotonin reuptake inhibitors (SSRIs), serotonin-norepinephrine reuptake inhibitors (SNRIs), tricyclic antidepressants (TCAs), bupropion, mirtazapine, etc.

ii. Each antidepressant was used at therapeutic dosages for at least 6 weeks in the current episode of depression, according to the prescriber; AND

C) Patient is concomitantly receiving at least one oral antidepressant; AND

Note: Antidepressants may include, but are not limited to, selective serotonin reuptake inhibitors (SSRIs), serotonin-norepinephrine reuptake inhibitors (SNRIs), tricyclic antidepressants (TCAs), mirtazapine, and bupropion.

D) Patient has one of the following (i or ii):

i. No history of psychosis; OR

ii. History of psychosis and the prescriber believes that the benefits of Spravato outweigh the risks; AND

E) The patient's history of controlled substance prescriptions has been checked using the state prescription drug monitoring program (PDMP), unless unavailable in the state (see note below), according to the prescriber; AND

Note: As of 03/25/2020, the state of Missouri is the only state in the US that does not have a PDMP program in place.

F) Spravato is being prescribed by a psychiatrist.

248. Acute Suicidal Ideation or Behavior. Approve for 2 months if the patient meets the following criteria (A, B, C, D, and E):

A) Patient is ≥ 18 years of age; AND

B) Patient has major depressive disorder; AND

C) Patient is concomitantly receiving at least one oral antidepressant; AND

Note: Antidepressants may include, but are not limited to, selective serotonin reuptake inhibitors (SSRIs), serotonin-norepinephrine reuptake inhibitors (SNRIs), tricyclic antidepressants (TCAs), mirtazapine, and bupropion.

D) Patient has one of the following (i or ii):
- **i.** No history of psychosis; OR
- **ii.** History of psychosis and the prescriber believes that the benefits of Spravato outweigh the risks; AND

E) Spravato is being prescribed by a psychiatrist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Spravato is not recommended in the following situations:

221. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Psychiatry – Zulresso™ (brexanolone injection for intravenous use – Sage Therapeutics)

DATE REVIEWED: 05/13/2020

OVERVIEW

Zulresso, a neuroactive steroid gamma-aminobutric acid (GABA) A receptor positive modulator, is indicated for the treatment of postpartum depression in adults.[1] Zulresso was approved under a priority review by the FDA and was granted a breakthrough therapy designation. The active ingredient of Zulpressa, brexanolone, is chemically identical to endogenous allopregnanolone. Plasma concentrations of allopregnanolone increase during pregnancy and decrease substantially after childbirth in both rodents and humans, and fluctuations in allopregnanolone have demonstrated effects on anxiety and depression in animal models.[2] The mechanism of action of Zulresso is not fully understood but it has been shown to modulate GABA-mediated currents from recombinant human $GABA_A$ receptors in mammalian cells expressing $\alpha_1\beta_2\gamma_2$, $\alpha_4\beta_3\delta$, and $\alpha_6\beta_3\delta$ receptor subunits.[1]

The efficacy of Zulresso was established in two Phase III, US-only, randomized, double-blind, placebo-controlled, multicenter, pivotal studies in patients with moderate to severe postpartum depression initiating treatment within 6 months of delivery.[2] Zulresso is administered as a one-time, continuous intravenous (IV) infusion over 60 hours.[1]

Disease Overview

Postpartum (or peripartum) depression is a major depressive episode with onset during pregnancy or within 4 weeks of delivery that can have serious effects on the maternal-infant bond and later infant development.[3] Postpartum depression is estimated to affect 10% to 20% of women who give birth worldwide and occurs in low- to high-income countries.[2] Approximately 40% to 80% of cases of postpartum depression are considered moderate to severe. In the US, the estimated prevalence of postpartum depression in new mothers varies by state from 8% to 20%, with an overall prevalence of approximately 12%.

Postpartum depression is symptomatically indistinguishable from major depression.[3] However, the timing of its onset has led to the acknowledgement of it potentially being a unique illness. As with other forms of depression, it is characterized by sadness and/or loss of interest in activities that one used to enjoy and a decreased ability to feel pleasure and may present with symptoms such as cognitive impairment, feelings of worthlessness or guilt, or suicidal ideation.[4] Because of the risk of suicide, postpartum depression is considered a life-threatening condition.[3]

Abuse and Misuse

Zulresso is a CIV controlled substance.[1] In a human abuse potential study, 3% of volunteers administered Zulresso 90 mcg/kg and 13% of volunteers administered Zulresso 270 mcg/kg (three times the maximum recommended infusion rate) reported euphoric mood compared with no volunteers administered placebo over a 1 hour infusion.

Safety

Based on findings from animal studies of other drugs that enhance GABAergic inhibition, Zulresso may cause fetal harm.[1] Currently, there are no available data on Zulresso use in pregnant women to determine a drug-associated risk of major birth defects, miscarriage, or adverse maternal or fetal outcomes. A pregnancy exposure registry is available to monitor pregnancy outcomes in women exposed to antidepressants during pregnancy.

Zulresso has a Boxed Warning regarding excessive sedation and sudden loss of consciousness.[1] Because of the risk of serious harm, patients must be monitored for excessive sedation and sudden loss of consciousness and have continuous pulse oximetry monitoring. Patients must be accompanied during interactions with their children. During the infusion, patients must be monitored for sedative effects every 2 hours during planned, non-sleep periods. If there are signs or symptoms of excessive sedation, the infusion must be stopped immediately. After symptom resolution, the infusion may be restarted at the same or a lower dose.

Due to the risks of serious adverse events resulting from excessive sedation and sudden loss of consciousness, Zulresso is only available through a restricted distribution system under a REMS.[1,5] The Zulresso REMS requires healthcare facilities be enrolled in the program and ensure that Zulresso is only administered to patients enrolled in the program. Pharmacies are required to be certified and can only dispense Zulresso to certified healthcare facilities. Patients must enroll in the program prior to administration of Zulresso. The REMS requires the prescriber and the patient sign the Patient Enrollment Form that clearly states that the patient understands the risk of excessive sedation and loss of consciousness associated with Zulresso. A healthcare provider must be available on site to monitor the patient for the duration of the infusion. Patients must be monitored for hypoxia using continuous pulse oximetry and for excessive sedation every 2 hours during planned, non-sleep periods.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Zulresso. Because of the specialized skills required for evaluation and diagnosis of patients treated with Zulresso as well as the monitoring required for adverse events and long-term efficacy, approval requires Zulresso to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Note that a 1-month (30 days) approval duration is applied to allow for the scheduling and administration of the one-time, 60-hour infusion of Zulresso.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zulresso is recommended in those who meet the following criteria:

FDA-Approved Indications

249. Postpartum Depression. Approve for 1 month if the patient meets the following criteria (A, B, C, D, and E):

- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has been diagnosed with moderate to severe depression; AND
- **C)** Patient is ≤ 6 months postpartum; AND
- **D)** Patient is not currently pregnant; AND
- **E)** Zulresso is being prescribed by, or in consultation with, a psychiatrist or an obstetrician-gynecologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Zulresso has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

222. Previous Treatment with Zulresso During the Current Episode of Postpartum Depression.

223. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Pulmonary – Corticosteroid/Long-Acting Beta$_2$-Agonist Combination Inhalers

- Advair Diskus® (fluticasone propionate/salmeterol inhalation powder – GlaxoSmithKline; generics [including Wixela™ Inhub™])
- Advair® HFA (fluticasone propionate/salmeterol inhalation aerosol – GlaxoSmithKline)
- AirDuo™ RespiClick® (fluticasone propionate/salmeterol inhalation powder – Teva; generic)
- Breo® Ellipta® (fluticasone furoate/vilanterol inhalation powder – GlaxoSmithKline)
- Dulera® (mometasone furoate/formoterol fumarate inhalation aerosol – Merck)
- Symbicort® (budesonide/formoterol fumarate inhalation aerosol – AstraZeneca)

REVIEW DATE: 07/01/2020

OVERVIEW

Fluticasone propionate and salmeterol inhalation powder (Advair Diskus, generics), Advair HFA, AirDuo RespiClick (and authorized generic), Breo Ellipta, Dulera, and Symbicort are inhaled corticosteroid (ICS) and long-acting beta-agonist (LABA) combination products that exert local anti-inflammatory effects in the lungs and produce bronchial smooth muscle relaxation.[1-6] An additional ICS/LABA inhaler, AirDuo® Digihaler™ (fluticasone propionate and salmeterol inhalation powder), is available. It is a digital dry powder inhaler (DPI) with built-in sensors that connect to a companion mobile application and provide inhaler use information. AirDuo Digihaler has been approved by the FDA, but has not yet become available and therefore, it is not currently included in this policy. Of note, Wixela Inhub (fluticasone propionate/salmeterol inhalation powder) is a generic to Advair Diskus that was given a brand name by its manufacturer. Therefore, it is also included in this policy.

Fluticasone propionate and salmeterol inhalation powder (Advair Diskus, generics), Advair HFA, AirDuo RespiClick, fluticasone and salmeterol inhalation powder (authorized generic of AirDuo RespiClick), Breo Ellipta, Dulera, and Symbicort are indicated for the treatment of asthma. Fluticasone propionate and salmeterol inhalation powder (Advair

Diskus, generics) Breo Ellipta, and Symbicort are also indicated for the maintenance treatment of airflow obstruction and reducing exacerbations in patients with COPD, including chronic bronchitis and/or emphysema.[1,3,5] Advair HFA and Dulera are not FDA-approved for the treatment of COPD; however, both products have been studied for this use.[2,4,7-9] AirDuo RespiClick (and authorized generic) also has not been studied in patients with COPD. However, this agent was filed as a New Drug Application (NDA) under Section 505(b)(2) of the Federal Food, Drug, and Cosmetic Act.[6] This approval pathway relies in part upon evidence not developed by the applicant. In the case of AirDuo RespiClick, the literature and safety and effectiveness evidence supporting the approval and use of Advair Diskus are considered part of the evidence supporting the approval and use of AirDuo RespiClick. The indications for the ICS/LABA inhalers are in Table 1.

Table 1. FDA-Approved Indications.[1-6]

Brand (generic)	COPD*	Reduction of COPD Exacerbations†	Asthma (patients ≥ 18 years of age)	Asthma (patients 12 to 17 years of age)	Asthma (patients 4 to 12 years of age)
Fluticasone propionate and salmeterol inhalation powder (Advair Diskus®, generics)	X (250 mcg/50 mcg)	X (250 mcg/50 mcg)	X	X	X
Advair® HFA (fluticasone propionate and salmeterol inhalation aerosol)	--	--	X	X	--
AirDuo™ RespiClick® (fluticasone propionate and salmeterol inhalation powder; authorized generic)	--	--	X	X	--
Breo® Ellipta® (fluticasone furoate and vilanterol inhalation powder)	X (100 mcg/25 mcg)	X (100 mcg/25 mcg)	X	--	--
Dulera® (mometasone furoate and formoterol fumarate inhalation aerosol)	--	--	X	X	X (≥ 5 years)
Symbicort® (budesonide and formoterol fumarate inhalation aerosol)	X (160 mcg/4.5 mcg)	X (160 mcg/4.5 mcg)	X	X	X (≥ 6 years)

COPD – Chronic obstructive pulmonary disease; * Maintenance treatment of airflow obstruction in patients with chronic obstructive pulmonary disease, including chronic bronchitis and/or emphysema; † In patients with a history of chronic obstructive pulmonary disease exacerbations; -- Not indicated for the condition.

Guidelines

The 2020 GOLD guidelines for the diagnosis, management, and prevention of COPD support the use of combination ICS/LABA therapy in select highly symptomatic patients who are at high risk for COPD exacerbations.[10] The 2020 Global Initiative for Asthma (GINA) Global Strategy for Asthma Management and Prevention states that low-dose ICS/LABA combination therapy is the preferred treatment for adults and adolescents when low-dose ICS monotherapy fails to control the patient's asthma.[29] Certain low-dose ICS/LABA combinations are also recommended as initial as-needed therapy for asthma as well. European Respiratory Society (ERS) guidelines on the diagnosis and treatment of chronic cough in adults and children recommend a short-term trial (2 to 4 weeks) of ICS and long-acting bronchodilator (e.g. a LABA) combination in adults with chronic cough and fixed airflow obstruction.

Other Uses with Supportive Evidence

There are also data to support the use of ICS/LABA inhalers in patients with postinfectious cough. Subacute postinfectious cough may have multiple possible underlying etiologies, including asthma.[11,12] The underlying cause of the cough must be determined before making therapeutic decisions. In this situation, ICS/LABA combination therapy may be used as diagnostic empiric therapy in determining the cause of cough (i.e., rule out asthma). When a patient with subacute cough presents with wheezes, rhonchi, or crackles with a normal chest radiograph, it may be a reasonable option to consider therapy with an inhaled bronchodilator and ICS. If cough following an upper respiratory tract infection persists for > 8 weeks, diagnoses other than postinfectious cough should be considered.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of fluticasone propionate and salmeterol inhalation powder (Advair Diskus, generics [including Wixela Inhub]), Advair HFA, AirDuo RespiClick, fluticasone and salmeterol inhalation powder (authorized generic of AirDuo RespiClick), Breo Ellipta, Dulera, and Symbicort. The purpose of this policy is to support the use of the corticosteroid/long-acting beta$_2$-agonist combination inhalers in chronic conditions where the products are indicated or their use is appropriate. All approvals are provided for the duration listed below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: Prescription claims (prior 130 days) for respiratory medications (e.g., leukotriene receptor antagonists; xanthines; inhaled mast cell stabilizers; oral and inhaled beta-agonists; inhaled corticosteroids, inhaled anticholinergic agents) are used as a surrogate marker for a diagnosis of asthma or chronic obstructive pulmonary disease (COPD). If use of these medications is not met at the point-of-service, coverage will be determined by prior authorization criteria. When available, the ICD-10 codes for asthma and COPD (including chronic bronchitis/emphysema) will also be used in automation to generate an approval of the requested medication (see Appendix A).

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of fluticasone propionate and salmeterol inhalation powder (Advair Diskus, generics [including Wixela Inhub]), Advair HFA, AirDuo RespiClick, fluticasone and salmeterol inhalation powder (authorized generic of AirDuo RespiClick), Breo Ellipta, Dulera, or Symbicort is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Asthma/Reactive Airway Disease.** Approve for 3 years.

2. **Chronic Obstructive Pulmonary Disease.** Approve for 3 years.

3. **Chronic Bronchitis.** Approve for 3 years.

4. **Emphysema.** Approve for 3 years.

Other Uses with Supportive Evidence

5. **Postinfectious Cough.** Approve for 2 months.
   Note: Postinfectious cough is cough that persists after an acute respiratory infection has resolved.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Fluticasone propionate and salmeterol inhalation powder (Advair Diskus, generics [including Wixela Inhub]), Advair HFA, AirDuo RespiClick, fluticasone and salmeterol inhalation powder (authorized generic of AirDuo RespiClick), Breo Ellipta, Dulera, and Symbicort have not been shown to be effective or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

105. **Acute Cough Associated with the Common Cold.** Note: This includes symptoms associated with a current rhinovirus infection.
   There are no data to support the use of ICS/LABA combination therapy in treating this condition. ACCP guidelines for the treatment of acute cough associated with the common cold do not recommend using an ICS or a bronchodilator in treating this condition.[11,26] Over-the-counter (OTC) cough and cold preparations are recommended, as is honey in pediatric patients.

106. Chronic Cough due to Gastroesophageal Reflux Disease (GERD). There are no data to support the use of ICS/LABA combination therapy in treating this condition. The ACCP guidelines for the management of chronic cough due to GERD recommend treatment of the underlying condition and do not mention the use of any inhaled therapies.[13,24]

107. Acute Cough due to an Acute Respiratory Infection. Note: Examples of an acute respiratory infection are acute bronchitis, sinusitis, influenza, or pneumonia. An acute exacerbation of chronic bronchitis is not the same as acute bronchitis.
ACCP guidelines for the management of acute cough due to acute bronchitis in immunocompetent adult outpatients do not recommend routine use of inhaled corticosteroids and inhaled beta-agonists.[14] Current evidence is not sufficient to prove that these therapies are safe and effective at reducing the severity and duration of cough in this setting. Bronchodilators are also not a recommended therapeutic option in treating cough associated with acute bacterial sinusitis.[12] Additional ACCP guidelines for the management of acute cough due to suspected pneumonia or influenza state that there is insufficient evidence on the use of nonantibiotic symptomatic therapies such as ICSs or bronchodilators.[26] There are no data to support the use of ICS/LABA combination therapy in treating these conditions.

108. Chronic Cough due to Non-Asthmatic Eosinophilic Bronchitis (NAEB). There are no data to support the use of ICS/LABA combination therapy in treating this condition. Per the guidelines for the management of chronic cough due to NAEB from ACCP ICSs are the recommended first-line treatment.[11,23] One of the clinical characteristics of NAEB is chronic cough without evidence of variable airflow obstruction or airway hyperresponsiveness. As a result, a beta-agonist bronchodilator would not be expected to be useful in treating this condition.

109. Chronic Cough due to Bronchiolitis. The ACCP guidelines do not recommend bronchodilators as a therapeutic option in treating bronchiolitis.[11,15] Use of asthma medications is discouraged unless other evidence of asthma is present. Guidelines from the American Academy of Pediatrics regarding the diagnosis and management of bronchiolitis (2014) also do not recommend inhaled corticosteroids or bronchodilators be routinely used in the management of bronchiolitis.[16]

110. Chronic Cough due to Bronchiectasis. Limited data are available with budesonide/formoterol (foreign formulation of Symbicort) for the treatment of non-cystic fibrosis (CF) bronchiectasis.[17,18] ACCP guidelines note that in patients with bronchiectasis due to CF or other causes, treatment of respiratory infections and airway clearance techniques are the mainstays of management.[27] In patients with airflow obstruction and/or bronchial hyperreactivity (e.g., asthma and/or COPD), bronchodilators may be of benefit.[11,19] However, the ACCP guidelines and the British Thoracic Society (BTS) guidelines do not recommend treatment with ICSs. Bronchiectasis guidelines from the European Respiratory Society also recommend against offering ICSs to adult patients with bronchiectasis.[20] There may be a role for combination ICS/LABA therapy in patients with coexisting asthma or COPD, but there is no evidence to support this therapy in patients without these concomitant conditions.[19,20]

111. Whooping Cough/Pertussis. There are no data to support the use of ICS/LABA combination therapy in treating this condition. According to the ACCP guidelines, LABAs and corticosteroids should not be offered to patients with whooping cough as there is no evidence to suggest benefit.[11] Although short-acting beta-agonists (along with other treatments) have been proposed as standard treatment for whooping cough, one review article reported that treatment with the SABA salbutamol resulted in no change in coughing.[21]

112. Angiotensin-Converting Enzyme (ACE) Inhibitor-Induced Cough. There are no data to support the use of ICS/LABA combination therapy in treating this condition. Discontinuation of the ACE inhibitor is the only uniformly effective treatment for ACE inhibitor-induced cough. In those patients in whom the ACE inhibitor cannot be discontinued, pharmacologic therapy aimed at suppressing cough should be attempted. ICSs and beta-agonists are not recommended therapeutic options.[11]

113. Psychogenic Cough/Habit Cough/Tic Cough. There are no data to support the use of ICS/LABA combination therapy in treating these conditions. Non-pharmacological therapies, such as behavior modification, hypnosis and psychiatric therapy are the mainstays of treatment.[11,22]

114. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

APPENDIX A

ICD-10 Codes Automated for Asthma and COPD

ICD-10 Codes	Code Description
J41*	Simple and mucopurulent chronic bronchitis
J41.0	Simple chronic bronchitis
J41.1	Mucopurulent chronic bronchitis
J41.8	Mixed simple and mucopurulent chronic bronchitis
J42	Unspecified chronic bronchitis
J43*	Emphysema
J43.0	Unilateral pulmonary emphysema (MacLeod's syndrome)
J43.1	Panlobular emphysema
J43.2	Centrilobular emphysema
J43.8	Other emphysema
J43.9	Emphysema, unspecified
J44*	Other chronic obstructive pulmonary disease
J44.0	Chronic obstructive pulmonary disease with (acute) lower respiratory infection
J44.1	Chronic obstructive pulmonary disease with (acute) exacerbation
J44.9	Chronic obstructive pulmonary disease, unspecified
J45*	Asthma
J45.2*	Mild intermittent asthma
J45.20	Mild intermittent asthma, uncomplicated
J45.21	Mild intermittent asthma with (acute) exacerbation
J45.22	Mild intermittent asthma with status asthmaticus
J45.3*	Mild persistent asthma
J45.30	Mild persistent asthma, uncomplicated
J45.31	Mild persistent asthma with (acute) exacerbation
J45.32	Mild persistent asthma with status asthmaticus
J45.4*	Moderate persistent asthma
J45.40	Moderate persistent asthma, uncomplicated
J45.41	Moderate persistent asthma with (acute) exacerbation
J45.42	Moderate persistent asthma with status asthmaticus
J45.5*	Severe persistent asthma
J45.50	Severe persistent asthma, uncomplicated
J45.51	Severe persistent asthma with (acute) exacerbation

J45.52	Severe persistent asthma with status asthmaticus
J45.9*	Other and unspecified asthma
J45.90*	Unspecified asthma
J45.901	Unspecified asthma with (acute) exacerbation
J45.902	Unspecified asthma with status asthmaticus
J45.909	Unspecified asthma, uncomplicated
J45.99*	Other asthma
J45.990	Exercise induced bronchospasm
J45.991	Cough variant asthma
J45.998	Other asthma

COPD – Chronic obstructive pulmonary disease; * Indicates the inclusion of subheadings.

PRIOR AUTHORIZATION POLICY

POLICY: Pulmonary – Daliresp® (roflumilast tablets – Astra Zeneca)

APPROVAL DATE: 10/23/2019

OVERVIEW

Daliresp, a selective phosphodiesterase-4 (PDE-4) inhibitor, is indicated as a treatment to reduce the risk of chronic obstructive pulmonary disease (COPD) exacerbations in patients with severe COPD associated with chronic bronchitis and a history of exacerbations.[1] Daliresp is not a bronchodilator and is not indicated for the relief of acute bronchospasm.

Disease Overview

COPD is a common preventable and manageable lung disease.[2] Approximately 16 million people in the US are known to have COPD and it is estimated that many more have impaired lung function and undiagnosed disease.[20] COPD results in significant morbidity and mortality; in 2017, it was the fourth leading cause of death nationwide.[3] Exposure to tobacco smoke is considered to be the primary cause, but occupational exposures to chemical agents and fumes, indoor and outdoor air pollution, genetics, age, and socioeconomic status may also have a role in the development of COPD.[2] The disease itself is generally characterized by persistent respiratory symptoms and airflow limitation that is related to airway and/or alveolar abnormalities resulting from significant exposure to noxious particles or gasses. This airflow limitation is caused by both small airway disease (obstructive bronchiolitis) and parenchymal destruction (emphysema). The most common symptoms of COPD are dyspnea, chronic cough, and/or sputum production. The goals of COPD treatment are to reduce symptoms, decrease the frequency and severity of exacerbations, and improve health status and exercise tolerance. None of the currently available medications for COPD have been found to modify the long-term decline in lung function that is hallmark to COPD disease progression.

Guidelines

The 2019 Global Initiative for Chronic Obstructive Lung Disease (GOLD) guidelines for the diagnosis, management, and prevention of COPD recommend bronchodilators and inhaled corticosteroids as initial pharmacological treatment.[2] Following initiation, therapies should adjusted as needed based on symptom severity and exacerbation risk. Daliresp is recommended in patients who continue to experience exacerbations despite long-acting muscarinic antagonist (LAMA)/long-acting beta$_2$-agonist (LABA) combination therapy and have a blood eosinophil level < 100 cells/microliter. Low blood eosinophils are

predictive of an insufficient response to inhaled corticosteroid (ICS) therapy, thereby making Daliresp a good option. Daliresp is also listed a possible option in patients receiving triple therapy with an ICS/LAMA/LABA who have an FEV_1 < 50% and chronic bronchitis, and continue to experience exacerbations (especially if the patient has been hospitalized for one or more COPD exacerbations in the past year).

Clinical Efficacy

Daliresp has been studied in patients currently receiving treatment with bronchodilators (e.g., LABAs) and ICSs with or without additional therapy with a LAMA.[5-10] Five placebo-controlled clinical trials evaluated the effect of Daliresp on COPD exacerbations.[1,5-10] Two of these studies (n = 1,176) initially included patients with severe COPD with chronic bronchitis and/or emphysema; in both studies, Daliresp did not demonstrate a significant reduction in COPD exacerbation rates. An exploratory analysis of these trials found that in the subgroup of patients with severe COPD who had chronic bronchitis and exacerbations within the previous year, Daliresp resulted in better exacerbation reduction than in the overall population. Two subsequent trials were conducted involving patients with severe COPD, chronic bronchitis, and at least one COPD exacerbation within the previous year (n = 3,096). In both trials, Daliresp demonstrated a significant reduction in the rate of moderate or severe exacerbations compared to placebo (15% to 18% reduction).

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of Daliresp. All approvals are provided for 3 years in duration unless otherwise noted below.

Automation: None.
RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Daliresp is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Chronic Obstructive Pulmonary Disease (COPD):** Approve Daliresp for 3 years if the patient meets the following criteria (A, B, C, and D):
   - **A)** Patient has severe COPD or very severe COPD according to the prescriber; AND
   - **B)** Patient has a history of exacerbations; AND
   - **C)** Patient meets ONE of the following (i or ii):
     - **i.** Patient has chronic bronchitis AND has tried an inhaled long-acting $beta_2$-agonist, an inhaled long-acting muscarinic antagonist, and an inhaled corticosteroid concomitantly; OR
     - **ii.** Patient has tried an inhaled long-acting muscarinic antagonist and long-acting $beta_2$-agonist concomitantly AND has a blood eosinophil level < 100 cells/microliter.

     Note: Use of a combination inhaler containing multiple agents from the medication classes listed would fulfil the requirement. Examples of an inhaled long-acting $beta_2$-agonists include Arcapta Neohaler, Serevent Diskus, Striverdi Respimat, Brovana, and Perforomist. Examples of a long-acting muscarinic antagonists include Incruse Ellipta, Seebri Neohaler, Spiriva HandiHaler, Spiriva Respimat, Tudorza Pressair, Lonhala Magnair, and Yupelri. Examples of inhaled corticosteroids include Alvesco, ArmonAir RespiClick, Arnuity Ellipta, Asmanex Twisthaler/HFA, Flovent Diskus/HFA, Pulmicort Flexhaler, Qvar RediHaler, and budesonide suspension for inhalation (Pulmicort Respules, generics). Examples of inhaled corticosteroid/long-acting $beta_2$-agonist combination inhalers include Advair Diskus (generic Wixela Inhub; authorized generics), Breo

Ellipta, and Symbicort. Examples of long-acting muscarinic antagonist/long-acting beta$_2$-agonist combination inhalers include Anoro Ellipta, Bevespi Aerosphere, Duaklir Pressair, Stiolto Respimat, and Utibron Neohaler. An example of an inhaled corticosteroid/long-acting beta$_2$-agonist/long-acting muscarinic antagonist combination inhaler is Trelegy Ellipta.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Daliresp has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

115. Asthma. The efficacy of roflumilast (formulation not specified) in patients with asthma[11-14], allergic asthma[15,16], and exercise-induced asthma[17] has been evaluated. More data are needed to define the place in therapy of Daliresp in the treatment of asthma. Current asthma guidelines from the Global Initiative for Asthma Prevention (GINA) [2019] and the European Respiratory Society (ERS)/American Thoracic Society (ATS) [2014] Global Strategy for Asthma Management and Prevention do not address Daliresp as a recommended therapy for asthma management.[18,19]

116. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Pulmonary Arterial Hypertension – Adempas® (riociguat tablets – Bayer)

APPROVAL DATE: 09/11/2019

OVERVIEW

Adempas, a soluble guanylate cyclase (sGC) stimulator, is indicated for the treatment of adults with persistent/recurrent chronic thromboembolic pulmonary hypertension (CTEPH) [World Health Organization {WHO} Group 4] after surgical treatment, or inoperable CTEPH, to improve exercise capacity and WHO functional class.[1] Adempas is also indicated for the treatment of adults with pulmonary arterial hypertension (PAH) [WHO Group 1], to improve exercise capacity, WHO functional class and to delay clinical worsening. Efficacy in WHO Group 1 PAH was established in patients receiving Adempas as monotherapy or in combination with endothelin receptor antagonists (ERAs) or prostanoids. Studies establishing effectiveness included mainly patients with WHO functional class II or III and etiologies of idiopathic or heritable PAH (61%) or PAH associated with connective tissue diseases (25%).

Disease Overview

PAH is a serious but rare condition impacting approximately fewer than 20,000 patients in the US. It is classified within Group 1 pulmonary hypertension among the five different groups that are recognized. In this progressive disorder the small arteries in the lungs become narrowed, restricted, or blocked causing the heart to work harder to pump blood, leading to activity impairment.[2,3] In time, right-sided heart failure and/or death may occur. Common PAH symptoms include shortness of breath, fatigue, chest pain, dizziness and fainting, along with impairment in activity tolerance. It is more prevalent in women. Patients of all ages may develop the disease; however, the mean age of diagnosis typically happens between 36 to 50 years. Children may also have PAH. The condition may occur due to various underlying medical conditions or as a disease that uniquely impacts the pulmonary circulation; both genetic and environmental factors may be involved. PAH is defined as a mean pulmonary artery pressure (mPAP) ≥ 25 mmHg with

a pulmonary capillary wedge pressure (PCWP) ≤ 15 mmHg measured by cardiac catheterization. The prognosis in PAH has been described as poor, with the median survival being approximately 3 years. However, primarily due to advances in pharmacological therapies, the long-term prognosis has improved. Lung transplantation may be recommended if pharmacological or medical therapies fail, based upon patient status. The WHO categorizes PAH into stages, which is also referred to as the functional class (Class I to IV) and is an adaptation of the New York Heart Association (NYHA) system to evaluate activity tolerance.

CTEPH is a persistent obstruction of pulmonary arteries and is often a complication of pulmonary embolism.[4,5] It is classified within Group 4 pulmonary hypertension. Symptoms include progressive dyspnea on exertion, as well as fatigue, syncope, hemoptysis, and signs of right heart failure. Pulmonary endarterectomy is the treatment of choice for most patients with CTEPH. However, around 40% of patients are deemed inoperable for various reasons. Medication therapy, including Adempas, may also be recommended. Anticoagulant therapy is also given.

Guidelines

In 2009, the American College of Cardiology Foundation (ACCF) Task Force on Expert Consensus Documents and the American Heart Association (AHA), developed in collaboration with the ACCP, American Thoracic Society (ATS) and the Pulmonary Hypertension Association, published an expert consensus document on pulmonary hypertension.[2] The hemodynamic definition of PAH is a mean pulmonary artery pressure (mPAP) greater than 25 mmHg; a pulmonary capillary wedge pressure (PCWP), left atrial pressure (LAP) or left ventricular end-diastolic pressure (LVEDP) less than or equal to 15 mmHg; and a pulmonary vascular resistance (PVR) greater than 3 Wood units. Many different medication from varying therapies classes and different routes of administration are recognized. In 2019, and updated CHEST guideline and Expert Panel Report regarding therapy for pulmonary arterial hypertension in adults was released.[3] Evidence for use of the many medications available is also detailed.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Adempas. Because of the specialized skills required for evaluation and diagnosis of patients treated with Adempas as well as the monitoring required for adverse events and long-term efficacy, approval requires these agents to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for 3 years in duration unless otherwise noted below.

Documentation: In the *Pulmonary Arterial Hypertension – Adempas Prior Authorization Policy*, documentation is required for initiation of therapy where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes and catheterization laboratory reports. For a patient case in which the documentation requirement of the right heart catheterization upon prior authorization coverage review for a different medication indicated for WHO Group 1 PAH has been previously provided, the documentation requirement in this *Pulmonary Arterial Hypertension – Adempas Prior Authorization Policy* is considered to be met.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Adempas is recommended in those who meet the following criteria:

FDA-Approved Indications

39. Pulmonary Arterial Hypertension (PAH) [World Health Organization {WHO} Group 1]. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 years if the patient meets all of the following criteria (i, ii, and iii):
- **i.** The patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND
- **ii.** The agent is prescribed by, or in consultation with, a cardiologist or a pulmonologist; AND
- **iii.** The patient meets the following criteria (a and b):
  - **a)** The patient has had a right heart catheterization **[documentation required]** (see documentation section above); AND
  - **b)** The results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; OR

B) Patients Currently Receiving Adempas. Approve for 3 years if the patient meets all of the following criteria (i, ii, and iii):
- **i.** The patient has a diagnosis of WHO Group 1 PAH; AND
- **ii.** The agent is prescribed by, or in consultation with, a cardiologist or a pulmonologist; AND
- **iii.** The patient meets the following criteria (a and b):
  - **a)** The patient has had a right heart catheterization; AND
  - **b)** The results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH.

40. Chronic Thromboembolic Pulmonary Hypertension (CTEPH). Approve for 3 years if prescribed by, or in consultation with, a pulmonologist or a cardiologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Adempas has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Pulmonary Arterial Hypertension – Endothelin Receptor Antagonists
- Tracleer® (bosentan tablets and oral suspension – Actelion)
- Letairis® (ambrisentan tablets – Gilead, generics)

- Opsumit® (macitentan tablets – Actelion)

APPROVAL DATE: 09/11/2019

OVERVIEW

Tracleer, Letairis and Opsumit are oral endothelin receptor antagonists (ERAs) that are used for the treatment of pulmonary arterial hypertension (PAH).[1-3] Tracleer is indicated for the treatment of PAH (World Health Organization [WHO] Group 1) in adults to improve exercise ability and decrease the rate of clinical worsening and in pediatric patients ≥ 3 years of age with idiopathic or congenital PAH to improve pulmonary vascular resistance (PVR), which is expected to result in an improvement in exercise ability.[1] In adults, trials establishing effectiveness included mainly patients with WHO Functional Class II to IV symptoms and etiologies of idiopathic or heritable PAH (60%), PAH associated with connective tissue disease (21%), and PAH associated with congenital heart disease with left-to-right shunts. Letairis is indicated for the treatment of PAH (WHO Group 1) to improve exercise ability and delay clinical worsening; and 2) for use in combination with tadalafil to reduce the risks of disease progression and hospitalization for worsening PAH, and to improve exercise ability.[2] Studies establishing effectiveness included predominantly those with WHO Functional Class II to III symptoms and etiologies of idiopathic or heritable PAH (60%) or PAH associated with connective tissue diseases (34%).[2] Opsumit is indicated for the treatment of PAH (WHO Group 1) to reduce the risks of disease progression and hospitalization for PAH.[3] The effectiveness was established in a long-term study involving patients with PAH who mainly had WHO Functional Class II to III symptoms who were treated for an average of 2 years. Patients had idiopathic and heritable PAH (57%), PAH due to connective tissue disorders (31%), and PAH due to congenital heart disease with repaired shunts (8%).

Disease Overview

PAH is a serious but rare condition impacting approximately fewer than 20,000 patients in the US. It is classified within Group 1 pulmonary hypertension among the five different groups that are recognized. In this progressive disorder the small arteries in the lungs become narrowed, restricted, or blocked causing the heart to work harder to pump blood, leading to activity impairment.[4,5] In time, right-sided heart failure and/or death may occur. Common PAH symptoms include shortness of breath, fatigue, chest pain, dizziness and fainting, along with impairment in activity tolerance. It is more prevalent in women. Patients of all ages may develop the disease; however, the mean age of diagnosis typically happens between 36 to 50 years. Children may also have PAH. The condition may occur due to various underlying medical conditions or as a disease that uniquely impacts the pulmonary circulation; both genetic and environmental factors may be involved. PAH is defined as a mean pulmonary artery pressure (mPAP) ≥ 25 mmHg with a pulmonary capillary wedge pressure (PCWP) ≤ 15 mmHg measured by cardiac catheterization. The prognosis in PAH has been described as poor, with the median survival being approximately 3 years. However, primarily due to advances in pharmacological therapies, the long-term prognosis has improved. Lung transplantation may be recommended if pharmacological or medical therapies fail, based upon patient status. The WHO categorizes PAH into stages, which is also referred to as the functional class (Class I to IV) and is an adaptation of the New York Heart Association (NYHA) system to evaluate activity tolerance.

Chronic thromboembolic pulmonary hypertension (CTEPH) is a persistent obstruction of pulmonary arteries and is often a complication of pulmonary embolism.[6,7] It is classified within Group 4 pulmonary hypertension. Symptoms include progressive dyspnea on exertion, as well as fatigue, syncope, hemoptysis, and signs of right heart failure. Pulmonary endarterectomy is the treatment of choice for most patients with CTEPH. However, around 40% of patients are deemed inoperable for various reasons. Medication therapy may also be recommended. Anticoagulant therapy is also given.

Guidelines

In 2009, the American College of Cardiology Foundation (ACCF) Task Force on Expert Consensus Documents and the American Heart Association (AHA), developed in collaboration with the American College of Chest Physicians (ACCP), American Thoracic Society (ATS) and the Pulmonary Hypertension Association, published an expert consensus document on pulmonary hypertension.[4] The hemodynamic definition of PAH is a mean pulmonary artery pressure (mPAP) greater than 25 mmHg; a pulmonary capillary wedge pressure (PCWP), left atrial pressure (LAP) or left ventricular end-diastolic pressure (LVEDP) less than or equal to 15 mmHg; and a pulmonary vascular resistance (PVR) greater than 3 Wood units. Many different medication from varying therapies classes and different routes of administration are recognized.[5] In 2019, and updated CHEST guideline and Expert Panel Report regarding therapy for pulmonary arterial hypertension in adults was released. Evidence for use of the many medications available is also detailed.

Other Uses with Supportive Evidence

The BENEFiT (Bosentan Effects in iNopErable Forms of chronic Thromboembolic pulmonary hypertension) study was a double-blind trial involving 156 patients with CTEPH who were randomized to placebo or Tracleer therapy (target dose of 125 mg BID) for 16 weeks. Benefits were noted in some hemodynamic parameters (e.g., decreased pulmonary vascular resistance).[8] Adempas, a soluble guanylate cyclase stimulator, is the only agent indicated for the treatment of adults with CTEPH (WHO Group 4) after surgical treatment, or inoperable CTEPH, to improve exercise capacity and WHO functional class.[9] The agent is also indicated for PAH (WHO Group 1) to improve exercise capacity, improve WHO functional class, and to delay clinical worsening. Adempas has a Boxed Warning regarding embryo-fetal toxicity and is contraindicated in patients using nitrates or nitric oxide donors in any forms, as well as in patients using PDE inhibitors. The main adverse effects of Adempas are symptomatic hypotension.

Tracleer has been used in patients with systemic sclerosis who have digital ulcers.[10-17] In a randomized, prospective, multicenter, placebo-controlled, double-blind study patients (n = 122) with limited or diffuse systemic sclerosis (scleroderma) were randomized in a 2:1 ratio to receive Tracleer or placebo for 16 weeks.[10] Patients receiving Tracleer had a 48% reduction in the mean number of new ulcerations (1.4 vs. 2.7 new ulcers; P = 0.0083), the primary efficacy endpoint. The effect was more substantial in patients with digital ulcers at study entry. However, no differences were noted in the healing of established ulcers.[10] Another trial showed a reduction in the occurrence of new digital ulcers in patients given Tracleer for 24 weeks.[14] Many other agents are utilized in digital ulcers.[12,16] In 2017 the European League Against Rheumatism (EULAR) updated recommendations for the treatment of systemic sclerosis.[16] Tracleer has efficacy from two high-quality randomized controlled trials to reduce the number of new digital ulcers in patients with systemic sclerosis. Tracleer should be considered to reduce the number of new digital ulcers in systemic sclerosis, especially in patients who have multiple digital ulcers despite use of calcium channel blockers, phosphodiesterase type 5 (PDE5) inhibitors or iloprost therapy.[16] A consensus of systemic sclerosis experts published an article that discusses therapy for digital ulcers.[15] The algorithm for digital ulcer prevention lists the following as first-line, second-line, third-line, and fourth-line treatment respectively: CCBs, PDE5 inhibitors, ERAs, and prostanoids. For the prevention of severe digital ulcers, selective sympathetecomy may occasionally be recommended. For active treatment CCBs are used first line, followed by PDE5 inhibitors.[15] A review on Raynaud's phenomenon and its manifestations (e.g., digital ulcers) also mentions similar medications. Other data describing use of epoprostenol are available.[18,19]

Safety

All agents are in Pregnancy Category X and have a Boxed Warning regarding teratogenicity.[1-3] Tracleer has a Boxed Warning regarding hepatotoxicity.[1] All agents have a Boxed Warning regarding embryofetal toxicity.[1-3]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Tracleer, Letairis, and Opsumit. Because of the specialized skills required for evaluation and diagnosis of patients treated with Tracleer, Letairis, and Opsumit, as well as the monitoring required for adverse events and long-term efficacy, approval requires the agents to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for 3 years in duration unless otherwise noted below.

Documentation: In the *Pulmonary Arterial Hypertension – Endothelin Receptor Antagonists Prior Authorization Policy*, documentation is required for initiation of therapy where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes and catheterization laboratory reports. For a patient case in which the documentation requirement of the right heart catheterization upon prior authorization coverage review for a different medication indicated for WHO Group 1 PAH has been previously provided, the documentation requirement in this *Pulmonary Arterial Hypertension – Endothelin Receptor Antagonist Prior Authorization Policy* is considered to be met.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tracleer, Opsumit, and Letairis is recommended in those who meet the following criteria:

FDA-Approved Indications

41. Pulmonary Arterial Hypertension (PAH) [World Health Organization {WHO} Group 1]. Approve for the duration noted if the patient meets ONE of the following (A or B):

C) Initial Therapy. Approve for 3 years if the patient meets all of the following criteria (i, ii, and iii).
- **i.** The patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND
- **ii.** The agent is prescribed by or in consultation with a cardiologist or a pulmonologist; AND
- **iii.** The patient meets the following criteria (a and b):
  - **a)** The patient has had a right heart catheterization **[documentation required]** (see documentation section above); AND
  - **b)** The results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; OR

D) Patients Currently Receiving the Requested Endothelin Receptor Antagonist (i.e., Tracleer, Letairis or Opsumit). Approve for 3 years if the patient meets the following criteria (i, ii, and iii):
- **iv.** The patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND
- **v.** The agent is prescribed by, or in consultation with, a cardiologist or a pulmonologist; AND
- **vi.** The patient meets the following criteria (a and b):
  - **a)** The patient has had a right heart catheterization; AND
  - **b)** The results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH.

Other Uses with Supportive Evidence

Coverage of Tracleer is also recommended in those who meet the following criteria:

42. Chronic Thromboembolic Pulmonary Hypertension (CTEPH). Approve Tracleer for 3 years if the patient meets the following criteria (A and B):
- **A)** The agent is prescribed by, or in consultation with, a cardiologist or a pulmonologist; AND
- **B)** The patient meets ONE of the following conditions (i, ii, or iii):
  - **i.** The patient has tried Adempas; OR
  - **ii.** The patient has a specific contraindication to use of Adempas according to the prescribing physician.
    Note: Examples of contraindications to use of Adempas include that the patient is receiving nitrates or nitric oxide donors, the patient is receiving a phosphodiesterase inhibitor such as sildenafil or tadalafil, or that the patient is hypotensive or is at risk for hypotension; OR
  - **iii.** The patient is currently receiving Tracleer.

43. Digital Ulcers/Systemic Sclerosis. Approve Tracleer for 3 years if the patient meets the following criteria (A or B):
- **A)** The patient has tried two other therapies for this condition such as calcium channel blockers (CCBs), phosphodiesterase type 5 (PDE5) inhibitors, alpha-adrenergic blockers, nitroglycerin, or angiotensin converting enzyme (ACE) inhibitors.
  Note: Examples of CCBs include amlodipine, felodipine, and nifedipine; an example of an alpha-adrenergic blocker is prazosin; and examples of PDE5 inhibitors include sildenafil and Levitra® (vardenafil tablets); OR
- **B)** The patient has tried one vasodilator/prostanoid therapy
  Note: Examples of vasodilator/prostanoid therapies include epoprostenol injection and alprostadil injection.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Letairis, Tracleer and Opsumit have has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

117. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Pulmonary Arterial Hypertension – Epoprostenol injection

- Flolan® (epoprostenol injection – GlaxoSmithKline, generic)
- Veletri® (epoprostenol injection – Actelion)

APPROVAL DATE: 09/11/2019

OVERVIEW

Epoprostenol injection, a prostacyclin vasodilator, is indicated for the treatment of pulmonary arterial hypertension (PAH) [World Health Organization {WHO} Group 1] to improve exercise capacity.[1-3] Studies establishing effectiveness included predominantly patients with New York Heart Association (NYHA) Functional Class III to IV symptoms and etiologies of idiopathic or heritable PAH (49%) or PAH associated with connective tissue diseases (51%). It is administered as a continuous intravenous infusion.[1-3]

Disease Overview

PAH is a serious but rare condition impacting approximately fewer than 20,000 patients in the US. It is classified within Group 1 pulmonary hypertension among the five different groups that are recognized. In this progressive disorder the small arteries in the lungs become narrowed, restricted, or blocked causing the heart to work harder to pump blood, leading to activity impairment.[4,5] In time, right-sided heart failure and/or death may occur. Common PAH symptoms include shortness of breath, fatigue, chest pain, dizziness and fainting, along with impairment in activity tolerance. It is more prevalent in women. Patients of all ages may develop the disease; however, the mean age of diagnosis typically happens between 36 to 50 years. Children may also have PAH. The condition may occur due to various underlying medical conditions or as a disease that uniquely impacts the pulmonary circulation; both genetic and environmental factors may be involved. PAH is defined as a mean pulmonary artery pressure (mPAP) $\geq$ 25 mmHg with a pulmonary capillary wedge pressure (PCWP) $\leq$ 15 mmHg measured by cardiac catheterization. The prognosis in PAH has been described as poor, with the median survival being approximately 3 years. However, primarily due to advances in pharmacological therapies, the long-term prognosis has improved.

Lung transplantation may be recommended if pharmacological or medical therapies fail, based upon patient status. The WHO categorizes PAH into stages, which is also referred to as the functional class (Class I to IV) and is an adaptation of the New York Heart Association (NYHA) system to evaluate activity tolerance.

CTEPH is a persistent obstruction of pulmonary arteries and is often a complication of pulmonary embolism.[6,7] It is classified within Group 4 pulmonary hypertension. Symptoms include progressive dyspnea on exertion, as well as fatigue, syncope, hemoptysis, and signs of right heart failure. Pulmonary endarterectomy is the treatment of choice for most patients with CTEPH. However, around 40% of patients are deemed inoperable for various reasons. Medication therapy may also be recommended. Anticoagulant therapy is also given.

Guidelines

In 2009, the American College of Cardiology Foundation (ACCF) Task Force on Expert Consensus Documents and the American Heart Association (AHA), developed in collaboration with the ACCP, American Thoracic Society (ATS) and the Pulmonary Hypertension Association, published an expert consensus document on pulmonary hypertension.[4] The hemodynamic definition of PAH is a mean pulmonary artery pressure (mPAP) greater than 25 mmHg; a pulmonary capillary wedge pressure (PCWP), left atrial pressure (LAP) or left ventricular end-diastolic pressure (LVEDP) less than or equal to 15 mmHg; and a pulmonary vascular resistance (PVR) greater than 3 Wood units. Many different medications from varying therapies classes and different routes of administration are recognized.

In 2019, and updated CHEST guideline and Expert Panel Report regarding therapy for pulmonary arterial hypertension in adults was released.[5] Evidence for use of the many medications available is also detailed. In the absence of contraindications, patients with PAH should undergo acute vasoreactivity testing utilizing a short-acting agent (e.g., calcium channel blockers [CCBs]). For patients in Functional Class II, oral therapies are recommended such as endothelin receptor antagonists (Letairis® [ambrisentan tablets], Tracleer® [bosentan tablets], Opsumit® [macitentan tablets]), phosphodiesterase type 5 (PDE 5) inhibitors (tadalafil, sildenafil), and Adempas® (riociguat tablets). It is suggest that parenteral or inhaled prostanoids not be chosen as initial therapy for treatment naïve patients with PAH with WHO Functional Class II symptoms or as second-line agents for patients with PAH with WHO Functional Class II who have not met their treatment goals. Parenteral prostanoids are recommended for patients with PAH in Functional Class III and IV.

Other Uses with Supportive Evidence

Epoprostenol injection has been used with varying results in patients with CTEPH.[8-10] It is sometimes used as a bridge prior to surgery. Limited options are available for patients with CTEPH.

Safety

Epoprostenol should not be abruptly discontinued or have the dose rapidly decreased as rebound pulmonary hypertension may occur.[1-3]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of epoprostenol injection. Because of the specialized skills required for evaluation and diagnosis of patients treated with epoprostenol injection as well as the monitoring required for adverse events and long-term efficacy, approval requires epoprostenol injection to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for 1 year in duration unless otherwise noted below. Specifically,

approvals will remain at 14 days for patients currently receiving the agent with inadequate information or if the criteria are not met.

Documentation: In the *Pulmonary Arterial Hypertension – Epoprostenol Prior Authorization Policy*, documentation is required for initiation of therapy where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes and catheterization laboratory reports. For a patient case in which the documentation requirement of the right heart catheterization upon prior authorization coverage review for a different medication indicated for WHO Group 1 PAH has been previously provided, the documentation requirement in this *Pulmonary Arterial Hypertension – Epoprostenol Prior Authorization Policy* is considered to be met.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of epoprostenol therapy is recommended in those who meet the following criteria:
FDA-Approved Indications

44. Pulmonary Arterial Hypertension (PAH) [World Health Organization {WHO} Group 1]. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 1 year if the patient meets all of the following criteria (i, ii, iii, iv, and v):

i. The patient has World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND

ii. The agent is prescribed by, or in consultation with, a cardiologist or a pulmonologist; AND

iii. The patient meets the following criteria (a and b):

a) The patient has had a right heart catheterization **[documentation required]** (see documentation section above); AND

b) The results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND

iv. The patient meets ONE of the following criteria (a or b):

a) The patient is in Functional Class III or IV; OR

b) The patient is in Functional Class II and meets ONE of the following criteria [(1) or (2)]:

(1) The patient has tried or is currently receiving one oral agent for PAH
Note: Examples of oral agents for PAH include Tracleer® (bosentan tablets), Letairis® (ambrisentan tablets [generic]), Opsumit® (macitentan tablets), Adempas® (riociguat tablets), Revatio® (sildenafil tablets and suspension [generics]), Adcirca® (tadalafil tablets [generic]), Orenitram® (treprostinil extended-release tablets) and Uptravi® (selexipag tablets); OR

(2) The patient has tried one inhaled or parenteral prostacyclin product for PAH
Note: Examples of inhaled and parenteral prostacyclin products for PAH include Remodulin® (treprostinil injection [generic]), Ventavis® (iloprost inhalation solution), and Tyvaso® (treprostinil inhalation solution); AND

v. Patients with idiopathic PAH must meet ONE of the following criteria (a, b, c, d, or e):

a) The patient has had an acute response to vasodilator testing that occurred during the right heart catheterization (defined as a decrease in mPAP of at least 10 mm Hg to an absolute mPAP of less than 40 mm Hg without a decrease in cardiac output) AND has tried one oral calcium channel blocker (CCB) therapy
Note: Examples of CCBs include amlodipine and nifedipine extended-release tablets; OR

b) The patient did not have an acute response to vasodilator testing; OR
c) The patient cannot undergo a vasodilator test; OR
d) The patient cannot take CCB therapy (e.g., right heart failure, decreased cardiac output); OR
e) The patient has tried one CCB
Note: Examples of CCBs include amlodipine and nifedipine extended-release tablets; OR

B) Patients Currently Receiving Epoprostenol. Approve for the duration noted below if the patient meets the following criteria (i or ii):
i. Approve for 1 year if the patient meets ALL of the following conditions (a, b, and c):
a) The patient has World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND
b) The agent is prescribed by, or in consultation with, a cardiologist or a pulmonologist; AND
c) The patient meets the following criteria [(1) and (2)]:
(1) The patient has had a right heart catheterization; AND
(2) The results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; OR
ii. Approve a short-term supply of epoprostenol for up to 14 days if the patient does not meet the criteria in 1Bi above or if there is insufficient information available.
Note: A 14-day supply should be sufficient to address coverage issues. However, multiple short-term approvals are allowed if a coverage determination cannot be made. Abrupt discontinuation of epoprostenol therapy may have severe adverse consequences.

