Annual revision	• **Breast Cancer – Neoadjuvant or Adjuvant Therapy**. Separated out indication from metastatic disease. Deleted criteria requiring locally advanced, inflammatory, or early stage disease for neoadjuvant therapy. For adjuvant therapy, deleted criteria requiring "early breast cancer with high risk of recurrence (e.g., node positive), according to the prescriber AND will be used in combination with chemotherapy." Instead, the following criteria was added: "The medication is continued after chemotherapy to complete 1 year of neoadjuvant or adjuvant therapy." • **Breast Cancer – Metastatic Disease**. Added separate indication for metastatic disease; previously it was addressed along with neoadjuvant/adjuvant therapy. Added criteria that the patient was not previously treated with anti-HER2 therapy or chemotherapy for metastatic disease, based on FDA label. Also, added requirement for combination use with chemotherapy along with trastuzumab. • **Colon or Rectal Cancer.** Added new approval condition under "Other Uses with Supportive Evidence" based on guideline recommendation.	07/29/2020

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Phesgo Prior Authorization Policy

- Phesgo™ (pertuzumab, trastuzumab, and hyaluronidase-zzxf injection for subcutaneous use – Genentech, Inc.)

REVIEW DATE: 07/08/2020

OVERVIEW

Phesgo, a combination of pertuzumab, trastuzumab, and hyaluronidase-zzxf, is indicated for the following uses:[1]

- **Early breast cancer**, for use in combination with chemotherapy for the neoadjuvant treatment of adult patients with human epidermal growth factor receptor 2 (HER2)-positive, locally advanced, inflammatory, or early stage breast cancer (either > 2 cm in diameter or node positive) as part of a complete treatment regimen for early breast cancer. It is also indicated for the adjuvant treatment of adult patients with HER2-positive early breast cancer at high risk of recurrence.
- **Metastatic breast cancer**, for use in combination with docetaxel for the treatment of adult patients with HER2-positive disease who have not received prior anti-HER2 therapy or chemotherapy for metastatic disease.

Patients should be selected for therapy based on an FDA-approved companion diagnostic test.

Guidelines

The National Comprehensive Cancer Network (NCCN) breast cancer guidelines (version 5.2020 – July 15, 2020) notes that Phesgo may be substituted anywhere that the combination of Perjeta IV and trastuzumab IV are given as part of systemic therapy.[2] The guidelines note that Phesgo has a different dosing and administration instructions compared with the IV products. For preoperative (neoadjuvant)/adjuvant therapy in HER2-positive disease, doxorubicin/cyclophosphamide followed by paclitaxel plus trastuzumab and Perjeta is one of the preferred regimens (category 2A). Docetaxel/carboplatin/trastuzumab/Perjeta is another recommend regimen (category 2A). Under other recommended regimens, doxorubicin/cyclophosphamide followed by docetaxel + trastuzumab + Perjeta is also listed (category 2A). In the neoadjuvant/adjuvant setting, the chemotherapy agents in combination with trastuzumab + Perjeta are administered for usually four cycles, followed by trastuzumab ± Perjeta to complete 1 year of therapy. In the metastatic setting, the preferred regimens are Perjeta + trastuzumab + docetaxel (category 1) or Perjeta + trastuzumab + paclitaxel (category 2A). In this setting, chemotherapy + trastuzumab + Perjeta is continued until disease progression or unmanageable toxicity.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Phesgo. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Phesgo, as well as the monitoring required for adverse events and long-term efficacy, approval requires Phesgo to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Phesgo is recommended in those who meet the following criteria:

FDA-Approved Indications

29. Breast Cancer – Neoadjuvant or Adjuvant Therapy. Approve for 1 year (total) if the patient meets all of the following (A, B, and C):
- **A)** Patient has human epidermal growth factor receptor 2 (HER2)-positive disease; AND
- **B)** Patient meets one of the following criteria (i or ii):
  - **i.** The medication will be used in combination with chemotherapy; OR
    Note: Examples of chemotherapy are doxorubicin, cyclophosphamide, docetaxel, paclitaxel, carboplatin.
  - **ii.** Phesgo is continued after chemotherapy to complete 1 year of neoadjuvant or adjuvant therapy; AND
- **C)** The medication is prescribed by or in consultation with an oncologist.

2. Breast Cancer – Metastatic Disease. Approve for 1 year if the patient meets all of the following (A, B, C, and D):
- **A)** Patient has human epidermal growth factor receptor 2 (HER2)-positive disease; AND
- **B)** Patient has not been previously treated with anti-HER2 therapy or chemotherapy for metastatic disease; AND
- **C)** The medication will be used in combination with chemotherapy; AND
  Note: Examples of chemotherapy are docetaxel, paclitaxel.
- **D)** The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Phesgo is not recommended in the following situations:

5. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Polivy Prior Authorization Policy
- Polivy™ (polatuzumab vedotin – piiq injection for intravenous use – Genentech)

REVIEW DATE: 06/24/2020

OVERVIEW

Polivy, a CD79b-directed antibody-drug conjugate, is indicated in combination with bendamustine and a rituximab product is indicated for the treatment of adult patients with relapsed or refractory diffuse large B-cell lymphoma (DLBCL), not otherwise specified, after at least two prior therapies.[1] Accelerated approval was granted for this indication based on complete response rate. Continued approval for this indication may be contingent upon verification and description of clinical benefit in a confirmatory trial.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on B-Cell Lymphomas (version 1.2020 – January 22, 2020) recommend Polivy for the second-line or subsequent treatment of DLBCL, follicular lymphoma, histologic transformation of nodal marginal zone lymphoma to DLBCL, mantle cell lymphoma, AIDS-related B-cell lymphoma, post-transplant lymphoproliferative disorders, and high-grade B-cell lymphoma after ≥ 2 prior therapies in non-candidates for transplant.[2,3]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Polivy. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Polivy as well as the monitoring required for adverse events and long-term efficacy, approval requires Polivy to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Polivy is recommended in those who meet the following criteria:

FDA-Approved Indications

195. Diffuse Large B-Cell Lymphoma. Approve for 6 months if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has been treated with at least two prior chemotherapy regimens; AND
- **C)** Polivy is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

196. B-Cell Lymphoma. (Note: Examples include follicular lymphoma, mantle cell lymphoma, high-grade B-cell lymphoma, AIDS-related B-cell lymphoma, post-transplant lymphoproliferative disorders, histologic transformation of nodal marginal zone lymphoma to diffuse large B-cell lymphoma). Approve for 6 months if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has been treated with at least two prior chemotherapy regimens; AND
- **C)** Polivy is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Polivy is not recommended in the following situations:

194. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

New Policy	--	06/13/2019
Early annual revision	Diffuse Large B-Cell Lymphoma. Criterion was reworded to specify that two prior therapies was in fact two prior chemotherapy regimens. High-grade B-cell lymphoma was added to the Other Uses with Supportive Evidence section.	06/26/2019
Annual revision	**Diffuse Large B-Cell Lymphoma**. Removed criteria for used in combination with bendamustine and a rituximab product. **High-Grade B-cell Lymphoma**. Revised condition of approval to B-Cell Lymphoma and added a note with examples of B-cell lymphoma. Removed criteria for used in combination with bendamustine and a rituximab product.	06/24/2020

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Portrazza Prior Authorization Policy

- Portrazza® (necitumumab injection for intravenous use – Eli Lilly)

REVIEW DATE: 01/20/2021

OVERVIEW

Portrazza is indicated in combination with gemcitabine and cisplatin for the **first-line treatment** of patients with **metastatic squamous non-small cell lung cancer** (NSCLC).[1] It has a limitation of use noted that it is not indicated for the treatment of non-squamous NSCLC.

Guidelines

The National Comprehensive Cancer Network (NCCN) NSCLC cancer guidelines (version 2.2021 – December 15, 2020) no longer addresses Portrazza in the treatment algorithms. In the discussion section, it is noted that the NCCN Panel feels the addition of Portrazza to treatment regimen is not beneficial based on toxicity, cost, and limited improvement in efficacy when compared with cisplatin/gemcitabine.[2]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Portrazza. Because of the specialized skills required for evaluation and diagnosis of patients treated with Portrazza as well as the monitoring required for adverse events and long-term efficacy, approval requires the medication to be prescribed by or in consultation with a prescriber who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Portrazza is recommended in those who meet the following criteria:

FDA-Approved Indications

23. Non-Small Cell Lung Cancer (NSCLC). Approve for 1 year if the patient meets the following criteria (A, B, and C):

A) Patient has metastatic squamous NSCLC; AND

B) Portrazza will be used in combination with chemotherapy.
Note: Examples of chemotherapy are gemcitabine, cisplatin; AND

C) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Portrazza is not recommended in the following situations:

277. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Poteligeo Prior Authorization Policy

- Poteligeo® (mogamulizumab-kpkc injection, for intravenous use – Kyowa Kirin, Inc.)

REVIEW DATE: 09/02/2020

OVERVIEW

Poteligeo is indicated for the treatment of adult patients with relapsed or refractory mycosis fungoides or Sézary syndrome after at least one prior systemic therapy.[1]

GUIDELINES

The National Comprehensive Cancer Network (NCCN) guidelines on Primary Cutaneous Lymphomas (version 2.2020 – April 10, 2020) recommend Poteligeo for primary treatment and for treatment of relapsed/refractory mycosis fungoides/Sezary syndrome.[2,3]

The NCCN guidelines on T-Cell Lymphomas (version 1.2020 – January 6, 2020) recommend Poteligeo as a single agent for the treatment of relapsed/refractory adult T-cell leukemia/lymphoma, acute or lymphoma subtypes.[3,4]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Poteligeo. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Poteligeo as well as the monitoring required for adverse events and long-term efficacy, approval requires Poteligeo to be prescribed by, or in consultation with, a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Poteligeo is recommended in those who meet the following criteria:

FDA-Approved Indications

~~71.~~68. **Mycosis Fungoides/Sezary Syndrome.** Approve for 1 year if Poteligeo is prescribed by or in consultation with an oncologist or dermatologist.