Other Uses with Supportive Evidence

45. Chronic Thromboembolic Pulmonary Hypertension (CTEPH). Approve for 1 year if prescribed by, or in consultation with, a pulmonologist or a cardiologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Epoprostenol injection (Flolan, Veletri, generics) has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

1. Chronic Obstructive Pulmonary Disease (COPD) in a Patient Without PAH (WHO Group 1). COPD is classified as Group 3 Pulmonary Hypertension (pulmonary hypertension associated with lung diseases and/or hypoxia). Pulmonary hypertension may develop late in the course of COPD, but medications used for the treatment of PAH (WHO Group 1) are not recommended therapies.[11]

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Pulmonary Arterial Hypertension – Inhaled Prostacyclin Products
- Ventavis® (iloprost inhalation solution – Actelion)
- Tyvaso® (treprostinil inhalation solution – United Therapeutics)

APPROVAL DATE: 09/11/2019

OVERVIEW

Ventavis and Tyvaso are both inhaled prostacyclin vasodilators indicated for the treatment of pulmonary arterial hypertension (PAH).[1,2] Ventavis is indicated for the treatment of PAH (World Health Organization [WHO] Group 1) to improve a composite endpoint consisting of exercise tolerance, symptoms (based on New York Heart Association [NYHA] Class), and lack of deterioration. Studies establishing effectiveness involved mainly patients with NYHA Functional Class III to IV symptoms and etiologies of idiopathic or heritable PAH (65%) or PAH associated with connective tissue diseases (23%).[1] Tyvaso is indicated for the treatment of PAH (WHO Group 1) to improve exercise ability.[2] Studies establishing effectiveness mainly included those with NYHA Functional Class III symptoms and etiologies of idiopathic or heritable PAH (56%) or PAH associated with connective tissue diseases (33%).[2]

Disease Overview

PAH is a serious but rare condition impacting approximately fewer than 20,000 patients in the US. It is classified within Group 1 pulmonary hypertension among the five different groups that are recognized. In this progressive disorder the small arteries in the lungs become narrowed, restricted, or blocked causing the heart to work harder to pump blood, leading to activity impairment.[3,4] In time, right-sided heart failure and/or death may occur. Common PAH symptoms include shortness of breath, fatigue, chest pain, dizziness and fainting, along with impairment in activity tolerance. It is more prevalent in women. Patients of all ages may develop the disease; however, the mean age of diagnosis typically happens between 36 to 50 years. Children may also have PAH. The condition may occur due to various underlying medical conditions or as a disease that uniquely impacts the pulmonary circulation; both genetic and environmental factors may be involved. PAH is defined as a mean pulmonary artery pressure (mPAP) $\geq$ 25 mmHg with a pulmonary capillary wedge pressure (PCWP) $\leq$ 15 mmHg measured by cardiac catheterization. The prognosis in PAH has been described as poor, with the median survival being approximately 3 years. However, primarily due to advances in pharmacological therapies, the long-term prognosis has improved. Lung transplantation may be recommended if pharmacological or medical therapies fail, based upon patient status. The WHO categorizes PAH into stages, which is also referred to as the functional class (Class I to IV) and is an adaptation of the New York Heart Association (NYHA) system to evaluate activity tolerance.

Guidelines

In 2009, the American College of Cardiology Foundation (ACCF) Task Force on Expert Consensus Documents and the American Heart Association (AHA), developed in collaboration with the ACCP, American Thoracic Society (ATS) and the Pulmonary Hypertension Association, published an expert consensus document on pulmonary hypertension.[3] The hemodynamic definition of PAH is a mean pulmonary artery pressure (mPAP) greater than 25 mmHg; a pulmonary capillary wedge pressure (PCWP), left atrial pressure (LAP) or left ventricular end-diastolic pressure (LVEDP) less than or equal to 15 mmHg; and a pulmonary vascular resistance (PVR) greater than 3 Wood units. Many different medication from varying therapies classes and different routes of administration are recognized.

An updated treatment algorithm (2013) by the 2nd World Symposium on Pulmonary Hypertension (WSPH) states that patients with Functional Class II should be treated initially with oral therapies (e.g., Adempas® [riociguat tablets], Revatio® (sildenafil tablets and suspension [generics] {Note: brand name Revatio injection also available}), Adcirca® [tadalafil tablets {generic}], Opsumit® [macitentan tablets], Tracleer® [bosentan tablets], and Letairis® [ambrisentan tablets]).[5] Ventavis and Tyvaso are recommended for patients in Functional Class III and IV. In situations of inadequate response, combination therapy (including double or triple therapy) is recommended.

In 2019, and updated CHEST guideline and Expert Panel Report regarding therapy for pulmonary arterial hypertension in adults was released.[4] Evidence for use of the many medications available is also detailed. One recommendation is that parenteral or inhaled prostanoids should not be used as initial therapy for patients with PAH who are treatment naïve with WHO Functional Class II symptoms or as second-line agents for patients with PAH with WHO Functional Class II symptoms who have not met original treatment goals.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Ventavis and Tyvaso. Because of the specialized skills required for evaluation and diagnosis of patients treated with Ventavis and Tyvaso as well as the monitoring required for adverse events and long-term efficacy, approval requires these agents to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for 3 years in duration unless otherwise noted below.

Documentation: In the *Pulmonary Arterial Hypertension – Inhaled Prostacyclin Products Prior Authorization Policy*, documentation is required for initiation of therapy where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes and catheterization laboratory reports. For a patient case in which the documentation requirement of the right heart catheterization upon prior authorization coverage review for a different medication indicated for WHO Group 1 PAH has been previously provided, the documentation requirement in this *Pulmonary Arterial Hypertension – Inhaled Prostacyclin Products Prior Authorization Policy* is considered to be met.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Ventavis and Tyvaso is recommended in those who meet the following criteria:

FDA-Approved Indications

46. Pulmonary Arterial Hypertension (PAH) [World Health Organization {WHO} Group 1]. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 years if the patient meets the following criteria (i, ii, iii, and iv):

i. The patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND

ii. The agent is prescribed by, or in consultation with, a cardiologist or a pulmonologist; AND

iii. The patient meets ONE of the following criteria (a or b):

a) The patient is in Functional Class III or IV; OR

b) The patient is in Functional Class II and meets ONE of the following criteria [(1) or (2)]:

(1) The patient has tried or is currently receiving one oral agent for PAH.
Note: Examples of oral agents for PAH include Tracleer® (bosentan tablets), Letairis® (ambrisentan tablets [generic]), Opsumit® (macitentan tablets), Revatio® (sildenafil tablets and suspension [generics]), Adcirca® (tadalafil tablets [generic]), Adempas® (riociguat tablets), Orenitram® (treprostinil extended-release tablets), and Uptravi® (selexipag tablets); OR

(2) The patient has tried one inhaled or parenteral prostacyclin product for PAH.
Note: Examples of inhaled and oral parenteral prostacyclin products for PAH include Tyvaso® (treprostinil inhalation solution), Ventavis® (iloprost inhalation solution), Remodulin® (treprostinil injection [generic]), and epoprostenol injection (Flolan®, Veletri®, generics); AND

iv. The patient meets the following criteria (a and b):

a) The patient has had a right heart catheterization **[documentation required]** (see documentation section above); AND

b) The results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; OR

B) Patients Currently Receiving the Requested Inhaled Prostacyclin for PAH (i.e., Ventavis or Tyvaso). Approve for 3 years if the patient meets the following criteria (i, ii, and iii):

i. The patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND

ii. The agent is prescribed by, or in consultation with, a cardiologist or a pulmonologist; AND

iii. The patient meets the following criteria (a and b):

a) The patient has had a right heart catheterization; AND

b) The results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Ventavis and Tyvaso have not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Pulmonary Arterial Hypertension – Orenitram® (treprostinil extended-release tablets – United Therapeutics)

APPROVAL DATE: 09/11/2019

OVERVIEW

Orenitram, an oral prostacyclin vasodilator, is indicated for the treatment of pulmonary arterial hypertension (PAH) World Health Organization (WHO) Group 1 to delay disease progression and to improve exercise capacity.[1] The studies that established the efficacy of Orenitram included mainly patients with WHO functional class II to III symptoms and etiologies of idiopathic or heritable PAH (66%) or PAH associated with connective tissue disease (26%).

Disease Overview

PAH is a serious but rare condition impacting approximately fewer than 20,000 patients in the US. It is classified within Group 1 pulmonary hypertension among the five different groups that are recognized. In this progressive disorder the small arteries in the lungs become narrowed, restricted, or blocked causing the heart to work harder to pump blood, leading to activity impairment.[2,3] In time, right-sided heart failure and/or death may occur. Common PAH symptoms include shortness of breath, fatigue, chest pain, dizziness and fainting, along with impairment in activity tolerance. It is more prevalent in women. Patients of all ages may develop the disease; however, the mean age of diagnosis typically happens between 36 to 50 years. Children may also have PAH. The condition may occur due to various underlying medical conditions or as a disease that uniquely impacts the pulmonary circulation; both genetic and environmental factors may be involved. PAH is defined as a mean pulmonary artery pressure (mPAP) $\geq$ 25 mmHg with a pulmonary capillary wedge pressure (PCWP) $\leq$ 15 mmHg measured by cardiac catheterization. The prognosis in PAH has been described as poor, with the median survival being approximately 3 years. However, primarily due to advances in pharmacological therapies, the long-term prognosis has improved. Lung transplantation may be recommended if pharmacological or medical therapies fail, based upon patient status. The WHO categorizes PAH into stages, which is also referred to as the functional class (Class I to IV) and is an adaptation of the New York Heart Association (NYHA) system to evaluate activity tolerance.

Guidelines

In 2009, the American College of Cardiology Foundation (ACCF) Task Force on Expert Consensus Documents and the American Heart Association (AHA), developed in collaboration with the ACCP, American Thoracic Society (ATS) and the Pulmonary Hypertension Association, published an expert consensus document on pulmonary hypertension.[2] The hemodynamic definition of PAH is a mean pulmonary artery pressure (mPAP) greater than 25 mmHg; a pulmonary capillary wedge pressure (PCWP), left atrial pressure (LAP) or left ventricular end-diastolic pressure (LVEDP) less than or equal to 15 mmHg; and a pulmonary vascular resistance (PVR) greater than 3 Wood units. Many different medication from varying therapies classes and different routes of administration are recognized. In 2019, and updated CHEST guideline and Expert Panel Report regarding therapy for pulmonary arterial hypertension in adults

was released.[3] Many other agents other than Orenitram are recommended as initial and subsequent therapy such as endothelin receptor antagonists (Letairis® [ambrisentan tablets], Tracleer® [bosentan tablets], Opsumit® [macitentan tablets], phosphodiesterase type 5 [PDE 5] inhibitors [tadalafil, sildenafil), and Adempas® (riociguat tablets). The addition of an oral prostanoid product is recommended in patients with PAH who are in Functional Class III without evidence of rapid disease progression or a poor prognosis among those not willing or able to manage parenteral prostanoids.

Safety

Abrupt discontinuation or sudden large reductions in the dosage of Orenitram may cause PAH symptoms to worsen.[1] In the event of a planned short-term treatment interruption for patients unable to take oral medication, consider a temporary infusion of subcutaneous or intravenous treprostinil.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Orenitram. Because of the specialized skills required for evaluation and diagnosis of patients treated with Orenitram as well as the monitoring required for AEs and long-term efficacy, initial approval requires Orenitram to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for 3 years in duration unless otherwise noted below.

Documentation: In the *Pulmonary Arterial Hypertension – Orenitram Prior Authorization Policy*, documentation is required for initiation of therapy where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes and catheterization laboratory reports. For a patient case in which the documentation requirement of the right heart catheterization upon prior authorization coverage review for a different medication indicated for WHO Group 1 PAH has been previously provided, the documentation requirement in this *Pulmonary Arterial Hypertension – Orenitram Prior Authorization Policy* is considered to be met.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Orenitram is recommended in those who meet the following criteria:

FDA-Approved Indications

47. Pulmonary Arterial Hypertension (World Health Organization [WHO] Group 1). Approve for the duration noted if the patient meets ONE of the following (A or B):

E) Initial Therapy. Approve for 3 years if the patient meets all of the following criteria (i, ii, iii, and iv):

- **i.** The patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND
- **ii.** The agent is prescribed by or in consultation with a cardiologist or a pulmonologist; AND
- **iii.** The patient meets the following criteria (a and b):
  - **a)** The patient has had a right heart catheterization **[documentation required]** (see documentation section above); AND
  - **b)** The results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND
- **iv.** The patient meets one of the following conditions (i or ii):

a) The patient has tried two oral therapies for PAH (or is currently receiving them) from two of the three following different categories (either alone or in combination) each for ≥ 60 days: one phosphodiesterase type 5 (PDE5) inhibitor, one endothelin receptor antagonist (ERA), or Adempas (riociguat tablets).
Note: Examples of PDE5 inhibitors include Revatio® (sildenafil tablets and suspension [generic]) and Adcirca® (tadalafil tablets [generic]) and examples of ERAs include Tracleer® (bosentan tablets), Letairis® (ambrisentan tablets [generic]), and Opsumit® (macitentan tablets); OR

b) The patient is receiving or has received in the past for PAH one prostacyclin therapy or a prostacyclin receptor agonist (i.e., Uptravi) for PAH.
Note: Examples of prostacyclin therapies for PAH include Tyvaso® (treprostinil inhalation solution), Ventavis® (iloprost inhalation solution), Remodulin® (treprostinil injection [generic]), and epoprostenol injection [Flolan, Veletri, generics]); OR

F) Patient Currently Receiving Orenitram. Approve for 3 years if the patient meets all of the following criteria (i, ii, and iii):

vii. The patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND

viii. The agent is prescribed by, or in consultation with, a cardiologist or a pulmonologist; AND

ix. The patient meets the following criteria (a and b):

a) The patient has had a right heart catheterization; AND

b) The results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Orenitram has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

118. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Pulmonary Arterial Hypertension – Phosphodiesterase Type 5 (PDE5) Inhibitors

- Adcirca® (tadalafil tablets [generic] – Eli Lilly/United Therapeutics)
- Alyq™ (tadalafil tablets [generic] – Teva)
- Revatio® (sildenafil tablets [generic], suspension [generic] and injection – Pfizer)

DATE REVIEWED: 09/18/2019

OVERVIEW

Revatio and Adcirca are phosphodiesterase type 5 (PDE5) inhibitors indicated for the treatment of pulmonary arterial hypertension (PAH).[1,2] Alyq is a generic to Adcirca.[7] Revatio is indicated for PAH (World Health Organization [WHO] Group I) in adults to improve exercise ability and delay clinical worsening. The delay in clinical worsening was demonstrated when Revatio was added to background epoprostenol injection therapy (Flolan® [generic], Veletri®). Studies establishing its effectiveness were short-term (12 to 16 weeks) and included mainly patients with New York Heart Association (NYHA) Functional Class II to III symptoms and idiopathic etiology (71%) or associated with connective tissue disease (25%).[1] Adcirca and Alyq are indicated for the treatment of PAH (WHO Group I) to improve exercise ability.[2,7] Studies establishing effectiveness were mainly in patients with NYHA Functional Class II to III symptoms and etiologies of idiopathic or heritable PAH (61%) or PAH associated with connective tissue diseases (23%). Sildenafil and tadalafil are also indicated as differently named brand products for the treatment of erectile dysfunction; tadalafil is also indicated for use in patients with benign prostatic hyperplasia.[3,4]

Disease Overview

PAH is a serious but rare condition impacting approximately fewer than 20,000 patients in the US. It is classified within Group 1 pulmonary hypertension among the five different groups that are recognized. In this progressive disorder the small arteries in the lungs become narrowed, restricted, or blocked causing the heart to work harder to pump blood, leading to activity impairment.[5,6] In time, right-sided heart failure and/or death may occur. Common PAH symptoms include shortness of breath, fatigue, chest pain, dizziness and fainting, along with impairment in activity tolerance. It is more prevalent in women. Patients of all ages may develop the disease; however, the mean age of diagnosis typically happens between 36 to 50 years. Children may also have PAH. The condition may occur due to various underlying medical conditions or as a disease that uniquely impacts the pulmonary circulation; both genetic and environmental factors may be involved. PAH is defined as a mean pulmonary artery pressure (mPAP) $\geq$ 25 mmHg with a pulmonary capillary wedge pressure (PCWP) $\leq$ 15 mmHg measured by cardiac catheterization. The prognosis in PAH has been described as poor, with the median survival being approximately 3 years. However, primarily due to advances in pharmacological therapies, the long-term prognosis has improved. Lung transplantation may be recommended if pharmacological or medical therapies fail, based upon patient status. The WHO categorizes PAH into stages, which is also referred to as the functional class (Class I to IV) and is an adaptation of the New York Heart Association (NYHA) system to evaluate activity tolerance.

Guidelines

In 2009, the American College of Cardiology Foundation (ACCF) Task Force on Expert Consensus Documents and the American Heart Association (AHA), developed in collaboration with the ACCP, American Thoracic Society (ATS) and the Pulmonary Hypertension Association, published an expert consensus document on pulmonary hypertension.[5] The hemodynamic definition of PAH is a mean pulmonary artery pressure (mPAP) greater than 25 mmHg; a pulmonary capillary wedge pressure (PCWP), left atrial pressure (LAP) or left ventricular end-diastolic pressure (LVEDP) less than or equal to 15 mmHg; and a pulmonary vascular resistance (PVR) greater than 3 Wood units. Many different medication from varying therapies classes and different routes of administration are recognized. In 2019, and updated CHEST guideline and Expert Panel Report regarding therapy for pulmonary arterial hypertension in adults was released.[6] Evidence for use of the many medications available is also detailed.

Safety

Revatio has a Warning regarding mortality with increasing doses in pediatric patients. In a long-term trial involving pediatric patients with PAH, an increase in mortality with increasing Revatio dose was noted.

Deaths were first observed following about 1 year and causes of death were usual of those with PAH. Revatio, especially chronic use, is not recommended in children.[1]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Revatio, Adcirca and Alyq. Because of the specialized skills required for evaluation and diagnosis of patients treated with Revatio, Adcirca and Alyq, as well as the monitoring required for adverse events and long-term efficacy, approval requires these agents to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for 3 years in duration unless otherwise noted below.

Documentation: In the *Pulmonary Arterial Hypertension – Phosphodiesterase Type 5 Inhibitors Prior Authorization Policy*, documentation is required for initiation of therapy where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes and catheterization laboratory reports. For a patient case in which the documentation requirement of the right heart catheterization upon prior authorization coverage review for a different medication indicated for WHO Group 1 PAH has been previously provided, the documentation requirement in this *Pulmonary Arterial Hypertension – Phosphodiesterase Type 5 Inhibitors Prior Authorization Policy* is considered to be met.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Revatio tablets, Revatio suspension, sildenafil suspension, Revatio injection, Adcirca, and Alyq is recommended in those who meet the following criteria:

FDA-Approved Indication

I. Coverage of Revatio tablets, Revatio suspension, sildenafil suspension, Adcirca tablets and Alyq tablets is recommended in those who meet the following criteria:

48. Pulmonary Arterial Hypertension (PAH) [World Health Organization {WHO} Group 1]. Approve for the duration noted if the patient meets ONE of the following (A or B):

G) Initial Therapy. Approve for 3 years if the patient meets all of the following criteria (i, ii, and iii):

- **i.** The patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND
- **ii.** The agent is prescribed by, or in consultation with, a cardiologist or a pulmonologist.
- **iii.** The patient meets the following criteria (a and b):
  - **a)** The patient has had a right heart catheterization **[documentation required]** (see documentation section above); AND
  - **b)** The results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; OR

H) Patients Currently Receiving the Requested Phosphodiesterase Type 5 (PDE5) inhibitor (i.e., Revatio tablets, Revatio suspension, sildenafil suspension or Adcirca). Approve for 3 years if the patient meets the following criteria (i, ii, and iii):

- **x.** The patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND
- **xi.** The agent is prescribed by, or in consultation with, a cardiologist or a pulmonologist; AND

xii. The patient meets the following criteria (a and b):
- **a)** The patient has had a right heart catheterization; AND
- **b)** The results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH).

II. Coverage of Revatio injection is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **Pulmonary Arterial Hypertension (PAH) [World Health Organization {WHO} Group 1].** Approve for the duration noted if the patient meets ONE of the following (A or B):
   - **A)** Initial Therapy. Approve Revatio injection for 3 years if the patient meets the following criteria (i, ii, iii, and iv):
     - **i.** The patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND
     - **ii.** The agent is prescribed by, or in consultation with, a cardiologist or a pulmonologist; AND
     - **iii.** The patient is unable to take an oral PDE5 inhibitor indicated for WHO Group 1 PAH. Note: Examples of oral PDE5 inhibitors for PAH include Revatio® (sildenafil tablets or suspension or suspension [generics]) and Adcirca® (tadalafil tablets [generic]); AND
     - **iv.** The patient meets the following criteria (a and b):
       - **a)** The patient has had a right heart catheterization **[documentation required]** (see documentation section above); AND
       - **b)** The results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; OR
   - **B)** Patients Currently Receiving Revatio Injection. Approve Revatio injection for 3 years if the patient meets the following criteria (i, ii, iii, and iv):
     - **i.** The patient has a diagnosis of World Health Organization (WHO) Group 1 PAH; AND
     - **ii.** The agent is prescribed by, or in consultation with, a cardiologist or a pulmonologist; AND
     - **iii.** The patient is unable to take an oral PDE5 inhibitor indicated for WHO Group 1 PAH. Note: Examples of oral PDE5 inhibitors for PAH include Revatio® (sildenafil tablets or suspension [generics]) and Adcirca® (tadalafil tablets [generic]); AND
     - **iv.** The patient meets the following criteria (a and b):
       - **a)** The patient has had a right heart catheterization; AND
       - **b)** The results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Revatio tablets, Revatio suspension, sildenafil suspension, Revatio injection, Adcirca or Alyq have not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

2. **Erectile Dysfunction.** Coverage is not recommended. Patients should use other PDE5 inhibitors indicated for erectile dysfunction.

3. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Pulmonary Arterial Hypertension – Remodulin® (treprostinil injection for subcutaneous or intravenous use – United Therapeutics Corporation, generics)

APPROVAL DATE: 09/11/2019

OVERVIEW

Treprostinil injection, a prostacyclin vasodilator, is indicated for the treatment of pulmonary arterial hypertension (PAH) [World Health Organization {WHO} Group 1] to diminish symptoms associated with exercise.[1,2] Studies establishing the effectiveness involved those with New York Heart Association (NYHA) Functional Class II to IV symptoms and etiologies of idiopathic or heritable PAH (58%), PAH associated with congenital systemic-to-pulmonary shunts (23%), or PAH associated with connective tissue diseases (19%). Treprostinil injection is also indicated for patients who require transition from epoprostenol, to reduce the rate of clinical deterioration. The risks and benefits of each agent should be considered carefully before transition. Treprostinil injection may be administered via continuous subcutaneous (SC) infusion or continuous intravenous infusion. Continuous SC infusion is the preferred route of administration. Use as an intravenous infusion if SC infusion is not tolerated.

Disease Overview

PAH is a serious but rare condition impacting approximately fewer than 20,000 patients in the US. It is classified within Group 1 pulmonary hypertension among the five different groups that are recognized. In this progressive disorder the small arteries in the lungs become narrowed, restricted, or blocked causing the heart to work harder to pump blood, leading to activity impairment.[3,4] In time, right-sided heart failure and/or death may occur. Common PAH symptoms include shortness of breath, fatigue, chest pain, dizziness and fainting, along with impairment in activity tolerance. It is more prevalent in women. Patients of all ages may develop the disease; however, the mean age of diagnosis typically happens between 36 to 50 years. Children may also have PAH. The condition may occur due to various underlying medical conditions or as a disease that uniquely impacts the pulmonary circulation; both genetic and environmental factors may be involved. PAH is defined as a mean pulmonary artery pressure (mPAP) $\geq$ 25 mmHg with a pulmonary capillary wedge pressure (PCWP) $\leq$ 15 mmHg measured by cardiac catheterization. The prognosis in PAH has been described as poor, with the median survival being approximately 3 years. However, primarily due to advances in pharmacological therapies, the long-term prognosis has improved. Lung transplantation may be recommended if pharmacological or medical therapies fail, based upon patient status. The WHO categorizes PAH into stages, which is also referred to as the functional class (Class I to IV) and is an adaptation of the New York Heart Association (NYHA) system to evaluate activity tolerance.

CTEPH is a persistent obstruction of pulmonary arteries and is often a complication of pulmonary embolism.[5,6] It is classified within Group 4 pulmonary hypertension. Symptoms include progressive dyspnea on exertion, as well as fatigue, syncope, hemoptysis, and signs of right heart failure. Pulmonary endarterectomy is the treatment of choice for most patients with CTEPH. However, around 40% of patients are deemed inoperable for various reasons. Medication therapy may also be recommended. Anticoagulant therapy is also given.

Guidelines

In 2009, the American College of Cardiology Foundation (ACCF) Task Force on Expert Consensus Documents and the American Heart Association (AHA), developed in collaboration with the ACCP, American Thoracic Society (ATS) and the Pulmonary Hypertension Association, published an expert consensus document on pulmonary hypertension.[3] The hemodynamic definition of PAH is a mean pulmonary artery pressure (mPAP) greater than 25 mmHg; a pulmonary capillary wedge pressure (PCWP), left atrial pressure (LAP) or left ventricular end-diastolic pressure (LVEDP) less than or equal to 15 mmHg; and a pulmonary vascular resistance (PVR) greater than 3 Wood units. Many different medications from varying therapies classes and different routes of administration are recognized.

In 2019, and updated CHEST guideline and Expert Panel Report regarding therapy for pulmonary arterial hypertension in adults was released.[4] Evidence for use of the many medications available is also detailed. In the absence of contraindications, patients with PAH should undergo acute vasoreactivity testing utilizing a short-acting agent (e.g., calcium channel blockers [CCBs]). For patients in Functional Class II, oral therapies are recommended such as endothelin receptor antagonists (Letairis® [ambrisentan tablets], Tracleer® [bosentan tablets], Opsumit® [macitentan tablets]), phosphodiesterase type 5 (PDE 5) inhibitors (tadalafil, sildenafil), and Adempas® (riociguat tablets). It is suggest that parenteral or inhaled prostanoids not be chosen as initial therapy for treatment naïve patients with PAH with WHO Functional Class II symptoms or as second-line agents for patients with PAH with WHO Functional Class II who have not met their treatment goals. Parenteral prostanoids are recommended for patients with PAH in Functional Class III and IV.

Other Uses with Supportive Evidence

Treprostinil injection has been used with varying results in patients with CTEPH.[7-10] Benefits noted include improvement in functional class, six-minute walk distance, and in hemodynamic parameters. Treprostinil injection is sometimes used as a bridge prior to surgery. Limited options are available for patients with CTEPH.

Safety

Treprostinil injection should not be abruptly discontinued or have the dose rapidly decreased as rebound pulmonary hypertension may occur.[1,2]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of treprostinil injection. Because of the specialized skills required for evaluation and diagnosis of patients treated with treprostinil injection as well as the monitoring required for adverse events and long-term efficacy, approval requires treprostinil injection to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for 1 year in duration unless otherwise noted below. Specifically, approvals will remain at 14 days for patients currently receiving the agent with inadequate information or if the criteria are not met.

Documentation: In the *Pulmonary Arterial Hypertension – Remodulin Authorization Policy*, documentation is required for initiation of therapy where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes and catheterization laboratory reports. For a patient case in which the documentation requirement of the right heart catheterization upon prior authorization coverage review for a different medication indicated for WHO Group 1 PAH has been previously provided, the documentation requirement in this *Pulmonary Arterial Hypertension – Remodulin Prior Authorization Policy* is considered to be met.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of treprostinil injection is recommended in those who meet the following criteria:

FDA-Approved Indications

49. Pulmonary Arterial Hypertension (PAH) [World Health Organization {WHO} Group 1]. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 1 year if the patient meets all of the following criteria (i, ii, iii, iv, and v):

i. The patient has World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND

ii. The agent is prescribed by, or in consultation with, a cardiologist or a pulmonologist; AND

iii. The patient meets the following criteria (a and b):

a) The patient has had a right heart catheterization **[documentation required]** (see documentation section above); AND

b) The results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND

iv. The patient meets ONE of the following criteria (a or b):

a) The patient is in Functional Class III or IV; OR

b) The patient is in Functional Class II and meets ONE of the following criteria [(1) or (2)]:

(1) The patient has tried or is currently receiving one oral agent for PAH
Note: Examples of oral agents for PAH include Tracleer® (bosentan tablets), Letairis® (ambrisentan tablets [generic]), Opsumit® (macitentan tablets), Adempas® (riociguat tablets), Revatio® (sildenafil tablets and oral suspension [generics]), Adcirca® (tadalafil tablets [generic]), Orenitram® (treprostinil extended-release tablets) and Uptravi® (selexipag tablets); OR

(2) The patient has tried one inhaled or parenteral prostacyclin product for PAH
Note: Examples of inhaled and parenteral prostacyclin products for PAH include Ventavis® (iloprost inhalation solution), Tyvaso® (treprostinil inhalation solution), and epoprostenol injection (Flolan, Veletri, generics); AND

v. Patients with idiopathic PAH must meet ONE of the following criteria (a, b, c, d, or e):

a) The patient has had an acute response to vasodilator testing that occurred during the right heart catheterization (defined as a decrease in mPAP of at least 10 mm Hg to an absolute mPAP of less than 40 mm Hg without a decrease in cardiac output) AND has tried one oral calcium channel blocker (CCB) therapy
Note: Examples of CCBs include amlodipine and nifedipine extended-release tablets; OR

b) The patient did not have an acute response to vasodilator testing; OR

c) The patient cannot undergo a vasodilator test; OR

d) The patient cannot take CCB therapy (e.g., right heart failure, decreased cardiac output); OR

e) The patient has tried one CCB
Note: Examples of CCBs include amlodipine and nifedipine extended-release tablets; OR

B) Patients Currently Receiving Remodulin. Approve for the duration noted below if the patient meets the following criteria (i or ii):

iii. Approve for 1 year if the patient meets ALL of the following conditions (a, b, and c):

d) The patient has World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND
e) The agent is prescribed by, or in consultation with, a cardiologist or a pulmonologist; AND
f) The patient meets the following criteria [(1) and (2)]:
(3) The patient has had a right heart catheterization; AND
(4) The results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; OR

iv. Approve a short-term supply of Remodulin for up to 14 days if the patient does not meet the criteria in 1Bi above or if there is insufficient information available.
Note: A 14-day supply should be sufficient to address coverage issues. However, multiple short-term approvals are allowed if a coverage determination cannot be made. Abrupt discontinuation of Remodulin therapy may have severe adverse consequences.

Other Uses with Supportive Evidence

50. Chronic Thromboembolic Pulmonary Hypertension (CTEPH). Approve for 1 year if prescribed by or in consultation with a pulmonologist or a cardiologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Treprostinil injection has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

3. Chronic Obstructive Pulmonary Disease (COPD) in a Patient without PAH (WHO Group 1). COPD is classified as Group 3 Pulmonary Hypertension (pulmonary hypertension associated with lung diseases and/or hypoxia). Pulmonary hypertension may develop late in the course of COPD, but medications used for the treatment of PAH (WHO Group 1) are not recommended therapies.[11]

4. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Pulmonary Arterial Hypertension – Uptravi® (selexipag tablets – Actelion)

DATE REVIEWED: 09/11/2019; selected revision 02/12/2020

OVERVIEW

Uptravi, a selective non-prostanoid IP prostacyclin receptor agonist, is indicated for the treatment of pulmonary arterial hypertension (PAH) World Health Organization (WHO) Group 1 to delay disease progression and reduce the risk of hospitalization for PAH.[1] The efficacy of Uptravi was established in a long-term study in patients with PAH with mostly WHO functional class II to III symptoms.

Disease Overview

PAH is a serious but rare condition impacting approximately fewer than 20,000 patients in the US. It is classified within Group 1 pulmonary hypertension among the five different groups that are recognized. In this progressive disorder the small arteries in the lungs become narrowed, restricted, or blocked causing the heart to work harder to pump blood, leading to activity impairment.[2,3] In time, right-sided heart failure and/or death may occur. Common PAH symptoms include shortness of breath, fatigue, chest pain, dizziness and fainting, along with impairment in activity tolerance. It is more prevalent in women. Patients of all ages may develop the disease; however, the mean age of diagnosis typically happens between 36 to 50 years. Children may also have PAH. The condition may occur due to various underlying medical conditions or as a disease that uniquely impacts the pulmonary circulation; both genetic and environmental factors may be involved. PAH is defined as a mean pulmonary artery pressure (mPAP) $\geq$ 25 mmHg with a pulmonary capillary wedge pressure (PCWP) $\leq$ 15 mmHg measured by cardiac catheterization. The prognosis in PAH has been described as poor, with the median survival being approximately 3 years. However, primarily due to advances in pharmacological therapies, the long-term prognosis has improved. Lung transplantation may be recommended if pharmacological or medical therapies fail, based upon patient status. The WHO categorizes PAH into stages, which is also referred to as the functional class (Class I to IV) and is an adaptation of the New York Heart Association (NYHA) system to evaluate activity tolerance.

Guidelines/Recommendations

In 2009, the American College of Cardiology Foundation (ACCF) Task Force on Expert Consensus Documents and the American Heart Association (AHA), developed in collaboration with the ACCP, American Thoracic Society (ATS) and the Pulmonary Hypertension Association, published an expert consensus document on pulmonary hypertension.[2] The hemodynamic definition of PAH is a mean pulmonary artery pressure (mPAP) greater than 25 mmHg; a pulmonary capillary wedge pressure (PCWP), left atrial pressure (LAP) or left ventricular end-diastolic pressure (LVEDP) less than or equal to 15 mmHg; and a pulmonary vascular resistance (PVR) greater than 3 Wood units. Many different medication from varying therapies classes and different routes of administration are recognized. In 2019, and updated

CHEST guideline and Expert Panel Report regarding therapy for pulmonary arterial hypertension in adults was released.[3] Many other agents other than Orenitram are recommended as initial and subsequent therapy such as endothelin receptor antagonists (Letairis® [ambrisentan tablets], Tracleer® [bosentan tablets], Opsumit® [macitentan tablets], phosphodiesterase type 5 [PDE 5] inhibitors [tadalafil, sildenafil), and Adempas® (riociguat tablets). The addition of an oral prostanoid product is recommended in patients with PAH who are in Functional Class III without evidence of rapid disease progression or a poor prognosis among those not willing or able to manage parenteral prostanoids.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Uptravi. Because of the specialized skills required for evaluation and diagnosis of patients treated with Uptravi as well as the monitoring required for AEs and long-term efficacy, initial approval requires Uptravi to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for 3 years in duration unless otherwise noted below.

Documentation: In the *Pulmonary Arterial Hypertension – Uptravi Prior Authorization Policy*, documentation is required for initiation of therapy where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes and catheterization laboratory reports. For a patient case in which the documentation requirement of the right heart catheterization upon prior authorization coverage review for a different medication indicated for WHO Group 1 PAH has been previously provided, the documentation requirement in this *Pulmonary Arterial Hypertension – Uptravi Prior Authorization Policy* is considered to be met.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Uptravi is recommended in those who meet the following criteria:

FDA-Approved Indications

51. Pulmonary Arterial Hypertension (PAH) [World Health Organization {WHO} Group 1]. Approve for the duration noted if the patient meets ONE of the following (A or B):

- **I)** Initial Therapy. Approve for 3 years if the patient meets the following criteria (i, ii, iii, and iv):
  - **i.** The patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND
  - **ii.** The agent is prescribed by, or in consultation with, a cardiologist or a pulmonologist; AND
  - **iii.** The patient meets the following criteria (a and b):
    - **a)** The patient has had a right heart catheterization **[documentation required]** (see documentation section above); AND
    - **b)** The results for the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND
  - **iv.** The patient meets ONE the of following conditions (a or b):
    - **a)** The patient has tried or is currently receiving at least one oral medication for PAH from one of the three following different categories (either alone or in combination) each for ≥ 60 days: one phosphodiesterase type 5 (PDE5) inhibitor, one endothelin receptor antagonist (ERA), or Adempas® (riociguat tablets).

Note: Examples of PDE5 inhibitors include Revatio® (sildenafil tablets and suspension [generic]) and Adcirca® (tadalafil tablets [generic]) and examples of ERAs include Tracleer® (bosentan tablets), Letairis® (ambrisentan tablets [generic]), and Opsumit® (macitentan tablets); OR

b) The patient is currently receiving, or has a history of receiving, one prostacyclin therapy for PAH.
Note: Examples of prostacyclin therapies for PAH include Orenitram® (treprostinil tablets), Tyvaso® (treprostinil inhalation solution), Ventavis® (iloprost inhalation solution), Remodulin® (treprostinil injection [generics]), and epoprostenol injection [Flolan, Veletri, generics]); OR

J) Patients Currently Receiving Uptravi. Approve for 3 years if the patient meets all of the following criteria (i, ii, and iii):
- **i.** The patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND
- **ii.** The agent is prescribed by, or in consultation with, a cardiologist or a pulmonologist; AND
- **iii.** The patient meets the following criteria (a and b):
  - **a)** The patient has had a right heart catheterization; AND
  - **b)** The results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Uptravi has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

119. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Qbrexza™ (glycopyrronium cloth 2.4% for topical use – Dermira)

APPROVAL DATE: 10/09/2019

OVERVIEW

Qbrexza, an anticholinergic, is indicated for the topical treatment of primary axillary (i.e., underarm) hyperhidrosis in adult and pediatric patients ≥ 9 years of age.[1] Qbrexza is a competitive inhibitor of acetylcholine receptors, which are located on peripheral tissues, including sweat glands. Qbrexza inhibits the action of acetylcholine on sweat glands in hyperhidrosis, thereby reducing sweating. Qbrexza is applied topically once every 24 hours to clean dry skin on the underarm areas only; it is not for use on other body

areas. It is administered by a single-use pre-moistened cloth supplied in an individual pouch. One single cloth should be used to apply Qbrexza to both underarms. Hands should be washed immediately with soap and water after applying and discarding the Qbrexza cloth. If Qbrexza comes in contact with the eyes it may cause temporary pupil dilation and blurred vision; avoid transfer of Qbrexza to the periocular area. Qbrexza should not be applied to broken skin or used with occlusive dressings.

Disease Overview

Hyperhidrosis is a skin disorder in which sweat is produced in excess of what is required to maintain normal body temperature.[2] It is categorized as either primary or secondary. Primary hyperhidrosis is idiopathic and presents in a bilateral and symmetrical pattern on the axilla, palms, soles, and face.[3] An underlying medical condition or use of a prescription medication generally results in secondary hyperhidrosis. Currently, the estimated prevalence of hyperhidrosis in the US is 4.8% (approximately 15.3 million people); 65% of these patients have axillary hyperhidrosis (equating to 3.12% of the US population or 9.9 million people).[2-3] Hyperhidrosis can range in severity with approximately 70% of patients with hyperhidrosis reporting severe excessive sweating in at least one part of the body.[2] This may result in restrictions in work and social relationships, limitations in physical and leisure activities, and emotional and mental health impairments. Low self-esteem and interpersonal difficulties have been reported to have a negative impact on daily activities; patients may also have impaired performance and productivity at work.[3] The exact etiology of hyperhidrosis is not completely understood.[3-4] However, it has been observed that patients with hyperhidrosis have a higher expression of acetylcholine and alpha-7 neuronal nicotinic receptor subunit in the sympathetic ganglia compared with controls.[4] Therefore, it has been hypothesized that excess sweating is caused by overstimulation of eccrine glands by sympathetic postganglionic nerve fibers releasing acetylcholine. The goal of the management of axillary hyperhidrosis is to decrease sweat production and sweat glands in an effort to ameliorate symptoms and improve quality of life.[4-5] There are some treatment options available in addition to modifications such as wearing lightweight clothing, replacing electrolytes lost in sweat, and maintaining a cold environment. Topical antiperspirants are first-line therapy for axillary hyperhidrosis. Over-the-counter (OTC) [e.g., aluminum zirconium tetrachlorohydrex gly] and prescription options (e.g., aluminum chloride hexahydrate 20% solution [Drysol™, generics]; Hypercare™ [aluminum chloride hexahydrate 15% solution], Xerac™ AC [aluminum chloride hexahydrate 6.25% solution]) are available. These agents work by blocking the openings of the sweat ducts. They are easy to use, but treatment with the prescription products is often limited by skin irritation. Other treatments have included topical anticholinergics (used off-label prior to the approval of Qbrexza) and botulinum toxin type A.

Guidelines

There are currently no guidelines for the treatment of hyperhidrosis published by a professional society. However, the International Hyperhidrosis Society, an independent, non-profit organization, provides an algorithm for the treatment of axillary hyperhidrosis (2014).[6] Topical antiperspirant therapy or Qbrexza are both listed as initial treatment choices.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Qbrexza. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Qbrexza is recommended in those who meet the following criteria:

FDA-Approved Indications

156. Hyperhidrosis, Primary Axillary. Approve for 1 year if the patient is ≥ 9 years of age.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Qbrexza has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

120. Hyperhidrosis, other than Primary Axillary. Qbrexza is not intended for application to areas other than the axillae.[1]

121. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Regranex® (becaplermin gel, 0.01% –Smith & Nephew)

REVIEW DATE: 07/15/2015

LAY CRITERIA EFFECTIVE DATE: Previously in Effect

OVERVIEW

Regranex is indicated for the treatment of lower extremity diabetic neuropathic ulcers that extend into the subcutaneous (SC) tissue or beyond and have an adequate blood supply when used as an adjunct to, and not a substitute for, good ulcer care practices, including initial sharp debridement, pressure relief and infection control.[1] Regranex is a recombinant human platelet-derived growth factor (PDGF) for topical administration and has similar biological activity as endogenous PDGF, which promotes the chemotactic recruitment and proliferation of cells involved in wound repair and enhances the formation of granulation tissue.[1] The efficacy of Regranex has not been established for the treatment of pressure ulcers and venous stasis ulcers and has not been evaluated for the treatment of diabetic neuropathic ulcers that do not extend through the dermis into SC tissue (Stage I or II International Association Enterostomal Therapy [IAET] staging classification), or ischemic diabetic ulcers. The effects of Regranex on exposed joints, tendons, ligaments, and bone have not been established in humans.

Efficacy

Diabetic Ulcers

Published studies and combined meta-analyses have documented the efficacy of Regranex (0.01% and becaplermin gel 0.003%) in diabetic neuropathic ulcers.[2-6] The largest fully published trial[3] was a multicenter, double-blind, placebo-controlled study where 382 adults with type 1 or 2 diabetes and lower-extremity chronic ulcers (classified as Stage III or IV, as defined in the IAET guide to chronic wound staging) of at least 8 weeks duration were randomized to receive becaplermin gel 0.003%, Regranex, or placebo (vehicle gel) in addition to good wound care, which included debridement. Therapy continued until complete wound closure occurred or for a maximum of 20 weeks. Treatment with Regranex led to an increased incidence of complete healing by 43% compared with placebo (P = 0.007). Complete wound healing occurred in 50% of patients given Regranex (n = 61/123) compared with 35% of patients given placebo (n = 44/127). The time to achieve complete healing was decreased by 32% for patients given Regranex compared with placebo gel (86 days vs. 127 days, respectively; estimated 35th percentile, P = 0.013). Efficacy results with the becaplermin gel 0.003% were similar to those noted in the placebo group. In a 3-month follow-up evaluation, the incidence of ulcer recurrence was approximately 30% in all groups showing that the durability of ulcer closure was similar among the groups.

A published study compared the healing rates of Regranex (control agent) with OASIS® Wound Matrix after 12 weeks of treatment.[7] OASIS Wound Matrix is comprised of porcine-derived acellular small intestine submucosa, which is compatible with human tissue and is approved as a medical device and is indicated for the management of wounds including: partial- and full-thickness wounds, pressure ulcers, venous ulcers, chronic vascular ulcers, diabetic ulcers, trauma wounds (abrasions, lacerations, second-degree burns, skin tears), drainage wounds, and surgical wounds (donor sites/grafts, post-Mohs' surgery, post-laser surgery, podiatric, wound dehiscence).[8-9] At the end of Week 12, the healing rate was 49% (n = 18/37) for OASIS vs. 28% (n = 10/36) for Regranex (P = 0.055). The mean time to healing was also not statistically different between the two groups (67 days for OASIS and 73 days for Regranex; P = 0.245). OASIS did have statistically significantly higher healing rates for plantar ulcers (52% [n = 14/27] vs. 14%

[n = 3/21] for Regranex; P = 0.014) and in patients with type 2 diabetes (63% [n = 12/19] vs. 29% [n = 8/28] for Regranex; P = 0.034), while there was no statistical difference in patients with type 1 diabetes (33% [n = 6/18] vs. 25% [n = 2/8] for Regranex; P = 1.0). At the 6-month follow-up, the recurrence rate for OASIS was 25% (n = 2/8) and for Regranex was 33% (n = 2/6). There was no overall difference in the rate of complications/adverse events (AEs) for OASIS (n = 17) and Regranex (n = 10), however, there was a higher number of wound infections in the study ulcer (n = 9) for OASIS than for Regranex (n = 3).

Regranex is the first platelet-derived topical growth factor to demonstrate therapeutic efficacy, albeit modest, in healing neuropathic ulcers. No similar agent exists and because there is a paucity of well-designed, placebo-controlled studies in the area of wound healing, comparison between different modalities are difficult.[3] Most cases of diabetic neuropathic ulcers heal with conventional ulcer care and data have suggested that a linear correlation may exist between the degree of aggressive debridement and the level of healing.[10-11] However, for diabetic patients that have poorly healing neuropathic ulcers, despite adequate perfusion and a reasonable trial of wound care, this product may provide benefits.[11]

Pressure Ulcers

Studies have also shown Regranex to have potential efficacy in the treatment of full thickness chronic pressure ulcers (Stage III or IV as defined by the National Pressure Ulcer Advisory Panel [NPUAP]).[14-16] In one trial, adults with non-healing full thickness pressure ulcers were given a standard regimen of good wound care and were randomized to one of four treatment arms for 16 weeks, which included Regranex (n = 31) and placebo gel (n = 31).[16] The incidence of complete healing was significantly greater for those given Regranex (23%), no patients receiving placebo had complete healing (P = 0.005). At least 90% healing was noted in 58% of patients given Regranex compared to 29% assigned to placebo gel (P = 0.021).

Other Ulcer/Wound Types

Regranex has also been used in other chronic non-healing ulcers. In one retrospective chart review, 11 out of 17 venous stasis ulcerations healed with use of Regranex in an average of 67.6 days.[21] In another retrospective chart review of Regranex use in patients with chronic lower extremity ulcers (venous ulcer, lipodermatosclerosis ulcer, neurotrophic [diabetic and non-diabetic] ulcers, and multifactorial [mixed arterial and venous] ulcers), 14 of the 21 target ulcers healed completely with a mean time to complete healing of 111.1 days.[22]

Reports in the literature also note Regranex being used for surgical wounds or for surgical wound dehiscense.[21,23-24] In a small double-blind, preliminary trial, patients (n = 21) with wound separation after cesarean delivery or benign abdominal gynecological procedures were randomized to receive Regranex or placebo (SurgiLube®) starting the day after the wound opened.[23] Wounds that were treated with Regranex closed more rapidly (35 ± 15 days) compared to those given placebo (54 ± 26 days; P = 0.05). Additional studies are needed to determine the effectiveness of Regranex for wound granulation and closure. Case reports and/or case series note that Regranex has also been used successfully for the treatment of ulcerated hemangiomas (including ulcerated perineal hemangiomas in infants),[25-26] chronic orbital ulcers,[27] scleroderma skin ulcers,[28] ulcerative lichen planus,[29] necrobiosis lipoidicum diabeticorum,[30] chronic irradiated wounds/ulcers (including wounds/ulcers with no granulation tissue at baseline),[31-33] wound dehiscence (following total laryngectomy) with pharyngocutaneous fistula,[24] and ulceration due to a stingray injury.[34]

Guidelines

Lower-Extremity Neuropathic Disease

Guidelines from the Wound Ostomy and Continence Nurses (WOCN) Society published in 2004 for the management of wounds in patients with lower-extremity neuropathic disease recommend that use of

Regranex can be considered for foot ulcers after necrotic tissue has been debrided, infection is cleared, and adequate perfusion has been established.[12]

Diabetic Ulcers

The Infectious Diseases Society of America (IDSA) guidelines for the diagnosis and treatment of diabetic foot infections recommend that all diabetic patients with a foot wound should receive appropriate wound care, which usually consists of debridement, redistribution of pressure off the wound to the entire weight-bearing surface of the foot, selection of dressings that allow for moist wound healing, and control excess exudation.[35] No adjunctive therapy has been proved to improve resolution of infection, but for selected diabetic foot wounds that are slow to heal, clinicians might consider using bioengineered skin equivalents, growth factors, granulocyte colony stimulating factors, hyperbaric oxygen therapy, or negative pressure wound therapy. The guidelines note that although an initial study with the PDGFs demonstrated benefit, subsequent investigations have not shown these treatments to improve healing, or they have been conducted in a fashion where the data cannot be interpreted in the context of routine care.

The 2005 g=Guidelines for diabetic foot care, developed by the Diabetes Committee of the American Orthopaedic Foot and Ankle Society, note that ulcers without a deep crater and with no bone exposed can be treated with sharp debridement of infected or necrotic tissue and surrounding thick callus.[13] Dry or moist saline dressings can be used in combination with therapeutic shoes or footwear in small ulcers. In addition, for larger ulcers the guidelines note that healing may be expedited with one of the newer hydrocolloid-type dressings, or platelet-derived wound healing factors.