Other Uses With Supportive Evidence

~~72.~~69. **Adult T-cell Leukemia/Lymphoma**. Approve for 1 year if the patient meets ALL of the following (A and B):

A) Patient has relapsed or refractory disease; AND

B) Poteligeo is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Poteligeo is not recommended in the following situations:

278. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Proleukin Prior Authorization Policy

- Proleukin® (aldesleukin injection for intravenous use – Prometheus Laboratories)

REVIEW DATE: 12/16/2020

OVERVIEW

Proleukin, a human recombinant interleukin-2 product, is indicated for the following conditions, in adults:

- **Metastatic melanoma**.
- **Metastatic renal cell carcinoma**.[1]

Guidelines

Proleukin is addressed in the following National Comprehensive Cancer Network (NCCN) guidelines:

- The NCCN **cutaneous melanoma** (version 1.2021 – November 25, 2020) NCCN clinical practice guidelines recommend Proleukin for unresectable or metastatic disease as a single agent for second-line or subsequent therapy for disease progression or after maximum clinical benefit from BRAF targeted therapy (Category 2A).[2,4] Proleukin may be considered for patients with small brain tumors and without significant peritumoral edema (Category 2B) or for intralesional therapy as primary or second-line treatment of unresectable stage III disease with clinical or satellite/in-transit metastases, or local satellite/in-transit recurrence (Category 2B).
- The NCCN **hematopoietic cell transplantation** (version 2.2020 – March 23, 2020) NCCN clinical practice guidelines recommend Proleukin as additional therapy, in combination with systemic corticosteroids, for steroid-refractory chronic graft-vs-host disease.[2,5]
- The NCCN **kidney cancer** (version 1.2021 – July 15, 2020) NCCN clinical practice guidelines recommend Proleukin as a single agent for first-line (Category 2A) and subsequent (Category 2B) therapy for patients with relapsed or stage IV disease and clear cell histology.[2,3]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Proleukin. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Proleukin as well as the monitoring required for adverse events and long-term efficacy, approval requires Proleukin to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Proleukin is recommended in those who meet the following criteria:

FDA-Approved Indications

197. Cutaneous Melanoma. Approve for 6 months if the patient meets ONE of the following (A or B):

A) Intravenous Therapy. Approve if the patient meets the following criteria (i, ii, iii, iv, and v):
- **i.** Patient is ≥ 18 years of age; AND
- **ii.** Patient has metastatic or unresectable disease; AND
- **iii.** Patient has tried at least one other systemic therapy; AND
- **iv.** Proleukin will be used as a single agent; AND
- **v.** Proleukin is prescriber by or in consultation with an oncologist.

B) Intralesional Therapy. Approve if the patient meets the following criteria (i, ii, and iii):
- **i.** Patient is ≥ 18 years of age; AND
- **ii.** Proleukin will be directly injected into metastatic, recurrent, or unresectable cutaneous, subcutaneous, or nodal lesions; AND
- **iii.** The medication is prescribed by or in consultation with an oncologist or dermatologist.

198. Kidney Cancer. Approve for 6 months if the patient meets the following criteria (A, B, C, D, and E):

A) Patient is ≥ 18 years of age; AND
B) Patient has relapsed or metastatic disease; AND
C) Patient has clear cell histology; AND
D) Proleukin will be used as a single agent; AND
E) Proleukin is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

199. Graft-Versus-Host Disease. Approve for 1 year if the patient meets the following criteria (A, B, C, and D):

A) Patient has chronic graft-versus-host disease; AND
B) According to the prescriber, the patient has steroid-refractory disease; AND
C) Proleukin will be used in combination with systemic corticosteroids; AND
D) Proleukin will be prescribed by or in consultation with an oncologist or a physician associated with a transplant center.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Proleukin is not recommended in the following situations:

195. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Rituxan Hycela Prior Authorization Policy

- Rituxan Hycela® (rituximab and hyaluronidase human injection for subcutaneous use – Biogen and Genentech/Roche)

REVIEW DATE: 11/04/2020

OVERVIEW

Rituxan Hycela, a combination of rituximab and hyaluronidase human, is indicated for treatment of adults with the following indications:

- **Diffuse large B-cell lymphoma**, in combination with CHOP (cyclophosphamide, doxorubicin, vincristine, and prednisone) or other anthracycline-based chemotherapy regimens in patients with previously untreated disease.
- **Chronic lymphocytic leukemia**, in combination with FC (fludarabine + cyclophosphamide) for previously treated and previously untreated disease.
- **Follicular lymphoma**, as a single agent for relapsed or refractory disease; in previously untreated disease in combination with first-line chemotherapy and, as single-agent maintenance therapy in patients achieving a complete or partial response to rituximab + chemotherapy; and as a single agent after first-line CVP (cyclophosphamide, vincristine, and prednisone) in non-progressing (including stable disease) disease.

Rituxan Hycela contains the identical molecular antibody of rituximab available in Rituxan intravenous, but hyaluronidase has been added to facilitate systemic delivery. Rituxan Hycela should be administered under the care of a healthcare professional with appropriate medical support to manage severe and potentially fatal reactions. The dose of Rituxan Hycela is fixed regardless of the patient's body surface area; dose reductions are not recommended. When given in combination with chemotherapy, reduce the dose of chemotherapeutic drugs to manage adverse events. Rituxan Hycela is not indicated for treatment of non-malignant conditions.

Guidelines

Rituximab features prominently in the National Comprehensive Cancer Network (NCCN) guidelines for multiple conditions. The following guidelines from NCCN have been updated to list Rituxan Hycela (noted as rituximab + hyaluronidase) in most clinical scenarios when the intravenous formulation is recommended, if the patient has received the first full dose with rituximab intravenous.

- **B-cell Lymphomas:** In the guidelines (version 4.2020 – August 13, 2020), rituximab included in multiple treatment regimens across the spectrum of disease.[2]
- **Chronic Lymphocytic Leukemia/Small Lymphocytic Lymphoma:** Rituximab features prominently in the guidelines (version 1.2021 – September 28, 2020) and is included in multiple treatment regimens across the spectrum of disease.[3]
- **Hairy Cell Leukemia:** Guidelines (version 1.2021 – September 28, 2020) recommend rituximab in multiple regimens for relapsed/refractory disease, including in patients with progressive disease after relapsed/refractory therapy.[4]
- **Waldenstrom Macroglobulinemia/Lymphoplasmacytic Lymphoma:** Guidelines (version 2.2020 – April 15, 2020) include rituximab in regimens across the spectrum of disease (primary therapy, previously treated disease, and maintenance).[5]

Safety

There is a higher risk of hypersensitivity and other acute reactions during the first infusion.[1] Therefore, all patients must receive at least one full dose of rituximab intravenous, which allows for management by slowing or stopping the infusion, before receiving Rituxan Hycela. Patients who are unable to complete one full intravenous infusion should continue to receive subsequent cycles with Rituxan intravenous and should not switch to Rituxan Hycela until a full intravenous dose is successfully administered. Safety is otherwise comparable to rituximab intravenous.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Rituxan Hycela. Because of the specialized skills required for evaluation and diagnosis of patients treated with Rituxan Hycela as well as the monitoring required for adverse events (AEs) and long-term efficacy, approval requires Rituxan Hycela to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

RECOMMENDED AUTHORIZATION CRITERIA

FDA-Approved Indications

22. B-Cell Lymphoma. Approve for 1 year if the patient meets ALL of the following (A, B, and C):
Note: Examples of B-cell lymphomas include Diffuse Large B-cell Lymphoma [DLBCL], Follicular Lymphoma, Acquired Immune Deficiency [AIDS]-Related B-Cell Lymphoma, Burkitt Lymphoma, Castleman's Disease, Marginal Zone Lymphoma [e.g., extranodal or MALT {gastric or nongastric}, nodal, or splenic marginal zone lymphoma], Primary Mediastinal Large B-Cell Lymphoma, Mantle Cell Lymphoma, Post-Transplant Lymphoproliferative Disorders, Gray Zone Lymphoma, Primary Cutaneous B-Cell Lymphoma).
- **A)** Patient has already received at least one full dose of rituximab intravenous; AND
- **B)** Rituxan Hycela is administered under the care of a healthcare professional; AND
- **C)** The medication is being prescribed by or in consultation with an oncologist.

23. Chronic Lymphocytic Leukemia or Small Lymphocytic Lymphoma. Approve for 1 year if the patient meets ALL of the following (A, B, and C):
- **A)** Patient has already received at least one full dose of rituximab intravenous; AND
- **B)** Rituxan Hycela is administered under the care of a healthcare professional; AND
- **C)** The medication is being prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

24. Hairy Cell Leukemia. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- **A)** Patient has relapsed/refractory hairy cell leukemia; AND
- **B)** Patient has already received at least one full dose of rituximab intravenous; AND
- **C)** Rituxan Hycela is administered under the care of a healthcare professional; AND
- **D)** The medication is prescribed by or in consultation with an oncologist.

25. Waldenstrom's Macroglobulinemia/Lymphoplasmacytic Lymphoma. Approve for 1 year if the patient meets ALL of the following (A, B, and C):
- **A)** Patient has already received at least one full dose of rituximab intravenous; AND
- **B)** Rituxan Hycela is administered under the care of a healthcare professional; AND
- **C)** The medication is being prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Rituxan Hycela is not recommended in the following situations:

279. Granulomatosis with Polyangiitis (Wegener's granulomatosis) or Microscopic Polyangiitis. Rituximab intravenous is indicated for treatment of these indications.[6] Rituxan Hycela has not been evaluated and does not have established dosing in this setting.

280. Pemphigus Vulgaris. Rituximab intravenous is indicated for treatment of pemphigus vulgaris.[6] Rituxan Hycela has not been evaluated and does not have established dosing for pemphigus vulgaris.