Pressure Ulcers

Guidelines from the WOCN Society updated in 2010 for the prevention and management of pressure ulcers recommend that Regranex can be considered an adjunctive therapy to enhance the healing (treatment) of pressure ulcers (no stage specified).[17] Other guidelines and references have also supported the consideration of adjuvant use of Regranex or platelet-derived growth factor for managing pressure ulcers which are not healing with conventional therapy.[18-20]

Safety

In 2008, after a follow-up from the Food and Drug Administration (FDA) about the ongoing safety review of Regranex,[36-37] the Regranex package labeling was revised to include a boxed warning noting that in a post-marketing retrospective cohort study, there was an increased rate of mortality secondary to malignancy observed in patients treated with three or more tubes of Regranex.[1] Also, additional detail was added to the warnings section in regards to a follow-up study performed to monitor for any evidence of adverse events (AEs) such as increased numbers of cancers and a retrospective study of a medical claims database.[1,36-37] This additional detail notes that malignancies distant from the site of application have occurred in Regranex users in both a clinical study and in post-marketing use. An increased rate of death from systemic malignancies was seen in patients who have received three or more tubes of Regranex gel.[1] In the follow-up study, 491 of the 651 patients from two randomized, controlled studies were followed up for a median of 20 months to identify malignancies diagnosed after the end of the controlled studies. The rate of cancer diagnosis in this follow-up period was 3% (n = 8/291) for Regranex users and 1% (n = 2/200) for vehicle/standard of care users, providing a relative risk of 2.7 (95% Confidence Interval [CI]: 0.6, 12.8). The types of cancers were varied and all were remote from the treatment site. In the retrospective medical claims database study, the incidence and mortality rates of cancer were assessed in 1,622 Regranex users and 2,809 matched comparators. Both groups had a similar incidence rate of all cancers (10.2 per 1,000 person-years for Regranex and 9.1 per 1,000 person-years for the comparators (adjusted rate ratio 1.2 [95% CI: 0.7, 1.9]). However, there was more of a difference between the groups in regards to mortality from all cancers. The incidence rate of mortality from all cancers was 1.6 per 1,000 person-years for Regranex

users and 0.9 per 1,000 person-years for comparators (adjusted rate ratio 1.8 [95% CI: 0.7, 4.9]), but the most prominent difference was the mortality incidence from all cancers among patients who received three or more tubes of Regranex gel which was 3.9 per 1,000 person-years vs. 0.9 per 1,000 person-years for comparators (adjusted rate ratio 5.2 [95% CI: 1.6, 17.6]). The retrospective medical claims database involved diabetic patients aged 19 years and older with no history of cancer and similar diagnoses, similar drug use, and similar use of health services who were applying Regranex to foot and leg ulcers or who did not receive treatment with Regranex.[36-37] Because inadequately treated ulcers can lead to complications such as infections, especially foot ulcer infections which are a leading cause of hospitalization among diabetics, the FDA recommends that Regranex be used only when the benefits are expected to outweigh the risks described in the labeling.[37]

The average amount of Regranex gel used per patient has not been fully evaluated, but most likely is highly variable and dependent upon the area of the ulcer or wound and the timeframe of healing. In an open-label study using Regranex in diabetics with lower extremity ulcers, the average amount of Regranex gel used was 27.2 g (slightly less than two-15 g tubes) for patients with baseline target ulcers < 2 cm^2.[4] However, only 57% of patients in this study had a baseline ulcer of this size. Another study comparing Regranex use with the OASIS Wound Matrix in diabetic ulcer patients also had similar Regranex usage of slightly less than two-15 g tubes per patient.[7] And a retrospective chart review study of 51 patients with lower extremity ulcerations due to various causes had an average Regranex tube use of 1.8 tubes per patient (tube size was not described).[21] In addition, 78% (n = 40/51) of these patients used two or fewer Regranex tubes.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Regranex. All approvals are provided for *5 months* unless otherwise noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Regranex is recommended in those who meet the following criteria:

Food and Drug Administration (FDA)-Approved Indications

1. **Lower Extremity Diabetic Neuropathic Ulcer(s) that is/are Classified as Stage III or IV** (see addendum for NPUAP classification system).[1] Approve for 5 months if Regranex is used in adjunct to good ulcer/wound care practices (e.g., sharp debridement, pressure relief, and infection control).

   Regranex is indicated for the treatment of lower extremity diabetic neuropathic ulcer(s) that extend into the subcutaneous (SC) tissue or beyond and have good blood supply.[1] Regranex is indicated as an adjunct to, and not a substitute for, good ulcer/wound care practices including initial sharp debridement, pressure relief, and infection control.

Other Uses with Supportive Evidence

2. **Clean and Granulating Ulcer/Wound Classified as Stage II** (e.g., Stage II diabetic neuropathic ulcers and pressure ulcers). Approve if the patients meets the following criteria A and B.
   A) The patient has tried one other standard ulcer/wound care therapy (e.g., debridement, topical therapies [collagenase]) for at least 4 weeks; AND

B) Regranex will be used in adjunct to good ulcer/wound care practices (e.g., sharp debridement, pressure relief, and infection control).

In the professional opinion of specialist physicians reviewing the data, we have adopted these criteria.

3. **Granulating Ulcer/Wound** (e.g., pressure ulcers, venous stasis ulcers, other diabetic ulcers) **Classified as Stage III or IV**[14-20,24-26,28,31-34] (see addendum NPUAP classification system[38-39]). Approve if Regranex is used in adjunct to good ulcer/wound care practices (e.g., sharp debridement, pressure relief, and infection control).

   Several studies[14-16] and case reports and/or case series[24-26,28,31-34] have found Regranex to be efficacious for treating/healing other non-diabetic neuropathic ulcers or wounds classified as Stage III or above. In addition, the WOCN Pressure Ulcer guidelines[17] list Regranex as an adjunctive therapy in the healing of pressure ulcers, and other references from the Wound Healing Society,[18] Canadian Association of Wound Care,[19] and a recent review[20] also support consideration of use of Regranex for treating non-healing chronic pressure ulcers. Regranex is indicated as an adjunct to, and not a substitute for, good ulcer/wound care practices including initial sharp debridement, pressure relief, and infection control.[1]

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Regranex has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

Coverage of Regranex is not recommended in the following circumstances:

122. **First-Line Therapy for the Treatment of Stage II Ulcers/Wounds.** Standard ulcer/wound care should be used first-line.

123. **Prevention of Ulcers/Wounds.** The efficacy of Regranex for prevention has not been evaluated.

124. **Treatment of Wounds/Ulcers Classified as Stage I.** These wounds are not open and therefore are not appropriate for Regranex therapy.

125. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

ADDENDUM

National Pressure Ulcer Advisory Panel (NPUAP) Pressure Ulcer Stages[38-39]
NPUAP Pressure Ulcer Stage Definitions[38-39]
Suspected Deep Tissue Injury: Purple or maroon localized area of discolored intact skin or blood-filled blister due to damage of underlying soft tissue from pressure and/or shear. The area may be preceded by tissue that is painful, firm, mushy, boggy, warmer or cooler as compared to adjacent tissue.

Stage I: Intact skin with non-blanchable redness of a localized area usually over a bony prominence. Darkly pigmented skin may not have visible blanching; its color may differ from the surrounding area.

Stage II: Partial-thickness loss of dermis presenting as a shallow open ulcer with a red pink wound bed, without slough. May also present as an intact or open-ruptured serum-filled blister.

Stage III: Full-thickness tissue loss. Subcutaneous fat may be visible but bone, tendon, or muscle are not exposed. Slough may be present but does not obscure the depth of tissue loss. May include undermining and tunneling.

Stage IV: Full-thickness tissue loss with exposed bone, tendon or muscle. Slough or eschar may be present on some parts of the wound bed. Often include undermining and tunneling.

Unstageable: Full thickness tissue loss in which the base of the ulcer is covered by slough (yellow, tan, gray, green or brown) and/or eschar (tan, brown or black) in the wound bed.

* Note that the WOCN was formerly called the International Association of Enterostomal Therapy (IAET).[11,16]

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Rituximab Intravenous Products

- Rituxan® (rituximab for intravenous infusion – Genentech)
- Ruxience™ (rituximab-pvvr IV injection – Pfizer)
- Truxima® (rituximab-abbs injection for intravenous use – Celltrion/Teva)

DATE REVIEWED: 06/03/2020 **[Effective 07/01/2020]**

OVERVIEW

Rituximab products are CD20-directed cytolytic antibodies. All approved rituximab intravenous products are indicated for treatment of the following conditions:

6. **Non-Hodgkin lymphoma** (NHL), for the following uses:
   - previously untreated follicular, CD20-positive disease, in combination with first-line chemotherapy, and in patients achieving a complete or partial response to rituximab in combination with chemotherapy, as a single-agent maintenance therapy; AND
   - for relapsed or refractory, low-grade or follicular, CD20-positive, B-cell, disease; AND
   - for non-progressing (including stable disease) low-grade, CD20-positive, B-cell disease as a single agent after first-line cyclophosphamide/vincristine/prednisone (CVP) chemotherapy; AND
   - for previously untreated diffuse large B-cell, CD20-positive disease, in combination with cyclophosphamide/doxorubicin/vincristine/prednisone (CHOP) or other anthracycline-based chemotherapy regimens; AND
7. **Chronic lymphocytic leukemia** (CLL), in combination with fludarabine and cyclophosphamide (FC) for the treatment of patients with previously untreated and previously treated CD20-positive disease; AND
8. **Granulomatosis with polyangitis** (GPA) [Wegener's granulomatosis {WG}] and **microscopic polyangiitis** (MPA) in adults, in combination with glucocorticoids.

In addition to the above indications, Rituxan IV and Truxima are also indicated for treatment of the following condition:

3. **Rheumatoid arthritis** (RA), in adult patients with moderately to severely active disease, in combination with methotrexate (MTX) for patients who have had an inadequate response to one or more tumor necrosis factor inhibitors (TNFis).

In addition to the above indications, Rituxan IV is also indicated for treatment of the following conditions:

1. **Pemphigus vulgaris**, for adults with moderate to severe; AND
2. **Granulomatosis with polyangitis** (GPA) [Wegener's granulomatosis {WG}] and **microscopic polyangiitis** (MPA) in patients ≥ 2 years of age, in combination with glucocorticoids.

Rituximab products are monoclonal antibody directed specifically against the CD20 antigen found on the surface of normal and malignant B lymphocytes.[1-3] The antigen CD20 is expressed on > 90% of B-cell non-Hodgkin's lymphomas (NHLs). B-cells are thought to play a role in the pathogenesis of rheumatoid arthritis (RA) and associated chronic synovitis.

Ruxience and Truxima are approved as biosimilar to Rituxan intravenous (IV), indicating no clinically meaningful differences in safety and effectiveness and the same mechanism of action, route of administration, dosage form, and strength as Rituxan IV. However, minor differences in clinically inactive

components are allowed. At this time, Ruxience and Truxima has only demonstrated biosimilarity, not interchangeability.

Guidelines

The use of rituximab products is supported in clinical guidelines in numerous situations, both as first-line therapy and in patients who are refractory or have relapsed following treatment with other therapies.[4-21]

- **Vasculitis:** EULAR/ERA-EDTA recommendations for antineutrophil cytoplasmic antibody (ANCA)-associated vasculitis mention rituximab in combination with low-dose corticosteroids as a potential treatment option for remission-maintenance therapy.[4] Remission-maintenance therapy is recommended for at least 24 months following induction of sustained remission. British guidelines for use of rituximab in ANCA-associated vasculitis recommend rituximab for maintenance of remission to reduce the risk of relapse and its consequences.[5]
- National Comprehensive Cancer Network (NCCN) guidelines:[6]
  - **CLL/SLL:** Rituximab features prominently in the guidelines (version 4.2020 – December 20, 2019) and is included in multiple treatment regimens across the spectrum of disease.[7]
  - **B-Cell Lymphomas:** In the guidelines (version 1.2020 – January 22, 2020), rituximab is included in multiple treatment regimens across the spectrum of disease.[8] Guidelines for pediatric aggressive mature B-cell lymphomas (version 2.2020 – April 10, 2020) include rituximab intravenous among treatment regimens for induction therapy/initial treatment and as subsequent therapy for relapsed or refractory disease.[9] For primary cutaneous lymphomas (version 2.2020 – April 10, 2020), rituximab is a treatment option for patients with primary cutaneous B-cell lymphoma.[10]
  - **Acute Lymphoblastic Leukemia (ALL):** Guidelines (version 1.2020 – January 15, 2020) list rituximab in multiple induction regimens for Philadelphia chromosome (Ph)-negative disese.[11] In those with Ph-positive disease, rituximab should be considered in addition to chemotherapy for those with CD20-positive disease, especially in those < 60 years of age. Rituximab is also included in a regimen for relapsed/refractory disease for those with Ph-positive or –negative disease.
  - **Hairy Cell Leukemia:** Guidelines (version 1.2020 – August 23, 2019) recommend rituximab in multiple regimens for relapsed/refractory disease, including in patients with progressive disease after relapsed/refractory therapy.[12]
  - **Hodgkin Disease:** Guidelines (version 2.2020 – April 17, 2020) recommend rituximab ± chemotherapy (depending on the clinical presentation) in the first-line setting for nodular lymphocyte-predominant disease.[13] Rituximab is also used for relapsed/refractory disease and for maintenance.
  - **Waldenstrom Macroglobulinemia/lymphoplasmacytic lymphoma:** Guidelines (version 2.2020 – April 15, 2020) include rituximab in regimens across the spectrum of disease (primary therapy, previously treated disease, and maintenance).[14]
  - **Graft Versus Host Disease:** Guidelines (version 2.2020 – March 23, 2020) list rituximab among the agents used for steroid-refractory chronic GVHD.[15]
- **Rheumatoid Arthritis:** Guidelines from the American College of Rheumatology (ACR) [2015] have tumor inhibitors and non-TNF biologics (including rituximab), equally positioned following a trial of a conventional synthetic DMARD.[16]
- **Immune Thrombocytopenia (ITP):** Guidelines from the American Society of Hematology (ASH) for ITP (2011) mention rituximab as an appropriate agent for children and adolescents with ITP who have significant on-going bleeding despite treatment with intravenous immunoglobulin G (IVIG), anti-D, or corticosteroids.[17] Rituximab is also appropriate as an alternative to splenectomy in children/adolescents with chronic ITP or in patient who do not respond to splenectomy. In adults,

rituximab in recommended for patients with ITP who are at risk for bleeding and who have failed one other line of therapy (e.g., corticosteroids, IVIg, splenectomy).

- **Multiple Sclerosis (MS):** In June 2019, a consensus paper was updated by the MS Coalition that discusses the use of disease-modifying therapies in MS.[18] Rituximab is listed among various options, involving different mechanisms of action and modes of administration, which have shown benefits in patients with MS. The American Academy of Neurology has practice guidelines regarding disease-modifying therapies for adults with MS.[19] The guidelines mention rituximab for use in MS.
- **Neuromyelitis Optica Spectrum Disorders:** A review article lists rituximab as an effective treatment for neuromyelitis optica.[20]
- **Systemic Lupus Erythematous (SLE):** EULAR recommendations for the management of systemic lupus erythematosus (2019) mention rituximab as a therapeutic option for patients who are refractory to standard immunosuppressive therapies.[21]

Safety

Rituximab IV products have Boxed Warnings due to fatal infusion reactions, severe mucocutaneous reactions, hepatitis B virus (HBV) reactivation, and progressive multifocal leukoencephalopathy (PML). Deaths within 48 hours of rituximab infusions have been reported, primarily (80%) associated with the first infusion. Screen all patients for HBV infection and monitor during and after treatment with rituximab IV. Discontinue rituximab products in cases of HBV reactivation.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of rituximab intravenous products. Because of the specialized skills required for evaluation and diagnosis of patients treated with rituximab as well as the monitoring required for adverse events and long-term efficacy, initial approval requires rituximab IV products to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration listed below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of rituximab IV products is recommended in those who meet the following criteria:

FDA-Approved Indications

34. Antineutrophil Cytoplasmic Antibody (ANCA)-Associated Vasculitis. Approve for the duration noted if the patient meets ONE of the following (A or B):

B) Induction Treatment. Approve for 1 month if the patient meets ALL of the following (i, ii, and iii):

a. The patient has an ANCA-associated vasculotide; AND
   Note: Examples of ANCA-associated vasculitis include granulomatosis with polyangiitis (GPA) [Wegener's granulomatosis] or microscopic polyangiitis (MPA).
~~b.~~ The requested agent is being administered in combination with glucocorticoids; AND
c. The agent is prescribed by or in consultation with a rheumatologist, nephrologist, or immunologist.

~~C)~~ Follow-Up Treatment of Patients Who Have Received Induction Treatment for ANCA-Associated Vasculitis (Note: This includes patients who received induction treatment using a rituximab

product or other standard of care immunosuppressants). Approve for 1 year if the patient meets BOTH of the following (i and ii):

~~a.~~ According to the prescriber, the patient achieved disease control with induction treatment; AND

~~b.~~ If the patient previously received a course of therapy, at least 16 weeks will elapse between courses.

35. Chronic Lymphocytic Leukemia (CLL) or Small Lymphocytic Lymphoma (SLL). Approve for 1 year if prescribed by or in consultation with an oncologist.

36. B-Cell Lymphoma (Note: Examples of B Cell Lymphomas include Follicular Lymphoma, Diffuse Large B-Cell Lymphoma [DLBCL], Acquired Immune Deficiency [AIDS]-Related B-Cell Lymphoma, Burkitt Lymphoma, Castleman's Disease, Marginal Zone Lymphoma [e.g., extranodal or MALT {gastric or nongastric}, nodal, or splenic marginal zone lymphoma], Primary Mediastinal Large B-Cell Lymphoma, Mantle Cell Lymphoma, Post-Transplant Lymphoproliferative Disorders, Gray Zone Lymphoma, Primary Cutaneous B-Cell Lymphoma, Pediatric Aggressive Mature B-cell Lymphomas). Approve for 1 year if prescribed by or in consultation with an oncologist.

37. Pemphigus Vulgaris. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Treatment. Approve for 1 month (which is adequate duration to administer one course of therapy) if the patient meets BOTH of the following (i and ii):

i. Therapy is initiated in combination with a corticosteroid unless contraindicated; AND
Note: An example of a corticosteroid is prednisone.

ii. The agent is prescribed by or in consultation with a dermatologist.

B) Patient is Being Treated of a Relapse or for Maintenance of Pemphigus Vulgaris. Approve for 1 year if the patient meets BOTH of the following (i and ii):

i. Subsequent infusions of will be administered no sooner than 16 weeks following the previous infusion of a rituximab product; AND

ii. The agent is prescribed by or in consultation with a dermatologist.

38. Rheumatoid Arthritis (RA). Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 1 month (which is adequate duration to administer one course of therapy) if the patient meets ALL of the following conditions (i, ii, and iii):

i. The patient has tried ONE conventional synthetic disease-modifying antirheumatic drug (DMARD) for at least 3 months; AND
Note: Examples of conventional synthetic disease-modifying antirheumatic drugs include methotrexate [oral or injectable], leflunomide, hydroxychloroquine, and sulfasalazine. An exception to the requirement for a trial of one conventional synthetic DMARD can be made if the patient has already has a 3-month trial at least one biologic. These patients who have already tried a biologic for RA are not required to "step back" and try a conventional synthetic DMARD.

ii. The agent will not be used concurrently with another biologic or with a targeted synthetic DMARD; AND
Note: Examples of biologics include Cimzia, adalimumab products, etanercept products, infliximab products, Simponi [Aria or SC], Actemra [IV or SC], Kevzara, Kineret, and Orencia [IV or SC]). Examples of targeted synthetic DMARDs include Xeljanz/XR, Olumiant, and Rinvoq.

iii. The requested agent is prescribed by or in consultation with a rheumatologist.

B) Patient has already Received One or More Courses of a Rituximab Product for Rheumatoid Arthritis (RA). Approve for 1 month (which is adequate duration to administer one course of therapy) if the patient meets BOTH of the following conditions (i and ii):

i. 16 weeks or greater will elapse between treatment courses; AND
Note: For example, there will be a minimum of 16 weeks since the first dose of the previous course and the first dose of the next course of a rituximab product.

ii. If the patient has already received two or more courses of therapy, the patient has responded to therapy as determined by the prescriber.
Note: Examples of a response include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improved laboratory values; reduced dosage of corticosteroids).

Other Uses with Supportive Evidence

6. Acute Lymphoblastic Leukemia (ALL). Approve for 1 year if the patient meets ALL of the following (A and B):

A) The patient has CD20-positive disease; AND

B) The agent is prescribed by or in consultation with an oncologist.

19. Graft Versus Host Disease (GVHD). Approve for 1 year if the patient meets BOTH of the following (A and B):

i. The patient has tried at least one conventional systemic treatment for graft versus host disease; AND
Note: Examples include systemic corticosteroids (methylprednisolone, prednisone), cyclosporine, tacrolimus, mycophenolate mofetil, Imbruvica® (ibrutinib capsules and tablets), imatinib. antithymocyte globulin, Nipent® (pentostatin infusion), or an infliximab product.

ii. The agent is prescribed by or in consultation with an oncologist, hematologist, or a physician affiliated with a transplant center.

20. Hairy Cell Leukemia. Approve for 1 year if the patient meets BOTH of the following conditions (A and B):

A) The patient has relapsed/refractory hairy cell leukemia; AND

B) The agent is prescribed by or in consultation with an oncologist.

21. Hodgkin Lymphoma. Approve for 1 year if the patient meets BOTH of the following (A and B):

A) The patient has nodular lymphocyte-predominant disease; AND

B) The agent is prescribed by or in consultation with an oncologist.

10. Immune Thrombocytopenia (ITP). Approve if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 1 month if the patient meets BOTH of the following (i and ii):

i. The patient has tried one other therapy; AND
Note: Examples of therapies for ITP include intravenous immunoglobulin (IVIG), anti-D (RHO) immunoglobulin, corticosteroids, and splenectomy.

ii. The agent is prescribed by or in consultation with a hematologist.

B) Patient has Already Received a Course of a Rituximab Product for ITP. Approve for 1 month if the patient meets ALL of the following (i, ii, and iii):

i. At least 6 months will elapse between treatment courses; AND

Note: For example, there will be a minimum of 6 months separating the first dose of the previous course and the first dose of the requested course of a rituximab product.

ii. The patient responded to therapy as determined by the prescriber; AND
Note: Examples of a response include a platelet count increase from baseline following treatment with a rituximab product.

iii. The prescriber has determined that the patient has relapsed.
Note: Examples of a relapse include the patient experiences thrombocytopenia after achievement of a remission.

11. Multiple Sclerosis. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

A) The patient has had an inadequate response or was unable to tolerate at least ONE other disease-modifying agent for MS; AND

B) The agent will not be used concurrently with another disease-modifying agent used for multiple sclerosis; AND
Note: Examples of disease-modifying agents for MS include Ocrevus (ocrelizumab IV infusion), Avonex (interferon beta-1a for intramuscular injection), Rebif (interferon beta-1a SC injection), Betaseron (interferon beta-1b SC injection), Extavia (interferon beta-1b SC injection), Copaxone (glatiramer acetate SC injection), Glatopa (glatiramer acetate SC injection), Plegridy (peginterferon beta-1a SC injection), Gilenya (fingolimod capsules), Aubagio (teriflunomide tablets), Tecfidera (dimethyl fumarate delayed-release capsules), or Lemtrada (alemtuzumab IV injection), mitoxantrone IV (Novantrone, generics), Tysabri (natalizumab IV injection), and Mavenclad (cladribine tablets).

C) The requested agent is prescribed by or in consultation with a physician who specializes in the treatment of MS and/or a neurologist; AND

D) At least 6 months will elapse between treatment courses.
Note: For example, if the patient has already received a course of therapy there will be a minimum of 6 months separating the first dose of the previous course and the first dose of the requested course of therapy.

1. Neuromyelitis Optica (NMO) Spectrum Disorder. Approve for 1 month if prescribed by or in consultation with a neurologist.

13. Systemic Lupus Erythematous (SLE) [Lupus]. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 1 month (adequate duration to receive one course) if the patient meets BOTH of the following (i and ii):

i. The patient has tried at least ONE standard immunomodulating or immunosuppressant agent; AND
Note: Examples of standard immunomodulating or immunosuppressant agents include hydroxychloroquine, corticosteroids (e.g., prednisone, methylprednisolone), methotrexate, azathioprine, mycophenolate, and cyclophosphamide.

ii. The agent is prescribed by or in consultation with a rheumatologist, nephrologist, or neurologist.

B) Patient has Already Received a Course of a Rituximab Product for SLE. Approve for 1 month (adequate duration to receive one course) if 6 months or greater will elapse between treatment courses (i.e., there will be a minimum of 6 months separating the first dose of the previous rituximab course and the first dose of the requested course of rituximab).

14. Waldenstrom's Macroglobulinemia/Lymphoplasmacytic Lymphoma. Approve for 1 year if prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Rituximab IV products have not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

APPENDIX

	Mechanism of Action	Examples of Inflammatory Indications for Products*
Biologics		
Adalimumab SC Products (Humira®, biosimilars)	Inhibition of TNF	AS, CD, PJIA, PsO, PsA, RA, SJIA, UC
Cimzia® (certolizumab pegol SC injection)	Inhibition of TNF	AS, CD, PsO, PsA, RA
Etanercept SC Products (Enbrel®, biosimilars)	Inhibition of TNF	AS, PJIA, PsO, PsA, RA, SJIA
Infliximab IV Products (Remicade®, biosimilars)	Inhibition of TNF	AS, CD, PJIA, PsO, PsA, RA, SJIA, UC
Simponi®, Simponi® Aria™ (golimumab SC injection, golimumab IV infusion)	Inhibition of TNF	SC formulation: AS, PsA, RA, UC
		IV formulation: AS, PsA, RA
Actemra® (tocilizumab IV infusion, tocilizumab SC injection)	Inhibition of IL-6	SC formulation: PJIA, RA, SJIA
		IV formulation: PJIA, RA, SJIA
Kevzara® (sarilumab SC injection)	Inhibition of IL-6	RA
Orencia® (abatacept IV infusion, abatacept SC injection)	T-cell costimulation modulator	SC formulation: PJIA, PSA, RA
		IV formulation: PJIA, PsA, RA
Rituximab IV Products (Rituxan®, biosimilars)	CD20-directed cytolytic antibody	RA
Ilaris (canakinumab SC injection**)**	Inhibition of IL-1β	SJIA
Kineret® (anakinra SC injection)	Inhibition of IL-1	RA, SJIA^
Stelara® (ustekinumab SC injection, ustekinumab IV infusion)	Inhibition of IL-12/23	SC formulation: CD, PsO, PsA, UC
		IV formulation: CD, UC
Siliq™ (brodalumab SC injection)	Inhibition of IL-17	PsO
Cosentyx™ (secukinumab SC injection)	Inhibition of IL-17A	AS, PsO, PsA
Taltz® (ixekizumab SC injection)	Inhibition of IL-17A	AS, PsO, PsA
Ilumya™ (tildrakizumab-asmn SC injection)	Inhibition of IL-23	PsO
Skyrizi™ (risankizumab-rzza SC injection)	Inhibition of IL-23	PsO
Tremfya™ (guselkumab SC injection)	Inhibition of IL-23	PsO
Entyvio™ (vedolizumab IV infusion)	Integrin receptor antagonist	CD, UC
Targeted Synthetic DMARDs		
Otezla® (apremilast tablets)	Inhibition of PDE4	PsO, PsA
Olumiant® (baricitinib tablets)	Inhibition of the JAK pathways	RA
Rinvoq® (upadacitinib extended-release tablets)	Inhibition of the JAK pathways	RA
Xeljanz®, Xeljanz XR (tofacitinib tablets, tofacitinib extended-release tablets)	Inhibition of the JAK pathways	RA, PsA, UC

* Not an all-inclusive list of indication (e.g., oncology indications and rare inflammatory conditions are not listed). Refer to the prescribing information for the respective agent for FDA-approved indications; SC – Subcutaneous; TNF – Tumor necrosis factor; IV – Intravenous, IL – Interleukin; PDE4 – Phosphodiesterase 4; JAK – Janus kinase; AS – Ankylosing spondylitis; CD – Crohn's disease; PJIA – Polyarticular juvenile idiopathic arthritis; PsO – Plaque psoriasis; PsA – Psoriatic arthritis; RA – Rheumatoid arthritis; SJIA – Systemic juvenile idiopathic arthritis; UC – Ulcerative colitis; ^ Off-label use of SJIA supported in guidelines.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Rituximab Intravenous Products

- Rituxan® (rituximab for intravenous infusion – Genentech)
- Ruxience™ (rituximab-pvvr IV injection – Pfizer)
- Truxima® (rituximab-abbs injection for intravenous use – Celltrion/Teva)

DATE REVIEWED: 06/03/2020

OVERVIEW
Rituximab products are CD20-directed cytolytic antibodies. All approved rituximab intravenous products are indicated for treatment of the following conditions:

9. **Non-Hodgkin lymphoma** (NHL), for the following uses:
   - previously untreated follicular, CD20-positive disease, in combination with first-line chemotherapy, and in patients achieving a complete or partial response to rituximab in combination with chemotherapy, as a single-agent maintenance therapy; AND
   - for relapsed or refractory, low-grade or follicular, CD20-positive, B-cell, disease; AND
   - for non-progressing (including stable disease) low-grade, CD20-positive, B-cell disease as a single agent after first-line cyclophosphamide/vincristine/prednisone (CVP) chemotherapy; AND
   - for previously untreated diffuse large B-cell, CD20-positive disease, in combination with cyclophosphamide/doxorubicin/vincristine/prednisone (CHOP) or other anthracycline-based chemotherapy regimens; AND
10. **Chronic lymphocytic leukemia** (CLL), in combination with fludarabine and cyclophosphamide (FC) for the treatment of patients with previously untreated and previously treated CD20-positive disease; AND
11. **Granulomatosis with polyangitis** (GPA) [Wegener's granulomatosis {WG}] and **microscopic polyangiitis** (MPA) in adults, in combination with glucocorticoids.

In addition to the above indications, Rituxan IV and Truxima are also indicated for treatment of the following condition:

4. **Rheumatoid arthritis** (RA), in adult patients with moderately to severely active disease, in combination with methotrexate (MTX) for patients who have had an inadequate response to one or more tumor necrosis factor inhibitors (TNFis).

In addition to the above indications, Rituxan IV is also indicated for treatment of the following conditions:

3. **Pemphigus vulgaris**, for adults with moderate to severe; AND
4. **Granulomatosis with polyangitis** (GPA) [Wegener's granulomatosis {WG}] and **microscopic polyangiitis** (MPA) in patients ≥ 2 years of age, in combination with glucocorticoids.

Rituximab products are monoclonal antibody directed specifically against the CD20 antigen found on the surface of normal and malignant B lymphocytes.[1-3] The antigen CD20 is expressed on > 90% of B-cell non-Hodgkin's lymphomas (NHLs). B-cells are thought to play a role in the pathogenesis of rheumatoid arthritis (RA) and associated chronic synovitis.

Ruxience and Truxima are approved as biosimilar to Rituxan intravenous (IV), indicating no clinically meaningful differences in safety and effectiveness and the same mechanism of action, route of administration, dosage form, and strength as Rituxan IV. However, minor differences in clinically inactive components are allowed. At this time, Ruxience and Truxima has only demonstrated biosimilarity, not interchangeability.

Guidelines
The use of rituximab products is supported in clinical guidelines in numerous situations, both as first-line therapy and in patients who are refractory or have relapsed following treatment with other therapies.[4-21]

- **Vasculitis:** EULAR/ERA-EDTA recommendations for antineutrophil cytoplasmic antibody (ANCA)-associated vasculitis mention rituximab in combination with low-dose corticosteroids as a potential treatment option for remission-maintenance therapy.[4] Remission-maintenance therapy is recommended for at least 24 months following induction of sustained remission. British guidelines for use of rituximab in ANCA-associated vasculitis recommend rituximab for maintenance of remission to reduce the risk of relapse and its consequences.[5]
- National Comprehensive Cancer Network (NCCN) guidelines:[6]
  - **CLL/SLL:** Rituximab features prominently in the guidelines (version 4.2020 – December 20, 2019) and is included in multiple treatment regimens across the spectrum of disease.[7]
  - **B-Cell Lymphomas:** In the guidelines (version 1.2020 – January 22, 2020), rituximab is included in multiple treatment regimens across the spectrum of disease.[8] Guidelines for pediatric aggressive mature B-cell lymphomas (version 2.2020 – April 10, 2020) include rituximab intravenous among treatment regimens for induction therapy/initial treatment and as subsequent therapy for relapsed or refractory disease.[9] For primary cutaneous lymphomas (version 2.2020 – April 10, 2020), rituximab is a treatment option for patients with primary cutaneous B-cell lymphoma.[10]
  - **Acute Lymphoblastic Leukemia (ALL):** Guidelines (version 1.2020 – January 15, 2020) list rituximab in multiple induction regimens for Philadelphia chromosome (Ph)-negative disese.[11] In those with Ph-positive disease, rituximab should be considered in addition to chemotherapy for those with CD20-positive disease, especially in those < 60 years of age. Rituximab is also included in a regimen for relapsed/refractory disease for those with Ph-positive or –negative disease.
  - **Hairy Cell Leukemia:** Guidelines (version 1.2020 – August 23, 2019) recommend rituximab in multiple regimens for relapsed/refractory disease, including in patients with progressive disease after relapsed/refractory therapy.[12]
  - **Hodgkin Disease:** Guidelines (version 2.2020 – April 17, 2020) recommend rituximab ± chemotherapy (depending on the clinical presentation) in the first-line setting for nodular lymphocyte-predominant disease.[13] Rituximab is also used for relapsed/refractory disease and for maintenance.
  - **Waldenstrom Macroglobulinemia/lymphoplasmacytic lymphoma:** Guidelines (version 2.2020 – April 15, 2020) include rituximab in regimens across the spectrum of disease (primary therapy, previously treated disease, and maintenance).[14]
  - **Graft Versus Host Disease:** Guidelines (version 2.2020 – March 23, 2020) list rituximab among the agents used for steroid-refractory chronic GVHD.[15]
- **Rheumatoid Arthritis:** Guidelines from the American College of Rheumatology (ACR) [2015] have tumor inhibitors and non-TNF biologics (including rituximab), equally positioned following a trial of a conventional synthetic DMARD.[16]
- **Immune Thrombocytopenia (ITP):** Guidelines from the American Society of Hematology (ASH) for ITP (2011) mention rituximab as an appropriate agent for children and adolescents with ITP who have significant on-going bleeding despite treatment with intravenous immunoglobulin G (IVIG), anti-D, or corticosteroids.[17] Rituximab is also appropriate as an alternative to splenectomy in children/adolescents with chronic ITP or in patient who do not respond to splenectomy. In adults, rituximab in recommended for patients with ITP who are at risk for bleeding and who have failed one other line of therapy (e.g., corticosteroids, IVIg, splenectomy).
- **Multiple Sclerosis (MS):** In June 2019, a consensus paper was updated by the MS Coalition that discusses the use of disease-modifying therapies in MS.[18] Rituximab is listed among various options, involving different mechanisms of action and modes of administration, which have shown benefits in patients with MS. The American Academy of Neurology has practice guidelines

regarding disease-modifying therapies for adults with MS.[19] The guidelines mention rituximab for use in MS.

- **Neuromyelitis Optica Spectrum Disorders:** A review article lists rituximab as an effective treatment for neuromyelitis optica.[20]
- **Systemic Lupus Erythematous (SLE):** EULAR recommendations for the management of systemic lupus erythematosus (2019) mention rituximab as a therapeutic option for patients who are refractory to standard immunosuppressive therapies.[21]

Safety

Rituximab IV products have Boxed Warnings due to fatal infusion reactions, severe mucocutaneous reactions, hepatitis B virus (HBV) reactivation, and progressive multifocal leukoencephalopathy (PML). Deaths within 48 hours of rituximab infusions have been reported, primarily (80%) associated with the first infusion. Screen all patients for HBV infection and monitor during and after treatment with rituximab IV. Discontinue rituximab products in cases of HBV reactivation.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of rituximab intravenous products. Because of the specialized skills required for evaluation and diagnosis of patients treated with rituximab as well as the monitoring required for adverse events and long-term efficacy, initial approval requires rituximab IV products to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration listed below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of rituximab IV products is recommended in those who meet the following criteria:

FDA-Approved Indications

39. Antineutrophil Cytoplasmic Antibody (ANCA)-Associated Vasculitis. Approve for the duration noted if the patient meets ONE of the following (A or B):

D) Induction Treatment. Approve for 1 month if the patient meets ALL of the following (i, ii, and iii):

a. The patient has an ANCA-associated vasculotide; AND
   Note: Examples of ANCA-associated vasculitis include granulomatosis with polyangiitis (GPA) [Wegener's granulomatosis] or microscopic polyangiitis (MPA).
~~b.~~ The requested agent is being administered in combination with glucocorticoids; AND
c. The agent is prescribed by or in consultation with a rheumatologist, nephrologist, or immunologist.

~~E)~~ Follow-Up Treatment of Patients Who Have Received Induction Treatment for ANCA-Associated Vasculitis (Note: This includes patients who received induction treatment using a rituximab product or other standard of care immunosuppressants). Approve for 1 year if the patient meets BOTH of the following (i and ii):

~~a.~~ According to the prescriber, the patient achieved disease control with induction treatment; AND
~~b.~~ If the patient previously received a course of therapy, at least 16 weeks will elapse between courses.

40. Chronic Lymphocytic Leukemia (CLL) or Small Lymphocytic Lymphoma (SLL). Approve for 1 year if prescribed by or in consultation with an oncologist.

41. B-Cell Lymphoma (Note: Examples of B Cell Lymphomas include Follicular Lymphoma, Diffuse Large B-Cell Lymphoma [DLBCL], Acquired Immune Deficiency [AIDS]-Related B-Cell Lymphoma, Burkitt Lymphoma, Castleman's Disease, Marginal Zone Lymphoma [e.g., extranodal or MALT {gastric or nongastric}, nodal, or splenic marginal zone lymphoma], Primary Mediastinal Large B-Cell Lymphoma, Mantle Cell Lymphoma, Post-Transplant Lymphoproliferative Disorders, Gray Zone Lymphoma, Primary Cutaneous B-Cell Lymphoma, Pediatric Aggressive Mature B-cell Lymphomas). Approve for 1 year if prescribed by or in consultation with an oncologist.

42. Pemphigus Vulgaris. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Treatment. Approve for 1 month (which is adequate duration to administer one course of therapy) if the patient meets BOTH of the following (i and ii):

i. Therapy is initiated in combination with a corticosteroid unless contraindicated; AND
Note: An example of a corticosteroid is prednisone.

ii. The agent is prescribed by or in consultation with a dermatologist.

B) Patient is Being Treated of a Relapse or for Maintenance of Pemphigus Vulgaris. Approve for 1 year if the patient meets BOTH of the following (i and ii):

i. Subsequent infusions of will be administered no sooner than 16 weeks following the previous infusion of a rituximab product; AND

ii. The agent is prescribed by or in consultation with a dermatologist.

43. Rheumatoid Arthritis (RA). Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 1 month (which is adequate duration to administer one course of therapy) if the patient meets ALL of the following conditions (i, ii, and iii):

iv. The patient has tried ONE conventional synthetic disease-modifying antirheumatic drug (DMARD) for at least 3 months; AND
Note: Examples of conventional synthetic disease-modifying antirheumatic drugs include methotrexate [oral or injectable], leflunomide, hydroxychloroquine, and sulfasalazine. An exception to the requirement for a trial of one conventional synthetic DMARD can be made if the patient has already has a 3-month trial at least one biologic. These patients who have already tried a biologic for RA are not required to "step back" and try a conventional synthetic DMARD.

v. The agent will not be used concurrently with another biologic or with a targeted synthetic DMARD; AND
Note: Examples of biologics include Cimzia, adalimumab products, etanercept products, infliximab products, Simponi [Aria or SC], Actemra [IV or SC], Kevzara, Kineret, and Orencia [IV or SC]). Examples of targeted synthetic DMARDs include Xeljanz/XR, Olumiant, and Rinvoq.

vi. The requested agent is prescribed by or in consultation with a rheumatologist.

B) Patient has already Received One or More Courses of a Rituximab Product for Rheumatoid Arthritis (RA). Approve for 1 month (which is adequate duration to administer one course of therapy) if the patient meets BOTH of the following conditions (i and ii):

ii. 16 weeks or greater will elapse between treatment courses; AND
Note: For example, there will be a minimum of 16 weeks since the first dose of the previous course and the first dose of the next course of a rituximab product.

iii. If the patient has already received two or more courses of therapy, the patient has responded to therapy as determined by the prescriber.
Note: Examples of a response include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improved laboratory values; reduced dosage of corticosteroids).

Other Uses with Supportive Evidence

6. Acute Lymphoblastic Leukemia (ALL). Approve for 1 year if the patient meets ALL of the following (A and B):
A) The patient has CD20-positive disease; AND
B) The agent is prescribed by or in consultation with an oncologist.

22. Graft Versus Host Disease (GVHD). Approve for 1 year if the patient meets BOTH of the following (A and B):
i. The patient has tried at least one conventional systemic treatment for graft versus host disease; AND
Note: Examples include systemic corticosteroids (methylprednisolone, prednisone), cyclosporine, tacrolimus, mycophenolate mofetil, Imbruvica® (ibrutinib capsules and tablets), imatinib. antithymocyte globulin, Nipent® (pentostatin infusion), or an infliximab product.
ii. The agent is prescribed by or in consultation with an oncologist, hematologist, or a physician affiliated with a transplant center.

23. Hairy Cell Leukemia. Approve for 1 year if the patient meets BOTH of the following conditions (A and B):
A) The patient has relapsed/refractory hairy cell leukemia; AND
B) The agent is prescribed by or in consultation with an oncologist.

24. Hodgkin Lymphoma. Approve for 1 year if the patient meets BOTH of the following (A and B):
C) The patient has nodular lymphocyte-predominant disease; AND
D) The agent is prescribed by or in consultation with an oncologist.

10. Immune Thrombocytopenia (ITP). Approve if the patient meets ONE of the following (A or B):
C) Initial Therapy. Approve for 1 month if the patient meets BOTH of the following (i and ii):
i. The patient has tried one other therapy; AND
Note: Examples of therapies for ITP include intravenous immunoglobulin (IVIG), anti-D (RHO) immunoglobulin, corticosteroids, and splenectomy.
ii. The agent is prescribed by or in consultation with a hematologist.
D) Patient has Already Received a Course of a Rituximab Product for ITP. Approve for 1 month if the patient meets ALL of the following (i, ii, and iii):
i. At least 6 months will elapse between treatment courses; AND
Note: For example, there will be a minimum of 6 months separating the first dose of the previous course and the first dose of the requested course of a rituximab product.
ii. The patient responded to therapy as determined by the prescriber; AND
Note: Examples of a response include a platelet count increase from baseline following treatment with a rituximab product.
iii. The prescriber has determined that the patient has relapsed.
Note: Examples of a relapse include the patient experiences thrombocytopenia after achievement of a remission.

11. Multiple Sclerosis. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

E) The patient has had an inadequate response or was unable to tolerate at least ONE other disease-modifying agent for MS; AND

F) The agent will not be used concurrently with another disease-modifying agent used for multiple sclerosis; AND

Note: Examples of disease-modifying agents for MS include Ocrevus (ocrelizumab IV infusion), Avonex (interferon beta-1a for intramuscular injection), Rebif (interferon beta-1a SC injection), Betaseron (interferon beta-1b SC injection), Extavia (interferon beta-1b SC injection), Copaxone (glatiramer acetate SC injection), Glatopa (glatiramer acetate SC injection), Plegridy (peginterferon beta-1a SC injection), Gilenya (fingolimod capsules), Aubagio (teriflunomide tablets), Tecfidera (dimethyl fumarate delayed-release capsules), or Lemtrada (alemtuzumab IV injection), mitoxantrone IV (Novantrone, generics), Tysabri (natalizumab IV injection), and Mavenclad (cladribine tablets).

G) The requested agent is prescribed by or in consultation with a physician who specializes in the treatment of MS and/or a neurologist; AND

H) At least 6 months will elapse between treatment courses.

Note: For example, if the patient has already received a course of therapy there will be a minimum of 6 months separating the first dose of the previous course and the first dose of the requested course of therapy.

1. Neuromyelitis Optica (NMO) Spectrum Disorder. Approve for 1 month if prescribed by or in consultation with a neurologist.

13. Systemic Lupus Erythematous (SLE) [Lupus]. Approve for the duration noted if the patient meets ONE of the following (A or B):

C) Initial Therapy. Approve for 1 month (adequate duration to receive one course) if the patient meets BOTH of the following (i and ii):

i. The patient has tried at least ONE standard immunomodulating or immunosuppressant agent; AND

Note: Examples of standard immunomodulating or immunosuppressant agents include hydroxychloroquine, corticosteroids (e.g., prednisone, methylprednisolone), methotrexate, azathioprine, mycophenolate, and cyclophosphamide.

ii. The agent is prescribed by or in consultation with a rheumatologist, nephrologist, or neurologist.

D) Patient has Already Received a Course of a Rituximab Product for SLE. Approve for 1 month (adequate duration to receive one course) if 6 months or greater will elapse between treatment courses (i.e., there will be a minimum of 6 months separating the first dose of the previous rituximab course and the first dose of the requested course of rituximab).

15. Waldenstrom's Macroglobulinemia/Lymphoplasmacytic Lymphoma. Approve for 1 year if prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Rituximab IV products have not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

3. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

APPENDIX

	Mechanism of Action	Examples of Inflammatory Indications for Products*
Biologics		
Adalimumab SC Products (Humira®, biosimilars)	Inhibition of TNF	AS, CD, PJIA, PsO, PsA, RA, SJIA, UC
Cimzia® (certolizumab pegol SC injection)	Inhibition of TNF	AS, CD, PsO, PsA, RA
Etanercept SC Products (Enbrel®, biosimilars)	Inhibition of TNF	AS, PJIA, PsO, PsA, RA, SJIA
Infliximab IV Products (Remicade®, biosimilars)	Inhibition of TNF	AS, CD, PJIA, PsO, PsA, RA, SJIA, UC
Simponi®, Simponi® Aria™ (golimumab SC injection, golimumab IV infusion)	Inhibition of TNF	SC formulation: AS, PsA, RA, UC
		IV formulation: AS, PsA, RA
Actemra® (tocilizumab IV infusion, tocilizumab SC injection)	Inhibition of IL-6	SC formulation: PJIA, RA, SJIA
		IV formulation: PJIA, RA, SJIA
Kevzara® (sarilumab SC injection)	Inhibition of IL-6	RA
Orencia® (abatacept IV infusion, abatacept SC injection)	T-cell costimulation modulator	SC formulation: PJIA, PSA, RA
		IV formulation: PJIA, PsA, RA
Rituximab IV Products (Rituxan®, biosimilars)	CD20-directed cytolytic antibody	RA
Ilaris (canakinumab SC injection**)**	Inhibition of IL-1β	SJIA
Kineret® (anakinra SC injection)	Inhibition of IL-1	RA, SJIA^
Stelara® (ustekinumab SC injection, ustekinumab IV infusion)	Inhibition of IL-12/23	SC formulation: CD, PsO, PsA, UC
		IV formulation: CD, UC
Siliq™ (brodalumab SC injection)	Inhibition of IL-17	PsO
Cosentyx™ (secukinumab SC injection)	Inhibition of IL-17A	AS, PsO, PsA
Taltz® (ixekizumab SC injection)	Inhibition of IL-17A	AS, PsO, PsA
Ilumya™ (tildrakizumab-asmn SC injection)	Inhibition of IL-23	PsO
Skyrizi™ (risankizumab-rzza SC injection)	Inhibition of IL-23	PsO

Tremfya™ (guselkumab SC injection)	Inhibition of IL-23	PsO
Entyvio™ (vedolizumab IV infusion)	Integrin receptor antagonist	CD, UC
Targeted Synthetic DMARDs		
Otezla® (apremilast tablets)	Inhibition of PDE4	PsO, PsA
Olumiant® (baricitinib tablets)	Inhibition of the JAK pathways	RA
Rinvoq® (upadacitinib extended-release tablets)	Inhibition of the JAK pathways	RA
Xeljanz®, Xeljanz XR (tofacitinib tablets, tofacitinib extended-release tablets)	Inhibition of the JAK pathways	RA, PsA, UC

* Not an all-inclusive list of indication (e.g., oncology indications and rare inflammatory conditions are not listed). Refer to the prescribing information for the respective agent for FDA-approved indications; SC – Subcutaneous; TNF – Tumor necrosis factor; IV – Intravenous, IL – Interleukin; PDE4 – Phosphodiesterase 4; JAK – Janus kinase; AS – Ankylosing spondylitis; CD – Crohn's disease; PJIA – Polyarticular juvenile idiopathic arthritis; PsO – Plaque psoriasis; PsA – Psoriatic arthritis; RA – Rheumatoid arthritis; SJIA – Systemic juvenile idiopathic arthritis; UC – Ulcerative colitis; ^ Off-label use of SJIA supported in guidelines.

PRIOR AUTHORIZATION POLICY

POLICY: Scenesse® (afamelanotide implant for subcutaneous use – Clinuvel)

DATE REVIEWED: February 19, 2020

OVERVIEW

Scenesse, a melanocortin 1 receptor agonist, is indicated to increase pain-free light exposure in adults with a history of phototoxic reactions from erythropoietic protoporphyria (EPP).[1] The agent is a controlled-release dosage form that is implanted subcutaneously (SC). Scenesse should be administered by a healthcare professional. A single implant which contains 16 mg of afamelanotide is inserted SC above the anterior supra-iliac crest once every 2 months.

Disease Overview

Porphyrias are disorders caused by enzyme defects in heme biosynthesis.[2] There are at least eight different types of porphyrias, which are classified as cutaneous or acute depending on the specific enzyme that is deficient. EPP is a cutaneous porphyria characterized by extreme photosensitivity. It is estimated to occur in 2 to 5 in 1,000,000 individuals.[3]

Two subtypes of EPP exist which differ in their genetic inheritance patterns. Classic EPP is inherited in an autosomal recessive fashion (sometimes referred to as EPP-AR). In this form of EPP, mutations in the *FECH* gene lead to decreased activity of ferrochelatase, the final enzymatic step in heme biosynthesis.[4] This results in accumulation of an intermediate metabolite called protoporphyrin. An X-linked subtype of EPP, often referred to in the literature as X-linked protoporphyria (XLP), accounts for 2% to 10% of all EPP cases. This type develops due to a gain-of-function mutation in the erythroid form of 5-aminolevulinate synthase 2 (ALAS2). This enzyme is responsible for an earlier step in heme biosynthesis; hyperactivity of the ALAS2 enzyme leads to excess protoporphyrin production.[3,4] The two subtypes share the same biochemical and clinical features, although females with XLP may be less severely affected. Diagnosis is confirmed by one or both of the following: 1) biochemically via markedly elevated free erythrocyte protoporphyrin, and/or 2) molecular genetic testing.[2,3]

In both EPP subtypes, protoporphyrin accumulates in the bone marrow and is taken up by the liver and vascular endothelium.[3,4] Accumulation in superficial skin vessels leads to phototoxicity upon light exposure, resulting in the hallmark symptoms of burning, tingling, and itching, which often occur without visible damage.[2-4] Some patients may also be sensitive to artificial light, as the photosensitivity is primarily due to visible blue light.[5,6] Phototoxic pain is not responsive to analgesics, including narcotics; management is focused on prevention of phototoxic episodes.[3]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Scenesse. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Scenesse as well as the monitoring required for adverse events and long-term efficacy, approval requires Scenesse to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Scenesse is recommended in those who meet the following criteria:

FDA-Approved Indications

250. Erythropoietic Protoporphyria (Including X-Linked Protoporphyria). Approve for 1 year if the patient meets the following criteria (A, B, C, and D):

- **A)** The patient is ≥ 18 years of age; AND
- **B)** The patient has a history of at least one porphyric phototoxic reaction; AND
- **C)** The diagnosis is confirmed by at least one of the following (i or ii):
  - **i.** Free erythrocyte protoporphyrin level above the normal reference range for the reporting laboratory; OR
  - **ii.** Molecular genetic testing consistent with the diagnosis; AND
- **D)** The agent is prescribed by or in consultation with a dermatologist, gastroenterologist, hepatologist, or physician specializing in the treatment of cutaneous porphyrias.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Scenesse not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

224. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

- temazepam (Restoril® – Mallinckrodt, generics)
- triazolam (Halcion® – Pfizer, generics)

DATE REVIEWED: 05/27/2020

OVERVIEW

Eszopiclone, zaleplon, zolpidem immediate-release (IR), zolpidem extended-release (ER), zolpidem sublingual tablets, Edluar, and Zolpimist are all non-benzodiazepine sedative hypnotics used for the treatment of insomnia.[1-7] These agents interact with gamma-aminobutyric acid (GABA) receptor complexes located closely to benzodiazepine receptors; the chemical structures of these agents are unrelated to the benzodiazepines. All are schedule IV controlled substances. Rozerem, another non-benzodiazepine sedative hypnotic, is a melatonin receptor agonist.[8] Silenor is a tricyclic compound that acts as a histamine H_1 receptor antagonist.[9] Neither Rozerem nor Silenor are controlled substances. Belsomra and Dayvigo are first-in-class orexin receptor antagonists and are schedule IV controlled substances.[10,11] Estazolam, flurazepam, Doral, temazepam, and triazolam are benzodiazepine sedative hypnotics indicated for the treatment of insomnia.[12] Benzodiazepines bind to receptors on the postsynaptic GABA neuron, and their effects appear to be linked to the GABA-A receptors.