281. Rheumatoid Arthritis. Rituximab intravenous is indicated for treatment of RA.[6] Rituxan Hycela has not been evaluated and does not have established dosing for rheumatoid arthritis.

282. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	**B-Cell Lymphoma:** To align with NCCN recommendations, combine criteria for B-Cell Lymphomas and list follicular lymphoma and diffuse large B-cell lymphoma among examples of B-Cell Lymphomas (previously follicular lymphoma and diffuse large B-cell lymphoma were listed separately in the policy). **Chronic Lymphocytic Leukemia:** To align with NCCN guidelines, add Small Lymphocytic Lymphoma as an approvable condition with the same criteria as Chronic Lymphocytic Leukemia. Also, remove criterion that required Rituxan Hycela to be administered in combination with fludarabine and cyclophosphamide.	09/19/2018
Annual Revision	**Chronic Lymphocytic Leukemia or Small Lymphocytic Lymphoma:** To align with other policies that approve for this condition, remove hematologist from the specialists who are required to prescribe or be consulted prior to approval. **B-Cell Lymphoma:** Primary cutaneous B-cell lymphoma was added to the list of examples of a B-cell lymphoma. To align with other policies that approve for this condition, remove hematologist from the specialists who are required to prescribe or be consulted prior to approval. **Hairy Cell Leukemia:** This indication was added to the policy as an Other Use with Supportive Evidence. Criteria approve for 1 year if the patient has relapsed or refractory disease and if the agent is prescribed by or in consultation with an oncologist. Similar to other indications, criteria also require that the patient has already received at least one dose of rituximab intravenous and that Rituxan Hycela will be administered under the care of a healthcare professional. **Conditions Not Recommended for Approval:** Pemphigus vulgaris was added as a condition not recommended for coverage.	10/16/2019
Annual Revision	**Waldenstrom's Macroglobulinemia/Lymphoplasmacytic Lymphoma:** This indication was added to the policy as an Other Use with Supportive Evidence. Criteria approve for 1 year if the medication is prescribed by or in consultation with an oncologist. Similar to other indications, criteria also require that the patient has already received at least one dose of rituximab intravenous and that Rituxan Hycela will be administered under the care of a healthcare professional.	11/04/2020

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Romidepsin Products (Istodax)

- Istodax® (romidepsin injection for intravenous use – Celegene)
- Romidepsin injection for intravenous use – authorized generics – various

DATE REVIEWED: 06/03/2020

OVERVIEW

Romidepsin (Istodax, authorized generics) is a histone deacetylase (HDAC) inhibitor which catalyzes the removal of acetyl groups from acetylated lysine residues in histones resulting in gene expression modulation.[1] Romidepsin also catalyzes the removal of acetyl groups from non-histone proteins. In vitro, romidepsin induces cell cycle arrest and death due to the accumulation of acetylated histones.

Romidepsin is indicated for the treatment of cutaneous T-cell lymphoma (CTCL) in patients who have received at least one prior systemic therapy and for the treatment of peripheral T-cell lymphoma (PTCL) in patients who have received at least one prior therapy.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) Primary Cutaneous Lymphomas practice guidelines (version 2.2020 – April 10, 2020) recommend romidepsin as systemic therapy for mycosis fungoides/Sezary syndrome with or without skin-directed therapy and as a single agent for relapsed or refractory primary cutaneous CD30+ T-cell lymphoproliferative disorders.[2,3]

The NCCN T-Cell Lymphomas practice guidelines (version 1.2020 – January 6, 2020) recommend romidepsin as a single agent for the second-line or subsequent therapy of relapsed or refractory peripheral T-cell lymphomas including anaplastic large cell lymphoma; peripheral T-cell lymphoma not otherwise specified, angioimmunoblastic T-cell lymphoma, enteropathy-associated T-cell lymphoma, monomorphic epitheliotropic intestinal T-cell lymphoma, and nodal peripheral T-cell lymphoma with T-follicular helper (TFH) phenotype; follicular T-cell lymphoma; extranodal NK/T-cell lymphoma – nasal type; and hepatosplenic gamma-delta T-cell lymphoma.[3,4]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of romidepsin. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with romidepsin as well as the monitoring required for adverse events and long-term efficacy, approval requires romidepsin to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of romidepsin is recommended in those who meet the following criteria:

FDA-Approved Indications

200. T-Cell Lymphoma, Peripheral. Approve for 1 year if the patient meets the following (A, B, and C):
- **A)** The patient has relapsed or refractory disease; AND
- **B)** Romidepsin is used as a single agent; AND
- **C)** Romidepsin is prescribed by or in consultation with an oncologist.

201. Cutaneous T-Cell Lymphoma – Mycosis Fungoides/Sezary Syndrome. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** The patient has received at least one prior systemic therapy, AND
- **B)** Romidepsin is prescribed by or in consultation with an oncologist or dermatologist.

202. Cutaneous T-Cell Lymphoma – Cutaneous CD30+ T-Cell Lymphoproliferative Disorders. Approve for 1 year if the patient meets the following (A, B, C, and D):
- **A)** The patient has relapsed or refractory disease; AND
- **B)** The patient has one of the following diagnoses (i or ii):
  - **i.** Primary cutaneous anaplastic large cell lymphoma with multifocal lesions; OR
  - **ii.** Cutaneous anaplastic large cell lymphoma with regional nodes; AND
- **C)** Romidepsin is used as a single agent; AND
- **D)** Romidepsin is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

203. Extranodal NK/T-Cell Lymphoma, Nasal Type. Approve for 1 year if the patient meets the following (A, B, and C):
- **A)** The patient has relapsed/refractory disease following combination (asparaginase-based) chemotherapy; AND
- **B)** Romidepsin is used as a single agent; AND
- **C)** Romidepsin is prescribed by or in consultation with an oncologist.

204. Hepatosplenic Gamma-Delta T-Cell Lymphoma. Approve for 1 year if the patient meets the following (A, B, and C):

A) Romidepsin is used as subsequent therapy after two primary treatment regimens; AND

B) Romidepsin is used as a single agent; AND

C) Romidepsin is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Romidepsin has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

196. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Sarclisa® (isatuximab-irfc injection, for intravenous use – Sanofi-Aventis)

DATE REVIEWED: 03/04/2020; selected revision 03/11/2020

OVERVIEW

Sarclisa, a CD38-directed monoclonal antibody, is indicated in combination with Pomalyst® (pomalidomide capsules) and dexamethasone for treatment of adults with multiple myeloma, for those who have received at least two previous therapies including with with Revlimid® (lenalidomide capsules) and a proteasome inhibitor.[1] In the pivotal study, the median number of prior lines of therapy was 3 lines (range, 2 to 11 prior lines of therapy). Safety and efficacy have not been established in patients < 18 years of age.

Disease Overview

Multiple myeloma is a cancer formed by malignant plasma cells which are found in the bone marrow.[2] Normally, B cells responding to an infection change into plasma cells that make antibodies to help attack and kill pathogens. In multiple myeloma, these plasma cells grow out of control and become cancerous. A monoclonal immunoglobulin (M protein) is produced by myeloma cells and may be found in the blood or excreted in the urine of patients with multiple myeloma. Beta-2 microglobulin is another protein made by myeloma cells, with high levels associated with more advanced disease. Sarclisa binds to CD38 and inhibits the growth of CD38-expressing tumor cells such as myeloma cells.

Guidelines

Sarclisa is not yet addressed in current guidelines for multiple myeloma.[3] Recently updated guidelines from the National Comprehensive Cancer Network (NCCN) [version 2.2020 – October 9, 2019] recommend various regimens as primary therapy (transplant eligible and non-transplant candidates), maintenance therapy, and previously-treated multiple myeloma. The relative efficacy and toxicity of each regimen, along with patient-specific factors (e.g., past therapies, renal disease), are considered for choice of primary and subsequent regimens.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Sarclisa. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Sarclisa as well as the monitoring required for adverse events and long-term efficacy, approval requires Sarclisa to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Sarclisa is recommended in those who meet the following criteria:

FDA-Approved Indications

26. Multiple Myeloma. Approve for 1 year if the patient meets ALL of the following (A, B, C, D, E and F):

24. The patient is ≥ 18 years of age; AND

25. The agent will be used in combination with Pomalyst (pomalidomide capsules)and dexamethasone; AND

26. The patient has tried at least TWO prior regimens for multiple myeloma.
Note: Examples include Velcade (bortezomib injection)/Revlimid (lenalidomide capsules) /dexamethasone, Kyprolis (carfilzomib infusion)/Revlimid/dexamethasone, Darzalex (daratumumab injection)/Velcade/melphalan/prednisone, Ninlaro (ixazomib capsules)/Revlimid/dexamethasone, and Darzalex/Revlimid/dexamethasone; AND

27. A proteasome inhibitor was a component of at least one previous regimen.
Note: Examples of proteasome inhibitors include Velcade (bortezomib injection), Kyprolis (carfilzomib infusion), Ninlaro (ixazomib capsules); AND

28. Revlimid (lenalidomide capsules) was a component of at least one previous regimen; AND

29. The agent is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Sarclisa has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

197. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Date Reviewed
New Policy	--	03/04/2020
Selected revision	**Multiple myeloma:** Add the requirement that the patient must have tried at least two prior regimens, with criteria that specify a proteasome inhibitor and Revlimid must have been a component of at least one prior regimen. Previously criteria required a previous trial of a proteasome inhibitor and of an immunomodulatory drug, but did not specifically require Sarclisa to be in the third-line setting.	03/11/2020

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Sylvant Prior Authorization Policy

- Sylvant® (siltuximab intravenous infusion – EUSA Pharma)

REVIEW DATE: 02/17/2021

OVERVIEW

Sylvant, an interleukin (IL)-6 antagonist, is indicated for treatment of patients with **multicentric Castleman's disease** (MCD) who are human immunodeficiency virus (HIV) negative and human herpesvirus-8 (HHV-8) negative.[1] Because Sylvant did not bind to virally produced IL-6 in a nonclinical study, Sylvant has not been studied in patients with MCD who are HIV positive or HHV-8 positive. The pivotal trials showed a higher proportion of patients with durable tumor response (partial or complete response) and improvement in patient-reported outcomes (e.g., fatigue, physical function) with Sylvant vs. placebo. Patients were treated until treatment failure, defined as disease progression based on increased symptoms, radiologic progression, or deterioration in performance status. Safety and efficacy has not been established in patients < 18 years of age.