Zolpidem IR, Edluar, Zolpimist, zaleplon, and the benzodiazepine sedative hypnotics are indicated for the short-term treatment of insomnia.[1,3,5,6,12] Zolpidem ER, eszopiclone, Silenor, and Rozerem are also indicated for the treatment of insomnia, but their product labeling does not specifically limit their use to short-term.[2,4,8,9] All of the agents in this category have been shown to decrease sleep latency. Zaleplon and Rozerem are specifically indicated for the treatment of insomnia characterized by difficulty with sleep onset.[3,8] Zolpidem IR, zolpidem ER, Silenor, and eszopiclone have also been shown to improve sleep maintenance or increase the duration of sleep.[1,2,4,9] Belsomra and Dayvigo are indicated for the treatment of insomnia, characterized by difficulties with sleep onset and/or sleep maintenance.[10,11] Zolpidem sublingual tablets are indicated for use as needed for the treatment of insomnia when a middle-of-the-night (MOTN) awakening is followed by difficulty returning to sleep.[7] However, zolpidem sublingual tablets are not indicated for treatment of MOTN insomnia when the patient has fewer than 4 hours of bedtime remaining before the planned time of waking. Doxepin is also available generically as oral capsules (10, 25, 50, 75, 100, and 150 mg) and oral solution (10 mg/mL).[12] These higher dose formulations are recommended for use in patients with depression and/or anxiety of varying etiologies.

Disease Overview

Insomnia is defined in the International Classification of Sleep Disorders, Third Edition, as a complaint of trouble initiating or maintaining sleep, resulting in daytime consequences (e.g., daytime fatigue, irritability, and decreased concentration) which is not attributable to environmental circumstances or inadequate opportunity for sleep.[13] Specific sleep complaints of patients with insomnia include delayed sleep onset, frequent awakenings, early morning awakenings, and waking up feeling unrefreshed. A wide array of terminology exists for defining the duration of

insomnia symptoms. Generally, transient insomnia lasts less than 1 week, short-term (acute) insomnia lasts up to 3 months, and chronic insomnia lasts more than 3 months at a frequency of at least three times per week.[13,14] Symptoms of insomnia commonly wax and wane over time, and manifestations of insomnia often change over time (e.g., difficulty falling to sleep changes to difficulty staying asleep, or vice versa). Insomnia is often subtyped by the predominant symptom, either sleep onset or sleep maintenance.[15]

Guidelines

The American Academy of Sleep Medicine (AASM) published a clinical guideline for the evaluation and management of chronic insomnia in adults (2008).[16] Insomnia is primarily diagnosed by clinical evaluation through a thorough sleep history and detailed medical, substance, and psychiatric history. The evaluation and differential diagnosis of insomnia can be aided by self-administered questionnaires, at-home sleep logs, symptom checklists, psychological screening tests, and bed partner interviews. At a minimum, patients should complete a general medical/psychiatric questionnaire to identify comorbid disorders; a sleepiness assessment (e.g., Epworth Sleepiness Scale) to identify sleepy patients and comorbid disorders of sleepiness; and a 2-week sleep log to identify general patterns of sleep-wake times and day-to-day variability. A sleep diary should be maintained prior to and during the course of active treatment and in the case of relapse or reevaluation in the long-term. The primary treatment goals are to improve sleep quality and quantity and to improve insomnia related daytime impairments. Initial approaches to treatment should include at least one behavioral intervention such as stimulus control therapy or relaxation therapy, or the combination of cognitive therapy, stimulus control therapy, sleep restriction therapy with or without relaxation therapy. Patients should be instructed to keep a regular schedule; have a healthy diet, regular daytime exercise, and a quiet sleep environment; and avoid napping, caffeine, other stimulants, nicotine, alcohol, excessive fluids, or stimulating activities before bedtime. Short-term hypnotic treatment should be supplemented with behavioral and cognitive therapies when possible. Chronic hypnotic medication may be indicated for long-term use in patients with severe or refractory insomnia or chronic comorbid illness. Whenever possible, patients should receive an adequate trial of cognitive behavioral treatment during long-term pharmacotherapy. Long-term prescribing should be accompanied by regular follow-up, ongoing assessment of effectiveness, monitoring for adverse events, and evaluation for new onset or exacerbation of existing comorbid disorders.

The AASM published an updated clinical practice guideline for the pharmacologic treatment of chronic insomnia in adults (2017).[13] The recommendations are intended as a guide for choosing a specific pharmacological agent (vs. no treatment) for treatment of chronic insomnia in adults, when such treatment is indicated. Each of the recommendations listed is weak, meaning it reflects a lower degree of certainty in the outcome and appropriateness of the patient care strategy for all patients but should not be construed as an indication of ineffectiveness. The guideline suggests that clinicians can use Belsomra as a treatment for sleep maintenance insomnia; eszopiclone can be used as a treatment for sleep onset and sleep maintenance insomnia; zaleplon can be used as a treatment for sleep onset insomnia; zolpidem can be used as a treatment for sleep onset and sleep maintenance insomnia; triazolam can be used as a treatment for sleep onset insomnia; temazepam can be used as a treatment for sleep onset and sleep maintenance insomnia; ramelteon can be used as a treatment for sleep onset insomnia; and Silenor can be used as a treatment for sleep maintenance insomnia. The guideline suggested that clinicians not use trazodone, tiagabine, diphenhydramine, melatonin, tryptophan, or valerian as a treatment for sleep onset or sleep maintenance insomnia. The authors note that cognitive behavioral therapy for insomnia (CBT-I) is a standard of care for this condition; however, the AASM guideline does not address the relative benefits of CBT-I vs. pharmacotherapy.

The American College of Physicians (ACP) developed a guideline on the management of chronic insomnia disorder in adults (2016).[17,18] Chronic insomnia can be managed with psychological therapy, pharmacologic therapy, or a combination of both. Psychological therapy options include CBT-I and other interventions, such as stimulus control, relaxation strategies, and sleep restriction. ACP recommends that all adults receive CBT-I as the initial treatment for chronic insomnia disorder (strong recommendation, moderate-quality evidence). ACP recommends that clinicians use a shared decision-making approach, including a discussion of the benefits, harms, and costs of short-term use of medications, to decide whether to prescribe a medication in adults with chronic insomnia disorder in whom CBT-I alone was unsuccessful (weak recommendation, low-quality evidence). A review of the evidence found that eszopiclone, zolpidem, Belsomra, and Silenor may improve short-term global and sleep outcomes for adults with insomnia disorder (low- to moderate-quality evidence), but the comparative effectiveness and long-term efficacy of

pharmacotherapies for insomnia are unknown. ACP also notes that pharmacotherapies for insomnia may cause cognitive and behavioral changes and may be associated with infrequent but serious harms.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of sedative hypnotics. All approvals are provided for the duration noted below.

Automation: Patients who use at least 180 days of a sedative/hypnotic medication in a 365-day time period will require prior authorization. If the patient has a prescription for a cancer medication (see Appendix A) within a 180-day period, the claim will adjudicate. When available, the ICD-10 codes for cancer will be used as part of automation to allow approval of the requested medication (see Appendix B).

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of a sedative hypnotic is recommended in those who meet the following criteria:

FDA-Approved Indications

12. Chronic Insomnia. Approve for 1 year if the patient meets ONE of the following criteria (A or B):

H) The patient has a cancer diagnosis; OR

I) The patient meets ALL of the following criteria (i, ii, iii, and iv):

E) Patient has tried at least one form of behavioral therapy for insomnia; AND
Note: Examples of behavioral therapy for insomnia include relaxation training, stimulus control therapy, or sleep restriction therapy.

F) Patient is not currently taking prescription stimulants (e.g., methylphenidate, amphetamine products); AND

G) Underlying psychiatric and/or medical conditions that may cause or exacerbate insomnia have been evaluated and are currently being addressed, according to the prescriber; AND

H) Patient's sleep quality and quantity and/or insomnia-related daytime impairments continue to improve or remain stable, according to the prescriber.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Sedative hypnotics have not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

225. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Selzentry® (maraviroc tablets – Pfizer)

REVIEW DATE: 06/10/2016

LAY CRITERIA EFFECTIVE DATE: Previously in Effect

OVERVIEW

Selzentry, in combination with other antiretroviral therapy (ART), is indicated for the treatment of adults with only cysteine-cysteine chemokine receptor 5 (CCR5)-tropic human immunodeficiency virus (HIV)-1.[1] This indication is based on analyses of plasma HIV-1 RNA levels in two controlled trials of Selzentry in treatment-experienced patients and one trial in treatment-naïve patients. Both trials in treatment-experienced patients were conducted in clinically advanced, three-class ART-experienced adults with evidence of HIV-1 replication despite ongoing ART therapy. When initiating therapy with Selzentry, the following should be considered:

- Adult patients infected with only CCR5-tropic HIV-1 should use Selzentry.
- Tropism testing must be conducted with a highly sensitive tropism assay that has demonstrated ability to identify patients appropriate for use of Selzentry. Outgrowth of pre-existing low-level cysteine-X-cysteine chemokine receptor 4 (CXCR4)- or dual-mixed tropic HIV-1 not detected by tropism testing at screening has been associated with virologic failure of Selzentry.
- Use of Selzentry is not recommended in patients with dual/mixed- or CXCR4-tropic HIV-1 as efficacy was not demonstrated in a Phase II study.
- The safety and efficacy of Selzentry have not been established in pediatric patients.
- In treatment-naïve patients, more patients treated with Selzentry experienced virologic failure and developed lamivudine resistance compared with Sustiva® (efavirenz tablets/capsules)-treated patients.

Selzentry is the only Food and Drug Administration (FDA-approved) CCR5 antagonist and works by selectively binding to the human chemokine receptor CCR5 preventing the interaction necessary for CCR5-tropic HIV-1 to enter cells. CXCR4-tropic and dual/mixed-tropic (e.g., CCR5/CXCR4) HIV-1 entry is not inhibited by Selzentry; the antiviral activity of Selzentry against HIV-2 has not been evaluated.

Co-receptor tropism assay should be performed whenever the use of CCR5 antagonist is being considered.[2] Phenotypic co-receptor tropism assays have been used in clinical practice. A genotypic assay to predict co-

receptor use is now commercially available and is less expensive than phenotypic assays. Evaluation of genotypic assays is ongoing; however, data suggest that testing should be considered as an alternative assay. The same principles regarding testing for co-receptor use also apply to testing when patients exhibit virologic failure on a CCR5 antagonist. Resistance to CCR5 antagonists in the absence of detectable CXCR4- using virus has been reported, but such resistance is uncommon. The Department of Health and Human Services (DHHS) guidelines make the following recommendations regarding co-receptor tropism assays: 1) A co-receptor tropism assay should be performed whenever the use of CCR5 co-receptor antagonist is being considered; 2) co-receptor tropism testing is also recommended for patients who exhibit virologic failure on a CCR5 antagonist; 3) a phenotypic assay is preferred to determine HIV-1 co-receptor usage; and 4) a genotypic tropism assay should be considered as an alternative test to predict HIV-1 co-receptor usage.

Two Trofile® assays are now available.[3] One Trofile assay if for patients with HIV RNA ≥ 1,000 copies/mL (Trofile) and the other is for patients with HIV RNA < 1,000 copies/mL (Trofile DNA). The Trofile assay is 100% sensitive at detecting 0.3% CXR4-using minor variant and uses the complete gp160 coding region of the HIV-1 envelope protein to ensure that all determinants of tropism are tested. The Trofile DNA is for patients with ***undetectable*** viral loads, and can be considered when a patient's viral tropism is unknown, and a CCR5 antagonist is desired. Unlike the standard Trofile assay, which uses viral RNA found in the plasma of patients with viral loads ≥ 1,000 copies/mL, Trofile DNA uses viral DNA extracted from cells in a whole blood draw. Once the viral information is obtained, Trofile DNA runs on the same clinically validated platform as the Trofile.

Clinical Efficacy

The clinical efficacy and safety of Selzentry have been established from analyses of data from three ongoing studies in adults infected with CCR5-tropic HIV-1 (two studies in ART-experienced patients[1] and one in ART-naïve patients[7]). These studies are supported by a 48-week study in ART-experienced adults infected with dual/mixed-tropic HIV-1.[4] In both treatment-experienced and treatment-naïve patients, detection of CXCR4-using virus prior to initiation of therapy has been associated with a reduced virologic response to Selzentry.[1] In the majority of cases, treatment failure on Selzentry in treatment-experienced patients with HIV-1 was associated with the detection of CXCR4- or dual/mixed-tropic virus.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Selzentry. All approvals are provided for 3 years unless otherwise noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Selzentry is recommended in those who meet the following criteria:

FDA-Approved Indications

4. **HIV-1 Infection with Cysteine-Cysteine Chemokine Receptor 5 (CCR5)-Tropic Virus.** Approve for patients who meet the following criteria (A and B):
   A) The patient has HIV-1 infection; AND
   B) The patient has only CCR5-tropic virus detected by an enhanced sensitivity tropism assay.

Selzentry is indicated for use in combination with other antiretroviral agents, for patients infected with only CCR5-tropic HIV-1.[1] Only patients with CCR5-tropic HIV-1 should use Selzentry tablets.[1]

The DHHS Panel on Antiretroviral Guidelines for Adults and Adolescents recommend the use of coreceptor tropism assays in clinical practice whenever the use of a CCR5 inhibitor is being considered.[2] Although Selzentry may be active against some HIV-2 isolates, there are no approved assays to determine HIV-2 coreceptor tropism. Further, HIV-2 is known to utilize multiple minor coreceptors in addition to CCR5 and CXCR4.

Other Uses with Supportive Evidence

2. **Patients with HIV-1 Infection Already Started on Selzentry.** Approve.
In the professional opinion of a specialist physician, we have adopted this criterion.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Selzentry has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

126. **HIV-1 Infection with CXCR4- or CCR5/CXCR4-Tropic Virus**. Selzentry is not indicated in patients with CXCR4- or CCR5/CXCR4-tropic virus. CXCR4-tropic and dual-tropic (CCR5/CXCR4) HIV-1 entry is not inhibited by Selzentry.

    The efficacy of Selzentry in patients with non-CCR5-tropic HIV-1 was not demonstrated in a Phase IIb study.[1,4] In treatment-experienced patients with non-CCR5-tropic HIV-1 from baseline to Week 24, patients who received placebo demonstrated a mean decrease in HIV-1 RNA levels of 0.97 $\log_{10}$ copies/mL, compared with mean decreases of 0.91 and 1.20 $\log_{10}$ copies/mL for those who were treated with Selzentry once daily (QD) or twice daily (BID), respectively; the difference between the two groups was not statistically significant (P = 0.83 and P = 0.38, for QD and BID vs. placebo, respectively). Mean increases in CD4 cell counts were 36 cells/µL, 60 cells/µL, and 62 cells/µL, for patients who received placebo, Selzentry QD, and Selzentry BID, respectively. In patients with CXCR4 mixed or dual-tropic HIV-1, treatment with Selzentry did not demonstrate superiority to placebo and failed to demonstrate non-inferiority to placebo.[4]

127. **HIV-1 Infection Initiating Therapy with Selzentry with Unknown CCR5-Tropic Status.** Tropism testing must be conducted with a highly sensitive tropism assay that has demonstrated the ability to identify patients appropriate for Selzentry use (i.e., CCR5-tropic HIV-1).[1] DHHS and Infectious Diseases Society of America (IDSA) guidelines endorse tropism testing prior to initiation of therapy with a CCR5 antagonist (i.e., Selzentry).

128. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Sickle Cell Disease – Adakveo® (crizanlizumab-tmca injection, for intravenous use – Novartis)

DATE REVIEWED: 11/20/2019

OVERVIEW

Adakveo, a monoclonal antibody, is indicated to reduce the frequency of vasocclusive crises in adults and pediatric patients aged 16 years and older with sickle cell disease.[1]

Disease Overview

Sickle cell disease, a multisystem disorder, is the most common condition caused by a single gene mutation.[2] In the US, population estimates suggest that a total of 100,000 persons have the disease. Approximately 300,000 babies are born with sickle cell anemia each year and it is estimated that the number could be as high as 400,000 by 2050.

Sickle cell disease is characterized by the presence of abnormal erythrocytes damaged by the sickle hemoglobin gene – this variant of the normal adult hemoglobin can be inherited from both parents or from one parent along with another variant, such as hemoglobin C or with β-thalassemia.[2] Complications of sickle cell disease include vaso-occlusion (which can result in pain and organ failure), hemolytic anemia, and large-vessel vasculopathy (cerebrovascular disease, pulmonary hypertension, ischemic organ damage hyposplenism, renal failure, bone disease, liver failure).

Guidelines

Adakveo has not been added to guidelines. The National Institutes of Health – National Heart, Lung, and Blood Institute issued the Evidence-Based Management of Sickle Cell Disease, Expert Panel Report in 2014.[3] There are two effective disease-modifying therapies for sickle cell disease: hydroxyurea and chronic blood transfusions. Hydroxyurea has been shown to reduce: the frequency of painful episodes, incidence of acute coronary syndrome events, and the need for transfusions and hospitalizations.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Adakveo. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Adakveo as well as the monitoring required for adverse events and long-term efficacy, approval requires Adakveo to be prescribed by, or in consultation with, a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Adakveo is recommended in those who meet the following criteria:

FDA-Approved Indications

157. Sickle Cell Disease. Approve Adakveo for 1 year if the patient meets the following criteria (A and B):

- **A)** The patient is ≥ 16 years of age; AND
- **B)** Adakveo is prescribed by, or in consultation with, a physician who specializes in sickle cell disease (e.g., a hematologist).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Adakveo has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

226. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Sickle Cell Disease – Endari™ (L-glutamine oral powder – Emmaus Medical, Inc)

DATE REVIEWED: 10/23/2019

OVERVIEW

Endari is indicated to reduce the acute complications of sickle cell disease in adults and pediatric patients ≥ 5 years of age.[1]

L-glutamine is an essential amino acid and serves as a precursor of nucleic acids and nucleotides including the pyridine nucleotides (nicotinamide adenine dinucleotide and reduced nicotinamide adenine dinucleotide).[1,2] These pyridine nucleotides play key roles in the regulation and prevention of oxidative

damage in red blood cells and studies have shown that oxidative phenomena may play a significant role in the pathophysiology of sickle cell disease.

Disease Overview

Sickle cell disease, a multisystem disorder, is the most common condition caused by a single gene mutation.[3] In the US, population estimates suggest that a total of 100,000 persons have the disease. Approximately 300,000 babies are born with sickle cell anemia each year and it is estimated that the number could be as high as 400,000 by 2050.

Sickle cell disease is characterized by the presence of abnormal erythrocytes damaged by the sickle hemoglobin gene – this variant of the normal adult hemoglobin can be inherited from both parents or from one parent along with another variant, such as hemoglobin C or with β-thalassemia.[3] Complications of sickle cell disease include vaso-occlusion (which can result in pain and organ failure), hemolytic anemia, and large-vessel vasculopathy (cerebrovascular disease, pulmonary hypertension, ischemic organ damage, hyposplenism, renal failure, bone disease, liver failure).

Guidelines

The National Institutes of Health – National Heart, Lung, and Blood Institute issued the Evidence-Based Management of Sickle Cell Disease, Expert Panel Report in 2014.[4] The use of L-glutamine products in sickle cell disease is not mentioned (guidelines were published before the approval of Siklos® [hydroxyurea tablets] and Endari). Hydroxyurea has been shown to reduce the frequency of painful episodes and acute coronary syndrome events and reduce the need for transfusions and hospitalizations.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Endari. Because of the specialized skills required for evaluation and diagnosis of patients treated with Endari as well as the monitoring required for adverse events, approval requires Endari to be prescribed by, or in consultation with, a physician who specializes in the condition being treated. All approvals are provided for 1 year in duration unless otherwise noted below.

Documentation: Documentation is required where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes and/or laboratory data. Subsequent coverage reviews for a patient who has previously met the documentation requirements and related criteria in the *ESI Endari Prior Authorization Policy* through the ESI Coverage Review Department, and who is now requesting reauthorization, the criteria utilized do NOT require resubmission of documentation for reauthorization.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Endari is recommended in those who meet the following criteria:

FDA-Approved Indication

158. Sickle Cell Disease [documentation required]. Approve Endari for 1 year if the patient meets the following criteria (A and B):

C) The patient is ≥ 5 years of age; AND

D) Endari is prescribed by, or in consultation with, a physician who specializes in sickle cell disease (e.g., a hematologist).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Endari has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for conditions not included in the Recommended Authorization Criteria.

129. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Sickle Cell Disease – Oxbryta™ (voxelotor tablets – Global Blood Therapeutics)

DATE REVIEWED: 12/04/2019

OVERVIEW

Oxbryta, a hemoglobin S (or sickle hemoglobin) polymerization inhibitor, is indicated for the treatment of sickle cell disease in adults and pediatric patients 12 years of age and older.[1]

Disease Overview

Sickle cell disease, a multisystem disorder, is the most common condition caused by a single gene mutation.[2] In the US, population estimates suggest 100,000 persons have the disease. Approximately 300,000 babies are born with sickle cell anemia each year and it is estimated that the number could be as high as 400,000 by 2050.

Sickle cell disease is characterized by the presence of abnormal erythrocytes damaged by the sickle hemoglobin gene – this variant of the normal adult hemoglobin can be inherited from both parents or from one parent along with another variant, such as hemoglobin C or with β-thalassemia.[2] Complications of sickle cell disease include vaso-occlusion (which can result in pain and organ failure), hemolytic anemia, and large-vessel vasculopathy (cerebrovascular disease, pulmonary hypertension, ischemic organ damage, hyposplenism, renal failure, bone disease, liver failure).

Guidelines

Oxbryta has not been added to guidelines. The National Institutes of Health – National Heart, Lung, and Blood Institute issued the Evidence-Based Management of Sickle Cell Disease, Expert Panel Report in 2014.[3] There are two

effective disease-modifying treatments for sickle cell disease: hydroxyurea and chronic blood transfusions. Hydroxyurea has been shown to reduce: the frequency of painful episodes, incidence of acute coronary syndrome events, and the need for transfusions and hospitalizations.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Oxbryta. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Oxbryta as well as the monitoring required for adverse events and long-term efficacy, approval requires Oxbryta to be prescribed by, or in consultation with, a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Oxbryta is recommended in those who meet the following criteria:

FDA-Approved Indication

159. Sickle Cell Disease. Approve Oxbryta for 1 year if the patient meets the following criteria (A and B):

E) The patient is ≥ 12 years of age; AND

F) Oxbryta is prescribed by, or in consultation with, a physician who specializes in sickle cell disease (e.g., a hematologist).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Oxbryta has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

227. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Somatostatin Analogs – Mycapssa Prior Authorization Policy

- Mycapssa® (octreotide delayed-release capsules – Chisama)

REVIEW DATE: 09/02/2020

OVERVIEW

Mycapssa, a somatostatin analog, is indicated for long-term maintenance treatment in acromegaly patients who have responded to and tolerated treatment with octreotide or lanreotide.[1] Mycapssa maintained growth hormone and insulin-like growth factor 1 levels in patients with acromegaly.

GUIDELINES

The Endocrine Society Clinical Practice Guidelines for Acromegaly (2014) recommend medical therapy as adjuvant treatment after surgical intervention.[2] Mycapssa is not addressed in the guidelines. Primary medical therapy with somatostatin analogs (no preferred agent) can be recommended for some patients (e.g., surgery is not curative or patient is a poor surgical candidate). Updated recommendations to the 2014 guidelines on therapeutic outcomes for patients with acromegaly were created by the Acromegaly Consensus Group (2017).[3] The statement recommends Somatuline Depot and Sandostatin LAR Depot as first-line medical therapies in patients with persistent disease after surgery. Signifor LAR is recommended as a second-line medical therapy due to its potential for hyperglycemic-associated adverse events.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Mycapssa. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Mycapssa as well as the monitoring required for adverse events and long-term efficacy, approval requires Mycapssa to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Mycapssa is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Acromegaly.** Approve for 1 year if the patient meets the following criteria (A, B, and C):
   - **A)** Patient has (or had) a pre-treatment (baseline) insulin-like growth factor 1 (IGF-1) level above the upper limit of normal based on age and gender for the reporting laboratory; AND
     Note: Pre-treatment (baseline) refers to the IGF-1 level prior to the initiation of a somatostatin analog (e.g., Mycapssa® [octreotide delayed-release capsules], an octreotide acetate injection product [e.g., Bynfezia Pen™, Sandostatin® {generics}, Sandostatin® LAR Depot], Signifor® LAR [pasireotide injection], Somatuline® Depot [lanreotide injection], dopamine agonist [e.g., cabergoline, bromocriptine], or Somavert® [pegvisomant injection]). Reference ranges for IGF-1 vary among laboratories.
   - **B)** According to the prescriber, patient has responded to one octreotide acetate injection product or Somatuline® Depot (lanreotide injection); AND
   - **C)** The medication is prescribed by or in consultation with an endocrinologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Mycapssa is not recommended in the following situations:

228. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

434. Mycapssa capsules [prescribing information]. Needham, MA: Chiasma; April 2019.

PRIOR AUTHORIZATION POLICY

POLICY: Somatostatin Analogs – Sandostatin® LAR Depot Prior Authorization Policy

- Sandostatin® LAR Depot (octreotide acetate for injectable suspension – Novartis)

REVIEW DATE: 08/05/2020

OVERVIEW

Sandostatin LAR Depot, a somatostatin analog, is indicated for the following uses:[1]

- **Acromegaly**, in patients who have had an inadequate response to surgery and/or radiotherapy, or for whom surgery and/or radiotherapy, is not an option. The goal of treatment in acromegaly is to reduce growth hormone and insulin-like growth factor-1 levels to normal.
- **Carcinoid tumors**, in patients with severe diarrhea and flushing episodes associated with metastatic carcinoid tumors.
- **Vasoactive intestinal peptide tumors (VIPomas)**, in patients with profuse watery diarrhea associated with vasoactive intestinal peptide (VIP)-secreting tumors.

Guidelines

National Comprehensive Cancer Network (NCCN) guidelines support use of Sandostatin LAR Depot in multiple conditions.

- **Central Nervous System Cancers:** Guidelines (version 2.2020 – April 30, 2020) recommend Sandostatin LAR Depot for the treatment of meningiomas that recur despite surgery and/or radiation therapy, or are not amenable to treatment with surgery or radiation therapy.[2]
- **Neuroendocrine and Adrenal Tumors:** Guidelines (version 1.2020 – July 10, 2020) recommend Sandostatin LAR Depot for the management of carcinoid syndrome, tumors of the gastrointestinal tract, lung, thymus (carcinoid tumors), and pancreas (including glucagonomas, gastrinomas, VIPomas, insulinomas), pheochromocytomas, and paragangliomas.[3] Patients who have local unresectable disease and/or distant metastases and clinically significant tumor burden or progression should be started on therapy with a somatostatin analog to potentially control tumor growth. The North American Neuroendocrine Tumor Society (NANETS) consensus guidelines for the surveillance and medical management of midgut NETs (2017) also recommend Sandostatin LAR Depot as a first-line initial therapy in most patients with metastatic midgut NETs for control of carcinoid syndrome and inhibition of tumor growth.[4]
- **Thymomas and Thymic Carcinomas:** Guidelines (version 1.2020 – November 27, 2019) recommend Sandostatin LAR Depot as a second-line systemic therapy option with or without concomitant prednisone therapy.[5] In patients with thymoma who have positive octreotide scan or symptoms of carcinoid syndrome, octreotide therapy may be useful.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Sandostatin LAR Depot. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Sandostatin LAR Depot as well as the monitoring required for adverse events and long-term efficacy, approval requires Sandostatin LAR Depot to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Sandostatin LAR Depot is recommended in those who meet the following criteria:

FDA-Approved Indications

2. Acromegaly. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **D)** Patient meets ONE of the following (i, ii, or iii):
  - **i.** Patient has had an inadequate response to surgery and/or radiotherapy; OR
  - **ii.** Patient is NOT an appropriate candidate for surgery and/or radiotherapy; OR
  - **iii.** Patient is experiencing negative effects due to tumor size (e.g., optic nerve compression); AND
- **E)** Patient has (or had) a pre-treatment (baseline) insulin-like growth factor-1 (IGF-1) level above the upper limit of normal based on age and gender for the reporting laboratory; AND
  Note: Pre-treatment (baseline) refers to the IGF-1 level prior to the initiation of any somatostatin analog (e.g., Mycapssa® [octreotide delayed-release capsules], an octreotide acetate injection product [e.g., Bynfezia Pen™, Sandostatin® {generics}, Sandostatin® LAR Depot], Signifor® LAR [pasireotide injection], Somatuline® Depot [lanreotide injection], dopamine agonist [e.g., cabergoline, bromocriptine], or Somavert® [pegvisomant injection]). Reference ranges for IGF-1 vary among laboratories.
- **F)** The medication is prescribed by or in consultation with an endocrinologist.

2. Neuroendocrine Tumor(s) [NETs] of the Gastrointestinal Tract, Lung, Thymus (Carcinoid Tumors), and Pancreas (including glucagonomas, gastrinomas, vasoactive intestinal peptides-secreting tumors [VIPomas], insulinomas). Approve for 1 year if the medication is prescribed by or in consultation with an oncologist, endocrinologist, or gastroenterologist.

Other Uses with Supportive Evidence

160. Meningioma. Approve for 1 year if the medication is prescribed by or in consultation with an oncologist, radiologist, or neurosurgeon.

161. Thymoma and Thymic Carcinoma. Approve for 1 year if the medication is prescribed by or in consultation with an oncologist.

162. Pheochromocytoma and Paraganglioma. Approve for 1 year if the medication is prescribed by or in consultation with an endocrinologist, oncologist, or neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Sandostatin LAR Depot is not recommended in the following situations:

229. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Somatostatin Analogs – Signifor LAR Prior Authorization Policy

- Signifor® LAR (pasireotide injectable suspension – Recordati Rare Diseases)

REVIEW DATE: 08/05/2020

OVERVIEW

Signifor LAR, a somatostatin analog, is indicated for the following uses:[1]

- **Acromegaly**, in patients who have had an inadequate response to surgery and/or for whom surgery is not an option. In vivo studies show that Signifor LAR lowers growth hormone and insulin-like growth factor-1 levels in patients with acromegaly.
- **Cushing's disease**, in patients for whom pituitary surgery is not an option or has not been curative.

Cushing's Syndrome/Disease

Cushing's syndrome refers to the general state of excessive levels of cortisol (hypercortisolism) in the blood.[2,3] Hypercortisolism can occur for reasons that are either endogenous or exogenous in nature (e.g., Cushing's disease, cortisol-containing medications, adrenal gland tumor, certain cancers). Endogenous Cushing's syndrome can be divided into adrenocorticotropic hormone (ACTH)-dependent and ACTH-independent, with the majority of cases being ACTH-dependent (80%). Cushing's disease (hypercortisolism caused by pituitary adenomas) is the most common type of ACTH-dependent Cushing's syndrome. Treatment for Cushing's syndrome requires a multi-modal approach. The goals of treatment are normalization of cortisol excess, long-term disease control, avoidance of recurrence, and reversal of clinical features.[4]

Guidelines

The Endocrine Society published clinical practice guidelines (2015) for the treatment of Cushing's syndrome.[5] Signifor LAR is not addressed in the guidelines. Treatment goals for Cushing's syndrome are to normalize cortisol levels or its action at the receptors to eliminate signs and symptoms of Cushing's syndrome. Best practice adjunctive management includes treating comorbidities associated with hypercortisolism (psychiatric disorders, diabetes, hypertension, hypokalemia, infections, dyslipidemia, osteoporosis, and poor physical fitness). First-line treatment involves resection of the tumor, unless surgery is not possible or is unlikely to meaningfully reduce excess glucocorticoid levels. Specifically for Cushing's disease, transsphenoidal selective adenomectomy by a surgeon with

extensive experience in pituitary surgery is recommended. In patients with ACTH-dependent Cushing's syndrome who underwent non-curative surgery or for whom surgery was not possible, the guidelines advocate several second-line therapies (e.g., repeat transsphenoidal surgery, radiotherapy, medical therapy, and bilateral adrenalectomy). For Cushing's disease, the guidelines recommend all medical therapies as second-line options after transsphenoidal surgery: steroidogenesis inhibitors (ketoconazole, Metopirone, Lysodren, etomidate) in patients either with or without radiotherapy/radiosurgery; pituitary-directed medical treatments (cabergoline, Signifor) in patients who are not surgical candidates or who have persistent disease; and Korlym in patients with diabetes or glucose intolerance who are not surgical candidates or who have persistent disease after transsphenoidal surgery.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Signifor LAR. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Signifor LAR as well as the monitoring required for adverse events and long-term efficacy, approval requires Signifor LAR to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Signifor LAR is recommended in those who meet the following criteria:

FDA-Approved Indications

3. Acromegaly. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **G)** Patient meets ONE of the following (i, ii, or iii):
  - **i.** Patient has had an inadequate response to surgery and/or radiotherapy; OR
  - **ii.** Patient is NOT an appropriate candidate for surgery and/or radiotherapy; OR
  - **iii.** Patient is experiencing negative effects due to tumor size (e.g., optic nerve compression); AND
- **H)** Patient has (or had) a pre-treatment (baseline) insulin-like growth factor-1 (IGF-1) level above the upper limit of normal based on age and gender for the reporting laboratory; AND
  Note: Pre-treatment (baseline) refers to the IGF-1 level prior to the initiation of any somatostatin analog (e.g., Mycapssa® [octreotide delayed-release capsules], an octreotide acetate injection product [e.g., Bynfezia Pen™, Sandostatin® {generics}, Sandostatin® LAR Depot], Signifor® LAR [pasireotide injection], Somatuline® Depot [lanreotide injection], dopamine agonist [e.g., cabergoline, bromocriptine], or Somavert® [pegvisomant for injection]). Reference ranges for IGF-1 vary among laboratories.
- **I)** The medication is prescribed by or in consultation with an endocrinologist.

2. Cushing's Disease. Approve for the duration noted if the patient meets the following criteria (A or B):
- **A)** Initial Therapy. Approve for 4 months of initial therapy if the patient meets the following criteria (i and ii):
  - **i.** According to the prescriber, patient is not a candidate for surgery, or surgery has not been curative; AND
    Note: For patients with Cushing's disease/syndrome awaiting surgery, see *Other Uses with Supportive Evidence.*
  - **ii.** Signifor LAR is prescribed by or in consultation with an endocrinologist or a physician who specializes in the treatment of Cushing's disease.
- **B)** Patient is Currently Receiving Signifor LAR/Signifor. Approve for 1 year of continuation therapy if the patient has responded to Signifor/Signifor LAR, as determined by the prescriber.
  Note: An example of patient response is decrease in the mean urinary free cortisol level.

Other Uses with Supportive Evidence

3. **Cushing's Disease/Syndrome – Patients Awaiting Surgery.** Approve for 4 months if Signifor LAR is prescribed by or in consultation with an endocrinologist or a physician who specialized in the treatment of Cushing's disease/syndrome.

4. **Cushing's Disease/Syndrome – Patients Awaiting Therapeutic Response After Radiotherapy.** Approve for 4 months if Signifor LAR is prescribed by or in consultation with an endocrinologist or a physician who specialized in the treatment of Cushing's disease/syndrome.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Signifor LAR is not recommended in the following situations:

230. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Somatostatin Analogs – Somatuline® Depot Prior Authorization Policy

- Somatuline Depot (lanreotide injection – Ipsen)

REVIEW DATE: 08/05/2020

OVERVIEW

Somatuline Depot, a somatostatin analog, is indicated for the following uses:[1]

- **Acromegaly**, in patients who have had an inadequate response to surgery and/or radiotherapy, or for whom surgery and/or radiotherapy, is not an option. The goal of treatment in acromegaly is to reduce growth hormone and insulin-like growth factor-1 levels to normal.
- **Carcinoid syndrome**, in adult patients.
- **Gastroenteropancreatic neuroendocrine tumors (GEP-NETs)**, in adult patients with unresectable, well or moderately differentiated, locally advanced or metastatic GEP-NETs to improve progression-free survival.

Guidelines

According to the National Comprehensive Cancer Network (NCCN) guidelines for neuroendocrine and adrenal tumors (version 1.2020 – July 10, 2020) recommend Somatuline Depot for the management of carcinoid syndrome, tumors of the gastrointestinal tract, lung, thymus (carcinoid tumors), and pancreas (including glucagonomas, gastrinomas, VIPomas, insulinomas), pheochromocytomas and paragangliomas.[2] Patients who have local

unresectable disease and/or distant metastases and clinically significant tumor burden or progression should be started on therapy with a somatostatin analog to potentially control tumor growth.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Somatuline Depot. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Somatuline Depot as well as the monitoring required for adverse events and long-term efficacy, approval requires Somatuline Depot to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Somatuline Depot is recommended in those who meet the following criteria:

FDA-Approved Indications

4. Acromegaly. Approve for 1 year if the patient meets the following criteria (A, B, and C):

- **A)** Patient meets ONE of the following (i, ii, or iii):
  - **i.** Patient has had an inadequate response to surgery and/or radiotherapy; OR
  - **ii.** Patient is NOT an appropriate candidate for surgery and/or radiotherapy; OR
  - **iii.** Patient is experiencing negative effects due to tumor size (e.g., optic nerve compression); AND
- **B)** Patient has (or had) a pre-treatment (baseline) insulin-like growth factor-1 (IGF-1) level above the upper limit of normal (ULN) based on age and gender for the reporting laboratory; AND
  Note: Pre-treatment (baseline) refers to the IGF-1 level prior to the initiation of any somatostatin analog (e.g., Mycapssa® [octreotide delayed-release capsules], an octreotide acetate injection product [e.g., Bynfezia Pen™, Sandostatin® {generics}, Sandostatin® LAR Depot], Signifor® LAR [pasireotide injection], Somatuline® Depot [lanreotide injection], dopamine agonist [e.g., cabergoline, bromocriptine], or Somavert® [pegvisomant injection]). Reference ranges for IGF-1 vary among laboratories.
- **C)** The medication is prescribed by or in consultation with an endocrinologist.

2. Neuroendocrine Tumor(s) [NETs] of the Gastrointestinal Tract, Lung, Thymus (Carcinoid Tumors), and Pancreas (including glucagonomas, gastrinomas, vasoactive intestinal peptides-secreting tumors [VIPomas], insulinomas). Approve for 1 year if the medication is prescribed by or in consultation with an oncologist, endocrinologist, or gastroenterologist.

163. Carcinoid Syndrome. Approve for 1 year if the medication is prescribed by or in consultation with an oncologist, endocrinologist, or gastroenterologist.

Other Uses with Supportive Evidence

164. Pheochromocytoma and Paraganglioma. Approve for 1 year if the medication is prescribed by or in consultation with an endocrinologist, oncologist, or neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Somatuline Depot is not recommended in the following situations:

231. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

PRIOR AUTHORIZATION POLICY

POLICY: Somavert Prior Authorization Policy
- Somavert® (pegvisomant for injection – Pfizer)

REVIEW DATE: 08/05/2020

OVERVIEW
Somavert, a growth hormone-receptor antagonist, is indicated for the treatment of acromegaly in patients who have had inadequate response to surgery and/or radiation therapy and/or other medical therapies, or for whom these therapies are not appropriate.[1] The goal of treatment is to normalize serum insulin-like growth factor-I levels.

POLICY STATEMENT
Prior Authorization is recommended for prescription benefit coverage of Somavert. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Somavert as well as the monitoring required for adverse events and long-term efficacy, approval requires Somavert to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Somavert is recommended in those who meet the following criteria:

FDA-Approved Indications

5. **Acromegaly.** Approve for 1 year if the patient meets the following criteria (A, B, and C):
   - **J)** Patient meets ONE of the following (i, ii, or iii):
     - **i.** Patient has had an inadequate response to surgery and/or radiotherapy; OR
     - **ii.** Patient is NOT an appropriate candidate for surgery and/or radiotherapy; OR
     - **iii.** Patient is experiencing negative effects due to tumor size (e.g., optic nerve compression); AND
   - **K)** Patient has (or had) a pre-treatment (baseline) insulin-like growth factor-1 (IGF-1) level above the upper limit of normal (ULN) based on age and gender for the reporting laboratory; AND
     Note: Pre-treatment (baseline) refers to the IGF-1 level prior to the initiation of any somatostatin analog (e.g., Mycapssa® [octreotide delayed-release capsules], an octreotide acetate injection product [e.g., Bynfezia Pen™, Sandostatin® {generics}, Sandostatin® LAR Depot], Signifor® LAR [pasireotide for injectable suspension], Somatuline® Depot [lanreotide subcutaneous injection]), dopamine agonist (e.g., cabergoline, bromocriptine), or Somavert® (pegvisomant for injection). Reference ranges for IGF-1 vary among laboratories.
   - **L)** The agent is prescribed by or in consultation with an endocrinologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Coverage of Somavert is not recommended in the following situations:

232. Treatment of excess growth hormone associated with McCune-Albright syndrome (MAS). Five patients with growth hormone excess due to MAS were treated with 20 mg of Somavert daily for 12 weeks in a randomized double-blind placebo-controlled trial at the National Institutes of Health.[2] Somavert reduced IGF-1 and IGF binding protein-3 (IGFBP-3) in these patients but had no effect on fibrous dysplasia.

233. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Spinal Muscular Atrophy – Evrysdi Prior Authorization Policy
- Evrysdi® (risdiplam oral solution – Genentech/Roche)

REVIEW DATE: 08/12/2020

OVERVIEW
Evrysdi, a survival motor neuron 2 (SMN2) splicing modifier, is indicated for the treatment of spinal muscular atrophy in patients 2 months of age and older.[1]

The recommended dosing is as follows:
- 0.2 mg/kg once daily (QD) for patients 2 months to < 2 years of age
- 0.25 mg/kg QD for patients ≥ 2 years of age and < 20 kg
- 5 mg for patients ≥ 2 years of age and ≥ 20 kg

Disease Overview
Spinal muscular atrophy is a genetic, autosomal recessive muscular disorder caused by deletion or loss of function mutation in the survival motor neuron 1 (SMN1) gene.[2-5] The reduced levels of survival motor neuron (SMN) protein causes degeneration of lower motor neurons.[5] Although the condition is a multisystem disorder, it is clinically characterized by progressive muscle weakness and atrophy. Patients have difficulties with ambulation, head control, feeding and respiration. Cognitive development is not impacted. In the US, spinal muscular atrophy affects approximately one in 11,000 infants and has an average carrier frequency of one in 54 individuals; as many as 10,000 to 20,000 children and adults in the US may be impacted.[5] Although the condition can be present in individuals of any age, it is more frequently diagnosed in infants and children, as it is more severe in this population.[2-5] The phenotypic expression of the disease is impacted by the presence of the SMN2 gene copy number. SMN1 is responsible for producing most of the effective SMN protein, although some SMN protein can be made by the SMN2 gene. Therefore, patients with a deletion of the SMN1 gene may have the potential for making some SMN protein through the SMN2 gene copy, although in most cases the resulting protein made by this gene is truncated and is not as effective or functional. Data have shown that patients with a higher number of SMN2 copies generally have a more mild phenotypic disease expression. Gene deletion testing for spinal muscular atrophy can be performed at many diagnostic laboratories. Table 1 describes disease types. A different manner of categorization classifies the main

three most common types as follows: Type 1 patients are "non-sitters", Type 2 patients are "sitters", and Type 3 patients are "walkers".[3,5]

Table 1. Types of Spinal Muscular Atrophy.[2-5]

SMA Type	Age at Onset	Features/Clinical Presentation	Lifespan	SMN2 Copy Gene Number
0	Prenatal	Severe hypotonia and weakness; respiratory failure at birth. There is no achievement of motor milestones.	A few weeks to < 6 months	0 to 1
1	< 6 months	Poor muscle tone, lack of movement, and respiratory assistance needed at birth. Patients are never able to sit.	< 2 years	1 to 2
2	Before 18 months	Patients are able to sit. However, patients are unable to walk or stand without assistance.	75% of patients are alive at 25 years of age	2 to 3
3	> 18 months	Walks independently but may lose this ability as the disease progresses.	Normal	3 to 4
4	Adulthood	Walk until adulthood.	Normal lifespan	≥ 4

SMA – Spinal muscular atrophy; SMN2 – Survival motor neuron 2.

Besides Evrysdi, other therapies are available. **Spinraza®** (nusinersen injection for intrathecal use), a SMN2-directed antisense oligonucleotide, is indicated for the treatment of spinal muscular atrophy in pediatric and adult patients.[6] Spinraza is given by intrathecal injection. Although studies and experience continue, the primary pivotal data include infantile-onset (Type 1) and later-onset (Type 2 and Type 3) spinal muscular atrophy primarily in children. Trials are evolving with Spinraza in adults. Data are also available in presymptomatic infants who were genetically diagnosed with spinal muscular atrophy.

Zolgensma® (onasemnogene abeparvovec-xioi suspension for intravenous infusion), an adeno-associated virus vector-based gene therapy, is indicated for the treatment of pediatric patients < 2 years of age with spinal muscular atrophy with bi-allelic mutations in the SMN1 gene.[7] The agent works by providing a copy of the gene encoding the SMN protein, which increases its production. Zolgensma is administered as a single-dose intravenous infusion over 60 minutes. Pivotal studies mainly involve infants with two or three SMN2 gene copies with primarily Type 1 or Type 2 disease.

Clinical Efficacy

The efficacy of Evrysdi for the treatment of patients with infantile-onset (Type 1) and later-onset (Type 2 and 3) spinal muscular atrophy is being evaluated in two ongoing pivotal clinical trials.[1] **FIREFISH** is an open-label, two-part study designed to investigate the efficacy, safety, pharmacokinetics, and pharmacodynamics of Evrysdi in patients with Type 1 spinal muscular atrophy who had symptom onset between 28 days and 3 months of age. Genetic confirmation of homozygous deletion or compound heterozygosity predictive or loss of function of the SMN1 gene was required for trial entry. Patients had two SMN2 gene copies. In Part 1 of the trial, the median age at enrollment was 6.7 months. For this population, of the patients who received the recommended dosage of Evrysdi (0.2 mg/kg QD) [n = 17], many patients gained improvements in the ability to sit for at least 5 seconds independently, as well as in the percentages of patients who were alive without permanent ventilation. **SUNFISH** is a two-part, multicenter trial assessing the efficacy, safety, pharmacokinetics, and pharmacodynamics of Evrysdi in patients with later-onset (Type 2 or Type 3) spinal muscular atrophy. Most patients (90.2%) had three SMN2 gene copies; 7.8% and 2.0% of patients had four and two SMN2 gene copies, respectively. Part 2 of the study involved 180 nonambulatory patients who were randomized to receive Evrysdi at the FDA-approved dose or placebo. Benefits were noted at Month 12 in motor function as well as in upper limb motor performance. Of note, in general, the onset of effect with Evrysdi was observed after approximately 4 months of therapy.

Guidelines

Evrysdi is not addressed in guidelines. The Spinal Muscular Atrophy Newborn Screening Multidisciplinary Working Group is comprised of clinicians and geneticists with expertise in spinal muscular atrophy who developed a treatment algorithm in 2018 for infants who have positive results from a newborn screening test for spinal muscular atrophy.[8] Spinal muscular atrophy Types 1 and 2 comprise a large majority of cases and account for many patients who screen positively for spinal muscular atrophy with three or fewer SMN2 gene copies. Immediate treatment is recommended in patients with two or three SMN2 gene copies. Treatment recommendations for patients who screen positive for spinal muscular atrophy and have only one SMN2 gene copy is more complicated. It is likely that patients with only one SMN2 gene copy will likely be symptomatic at birth and the physician should determine if treatment is warranted.[8] In 2020, the Working Group updated recommendations that infants diagnosed with spinal muscular atrophy via newborn screening with four SMN2 gene copies should receive immediate treatment.[9] Also, patients with five (or more) SMN2 gene copies should observed and screened for symptoms.

Safety

Based on animal data, Evrysdi may cause fetal harm if given to a pregnant women.[1] Pregnancy testing is recommended for females of reproductive potential prior to initiating Evrysdi. Advise females of reproductive potential to use effective contraception during treatment with Evrysdi and for at least 1 month after the last dose. Because the efficacy and safety of Evrysdi in patients with hepatic impairment have not been studied, avoid use of this agent in patients with impaired hepatic function.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Evrysdi. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Evrysdi as well as the monitoring required for adverse events and long-term efficacy, approval requires Evrysdi to be prescribed by or in consultation with a physician who specializes in the condition being treated. For certain criteria, verification is required as noted by **[verification required by prescriber]**. All reviews will be forwarded to the Medical Director for evaluation.

Automation: None.

Documentation: Documentation is required for use of Evrysdi as noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes, laboratory tests, claims records, and/or other information.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Evrysdi is recommended in those who meet the following criteria:

FDA-Approved Indications

251. Spinal Muscular Atrophy – Treatment. Approve if the patient meets ONE of the following criteria (A or B):

- **A)** Initial Therapy. Approve for 4 months if the patient meets all of the following criteria (i, ii, iii, iv, v, vi, vii, viii, and ix):
  - **i.** Patient is ≥ 2 months to ≤ 25 years of age; AND
  - **ii.** Patient has had a genetic test confirming the diagnosis of spinal muscular atrophy with bi-allelic mutations in the survival motor neuron 1 (SMN1) gene reported as at least one of the following: homozygous deletion, homozygous mutation, or compound heterozygous mutation **[documentation required]**; AND
  - **iii.** Patient meets both of the following (a and b):

a) Patient has two to four survival motor neuron 2 (SMN2) gene copies **[documentation required]**; AND
b) According to the prescriber, the patient has objective signs consistent with spinal muscular atrophy Types 1, 2, or 3 **[documentation required]**; AND

iv. For patients who have received prior treatment with Spinraza® (nusinersen injection for intrathecal use), the prescriber attests that further therapy with Spinraza will be discontinued; AND

v. Patient has not received Zolgensma® (onasemnogene abeparvovec-xioi suspension for intravenous infusion) in the past **[verification required by prescriber]**; AND
Note: Verify through claims history that the patient has NOT previously received Zolgensma AND, if no claim for Zolgensma is present, the prescriber must attest that the patient has not previously received Zolgensma.

vi. Females of current reproductive potential must have the prescriber confirm BOTH of the following (a and b):
a) Patient is not currently pregnant; AND
b) Effective contraception will be utilized during treatment and for 1 month after the last Evrysdi dose; AND

vii. According to the prescriber, the patient does not have evidence of hepatic impairment; AND

viii. Dosing of Evrysdi meets ONE of the following based on the current (within the past 1 month) kg weight (a, b, or c):
a) 0.2 mg/kg once daily if the patient is 2 months to < 2 years of age; OR
b) 0.25 mg/kg once daily for patients ≥ 2 years of age who weigh < 20 kg; OR
c) 5 mg once daily for patients ≥ 2 years of age who weigh ≥ 20 kg; AND

ix. Medication is prescribed by or in consultation with a physician who specializes in the management of patients with spinal muscular atrophy and/or neuromuscular disorders; OR

B) Patient is Currently Receiving Evrysdi. Approve for 4 months if the patient meets all of the following criteria (i, ii, iii, iv, v, vi, vii, viii, ix, and x):

i. Patient is ≥ 2 months to ≤ 25 years of age; AND

ii. Patient has had a genetic test confirming the diagnosis of spinal muscular atrophy with bi-allelic mutations in the survival motor neuron 1 (SMN1) gene reported as at least one of the following: homozygous deletion, homozygous mutation, or compound heterozygous mutation **[documentation required]**; AND

iii. Patient meets BOTH of the following (a and b):
a) Patient has two to four survival motor neuron 2 (SMN2) gene copies **[documentation required]**; AND
b) According to the prescriber, the patient has objective signs consistent with spinal muscular atrophy Types 1, 2, or 3 **[documentation required]**; AND

iv. For patients who have received prior treatment with Spinraza® (nusinersen injection for intrathecal use), the prescriber attests that further therapy with Spinraza will be discontinued; AND

v. Patient has NOT received Zolgensma® (onasemnogene abeparvovec-xioi suspension for intravenous infusion) in the past **[verification required by the prescriber]**; AND
Note: Verify through claims history that the patient has NOT previously received Zolgensma AND, if no claim for Zolgensma is present, the prescriber must attest that the patient has not previously received Zolgensma.

vi. Females of current reproductive potential must have the prescriber confirm BOTH of the following (a and b):
a) Patient is not currently pregnant; AND

b) Effective contraception will be utilized during treatment and for 1 month after the last Evrysdi dose; AND

vii. According to the prescriber, the patient does not have evidence of hepatic impairment; AND

viii. Dosing of Evrysdi meets ONE of the following based on the current (within the past 1 month) kg weight (a, b, or c):

a) 0.2 mg/kg if the patient is 2 months to < 2 years of age; OR

b) 0.25 mg/kg for patients ≥ 2 years of age who weigh < 20 kg; OR

c) 5 mg for patients ≥ 2 years of age who weigh ≥ 20 kg; AND

ix. Medication is prescribed by or in consultation with a physician who specializes in the management of patients with spinal muscular atrophy and/or neuromuscular disorders; AND

x. According to the prescriber, the patient has responded to Evrysdi or continues to have benefit from ongoing Evrysdi therapy by an objective measurement and/or assessment tool **[documentation required]**.

Note: Examples of improvement, achievement, and/or maintenance in motor milestones should be demonstrated and can be evaluated by tests such as the Bayley Scales of Infant and Toddler Development, Third Edition (BSID-III) [Item 22], Motor Function Measure-32 Items (MFM-32), Hammersmith Infant Neurologic Exam (HINE) [section 2], Hammersmith Functional Motor Scale Expanded (HFMSE), Children's Hospital of Philadelphia Test of Neuromuscular Disorders (CHOP-INTEND), as well as other physician monitoring tools (pulmonary function tests showing improvement, bulbar function results, reduced need for respiratory support, and/or prevention of permanent assisted ventilation).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Evrysdi is not recommended in the following situations:

234. Patient has Complete Paralysis of All Limbs. Data are needed to determine if this patient population with advanced spinal muscular atrophy would derive benefits from Evrysdi.

235. Patient has Permanent Ventilator Dependence. Data are needed to determine if this patient population with advanced spinal muscular atrophy would derive benefits from Evrysdi.

236. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Spinal Muscular Atrophy – Spinraza Prior Authorization Policy
- Spinraza® (nusinersen injection for intrathecal use – Biogen)

REVIEW DATE: 6/03/2020; selected revision 08/12/2020

OVERVIEW

Spinraza, a survival motor neuron 2 (SMN2)-directed antisense oligonucleotide, is indicated for the treatment of spinal muscular atrophy in pediatric and adult patients.[1]

Disease Overview

Spinal muscular atrophy is a genetic, autosomal recessive muscular disorder caused by deletion or loss of function mutation in the survival motor neuron 1 (SMN1) gene.[2-5] The reduced levels of survival motor neuron (SMN) protein causes degeneration of lower motor neurons.[5] Although the condition is a multisystem disorder, it is clinically characterized by progressive muscle weakness and atrophy. Patients have difficulties with ambulation, head control, feeding, and respiration. Cognitive development is not impacted. In the US, spinal muscular atrophy affects approximately one in 11,000 infants and has an average carrier frequency of one in 54 individuals; as many as 10,000 to 20,000 children and adults in the US may be impacted.[5] Although the condition can be present in individuals of any age, it is more frequently diagnosed in infants and children, as it is more severe in this population.[2-5] The phenotypic expression of the disease is impacted by the presence of the SMN2 gene copy number. SMN1 is responsible for producing most of the effective SMN protein, although some SMN protein can be made by the SMN2 gene. Therefore, patients with a deletion of the SMN1 gene may have the potential for making some SMN protein through the SMN2 gene copy, although in most cases the resulting protein made by this gene is truncated and is not as effective or functional. Data have shown that patients with a higher number of SMN2 copies generally have a more mild phenotypic disease expression. Gene deletion testing for spinal muscular atrophy can be performed at many diagnostic laboratories. Table 1 describes disease types. A different manner of categorization classifies the main three most common types as follows: Type 1 patients are "non-sitters", Type 2 patients are "sitters", and Type 3 patients are "walkers".[3,5]

Table 1. Types of Spinal Muscular Atrophy.[2-5]

SMA Type	Age at Onset	Features/Clinical Presentation	Lifespan	SMN2 Copy Gene Number
0	Prenatal	Severe hypotonia and weakness; respiratory failure at birth. There is no achievement of motor milestones.	A few weeks to < 6 months	0 to 1
1	< 6 months	Poor muscle tone, lack of movement, and respiratory assistance needed at birth. Patients are never able to sit.	< 2 years	1 to 2
2	Before 18 months	Patients are able to sit. However, patients are unable to walk or stand without assistance.	75% of patients are alive at 25 years of age	2 to 3
3	> 18 months	Walks independently but may lose this ability as the disease progresses.	Normal	3 to 4
4	Adulthood	Walk until adulthood.	Normal lifespan	≥ 4

SMA – Spinal muscular atrophy; SMN2 – Survival motor neuron 2.

Besides Spinraza, other therapies are available. **Evrysdi®** (risdiplam oral solution), a SMN2 splicing modifier, is indicated for the treatment of spinal muscular atrophy in patients 2 months of age and older.[6] The primary pivotal data include infantile-onset (Type 1) and later-onset (Type 2 and Type 3) spinal muscular atrophy primarily in children and adults up to 25 years of age. Trials are ongoing in older adults, as well as in presymptomatic infants who were genetically diagnosed with spinal muscular atrophy.

Zolgensma® (onasemnogene abeparvovec-xioi suspension for intravenous infusion), an adeno-associated virus vector-based gene therapy, is indicated for the treatment of pediatric patients < 2 years of age with spinal muscular atrophy with bi-allelic mutations in the SMN1 gene.[7] The agent works by providing a copy of the gene encoding the SMN protein, which increases its production. Zolgensma is administered as a single-dose intravenous infusion over 60 minutes. Pivotal studies mainly involve infants with two or three SMN2 gene copies with primarily Type 1 or Type 2 disease.

Clinical Efficacy

Spinraza was investigated in a pivotal trial called ENDEAR, which was a Phase III, multicenter, multinational, randomized, double-blind, sham-procedure controlled study involving 121 symptomatic infants diagnosed with infantile-onset spinal muscular atrophy (Type I).[1,8] Patients were randomized 2:1 to receive either Spinraza (n = 80) or sham injection (n = 41).[1] Eligible patients were ≤ 7 months of age at the time of the first dose and diagnosed with spinal muscular atrophy with a symptom onset prior to 6 months of age. A planned interim efficacy analysis was performed based on patients who died, withdrew, or completed at least 183 days of treatment. Baseline demographics were balanced between the Spinraza and control groups with the exception of age at first treatment (median age of 175 and 206 days, respectively).[1] At baseline, all infants were symptomatic, hypotonic and weak, which are features consistent with a phenotype that is most likely to be categorized as spinal muscular atrophy Type 1.[8] Patients had two SMN2 gene copies. The median time of treatment was 261 days (range 6 to 442 days).[1] Those who received Spinraza compared with sham-control experienced improvement on achieving motor milestone responses. Outcomes assessing survival also revealed improvements for patients receiving Spinraza vs. sham control.

CHERISH was a multicenter, double-blind, sham-controlled, Phase III trial which involved children with symptomatic later-onset spinal muscular atrophy who were 2 to 12 years of age (n = 126) with likely Type 2 or 3 disease (symptom onset after 6 months of age).[1,9] Patients were randomized (2:1) to receive Spinraza or sham injection. Patients had genetically-confirmed 5q spinal muscular atrophy.[9] Three SMN2 gene copies were reported among 88% of patients; approximately 8% of patients had two SMN2 gene copies. The median age at screening was 4 years and 3 years in the Spinraza and sham procedure control groups, respectively.[1,9] Patients who received Spinraza experienced more improvement in motor milestones compared with sham control.

NURTURE was an open-label uncontrolled trial involving patients with presymptomatic spinal muscular atrophy who ranged in age from 3 days to 42 days at the time of the first dose (n = 25).[1,10] For study inclusion, patients were required to have two or three SMN2 gene copies.[10] Some patients who were given Spinraza prior to the onset of symptoms related to spinal muscular atrophy survived without requiring permanent ventilation beyond what would be anticipated based on their SMN2 copy number. Also, some patients also met age-appropriate growth and development motor milestones (e.g., ability to sit unassisted, stand, or walk). Data are available from almost a median of 3-year follow-up.

Other data with Spinraza are also available and data are accumulating in adults.[11-18] Follow-up is available for up to 4 years. Patients experienced a reversal of decline, achieved milestones, and experienced additional improvement in scales assessing motor function.

Dosing

Spinraza is given intrathecally by, or under the direction of, healthcare professionals experienced in performing lumbar punctures.[1] The recommended dosage is 12 mg (5 mL) per administration. Initiate Spinraza treatment with four loading doses. The first three loading doses should be administered at 14-day intervals. The fourth loading dose should be given 30 days after the third dose. A maintenance dose should be given once every 4 months thereafter. The safety and effectiveness of Spinraza in pediatric patients from newborn to 17 years of age have been established.

Guidelines

The Spinal Muscular Atrophy Newborn Screening Multidisciplinary Working Group is comprised of clinicians and geneticists with expertise in spinal muscular atrophy who developed a treatment algorithm in 2018 for infants who have positive results from a newborn screening test for spinal muscular atrophy.[19] Spinal muscular atrophy Types 1 and 2 comprise a large majority of cases and account for many patients who screen positively for spinal muscular atrophy with three or fewer SMN2 gene copies. Immediate treatment is recommended in patients with two or three SMN2 gene copies. Treatment recommendations for patients who screen positive for spinal muscular atrophy and have only one SMN2 gene copy is more complicated. It is likely that patients with only one SMN2 gene copy will likely be symptomatic at birth and the physician should determine if treatment is warranted.[19] In 2020, the Working Group updated recommendations that infants diagnosed with spinal muscular atrophy via newborn screening with four SMN2 gene copies should receive immediate treatment.[20] Also, patients with five (or more) SMN2 gene copies should be observed and screened for symptoms.

Safety

Spinraza has Warnings/Precautions regarding thrombocytopenia and coagulation abnormalities, as well as renal toxicity. Due to the increased risk of bleeding complications and renal toxicity, testing is required at baseline and prior to each dose. The following laboratory tests should be performed at baseline and prior to each Spinraza dose, and as clinically needed: platelet count; prothrombin time; activated partial thromboplastin time; and quantitative spot urine protein testing.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Spinraza. Due to the specialized skills required for evaluation and diagnosis of patients treated with Spinraza, as well as the monitoring required for AEs and long-term efficacy, approval requires Spinraza to be prescribed by or in consultation with a physician who specializes in the condition being treated. Approvals are provided for the durations noted below. All reviews will be forwarded to the Medical Director for evaluation.

Documentation: Documentation is required where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes and/or laboratory data. Subsequent coverage reviews for a patient who has previously met the documentation requirements and related criteria in the *Spinal Muscular Atrophy – Spinraza Prior Authorization Policy* through the Coverage Review Department, and who is requesting reauthorization, the criteria utilized do NOT require resubmission of documentation for reauthorization. For certain criteria, verification is required as noted by **[verification required by prescriber]**. All reviews will be forwarded to the Medical Director for evaluation.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Spinraza is recommended in those who meet the following criteria:

FDA-Approved Indication

165. Spinal Muscular Atrophy – Treatment. Approve for the duration noted if the patient meets ONE of the following (A or B):

D) Initial Therapy. Approve for 3 months if the patient meets all of the following criteria (i, ii, iii, iv, v, and vi):

i. Patient has had a genetic test confirming the diagnosis of spinal muscular atrophy with bi-allelic mutations in the survival motor neuron 1 (SMN1) gene reported as at least one of the following: homozygous deletion, homozygous mutation, or compound heterozygous mutation **[documentation required]**; AND

ii. Patient meets both of the following (a and b):

a) Patient has two to four survival motor neuron 2 (SMN2) gene copies **[documentation required]**; AND

b) According to the prescriber, the patient has objective signs consistent with spinal muscular atrophy Types 1, 2, or 3 **[documentation required]**; AND

iii. For patients who have received prior treatment with Evrysdi® (risdiplam oral solution), the prescriber attests that further therapy with Evrysdi will be discontinued; AND

iv. Patient has not received Zolgensma® (onasemnogene abeparvovec-xioi suspension for intravenous infusion) in the past **[verification required by prescriber]**; AND
Note: Verify through claims history that the patient has not previously received Zolgensma AND, if no claim for Zolgensma is present, the prescriber must attest that the patient has not previously received Zolgensma.

v. The following laboratory tests will be evaluated prior to the administration of Spinraza (a, b, and c):

a) Prothrombin time and/or activated partial thromboplastin time; AND

b) Platelet count; AND

c) Quantitative spot urine protein testing; AND

vi. Medication is prescribed by or in consultation with a physician who specializes in the management of patients with spinal muscular atrophy and/or neuromuscular disorders; OR

E) Patients Currently Receiving Spinraza Therapy. Approve one dose (for a dose to be used once within the next 4 months as maintenance therapy) if the patient meets all of the following criteria (i, ii, iii, iv, v, vi, and vii):

i. Patient has had a genetic test confirming the diagnosis of spinal muscular atrophy with bi-allelic mutations in the survival motor neuron 1 (SMN1) gene reported as at least one of the following: homozygous deletion, homozygous mutation, or compound heterozygous mutation **[documentation required]**; AND

ii. Patient meets both of the following (a and b):

a) Patient has two to four survival motor neuron 2 (SMN2) gene copies **[documentation required]**; AND

b) According to the prescriber, the patient has objective signs consistent with spinal muscular atrophy Types 1, 2, or 3 **[documentation required]**; AND
Note: If the patient is currently receiving Spinraza that was approved through a request from the coverage review department, an exception to the requirement of SMN2 gene copy information may be granted if, according to the prescriber, the patient has objective signs consistent with spinal muscular atrophy Types 1, 2, or 3.

iii. For patients who have received prior treatment with Evrysdi® (risdiplam oral solution), the prescriber attests that further therapy with Evrysdi will be discontinued; AND

iv. Patient has not received Zolgensma® (onasemnogene abeparvovec-xioi suspension for intravenous infusion) in the past **[verification required by prescriber]**; AND
Note: Verify through claims history that the patient has not previously received Zolgensma AND, if no claim for Zolgensma is present, the prescriber must attest that the patient has not previously received Zolgensma.

v. The following laboratory tests will be evaluated prior to administration of Spinraza (a, b, and c):
- **a)** Prothrombin time and/or activated partial thromboplastin time; AND
- **b)** Platelet count; AND
- **c)** Quantitative spot urine protein testing; AND

vi. Medication is prescribed by or in consultation with a physician who specializes in the management of patients with spinal muscular atrophy and/or neuromuscular disorders; AND

vii. According to the prescriber, the patient has responded to Spinraza or continues to have benefit from ongoing Spinraza therapy by an objective measurement and/or assessment tool **[documentation required]**.
Note: Examples of improvement, achievement, and/or maintenance in motor milestones should be demonstrated and can be evaluated by tests such as the Bayley Scales of Infant and Toddler Development, Third Edition (BSID-III) [Item 22], Motor Function Measure-32 Items (MSM-32), Hammersmith Infant Neurologic Exam (HINE) [section 2], Hammersmith Functional Motor Scale Expanded (HFMSE), Children's Hospital of Philadelphia Test of Neuromuscular Disorders (CHOP-INTEND) as well as other physician monitoring tools (pulmonary function tests showing improvement, bulbar function tests, reduced need for respiratory support, and/or prevention of permanent assisted ventilation).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Spinraza is not recommended in the following situations:

237. Patient has Complete Paralysis of All Limbs. Data are needed to determine if this patient population would derive benefits from Spinraza.

238. Patient has Permanent Ventilator Dependence. Data are needed to determine if this patient population would derive benefits from Spinraza.

239. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Spinal Muscular Atrophy – Zolgensma® (onasemnogene abeparvovec-xioi suspension for intravenous infusion – AveXis)

REVIEW DATE: 06/03/2020; selected revision 08/12/2020

OVERVIEW

Zolgensma, an adeno-associated virus vector-based gene therapy, is indicated for the treatment of pediatric patients less than 2 years of age with spinal muscular atrophy with bi-allelic mutations in the survival motor neuron 1 (SMN1) gene.[1]

Limitations of use are that the safety and effectiveness of repeat administration of Zolgensma have not been evaluated.[1] The use of Zolgensma in patients with advanced spinal muscular atrophy (e.g., complete paralysis of limbs, permanent ventilator dependence) has not been assessed. Use of Zolgensma in premature neonates before reaching full-term gestational age is not recommended because concomitant treatment with corticosteroids may adversely affect neurological development. Zolgensma therapy should be delayed until full-term gestational age is achieved.[1] The definition of full-term pregnancy commences at 39 weeks and 0 days gestation.[2]

Disease Overview

Spinal muscular atrophy is a genetic, autosomal recessive muscular disorder caused by deletion or loss of function mutation in the SMN1 gene.[3-6] The reduced levels of survival motor neuron (SMN) protein causes degeneration of

lower motor neurons.[6] Although the condition is a multisystem disorder, it is clinically characterized by progressive muscle weakness and atrophy. Patients have difficulties with ambulation, head control, feeding and respiration. Cognitive development is not impacted. In the US, spinal muscular atrophy affects approximately one in 11,000 infants and has an average carrier frequency of one in 54 individuals; as many as 10,000 to 20,000 children and adults in the US may be impacted.[6] Although the condition can be present in individuals of any age, it is more frequently diagnosed in infants and children, as it is more severe in this population.[3-6] The phenotypic expression of the disease is impacted by the presence of the SMN2 gene copy number. SMN1 is responsible for producing most of the effective SMN protein, although some SMN protein can be made by the SMN2 gene. Therefore, patients with a deletion of the SMN1 gene may have the potential for making some SMN protein through the survival motor neuron 2 (SMN2) gene copy, although in most cases the resulting protein made by this gene is truncated and is not as effective or functional. Data have shown that patients with a higher number of SMN2 gene copies generally have a more mild phenotypic disease expression. Gene deletion testing for spinal muscular atrophy can be performed at many diagnostic laboratories. Table 1 describes disease types. A different manner of categorization classifies the main three most common types as follows: Type 1 patients are "non-sitters", Type 2 patients are "sitters", and Type 3 patients are "walkers".[4,6]

Table 1. Types of Spinal Muscular Atrophy.[3-6]

SMA Type	Age at Onset	Features/Clinical Presentation	Lifespan	SMN2 Copy Gene Number
0	Prenatal	Severe hypotonia and weakness; respiratory failure at birth. There is no achievement of motor milestones.	A few weeks to < 6 months	0 to 1
1	< 6 months	Poor muscle tone, lack of movement, and respiratory assistance needed at birth. Patients are never able to sit.	< 2 years	1 to 2

Table 1 (continued). Types of Spinal Muscular Atrophy.[2-5]

SMA Type	Age at Onset	Features/Clinical Presentation	Lifespan	SMN2 Copy Gene Number
2	Before 18 months	Patients are able to sit. However, patients are unable to walk or stand without assistance.	75% of patients are alive at 25 years of age	2 to 3
3	> 18 months	Walks independently but may lose this ability as the disease progresses.	Normal	3 to 4
4	Adulthood	Walk until adulthood.	Normal lifespan	≥ 4

SMA – Spinal muscular atrophy; SMN2 – Survival motor neuron 2.

Besides Zolgensma, other therapies are available. **Spinraza®** (nusinersen injection for intrathecal use), a SMN2-directed antisense oligonucleotide, is indicated for the treatment of spinal muscular atrophy in pediatric and adult patients.[7] Spinraza is given by intrathecal injection. Although studies and experience continue, the primary pivotal data include infantile-onset (Type 1) and later-onset (Type 2 and Type 3) spinal muscular atrophy primarily in children. Trials are evolving with Spinraza in adults. Data are also available in presymptomatic infants who were genetically diagnosed with spinal muscular atrophy.

Evrysdi® (risdiplam oral solution), a SMN2 splicing modifier, is indicated for the treatment of spinal muscular atrophy in patients 2 months of age and older.[8] The primary pivotal data include infantile-onset (Type 1) and later-onset (Type 2 and Type 3) spinal muscular atrophy primarily in children and adults up to 25 years of age. Trials are ongoing in older adults, as well as in presymptomatic infants who were genetically diagnosed with spinal muscular atrophy.

Clinical Efficacy

The efficacy of Zolgensma was established in patients less than 2 years of age with spinal muscular atrophy who had bi-allelic mutations in the SMN1 gene.[1,9] One trial was an open-label, single-arm study which is ongoing and the other was an open-label, single-arm, ascending-dose clinical trial.[1] Symptoms onset occurred before patients were 6 months of age. All patients had genetically confirmed bi-allelic SMN1 gene deletions and two SMN2 gene copies. In both trials, Zolgensma was given as a single-dose intravenous infusion. Efficacy was assessed on parameters such as survival and achievement of developmental motor milestones (e.g., sitting without support). The definition of

survival was at the time from birth to either death or permanent ventilation. Other efficacy parameters were evaluated (e.g., assessment of Children's Hospital of Philadelphia Infant Test of Neuromuscular Disorders [CHOP-INTEND] scores, evaluation of ventilator use). The ongoing clinical trial involved 21 patients with infantile-onset spinal muscular atrophy. The mean CHOP-INTEND score was 31.0 (range, 18 to 47). The mean patient age at the time of treatment was 3.9 months (range, 0.5 to 5.9 months). As of the March 2019 cutoff date, 19 patients were alive without permanent ventilation. Compared with natural history data Zolgensma is effective as more patients attained the ability to sit without support.[1] The completed clinical trial involved 15 patients with infantile-onset spinal muscular atrophy.[1,9] Three patients were in a low-dose cohort and 12 patients were in a high-dose cohort.[1] At the time of treatment, the mean age of patients in the low-dose cohort was 6.3 months (range, 5.9 to 7.2 months) and 3.4 months (range, 0.9 to 7.9 months) in the high-dose group. The dose in the low-dose cohort was approximately one-third of the dosage received by patients in the high-dose cohort. At 24 months following Zolgensma infusion, one patient in the low-dose cohort met the endpoint of permanent ventilation; all 12 patients in the high-dose cohort were alive without permanent ventilation. In the high-dose cohort, 9 of 12 patients (75%) were able to stand and walk without assistance.[1,9] Additional data supports benefits in patients in the high-dose cohort.[10-12]

Guidelines

The Spinal Muscular Atrophy Newborn Screening Multidisciplinary Working Group is comprised of clinicians and geneticists with expertise in spinal muscular atrophy who developed a treatment algorithm in 2018 for infants who have positive results from a newborn screening test for spinal muscular atrophy.[13] Spinal muscular atrophy Types 1 and 2 comprise a large majority of cases and account for many patients who screen positively for spinal muscular atrophy with three or fewer SMN2 gene copies. Immediate treatment is recommended in patients with two or three SMN2 gene copies. Treatment recommendations for patients who screen positive for spinal muscular atrophy and have only one SMN2 gene copy is more complicated. It is likely that patients with only one SMN2 gene copy will likely be symptomatic at birth and the physician should determine if treatment is warranted.[13] In 2020, the Working Group updated recommendations that infants diagnosed with spinal muscular atrophy via newborn screening with four SMN2 gene copies should receive immediate treatment.[14] Also, patients with five (or more) SMN2 gene copies should be observed and screened for symptoms.

Dosing

The recommended dose of Zolgensma is 1.1 x 10^{14} vector genomes (vg) per kg of body weight.[1] Administer Zolgensma as an intravenous infusion over 60 minutes. Starting 1 day prior to Zolgensma infusion, give systemic corticosteroids equivalent to oral prednisolone 1 mg/kg of body weight for a total of 30 days. Examine liver function after this juncture and follow recommended guidelines.

Safety

Zolgensma has a Boxed Warning regarding acute serious liver injury.[1] Elevated aminotransferases can occur with Zolgensma. Patients with preexisting liver impairment may be at higher risk. Prior to infusion, evaluate liver function in all patients by clinical examination and laboratory testing. One day before Zolgensma infusion, commence administration of systemic corticosteroids equivalent to oral prednisolone at 1 mg per kg of body weight per day for a total of 30 days. Transient decreases in platelet counts may occur. Therefore, measure platelet counts prior to the infusion, weekly for the first month, and then once every other week for the second and third month until platelet counts return to baseline. Also, temporary increases in cardiac troponin-I levels were noted with Zolgensma administration. Therefore, assess troponin-I prior to the infusion, as well as weekly for the first month and then monthly for the second and third until troponin-I level returns to baseline. Perform baseline anti-AAV9 antibody testing prior to Zolgensma infusion. Patients in the Zolgensma trials were required to have baseline anti-AAV9 antibody titers of $\leq$ 1:50.

POLICY STATEMENT

Prior authorization is recommended for benefit coverage of Zolgensma. Approval is recommended for those who meet the Criteria for the listed indication(s). Because of the of the specialized skills required for evaluation and diagnosis of patients treated with Zolgensma as well as the specialized training required for administration of Zolgensma, approval requires Zolgensma to be prescribed by or in consultation with a physician who specializes in

the condition being treated. All approvals are provided for one dose per lifetime. All reviews (approvals and denials) will be forwarded to the Medical Director for evaluation. For certain criteria, verification is required as noted by **[verification required by prescriber]**.

Documentation: Documentation is required where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to chart notes and/or laboratory data.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zolgensma is recommended in those who meet the following criteria:

FDA-Approved Indication

52. Spinal Muscular Atrophy – Treatment. Approve for a one-time per lifetime dose if the patient meets the following criteria (A, B, C, D, E, F, G, H, I, J, K, and L):

- **A)** Patient is less than 2 years of age; AND
- **B)** If the patient is a premature neonate, full-term gestational age of 39 weeks and 0 days has been met; AND
- **C)** Patient has had a genetic test confirming the diagnosis of spinal muscular atrophy with bi-allelic mutations in the survival motor neuron 1 (SMN1) gene reported as at least one of the following: homozygous deletion, homozygous mutation, or compound heterozygous mutation **[documentation required]**; AND
- **D)** Patient has three or fewer survival motor neuron 2 (SMN2) gene copies **[documentation required]**; AND
- **E)** Patient has started or will receive systemic corticosteroids equivalent to oral prednisolone at a dose of 1 mg/kg per day commencing 1 day prior to Zolgensma infusion and for a total of 30 days; AND
- **F)** Baseline anti-AAV9 antibody titers are ≤ 1:50; AND
- **G)** The following laboratory tests will be evaluated prior to administration of Zolgensma (i, ii, and iii):
  - **i.** Baseline liver function testing (e.g., aspartate aminotransferase, alanine aminotransferase, total bilirubin, prothrombin time); AND
  - **ii.** Platelet count; AND
  - **iii.** Troponin-I levels; AND
- **H)** The patient has not received Zolgensma in the past **[verification required by prescriber]**; AND
  Note: Verify through claims history that the patient has not previously received Zolgensma AND, if no claim for Zolgensma is present, the prescriber must attest that the patient has not previously received Zolgensma.
- **I)** For patients who have received prior treatment with Spinraza® (nusinersen injection for intrathecal use), the prescriber attests that further therapy with Spinraza will be discontinued; AND
- **J)** For patients who have received prior treatment with Evrysdi® (risdiplam oral solution), the prescriber attests that further therapy with Evrysdi will be discontinued; AND
- **K)** Medication is prescribed by or in consultation with a physician who specializes in the management of patients with spinal muscular atrophy and/or neuromuscular disorders; AND
- **L)** If criteria A through K are met, approve one dose (kit) of Zolgensma based on the current weight in kg (within the past 14 days) **[documentation required]** per the cited NDC as in Table 2 below.

Table 2. Dose of Zolgensma Based on Availability.[1]

Patient Weight Range (kg)	Dose Volume (mL)*	Zolgensma Kit Configuration			NDC Number
		5.5 mL vial	8.3 mL vial	Total Vials per Kit	
2.6 to 3.0	16.5	0	2	2	71894-120-02
3.1 to 3.5	19.3	2	1	3	71894-121-03
3.6 to 4.0	22.0	1	2	3	71894-122-03
4.1 to 4.5	24.8	0	3	3	71894-123-03
4.6 to 5.0	27.5	2	2	4	71894-124-04
5.1. to 5.5	30.3	1	3	4	71894-125-04
5.6 to 6.0	33.0	0	4	4	71894-126-04
6.1 to 6.5	35.8	2	3	5	71894-127-05
6.6 to 7.0	38.5	1	4	5	71894-128-05
7.1 to 7.5	41.3	0	5	5	71894-129-05
7.6 to 8.0	44.0	2	4	6	71894-130-06
8.1 to 8.5	46.8	1	5	6	71894-131-06
8.6 to 9.0	49.5	0	6	6	71894-132-06
9.1 to 9.5	52.3	2	5	7	71894-133-07
9.6 to 10.0	55.0	1	6	7	71894-134-07
10.1 to 10.5	57.8	0	7	7	71894-135-07
10.6 to 11.0	60.5	2	6	8	71894-136-08
11.1 to 11.5	63.3	1	7	8	71894-137-08
11.6 to 12.0	66.0	0	8	8	71894-138-08
12.1 to 12.5	68.8	2	7	9	71894-139-09
12.6 to 13.0	71.5	1	8	9	71894-140-09
13.1 to 13.5	74.3	0	9	9	71894-141-09
≥ 13.6 kg†	Refer to the medical director for approval of specific NDCs				

* Dose volume is calculated using the upper limit of the patient weight range for pediatric patients less than 2 years of age between 2.6 kg and 13.5 kg; † Dose volume for pediatric patients less than 2 years of age weighing equal to or greater than 13.6 kg will require a combination of Zolgensma kits.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Zolgensma is not recommended in the following situations:

240. Patient has Four or More Survival Motor Neuron 2 (SMN2) Gene Copies. These patients were not studied and guidance does not recommend treatment.

241. Patient has Complete Paralysis of All Limbs. This is cited as a limitation of use in the Zolgensma prescribing information.[1] Data are needed to determine if this patient population would derive benefits from Zolgensma.

242. Patient has Permanent Ventilator Dependence. This is cited as a limitation of use in the Zolgensma prescribing information.[1] Data are needed to determine if this patient population would derive benefits from Zolgensma.

243. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY Synagis® (palivizumab solution for intramuscular administration – MedImmune)

APPROVAL DATE: 10/16/2019

OVERVIEW

Synagis is a humanized monoclonal antibody indicated for *prevention* of serious lower respiratory tract disease caused by respiratory syncytial virus (RSV) in pediatric patients with at least one of the following[1]:

- bronchopulmonary dysplasia (BPD) that required medical treatment within the previous 6 months and who are ≤ 24 months of age at the beginning of the RSV season;
- history of premature birth (≤ 35 weeks gestational age) and who are ≤ 6 months of age at the beginning of the RSV season;
- hemodynamically significant congenital heart disease (CHD) who are ≤ 24 months of age at the beginning of the RSV season.

The safety and efficacy of Synagis for the treatment of RSV have not been established.[1] The recommended dose is 15 mg/kg intramuscularly once monthly (every 30 days). The first dose of Synagis should be administered prior to commencement of the RSV season and the remaining doses should be administered monthly throughout the RSV season.

Efficacy

Synagis was licensed by the FDA in June 1998, based largely on data from the IMpact-RSV trial conducted during the 1996-1997 RSV season.[2,3] IMpact-RSV enrolled children with either prematurity (≤ 35 weeks gestation and ≤ 6 months of age at the time of the study) or chronic lung disease (CLD) and ≤ 24 months of age at the time of the study. The RSV hospitalization rate was 4.8% among patients given Synagis prophylaxis, vs. 10.6% in patients given placebo. Synagis also benefits children with CHD as noted in a randomized, double-blind, placebo-controlled study of Synagis (15 mg/kg) once monthly during RSV

season in 1,287 children ≤ 2 years of age with serious CHD.[2,4] In this study, conducted from 1998 to 2002, RSV hospitalization rates were 5.3% with Synagis and 9.7% with placebo.

More recent literature has emerged to guide appropriate Synagis use.[2] Mortality from RSV-related hospitalizations has been found to be lower than previously reported. Additionally, reports have described Synagis-resistant RSV isolates from hospitalized patients who received prophylaxis. Therefore, not all infants enrolled in the two randomized trials are included in the current guidance.

Infants with CHD in Second Year of Life
A retrospective analysis of children < 3 years of age in the Tennessee Medicaid program revealed that the RSV hospitalization rate for children with CHD in the second year of life (18.2/1,000) was less than half the hospitalization rate for low-risk infants in the first 5 months after birth (44.1/1,000), a group for whom Synagis prophylaxis is not recommended.[2] Therefore, prophylaxis is not recommended during the second year of life.

Infants Born Prematurely
The New Vaccine Surveillance Network (NVSN) sponsored by the Centers for Disease Prevention and Control (CDC) was a prospective population-based surveillance program for three geographically diverse locations in the US for young children hospitalized with laboratory-confirmed RSV respiratory illness.[2] Several studies were published summarizing data from the NVSN. Data revealed that for all preterm infants (< 37 weeks' gestation), the RSV hospitalization rate was 4.6/1,000 children, which was not significantly different from the hospitalization rate for term infants, which was 5.3/1,000 children. Infants born < 29 weeks' gestation had a higher RSV hospitalization rate (19.3/1,000 children).

Infants with Anatomic Pulmonary Abnormalities or Neuromuscular Disorder
The risk for hospitalization is not well defined in children with neuromuscular disorders that impair the ability to clear secretions from the upper airway because of ineffective cough, recurrent gastroesophageal tract reflux, pulmonary malformations, tracheoesophageal fistula, upper airway conditions, or conditions requiring tracheostomy.[2] Infants with neuromuscular disease or congenital anomaly that impairs the ability to clear airway secretions from the upper airway because of ineffective cough are known to be at risk for a prolonged hospitalization related to lower respiratory tract infection and, therefore, may be considered for prophylaxis during the first year of life.

Immunocompromised Children
Risk factors for a poor outcome after RSV infection in an immunocompromised patient include age < 2 years, presence of lower respiratory tract symptoms at presentation, corticosteroid therapy, and varying degrees of lymphopenia.[2]

RSV Seasonality
The CDC National Respiratory and Enteric Virus Surveillance System (NREVSS) provides reports determining RSV seasonality nationally and by region.[5] For the 2014 to 2017 seasons, median RSV onset occurred mid-October and lasted 31 weeks until early May. The median national peak occurred in early February. Many factors might influence national, regional, and county-level RSV activity, including social and demographic factors, population density, pollution, and climate.

Patterns of weekly RSV circulation in Florida are different from regional and national patterns.[5] Across the 2014 to 2017 seasons, the median onset for Florida was mid-September and the season continued through mid-April. Despite varying onset and offset dates of the RSV season in different regions of Florida, a maximum of five monthly doses will be adequate for qualifying infants for most RSV seasons in Florida.[2]

Even if the first of five monthly doses is administered in July, protective serum concentrations of Synagis will be present for most infants and young children for at least 6 months and likely into February. More than five monthly doses are not recommended, despite the detection of a small number of cases of RSV infection outside this time window. A small number of sporadic RSV hospitalizations occur before or after the main season in many areas of the US, but maximum benefit from prophylaxis is derived during the peak of the season and not when the incidence of RSV hospitalization is low.

Guidelines

The AAP Policy Statement on the Updated Guidance for Synagis Prophylaxis Among Infants and Young Children at Increased Risk of Hospitalization for RSV Infection was updated on August 1, 2014.[2] Additionally, the AAP Red Book was updated in 2018.[6] Below is a summary of their recommendations.
Groups recommended for a maximum of five monthly doses (5 months):

Infants with CLD

- Prophylaxis may be considered during the RSV season during the first year of life for preterm infants who develop CLD of prematurity defined as < 32 weeks' gestation (≤ 31 weeks, 6 days) AND required > 21% oxygen for at least the first 28 days after birth.
- In the second year of life, prophylaxis is recommended only for infants who satisfy the above definition of CLD AND who continue to require medical support (i.e., chronic corticosteroid therapy, diuretic therapy, or supplemental oxygen) during the 6-month period before the start of the second RSV season.

Infants with CHD

- Infants ≤ 12 months of age with hemodynamically significant CHD may benefit from prophylaxis with Synagis.
- Infants with CHD who are most likely to benefit from Synagis include: 1) infants with acynaotic heart disease who are receiving medication to control CHF and will require cardiac surgical procedures; and 2) infants with moderate to severe pulmonary hypertension. Decisions regarding prophylaxis with Synagis for infants with cyanotic heart disease may be made in consultation with a pediatric cardiologist.
- The following group of infants are not at increased RSV risk and should generally not receive prophylaxis: 1) infants and children with hemodynamically insignificant heart disease (e.g., secundum atrial septal defect, small ventricular septal defect, pulmonic stenosis, uncomplicated aortic stenosis, mild coarctation of the aorta, and patent ductus arteriosus); 2) infants with lesions adequately corrected by surgery, unless they continue to require heart failure medication; 3) infants with mild cardiomyopathy who are not receiving medical therapy for the condition; and 4) children in their second year of life.
- Following cardiopulmonary bypass or at the conclusion of extracorporeal membrane oxygenation, in children who are receiving Synagis prophylaxis, a postoperative dose (15 mg/kg) should be considered for infants and children < 24 months of age.
- Children < 2 years of age who undergo cardiac transplantation during RSV season may be considered for Synagis prophylaxis.

Preterm infants born before 29 weeks' gestation (≤ 28 weeks, 6 days)

- Synagis prophylaxis may be administered to infants born ≤ 28 weeks, 6 days' gestation who are < 12 months at the start of the RSV season. For infants born during the RSV season, fewer than 5 monthly doses will be needed.

Infants with anatomic pulmonary abnormalities or a neuromuscular disease

- Infants with a congenital anomaly or neuromuscular disease that impairs the ability to clear secretions from the upper airway because of ineffective cough may be considered for Synagis prophylaxis during the first year of life.

Immunocompromised children

- Prophylaxis may be considered for children < 24 months of age who are profoundly immunocompromised during the RSV season (e.g., receiving chemotherapy, transplantation).

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Synagis. All approvals are provided for up to 5 months unless otherwise noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. When referencing age, 1 year equals 12 months.

Because five monthly doses of Synagis at 15 mg/kg per dose will provide more than 6 months of serum Synagis concentrations for most infants, administration of more than five monthly doses is not recommended within the continental US. Children who qualify for five monthly doses of Synagis should receive the first dose at the time of onset of the RSV season. For qualifying infants born during the RSV season, fewer than five monthly doses will be needed to provide protection until the RSV season ends in their region (maximum of five monthly doses).

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Synagis is recommended for those who meet the following criteria:

FDA-Approved Indications

1. **Respiratory Syncytial Virus (RSV), Prevention in an Infant with Chronic Lung Disease (CLD)**. Approve Synagis for a maximum of 5 months during the RSV season in children who meet ONE of the following conditions (A or B):
   - **A)** Infants ≤ 1 year of age at the start of the RSV season must meet the following criteria (i and ii):
     - **i.** The infant was born at < 32 weeks, 0 days gestation; AND
     - **ii.** The infant required > 21% oxygen for at least 28 days after birth; OR
   - **B)** Infants ≤ 2 years of age at the start of the RSV season must meet the following criteria (i, ii, and iii):
     - **i.** The infant was born at < 32 weeks, 0 days gestation; AND
     - **ii.** The infant required > 21% oxygen for at least 28 days after birth; AND
     - **iii.** The child has required medical therapy (i.e., supplemental oxygen, diuretic therapy, or chronic corticosteroid therapy) during the 6 months before the start of the second RSV season.[2]

2. **Respiratory Syncytial Virus (RSV), Prevention in an Infant with Congenital Heart Disease (CHD).** Approve Synagis for a maximum of 5 months during the RSV season in children who meet the following criteria (A, B, and C):
   - **A)** The infant is ≤ 1 year of age at the start of the RSV season; AND
   - **B)** According to the prescribing physician, the infant meets ONE of the following conditions (i, ii, iii, or iv):

i. The infant is considered to have hemodynamically significant cyanotic CHD; OR
ii. The infant has acyanotic heart disease AND is receiving medication to control heart failure AND will require cardiac surgical procedures; OR
iii. The infant has moderate to severe pulmonary hypertension; OR
iv. The infant has lesions that have been adequately corrected by surgery AND continues to require medication for congestive heart failure; AND

C) Synagis is prescribed by or in consultation with a cardiologist or intensivist.

3. **Respiratory Syncytial Virus (RSV), Prevention in an Infant Born Prematurely.** Approve Synagis for a maximum of 5 months during the RSV season in children who meet the following criteria (A and B):
   A) The infant is ≤ 12 months of age at the start of the RSV season; AND
   B) The infant was born before 29 weeks, 0 days gestation (≤ 28 weeks, 6 days gestation).

Other Uses with Supportive Evidence

4. **Respiratory Syncytial Virus (RSV), Prevention in an Infant with Anatomic Pulmonary Abnormalities or a Neuromuscular Disorder.** Approve Synagis for a maximum of 5 months during the RSV season in children who meet the following criteria (A and B):
   A) The infant is ≤ 1 year of age at the start of the RSV season; AND
   B) According to the prescribing physician, the patient's condition compromises the handling of respiratory secretions.

5. **Respiraotry Syncytial Virus (RSV), Prevention in an Immunocompromised Child.** Approve Synagis for a maximum of 5 months during the RSV season in children who meet the following criteria (A, B, and C):
   A) The child is < 24 months of age at the start of the RSV season; AND
   B) Synagis is prescribed by or in consultation with an immunologist or infectious diseases specialist; AND
   C) According to the prescribing physician, the child is/will be profoundly immunocompromised during the RSV season (e.g., receiving chemotherapy, transplant).

6. **Respiratory Syncytial Virus (RSV), Prevention in a Child with Cardiac Transplant.** Approve for a maximum of 5 months during the RSV season in children who meet the following criteria (A, B, and C):

   A) The child is < 2 years of age at the start of the RSV season; AND
   B) The child has undergone or will undergo cardiac transplantation during the current RSV season; AND
   C) Synagis is prescribed by or in consultation is a cardiologist, intensivist, or transplant physician.

   Note: Children with cardiac transplant may also be immunocompromised. In children who do not meet criteria for cardiac transplant, please see *criterion 5* above.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Synagis has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

1. **Respiratory Syncytial Virus (RSV), Prevention in a Patient with Cystic Fibrosis (CF) Who Does Not Meet Any of the Approval Criteria.** The AAP guidelines for RSV note that routine use of Synagis prophylaxis in patients with CF, including neonates diagnosed with CF by newborn screening, is not recommended unless other indications are present.[6] Available studies indicate the incidence of RSV hospitalization in children with CF is uncommon and unlikely to be different from children without CF.[2] A Cochrane Review identified one trial (presented in poster/abstract form) eligible for their review of Synagis prophylaxis in children with cystic fibrosis.[7] In this prospective, double-blind, placebo-controlled, multi-center study, 14.1% vs. 14.9% of Synagis and placebo-treated patients, respectively were hospitalized within the first 6 months, and only one patient in each group was identified with RSV infection. There were no deaths in either group of patients during the first 6 months follow-up; this outcome was not reported at 12 months follow-up.

2. **Respiratory Syncytial Virus (RSV), Prevention in a Patient with Down Syndrome Who Does Not Meet Any of the Approval Criteria.** Data suggest that children with Down syndrome have a slightly higher hospitalization rate for RSV, but the absolute number of hospitalizations is small, and a number of children with Down syndrome are at increased risk because of other qualifying risk factors (e.g., CHD, abnormalities of the respiratory tract, muscle dystonia).[2]

3. **Respiratory Syncytial Virus (RSV), Prevention in a Patient with Hematopoietic Stem Cell Transplant (Bone Marrow Transplant, Peripheral Blood, Placental, or Cord Blood) Who Does Not Meet Any of the Approval Criteria.** Phase I studies in a total of 21 patients have evaluated Synagis in BMT patients.[8] Guidelines (2009) address RSV prevention in patients with hematopoietic stem cell transplant.[9] Although a definitive, uniformly effective preemptive therapy for RSV infection among hematopoietic stem cell transplant recipients has not been identified, certain other strategies have been proposed, including systemic ribavirin, RSV antibodies (i.e., passive immunization with high RSV-titer intravenous immune globulin [IVIG], RSV immunoglobulin) in combination with aerosolized ribavirin, and RSV monoclonal antibody (e.g., Synagis). No randomized trial has been completed to test the efficacy of these strategies; therefore, no specific recommendation regarding any of these strategies can be given at this time.

4. **Respiratory Syncytial Virus (RSV), Treatment of Disease.** There are limited data investigating Synagis for the treatment of established RSV infections. Passive antibody administration is not effective in treatment of RSV disease and is not approved or recommended for this indication.[2,6] If any infant or young child receiving monthly Synagis prophylaxis experiences a breakthrough RSV hospitalization, monthly prophylaxis should be discontinued because of the extremely low likelihood of a second RSV hospitalization (< 0.5%).[6]

5. **Wheezing, Prevention in a Patient Who Does Not Meet Any of the Approval Criteria.** Prophylaxis with Synagis is not recommended for primary asthma prevention or to reduce subsequent episodes of wheezing.[6]

6. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Testosterone (Injectable) Products

- Depo® – Testosterone (testosterone cypionate injection – Pfizer, generics)
- Delatestryl® (testosterone enanthate injection – Actavis Pharma, Inc., generics only)
- Aveed™ (testosterone undecanoate injection – Endo Pharmaceuticals, Inc.)
- Testopel® (testosterone pellet – Endo Pharmaceuticals, Inc.)
- Xyosted™ (testosterone enanthate injection – Antares Pharma, Inc.)

APPROVAL DATE: 8/28/2019

OVERVIEW

Testosterone replacement regimens supply exogenous testosterone and restore serum testosterone levels in the normal range (300 to 1,000 ng/dL).[4] Testosterone level increases in males until 17 years of age and stabilizes to a serum level in the range of 300 to 1,000 ng/dL, until about 40 years of age. After this, the levels begin to decline at 1.2% to 2% per year. About 20% of men > 60 years of age and 50% of men > 80 years of age are estimated to have serum testosterone levels that are subnormal compared with younger men.

Male hypogonadism is characterized by low serum levels of testosterone and is classified according to the level of the hypothalamus-pituitary-testis axis involvement.[6] It is classified as primary hypogonadism when the main problem involves the testes (elevated lutenizing hormone [LH] and follicle stimulating hormone [FSH]). It is secondary hypogonadism (hypogonadotropic hypogonadism) if the hypothalamus/pituitary axis are involved; low testosterone levels in this case are associated with low or inadequately normal levels of LH and FSH. The diagnosis of male hypogonadism is based on both signs/symptoms and low testosterone levels. By restoring normal levels of testosterone, the replacement regimens correct symptoms of hypogonadism, which can include malaise, loss of muscle strength, depressed mood, and decreased libido.[4]

Testosterone regimens can be administered orally, parenterally, or transdermally. Injectable testosterone replacement products include Depo-Testosterone (testosterone cypionate) for intramuscular [IM] use, Delatestryl (testosterone enanthate) for IM use, Xyosted (testosterone enanthate) for subcutaneous [SC] use, Aveed injections for IM use, and Testopel, which is implanted subcutaneously.[1-3,7,11] These agents are all indicated in adult men for use in congenital or acquired primary hypogonadism and hypogonadotropic hypogonadism (secondary hypogonadism).[1-3,7,11] Testopel and Delatestryl (testosterone enanthate) are also indicated for delayed puberty.[2,3] The safety and efficacy of Aveed and Xyosted in males < 18 years of age have not been established.[7,11] Delatestryl (testosterone enanthate) may also be used secondarily in women with advanced inoperable metastatic mammary cancer that are 1 to 5 years postmenopausal.[2] The goal of therapy is ablation of ovaries. It can also be used in premenopausal women with breast cancer that have benefited from oophorectomy and are considered to have hormone-responsive tumor.

Guidelines

American Urological Association (AUA)

Guidelines from the AUA (2018) note that clinicians should use a total testosterone level below 300 ng/dL as a reasonable cut-off in support of the diagnosis of low testosterone.[8] The guidelines additionally note that a diagnosis of low testosterone should be made only after two total testosterone measurements are taken on separate occasions with both conducted in an early morning fashion and that a clinical diagnosis should be made when patients have low testosterone levels combined with signs or symptoms.

Endocrine Society

Men with Hypogonadism

The Endocrine Society guidelines on testosterone therapy in men with hypogonadism (2018) recommend diagnosing hypogonadism in men with symptoms and signs of testosterone deficiency and unequivocally and consistently low serum total testosterone and/or free testosterone concentrations (when indicated).[9]

Endocrine treatment of gender-dysphoric/gender-incongruent persons

A clinical practice guideline published by the Endocrine Society (2017), recommends that, prior to initiation of hormonal therapy, the treating endocrinologist should confirm the diagnostic criteria of gender dysphoria/gender incongruence and the criteria for the endocrine phase of gender transition.[5] The clinician should also evaluate and address medical conditions that can be exacerbated by hormone depletion and treatment with sex hormones of the affirmed gender before beginning treatment. Guidelines mention that clinicians can use either parenteral or transdermal preparations to achieve appropriate testosterone values.

The World Professional Association for Transgender Health (WPATH)

The WPATH Standards of Care document (2011) states that exogenous administration of hormone therapy to induce feminizing or masculinizing changes is a medically necessary intervention for many transsexual, transgender, and gender nonconforming individuals with gender dysphoria.[10]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of injectable testosterone (e.g., testosterone cypionate, testosterone enanthate, Aveed, Testopel, Xyosted). All approvals are provided for the duration noted below. In the clinical criteria, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: males are defined as individuals with the biological traits of a male, regardless of the individual's gender identity or gender expression; females are defined as individuals with the biological traits of a female, regardless of the individual's gender identity or gender expression.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of injectable testosterone (e.g., testosterone cypionate, testosterone enanthate, Aveed, Testopel, Xyosted) is recommended in those who meet the following criteria:

FDA-Approved Indications

5. **Hypogonadism (Primary or Secondary) in Males* [Testicular Hypofunction/Low Testosterone with Symptoms].**
   - **A)** Initial Therapy. Approve for 1 year in patients with hypogonadism as confirmed by the following criteria (i, ii, and iii):
     - **i.** Patient has had persistent signs and symptoms (e.g., depressed mood, decreased energy, progressive decrease in muscle mass, osteoporosis, loss of libido) of androgen deficiency (pre-treatment); AND
     - **ii.** Patient has had two pre-treatment serum testosterone (total or bioavailable) measurements, each taken in the morning, on two separate days; AND
     - **iii.** The two serum testosterone levels are both low, as defined by the normal laboratory reference values.
   - **B)** Patients Continuing Therapy. Approve for 1 year if the patient meets the following criteria (i and ii):
     - **i.** Patient has had persistent signs and symptoms (e.g., depressed mood, decreased energy, progressive decrease in muscle mass, osteoporosis, loss of libido) of androgen deficiency (pre-treatment); AND
     - **ii.** Patient has had at least one pre-treatment serum testosterone (total or bioavailable) level, which was low, as defined by the normal laboratory reference values.