Disease Overview

MCD affects approximately 1,000 patients in the US. It typically presents with lymphoid hyperplasia at multiple sites, including the peripheral lymph nodes, bone marrow, and multiple organs. Patients often have serious infections, fevers, weight loss, fatigue, night sweats, and nerve damage that can cause weakness and numbness. Persistent IL-6 production has been implicated in the development of various autoimmune, chronic, inflammatory diseases and cancers, including MCD.[2] Sylvant, a human-mouse chimeric monoclonal antibody that is produced by Chinese hamster ovary cells, binds human IL-6 and prevents the binding of IL-6 to both soluble and membrane-bound IL-6 receptors.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for B-cell lymphomas (version 1.2021 – January 20, 2021) list Sylvant as a treatment option for MCD and for refractory or relapsed unicentric disease.[3]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Sylvant. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Sylvant as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Sylvant to be prescribed by or in consultation with a physician who specializes in the condition being treated.

All reviews for use of Sylvant for COVID-19 and/or cytokine release syndrome associated with COVID-19 will be forwarded to the Medical Director.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Sylvant is recommended in those who meet the following criteria:

FDA-Approved Indications

F) Castleman's Disease. Approve for the duration noted if the patient meets ONE of the following (A or B):

- **F)** Initial Therapy. Approve for 6 months if the patient meets ALL of the following conditions (i, ii, iii, and iv):
  - **i.** Patient is ≥ 18 years of age; AND
  - **ii.** Patient is negative for the human immunodeficiency virus (HIV) and human herpesvirus-8 (HHV-8); AND
  - **iii.** Patient meets ONE of the following (a or b):
    - **a)** Patient has multicentric Castleman's disease; OR
    - **b)** Sylvant is being used for relapsed or refractory unicentric Castleman's disease; AND
  - **iv.** Sylvant is prescribed by or in consultation with an oncologist or hematologist.
- **B)** Patient is Currently Receiving Sylvant. Approve for 1 year if the patient has responded to Sylvant, as determined by the prescriber.

  Note: Examples of a response include stabilized disease, tumor response, and resolution or stabilization of symptoms, such as fatigue and physical function.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Sylvant is not recommended in the following situations:

3. **COVID-19 (Coronavirus Disease 2019).** Forward all requests to the Medical Director.
   Note: This includes requests for cytokine release syndrome associated with COVID-19.

2. **Multiple Myeloma**. Efficacy is not established. In a Phase II study (n = 286) evaluating patients with relapsed or refractory multiple myeloma, median progression-free survival was similar in patients treated with Velcade (bortezomib injection) + Sylvant (8.0 months) vs. in those treated with Velcade + placebo (7.6 months).[4] Following 24.5 months of follow-up, there was not a significant difference between the groups in median overall survival (30.8 months in the group that received Velcade + Sylvant vs. 36.8 months in the Velcade + placebo group). There was not a significant difference on overall response rate or other secondary endpoints. Another Phase II study evaluated Sylvant in patients (n = 106) with previously untreated symptomatic multiple myeloma who were transplant-ineligible.[6] There was not a significant difference in complete response rate or overall response rate in patients treated with Velcade/melphalan/prednisone (VMP) vs. those treated with VMP + Sylvant. Progression-free survival and overall survival was the same in the two treatment groups. Another Phase II study in adults with relapsed or refractory multiple myeloma did not show any response with Sylvant monotherapy compared with 8% response rate in those who received Sylvant + dexamethasone.[7]

3. **Myelodysplastic Syndrome (MDS).** Efficacy is not established. A double-blind, placebo-controlled, Phase II study assigned adults with MDS (n = 76) to treatment with best supportive care in combination with Sylvant or placebo.[5] There was not a significant difference in the proportion of patients with reduced transfusions to treat anemia (primary endpoint). The study was terminated early due to lack of efficacy.

4. **Prostate Cancer.** Efficacy is not established. An open-label Phase II study did not demonstrate added efficacy with Sylvant added on to mitoxantrone/prednisone vs. mitoxantrone/prednisone.[8] Although the treatment groups were not balanced, progression-free survival was 97 days in the group that received Sylvant/mitoxantrone/prednisone vs. 228 days with mitoxantrone/prednisone. The study was stopped early.

5. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Synribo Prior Authorization Policy

- Synribo® (omacetaxine mepesuccinate injection for subcutaneous use – Teva)

REVIEW DATE: 09/09/2020

OVERVIEW

Synribo is indicated for the treatment of chronic or accelerated phase chronic myeloid leukemia (CML) with resistance and/or intolerance to two or more tyrosine kinase inhibitors (TKIs) in adults.[1] The safety and efficacy of Synribo in pediatric patients have not been established.

Disease Overview

CML is a myeloproliferative neoplasm that comprises 15% of newly-diagnosed adult leukemias with an incidence of 1 to 2 cases per 100,000 adults.[2,3] In 2020, it was estimated that 8,450 patients would be diagnosed in the US, and 1,130 patients would die from the disease.[2] The median age at onset is 67 years; however, CML occurs in all age groups. CML is diagnosed by persistent unexplained leukocytosis with the presence of the Philadelphia chromosome abnormality characterized by a reciprocal translocation between chromosomes 9 and 22 that gives rise to the breakpoint cluster region (*BCR*) Abelson murine leukemia (*ABL*) 1 fusion gene which is believed to play a central role in the initial development of CML. Approximately 50% of patients with CML that are diagnosed in the US are asymptomatic.[3] Diagnosis often occurs following a routine physical examination or blood test.[2,3] CML occurs in three different phases (chronic phase [CP], accelerated phase [AP], or blast phase [BP]) and is usually diagnosed in

CP. Common signs and symptoms of CP CML are related to anemia and splenomegaly. These include fatigue, weight loss, malaise, and left upper quadrant pain or fullness. Untreated CP CML will eventually progress to advanced disease in 3 to 5 years. Certain mutations are associated with high rates of disease progression and relapse. The T315I mutation is a commonly noted example, which occurs in about 5% to 15% of cases.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for CML (version 1.2021 – August 28, 2020) recommend Synribo as a treatment option for patients who have experienced disease progression to accelerated phase CML on TKI therapy.[2] It is not an option among patients who present with accelerated phase CML. Synribo is also a treatment option for patients with the T315I mutation. Synribo is stated as an option for patients with disease that is resistant and/or intolerant to two other TKIs.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Synribo. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Synribo as well as the monitoring required for adverse events and long-term efficacy, approval requires Synribo to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Synribo is recommended in those who meet the following criteria:

FDA-Approved Indication

205. Chronic Myeloid Leukemia (CML). Approve for 6 months if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient meets one of the following criteria (i or ii):
  - **i.** Patient is T315I-positive; OR
  - **ii.** Patient has tried at least two tyrosine kinase inhibitors indicated for use in CML; AND
    Note: Examples include imatinib tablets, Sprycel® (dasatinib tablets), Tasigna® (nilotinib capsules), Bosulif® (bosutinib tablets), and Iclusig® (ponatinib tablets).
- **C)** Medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Coverage of Synribo is not recommended in the following situations:

198. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Tecartus Prior Authorization Policy
- Tecartus™ (brexucabtagene autoleucel suspension for intravenous injection – Kite Pharma)

REVIEW DATE: 08/05/2020

OVERVIEW
Tecartus, a CD19-directed genetically modified autologous T cell immunotherapy, is indicated for the treatment of adult patients with relapsed or refractory mantle cell lymphoma.[1] This indication was approved under accelerated approval based on the overall response rate and durability of response. Continued approval for this indication may be contingent upon verification and description of clinical benefit in a confirmatory trial.

Tecartus is supplied in infusion bag(s) containing frozen suspension of genetically modified autologous T cells in human serum albumin.[1] Each bag is supplied in a metal cassette stored in the vapor phase of liquid nitrogen. Store Tecartus frozen in the vapor phase of liquid nitrogen and thaw prior to administration.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for B-cell lymphomas (version 3.2020 – August 4, 2020) recommend Tecartus for the subsequent treatment of relapsed or refractory mantle cell lymphoma, following treatment with chemoimmunotherapy and bruton tyrosine kinase inhibitor therapy.[2,3]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Tecartus. All approvals for therapy are provided for the approval duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Tecartus as well as the monitoring required for adverse events and long-term efficacy, approval requires Tecartus to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tecartus is recommended in those who meet the following criteria:

FDA-Approved Indications

206. Mantle Cell Lymphoma. Approve a single dose if the patient meets the following criteria (A, B, C, and D):

- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has previously received the following (i, ii, and iii):
  - **i.** Anthracycline- or bendamustine-based chemotherapy; AND
  - **ii.** An anti-CD20 monoclonal antibody; AND
  - **iii.** A Bruton tyrosine kinase inhibitor; AND
    Note: Bruton tyrosine kinase inhibitors include Brukinsa™ (zanubrutinib capsules), Calquence® (acalabrutinib capsules), and Imbruvica® (ibrutinib capules and tablets).
- **C)** Patient received lymphodepleting chemotherapy prior to Tecartus infusion; AND
- **D)** Tecartus is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tecartus is not recommended in the following situations:

199. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Type of Revision	Summary of Changes	Review Date
New Policy	--	08/05/2020

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Tecentriq Prior Authorization Policy
- Tecentriq® (atezolizumab injection for intravenous use – Genentech/Roche)

REVIEW DATE: 12/09/2020

OVERVIEW

Tecentriq, a programmed death-ligand 1 (PD-L1) blocking antibody, is indicated for the treatment of the following indications:[1]

- **Breast cancer**, in combination with paclitaxel protein-bound (Abraxane) for the treatment of adult patients with unresectable locally advanced or metastatic triple-negative breast cancer whose tumors express PD-L1 (PD-L1 stained tumor-infiltrating immune cells of any intensity covering ≥ 1% of the tumor area), as determined by an FDA-approved test. This indication is approved under accelerated approval based on progression-free survival. Continued approval for this indication may be contingent upon verification and description of clinical benefit in confirmatory trials.
- **Hepatocellular carcinoma**, in combination with bevacizumab, for the treatment of patients with unresectable or metastatic hepatocellular carcinoma who have not received prior systemic therapy.
- **Melanoma**, in combination with Cotellic (cobimetinib tablets) and Zelboraf (vemurafenib tablets), for the treatment of patients with *BRAF V600* mutation-positive unresectable or metastatic disease.
- **Metastatic non-small cell lung cancer** (NSCLC):
  - As a single agent, for the first-line treatment of patients with metastatic NSCLC whose tumors have high PD-L1 expression (PD-L1 staining ≥ 50% of tumor cells or PD-L1 staining of tumor infiltrating immune cells covering ≥ 10% of the tumor area), with no anaplastic lymphoma kinase (*ALK*) or epidermal growth factor receptor (*EGFR*) genomic tumor aberrations; OR
  - In combination with bevacizumab, paclitaxel, and carboplatin for the first-line treatment of patients with metastatic non-squamous NSCLC with no *ALK* or *EGFR* genomic tumor aberrations; OR
  - In combination with paclitaxel protein-bound and carboplatin, for the first-line treatment of adults with non-squamous metastatic NSCLC with no *ALK* or *EGFR* genomic tumor aberrations; OR
  - As a single-agent, in patients who have disease progression during or following platinum-containing chemotherapy. Patients with *EGFR* or *ALK* genomic tumor aberrations should have disease progression on FDA-approved therapy for these aberrations prior to receiving Tecentriq.
- **Small cell lung cancer**, in combination with carboplatin and etoposide, for the first-line treatment of adult patients with extensive-stage SCLC.
- **Urothelial carcinoma**, in patients with locally advanced or metastatic disease who:
  - Are not eligible for cisplatin-based chemotherapy and whose tumors express PD-L1 (PD-L1 stained tumor infiltrating immune cells covering ≥ 5% of the tumor area); OR
  - Are not eligible for any platinum-containing chemotherapy regardless of the PD-L1 status; OR
  - Have disease progression during or following any platinum-containing chemotherapy, or within 12 months of neoadjuvant or adjuvant chemotherapy.

This indication is approved under accelerated approval based on tumor response rate and duration of response. Continued approval for this indication may be contingent upon verification and description of clinical benefit in confirmatory trials.

POLICY STATEMENT
Prior Authorization is recommended for prescription benefit coverage of Tecentriq. Because of the specialized skills required for evaluation and diagnosis of patients treated with Tecentriq as well as the monitoring required for adverse events and long-term efficacy, approval requires the medication to be prescribed by or in consultation with a prescriber who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Tecentriq is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Breast Cancer.** Approve for 1 year if the patient meets the following criteria (A, B, C, and D):
   - **A)** Patient has unresectable locally advanced or metastatic triple-negative breast cancer; AND
     Note: Triple-negative breast cancer is estrogen receptor-negative, progesterone receptor-negative, and human epidermal growth factor 2 (HER2)-negative.
   - **B)** The tumor is programmed death-ligand 1 (PD-L1)-positive; AND
     Note: PD-L1 stained tumor infiltrating immune cells covering ≥ 1% of the tumor area.
   - **C)** The medication will be used in combination with Abraxane (paclitaxel albumin-bound for injection); AND
   - **D)** The medication is prescribed by or in consultation with an oncologist.

2. **Hepatocellular Carcinoma.** Approve for 1 year if the patient meets the following criteria (A, B, C, and D):
   - **A)** Patient has unresectable or metastatic hepatocellular carcinoma; AND
   - **B)** Patient has not received prior systemic therapy; AND
   - **C)** The medication will be used in combination with bevacizumab; AND
   - **D)** The medication is prescribed by or in consultation with an oncologist.

3. **Melanoma.** Approve for 1 year if the patient meets the following (A, B, C, and D):
   - **A)** Patient has unresectable or metastatic melanoma; AND
   - **B)** Patient has *BRAF V600* mutation-positive disease; AND
   - **C)** The medication will be used in combination with Cotellic (cobimetinib tablets) and Zelboraf (vemurafenib tablets); AND
   - **D)** The medication is prescribed by or in consultation with an oncologist.

4. **Non-Small Cell Lung Cancer.** Approve for 1 year if the patient meets the following criteria (A, B, and C):
   - **C)** Patient has advanced or metastatic disease; AND
   - **D)** Patient meets one of the following (i, ii, or iii):
     - ~~**A)**~~ Patient has non-squamous NSCLC (i.e., adenocarcinoma, large cell, or NSCLC not otherwise specified) and the patient meets the following criteria (a and b):
       - **a)** The tumor is negative for actionable mutations; AND

Note: Examples of actionable mutations include epidermal growth factor receptor (*EGFR*) mutation, anaplastic lymphoma kinase (*ALK*) fusions, *ROS1*, *BRAF V600E, MET exon 14* skipping mutation, *RET* rearrangement.

b) Patient meets one of the following [(1),(2), or (3)]:

(1) Patient's tumor expresses programmed death-ligand 1 (PD-L1) ≥ 50% as determined by an approved test; OR
Note: In this setting Tecentriq can be used either as a single agent or in combination with other agents.

(2) The medication will be used in combination with chemotherapy; OR
Note: Examples of chemotherapy regimens may include bevacizumab, paclitaxel, and carboplatin, carboplatin and Abraxane (paclitaxel, albumin-bound for injection).

(3) The medication is used as continuation maintenance therapy.
Note: Tecentriq can be used in combination with bevacizumab or as single agent in this setting.

ii. Patient has squamous cell NSCLC and meets both of the following (a and b):

a) The tumor is negative for actionable mutations; AND
Note: Examples of actionable mutations include epidermal growth factor receptor (*EGFR*) mutation, anaplastic lymphoma kinase (*ALK*) fusions, *ROS1*, *BRAF V600E, MET exon 14* skipping mutation, *RET* rearrangement.

b) Patient's tumor expresses programmed death-ligand 1 (PD-L1) ≥ 50% as determined by an approved test; OR

iii. The tumor is positive for actionable mutations and the patient has tried at least one of the targeted therapy options; AND
Note: Examples of actionable mutations include epidermal growth factor receptor (*EGFR*) mutation, anaplastic lymphoma kinase (*ALK*) fusions, *ROS1*, *BRAF V600E, MET exon 14* skipping mutation, *RET* rearrangement.

C) The medication is prescribed by or in consultation with an oncologist.

4. Small Cell Lung Cancer. Approve for 1 year if Tecentriq is prescribed by or in consultation with an oncologist.

5. Urothelial Carcinoma. Approve for 1 year if the patient meets the following criteria (A and B):

I) Patient meets ONE of the following conditions (i, ii, or iii):

i. According to the prescriber, the patient meets both of the following (a and b):

a) Patient is not eligible for cisplatin-based chemotherapy; AND

b) Patient's tumor expresses PD-L1 (i.e., PD-L1 stained tumor infiltrating immune cells covering ≥ 5% of the tumor area); OR

ii. According to the prescriber, the patient is not eligible for platinum-containing chemotherapy (i.e., cisplatin and carboplatin); OR
Note: This is regardless of the PD-L1 status.

iii. Patient has tried at least one platinum- (cisplatin or carboplatin) containing chemotherapy; AND

J) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tecentriq is not recommended in the following situations:

283. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
New Policy	New criteria	11/13/2019
Selected Revisions	• **NSCLC:** Updated criteria for non-squamous cell carcinoma to include additional targetable mutations and PD-L1 expression of ≥ 50% and ≥ 1% to 49%. Added criteria for squamous cell NSCLC and for patients that are targetable mutation positive. • **Hepatocellular carcinoma:** Added new approval condition and criteria.	06/24/2020
Annual Revision	• **Breast Cancer:** Added two new Notes; one to define triple-negative disease and second Note defining PD-L1 positivity. • **Melanoma:** Added new condition and criteria based on FDA approval. • **Non-Small Cell Lung Cancer:** Instead of "targetable" changed it to "actionable". Under non-squamous NSCLC, added a Note under criteria for PD-L1 ≥ 50% to state that Tecentriq can be used as single agent or in combination in this setting. Deleted part of the criteria, tumor has PD-L1 expression ≥ 1% to 49%; but kept the criteria that the medication is used in combination with chemotherapy. Added new criteria that Tecentriq is used for continuation maintenance therapy. Under criteria where tumor is positive for targetable mutations, deleted duplicate criteria that Tecentriq is used as subsequent therapy. This is not needed since criteria requires use of a targeted therapy. • **Urothelial Carcinoma:** Changed "prescribing physician" to "prescriber".	12/09/2020

NSCLC – Non-small cell lung cancer; PD-L1 – Programmed death-ligand 1.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Thiotepa Products Prior Authorization Policy

- Thiotepa injection for intravenous, intracavitary, or intravesical use (Tepadina® – Adienne SA, generics)

REVIEW DATE: 10/28/2020

OVERVIEW

Thiotepa is an alkylating agent indicated for:

- **Beta-thalassemia**, to reduce the risk of graft rejection when used in conjunction with high-dose busulfan and cyclophosphamide as a preparative regimen for allogeneic hematopoietic progenitor (stem) cell transplantation for pediatric patients with class 3 disease.[1]
- **Bladder cancer**, for superficial papillary carcinoma of the urinary bladder.[1,2]
- **Breast adenocarcinoma**.[1]

- **Neoplastic diseases of various serosal cavities**, for controlling intracavitary effusions secondary to diffuse or localized disease.
- **Ovarian adenocarcinoma**.