   ***** Refer to the Policy Statement.

   Note: The pre-treatment timeframe refers to signs and symptoms of androgen deficiency and serum testosterone levels prior to the initiation of any testosterone therapy.

6. **Delayed Puberty or Induction of Puberty in Males* 14 years of Age or Older** Approve Depo-Testosterone **(**testosterone cypionate), Delatestryl (testosterone enanthate), or Testopel for 6 months.

   ***** Refer to the Policy Statement.

7. **Breast Cancer in Females*.** Approve Delatestryl (testosterone enanthate) injection in women for 6 months if it is prescribed by or in consultation with an oncologist.

   ***** Refer to the Policy Statement.

Other Uses with Supportive Evidence

8. **Gender-Dysphoric/Gender-Incongruent Persons; Persons Undergoing Female-to-Male (FTM) Gender Reassignment (i.e., Endocrinologic Masculinization).** Approve for 1 year if prescribed by

or in consultation with an endocrinologist or a physician who specializes in the treatment of transgender patients.

Note: For patients who have undergone gender reassignment, use this FTM criterion for hypogonadism indication.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Injectable testosterone (e.g., testosterone cypionate, testosterone enanthate, Aveed, Testopel) has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

130. To Enhance Athletic Performance. Injectable testosterone products are not recommended for approval because this indication is excluded from coverage in a typical pharmacy benefit.

131. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Testosterone (Oral, Topical, and Nasal) products

Oral Testosterone Products

- Jatenzo® (testosterone undecanoate capsules – Clarus Therapeutics, Inc.)
- Striant™ (testosterone buccal system, mucoadhesive – Endo Pharmaceuticals, Inc.)

Transdermal Patch

- Androderm® (testosterone transdermal system [2,4 mg/day] – Allergan)

Transdermal Gels

- AndroGel® (testosterone 1% gel, 1.62% gel – AbbVie, Inc.; generics)
- Fortesta™ (testosterone 2% topical gel – Endo Pharmaceuticals, Inc.; generics)
- Testim® (testosterone 1% gel – Endo Pharmaceuticals, Inc.; generics)
- Vogelxo™ (testosterone 1% gel – Upsher-Smith Laboratories; generics)

Transdermal Solution

- Axiron™ (testosterone 2% solution – Lilly USA, LLC; generics only)

Nasal Gel

- Natesto™ (testosterone nasal gel – Aytu Bioscience, Inc.)

APPROVAL DATE: 8/28/2019

OVERVIEW

The oral, topical, and nasal, and testosterone replacement products are all indicated for testosterone replacement therapy in adult males for conditions associated with a deficiency or absence of endogenous testosterone.[1-10] The prescribing information for the FDA-approved products define those patients and/or conditions for which use of testosterone replacement products is indicated:

- Primary hypogonadism (congenital or acquired) – testicular failure due to cryptorchidism, bilateral torsion, orchitis, vanishing testis syndrome, orchidectomy, Klinefelter's syndrome, chemotherapy, or toxic damage from alcohol or heavy metals. These men usually have low serum testosterone concentrations accompanied by gonadotropins (follicle-stimulating hormone [FSH], luteinizing hormone [LH]) above the normal range.
- Hypogonadotropic hypogonadism [congenital or acquired] –gonadotropin or luteinizing hormone-releasing hormone (LHRH) deficiency, or pituitary-hypothalamic injury from tumors, trauma, or radiation. These men have low testosterone serum concentrations, but have gonadotropins in the normal or low range.

The limitations of use for these products may include that safety and efficacy in men with "age-related hypogonadism" (also referred to as "late-onset hypogonadism") have not been established[1-9]; safety and efficacy in males < 18 years of age have not been established[1-10]; and topical testosterone products may have different doses, strengths or application instructions that may result in different systemic exposure[2-4,8]. The most recently labeled product Jatenzo is specifically contraindicated in men with hypogonadal conditions, such as "age-related hypogonadism", that are not associated with structural or genetic etiologies.[10] The diagnosis of male hypogonadism is based on both signs/symptoms and low testosterone levels. By restoring normal levels of testosterone, the replacement regimens correct symptoms of hypogonadism, which can include malaise, loss of muscle strength, depressed mood, and decreased libido.[12]

American Urological Association (AUA)

Guidelines from the AUA (2018) note that clinicians should use a total testosterone level below 300 ng/dL as a reasonable cut-off in support of the diagnosis of low testosterone.[13] The guidelines additionally note that a diagnosis of low testosterone should be made only after two total testosterone measurements are taken on separate occasions with both conducted in an early morning fashion and that a clinical diagnosis should be made when patients have low testosterone levels combined with signs or symptoms.

Endocrine Society

Men with Hypogonadism

The Endocrine Society guidelines on testosterone therapy in men with hypogonadism (2018) recommend diagnosing hypogonadism in men with symptoms and signs of testosterone deficiency and unequivocally and consistently low serum total testosterone and/or free testosterone concentrations (when indicated).[11]

Endocrine treatment of gender-dysphoric/gender-incongruent persons
A clinical practice guideline published by the Endocrine Society (2017), recommends that, prior to initiation of hormonal therapy, the treating endocrinologist should confirm the diagnostic criteria of gender dysphoria/gender incongruence and the criteria for the endocrine phase of gender transition.[14] The clinician should also evaluate and address medical conditions that can be exacerbated by hormone depletion and treatment with sex hormones of the affirmed gender before beginning treatment. Guidelines mention that clinicians can use either parenteral or transdermal preparations to achieve appropriate testosterone values.

The World Professional Association for Transgender Health (WPATH)
The WPATH Standards of Care document (2011) states that exogenous administration of hormone therapy to induce feminizing or masculinizing changes is a medically necessary intervention for many transsexual, transgender, and gender nonconforming individuals with gender dysphoria.[15]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of oral, topical, and nasal testosterone products (e.g., Jatenzo, Androderm, AndroGel, Axiron, Fortesta, Natesto, Striant, Testim, Vogelxo). In the approval indication, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: males are defined as individuals with the biological traits of a male, regardless of the individual's gender identity or gender expression. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of oral, topical, and nasal testosterone products (e.g., Jatenzo, Androderm, AndroGel, Axiron, Fortesta, Natesto, Striant, Vogelxo, Testim,) is recommended in those who meet the following criteria:

FDA-Approved Indications

9. Hypogonadism (Primary or Secondary) in Males* [Testicular Hypofunction/Low Testosterone with Symptoms].

A) Initial Therapy. Approve for 1 year in patients with hypogonadism as confirmed by the following criteria (i, ii, and iii):
- **i.** Patient has had persistent signs and symptoms (e.g., depressed mood, decreased energy, progressive decrease in muscle mass, osteoporosis, loss of libido) of androgen deficiency (pre-treatment); AND
- **ii.** Patient has had two pre-treatment serum testosterone (total or bioavailable) measurements, each taken in the morning, on two separate days; AND
- **iii.** The two serum testosterone levels are both low, as defined by the normal laboratory reference values.

B) Patients Continuing Therapy. Approve for 1 year if the patient meets the following criteria (i and ii):

iii. Patient has had persistent signs and symptoms (e.g., depressed mood, decreased energy, progressive decrease in muscle mass, osteoporosis, loss of libido) of androgen deficiency (pre-treatment); AND

iv. Patient has had at least one pre-treatment serum testosterone (total or bioavailable) level, which was low, as defined by the normal laboratory reference values.

***** Refer to the Policy Statement.

Note: The pre-treatment timeframe refers to signs and symptoms of androgen deficiency and serum testosterone levels prior to the initiation of any testosterone therapy.

Other Uses with Supportive Evidence

10. Gender-Dysphoric/Gender-Incongruent Persons; Persons Undergoing Female-To-Male (FTM) Gender Reassignment (i.e., Endocrinologic Masculinization). Approve for 1 year if prescribed by or in consultation with an endocrinologist or a physician who specializes in the treatment of transgender patients.

Note: For patients who have undergone gender reassignment, use this FTM criterion for hypogonadism indication.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Oral, topical, and nasal testosterone products (e.g., Jatenzo, Androderm, AndroGel, Axiron, Fortesta, Natesto, Striant, Testim, Vogelxo) have not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

132. To Enhance Athletic Performance. Topical testosterone products are not recommended for approval because this indication is excluded from coverage in a typical pharmacy benefit.

133. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Thrombocytopenia – Doptelet® (avatrombopag tablets for oral use – Dova/AkaRx)

DATE REVIEWED: 03/11/2020

OVERVIEW

Doptelet, a thrombopoietin receptor agonist (TPO-RA), is indicated for the treatment of thrombocytopenia in adults with chronic immune thrombocytopenia (ITP) who have had an insufficient response to a previous treatment.[1] Also, Doptelet is indicated for the treatment of thrombocytopenia in adults with chronic liver disease who are scheduled to undergo a procedure. For chronic ITP initiate at 20 mg once daily (QD) and adjust the dose to maintain a platelet count ≥ 50 x 10^9/L. Do not exceed a dose of 40 mg QD. For chronic liver disease in patients undergoing a procedure, begin Doptelet dosing 10 to 13 days before the scheduled procedure. The recommended daily dose of Doptelet is based on the patient's platelet count prior to the scheduled procedure. The dose is 60 mg (three tablets) QD for 5 days in patients with a platelet count < 40 x 10^9/L and 40 mg (two tablets) QD for 5 days for patients with a platelet count of 40 x 10^9/L to < 50 x 10^9/L. Doptelet should be given with food. Patients should undergo their procedure 5 to 8 days after the last Doptelet dose. For chronic ITP, Doptelet should be discontinued if the platelet count does not increase to ≥ 50 x 10^9/L within 4 weeks at the maximum dose of 40 mg QD. The safety and efficacy of Doptelet have not been established in pediatric patients.

Clinical Efficacy

The efficacy of Doptelet in adults with chronic ITP was assessed in a Phase III, double-blind, placebo-controlled trial in patients who had previously received one or more therapies and had an average baseline platelet count < 30 x 10^9/L.[1,2] The median exposure duration was 26 weeks for Doptelet and 6 weeks for patients given placebo. Doptelet-treated patients had a longer duration of platelet counts ≥ 50 x 10^9/L in the absence of rescue therapy compared with patients who received placebo (12.4 vs 0 weeks, respectively; P < 0.001). Also, more patients receiving Doptelet had platelet counts ≥ 50 x 10^9/L (≥ 50,000/µL) at Day 8 compared with patients who received placebo (66% vs. 0.0%, respectively; P < 0.0001).

The efficacy of Doptelet for the treatment of thrombocytopenia in patients with chronic liver disease who were scheduled to undergo a procedure was established in two identically-designed, multicenter, randomized, double-blind, placebo-controlled trials (ADAPT-1 [n = 231] and ADAPT-2 [n = 204]).[1,3] Patients were assigned to the low baseline platelet count cohort (< 40 x 10^9/L) or the high baseline platelet count cohort (≥ 40 to < 50 x 10^9/L) based on their baseline platelet count. In the trials the FDA-approved dosing was utilized for patients randomized (2:1) to receive Doptelet or placebo. Patients were scheduled to undergo their procedure (low, moderate, or high-bleeding risk) 5 to 8 days after their last treatment dose.

In ADAPT-1, patients in the low- and high-baseline platelet count groups had baseline platelet counts of 31 x 10^9/L and 44 x 10^9/L, respectively. In ADAPT-2, patients in the low- and high-baseline platelet count groups had baseline platelet counts of 32 x 10^9/L and 44 x 10^9/L, respectively. The major efficacy outcome was the proportion of patients who did not require a platelet transfusion or any rescue procedure for bleeding after randomization and up to 7 days following an elective procedure. In ADAPT-1, this endpoint was statistically superior for patients given Doptelet compared with placebo (66% for Doptelet 60 mg vs. 23% with placebo and 88% for Doptelet 40 mg vs. 38% with placebo). Also, in ADAPT-2, the endpoint was statistically superior for patients given Doptelet compared with placebo (69% for Doptelet 60 mg vs. 35% with placebo and 88% for Doptelet vs. 33% with placebo).

Guidelines
In 2019 the American Society of Hematology updated guidelines for immune thrombocytopenia.[4] There are several recommendations. For adults with ITP for at least 3 months who are corticosteroid-dependent or unresponsive to corticosteroid, a thrombopoietin receptor agonist (either Promacta® [eltrombopag tablets and oral suspension] or Nplate® [romiplostim injection for subcutaneous use]) or a splenectomy are recommended. In children with newly diagnosed ITP who have non-life-threatening mucosal bleeding, corticosteroids are recommended. For children who have non-life-threatening mucosal bleeding and do not respond to first-line treatment, thrombopoietin receptor agonists are recommended. Other treatment options in children and adults include intravenous immunoglobulin (IVIG), anti-D immunoglobulin, and rituximab.

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of Doptelet. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Doptelet as well as the monitoring required for adverse events and long-term efficacy, approval may require Doptelet to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Doptelet is recommended in those who meet the following criteria:

FDA-Approved Indications

166. Chronic Immune Thrombocytopenia. Approve if the patient meets the following criteria (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets all of the following (i, ii, iii, and iv):
- **i.** The patient must meet one of the following (a or b):
  - **a)** The patient has a platelet count < 30 x 10^9/L (< 30,000/µL); OR
  - **b)** The patient has a platelet count < 50 x 10^9/L (< 50,000/ µL) and according to the prescriber the patient is an increased risk of bleeding; AND
- **ii.** The patient is ≥ 18 years of age; AND
- **iii.** The agent is prescribed by or in consultation with a hematologist; AND
- **iv.** The patient meets one of the following criteria (a or b):
  - **a)** The patient has tried at least one other therapy.
    Note: Examples of therapies are systemic corticosteroids, intravenous immunoglobulin, anti-D immunoglobulin, Promacta® (eltrombopag tablets and oral suspension), Nplate®

(romiplostim injection for subcutaneous use), Tavalisse™ (fostamatinib tablets), and rituximab; OR

b) The patient has undergone splenectomy; OR

B) Continuation of Therapy. Approve for 1 year if the patient meets both of the following criteria: (i and ii):

i. According to the prescriber the patient demonstrates a beneficial clinical response (e.g., increased platelet counts); AND

ii. The patient remains at risk for bleeding complications.

167. Thrombocytopenia in Patients with Chronic Liver Disease. Approve for 5 days if the patient meets the following criteria (A, B and C):

13. The patient is an adult ≥ 18 years of age; AND

14. The patient has a current platelet count < 50 x 10^9/L (< 50,000/µL); AND

15. The patient is scheduled to undergo a procedure within 10 to 13 days after starting Doptelet therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Doptelet has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

134. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Thrombocytopenia – Mulpleta® (lusutrombopag tablets for oral use – Shionogi/Quotient)

DATE REVIEWED: 03/11/2020

OVERVIEW

Mulpleta is a thrombopoietin receptor agonist (TPO-RA) indicated for the treatment of thrombocytopenia in adults with chronic liver disease who are scheduled to undergo a procedure.[1] Begin Mulpleta dosing 8 to 14 days before the scheduled procedure. The recommended dose is 3 mg once daily (QD) with or without food for 7 days. Patients should undergo their procedure 2 to 8 days after the last Mulpleta dose. The safety and efficacy in pediatric patients have not been established.

Clinical Efficacy

The efficacy of Mulpleta for the treatment of thrombocytopenia in patients with chronic liver disease who were scheduled to undergo a procedure was established in two randomized, double-blind, placebo-controlled trials (L-PLUS 1 [n = 97] and L-PLUS 2 [n = 215]).[1-3] Patients with chronic liver disease who were to be undergoing an invasive procedure were required to have a platelet count < 50 x 10^9/L to participate. The median patient age was 60 years (range, 18 to 88 years). In L-PLUS 1, the major efficacy outcome was the proportion of patients who did not require a platelet transfusion prior to the primary invasive procedure. In L-PLUS 2, the major efficacy outcome was the proportion of patients who did not require a platelet transfusion before the procedure and no rescue therapy for bleeding (i.e., platelet preparations, other blood preparations [including red blood cells and plasma, volume expanders]) from randomization through 7 days following the primary invasive procedure. Other endpoints were also assessed. In L-PLUS 1, 78% of patients given Mulpleta (n = 38/49) compared with 13% of patients randomized to placebo (n = 6/48) did not require a platelet transfusion prior to the invasive procedure (P < 0.0001). In L-PLUS 2, the proportion of patients not requiring a platelet transfusion prior to the invasive procedure or rescue therapy for bleeding from randomization through 7 days following the invasive procedure was 65% in the Mulpleta group vs. 29% (n = 31/107) in the placebo group (P < 0.0001).

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Mulpleta. Approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Mulpleta is recommended in those who meet the following criteria:

FDA-Approved Indications

168. Thrombocytopenia in Patients with Chronic Liver Disease. Approve Mulpleta for 7 days if the patient meets the following criteria (A, B and C):
16. The patient is ≥ 18 years of age; AND
17. The patient has a current platelet count < 50 x 10^9/L (< 50,000/µL); AND
18. The patient is scheduled to undergo a procedure within 8 to 14 days after starting Mulpleta therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Mulpleta has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

135. Chronic Immune Thrombocytopenia. Data are not available regarding use of Mulpleta in patients with persistent and chronic ITP. Many other agents are FDA-approved for this condition and are recommended in standard guidelines and have established efficacy and safety.[4]

136. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Thrombocytopenia – Nplate® (romiplostim injection for subcutaneous use – Amgen)

DATE REVIEWED: 03/11/2020

OVERVIEW
Nplate, a thrombopoietin receptor agonist, is indicated for the treatment of thrombocytopenia in adults with chronic immune thrombocytopenia (ITP) who have had an insufficient response to corticosteroids, immunoglobulins, or splenectomy.[1] Also, Nplate is indicated for use in patients ≥ 1 year of age with ITP for at least 6 months who have had an insufficient response to corticosteroids, immunoglobulins, or splenectomy. Nplate should only be utilized in patients with ITP whose degree of thrombocytopenia and clinical condition increase the risk for bleeding. Nplate should not be used in an attempt to normalize platelet counts. The initial Nplate dose is 1 mcg/kg once weekly as a subcutaneous (SC) injection by a healthcare provider. The dose should be adjusted weekly by increments of 1 mcg/kg to achieve and maintain a platelet count ≥ 50 x 10^9/L as needed to reduce the bleeding risk. Do not exceed a maximum

weekly dose of 10 mcg/kg. Discontinue Nplate if the platelet count does not increase after 4 weeks at the maximum dose.

Guidelines

ITP

In 2019 the American Society of Hematology updated guidelines for immune thrombocytopenia.[2] There are several recommendations. For adults with ITP for at least 3 months who are corticosteroid-dependent or unresponsive to corticosteroid, a thrombopoietin receptor agonist (Nplate or Promacta® [eltrombopag tablets and oral suspension) or a splenectomy are recommended. In children with newly diagnosed ITP who have non-life-threatening mucosal bleeding, corticosteroids are recommended. For children who have non-life-threatening mucosal bleeding and do not respond to first-line treatment, thrombopoietin receptor agonists are recommended. Other treatment options in children and adults include anti-D immunoglobulin, and rituximab.

Myelodysplastic Syndrome (MDS)

National Comprehensive Cancer Network recommendations regarding MDS (version 2.2020 – February 28, 2020) state to consider treatment with a thrombopoietin receptor agonist in patients with lower-risk MDS who have severe or life-threatening thrombocytopenia.[3] Data are available that describe the use of Nplate in patients with MDS.[4-13] The data with Nplate are discussed noting an increased rate of platelet response and decreased overall bleeding events among patients with low to intermediate risk MDS.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Nplate. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Nplate as well as the monitoring required for adverse events and efficacy, approval requires Nplate to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Nplate is recommended in those who meet the following criteria:

FDA-Approved Indication

11. Chronic Immune Thrombocytopenia (ITP). Approve if the patient meets one of the following criteria (A or B):
- **A)** Initial Therapy. Approve for 3 months if the patient meets all of the following criteria (i, ii, and iii):
  - **i.** The patient meets one of the following (a or b):
    - **a)** The patient has a platelet count < 30 x 10^9/L (< 30,000/µL); OR
    - **b)** The patient has a platelet count < 50 x 10^9/L (< 50,000/µL) and according to the prescriber the patient is at an increased risk of bleeding; AND
  - **ii.** The agent is prescribed by or in consultation with a hematologist; AND
  - **iii.** The patient meets one of the following criteria (a or b):
    - **a)** The patient has tried at least one other therapy.
      Note: Examples of therapies are systemic corticosteroids, intravenous immunoglobulin, anti-D immunoglobulin, Promacta® (eltrombopag tablets and oral suspension), Tavalisse™

(fostamatinib disodium hexahydrate tablets), Doptelet® (avatrombopag tablets), or ritixumab; OR

b) The patient has undergone splenectomy; OR

B) Continuation of Therapy. Approve for 1 year if the patient meets both of the following criteria: (i and ii):

iii. According to the prescriber the patient demonstrates a beneficial clinical response (e.g., increased platelet counts); AND

iv. The patient remains at risk for bleeding complications.

Other Uses with Supportive Evidence

137. Thrombocytopenia in Myelodysplastic Syndrome (MDS). Approve if the patient meets one the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets the following criteria (i, ii, and iii):

i. The agent is prescribed by or in consultation with a hematologist or an oncologist; AND

ii. The patient has low- to intermediate-risk MDS; AND

iii. The patient meets one of the following (a or b):

a) The patient has a platelet count < 30 x 10^9/L (< 30,000/µL); OR

b) The patient has a platelet count < 50 x 10^9/L (< 50,000/µL) and according to the prescriber the patient is at an increased risk for bleeding; OR

B) Continuation of Therapy. Approve for 1 year if the patient meets both of the following criteria (i and ii):

i. According to the prescriber the patient demonstrates a beneficial clinical response (e.g., increased platelet counts); AND

ii. The patient remains at risk for bleeding complications.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Nplate has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Thrombocytopenia – Promacta® (eltrombopag tablets and oral suspension – Novartis)

DATE REVIEWED: 03/11/2020

OVERVIEW

Promacta is also indicated for the treatment of patients with severe aplastic anemia who have had an insufficient response to immunosuppressive therapy. Also, Promacta is indicated for use in combination with standard immunosuppressive therapy for the first-line treatment of adult and pediatric patients ≥ 2 years of age with severe aplastic anemia. Promacta, a thrombopoietin receptor agonist, has several indications.[1] It is indicated for the treatment of thrombocytopenia in adult and pediatric patients ≥ 1 year of age with chronic immune thrombocytopenia (ITP) who have had an insufficient response to corticosteroids, immunoglobulins, or splenectomy.[1] Promacta is also indicated for the treatment of thrombocytopenia in patients with chronic hepatitis C (CHC) to allow initiation and maintenance of interferon-based therapy. Use Promacta only in patients with CHC whose degree of thrombocytopenia prevents the initiation of interferon-based therapy or limits the ability to maintain interferon-based therapy. The safety and efficacy of Promacta have not been established in combination with direct-acting antiviral agents used without interferon for the treatment of chronic hepatitis C infection. For the management of ITP the dose of Promacta is titrated per response. Promacta should be discontinued if the platelet count does not increase to a level sufficient to avoid clinically important bleeding after 4 weeks of therapy with Promacta at the maximum daily dose of 75 mg. For the management of CHC, Promacta should be stopped upon discontinuation of antiviral treatment futility. For patients with refractory severe aplastic anemia, if no hematologic response has occurred after 16 weeks of treatment with Promacta, discontinue therapy.

Guidelines

Aplastic Anemia

Guidelines for the diagnosis and management of adult aplastic anemia are also available for the British Society.[2] The current standard first-line immunosuppressive therapy is horse ATG (ATG-ATGAM) combined with cyclosporine. Immunosuppressive therapy is recommended first-line for non-severe aplastic anemia in patients requiring treatment, severe or very severe aplastic anemia in patients who lack a matched sibling donor, and severe or very severe aplastic anemia in patients > 35 to 50 years. Other immunosuppressive recommended have been studied (e.g., mycophenolate mofetil, sirolimus, corticosteroids) but expertise should be provided prior to consideration of such agents. Hematopoietic stem cell transplantation (HSCT) is also recommended in certain circumstances. Promacta is an option is some clinical scenarios (e.g., heavily pre-treated patients, those unsuitable for HSCT).

ITP
In 2019 the American Society of Hematology updated guidelines for immune thrombocytopenia.[3] There are several recommendations. For adults with ITP for at least 3 months who are corticosteroid-dependent or unresponsive to corticosteroid, a thrombopoietin receptor agonist (Promacta or Nplate® [romiplostim injection for subcutaneous use]) or a splenectomy are recommended. In children with newly diagnosed ITP who have non-life-threatening mucosal bleeding, corticosteroids are recommended. For children who have non-life-threatening mucosal bleeding and do not respond to first-line treatment, thrombopoietin receptor agonists are recommended. Other treatment options in children and adults include intravenous immunoglobulin (IVIG), anti-D immunoglobulin, and rituximab.

Myelodysplastic Syndrome (MDS)
Current recommendations from the NCCN for MDS (version 2.2020 – February 28, 2020) state to consider treatment with a thrombopoietin receptor agonist in patients with lower-risk MDS who have severe or life-threatening thrombocytopenia.[4] The data with Promacta are discussed noting increased rate of platelet response and decreased overall bleeding events among patients with low to intermediate risk MDS. Of note, data are available that describe the use of Promacta in patients with MDS.[5-7]

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of Promacta. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Promacta as well as the monitoring required for adverse events and efficacy, approval requires Promacta to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Promacta is recommended in those who meet the following criteria:

FDA-Approved Indication

12. Aplastic Anemia. Approve Promacta for if the patient meets one of the following (A or B):
- **A.** Initial Therapy. Approve for 4 months if the patient meets the following criteria (i, ii, and iii):
  - **i.** The patient has low platelet counts at baseline (pretreatment) [e.g., < 30 x 10^9/L {< 30,000/µL}; AND
  - **ii.** Promacta is prescribed by, or in consultation with, a hematologist; AND
  - **iii.** The patient meets one of the following (a or b):
    - **a)** The patient had tried at least one immunosuppressant therapy.
      Note: Examples of therapies are cyclosporine, Atgam® (lymphocyte immune globulin, anti-thymocyte globulin [equine] sterile solution for intravenous use only), mycophenolate moefetil, or sirolimus; OR
    - **b)** The patient will be using Promacta in combination with standard immunosuppressive therapy.
      Note: Examples of therapies are cyclosporine, Atgam® (lymphocyte immune globulin, anti-thymocyte globulin [equine] sterile solution for intravenous use only), mycophenolate moefetil, or sirolimus; OR

B. Continuation of Therapy. Approve for 1 year if according to the prescriber the patient demonstrates a beneficial clinical response.
Note: Examples include increases in platelet counts, reduction in red blood cell transfusions, hemoglobin increase, and/or absolute neutrophil count increase.

13. Chronic Immune Thrombocytopenia. Approve Promacta if the patient meets one the following (A or B):

A. Initial Therapy. Approve for 3 months if the patient meets all the following criteria (i, ii and iii):
- **i.** The patient meets one of the following (a or b):
  - **a)** The patient has a platelet count < 30 x 10^9/L (< 30,000/µL); OR
  - **b)** The patient has a platelet count < 50 x 10^9/L (< 50,000/ µL) and according to the prescriber the patient is at an increased risk for bleeding; AND
- **ii.** The agent is prescribed by, or in consultation with, a hematologist; AND
- **iii.** The patient meets ONE of the following criteria (a or b):
  - **a)** The patient has tried at least one other therapy.
    Note: Examples of therapies are systemic corticosteroids, intravenous immunoglobulin, anti-D immunoglobulin, Nplate® (romiplostim injection for subcutaneous use), Tavalisse™ (fostamatinib disodium hexahydrate tablets), Doptelet® (avatrombopag tablets), or rituximab; OR
  - **b)** The patient has undergone splenectomy; OR

B. Continuation of Therapy. Approve for 1 year if the patient meets both of the following criteria (i and ii):
- **i.** According to the prescriber the patient demonstrates a beneficial clinical response (e.g., increased platelet counts); AND
- **ii.** The patient remains at risk for bleeding complications.

14. Treatment of Thrombocytopenia in Patients with Chronic Hepatitis C. Approve Promacta for 1 year if the patient meets the following criteria (A, B, and C):

A) Promacta is prescribed by, or in consultation with, either a gastroenterologist, a hepatologist, or a physician that specializes in infectious disease; AND

B) The patient has low platelet counts at baseline (pretreatment) [e.g., < 75 x 10^9/L {< 75,000/µL}]; AND

C) The patient will be receiving interferon-based therapy for chronic hepatitis C.
Note: Examples of therapies are pegylated interferon (Pegasys® [peginterferon alfa-2a injection], PegIntron® [peginterferon alfa-2b injection], or Intron A® (interferon alfa-2b).

Other Uses with Supportive Evidence

138. Thrombocytopenia in Myelodysplastic Syndrome (MDS). Approve if the patient meets one of the following (A or B):

B) Initial Therapy. Approve for 3 months if the patient meets the following criteria (i, ii, and iii):
- a. The agent is prescribed by, or in consultation with, a hematologist or an oncologist; AND
- b. The patient has low- to intermediate-risk MDS; AND
- c. The patient meets one of the following (a or b):
  - **c)** The patient has a platelet count < 30 x 10^9/L (< 30,000/µL); OR
  - **d)** The patient has a platelet count < 50 x 10^9/L (< 50,000/µL) and according to the prescriber the patient is at an increased risk for bleeding; OR

B. Continuation of Therapy. Approve for 1 year if the patient meets both of the following criteria (i and ii):

iii. According to the prescriber the patient demonstrates a beneficial clinical response (e.g., increased platelet counts); AND
iv. The patient remains at risk for bleeding complications.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Promacta has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Thrombocytopenia – Tavalisse™ (fostamatinib disodium hexahydrate tablets – Rigel/Patheon Whitby)

DATE REVIEWED: 03/11/2020

OVERVIEW

Tavalisse, a tyrosine kinase inhibitor with demonstrated activity against spleen tyrosine kinase, is indicated for the treatment of thrombocytopenia in adult patients with chronic immune thrombocytopenia (ITP) who have had an insufficient response to a previous treatment.[1] The safety and efficacy of Tavalisse have not been established in pediatric patients. Use of Tavalisse is not recommended for patients < 18 years of age because adverse events on actively growing bones were observed in nonclinical studies. Discontinue

Tavalisse if after 12 weeks of treatment the platelet count does not increase to a sufficient level to control bleeding.

Clinical Efficacy

The efficacy of Tavalisse was established in two identical, double-blind, placebo-controlled, multinational, randomized (2:1), 24-week studies (FIT-1 and FIT-2) in patients with persistent or chronic ITP with an insufficient response to previous therapies.[1,2] An open-label extension trial (FIT-3), involving patients from FIT-1 and FIT-2 was also performed.[1,3] In FIT-1 (n = 76), a stable platelet response (defined as at least 50 x 10^9/L on at least four of the six visits between Weeks 14 to 24) was achieved in 18% of patients (n = 9/51) who received Tavalisse compared with none of the patients who received placebo (P = 0.03).[1,2] In FIT-2 (n = 74), a stable platelet response was achieved in 16% of patients (n = 8/50) given Tavalisse vs. 4% of patients (n = 1/24) given placebo (a non statistically-significant difference). In FIT-1 and FIT-2, 47 patients given Tavalisse had received a prior thrombopoietin receptor agonist TPO-RA therapy, of which 17% of patients (n = 8/47) achieved a stable response. In FIT-3 (n = 123), 50% of the patients (n = 61/123) discontinued early. Of the 44 patients treated with placebo in the prior study, 23% of patients (n = 10/44) met the criteria for a stable response.

Guidelines

In 2019 the American Society of Hematology updated guidelines for immune thrombocytopenia.[4] There are several recommendations. For adults with ITP for at least 3 months who are corticosteroid-dependent or unresponsive to corticosteroid, a thrombopoietin receptor agonist (either Promacta® [eltrombopag tablets and oral suspension] or Nplate® [romiplostim injection for subcutaneous use]) or a splenectomy are recommended. In children with newly diagnosed ITP who have non-life-threatening mucosal bleeding, corticosteroids are recommended. For children who have non-life-threatening mucosal bleeding and do not respond to first-line treatment, thrombopoietin receptor agonists are recommended. Other treatment options in children and adults include intravenous immunoglobulin (IVIG), anti-D immunoglobulin, and rituximab.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Tavalisse. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Tavalisse as well as the monitoring required for adverse event and long-term efficacy, approval requires Tavalisse to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tavalisse is recommended in those who meet the following criteria:

FDA-Approved Indications

169. Chronic Immune Thrombocytopenia. Approve for if the patient meets one of the following criteria (A or B):

19. Initial Therapy. Approve for 3 months if the patient meets all of the following criteria (i, ii, iii, and iv):

i. The patient meets one of the following (a or b):

a) The patient has a platelet count < 30 x 10^9/L (< 30,000/µL): OR

b) The patient has a platelet count < 50 x 10^9/L (< 50,000/µL) and according to the prescriber the patient is at an increased risk of bleeding; AND

ii. The patient is ≥ 18 years of age; AND

iii. The agent is prescribed by or in consultation with a hematologist; AND

iv. The patient meets one of the following criteria (a or b):

a) The patient has tried at least one other therapy.
Note: Examples of therapies are systemic corticosteroids, intravenous immunoglobulin, anti-D immunoglobulin, Promacta® (eltrombopag tablets and oral suspension), Nplate® (romiplostim injection for subcutaneous use), Doptelet® (avatrombopag tablets), or rituximab; OR

b) The patient has undergone splenectomy; OR

C. Continuation of Therapy. Approve for 1 year if the patient meets both of the following criteria (i and ii):

iii. According to the prescriber the patient demonstrates a beneficial clinical response (e.g., increased platelet counts); AND

iv. The patient remains at risk for bleeding complications.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Tavalisse has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below.

139. B-Cell Lymphomas. Tavalisse has been investigated in patients with various B-cell lymphomas (e.g., non-Hodgkin's lymphoma, diffuse large B-cell lymphoma [DLBCL]).[5,6] Many other therapies are available for this use.

140. Rheumatoid Arthritis. Tavalisse has been studied in patients with rheumatoid arthritis.[7-11] However, other therapies are more well-established and are recommended in guidelines.

141. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Tolvaptan Products – Jynarque® (tolvaptan tablets – Otsuka)

DATE REVIEWED: 06/10/2020

OVERVIEW

Jynarque, a selective vasopressin V_2-receptor antagonist, is indicated to slow kidney function decline in adults at risk of rapidly-progressing autosomal dominant polycystic kidney disease (ADPKD).[1]

Disease Overview

ADPKD is a heterogeneous, inherited kidney disorder associated with the development of kidney cysts, which result in kidney pain, hypertension, renal failure, and other clinical sequelae.[5-8] The condition is a common cause of end-stage renal disease (ESRD); however, other organs are also impacted (e.g., hepatic and vascular systems). Progressive kidney enlargement occurs; however, manifestations generally do not occur until later in life (fourth decade) due to compensatory renal mechanisms. If a parent has the condition, a child has a 50% chance of inheritance. Approximately 600,000 people in the US have this condition.

Clinical Efficacy

Jynarque was shown to slow the rate of decline in renal function in adults at risk of rapidly-progressing ADPKD in two trials.[1-4] TEMPO 3:4 (n = 1,445) [published] involved adults (18 to 50 years of age) with early, rapidly-progressing (total kidney volume ≥ 750 mL and aged < 51 years) ADPKD who received Jynarque or placebo for up to 3 years.[1-2] Patients had an average estimated glomerular filtration rate (eGFR) of 82 mL/min/1.73 m^2. The prespecified primary endpoint of 3-year change in total kidney volume was achieved with Jynarque therapy ($P < 0.0001$).[1] During the 3-year period, total kidney volume increased by 2.8% per year with Jynarque vs. 5.5% per year with placebo ($P < 0.001$). [2] The difference in total kidney volume occurred mainly in Year 1, with little additional differences noted in Year 2 and 3.[1] The relative rate of ADPKD-related events were decreased by 13.5% in patients randomized to Jynarque compared with placebo (44 vs. 50 events per 100 person-years; $P = 0.0095$). This composite endpoint was primarily driven by decreases in worsening kidney function and kidney pain events.[1-2] TEMPO 4:4 *(*n = 871) [published] involved patients completing TEMPO 3:4 and provided an additional 2 years of data regarding the effects of Jynarque, as all patients were given active therapy.[1,3] The difference between groups in total kidney volume was not maintained.[1] The percent changes in total kidney volume from the baseline of TEMPO 3:4 to Month 24 of TEMPO 4:4 were 29.9% among those previously receiving Jynarque vs. 31.6% who were given placebo prior [$P = 0.38$]).

REPRISE (n = 1,370) [published] involved adults (18 to 65 years of age) with later stage ADPKD who received Jynarque or placebo for up to 1 year.[1,4] The trial included a prerandomization phase to assess tolerability, as well as a 3-week randomized withdrawal period to evaluate renal function. Patients had an

average eGFR of 41 mL/min/1.73 m^2. In the randomized period, the change in eGFR from pretreatment baseline to post-treatment follow-up was -2.3 mL/min/1.73 m^2/year with Jynarque compared with -3.6 mL/min/1.73 m^2/year with placebo, with a treatment effect of 1.3 mL/min/1.73 m^2/year ($P < 0.0001$). The eGFR slope (with adjustment per trial duration), a key secondary endpoint, also demonstrated a difference between treatment groups of 1.0 mL/min/m^2/year ($P < 0.0001$).

Guidelines

The European Renal Association-European Dialysis and Transplant Association (ERA-EDTA) Working Groups on Inherited Kidney Disorders and European Renal Best Practice published a position statement regarding use of tolvaptan in ADPKD (2016).[10] A confirmed eGFR decline ≥ 5 mL/min/1.73 m^2 in 1 year, and/or ≥ 2.5 mL/min/1.73 m^2 per year over a period of 5 years defines rapid progression. Also, a total kidney volume increase > 5% per year by repeated measurements (preferably three or more, each at least 6 months apart and by magnetic resonance imaging) defines rapid progression.[10] The pivotal trials for Jynarque did not involve patients with Stage 5 CKD (glomerular filtration rate [GFR] < 15 mL/min/1.73 m^2 or receiving dialysis).

The National Kidney Foundation and the Polycystic Kidney Disease Foundation, list tolvaptan as an FDA-approved treatment option for patient with ADPKD.[8,11]

Safety

Jynarque has a Boxed Warning regarding a risk of serious liver injury which can be fatal.[1] Monitor transaminases and bilirubin levels prior to therapy initiation, at 2 weeks and 4-weeks after initiation, then continuing monthly for the first 18 months and once every 3 months thereafter.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Jynarque. All approvals are provided for the duration noted below. Due to the specialized skills required for evaluation and diagnosis of patients treated with Jynarque as well as the monitoring required for adverse events and long-term efficacy, approval requires Jynarque to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Jynarque is recommended in those who meet the following criteria:

FDA-Approved Indication

170. Autosomal Dominant Polycystic Kidney Disease. Approve for 1 year if the patient meets the following criteria (A, B, C and D):

20. The patient is ≥ 18 years of age; AND

21. The agent is prescribed by or after consultation with a nephrologist; AND

22. According to the prescribing physician, the patient has rapidly-progressing autosomal dominant polycystic kidney disease (e.g., reduced or declining renal function, high or increasing total kidney volume [height adjusted]); AND

23. The patient does not have Stage 5 chronic kidney disease (glomerular filtration rate < 15 mL/min/1.73 m^2 or receiving dialysis).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Jynarque has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below.

142. Patient is Currently Receiving Samsca® (tolvaptan tablets). Samsca is a tolvaptan product that is indicated for the treatment of clinically-significant hypervolemic and euvolemic hyponatremia, including patients with heart failure and syndrome of inappropriate antidiuretic hormone.[9] Concomitant use is not recommended.

143. Hyponatremia. Samsca is another tolvaptan product indicated for the treatment of clinically-significant hypervolemic and euvolemic hyponatremia (serum sodium < 125 mEq/L or less marked hyponatremia that is symptomatic and has resisted correction and fluid restriction), including patients with heart failure and syndrome of inappropriate antidiuretic hormone (SIADH). Samsca should be used for this condition.

144. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Tolvaptan Products – Tolvaptan tablets (Samsca® – Otsuka; generics)

DATE REVIEWED: 06/10/2020

OVERVIEW
Samsca, a selective vasopressin V_2-receptor antagonist, is indicated for the treatment of clinically significant hypervolemic and euvolemic hyponatremia (serum sodium < 125 mEq/L or less marked hyponatremia that is symptomatic and has resisted correction with fluid restriction), including patients with heart failure (HF) and syndrome of inappropriate antidiuretic hormone (SIADH). Patients requiring intervention to raise serum sodium urgently to prevent or to treat serious neurological symptoms should not be treated with Samsca. It has not been established that raising serum sodium with Samsca provides a symptomatic benefit to patients.

Clinical Data
Two trials (Study of Ascending Levels of Tolvaptan in Hyponatremia 1 and 2 [SALT-1 and SALT-2; n = 424]) demonstrated that Samsca increased serum sodium effectively in patients with euvolemic or hypervolemic hyponatremia that was due to many underlying causes (e.g., HF, liver cirrhosis, SIADH).[1,2] Patients (aged ≥ 18 years) received therapy for 30 days with Samsca or placebo and were followed for an additional 7 days after study withdrawal. Patients in the trial had a serum sodium < 135 mEq/L at study entry (baseline 129 mEq/L). In both trials, Samsca therapy led to a greater increase in serum sodium ($P < 0.0001$) compared with baseline for the measured endpoints at Day 4 and Day 30. The effects of sustained serum sodium were demonstrated for up to 1 year in an open-label study.[1] Another long-term analysis (the Safety and sodium Assessment of Long-term Tolvaptan With hyponatremia: A year-long, open-label Trial to gain Experience under Real-world conditions [SALTWATER]) showed that in 111 patients who received Samsca for approximately 1 year, increases in serum sodium were maintained.[1,3]

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of Samsca. All approvals are provided for up to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Samsca is recommended in those who meet the following criteria:

FDA-Approved Indications

15. Hyponatremia. Approve for up to 30 days if patient meets ONE of the following criteria (A, B, or C):
- **A)** The patient has a serum sodium < 125 mEq/L at baseline; OR
- **B)** The patient meets the following criteria (i and ii):
  - **i.** The patient has less marked hyponatremia, defined as serum sodium < 135 mEq/L at baseline; AND
  - **ii.** The patient has symptomatic hyponatremia.
    Note: Symptoms of hyponatremia include nausea, vomiting, headache, lethargy, confusion; OR
- **C)** The patient has already been started on Samsca and has received < 30 days of therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Samsca has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

145. **Autosomal Dominant Polycystic Kidney Disease (ADPKD).** Jynarque (tolvaptan tablets) is another tolvaptan product that is indicated to slow kidney function decline in adults at risk of rapidly-progressing ADPKD. The recommended dosing differs.[4] The Samsca prescribing information states that tolvaptan should not be prescribed or used to treat ADPKD outside of the FDA-approved REMS for ADPKD.

146. **Patient is Currently Receiving Jynarque® (tolvaptan tablets).** Jynarque is another tolvaptan product that is indicated to slow kidney function decline in adults at risk of rapidly-progressing ADPKD. Concomitant use is not recommended.

147. **Patients Requiring Intervention to Raise Serum Sodium Urgently to Prevent or to Treat Serious Neurological Symptoms.** Samsca has not been studied in a setting of urgent need to raise serum sodium acutely.[1]

148. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Topical Acyclovir Cream and Ointment Prior Authorization Policy

- Zovirax® (acyclovir 5% cream – Valeant, generics)
- Zovirax® (acyclovir 5% ointment – Valeant, generics)

REVIEW DATE: 06/24/2020

OVERVIEW

Acyclovir 5% cream (Zovirax, generics) is indicated for the treatment of recurrent herpes labialis (cold sores) in immunocompetent adults and adolescents 12 years of age and older.[1] Acyclovir 5% ointment (Zovirax, generics) is indicated in the management of initial genital herpes and in limited non-life-threatening mucocutaneous herpes simplex virus infections in immunocompromised patients.[2]

POLICY STATEMENT
Prior Authorization is recommended for prescription benefit coverage of acyclovir 5% cream and acyclovir 5% ointment. All approvals are provided for the duration noted below. For the ointment, a trial of generic acyclovir 5% ointment is required prior to approval of brand Zovirax 5% ointment.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

I. Coverage of acyclovir 5% cream (Zovirax 5% cream, generics) is recommended in those who meet the following criterion:

FDA-Approved Indication

28. Herpes Labialis (Cold Sores). Approve for 1 year if the patient meets both of the following criteria (A and B):
- **a)** Patient is ≥ 12 years of age; AND
- **b)** Patient is immunocompetent.

II. Coverage of acyclovir 5% ointment (Zovirax 5% ointment, generics) is recommended in those who meet the following criteria:

FDA-Approved Indications

29. Genital Herpes. Approve for 1 year if the patient meets one of the following criteria (A or B):
- a. Generic acyclovir 5% ointment is requested; OR
- b. If brand Zovirax 5% ointment is requested, the patient meets both of the following criteria (i and ii):
  - i. Patient has tried generic acyclovir 5% ointment; AND
  - ii. Patient cannot use the generic product to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the brand and the bioequivalent generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.

30. Limited Non-Life-Threatening Mucocutaneous Herpes Simplex Virus Infections. Approve for 1 year if the patient meets one of the following criteria (A and B):
- a. Patient is immunocompromised; AND
- b. Patient meets one of the following criteria (i or ii):
  - i. Generic acyclovir 5% ointment is requested; OR
  - ii. If brand Zovirax 5% ointment is request, the patient meets both of the following criteria (a and b):
    1. Patient has tried generic acyclovir 5% ointment; AND
    2. Patient cannot use the generic product due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the brand and the bioequivalent generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of acyclovir 5% cream and acyclovir 5% ointment are not recommended in the following situation:

13. Shingles. Shingles is a viral infection caused by the varicella-zoster virus, the same virus that causes chickenpox.[3,4] The Centers for Disease Control and Prevention (CDC) and the National Institute of Health (NIH), National Institute of Neurological Disorders and Stroke (NINDS) cite the use of oral antivirals (acyclovir capsules/tablets/suspension [Zovirax, generics], famciclovir tablets [Famvir®, generics], and valacyclovir caplets [Valtrex®, generics]) for the treatment of shingles. Oral antivirals speed healing and reduce the risk of complications. Topical antivirals are not noted as treatment options for shingles.

14. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Topical Alpha-Adrenergic Agonists for Rosacea

- Mirvaso® (brimonidine gel, 0.33% – Galderma)
- Rhofade™ (oxymetazoline hydrochloride cream, 1% – EPI Health)

DATE REVIEWED: 05/27/2020

OVERVIEW

The topical alpha-adrenergic agonists, Mirvaso and Rhofade, are indicated for the topical treatment of persistent facial erythema associated with rosacea in adults ≥ 18 years of age.[1,2]

Mirvaso is an $alpha_2$-adrenergic agonist and Rhofade is an $alpha_{1A}$-adrenergic agonist. Both of these products have been shown to decrease the erythema associated with rosacea; neither has been shown to exert any beneficial effects on inflammatory lesions.[1-4]

Rosacea, a chronic, inflammatory facial skin disorder, affects approximately 16 million people in the US.[5-7] The hallmark of rosacea is centrofacial persistent erythema, typically affecting the cheeks, chin, forehead, and nose; the perioral and periocular regions are generally unaffected.[6] Patients with rosacea typically present with clinical manifestations that include flushing, persistent facial erythema, dryness, burning and stinging skin, inflammatory papules and pustules, telangiectasia or dilation of blood vessels, and watery or irritated eyes.[7] Diffuse centrofacial erythema is almost universally present in all patients

with rosacea; it generally intensifies in magnitude during a flare and persists between flares at a lesser degree of intensity.[8]

The American Acne & Rosacea Society (AARS) published consensus guidelines on the management of rosacea in 2014.[3,4] The panel notes that a gentle skin care and photoprotection regimen is recommended for all patients. A topical alpha-adrenergic agonist is recommended for use as monotherapy in patients with centrofacial erythema without papulopustular lesions or in combination with an anti-inflammatory (e.g., topical metronidazole, azelaic acid 15% gel [Finacea®, generics], Finacea® foam [azelaic acid], ivermectin 1% cream [Soolantra®, generics]) in patients with centrofacial erythema and papulopustular lesions. The topical alpha-agonists should not be considered as alternatives to anti-inflammatory therapies.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of the topical alpha-adrenergic agonists. All approvals are provided for 1 year in duration.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Mirvaso or Rhofade is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Facial Erythema Due to Rosacea in Adults ≥ 18 years of age.** Approve for 1 year.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Neither Mirvaso nor Rhofade has been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

149. Erythema Caused by Conditions Other Than Rosacea.

150. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Topical Diclofenac Sodium Gel (Solaraze) Prior Authorization Policy
- Solaraze® (diclofenac sodium 3% gel – PharmaDerm, generics)

REVIEW DATE: 06/24/2020

OVERVIEW

Diclofenac sodium 3% gel (Solaraze®, generics) is a topical nonsteroidal anti-inflammatory drug (NSAID) indicated for the topical treatment of actinic keratoses (AK).[1] It is also noted in the labeling that sun avoidance is indicated during therapy. The mechanism of action of diclofenac sodium in the treatment of AK is unknown or not completely understood; however, it is hypothesized that diclofenac sodium may clear AK lesions via cell signaling mechanisms and possibly may play a part in the reduction of angiogenesis and induction of apoptosis (either directly or through a cytotoxic independent pathway).[2]

There are other topical NSAIDs commercially available in the US: diclofenac sodium topical 1% gel (Voltaren® Gel, generics) which is indicated for the relief of the pain of osteoarthritis (OA) of joints amenable to topical treatment, such as the knees and those of the hands; Flector® Patch (diclofenac epolamine 1.3% topical patch) which is indicated for the topical treatment of acute pain due to minor strains, sprains, and contusions; and Pennsaid® (diclofenac sodium 2% w/w topical solution) which is indicated for the treatment of the pain of OA of the knee(s).[3-5]

Other Uses

There are data to support the use of diclofenac sodium 3% gel for the treatment of actinic cheilitis (actinic keratosis of the lips). In a study where 31 patients with actinic cheilitis were treated with diclofenac 3% gel for a period of 90 days, ten patients showed total remission and three patients showed partial improvement.[6] A report of six cases treated with diclofenac sodium 3% gel demonstrated complete response for five patients and partial response for one patient, after 6 weeks of treatment.[7] In an open-label study involving 27 patients with actinic cheilitis who completed 30 to 180 days of therapy with diclofenac 3% in 2.5% hyaluronic acid gel, complete remission was observed in 44% of patients (n = 12/27) and a significant improvement in 56% (n = 15/27) of patients was observed.[8] Another open-label study demonstrated efficacy with diclofenac sodium 3% gel when used for 90 days in 19 patients with actinic cheilitis.[9]

Diclofenac can also be used for the treatment of Bowen's disease, a form of squamous cell carcinoma in situ.[10,11] There are two published case series (one involving two patients, another involving five patients) which demonstrated clinical and histological resolution of Bowen's disease in all seven patients. In one case series, patients were treated for 90 days, while in the other case series, patients were treated for 8 weeks. Available guidelines detailing management of Bowen's disease note that evaluation of studies on the treatment of Bowen's disease can be problematic due to the varying healing and success rates with the

varying locations of the lesions/patches.[12,13] In addition, the management of Bowen's disease employs several different types of treatment and, like the management of AK, selection of therapy depends on various factors such as lesion characteristics, lesion location, etc. The main treatment options used for Bowen's disease include topical fluorouracil (5-FU), imiquimod, cryotherapy, curettage, excision, photodynamic therapy, radiotherapy, and laser.[12]

The use of diclofenac sodium 3% gel has been studied in a small open-label study (exact formulation not specified) and in one case series for the management of patients with disseminated superficial actinic porokeratosis (DSAP).[14,15] In the open-label study, 17 adults with DSAP initially received 12 weeks of therapy with diclofenac sodium 3% gel and could continue for an additional 12 weeks.[14] At 12 weeks, the target area lesions (treated lesions) had a mean reduction of 4% vs. a 12% mean increase in the total body (global) lesions. For those ten patients who received 24 weeks of therapy, there was a mean increase in the target area lesions of 10% vs. a mean increase of 19% for the total body (global) lesions at that time point. Only three of the ten patients who completed 24 weeks of therapy had a reduction in their number of lesions. In the eight patient case series, all patients received diclofenac sodium 3% gel for at least 6 months.[15] All of these DSAP patients had tried at least one other therapy (mean was three previous therapies) prior to diclofenac sodium 3% gel. Only two of the eight patients (25%) had a partial response at 6 months. Three other patients received more than 6 months of treatment (7 or 13 months), but none experienced a response. As is typical of other therapies tried for the management of DSAP, results with diclofenac sodium 3% gel demonstrated limited, if not marginal, effectiveness. Most of the therapies tried for DSAP (e.g., cryotherapy, topical 5-FU, topical vitamin D_3 analogs, retinoids, keratolytics, imiquimod, laser, and photodynamic therapy) are ineffective.[14-16]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of diclofenac sodium 3% gel. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of diclofenac sodium 3% gel is recommended in those who meet the following criteria:

FDA-Approved Indications

16. **Actinic Keratoses.** Approve for 6 months.

Other Uses with Supportive Evidence

17. **Actinic Cheilitis (Actinic Keratoses of the Lip[s]).** Approve for 6 months.

3. **Bowen's Disease.** Approve for 6 months after a trial of at least one other therapy used for the management of Bowen's disease.
   Note: Examples of therapies for Bowen's disease include: topical 5-fluorouracil [5-FU], imiquimod, cryotherapy, photodynamic therapy, curettage, excision, laser, or radiotherapy.

4. **Disseminated Superficial Actinic Porokeratosis.** Approve for 6 months after a trial of at least two other therapies used for the management of disseminated superficial actinic porokeratosis.
   Note: Examples of therapies for management of disseminated superficial actinic porokeratosis: topical 5-fluorouracil [5-FU], imiquimod, topical corticosteroids, topical vitamin D_3 analogs, topical or oral retinoids, cryotherapy, photodynamic therapy, and laser.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of diclofenac sodium 3% gel is not recommended in the following situations:

151. Osteoarthritis (OA). The benefit of topical diclofenac therapy in osteoarthritis is uncertain. There has been one small, randomized, placebo-controlled study assessing the efficacy of a topical diclofenac 3%/sodium hyaluronate 2.5% gel (Canadian formulation) applied as 2 grams four times daily to one joint for 2 weeks in patients (n = 119) with uncontrolled OA pain despite chronic (≥ 1 month) oral nonsteroidal anti-inflammatory drug (NSAID) use.[17] The addition of topical diclofenac 3%/sodium hyaluronate to oral NSAID therapy resulted in only marginally greater analgesic effect than NSAID alone. Other topical agents are indicated for this use.

152. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Topical Retinoids – Aklief® – (trifarotene cream – Galderma Laboratories)

DATE REVIEWED: 12/04/2019

OVERVIEW

Aklief, a topical retinoid, is indicated for the topical treatment of acne vulgaris in patients 9 years of age and older.

Aklief has not been added to the guidelines. Topical retinoids are effective for the treatment of acne, both as initial and maintenance therapy. Treatment algorithms and consensus statements do not differentiate between the topical retinoids, but rather refer to them as a therapeutic category.[2-5]

Topical retinoid products (e.g., tretinoin) have been used to treat numerous other medical skin conditions in addition to acne vulgaris.[6] Some indications have minimal published clinical data and thus appear experimental. Topical retinoid products have also been used to treat a variety of cosmetic skin conditions, such as wrinkles, stretch marks, liver spots, premature aging, and photo-aged or photo-damaged skin.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Aklief. Use should be limited to the treatment of medical conditions, and prescription benefit coverage is not recommended for cosmetic conditions. All approvals are provided for the duration noted below

Automation: None

RECOMMENDED AUTHORIZATION CRITERIA

FDA-Approved Indication

18. Acne Vulgaris. Approve for 3 years.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Aklief has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

153. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Topical Retinoids – Panretin Prior Authorization Policy
- Panretin® (alitretinoin topical gel – Eisai, Inc.)

REVIEW DATE: 06/24/2020

OVERVIEW

Panretin, a topical retinoid, is indicated for topical treatment of cutaneous lesions in patients with Acquired Immunodeficiency Syndrome (AIDS)-related Kaposi sarcoma (KS).[1] It is not indicated when systemic anti-KS therapy is required (e.g., more than 10 new KS lesions in the prior month, symptomatic lymphedema, symptomatic pulmonary KS, or symptomatic visceral involvement). There is no experience to date using Panretin gel with systemic anti-KS treatment.

Disease Overview

KS is a multifocal malignancy of endothelial cells, presenting with characteristic red or brown papules.[2,3] Skin lesions are most common although other areas may be involved, including the oral mucosa and lymphatic system.[4] KS is caused by human herpesvirus 8, which is also known as KS-associated herpesvirus (KSHV).[2] KSHV infections are usually asymptomatic but may lead to disease in immunosuppressed individuals. The incidence of KS in the US is approximately six cases per million people annually.[3] AIDS-related KS, also known as epidemic KS, is the most common type of KS in the United States. In persons infected with HIV, the development of KS is an AIDS-defining illness. Additionally, about one in 200 transplant recipients in the US will develop KS (iatrogenic/transplant-associated KS). In the iatrogenic/transplant-associated form, adequate response is often achieved by reduction or cessation of immunosuppression. Other forms of KS include classic KS and endemic KS, which are not common in the US.

Guidelines

Use of Panretin is addressed in the National Comprehensive Cancer Network (NCCN) guidelines for AIDS-related KS (version 2.2020 – June 1, 2020).[2] For limited cutaneous AIDS-releated KS that is symptomatic and/or cosmetically unacceptable, antiretroviral therapy may be used with or without topical agents (i.e., Panretin or imiquimod 5% cream), systemic therapy, intralesional chemotherapy, radiation therapy, or local excision (all category 2A). For patients with advanced cutaneous, oral, visceral, or nodal disease, Panretin is not recommended; a clinical trial, systemic therapy, or radiation treatment may be used (all in conjunction with antiretroviral therapy).

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Panretin. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Panretin, approval requires Panretin to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Prior authorization and prescription benefit coverage are not recommended for cosmetic uses.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Panretin is recommended in those who meet the following criteria:

FDA-Approved Indications

29. Kaposi Sarcoma Related to Acquired Immunodeficiency Syndrome. Approve for 1 year if the patient meets all of the following (A and B):
Note: Kaposi sarcoma related to Acquired Immunodeficiency Syndrome may also be referred to as epidemic Kaposi sarcoma.

H) Patient is not receiving systemic therapy for Kaposi sarcoma; AND

I) Panretin is prescribed by or in consultation with a dermatologist, oncologist, or infectious disease specialist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Panretin is not recommended in the following situations:

7. Cosmetic Uses (e.g., photoaging of the skin). Cosmetic use is not recommended for coverage as this indication is excluded from coverage in a typical pharmacy benefit.

8. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Topical Retinoids – Tazarotene Products Prior Authorization Policy

- Arazlo™ (tazarotene 0.045% lotion – Bausch Health US, LLC)
- Fabior® (tazarotene 0.1% foam – Mayne Pharma)
- Tazorac® (tazarotene 0.05% cream, 0.05% gel and 0.1% cream [generics], 0.1% gel – Allergan)

REVIEW DATE: 07/01/2020

OVERVIEW

Tazorac gel is indicated for the following uses:[1]

- **Plaque psoriasis**, in patients with up to 20% body surface area involvement (0.05% and 0.1% strengths)
- **Facial acne vulgaris,** in patients with mild to moderate severity (0.1% strength only).

Tazorac cream (0.05% and 0.1%) is indicated for the following uses:[2]

- **Plaque psoriasis** involvement (0.05% and 0.1% strengths).
- **Acne vulgaris** (0.1% strength only).

Arazlo lotion is indicated for the topical treatment of acne vulgaris in patients ≥ 9 years of age.[3]

Fabior foam is indicated for the topical treatment of acne vulgaris use in patients ≥ 12 years of age.[4]

In addition to acne vulgaris and plaque psoriasis, topical tazarotene has been used to treat other medical skin conditions, such as basal cell carcinoma and congenital ichthyoses.[5] Topical tazarotene has also been used to treat cosmetic skin conditions such as wrinkles, premature aging, and treatment of photo-aged or photo-damaged skin.

Avage® (tazarotene 0.1% cream) is indicated as an adjunctive agent for the mitigation (palliation) of facial fine wrinkling, facial mottled hyper- and hypo-pigmentation, and benign facial lentigines in patients who use comprehensive skin care and sunlight avoidance programs.[6] Avage is not included in this Prior Authorization policy.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Arazlo, Fabior, and Tazorac. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of topical tazarotene products is recommended for those who meet the following criteria:

FDA-Approved Indications

1. **Acne Vulgaris.** Approve for 3 years.

2. **Plaque Psoriasis (Psoriasis Vulgaris).** Approve for 3 years.

Other Uses with Supportive Evidence

3. **Treatment of Other Non-Cosmetic Conditions Not Listed Above.** Approve for 1 year.
   Note: Examples of other non-cosmetic conditions include: psoriasis of fingernails or toenails, oral lichen planus, congenital ichthyoses (X-linked recessive ichthyosis, non-erythrodermic autosomal recessive lamellar ichthyosis, autosomal dominant ichthyosis vulgaris), basal cell carcinoma, mycosis fungoides, cutaneous T-cell lymphoma, keratosis pilaris (atrophicans), actinic keratoses, skin neoplasms, warts, dermatitis/eczema, folliculitis, acne rosacea, cystic acne, comedonal acne.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of topical tazarotene products is not recommended in the following situations:

1. **Cosmetic Conditions.** Cosmetic use is not recommended for coverage as this indication is excluded from coverage in a typical pharmacy benefit.
   Note: Examples of cosmetic conditions include: alopecia, hyperpigmentation, liver spots, melasma/cholasma, seborrheic keratosis, stretch marks, scarring, wrinkles, premature aging, photo-aged or photo-damaged skin, mottled hyper- and hypopigmentation, benign facial lentigines, roughness, telangiectasia, skin laxity, keratinocytic atypia, melanocytic atypia, dermal elastosis.

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Topical Retinoid – Tretinoin Products Prior Authorization Policy

- Altreno™ (tretinoin lotion – Dow Pharmaceuticals, a division of Valeant Pharmaceuticals)
- Atralin™ (tretinoin gel – Valeant Pharmaceuticals, generics)
- Avita® (tretinoin cream, gel – Mylan, generics [Avita gel 0.025% is brand only])
- Retin-A® (tretinoin cream, gel – Valeant Pharmaceuticals, generics)

- Retin-A® Micro® (tretinoin gel microsphere – Valeant Pharmaceuticals, generic)
- Retin-A Micro® Pump (tretinoin gel microsphere – Valeant Pharmaceuticals, generics [Retin-A Micro gel 0.06% and 0.08% are branded products only])
- Tretin•X® (tretinoin cream – Onset Dermatologicals)
- Veltin™ (clindamycin phosphate 1.2% and tretinoin 0.025% gel – Aqua Pharmaceuticals)
- Ziana® (clindamycin phosphate 1.2% and tretinoin 0.025% gel – Valeant Pharmaceuticals, generics)

REVIEW DATE: 08/05/2020

OVERVIEW

The following topical tretinoin products are indicated for the topical treatment of acne vulgaris: Altreno, Atralin, Avita, Retin-A, Retin-A Micro, Tretin•X, and generics.[1,2] Renova® and Refissa® are also topical tretinoin products; these products are not indicated for use in the treatment of acne vulgaris.[1]

Ziana and Veltin are combination gel products containing clindamycin phosphate 1.2% and tretinoin 0.025%; these products are indicated for the topical treatment of acne vulgaris in patients aged ≥ 12 years.[1,2]

Topical tretinoin products have been used to treat numerous other medical skin conditions in addition to acne vulgaris. Some indications have minimal published clinical data and thus appear experimental. Topical tretinoin products have also been used to treat a variety of cosmetic skin conditions, such as wrinkles, stretch marks, liver spots, premature aging, and photo-aged or photo-damaged skin.[2]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of topical tretinoin products. All approvals are provided for the duration noted below.

Prior Authorization and prescription benefit coverage is not recommended for Renova or Refissa.

Automation: An age edit targeting patients > 30 years of age is recommended to monitor for appropriate use and to screen for cosmetic use. Therefore, patients ≤ 30 years of age will be approved at the point-of-service. For patients > 30 years of age, coverage will be determined by the prior authorization criteria.

RECOMMENDED AUTHORIZATION CRITERIA

I. Coverage of topical tretinoin products is recommended in those who meet the following criteria:

FDA-Approved Indication

19. Acne Vulgaris. Approve for 3 years.

Other Uses with Supportive Evidence

~~20.~~ Treatment of Other Non-Cosmetic Conditions Not Listed Above. Approve for 1 year.
Note: Examples of other non-cosmetic conditions include acne rosacea, actinic keratosis/treatment of precancerous lesions, ichthyosis, diabetic foot ulcers, mucositis, warts, lichen planus, lichen sclerosis, pseudofolliculitis, oral leukoplakia, molluscum contagiosum, Darier's disease (keratosis follicularis), dermatitis/eczema, folliculitis, keratosis pilaris, basal cell carcinoma (skin cancer), confluent and reticulated papillomatosis, and cutis laxa.

II. Coverage of clindamycin plus tretinoin combination products (Ziana, generics; Veltin) is recommended in those who meet the following criteria:

FDA-Approved Indication

1. Acne Vulgaris. Approve for 1 year.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of topical tretinoin products and topical clindamycin/tretinoin products is not recommended in the following situations:

154. Cosmetic Conditions. Cosmetic use is not recommended for coverage as this indication is excluded from coverage in a typical pharmacy benefit.
Note: Examples of cosmetic conditions include liver spots, stretch marks, scarring, solar elastosis, premature aging, treatment of photo-aged or photo-damaged skin, solar lentigines, skin roughness, mottled hyperpigmentation, age spots, wrinkles, geographic tongue, hyperpigmentation (caused by folliculitis, acne, or eczema), melasma/cholasma, alopecia androgenetic, alopecia areata, seborrheic keratosis, milia, nevus, poikiloderma (of Civatte), purpura (actinic/solar), keloids, and sebaceous hyperplasia.

155. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Uplizna Prior Authorization Policy

- Uplizna™ (inebilizumab-cdon injection for intravenous use – Viela Bio)

REVIEW DATE: 06/24/2020

OVERVIEW

Uplizna, a CD19-directed cytolytic antibody, is indicated for the treatment of neuromyelitis optica spectrum disorder (NMOSD) in patients ≥ 18 years of age who are anti-aquaporin-4 antibody positive.[1] The recommended dose is 300 mg administered as an intravenous infusion under the close supervision of an experienced healthcare professional. The initial infusion is followed 2 weeks later by a second infusion. Starting 6 months from the first infusion, subsequent doses are administered once every 6 months.

Disease Overview

NMOSD is a rare, relapsing, autoimmune disorder of the brain and spinal cord with optic neuritis and/or myelitis as predominate characteristic symptoms.[2] NMOSD often causes significant, permanent damage to vision and/or spinal cord function causing blindness or impaired mobility.[3] Patients may experience pain, paralysis, loss of bowel and bladder control, loss of visual acuity, uncontrolled motor functions, and complications can cause death. Soliris® (eculizumab for intravenous use), a complement inhibitor, is the only other FDA-approved medication for treatment of NMOSD in adult patients who are anti-aquaporin-4 antibody positive.[4] For acute attacks, typical treatment is high-dose intravenous corticosteroids.[5,6] Plasma exchange may be effective in patients who suffer acute severe attacks that do not response to intravenous corticosteroids. For long-term control of the disease a variety of immunosuppressive drugs are utilized by providers as first-line therapy. While all are considered off-label use, corticosteroids, azathioprine, mycophenolate mofetil, and rituximab are treatments prescribed as preventative therapy.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Uplizna. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Uplizna as well as the monitoring required for adverse events and long-term efficacy, approval requires Uplizna to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Uplizna is recommended in those who meet the following criteria:

FDA-Approved Indications

171. Neuromyelitis Optica Spectrum Disorder. Approve for 1 year if the patient meets the following criteria (A, B, C, and D):
- **C)** Patient is ≥ 18 years of age; AND
- **D)** Neuromyelitis optica spectrum disorder diagnosis was confirmed by blood serum test for anti-aquaporin-4 antibody positive; AND
- **E)** Patient has previously tried one of the following systemic therapies (i, ii, iii, iv, or v):
  - **i.** Azathioprine
  - **ii.** Corticosteroid
  - **iii.** Mycophenolate mofetil
  - **iv.** Rituximab
  - **v.** Soliris (eculizumab for intravenous use)
- **F)** Uplizna is being prescribed by or in consultation with a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Uplizna is not recommended in the following situations:

244. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Vecamyl™ (mecamylamine hydrochloride tablets – Vyera Pharmaceuticals)

DATE REVIEWED: 05/27/2020

OVERVIEW

Vecamyl is a nicotinic parasympathetic ganglionic blocker indicated for the management of moderately severe to severe essential hypertension and in uncomplicated cases of malignant hypertension.[1, 2] Vecamyl prevents stimulation of postsynaptic receptors by acetylcholine released from presynaptic nerve endings. The hypotensive effect of Vecamyl is attributed to reduction in sympathetic tone, vasodilation, and reduced cardiac output. Vecamyl is considered a nonselective antagonist that easily passes through the blood-brain barrier, and thus, having the potential to affect nicotinic acetylcholine receptors in the central nervous system.

Guidelines

The Clinical Practice Guidelines from the American College of Cardiology/American Heart Association Task Force (2017) state the prevalence of severe hypertension has been declining, but approximately 12.3% of US adults with hypertension have an average systolic blood pressure ≥ 160 mm Hg or average diastolic blood pressure ≥ 100 mm Hg.[3] Numerous classes of antihypertensive agents are available to treat high blood pressure. Vecamyl is not suggested as a primary or secondary agent in the treatment of hypertension. The Evidence-Based Guideline for the Management of High Blood Pressure in Adults from the panel members of the eighth joint national committee (2014 [JNC 8]) advise selection among four specific medication classes (thiazide-type diuretics, calcium channel blockers, angiotensin-converting enzyme inhibitors, or angiotensin receptor blockers) as initial and secondary choices in treatment.[4]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Vecamyl. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Vecamyl as well as the monitoring required for adverse events and long-term efficacy, approval requires Vecamyl to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Vecamyl is recommended in those who meet the following criteria:

FDA-Approved Indications

252. Essential Hypertension, Moderately Severe to Severe. Approve for 1 year if the patient meets the following criteria (A):

A) The patient has tried four antihypertensive therapies each from different pharmacologic classes (e.g., diuretics, calcium channel blockers, angiotensin-converting enzyme inhibitors, and angiotensin receptor blockers [as single-entity or as combination products]) and has had at least one of the following from each of these agents (i or ii)

i. The patient has had inadequate efficacy; OR

ii. The patient has experienced adverse event(s) severe enough to warrant discontinuation of this agent, according to the prescriber.

253. Uncomplicated Malignant Hypertension. Approve for 1 year if the patient meets the following criteria (A):

A) The patient has tried four antihypertensive therapies each from different pharmacologic classes (e.g., diuretics, calcium channel blockers, angiotensin-converting enzyme inhibitors, and angiotensin receptor blockers [as single-entity or as combination products]) and has had at least one of the following from each of these agents (i or ii)

i. The patient has had inadequate efficacy; OR

ii. The patient has experienced adverse event(s) severe enough to warrant discontinuation of this agent, according to the prescriber.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Vecamyl has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

156. Tourette Syndrome. Limited data are available to validate the use of mecamylamine in Tourette Syndrome. A clinical trial has shown mecamylamine to not be an effective treatment for tics or for the total spectrum of symptoms associated with Tourette Syndrome.[5]

157. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Vesicular Monoamine Transporter Type 2 Inhibitors – Austedo® (deutetrabenazine tablets – Teva)

DATE REVIEWED: 06/10/2020

OVERVIEW

Austedo reversibly depletes monoamines (such as dopamine, serotonin, norepinephrine, and histamine) from nerve terminals.[1] Austedo and its major circulating metabolites (α-dihydrotetrabenazine [HTBZ] and β-HTBZ) reversibly inhibit vesicular monoamine transporter type 2 (VMAT2), resulting in decreased uptake of monoamines (e.g., dopamine) into synaptic vesicles and depletion of monoamine stores. Austedo is indicated for the treatment of chorea associated with Huntington's disease and for the treatment of tardive dyskinesia in adults. Austedo has been evaluated for use in one small, Phase Ib study in adolescents with moderate-to-severe tics associated with Tourette syndrome.[2] Tetrabenazine (Xenazine®, generics) is also a VMAT2 inhibitor indicated for the treatment of chorea associated with HD.[3]

Guidelines

According to the American Academy of Neurology (AAN) guidelines on the treatment of chorea of Huntington's disease (2012), if HD chorea requires treatment, clinicians should prescribe tetrabenazine (≤ 100 mg/day), amantadine (300 to 400 mg/day), or riluzole (200 mg/day) [Level B] for varying degrees of expected benefit.[5] Austedo is not addressed in the guidelines.

Safety

Austedo is contraindicated in patients who are suicidal or in patients with untreated or inadequately treated depression in patients with Huntington's disease.[1] Austedo also has a Boxed Warning regarding depression and suicidality in patients with Huntington's disease. Patients with Huntington's disease are at increased risk for depression, and suicidal ideation or behaviors (suicidality), and Austedo may increase the risk for suicidality in patients with Huntington's disease. When considering the use of Austedo, the risk of

suicidality should be balanced against the need for treatment of chorea. All patients treated with Austedo should be observed for new or worsening depression or suicidality. If depression or suicidality does not resolve, consider discontinuing treatment with Austedo.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Austedo. Because of the specialized skills required for evaluation and diagnosis of patients treated with Austedo as well as the monitoring required for adverse events and long-term efficacy, approval requires Austedo to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for 1 year in duration.

Documentation: In the Austedo Policy, documentation is required where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes, prescription claims records, prescription receipts and/or laboratory data.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Austedo is recommended in those who meet the following criteria:

FDA-Approved Indications

21. **Chorea Associated with Huntington's Disease:** Approve for 1 year if the patient meets BOTH of the following criteria (A and B):
    - **A)** Patient has been diagnosed with chorea associated with Huntington's Disease **[documentation required]**; AND
    - **B)** Austedo is prescribed by or in consultation with a neurologist.

22. **Tardive dyskinesia:** Approve for 1 year if Austedo is prescribed by or in consultation with a neurologist or psychiatrist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Austedo has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

158. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Vesicular Monoamine Transporter Type 2 Inhibitors – Ingrezza® (valbenazine capsules)

DATE REVIEWED: 06/10/2020

OVERVIEW

Ingrezza, a vesicular monoamine transporter type 2 (VMAT2) inhibitor, is indicated for the treatment of adults with tardive dyskinesia.[1] Ingrezza is thought to provide benefit in tardive dyskinesia through the reversible inhibition of VMAT2, a transporter that regulates monoamine (e.g., dopamine) uptake from the cytoplasm to the synaptic vesicle for storage and release, thereby reducing presynaptic release of dopamine. The initial dose is 40 mg once daily (QD) taken with or without food. After one week, increase to the recommended dose of 80 mg QD. Continuation of 40 mg QD dosing may be considered for some patients.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Ingrezza. Because of the specialized skills required for evaluation and diagnosis of patients treated with Ingrezza as well as the monitoring required for adverse events and long-term efficacy, approval requires Ingrezza to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for 1 year in duration.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Ingrezza is recommended in those who meet the following criteria:

FDA-Approved Indications

2. Tardive Dyskinesia. Approve for 1 year if Ingrezza is prescribed by or in consultation with a neurologist or psychiatrist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Ingrezza has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

159. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Vesicular Monoamine Transporter Type 2 Inhibitors – Tetrabenazine tablets (Xenazine® – Lundbeck, generics)

DATE REVIEWED: 06/10/2020

OVERVIEW
Tetrabenazine reversibly depletes monoamines (such as dopamine, serotonin, norepinephrine, and histamine) from nerve terminals.[1] Tetrabenazine, and its major circulating metabolites (α-dihydrotetrabenazine [HTBZ] and β-HTBZ), reversibly inhibits vesicular monoamine transporter type 2 (VMAT2), resulting in decreased uptake of monoamines into synaptic vesicles and depletion of monoamine stores. Tetrabenazine is indicated for the treatment of chorea associated with Huntington's disease (HD). There are several other published studies which have assessed the efficacy and safety of tetrabenazine for the treatment of other hyperkinetic movement disorders (e.g., tics in Tourette Syndrome and tardive dyskinesia).

Beginning in September 2015, tetrabenazine has been available as an AB-rated generic to brand Xenazine. Generic tetrabenazine is Food and Drug Administration (FDA)-approved and is available in the same tablet dosage form and the same 12.5 mg and 25 mg strengths as brand Xenazine.

Clinical Efficacy
There are multiple controlled and uncontrolled trials conducted with tetrabenazine that included patients with dystonias.[6-10,12,13,16,19,21,22] In retrospective trials, an overall moderate clinical improvement or better was seen in 161 out of 163 patients with dystonia treated with tetrabenazine.[21] A treatment algorithm for secondary dystonias was developed that notes tetrabenazine can be tried following a trial of an anticholinergic in children with severe secondary dystonias.[22] In adults, tetrabenazine can be tried (alone or as combination therapy) following a low-dose trial of anticholinergic.

Tetrabenazine has been studied for the treatment of tardive dyskinesia, either as initial therapy or in patients who have responded poorly to other agents (e.g., reserpine, bromocriptine, clozapine).[5-15]

While most of the data for treatment of Tourette syndrome indicate that antipsychotic medications, both typical and atypical, are most effective, other medications (including tetrabenazine) may be used first to avoid the potential side effects of dopamine blockade.[18]

Guidelines
The American Academy of Neurology (AAN) evidence-based guidelines on pharmacologic treatment of chorea in HD (2012) states that if chorea in HD requires treatment, clinicians should prescribe tetrabenazine, amantadine, or Rilutek® (riluzole tablets) [Level B].[2]

The AAN published an evidence-based guideline for the treatment of tardive syndromes (TDS) [2013].[3] The authors found that tetrabenazine possibly reduces TDS symptoms (based on two consistent Class III studies). Therefore, tetrabenazine may be considered in treating TDS (Level C).

The AAN published practice guideline recommendations for the treatment of tics in people with Tourette syndrome and chronic tic disorders (2019).[4] The guidelines state that the dopamine depleters, tetrabenazine, deutetrabenazine, and valbenazine, are lacking published, randomized, controlled trials in the treatment of tics but note that these drugs are increasingly used off-label. When appropriately dosed, these drugs are generally well-tolerated but may be associated with drowsiness, depression, and parkinsonism.

Safety

The prescribing information for tetrabenazine includes a contraindication in patients who are actively suicidal or who have depression which is untreated or undertreated.[1] Of note, tetrabenazine is only FDA-approved for use in patients with Huntington's disease. Tetrabenazine also has a Boxed Warning regarding depression and suicidality in patients with Huntington's disease. Patients with Huntington's disease are at increased risk for depression and suicidal ideation or behaviors (suicidality), and tetrabenazine may increase the risk for suicidality in these patients. When considering the use of tetrabenazine, the risk of suicidality should be balanced against the need for treatment of chorea. All patients treated with tetrabenazine should be observed for new or worsening depression or suicidality. If depression or suicidality does not resolve, consider discontinuing treatment with tetrabenazine.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of tetrabenazine. Because of the specialized skills required for evaluation and diagnosis of patients treated with tetrabenazine as well as the monitoring required for adverse events and long-term efficacy, approval requires tetrabenazine to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of tetrabenazine is recommended in those who meet the following criteria:

FDA-Approved Indications

23. Chorea Associated with Huntington's Disease. Approve for 1 year if tetrabenazine is prescribed by or in consultation with a neurologist.

Other Uses with Supportive Evidence

3. Hyperkinetic Dystonia. Approve for 1 year if tetrabenazine is prescribed by or in consultation with a neurologist.

4. Tardive Dyskinesia. Approve for 1 year if tetrabenazine is prescribed by or in consultation with a neurologist or psychiatrist.

5. **Tourette Syndrome and Related Tic Disorders.** Approve for 1 year if tetrabenazine is prescribed by or in consultation with a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Tetrabenazine has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

160. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Wakefulness-Promoting Agents – Armodafinil, Modafinil

- Nuvigil® (armodafinil tablets – Cephalon, generics)

- Provigil® (modafinil tablets – Cephalon, generics)

DATE REVIEWED: 08/21/2019; selected revision 03/25/2020 and 5/20/2020

OVERVIEW
Armodafinil and modafinil, agents with wake-promoting actions that are similar to sympathomimetic agents (e.g., amphetamine and methylphenidate), are indicated to improve wakefulness in adults with excessive sleepiness associated with narcolepsy; obstructive sleep apnea/hypoapnea syndrome (approved as adjunctive therapy); and shift work sleep disorder.[1,2] Armodafinil and modafinil are Schedule IV controlled substances. Review of the medical literature notes many other uses of modafinil that are considered off-label or investigational. While armodafinil has not been studied off-label to the same extent as modafinil, it is expected that armodafinil will have similar clinical efficacy for these uses.

Guidelines

According to the American Academy of Sleep Medicine, CPAP is the most uniformly effective therapy, and, to date, this is the only intervention for obstructive sleep apnea (OSA) shown to have favorable impacts on both cardiovascular and neurobehavioral morbidities.[3] Modafinil, in patients compliant with nasal CPAP, consistently improved subjective and objective sleepiness, quality of life, and vigilance compared with placebo.

According to the American Psychiatric Association (APA) practice guideline for the treatment of patients with major depressive disorder (MDD), modafinil (or methylphenidate) are potential treatments for sedation associated with antidepressant medications.[4] The APA guidelines state that modafinil has shown benefit when combined with SSRIs, related to specific effects on residual symptoms such as fatigue and hypersomnolence. The guidelines go on to note that there is no clear guidance regarding the length of time modafinil should be coadministered. Limited data have investigated modafinil as monotherapy for depression.[5] While armodafinil has not been studied for this use, expert opinion considers it to be interchangeable with modafinil for this condition.

Guidelines from the AASM, updated in 2007, state that modafinil may be effective for the treatment of daytime sleepiness due to PD.[14] A practice parameter on the treatment of nonmotor symptoms of PD, published by the American Academy of Neurology (AAN) in 2011, states that for patients with PD and excessive daytime sleepiness (EDS), modafinil is effective in improving patients' perception of wakefulness, but is ineffective in objectively improving EDS as measured by objective tests.[17] The practice parameter recommendations indicate modafinil should be considered for patients to improve their subjective perception of EDS; however, it should be noted that patients may experience an improvement in sleep perception without an actual improvement in objective sleep measurements. While armodafinil has not been studied for this use, expert opinion considers it to be interchangeable with modafinil for this condition.

Practice parameters for the treatment of narcolepsy and other hypersomnias of central origin, updated in 2007 by the AASM, state that modafinil may be effective for the treatment of daytime sleepiness due to MS.[14] Although the results with modafinil in clinical trials are heterogeneous, expert opinion considers it to be a first-line anti-fatigue drug for MS patients. While armodafinil has not been studied for this use, expert opinion considers it to be interchangeable with modafinil for this condition.

Idiopathic hypersomnia, a condition similar to narcolepsy, is characterized by constant or recurrent daytime sleepiness with no other cause of sleepiness, prolonged nocturnal sleep, difficulty awakening with sleep

drunkenness, and long unrefreshing naps with no history of cataplexy.[29-32] The practice parameters for the treatment of narcolepsy and other hypersomnias of central origin, updated in 2007, state that modafinil may be effective for the treatment of daytime sleepiness due to idiopathic hypersomnia.[14] As there may be underlying causes/behaviors associated with EDS, a sleep specialist physician has the training to correctly recognize and diagnose this condition. While armodafinil has not been studied for this use, expert opinion considers it to be interchangeable with modafinil for this condition.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Nuvigil (brand and generic) and Provigil (brand and generic). All approvals are provided for 1 year in duration unless otherwise noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Nuvigil (brand and generic) and Provigil (brand and generic) are recommended in those who meet one of the following criteria:

Food and Drug Administration (FDA)-Approved Indications

25. Excessive Daytime Sleepiness Associated with Obstructive Sleep Apnea/Hypoapnea Syndrome. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** The patient is ≥ 18 years of age; AND
- **B)** The patient meets one of the following criteria (i or ii):
  - **i.** Armodafinil/modafinil will be used in conjunction with continuous positive airway pressure (CPAP); OR
  - **ii.** The patient is unable to initiate or tolerate CPAP therapy; AND
- **C)** If brand Provigil or Nuvigil is being requested, the patient meets both of the following criteria (i and ii):
  - **i.** The patient has tried generic modafinil or generic armodafinil; AND
  - **ii.** The brand product (Nuvigil or Provigil) is being requested due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the corresponding generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.

26. Excessive Sleepiness Associated with Shift Work Sleep Disorder. Approve for 1 year if the patient meets the following criteria (A, B and C):
- **A)** The patient is ≥ 18 years of age; AND
- **B)** The patient works at least five overnight shifts per month; AND
- **C)** If brand Provigil or Nuvigil is being requested, the patient meets both of the following criteria (i and ii):
  - **i.** The patient has tried generic modafinil or generic armodafinil; AND
  - **ii.** The brand product (Nuvigil or Provigil) is being requested due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the corresponding generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.

27. Excessive Daytime Sleepiness Associated with Narcolepsy. Approve for 1 year if the patient meets both of the following criteria (A, B and C):
- **A)** The patient is ≥ 18 years of age; AND
- **B)** Narcolepsy has been confirmed with polysomnography and a multiple sleep latency test (MSLT); AND
- **C)** If brand Provigil or Nuvigil is being requested, the patient meets both of the following criteria (i and ii):
  - **i.** The patient has tried generic modafinil or generic armodafinil; AND
  - **ii.** The brand product (Nuvigil or Provigil) is being requested due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the corresponding generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.

Other Uses with Supportive Evidence

~~28.~~ Adjunctive/Augmentation Treatment for Depression in Adults. Approve for 1 year if the patient meets the following criteria (A, B and C):
- **A)** The patient is ≥ 18 years of age; AND
- **B)** The patient is concurrently receiving other medication therapy for depression (e.g., selective serotonin reuptake inhibitors [SSRIs]); AND
- **C)** If brand Provigil or Nuvigil is being requested, the patient meets both of the following criteria (i and ii):
  - **i.** The patient has tried generic modafinil or generic armodafinil; AND
  - **ii.** The brand product (Nuvigil or Provigil) is being requested due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the corresponding generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.

~~29.~~ Excessive Daytime Sleepiness Associated with Myotonic Dystrophy. Approve for 1 year if the patient meets both of the following criteria (A and B):
- **A)** The patient is ≥ 18 years of age; AND
- **B)** If brand Provigil or Nuvigil is being requested, the patient meets both of the following criteria (i and ii):
  - **i.** The patient has tried generic modafinil or generic armodafinil; AND
  - **ii.** The brand product (Nuvigil or Provigil) is being requested due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the corresponding generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.

~~30.~~ Excessive Daytime Sleepiness Associated with Parkinson's Disease. Approve for 1 year if the patient meets both of the following criteria (A and B):
- **A)** The patient is ≥ 18 years of age; AND
- **B)** If brand Provigil or Nuvigil is being requested, the patient meets both of the following criteria (i and ii):
  - **i.** The patient has tried generic modafinil or generic armodafinil; AND
  - **ii.** The brand product (Nuvigil or Provigil) is being requested due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand

and the corresponding generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction

~~31.~~ **Fatigue Associated with Multiple Sclerosis (MS).** Approve for 1 year if the patient meets both of the following criteria (A and B):
- **A)** The patient is ≥ 18 years of age; AND
- **B)** If brand Provigil or Nuvigil is being requested, the patient meets both of the following criteria (i and ii):
  - **i.** The patient has tried generic modafinil or generic armodafinil; AND
  - **ii.** The brand product (Nuvigil or Provigil) is being requested due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the corresponding generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.

~~32.~~ **Idiopathic Hypersomnia.** Approve for 1 year if the patient meets both of the following (A, B and C):
- ~~a)~~ The patient is ≥ 18 years of age; AND
- ~~b)~~ The diagnosis is confirmed by a sleep specialist physician or at an institution that specializes in sleep disorders (i.e., sleep center); AND
- ~~c)~~ If brand Provigil or Nuvigil is being requested, the patient meets both of the following criteria (i and ii):
  - **i.** The patient has tried generic modafinil or generic armodafinil; AND
  - **ii.** The brand product (Nuvigil or Provigil) is being requested due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the corresponding generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Nuvigil and Provigil (brand and generic) have not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

12. **Attention Deficit Hyperactivity Disorder (ADHD).** The American Academy of Pediatrics (AAP) clinical practice guidelines for the treatment of ADHD in children and adolescents (2011) does not address the use of modafinil/armodafinil.[43,44] These guidelines note that with the greater availability of approved medications for children/adolescents with ADHD, it has become increasingly unlikely that clinicians need to consider the off-label use of other medications. Two published studies, both of which involved approximately 20 adult patients with ADHD, preliminarily suggested that modafinil may be useful for this condition.[45,49] However, a 9-week, randomized, double-blind, placebo-controlled, parallel-group, dose-finding study in adults with ADHD (n = 338) evaluated modafinil doses of 255 mg to 510 mg and did not find significant benefit in reducing ADHD symptoms, as measured by the change from baseline at final visit in the Adult ADHD Investigator Symptom Rating Scale (AISRS) total score.[47] Many options exist for the treatment of ADHD in adults (e.g., methylphenidate, dextroamphetamine) and further large scale trials that demonstrate benefit for modafinil in adults with ADHD are needed.

13. **Bipolar Disorder, including Bipolar Depression.** Limited data (one small study [n = 85] and case reports [n = 2]) are available that describe the use of modafinil for bipolar disorder and bipolar

depression.[48-50] In one study (n = 257) armodafinil was not more effective than placebo in treating bipolar depression.[51] Only limited data supports modafinil for this condition and more data are needed.

14. **Cancer-Related Fatigue.** The National Comprehensive Cancer Network (NCCN) guidelines on cancer-related fatigue (version 1.2019 – March 12, 2019) no longer consider modafinil to be effective for the treatment of cancer-related fatigue and recommend against its use.[28] A randomized, double-blind, placebo-controlled trial involving 631 patients with cancer receiving chemotherapy found modafinil useful in the control of severe cancer-related fatigue only.[7] Other studies do not support the use of modafinil or armodafinil for cancer-related fatigue.[69-72]

15. **Chronic Fatigue Syndrome.** Limited data characterize modafinil therapy in those with chronic fatigue syndrome.[52,53] In a randomized, double-blind, crossover study in 14 patients with chronic fatigue syndrome, use of modafinil for 20 days had minimal effects on cognitive function and no significant effects on fatigue, health-related quality of life, or mood.[70] More data are required to assess efficacy in this patient population.

16. **Excessive Daytime Sleepiness Associated with Primary Insomnia.** One randomized, placebo-controlled study found that neither combination therapy with modafinil and cognitive behavioral therapy nor modafinil as monotherapy significantly decreased daytime sleepiness associated with primary insomnia.[54]

17. **Enhancement of Performance in Situations of Induced Sleep Deprivation.** Studies are needed to define the role/appropriateness of modafinil in these situations for the general population (as opposed to military personnel, etc.). Studies have shown that modafinil may enhance performance and sustain alertness in individuals subjected to situations that deprive sleep (e.g., military aviation, emergency physicians).[55-58] Further studies are needed before its use in the general population in these types of situations can be promoted.

18. **Fatigue and Excessive Daytime Sleepiness in Chronic Traumatic Brain Injury (TBI).** A single-center, double-blind, placebo- controlled, crossover trial involving 53 patients suggests that overall, modafinil was not beneficial in relieving fatigue and EDS in such patients.[59] In a small (n = 20) randomized, placebo-controlled trial, modafinil improved EDS vs. placebo in patients with TBI; however, modafinil did not improve fatigue compared with placebo.[60] Additional data are needed to determine effectiveness in this setting.

19. **Fibromyalgia.** Limited data are available regarding the use of modafinil in fibromyalgia with most of the data being observational.[61-63] Larger-sized, randomized, placebo-controlled trials are required to better assess and validate the efficacy of modafinil in patients with fibromyalgia before it can be recommended as a therapeutic modality.

20. **Hypersomnia, Fatigue or Sleepiness Due to Other Conditions (<u>not</u> Idiopathic Hypersomnia, see Other Uses with Supportive Evidence).** More data are needed in specific conditions to define the role of modafinil and armodafinil.

21. **Post-Stroke Sleep-Wake Disorders or Sleep Disorders.** Sleep-wake disorders occur in approximately 20% to 40% of patients that have experienced a stroke, which includes hypersomnia and EDS. Very limited data (i.e., case reports and one small study) have explored the use of modafinil in

these patients to improve alertness.[64,73] More data are needed to determine effectiveness in this condition.

22. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY WITH STEP THERAPY

POLICY: Wakefulness-Promoting Agents – Sunosi Prior Authorization Policy with Step Therapy

- Sunosi™ (solriamfetol tablets – Jazz Pharmaceuticals)

REVIEW DATE: 07/29/2020

OVERVIEW

Sunosi, a dopamine and norepinephrine reuptake inhibitor (DNRI), is indicated to improve wakefulness in adult patients with excessive daytime sleepiness associated with narcolepsy or obstructive sleep apnea (OSA).[1] Limitations of Use: Sunosi is not indicated to treat the underlying airway obstruction in OSA. The underlying airway obstruction should be treated (e.g., with continuous positive airway pressure [CPAP]) for at least 1 month prior to initiating Sunosi for excessive daytime sleepiness. Modalities to treat the underlying airway obstruction should be continued during treatment with Sunosi. Sunosi is not a substitute for these modalities. The mechanism of action of Sunosi to improve wakefulness in patients with excessive daytime sleepiness associated with narcolepsy or OSA is unclear. Its efficacy is thought to be mediated through its activity as an inhibitor of dopamine and norepinephrine reuptake. Sunosi is a schedule IV controlled substance.

Armodafinil and modafinil are wakefulness-promoting agents with actions similar to sympathomimetic agents (e.g., amphetamine and methylphenidate). They are indicated to improve wakefulness in adult patients with excessive sleepiness associated with narcolepsy, OSA, or shift work disorder (SWD).[2,3] Armodafinil and modafinil are Schedule IV controlled substances. For narcolepsy and OSA, they are dosed QD in the morning. For SWD, they are dosed QD as a single dose approximately 1 hour prior to the start of their work shift. Stimulant medications (e.g., amphetamine, methamphetamine, dextroamphetamine, and methylphenidate) are used off-label for the treatment of daytime sleepiness due to narcolepsy and OSA and are mentioned in guidelines.[4-7]

Disease Overview

Narcolepsy is a rare, chronic neurologic disorder that affects the brain's ability to control sleep-wake cycles.[8] There are two types of narcolepsy: Type 1 narcolepsy (previously termed narcolepsy with cataplexy) and Type 2 narcolepsy (previously termed narcolepsy without cataplexy). People with narcolepsy usually feel rested after waking, but then feel very sleepy throughout much of the day. Sleepiness in narcolepsy is described as a "sleep attack", where an overwhelming sense of sleepiness comes on quickly. People may unwillingly fall asleep even if they are in the middle of an activity like driving, eating, or talking. Symptoms can partially improve over time, but they will never disappear completely. If left undiagnosed or untreated, narcolepsy can interfere with psychological, social, and cognitive function and development and can inhibit academic, work, and social activities.

Two specialized tests, which can be performed in a sleep disorders clinic, are required to establish a diagnosis of narcolepsy.[8] Polysomnogram (PSG) is an overnight recording of brain and muscle activity, breathing, and eye movements. The multiple sleep latency test (MSLT) assesses daytime sleepiness by measuring how quickly a person falls asleep and whether they enter rapid eye movement (REM) sleep. On the day after PSG, the patient is asked to take five short naps separated by two hours over the course of a day. If an individual falls asleep in < 8 minutes on

average over the five naps, this indicates excessive daytime sleepiness. However, patients with narcolepsy also have an abnormally quick start to REM sleep. If REM sleep happens within 15 minutes at least two times out of the five naps and the sleep study the night before, this is likely an abnormality caused by narcolepsy.

OSA is a potentially serious sleep disorder, causing breathing to repeatedly stop and start during sleep.[9] Several types of sleep apnea occur, but the most common is OSA. OSA occurs when the muscles in the back of the throat relax too much, inhibiting normal breathing. When the muscles relax, the airway narrows or closes. Breathing may be inadequate for 10 to 20 seconds, lowering the level of oxygen in the blood and causing a buildup of carbon dioxide. The brain senses this impaired breathing and briefly rouses the patient from sleep so that the airway can be reopened. This pattern can repeat itself five to 30 times or more each hour, throughout the night. The disruptions impair the ability to reach the desired deep, restful phases of sleep, resulting in a sleepy feeling during the waking hours. OSA can cause severe daytime drowsiness, fatigue, and irritability; hypertension, which can increase the risk of coronary artery disease, heart attack, heart failure and stroke; and arrhythmias.

CPAP is the most uniformly effective therapy, and to date this is the only intervention for OSA shown to have a favorable impact on both cardiovascular and neurobehavioral morbidities.[6] Oral appliances and surgical procedures to improve upper airway patency are successful in certain subsets of patients, but many do not receive adequate clinical benefit from these approaches. In addition, individuals treated with CPAP therapy may experience residual sleepiness, despite marked improvements in the apnea-hypopnea index. Therefore, medical therapies may be considered for the subsets of patients who will not or cannot use CPAP and for patients with residual sleepiness despite alleviation of upper airway obstruction during sleep by CPAP, oral appliances, or upper airway surgery.

Guidelines

The American Academy of Sleep Medicine (AASM) practice parameters for the treatment of narcolepsy and other hypersomnias of central origin (2007) list modafinil as an effective for treatment of daytime sleepiness due to narcolepsy (Standard) and Xyrem as effective for treatment of cataplexy, daytime sleepiness, and disrupted sleep due to narcolepsy (Standard).[4,5] At the time this practice parameter was written, published studies involving armodafinil were limited.

The AASM has published recommendations for the medical therapy of OSA (2006).[6,7] CPAP is the most uniformly effective therapy and is the only intervention for OSA shown to have favorable impacts on both cardiovascular and neurobehavioral morbidities. When the recommendation was published, there were no widely effective pharmacotherapies for individuals with sleep apnea, with the important exceptions of individuals with hypothyroidism or with acromegaly. Treating the underlying medical condition can have pronounced effects on the apnea/hypopnea index. Stimulant therapy leads to a small but statistically significant improvement in objective sleepiness.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Sunosi. This PA Policy also contains a Step Therapy component. When clinically appropriate, patients are directed to try one Step 1 agent (modafinil or armodafinil) prior to Sunosi (Step 2). All approvals are provided for the duration cited.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Sunosi is recommended in those who meet the following criteria:
FDA-Approved Indications

33. Excessive Daytime Sleepiness Associated with Obstructive Sleep Apnea. Approve for 1 year if the patient meets one of the following criteria (A, B and C):

- **D)** Patient is ≥ 18 years of age; AND
- **E)** Patient meets one of the following criteria (i or ii):
  - **i.** Sunosi will be used in conjunction with continuous positive airway pressure (CPAP); OR

ii. Patient is unable to initiate or tolerate CPAP therapy; AND

F) Patient has tried generic modafinil or generic armodafinil.
Note: An exception to this requirement is allowed if the patient has previously tried brand Provigil or Nuvigil.

254. Excessive Daytime Sleepiness Associated with Narcolepsy. Approve for 1 year if the patient meets the following criteria (A, B, and C):

A) Patient is ≥ 18 years of age; AND

B) Narcolepsy has been confirmed with polysomnography and a multiple sleep latency test (MSLT); AND

C) Patient has tried generic modafinil or generic armodafinil.
Note: An exception to this requirement is allowed if the patient has previously tried brand Provigil or Nuvigil.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Sunosi is not recommended in the following situations:

245. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY WITH STEP THERAPY

POLICY: Wakefulness-Promoting Agents – Wakix® (pitolisant tablets – Harmony)

DATE REVIEWED: 10/02/2019; selected revision 03/25/2020

OVERVIEW

Wakix is indicated for the treatment of excessive daytime sleepiness (EDS) in adults with narcolepsy.[1] Wakix is an antagonist/inverse agonist of the histamine-3 (H_3) receptor. Wakix should be titrated up to the recommended dosage range of 17.8 mg to 35.6 mg once daily (QD) in the morning upon wakening. The dose may be adjusted based on

patient tolerability. For some patients, it may take up to 8 weeks to achieve a clinical response. Wakix is the only wakefulness-promoting agent that is not a controlled substance.

Armodafinil and modafinil are wakefulness-promoting agents with actions similar to sympathomimetic agents (e.g., amphetamine and methylphenidate). They are indicated to improve wakefulness in adult patients with excessive sleepiness associated with narcolepsy, OSA, or shift work disorder (SWD).[2,3] For narcolepsy and OSA, they are dosed QD in the morning. For SWD, they are dosed QD as a single dose approximately 1 hour prior to the start of their work shift. Sunosi™ (solriamfetol tablets), a dopamine and norepinephrine reuptake inhibitor (DNRI), is indicated to improve wakefulness in adult patients with excessive daytime sleepiness associated with narcolepsy or obstructive sleep apnea (OSA).[4] Sunosi whould be titrated to the recommended dose range of 37.5 mg to 150 mg QD, taken upon awakening with or without food. Sunosi should be avoided within 9 hours of planned bedtime because of the potential to interfere with sleep if taken too late in the day. Armodafinil, modafinil, and Sunosi are Schedule IV controlled substances.[2-4]

Disease Overview

Narcolepsy is a rare, chronic neurologic disorder that affects the brain's ability to control sleep-wake cycles.[7] There are two types of narcolepsy: Type 1 narcolepsy (previously termed narcolepsy with cataplexy) and Type 2 narcolepsy (previously termed narcolepsy without cataplexy). People with narcolepsy usually feel rested after waking, but then feel very sleepy throughout much of the day. The most typical symptoms are excessive daytime sleepiness, cataplexy, sleep paralysis, and hallucinations. Sleepiness in narcolepsy is described as a "sleep attack", where an overwhelming sense of sleepiness comes on quickly. People may unwillingly fall asleep even if they are in the middle of an activity like driving, eating, or talking. Symptoms can partially improve over time, but they will never disappear completely. If left undiagnosed or untreated, narcolepsy can interfere with psychological, social, and cognitive function and development and can inhibit academic, work, and social activities.