Guidelines

The National Comprehensive Cancer Network (NCCN) **bladder cancer** guidelines (version 6.2020 – July 16, 2020) state that intravesical thiotepa does not appear to be effective. NCCN recommends gemcitabine and mitomycin for intravesical chemotherapy.[5]

The NCCN **breast cancer** guidelines (version 6.2020 – September 8, 2020) do not provide any recommendations on the use of thiotepa in the management of breast cancer.[3]

The NCCN **central nervous system** (CNS) cancers guidelines (version 3.2020 – September 11, 2020) recommend thiotepa, in combination with carmustine or busulfan and cyclophosphamide, with stem cell rescue for consolidation therapy of primary CNS lymphoma.[6] NCCN recommends intra-cerebrospinal fluid thiotepa for the treatment of leptomeningeal metastases.

The NCCN **ovarian cancer** guidelines (version 1.2020 – March 11, 2020) do not provide any recommendations on the use of thiotepa in the management of ovarian cancer.[4]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of thiotepa. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Because of the specialized skills required for evaluation and diagnosis of patients treated with thiotepa as well as the monitoring required for adverse events and long-term efficacy, approval requires thiotepa to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of thiotepa is recommended in those who meet the following criteria:

FDA-Approved Indications

207. Beta-Thalassemia. Approve for 1 month if the patient meets the following criteria (A, B, C, D, and E):
- **A)** Patient is ≤ 18 years of age; AND
- **B)** Patient has class 3 beta-thalassemia; AND
- **C)** Thiotepa will be used prior to allogeneic hematopoietic stem cell transplantation; AND
- **D)** Thiotepa will be used in combination with high-dose busulfan and cyclophosphamide; AND
- **E)** The medication is prescribed by or in consultation with an oncologist.

208. Bladder Cancer. Approve for 1 month if the patient meets the following criteria (A and B):
- **A)** Patient has superficial papillary carcinoma of the urinary bladder; AND
- **B)** The medication is prescribed by or in consultation with an oncologist.

209. Breast Cancer. Approve for 6 months if thiotepa is prescribed by or in consultation with an oncologist.

210. Malignant Effusions. Approve for 6 months if the patient meets the following criteria (A and B):
- **A)** Patient has intracavitary effusions secondary to diffuse or localized neoplastic disease; AND
- **B)** The medication is prescribed by or in consultation with an oncologist.

211. Ovarian Cancer. Approve for 6 months if thiotepa is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

212. Leptomeningeal Metastases. Approve for 6 months if thiopeta is prescribed by or in consultation with an oncologist.

213. Primary Central Nervous System Lymphoma. Approve for 3 months if the patient meets if the patient meets the following criteria (A and B):

A) Thiotepa is used as a component of high-dose chemotherapy followed by hematopoietic stem cell transplantation; AND

B) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of thiotepa is not recommended in the following situations:

200. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

New Policy	--	10/16/2019
Annual Revision	No criteria changes.	10/28/2020

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Topotecan Products Prior Authorization Policy

- Hycamtin® (topotecan capsule – Novartis)
- Topotecan injection for intravenous use (Hycamtin® – Novartis, generics)

REVIEW DATE: 12/16/2020

OVERVIEW

Topotecan injection, a topoisomerase inhibitor, is indicated for the treatment of patients with:

- **Cervical cancer**, stage IV-B, recurrent, or persistent disease which is not amenable to curative treatment, in combination with cisplatin.
- **Metastatic ovarian cancer**, after disease progression on or after initial or subsequent chemotherapy, as a single agent.
- **Small cell lung cancer** (SCLC), platinum-sensitive disease who progressed at least 60 days after initiation of first-line chemotherapy, as a single agent.[1]

Guidelines

Topotecan is included in a variety of National Comprehensive Cancer Network (NCCN) guidelines:

- The NCCN **bone cancer** (Version 1.2021 – November 20, 2020) clinical practice guidelines recommend topotecan in combination with cyclophosphamide, as second-line therapy for patients with relapsed/refractory, or metastatic osteosarcoma and Ewing sarcoma (both category 2A), and dedifferentiated chondrosarcoma, high-grade undifferentiated pleomorphic sarcoma, and mesenchymal chondrosarcoma (category 2B).[2,7]
- The NCCN **central nervous system** cancers (Version 3.2020 – September 11, 2020) clinical practice guidelines recommend topotecan as a single agent for the treatment of brain metastases in patients with small cell lung cancer.[2,8] In addition, the guidelines recommend intra-cerebrospinal fluid topotecan for the treatment of leptomeningeal metastases.
- The NCCN **cervical cancer** (Version 1.2021 – October 2, 2020) clinical practice guidelines recommend topotecan as first- or second-line therapy for patients with local/regional recurrence, stage IV-B disease, or distant metastases and as second-line therapy for patients with persistent, recurrent, or metastatic small cell neuroendocrine carcinoma of the cervix.[2,5] Topotecan can be used in combination with paclitaxel with or without bevacizumab, in combination with cisplatin, or as a single agent for second-line therapy (category 2B recommendation).
- The NCCN **Merkel cell carcinoma** (Version 1.2020 – October 2, 2019) clinical practice guidelines recommend topotecan as a treatment option for patients with distant metastatic disease who have contraindications to checkpoint immunotherapy (Bavencio® [avelumab injection for intravenous use], Keytruda® [injection for intravenous use], and Opdivo® [injection for intravenous use].[2,9]
- The NCCN **ovarian cancer** (Version 1.2020 – March 11, 2020) clinical practice guidelines recommend topotecan, as a single agent or in combination with bevacizumab or Nexavar® (sorafenib tablet), for the treatment of recurrent or persistent platinum-resistant epithelial ovarian cancer, fallopian tube cancer, and peritoneal cancer.[2,3] Treatment of clinical relapse is a category 2A recommendation and immediate treatment of biochemical relapse is category 2B recommendation.
- The NCCN **soft tissue sarcoma** (Version 1.2021 – October 30, 2020) clinical practice guidelines recommend topotecan as a single agent or in combination with cyclophosphamide for the treatment of non-pleomorphic rhabdomyosarcoma.[2,10]
- The NCCN **SCLC** (Version 1.2021 – August 11, 2020) clinical practice guidelines recommend topotecan as a single agent for patients with a performance status of 0-2 and relapse within 6 months following complete or partial response, or stable disease with initial treatment; or for primary progressive disease.[2,4]
- The NCCN **uterine cancer** (Version 1.2021 – October 20, 2020) clinical practice guidelines recommend topotecan as a single agent for the treatment of recurrent, metastatic, or high-risk endometrial carcinoma.[2,6]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of topotecan. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with topotecan as well as the monitoring required for adverse events and long-term efficacy, approval requires topotecan to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of topotecan is recommended in those who meet the following criteria:

FDA-Approved Indications

214. Cervical Cancer. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** Patient meets one of the following (i or ii):
  - **i.** Patient has persistent or recurrent disease; OR
  - **ii.** Patient has metastatic disease; AND
- **B)** Topotecan is prescribed by or in consultation with an oncologist.

215. Ovarian, Fallopian Tube, and Primary Peritoneal Cancer. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Patient has persistent or recurrent disease; AND
- **B)** The cancer is platinum-resistant; AND
- **C)** Topotecan is prescribed by or in consultation with an oncologist.

216. Small Cell Lung Cancer. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Patient meets one of the following (i or ii):
  - **i.** Patient has relapsed disease; OR
  - **ii.** Patient has primary progressive disease; AND
- **B)** Topotecan will be used as a single agent; AND
- **C)** Topotecan is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

217. Bone Cancer. Approve for 1 year if the patient meets the following criteria (A, B, C, D, and E):
- **A)** Patient has one of the following (i, ii, iii, iv, or v):
  - **i.** Osteosarcoma; OR
  - **ii.** Ewing sarcoma; OR
  - **iii.** Dedifferentiated chondrosarcoma; OR
  - **iv.** High-grade undifferentiated pleomorphic sarcoma; OR
  - **v.** Mesenchymal chondrosarcoma; AND
- **B)** Patient has relapsed, refractory, or metastatic disease; AND
- **C)** Topotecan is used second-line; AND
- **D)** Topotecan is used in combination with cyclophosphamide; AND
- **E)** Topotecan is prescribed by or in consultation with an oncologist.

218. Brain Metastases. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Patient has small cell lung cancer; AND
- **B)** Topotecan will be used as a single agent; AND
- **C)** Topotecan is prescribed by or in consultation with an oncologist.

219. Endometrial Carcinoma. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Patient has recurrent, metastatic, or high-risk disease; AND
- **B)** Topotecan will be used as a single agent; AND
- **C)** Topotecan is prescribed by or in consultation with an oncologist.

220. Leptomeningeal and Spinal Metastases. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** Topotecan will be administered intraventricularly; AND
- **B)** Topotecan is prescribed by or in consultation with an oncologist.

221. Merkel Cell Carcinoma. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Patient has distant metastatic disease; AND
- **B)** Patient has contraindications to checkpoint immunotherapy; AND
  Note: Checkpoint immunotherapy includes Bavencio® (avelumab injection for intravenous use), Keytruda® (injection for intravenous use), and Opdivo® (injection for intravenous use).
- **C)** Topotecan is prescribed by or in consultation with an oncologist.

222. Rhabdomyosarcoma. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** Patient has non-pleomorphic rhabdomyosarcoma; AND
- **B)** Topotecan is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of topotecan is not recommended in the following situations:

201. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Torisel Prior Authorization Policy

- Torisel® (temsirolimus injection for intravenous use – Wyeth Pharmaceuticals)

REVIEW DATE: 10/28/2020

OVERVIEW

Torisel, an inhibitor of mammalian target of rapamycin (mTOR), is indicated for the treatment of **advanced renal cell carcinoma**.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for **kidney cancer** (version 1.2021 – July 15, 2020) recommend Torisel as a single agent for the treatment of relapsed or stage IV renal cell carcinoma.[2,3]

The NCCN guidelines for **soft tissue sarcoma** (version 2.2020 – May 28, 2020) recommend Torisel as a single agent for the treatment of perivascular epithelioid cell tumors (PEComas), and lymphangioleiomyomatosis or angiomyolipomas.[2,4]

The NCCN guidelines for **uterine neoplasms** (version 2.2020 – July 24, 2020) recommend Torisel as a single-agent for the treatment of recurrent, metastatic, or high-risk endometrial cancer.[2,5]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Torisel. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Torisel as well as the monitoring required for adverse events and long-term efficacy, approval requires Torisel to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Torisel is recommended in those who meet the following criteria:

FDA-Approved Indications

223. Renal Cell Carcinoma. Approve for 1 year if the patient meets the following criteria (A, B, and C):

A) Patient has relapsed, advanced, or metastatic disease; AND

B) Torisel will be used as a single-agent; AND

C) The medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

224. Endometrial Carcinoma. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Patient has recurrent, metastatic, or high-risk disease; AND
- **B)** Torisel will be used as a single-agent; AND
- **C)** The medication is prescribed by or in consultation with an oncologist.

225. Soft Tissue Sarcoma. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Patient has one of the following (i, ii, or iii):
  - **i.** Perivascular epithelioid cell tumors (PEComas); OR
  - **ii.** Lymphangioleiomyomatosis; OR
  - **iii.** Recurrent angiomyolipoma; AND
- **B)** Torisel will be used as a single-agent; AND
- **C)** The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Torisel is not recommended in the following situations:

202. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Trastuzumab Products
- Herceptin® (trastuzumab intravenous infusion – Genentech, Inc.)
- Herzuma® (trastuzumab-pkrb injection for intravenous infusion – Celltrion)
- Ogivri™ (trastuzumab-dkst injection for intravenous infusion – Mylan)
- Ontruzant® (trastuzumab-dttb injection for intravenous infusion – Merck)
- Trazimera™ (trastuzumab-qyyp injection for intravenous infusion – Pfizer)
- Kanjinti™ (trastuzumab-anns injection for intravenous infusion – Amgen)

DATE REVIEWED: 06/10/2020

OVERVIEW

Herceptin is indicated for adjuvant treatment of human epidermal growth factor receptor 2 (HER2) overexpressing node positive or node negative (estrogen receptor [ER]/progesterone receptor [PR] negative or with one high risk feature) breast cancer 1) as part of a treatment regimen consisting of doxorubicin, cyclophosphamide, and either paclitaxel or docetaxel; 2) with docetaxel and carboplatin; or 3) as a single agent following multi-modality anthracycline based therapy.[1] Herceptin is also indicated for the treatment of HER2 overexpressing metastatic breast cancer, either in combination with paclitaxel for first-line treatment, or as a single agent in patients who have received one or more chemotherapy regimens. In addition, Herceptin is indicated, in combination with cisplatin and capecitabine or 5-fluorouracil (5-FU), for the treatment of patients with HER2 overexpressing metastatic gastric or gastroesophageal (GE) junction adenocarcinoma, who have not received prior treatment for metastatic disease. For all indications, patients must be selected for therapy based on an FDA-approved companion diagnostic for Herceptin. Tests are specific for breast cancer or gastric cancer.

Guidelines

The National Comprehensive Cancer Network (NCCN) breast cancer guidelines (version 4.2020 – May 8, 2020) recommend trastuzumab in combination with chemotherapy and endocrine therapy for adjuvant treatment of HER2-positive breast cancer (category 1).[2] Perjeta® (pertuzumab intravenous injection) can also be added to this treatment regimen (category 2A). The preferred first-line agents for HER2-positive *recurrent or metastatic disease* (either hormone receptor-negative or hormone receptor-positive and refractory to endocrine therapy) include: Perjeta plus trastuzumab plus docetaxel (category 1) or paclitaxel (category 2A). The guidelines list other trastuzumab-containing regimens for HER2-positive metastatic disease.

The NCCN clinical practice guidelines on gastric cancer (version 2.2020 – May 13, 2020) and on esophageal and esophagogastric junction cancers (version 2.2020 – May 13, 2020) state that for metastatic or locally advanced disease (where local therapy is not indicated) trastuzumab should be added to first-line systemic chemotherapy for HER2-overexpressing adenocarcinoma.[3,4] The recommended regimens for metastatic or locally advanced HER2-positive gastric, esophageal, or esophagogastric junction adenocarcinoma are trastuzumab in combination with cisplatin and a fluoropyrimidine (5-FU or capecitabine) [category 1] or trastuzumab in combination with other chemotherapy agents (category 2B) [various regimens based on individual patient variability]. Trastuzumab is not recommended for use in combination with anthracyclines.

Uterine serous carcinoma is a rare, aggressive histology of endometrial cancer. The NCCN guidelines for uterine neoplasms (version 1.2020 – March 6, 2020) lists the combination chemotherapy regimen of carboplatin/paclitaxel/trastuzumab as one of the recommended therapies for patients with HER2-positive uterine serous carcinoma (category 2A).[6]

The NCCN Compendium recommends use of trastuzumab for endometrial carcinoma and rectal or colon cancer.[5]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of trastuzumab products. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with trastuzumab products, as well as the monitoring required for adverse events

and long-term efficacy, approval requires trastuzumab products to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of trastuzumab products is recommended in those who meet the following criteria:

FDA-Approved Indications

30. Breast Cancer. Approve if the patient meets the following criteria (A, B, and C):
- **A)** The medication is prescribed by or in consultation with an oncologist; AND
- **B)** The patient has human epidermal growth factor receptor 2 (HER2)-positive disease; AND
- **C)** The patient meets ONE of the following criteria (i or ii):

  i. Approve for 1 year (total) if trastuzumab is used for neoadjuvant (preoperative)/adjuvant therapy; OR

  ii. Approve for 1 year if trastuzumab is used for recurrent or metastatic disease.

31. Gastric, Esophageal, or Gastroesophageal Junction Cancer. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** The medication is prescribed by or in consultation with an oncologist; AND
- **B)** The patient has human epidermal growth factor receptor 2 (HER2)-positive locally advanced or metastatic disease; AND
- **C)** Trastuzumab will be used first-line in combination with chemotherapy.
  Note: Examples of chemotherapy are cisplatin, oxaliplatin, capecitabine, 5-fluorouracil (5-FU).

Other Uses with Supportive Evidence

3. Endometrial Carcinoma. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** The medication is prescribed by or in consultation with an oncologist; AND
- **B)** The patient has human epidermal growth factor receptor 2 (HER2)-positive advanced or recurrent uterine serous carcinoma; AND
- **C)** Trastuzumab will be used in combination with chemotherapy.
  Note: Examples of chemotherapy are carboplatin, paclitaxel.

4. Colon or Rectal Cancer. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** The medication is prescribed by or in consultation with an oncologist; AND
- B) The patient has human epidermal growth factor receptor 2 (HER2)-positive disease; AND
- **C)** The medication is used in combination with Perjeta® (pertuzumab for injection) or Tykerb® (lapatinib tablets).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Trastuzumab has not been shown to be effective or there are limited or preliminary data that are not supportive of general approval for the following conditions.

6. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes*	Date Reviewed
Annual revision	No criteria changes.	04/06/2016
Annual revision	No criteria changes.	05/24/2017
Annual revision	No criteria changes.	06/27/2018
Annual revision	Changed name of policy to Trastuzumab Products due to the approval of several biosimilars. Changed intent of the policy from a pharmacogenomics PA to a regular PA policy. **Breast Cancer.** Added new criteria to ask for prescriber specialty, HER2-positive disease, and to approve for 1 year (total) for neoadjuvant/adjuvant therapy and approve 1 year for metastatic disease. **Gastric, Esophageal, or Gastroesophageal (GE) Junction Cancer.** Added "Esophageal" to the condition approval. Specified that trastuzumab will be used "first-line" in combination with "chemotherapy" and the examples are listed as a Note. Added requirement for prescriber specialty and HER2-positive disease. **Endometrial Carcinoma.** Added new approval condition under "Other Uses with Supportive Evidence" based on guidelines/compendium support.	07/31/2019
Early annual revision	Added new condition of approval for Colon or Rectal Cancer based on guidelines.	06/10/2020

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Trodelvy™ (sacituzumab govitecan-hziy injection for intravenous use – Immunomedics, Inc.)

DATE REVIEWED: 04/23/2020

OVERVIEW

Trodelvy, a Trop-2-directed antibody and topoisomerase inhibitor conjugate, is indicated for the treatment of adult patients with metastatic triple-negative breast cancer (mTNBC) who have received at least two prior therapies for metastatic disease.[1] This indication is approved under accelerated approval based on tumor response rate and duration of response. Continued approval for this indication maybe contingent upon verification and description of clinical benefit in trials.

Guidelines

Trodelvy is not addressed in the guidelines. According to the National Comprehensive Cancer Network (NCCN) breast cancer guidelines (version 3.2020 – March 6, 2020), systemic therapy options for metastatic disease include a variety of chemotherapy agents such as carboplatin or cisplatin (specified for TNBC and germline BRCA 1/2 mutation), Tecentriq (atezolizumab for injection) + Abraxane (albumin-bound paclitaxel for injection) [for programmed death ligand-1 {PD-L1} expression ≥ 1%], paclitaxel,

cyclophosphamide, doxorubicin, Doxil (liposomal doxorubicin for injection), capecitabine, gemcitabine, docetaxel, epirubicin, vinorelbine, eribulin.[2] Single agents are preferred; however, chemotherapy combinations may be used in patients with high tumor burden, rapidly progressing disease, and visceral crisis.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Trodelvy. All approvals are provided for the duration noted below. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Trodelvy, as well as the monitoring required for adverse events and long-term efficacy, approval requires Trodelvy to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Trodelvy is recommended in those who meet the following criteria:

FDA-Approved Indications

32. Breast Cancer. Approve for 1 year if the patient meets ALL of the criteria (A, B, C, and D):

A) The patient is ≥ 18 years of age; AND

B) The patient has metastatic triple-negative breast cancer; AND

C) The patient has been previously treated with at least two systemic therapy regimens for metastatic disease.