Guidelines

The American Academy of Sleep Medicine (AASM) published practice parameters in 2007 for the treatment of narcolepsy and other hypersomnias of central origin.[5,6] It should be noted that the guidelines are dated and do not include more recently-approved medications. Modafinil is listed as an effective for treatment of daytime sleepiness due to narcolepsy and Xyrem as effective for treatment of cataplexy, daytime sleepiness, and disrupted sleep due to narcolepsy. Amphetamine, methamphetamine, dextroamphetamine, and methylphenidate are considered effective for the treatment of daytime sleepiness due to narcolepsy.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Wakix. This PA Policy also contains a Step Therapy component. When clinically appropriate, patients are directed to try one Step 1 agent (modafinil or armodafinil) prior to Wakix (Step 2). All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Wakix is recommended in those who meet the following criteria:

FDA-Approved Indications

34. Excessive Daytime Sleepiness Associated with Narcolepsy. Approve for 1 year if the patient meets one of the following criterion (A, B, and C):
- **a)** The patient is ≥ 18 years of age; AND
- **b)** Narcolepsy has been confirmed with polysomnography and a multiple sleep latency test (MSLT); AND
- **c)** The patient meets one of the following criteria (i or ii):
  - **i.** The patient has tried generic modafinil or generic armodafinil; OR

Note: An exception to this requirement is allowed if the patient has previously tried brand Provigil or Nuvigil.

ii. The patient has a history of misuse or abuse of controlled substances and a wakefulness-promoting agent that is not a controlled substance is necessary, per the prescriber.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Wakix has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

246. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Weight Loss Drugs

- Adipex-P® (phentermine hydrochloride capsules and tablets – Teva, generics)
- benzphetamine hydrochloride tablets (generics only)
- Contrave® (naltrexone HCl/buproprion HCl extended-release tablets – Orexigen Therapeutics)
- diethylpropion hydrochloride immediate-release and controlled-release tablets (generics only)
- Lomaira™ (phentermine hydrochloride tablets – KVK-Tech)
- phendimetrazine tartrate tablets (generics only)
- phentermine hydrochloride orally disintegrating tablets (generics only)
- Regimex (benzphetamine 25 mg tablets – WraSer Pharmaceuticals, generics – obsolete 1/15/2019)
- Saxenda® (liraglutide [rDNA] injection – NovoNordisk)
- Qsymia™ (phentermine and topiramate extended-release capsules – Vivus, Inc.)
- Xenical® (orlistat 120 mg capsules − Roche)

DATE REVIEWED: 10/30/2019; selected revisions 03/11/2020

OVERVIEW

This policy is limited to prescription medications that are indicated to promote weight loss in obese patients. Obesity in adults is defined as a body mass index (BMI) of ≥ 30 kg/m^2; a BMI of 25 to 29.9 kg/m^2 is termed overweight.[1] The combined prevalence of obesity and overweight is estimated at > 64% of US adults; 4.7% of adults have a BMI ≥ 40 kg/m^2. In the US, an estimated 300,000 adult deaths per year are due to obesity-related causes. With the increase in obesity, treatments for obesity have increased in number and are more commonly used. Diet therapy with a low calorie diet, increased physical activity, and behavioral modification are the mainstays of treatment of overweight and obese adults. Such a regimen should be maintained for at least 6 months before considering pharmacotherapy. The rationale for adding drug therapy to these regimens in selected adults is that a more successful weight loss and maintenance may result.[2-3] Weight loss goals should be individually determined and these goals may include not just weight loss but other parameters, such as improved glucose metabolism, lipid levels, and blood pressure.[1]

Drugs that are indicated for weight loss either: 1) decrease food intake by decreasing appetite or increasing satiety (appetite suppressant, anorectic), or 2) decrease nutrient absorption.[4] The appetite suppressants increase the availability of anorexigenic neurotransmitters (norepinephrine, serotonin, dopamine, or some combination of these) in the central nervous system (CNS). Appetite suppressant products currently available are as follows:

- benzphetamine hydrochloride (Regimex and generic products) C-III [noradrenergic][5,32]
- diethylpropion hydrochloride (generic products) C-IV [noradrenergic][6]
- phendimetrazine tartrate (generic products) C-III [noradrenergic][7]
- phentermine hydrochloride (Adipex-P, Lomaira, and generic products) C-IV [noradrenergic][8-9,31]
- Qsymia (anorectic and antiepileptic) C-IV[10]
- Contrave (opioid antagonist and antidepressant)[27]
- Saxenda (glucagon-like peptide-1 agonist)[28]

The other commercially available weight loss product, orlistat, acts by inhibiting the absorption of dietary fats and is not an appetite suppressant.[11] Orlistat is available by prescription as Xenical, and over-the-counter (OTC) as Alli® (orlistat 60 mg capsules). Alli is not included within the scope of this policy.

The appetite suppressant products vary slightly in the wording of their FDA-approved indications. Benzphetamine, diethylpropion, and phendimetrazine are indicated for the management of exogenous obesity as a short-term adjunct (a few weeks) to a regimen of weight reduction based on caloric restriction in patients with an initial BMI of ≥ 30 kg/m^2 who have not responded to a weight reducing regimen (diet and/or exercise) alone.[5-7,32] Phentermine hydrochloride is indicated for short-term (a few weeks) adjunctive therapy in a regimen of weight reduction based on exercise, behavioral modification and caloric restriction in the management of exogenous obesity in those with an initial BMI ≥ 30 kg/m^2, or a BMI ≥ 27 kg/m^2 when other risk factors are present (e.g., controlled hypertension, diabetes mellitus, or dyslipidemia).[8-9,31] Qsymia, Contrave, and Saxenda are indicated as an adjunct to a reduced-calorie diet and increased physical activity for chronic weight management in adult patients with an initial BMI of ≥ 30 kg/m^2 (obese), or ≥ 27 kg/m^2 (overweight) in the presence of at least one weight-related comorbid condition (e.g., hypertension, dyslipidemia, type 2 diabetes).[10,27-28]

Xenical

Xenical is indicated for obesity management including weight loss and weight maintenance when used in conjunction with a reduced calorie diet.[11] Xenical is also indicated to reduce the risk for weight regain after prior weight loss. Xenical is indicated for obese patients with an initial BMI ≥ 30 kg/m^2 or ≥ 27 kg/m^2 in the presence of other risk factors (e.g., hypertension, diabetes, dyslipidemia).[11] Xenical has been used effectively to further reduce weight, maintain weight loss, or prevent as much regain in patients (BMI

initially 28 to 43 kg/m^2) who initially lost weight on a 6-month low calorie diet.[12] In another study, patients who lost ≥ 5% of their body weight on an 8-week very-low-calorie diet (n = 309) were randomized to receive Xenical or placebo for 3 years, plus lifestyle counseling.[13] The mean weight gain after 3 years was 4.6 kg with Xenical and 7.0 kg with placebo (P < 0.02). The incidence of new cases of type 2 diabetes was reduced in the Xenical group (n = 8/153) vs. placebo (n = 17/156) [P = 0.04].

The XENical in the prevention of Diabetes in Obese Subjects (XENDOS) study was a 4-year, double-blind, prospective trial that randomized 3,305 patients to lifestyle changes plus either Xenical 120 mg TID with meals or placebo.[14] The primary study outcomes were the onset of type 2 diabetes and body weight changes. Patients (30 to 60 years of age) were nondiabetic and had a BMI ≥ 30 kg/m^2. Most patients had normal glucose tolerance, but some had impaired glucose tolerance (79% and 21% of patients, respectively). Lifestyle changes and a reduced calorie diet were also implemented. Of the patients randomized to Xenical, 52% completed 4 years of treatment vs. 34% of patients randomized to placebo. The mean weight loss with Xenical at 4 years was greater (5.8 kg) compared with placebo (3.0 kg; P < 0.001). After 4 years of therapy, fewer patients randomized to Xenical progressed to having type 2 diabetes compared with placebo (P = 0.0032) [cumulative 4-year incidence rates of 6.2% {Xenical} and 9.0% {placebo}] (risk reduction of 37.3%). The reduction in the development of type 2 diabetes with Xenical was more marked in patients with impaired glucose tolerance at baseline (18.8% with Xenical vs. 28.8% with placebo) corresponding to a 45% risk reduction. Xenical did not reduce the risk of developing diabetes in patients with normal glucose tolerance at baseline.[13] The effect of Xenical to delay the onset of type 2 diabetes in obese patients with impaired glucose tolerance is presumably due to weight loss and not to an independent effect(s) of the drug on glucose or insulin metabolism.

Use of Xenical in Obese or Overweight Pediatric Patients

In a 54-week trial, 539 adolescents (12 to 16 years of age with BMI ≥ 2 units above the 95th percentile; maximum BMI of 44 kg/m^2) were randomized to Xenical 120 mg TID or placebo.[11,15] Both groups were on a mildly hypocaloric diet, exercise and behavioral therapy. In all, 190 patients dropped out. Both groups had a decrease in BMI up to 12 weeks. At 54 weeks, the mean BMI decreased from baseline by -0.55 kg/m^2 with Xenical and increased by +0.31 kg/m^2 with placebo (P = 0.001); weight increased by +0.53 kg with Xenical and by +3.14 kg with placebo (P < 0.001). In a 6-month double-blind trial, 40 adolescents (14 to 18 years of age) were randomized to Xenical 120 mg TID (mean BMI 39.2 kg/m^2) or placebo (mean BMI 41.7 kg/m^2).[16] Patients received dietary and exercise counseling. No statistically significant difference was noted between the two study groups for decrease in BMI from baseline to 6 months (P = 0.39), the primary end point. The BMI decreased within the Xenical group (-1.3 ± 1.6 kg/m^2; P = 0.04) and within the placebo group (-0.8 ± 3.0 kg/m^2; P = 0.02) which was statistically significant. The Xenical group had increased adverse events compared to placebo, primarily gastrointestinal symptoms.

The most commonly used pharmacotherapeutic agents in pediatric patients are sibutramine (prior to withdrawal from the US market), orlistat, and metformin (note that metformin is not indicated for the treatment of obesity).[17] A meta-analysis, commissioned by the Endocrine Society task force, showed that sibutramine demonstrated the greatest effect with a decrease in BMI of -2.4 kg/m^2 (95% confidence interval [CI]: 1.8, 3.1 kg/m^2) after 6 months, but patients had a greater increase in blood pressure and pulse rate than with placebo.[20] Orlistat produced a significant decrease in BMI of -0.7 kg/m^2 (95% CI: 0.3, 1.2 mg/m^2) but there were increased gastrointestinal adverse events (abdominal discomfort, pain, and steatorrhea). Orlistat has reduced utility in children since it must be taken with each meal and children are often in school at lunchtime.[17] Metformin monotherapy decreased BMI in hyperinsulinemic, non-diabetic obese adolescents slightly but significantly in each of the studies analyzed. The overall effect did not reach statistical significance in the meta-analysis. Metformin is indicated for type 2 diabetes mellitus in children ≥ 10 years of age. The Endocrine Society guidelines recommend that use of agents that are not indicated for obesity

(e.g., metformin, octreotide, leptin, topiramate, growth hormone) should be restricted to large, well-controlled studies.

Guidelines

The Endocrine Society published a clinical practice guideline (2015) for the pharmacological management of obesity.[29] The guidelines recommend that pharmacotherapy be employed for patients with BMI ≥ 27 kg/m^2 with comorbidity or BMI > 30 kg/m^2) as adjuncts to behavioral modification to reduce food intake and increase physical activity when possible. The Society states that patients who have a history of being unable to successfully lose and maintain weight and who meet label indications are candidates for weight-loss medication. Safety and efficacy is recommended to be assessed monthly for the first three months, and then at least every 3 months in all patients prescribed medications for weight loss. If a patient has an adequate response to weight loss medication (weight loss ≥ 5% at 3 months), medication is recommended to be continued. If deemed to be ineffective (weight loss < 5% at 3 months) or if there are safety or tolerability issues at any time, it is recommended that medication be discontinued and alternative medications or referral for alternative treatment approaches be considered.

The American Association of Clinical Endocrinology (AACE)/American College of Endocrinology (ACE) guidelines for medical care of patients with obesity (2016) recommend pharmacotherapy for overweight and obese patients only as an adjunct to lifestyle therapy.[30] Pharmacotherapy should be offered to patients who are obese when the potential benefits outweigh the risks, for the chronic treatment of obesity. Short-term (3 to 6 months) use of weight-loss medications has not been demonstrated to produce longer-term health benefits and cannot be generally recommended.

Guidelines in Pediatric Obesity

A 2017 Endocrine Society clinical practice guideline on pediatric obesity recommends pharmacotherapy in combination with lifestyle modification be considered in obese children or adolescents only after failure of a formal program of intensive lifestyle [dietary, physical activity and behavioral] modification to limit weight gain or to ameliorate comorbidities.[17] The Endocrine Society recommends pharmacotherapy in overweight children and adolescents < 16 years only in the context of a clinical trial. Pharmacotherapy should be provided only by clinicians who are experienced in the use of antiobesity agents and aware of the potential for adverse events. These guidelines recommend limited use of pharmacotherapy because pediatric obesity should be managed preferably as a serious lifestyle condition with important lifelong consequences.

The Endocrine Society defines overweight as BMI in at least the 85th percentile but less than the 95th percentile, and obesity as BMI in at least the 95th percentile for age and sex against routine endocrine studies, unless the height velocity is attenuated or inappropriate for the family background or stage of puberty.[17] The Centers for Disease Control (CDC) derived normative percentiles are recommended as the appropriate method for determining the BMI in children.[18-19]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of benzphetamine, diethylpropion, phendimetrazine tartrate, phentermine hydrochloride, Qsymia, Contrave, Saxenda, and Xenical. All approvals are provided for the durations noted below.

Prior authorization and prescription benefit coverage is not recommended for Alli.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

I. Coverage of benzphetamine (including Regimax 25 mg tablets [generics]), diethylpropion, phendimetrazine tartrate, or phentermine hydrochloride is recommended in those who meet all of the following criteria:

FDA-Approved Indications

4. Weight Loss in Adults or Adolescents ≥ 16 Years of Age. Note: For individuals who have not completed the initial 3 months of therapy, criterion 1, A must be met (do not use continuation criteria if the initial 3 months were not completed).

a) Initial Therapy. Approve for 3 months if the patient meets all of the following criteria (i, ii, and iii):

- **i.** Patient currently has a body mass index (BMI) ≥ 30 kg/m^2, or a BMI ≥ 27 kg/m^2 for those with risk factors besides obesity (e.g., diabetes mellitus, impaired glucose tolerance, dyslipidemia, hypertension, coronary heart disease, sleep apnea) [Appendix A contains a BMI chart]; AND
- **ii.** Patient has engaged in a trial of behavioral modification and dietary restriction for at least 3 months and has failed to achieve the desired weight loss; AND
- **iii.** Patient is currently engaged in behavioral modification and on a reduced calorie diet.

B) Patients Continuing Therapy. Approve for 12 months if the patient meets all of the following criteria (i, ii, and iii):

- **i.** Patient had an initial BMI ≥ 30 kg/m^2, or a BMI ≥ 27 kg/m^2 for those with risk factors besides obesity (e.g., diabetes mellitus, impaired glucose tolerance, dyslipidemia, hypertension, coronary heart disease, sleep apnea); AND
- **ii.** Patient is currently engaged in behavioral modification and on a reduced calorie diet; AND
- **iii.** Patient has lost ≥ 5% of baseline body weight.

Although the noradrenergic weight loss medications are only labeled for short-term use, the Endocrine Society (2015) notes that off-label, long-term prescribing of phentermine is reasonable for most patients, as long as the patient has been informed that other medications for weight loss are FDA-approved for long-term use.[29] According to prescribing information, safety and efficacy have not been established for diethylpropion and phentermine (hydrochloride or resin) in children younger than 16 years,[6,8,9,31] and for benzphetamine, phendimetrazine and Xenical in children < 12 years of age.[5,7,11,32] However, the Endocrine Society has established guidelines for use of Xenical in pediatric patients.[17] Benzphetamine, diethylpropion, phendimetrazine and phentermine are not included in these guidelines.

II. Coverage of Contrave is recommended in those who meet all of the following criteria:

FDA-Approved Indications

1. Weight Loss in Adults ≥ 18 Years of Age. Note: For individuals who have not completed the initial 4 months of therapy, criterion 1, A must be met (do not use continuation criteria if the initial 4 months were not completed).

A) Initial Therapy. Approve for 4 months if the patient meets the following criteria (i, ii, and iii):

- **i.** Patient currently has a BMI ≥ 30 kg/m^2, or a BMI ≥ 27 kg/m^2 for those with risk factors besides obesity (e.g., diabetes mellitus, impaired glucose tolerance, dyslipidemia, hypertension, coronary heart disease, sleep apnea) [Appendix A contains a BMI chart]; AND

ii. Patient has engaged in a trial of behavioral modification and dietary restriction for at least 3 months and has failed to achieve the desired weight loss; AND
iii. Patient is currently engaged in behavioral modification and on a reduced calorie diet.

B) Patients Continuing Therapy. Approve for 12 months if the patient meets the following criteria (i, ii, and iii):
i. Patient had an initial BMI ≥ 30 kg/m^2, or a BMI ≥ 27 kg/m^2 for those with risk factors besides obesity (e.g., diabetes mellitus, impaired glucose tolerance, dyslipidemia, hypertension, coronary heart disease, sleep apnea); AND
ii. Patient is currently engaged in behavioral modification and on a reduced calorie diet; AND
iii. Patient has lost ≥ 5% of baseline body weight.

The recommended maintenance dose of Contrave is achieved at Week 4.[27] Response to therapy should be evaluated after 12 weeks at the maintenance dosage (Week 16, if dosed according to the prescribing information). If a patient has not lost ≥ 5% of baseline body weight, discontinue Contrave, as it is unlikely that the patient will achieve and sustain clinically meaningful weight loss with continued treatment.

III. Coverage of Qsymia is recommended in those who meet all of the following criteria:

FDA-Approved Indications

1. **Weight Loss in Adults ≥ 18 Years of Age.** Note: For individuals who have not completed the initial 6 months of therapy, criterion 1, A must be met (do not use continuation criteria if the initial 6 months were not completed).
A) Initial Therapy. Approve for 6 months if the patient meets the following criteria (i, ii, and iii):
i. Patient currently has a BMI ≥ 30 kg/m^2, or a BMI ≥ 27 kg/m^2 for those with risk factors besides obesity (e.g., diabetes mellitus, impaired glucose tolerance, dyslipidemia, hypertension, coronary heart disease, sleep apnea) [Appendix A contains a BMI chart]; AND
ii. Patient has engaged in a trial of behavioral modification and dietary restriction for at least 3 months and has failed to achieve the desired weight loss; AND
iii. Patient is currently engaged in behavioral modification and on a reduced calorie diet.
B) Patients Continuing Therapy. Approve for 12 months if the patient meets the following criteria (i, ii, and iii):
i. Patient had an initial BMI ≥ 30 kg/m^2, or a BMI ≥ 27 kg/m^2 for those with risk factors besides obesity (e.g., diabetes mellitus, impaired glucose tolerance, dyslipidemia, hypertension, coronary heart disease, sleep apnea); AND
ii. Patient is currently engaged in behavioral modification and on a reduced calorie diet; AND
iii. Patient has lost ≥ 5% of baseline body weight.

Response to therapy should be evaluated by Week 12.[10] If a patient has not lost ≥ 3% of baseline body weight, discontinue Qsymia or escalate the dose. If a patient has not lost ≥ 5% of baseline body weight after an additional 12 weeks of treatment on the escalated dose, discontinue Qsymia as directed as it is unlikely the patient will achieve and sustain clinically meaningful weight loss with continued treatment.

IV. Coverage of Saxenda is recommended in those who meet all of the following criteria:

1. **Weight Loss in Adults ≥ 18 years of Age.** Note: For individuals who have not completed the initial 4 months of therapy, criterion 1, A must be met (do not use continuation criteria if the initial 4 months were not completed).
   - **A)** Initial Therapy. Approve for 4 months if the patients meets the following criteria (i, ii, and iii):
     - **i.** Patient currently has a BMI ≥ 30 kg/m^2, or a BMI ≥ 27 kg/m^2 for those with risk factors besides obesity (e.g., diabetes mellitus, impaired glucose tolerance, dyslipidemia, hypertension, coronary heart disease, sleep apnea) [Appendix A contains a BMI chart]; AND
     - **ii.** Patient has engaged in a trial of behavioral modification and dietary restriction for at least 3 months and has failed to achieve the desired weight loss; AND
     - **iii.** Patient is currently engaged in behavioral modification and on a reduced calorie diet.
   - **B)** Patients Continuing Therapy. Approve for 12 months if the patient meets the following criteria (i, ii, and iii):
     - **i.** Patient had an initial BMI ≥ 30 kg/m^2, or a BMI ≥ 27 kg/m^2 for those with risk factors besides obesity (e.g., diabetes mellitus, impaired glucose tolerance, dyslipidemia, hypertension, coronary heart disease, sleep apnea); AND
     - **ii.** Patient is currently engaged in behavioral modification and on a reduced calorie diet; AND
     - **iii.** Patient has lost ≥ 4% of baseline body weight.

   The change in body weight with Saxenda should be evaluated 16 weeks after initiating Saxenda.[28] If the patient has not lost ≥ 4% of baseline body weight, Saxenda should be discontinued because it is unlikely that the patient will achieve and sustain clinically meaningful weight loss with continued treatment.

V. Coverage of Xenical is recommended in those who meet all of the following criteria:

FDA-Approved Indications

1. **Weight Loss in Adults ≥ 18 Years of Age**. Note: For individuals who have not completed the initial 3 months of therapy, criterion 1, A must be met (do not use continuation criteria if the initial 3 months were not completed).
   - **A)** Initial Therapy. Approve for 3 months if the patient meets the following criteria (i, ii, and iii):
     - **i.** Patient meets ONE of the following (a or b):
       - **a)** Patient currently has a BMI ≥ 30 kg/m^2, or a BMI ≥ 27 kg/m^2 for those with risk factors besides obesity (e.g., diabetes, dyslipidemia, hypertension, coronary heart disease, sleep apnea) [Appendix A contains a BMI chart]; OR
       - **b)** Patient had an initial BMI ≥ 30 kg/m^2, or a BMI ≥ 27 kg/m^2 for those with risk factors besides obesity (e.g., diabetes, dyslipidemia, hypertension, coronary heart disease, sleep apnea) if maintaining weight loss after using a low calorie diet; AND
     - **ii.** Patient has engaged in a trial of behavioral modification and dietary restriction for at least 3 months and has failed to achieve the desired weight loss; AND
     - **iii.** Patient is currently engaged in behavioral modification and on a reduced calorie diet.
   - **B)** Patients Continuing Therapy. Approve for 12 months if the patient meets the following criteria (i, ii, and iii):
     - **i.** Patient had an initial BMI ≥ 30 kg/m^2, or a BMI ≥ 27 kg/m^2 for those with risk factors besides obesity (e.g., diabetes mellitus, impaired glucose tolerance, dyslipidemia, hypertension, coronary heart disease, sleep apnea); AND
     - **ii.** Patient is currently engaged in behavioral modification and on a reduced calorie diet; AND
     - **iii.** Patient has lost ≥ 5% of baseline body weight.

2. **Weight Loss in Adolescents Aged ≥ 12 to < 18 Years.** Note: For individuals who have not completed the initial 3 months of therapy, criterion 2, A must be met (do not use continuation criteria if the initial 3 months were not completed).
   - **A)** Initial Therapy. Approve for 3 months if the patient meets the following criteria (i, ii, and iii):
     - **i.** Patient currently has a BMI of ≥ 95th percentile for age and sex, or in ≥ 85th percentile but < 95th percentile for age and sex and has at least one severe co-morbidity (type 2 diabetes mellitus, premature cardiovascular disease) or has a strong family history of type 2 diabetes or premature cardiovascular disease (CVD); AND
     - **ii.** Patient has engaged in a trial of behavioral modification and dietary restriction for at least 3 months and has failed to limit weight gain or to modify co-morbidities; AND
     - **iii.** Patient is currently engaged in behavioral modification and on a reduced calorie diet.
   - **B)** Patients Continuing Therapy. Approve for 12 months if the patient meets the following criteria (i, ii, iii and iv):
     - **i.** Patient had an initial BMI of ≥ 95th percentile for age and sex, or ≥ 85th percentile but < 95th percentile for age and sex and has at least one severe co-morbidity (type 2 diabetes or premature CVD) or strong family history of type 2 diabetes or premature CVD; AND
     - **ii.** Patient is currently engaged in behavioral modification and on a reduced calorie diet; AND
     - **iii.** Patient's current BMI percentile has decreased for age and weight (taking into account that the patient is increasing in height and will have a different normative BMI from when Xenical was started); AND
     - **iv.** Patient currently has a BMI > 85th percentile.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

These drugs for weight loss have not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

1. **Combination Appetite Suppressant Therapy**. Appetite suppressants (benzphetamine, diethylpropion, phendimetrazine tartrate, phentermine hydrochloride or resin, Qsymia, Contrave, Saxenda) are indicated *only* as monotherapy and should not be used in combination with other appetite suppressant drugs.[5-10,27-28,31-32] A 12-week, pilot study assessed the addition of phentermine to Saxenda following 1 year of Saxenda treatment.[34] A total of 45 patients were randomized to Saxenda plus phentermine or Saxenda plus placebo. At 12 weeks, the patients in the Saxenda plus phentermine group had numerically, but not statistically, larger reduction in weight compared with the Saxenda plus placebo group (1.6% vs. 0.1%, respectively, P = 0.073). This study was of inadequate size and duration to assess for long-term safety and efficacy, particularly in regard to cardiovascular outcomes.

2. **Simultaneous Use of Xenical with Any of the Following: benzphetamine, diethylpropion, phendimetrazine tartrate, or phentermine hydrochloride or resin, Contrave, Saxenda or Qsymia.** Limited information from published well-controlled studies is available on the combination use of these drugs. Using weight loss drugs one at a time and starting with the lowest effective doses can decrease the chance of adverse effects.[2] Unproven combination therapy is not recommended.[4]

3. **Treatment of Hyperlipidemia in Non-Obese Patients**. Short-term use of Xenical has slightly decreased total and low density lipoprotein (LDL) cholesterol in patients with increased total and LDL cholesterol levels and normal triglyceride levels who were not obese (BMI 19 to 28.7 kg/m^2).[21]

Triglycerides were unchanged and high density lipoprotein (HDL) cholesterol tended to decrease. Although not directly compared with other drugs, Xenical's effects on total and LDL cholesterol were less than those observed with hydroxy-methylglutaryl-coenzyme A (HMG-CoA) reductase inhibitors (HMGs) and low dose cholestyramine.

4. **Treatment of Binge-Eating Disorder in Non-Obese Patients (BMI < 30 kg/m^2 or < 27 kg/m^2 for Those with Risk Factors).** In a short term (12 or 24 week) placebo-controlled trial in obese patients (BMI ≥ 30 kg/m^2) with binge eating disorder, Xenical has been effective in producing weight loss.[22-23] In an open-label study, 10 patients with binge eating disorder were treated with Qsymia.[35] Nine of the patients were obesity and one was overweight. After 12 weeks of treatment, the patients on average lost 4.9 kg of body weight. Patients with binge-eating disorder are usually obese and should be reviewed for weight loss therapy using the criteria in the section above.

5. **Prevention of Diabetes in Patients with BMI < 30 kg/m^2.** In a large (n = 3,305) 4-year study, Xenical, in addition to lifestyle changes, led to a 37% risk reduction in the development of type 2 diabetes in obese (BMI ≥ 30 kg/m^2) patients compared with placebo.[18] However, those most affected had impaired glucose tolerance at baseline and these patients achieved a more pronounced weight reduction. Qsymia in addition to lifestyle modification reduced the progression to type 2 diabetes in overweight/obese patients (BMI 27 to 45 kg/m^2) plus at least two weight-related comorbidities with pre-existing prediabetes and/or metabolic syndrome in a 108-week study compared with placebo (n = 475). However, the magnitude of effect for prevention of type 2 diabetes was related to the degree of weight loss achieved in this sub-analysis. Such patients should be evaluated based on overweight or obesity using the appropriate criteria above.

6. **Nonalcoholic Fatty Liver Disease.** In a single-center trial, 52 patients with nonalcoholic fatty liver disease were randomized to Xenical 120 mg three times daily or placebo.[24] Mean BMI was 33 kg/m^2. All patients were in a behavioral weight loss program. Forty-four patients completed 6 months and their results were analyzed. Patients were not well-matched for baseline characteristics (e.g., BMI, waist circumference, glucose and insulin levels were significantly different between groups at baseline). The authors concluded that Xenical improves serum alanine aminotransferase (ALT) and steatosis on ultrasound in these patients beyond its effect on weight reduction. An additional 24 week study, compared Xenical (n = 68) with conventional treatment (n = 102) in patients with nonalcoholic fatty liver disease and a BMI of ≥ 25 kg/m^2 using magnetic resonance imaging-derived proton density fat fraction.[36] After 24 weeks of treatment, patients treated with Xenical had significantly greater reduction in total liver fat compared with the conventional treatment group (-5.45% vs. -1.96%, P < 0.001). In addition, steatosis improved in more patients treated with Xenical compared with the conventional treatment arm (57.3% vs. 23.5%, p < 0.001). Long-term, well-designed trials in a large number of patients are needed to determine if Xenical has a place in therapy for nonalcoholic fatty liver disease. In a small, randomized trial, Saxenda was compared with lifestyle modification in obese patients with nonalcoholic fatty liver disease.[37] After 26 weeks, similar reductions in weight (-3.3 kg vs. -3.0 kg), liver fat fraction (-8.1% vs. -7.0%), alanine aminotransferase (-39 U/L vs. -26 U/L), and caspase-cleaved cytokeratin-18 (-206 U/L vs. -130 U/L) occurred in the lifestyle modification and Saxenda groups, respectively. However, after discontinuing Saxenda, patients regained weight and liver fat fraction at week 52 while patients in the lifestyle modification group maintained the improvements in weight and liver fat fraction. There is very little good quality evidence to support or refute the use of weight reduction as a treatment for nonalcoholic fatty liver disease.[25]

7. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

APPENDIX A

Below is a chart of BMI based on various heights and weights.[2] To use the table, find the appropriate height in the far left column, and move across the row to the given weight; the number at the top of the column is the BMI. For example, a patient who is 5 feet 6 inches in height and weighs 192 pounds has a BMI of 31 kg/m^2.

BMI can also be calculated using the following formula: BMI equals body weight in kilograms divided by height meters squared (m^2), i.e., BMI = kg/m^2.

Body Mass Index

BMI, kg/m^2	**25**	**26**	**27**	**28**	**29**	**30**	**31**	**32**	**33**	**34**	**35**	**40**

PRIOR AUTHORIZATION POLICY

POLICY: Xiaflex® (collagenase clostridium histolyticum for intralesional injection – Endo Pharmaceuticals)

DATE REVIEWED: 01/29/2020

OVERVIEW

Xiaflex is a combination of bacterial collagenases indicated for the treatment of adult patients with Dupuytren's contracture with a palpable cord, and for the treatment of adult men with Peyronie's disease with a palpable plaque and curvature deformity of at least 30 degrees at the start of therapy.[1]

Dupuytren's contracture is a disorder of the palmar and digital fascia of the hand.[2] Abnormal deposition of collagen initially causes nodules in the palm of the hand, which may thicken and lead to formation of cords. As the disease progresses, the cords gradually contract, leading to flexion deformities of the fingers. Joint contractures are typically painless but are associated with significant functional impairment. The exact etiology of Dupuytren's contracture is unknown, although a number of risk factors have been reportedly associated with the condition, including alcohol, smoking, diabetes, epilepsy, thyroid disorders, and trauma. Prevalence varies widely by age and geographical location but is most common among Caucasian males greater than 50 years of age. Surgical intervention, either by open partial fasciectomy or percutaneous needle fasciotomy, is the mainstay of therapy for severe cases. However, surgery may be associated with complications including neurovascular injury or hematoma, and recurrence after surgery is common. In clinical studies of Dupuytren's contracture, patients were eligible to participate if they had a finger contraction of 20 degrees to 100 degrees in a metacarpophalangeal (MP) joint or 20 degrees to 80 degrees in a proximal interphalangeal (PIP) joint.[1]

Peyronie's disease is an acquired penile abnormality caused by fibrosis of the tunica albuginea, which may lead to pain, deformity, erectile dysfunction, and/or distress.[3] It is thought that repeated minor trauma to the penis initiates a cascade involving extravascular protein deposition, fibrin trapping, and overexpression of cytokines, leading to collagen changes characteristic of the condition. Males around 50 years of age are most commonly affected. Peyronie's disease has a variable course; for most patients, pain will resolve over time without intervention, but curvature deformities are less likely to resolve without treatment. Intralesional therapy with Xiaflex may be used to treat curvature associated with Peyronie's disease and is supported by American Urological Association guidelines (2015). In the pivotal studies, patients were required to have a penile deformity of at least 30 degrees.[1]

Dosing Considerations

For treatment of Dupuytren's contracture, the dose of Xiaflex is 0.58 mg per injection into a palpable cord with a contracture of an MP or PIP joint.[1] Two palpable cords affecting two joints or one palpable cord affecting two joints in the same finger may be injected per treatment visit. Injections may be administered up to three times per cord at approximately 4-week intervals.

For treatment of Peyronie's disease, one treatment course consistent of four cycles.[1] Each cycle consists of two Xiaflex injection procedures (1 to 3 days apart). Up to four cycles of Xiaflex may be administered, given at approximately 6-week intervals. The safety of more than one treatment course (8 total injections) is unknown.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Xiaflex. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Xiaflex, approval requires it to administered by a healthcare provider with expertise in the condition being treated.

Prior authorization is not recommended for Xiaflex for cosmetic uses

Automation: None

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Xiaflex is recommended in those who meet the following criteria:

FDA-Approved Indications

7. Dupuytren's Contracture. Approve Xiaflex for 3 months in patients meeting all of the following criteria (A, B, C, and D):
- **A)** The patient is ≥ 18 years of age; AND
- **B)** At baseline (prior to initial injection of Xiaflex), the patient had contracture of a metacarpophalangeal (MP) or proximal interphalangeal (PIP) joint of at least 20 degrees; AND
- **C)** The patient will not be treated with more than a total of three injections (maximum) per affected cord; AND
- **D)** Xiaflex is administered by a healthcare provider experienced in injection procedures of the hand and in the treatment of Dupuytren's contracture.

8. Peyronie's Disease. Approve Xiaflex for 6 months if the patients meets ALL of the following criteria (A, B, C, and D):
- **A)** The patient is ≥18 years of age; AND
- **B)** The patient meets ONE of the following (i or ii):
  - **i.** At baseline (prior to use of Xiaflex), the patient has a penile curvature deformity of at least 30 degrees; OR
  - **ii.** In a patient who has received prior treatment with Xiaflex, the patient has a penile curvature deformity of at least 15 degrees; AND
- **C)** The patient has not previously been treated with a complete course (8 injections) of Xiaflex for Peyronie's disease; AND
- **D)** The medication is being administered by a healthcare provider experienced in the treatment of male urological diseases.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Xiaflex has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

247. Cosmetic Uses (e.g., cellulite of buttocks). Cosmetic use is not recommended for coverage as this indication is excluded from coverage in a typical pharmacy benefit.

248. Retreatment (i.e., treatment beyond three injections per affected cord for those with Dupuytren's Contracture or beyond eight injections for Peyronie's Disease). For Dupuytren's contracture, injections and finger extension procedures may be administered up to three times per cord.[1] However, this does not limit treatment of additional cords. For Peyronie's disease, the safety of more than one treatment course (8 injections) is unknown.

249. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Xyrem Prior Authorization Policy

- Xyrem® (sodium oxybate oral solution – Jazz Pharmaceuticals)

REVIEW DATE: 03/25/2020; selected revision 06/24/2020

OVERVIEW

Xyrem, a central nervous system (CNS) depressant, is indicated for the following uses:[1]

- **Cataplexy treatment in patients with narcolepsy**, in patients ≥ 7 years of age.
- **Excessive daytime sleepiness in narcolepsy**, in patients ≥ 7 years of age.

Guidelines

Guidelines recommend the use of Xyrem for the treatment of narcolepsy and for cataplexy due to narcolepsy.[2-3] The American Academy of Sleep Medicine (AASM) practice parameters for the treatment of narcolepsy and other hypersomnias of central origin (2007) list Xyrem as effective for treatment of cataplexy, daytime sleepiness, and disrupted sleep due to narcolepsy (*Standard*) and modafinil as an effective for treatment of daytime sleepiness due to narcolepsy (*Standard*). Amphetamine, methamphetamine, dextroamphetamine, and methylphenidate are considered effective for the treatment of daytime sleepiness due to narcolepsy (*Guideline*). Tricyclic antidepressants (TCAs), selective serotonin reuptake inhibitors (SSRIs), and venlafaxine may be effective for the treatment of cataplexy (*Guideline*). Selegiline may be an effective treatment for cataplexy and daytime sleepiness (*Option*). *Standard* recommendations are considered to be generally accepted patient-care strategies that reflect a high degree of clinical certainty based on Level I evidence or overwhelming Level II evidence. *Guideline* recommendations are considered to be patient-care strategies that reflect a moderate degree of clinical certainty based on Level II evidence or a consensus of Level III evidence. *Option* recommendations are

considered to be patient-care strategies that reflect uncertain clinical use based on inconclusive or conflicting evidence or conflicting expert opinion. At the time this practice parameter was written, published studies involving Nuvigil® (armodafinil tablets) were limited.

Safety

Xyrem is the sodium salt of gamma hydroxybutyrate (GHB) and is a Schedule III controlled substance.[1] Abuse of GHB (a Schedule I controlled substance), either alone or in combination with other CNS depressants, is associated with CNS adverse reactions, including seizure, respiratory depression, decreases in the level of consciousness, coma, and death. Because of the risks of CNS depression, abuse, and misuse, Xyrem is available only through a restricted distribution program called the Xyrem Success Program, using a centralized pharmacy. Healthcare professionals who prescribe Xyrem and patients must enroll in the Xyrem Success Program and must comply with the requirements to ensure the drug's safe use.

In 2012, the FDA issued a safety communication for Xyrem, reminding healthcare professionals and patients that the combined use of Xyrem with alcohol or CNS depressant drugs can markedly impair consciousness and may lead to severe respiratory depression.[4] At that time, the use of alcohol with Xyrem was a new contraindication added to the Xyrem label, which already contraindicated its use with insomnia medications. The use of Xyrem with other CNS depressant drugs (such as opioid analgesics, benzodiazepines, sedating antidepressants or antipsychotics, general anesthetics, and muscle relaxants) should generally be avoided.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Xyrem. Because Xyrem has been associated with significant risks, including CNS and respiratory depression, and has the potential for abuse, misuse, and overdose, approval requires Xyrem to be prescribed by a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: Grandfathering is not clinically necessary for Xyrem. Refer to the AUM reference guide for additional information.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Xyrem is recommended in those who meet the following criteria:

FDA-Approved Indications

35. Cataplexy Treatment in Patients with Narcolepsy. Approve for 1 year if the patient meets the following criteria (A, B, and C):

G) Patient has tried one of the following treatments: a tricyclic antidepressant (TCA), a selective serotonin reuptake inhibitor (SSRI), or venlafaxine; AND
Note: Examples of tricyclic antidepressants include amitriptyline, desipramine, and imipramine. Examples of SSRIs include fluoxetine, sertraline, and paroxetine.

H) Narcolepsy has been confirmed with polysomnography and a multiple sleep latency test (MSLT); AND

I) Xyrem has been prescribed by a sleep specialist physician or a neurologist.

36. Excessive Daytime Sleepiness in Patients with Narcolepsy. Approve for 1 year if the patient meets the following criteria (A, B, and C):

A) Patient has tried one of the following treatments: a central nervous system (CNS) stimulant, modafinil, or armodafinil; AND

Note: Examples of CNS stimulants include methylphenidate, dexmethylphenidate, and dextroamphetamine.

B) Narcolepsy has been confirmed with polysomnography and a multiple sleep latency test (MSLT); AND

C) Xyrem has been prescribed by a sleep specialist physician or a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Xyrem is not recommended in the following situations:

161. Fibromyalgia. The effectiveness of Xyrem in fibromyalgia has been evaluated in clinical trials of varying size.[5-10] However, due to safety concerns, Xyrem is not recommended for approval for fibromyalgia at this time. Duloxetine, Lyrica® (pregabalin capsules and oral solution), and Savella® (milnacipran tablets) are indicated for the treatment of fibromyalgia.[11-13] Other recommended treatments include TCAs (i.e., amitriptyline), cyclobenzaprine, gabapentin, and SSRIs (i.e., fluoxetine, sertraline, paroxetine).[14]

The European League Against Rheumatism (EULAR) has issued updated evidence-based recommendations for the management of fibromyalgia (2016) stating that initial management should involve patient education and focus on nonpharmacological therapies.[15] In case of non-response, further therapies should be tailored to the specific needs of the individual and may involve psychological therapies (for mood disorders and unhelpful coping strategies), pharmacotherapy (for severe pain or sleep disturbance) and/or a multimodal rehabilitation program (for severe disability). EULAR notes that the European Medicines Agency and the FDA refused approval of Xyrem for fibromyalgia because of safety concerns. EULAR's position on Xyrem for fibromyalgia is strongly against with 94% agreement.

162. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Zontivity™ (vorapaxar tablets – Aralez Pharmaceuticals)

APPROVAL DATE: 10/9/2019

OVERVIEW

Zontivity, a protease-activated receptor-1 (PAR-1) antagonist, is indicated for the reduction of thrombotic cardiovascular (CV) events in patients with a history of myocardial infarction (MI) or with peripheral arterial disease (PAD).[1] Zontivity has been shown to reduce the rate of a combined endpoint of CV death, MI, stroke, and urgent coronary revascularization. The recommended dose is one tablet (Zontivity 2.08 mg) once daily (QD), with or without food. One Zontivity tablet (2.08 mg) is equivalent to 2.5 mg of vorapaxar sulfate. There is no experience with the use of Zontivity alone as the only administered antiplatelet agent. Studies involving Zontivity involved adding the agent to aspirin and/or clopidogrel. Use Zontivity with aspirin and/or clopidogrel according to indicated uses or the standard of care. The clinical use of Zontivity with other antiplatelet medications is limited.

Clinical Efficacy

The efficacy of Zontivity is supported by a trial called TRA 2°P-TIMI 50 (Thrombin Receptor Antagonist in Secondary Prevention of Atherothrombotic Ischemic Events-Thrombolysis In Myocardial Infarction 50).[1,2] This study was a multinational, multicenter, randomized, double-blind, placebo-controlled trial that investigated the efficacy of Zontivity in patients with atherosclerosis that affected the coronary (spontaneous MI $\geq$ 2 weeks but $\leq$ 12 months prior), cerebral (ischemic stroke), or peripheral vascular (documented PAD) systems (n = 26,449). The qualifying types of atherosclerosis were MI (67.25%), ischemic stroke (18.45%), and PAD (14.30%). Most patients with a qualifying MI were receiving aspirin therapy (98.1%) and 78.1% of patients reported using a thienopyridine (e.g., clopidogrel). A substantial proportion of patients with a qualifying event of PAD were receiving aspirin (88%); 36.8% of patients were receiving a thienopyridine. The primary endpoint was the composite of CV death, MI, stroke, and urgent coronary revascularization. The median follow up was 2.5 years.[1-2] After a median of 24 months of treatment, the data and safety monitoring board noted that there was an excess of intracranial hemorrhage (ICH) in patients with a history of stroke in the Zontivity group and recommended discontinuation of the medication in all patients with previous stroke, including patients who experienced a new stroke during the study.[2] The trial was permitted to continue in patients without a history of stroke. The 3-year event rate for the composite endpoint in patients who had a prior MI or PAD, without a history of stroke or TIA (n = 20,170), was 10.1% for patients given Zontivity vs. 11.8% in the placebo group (hazard ratio 0.83; 95% confidence interval [CI]: 0.76, 0.90; P < 0.001), an approximate 17% reduction. Of note, among patients

weighing < 60 kg (n = 1,177/20,170), those assigned to receive Zontivity did not have a favorable outcomes compared with the group given placebo.[1,2]

Guidelines

In 2016 and American Heart Association and the American College of Cardiology published a guidelines on the management of patients with lower extremity peripheral artery disease (PAD).[3] The guidelines state that the overall clinical benefit of Zontivity added to existing antiplatelet therapy in patients with symptomatic PAD is uncertain.

Safety

Zontivity has a Boxed Warning regarding the risk of bleeding. Zontivity is contraindicated in patients with a history of stroke, transient ischemic attack (TIA), or intracranial hemorrhage (ICH) because of the risk of ICH in this patient population.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Zontivity. Because of the specialized skills required for evaluation and diagnosis of patients treated with Zontivity, as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Zontivity to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for 3 years in duration unless otherwise noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zontivity is recommended in patients who meet the following criteria:

FDA-Approved Indication

172. Patients with a Previous Myocardial Infarction (MI) or Peripheral Arterial Disease (PAD). Approve if the patient meets the following criteria (A, B and C):

Z) The patient is receiving Zontivity in combination with aspirin and/or clopidogrel; AND

AA) The patient has been determined to be at high risk for future thrombotic events as determined by the prescribing physician (e.g., patient has experienced multiple MIs, has undergone many urgent coronary revascularization procedures, has had placement of coronary artery stents, or the patient has other concomitant diseases that increase CV risk [e.g., diabetes]); AND

BB) The patient weighs ≥ 60 kg.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Zontivity has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

163. Acute Coronary Syndrome (ACS) that Occurred Recently (within < 14 days). TRACER (Thrombin Receptor Antagonist for Clinical Event Reduction in acute coronary syndrome), which was a multinational, multicenter, double-blind, placebo-controlled, randomized investigation studied the

effects of Zontivity in patients who had experienced an ACS without ST-segment elevation (n = 12,944).[4] Patients were randomized to receive Zontivity (loading dose of 40 mg and then a daily maintenance dose of 2.5 mg thereafter) or matching placebo. Most patients were also receiving a thienopyridine (87.4%) and aspirin (96.9%). The trial was terminated early after a safety review indicated adding Zontivity to standard therapy increased the risk of major bleeding, including ICH. Also, after a median follow-up of 502 days the primary endpoint (death from CV causes, MI, stroke, current ischemia with rehospitalization, or urgent coronary revascularization) was not significantly reduced with adding Zontivity compared with placebo (Kaplan-Meier 2-year rate 18.5% vs. 19.9% respectively; P = 0.07). TRA 2°P-TIMI 50 enrolled patients who were 2 weeks post a spontaneous MI or ischemic stroke.

164. **Patients with a Prior History of Stroke, Transient Ischemic Attack (TIA), or Intracranial Hemorrhage (ICH).** Zontivity is contraindicated for use in patients with a history of stroke, TIA or ICH due to an increased risk of ICH in this population.

165. **Concurrent Use of Effient® (prasugrel tablets) or Brilinta® (ticagrelor tablets).** There is limited clinical experience involving use of Zontivity with antiplatelet agents other than aspirin and/or clopidogrel (e.g., Effient, Brilinta). In the pivotal trial with Zontivity (TRA 2°P-TIMI 50) only 177 patients (0.7%) received Effient during the trial. Further data are needed to determine if Zontivity has efficacy and can be used safely in combination with other antiplatelet medications. In the professional opinion of specialist physicians reviewing the data, we have adopted this criterion.

166. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Prior Authorization Policy

POLICY: Zovirax (Topical)

- Zovirax® (acyclovir 5% cream – Valeant, generics)
- Zovirax (acyclovir 5% ointment – Valeant, generics)

APPROVAL DATE: 06/12/2019

Overview

Acyclovir 5% cream (Zovirax, generics) is indicated for the treatment of recurrent herpes labialis (cold sores) in immunocompetent adults and adolescents 12 years of age and older.[1] Acyclovir 5% ointment

(Zovirax, generics) is indicated in the management of initial genital herpes and in limited non-life-threatening mucocutaneous herpes simplex virus infections in immunocompromised patients.[2]

Herpes simplex virus type 1 (HSV-1) is mainly transmitted by oral-to-oral contact and causes infections in and around the mouth (oral herpes).[3,4] HSV-1 can also cause genital herpes, but genital herpes is more commonly caused by HSV-2, which is transmitted via sexual contact.

Herpes labialis (cold sores, fever blisters), a highly contagious infection, is a common condition caused by HSV-1.[3,5] This condition is typically self-limiting; many patients do not require or use treatment.[5,6] However, if pharmacologic therapy is desired, it is important to initiate therapy as soon as possible. Topical antiviral medications can be helpful in the treatment of herpes labialis. Approximately one-third of all infected patients experience relapses. Recurrent episodes of herpes labialis can be painful, long-lasting, and disfiguring.[6]

Genital herpes, a chronic, life-long viral infection, requires prompt treatment.[3,4] Systemic antiviral drugs are used to treat first and recurrent episodes and in some cases, systemic antiviral drugs are used as daily suppressive therapy.[4]

Shingles is a viral infection caused by the varicella-zoster virus, the same virus that causes chickenpox.[7,8] The Centers for Disease Control and Prevention (CDC) and the National Institute of Health (NIH), National Institute of Neurological Disorders and Stroke (NINDS) cite the use of oral antivirals (acyclovir capsules/tablets/suspension [Zovirax, generics], famciclovir tablets [Famvir®, generics], and valacyclovir caplets [Valtrex®, generics]) for the treatment of shingles. Oral antivirals speed healing and reduce the risk of complications. Topical antivirals are <u>not</u> noted as treatment options for shingles.

Policy Statement

Prior authorization is recommended for prescription benefit coverage of Acyclovir 5% cream (Zovirax, generics) and Acyclovir 5% ointment (Zovirax, generics). Use should be limited to the treatment of medical conditions. All approvals are provided for 1 year. For the ointment, a trial of generic acyclovir 5% ointment is required prior to approval of brand Zovirax 5% ointment.

<u>Automation</u>: None.

RECOMMENDED AUTHORIZATION CRITERIA

III. Coverage of <u>acyclovir 5% cream (Zovirax 5% cream, generics)</u> is recommended in those who meet the following criterion:

FDA-Approved Indication

30. Herpes Labialis (Cold Sores) in Immunocompetent Adults and Adolescents ≥ 12 Years of Age. Approve for 1 year.

IV. Coverage of <u>acyclovir 5% ointment (Zovirax 5% ointment, generics)</u> is recommended in those who meet the following criteria:

FDA-Approved Indications

31. Genital Herpes. Approve for 1 year if the patient meets one of the following criteria (A <u>or</u> B):

a. Generic acyclovir 5% ointment is requested; OR
b. If brand Zovirax 5% ointment is requested, the patient has tried generic acyclovir 5% ointment AND cannot use the generic product due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the brand and the bioequivalent generic product, which per the prescribing physician, would result in a significant allergy or serious adverse reaction.

32. Limited Non-Life-Threatening Mucocutaneous Herpes Simplex Virus Infections in Immunocompromised Patients. Approve for 1 year if the patient meets one of the following criteria (A or B):
a. Generic acyclovir 5% ointment is requested; OR
b. If brand Zovirax 5% ointment is requested, the patient has tried generic acyclovir 5% ointment AND cannot use the generic product due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the brand and the bioequivalent generic product, which per the prescribing physician, would result in a significant allergy or serious adverse reaction.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Acyclovir 5% cream (Zovirax cream, generics) and acyclovir 5% ointment (Zovirax ointment, generics) have not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

15. Shingles.

16. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.