Note: Examples are cisplatin, carboplatin, doxorubicin, cyclophosphamide, paclitaxel, docetaxel, capecitabine, gemcitabine, ixabepilone, vinorelbine, eribulin, epirubicin, Doxil (liposomal doxorubicin for injection), Tecentriq (atezolizumab for injection) + Abraxane (albumin-bound paclitaxel for injection); AND

D) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Trodelvy has not been shown to be effective or there are limited or preliminary data that are not supportive of general approval for the following conditions.

7. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Unituxin Prior Authorization Policy

- Unituxin® (dinutuximab injection for intravenous use – United Therapeutics Corp)

REVIEW DATE: 12/02/2020

OVERVIEW

Unituxin, a glycolipid disialoganglioside (GD2)-binding monoclonal antibody, is indicated for the treatment of pediatric patients with high-risk **neuroblastoma** who achieve at least a partial response to prior first-line multi-agent, multimodality therapy, in combination with granulocyte-macrophage colony-stimulating factor (GM-CSF), interleukin-2 (IL-2), and 13-cis-retinoic acid.[1]

Guidelines

Unituxin is not addressed in National Comprehensive Cancer Network treatment guidelines.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Unituxin. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Unituxin as well as the monitoring required for adverse events and long-term efficacy, approval requires Unituxin to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Unituxin is recommended in those who meet the following criteria:

FDA-Approved Indications

226. Neuroblastoma. Approve for 6 months if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≤ 18 years of age; AND
- **B)** Unituxin is used as subsequent therapy; AND
- **C)** Unituxin is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Unituxin is not recommended in the following situations:

203. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Type of Revision	Summary of Changes	Review Date
New Policy	--	12/02/2020

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Vectibix Prior Authorization Policy

- Vectibix® (panitumumab solution for intravenous infusion – Amgen Inc.)

REVIEW DATE: 07/22/2020

OVERVIEW

Vectibix, an epidermal growth factor receptor monoclonal antibody, is indicated for the treatment of wild-type *RAS* (defined as wild-type in both KRAS and NRAS as determined by an FDA-approved test for this use) metastatic colorectal cancer (mCRC) as a) first-line therapy in combination with FOLFOX (5-fluorouracil [5-FU], leucovorin, oxaliplatin) or b) monotherapy following disease progression after prior treatment with fluoropyrimidine-, oxaliplatin-, and irinotecan-containing chemotherapy.[1] It is a limitation

of use that Vectibix is not indicated for the treatment of patients with *RAS*-mutant mCRC or for whom *RAS* mutation status is unknown.

Guidelines

Colon Cancer

The National Comprehensive Cancer Network (NCCN) colon cancer guidelines (version 4.2020 – June 15, 2020) recommend Vectibix as primary therapy for unresectable, advanced, or metastatic *KRAS/NRAS/BRAF* wild-type gene and left-sided tumors only in combination with irinotecan, FOLFOX, FOLFIRI (5-FU, leucovorin, irinotecan), or FOLFOXIRI (5-FU, leucovorin, oxaliplatin, irinotecan) regimens in patients who can tolerate intensive therapy or as a single agent in patients who cannot tolerate intensive therapy.[2,4] Reference to left-sided only disease refers to a primary tumor that originated in the left side of the colon and only refers to use of Vectibix as first-line therapy for metastatic disease. Therapies recommended after first progression vary depending on the initial treatment regimen (i.e., 5-FU/leucovorin-based or capecitabine-based therapy) that was used. The NCCN guidelines recommend Vectibix, in combination with irinotecan, FOLFOX, or FOLFIRI for the subsequent treatment of *KRAS/NRAS/BRAF* wild-type tumors; or in combination with Braftovi (encorafenib capsules) for the subsequent treatment of *BRAF V600E* positive disease. The NCCN rectal cancer guidelines (version 6.2020 – June 25, 2020) make the same recommendations for Vectibix for the treatment of rectal cancer.[3,4]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Vectibix. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Vectibix as well as the monitoring required for adverse events and long-term efficacy, approval requires Vectibix to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Vectibix is recommended in those who meet the following criteria:

FDA-Approved Indications

27. Colon and Rectal Cancer. Approve for 1 year if the patient meets the following criteria (A, B, C, D, and E):
- **A)** Patient has advanced or metastatic disease; AND
- **B)** Patient's tumor or metastases are wild-type *RAS* (*KRAS* wild-type and/or *NRAS* wild-type) [that is, the tumor or metastases are *KRAS* and/or *NRAS* mutation negative]; AND
- **C)** If Vectibix is being used for first-line treatment, the primary tumor originated on the left side of the colon (from splenic flexure to rectum); AND
- **D)** Patient meets ONE of the following criteria (i or ii):
  - **i.** Patient's tumor or metastases are wild-type *BRAF* (that is, the tumor or metastases are *BRAF V600E* mutation negative); OR
  - **ii.** Patient's tumor or metastases are *BRAF V600E* mutation-positive and the patient meets the following (a and b):
    - **a)** Patient has previously received a chemotherapy regimen for colon or rectal cancer; AND
      Note: Examples of chemotherapy regimens include a fluoropyrimidine such as 5-fluorouracil (5-FU), capecitabine, oxaliplatin, irinotecan, or an adjunctive chemotherapy

regimen such as FOLFOX (5-FU, leucovorin, and oxaliplatin) or CapeOX (capecitabine and oxaliplatin).

b) Vectibix is prescribed in combination with Braftovi (encorafenib capsules).

E) Vectibix is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Vectibix is not recommended in the following situations:

204. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Vyxeos Prior Authorization Policy

- Vyxeos® (daunorubicin and cytarabine liposome for injection – Jazz Pharmaceuticals)

REVIEW DATE: 10/28/2020

OVERVIEW

Vyxeos is a liposomal combination of daunorubicin, an anthracycline topoisomerase inhibitor, and cytarabine, a nucleoside metabolic inhibitor, is indicated for the treatment of newly-diagnosed therapy-related **acute myeloid leukemia** (AML) or **AML with myelodysplasia-related changes** in adults.[1]

Guidelines

The National Comprehensive Cancer Network guidelines for **acute myeloid leukemia** (version 4.2020 – September 28, 2020) recommend Vyxeos for induction and post-remission therapy for patients with therapy-related AML, antecedent myelodysplastic syndrome/chronic myelomonocytic leukemia, and AML with myelodysplasia-related changes.[2,3]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Vyxeos. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Vyxeos as well as the monitoring required for adverse events and long-term efficacy, approval requires Vyxeos to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Vyxeos is recommended in those who meet the following criteria:

FDA-Approved Indications

227. Acute Myeloid Leukemia. Approve for 6 months if the patient meets the following criteria (A, B, and C):

A) Patient is ≥ 18 years of age; AND

B) Patient meets one of the following (i or ii):

i. Patient has therapy-related acute myeloid leukemia; OR

ii. Patient has secondary acute myeloid leukemia; AND

Note: Examples include antecedent myelodysplastic syndrome/chronic myelomonocytic leukemia and acute myeloid leukemia with myelodysplasia-related changes.

C) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Vyxeos is not recommended in the following situations:

205. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Yervoy Prior Authorization Policy

- Yervoy® (ipilimumab injection for intravenous use – Bristol-Myers Squibb)

REVIEW DATE: 10/07/2020

OVERVIEW

Yervoy, a human cytotoxic T-lymphocyte antigen 4 (CTLA-4)-blocking antibody, is indicated for the following conditions:

- **Melanoma**, unresectable or metastatic in adults and pediatric patients (≥ 12 years).
- **Melanoma**, for adjuvant treatment of cutaneous disease in patients with pathologic involvement of regional lymph nodes of > 1 mm who have undergone complete resection, including total lymphadenectomy.
- **Renal cell carcinoma (RCC)**, advanced, in combination with Opdivo® (nivolumab for intravenous injection) for the treatment of patients with intermediate or poor risk, previously untreated disease.
- **Colorectal cancer, microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR)**, in combination with Opdivo for the treatment of adult and pediatric patients ≥ 12 years of age with metastatic disease that has progressed following treatment with a fluoropyrimidine, oxaliplatin, and irinotecan.[1]
- **Hepatocellular carcinoma**, in combination with Opdivo, for the treatment of patients who have been previously treated with Nexavar® (sorafenib tablets). This indication is approved under accelerated approval based on overall response rate and duration of response. Continued approval for this indication may be contingent upon verification and description of clinical benefit in the confirmatory trials.
- **Malignant pleural mesothelioma**, in combination with Opdivo, for the first-line treatment of adult patients with unresectable disease.
- **Non-small cell lung cancer (NSCLC)**, in combination with Opdivo, for the first-line treatment of adult patients with metastatic disease whose tumors express programmed death ligand-1 (PD-L1) [≥ 1%], as determined by an FDA-approved test, with no epidermal growth factor receptor (*EGFR*) or anaplastic lymphoma kinase (*ALK*) genomic tumor aberrations.
- **Non-small cell lung cancer (NSCLC)**, in combination with Opdivo and two cycles of platinum-doublet chemotherapy, for the first-line treatment of adult patients with metastatic or recurrent NSCLC, with no *EGFR* or *ALK* genomic tumor aberrations.

Guidelines

The National Comprehensive Cancer Network (NCCN) Compendium recommends Yervoy for the following indications: melanoma (uveal, cutaneous, and brain metastases), small bowel adenocarcinoma, kidney cancer, small cell lung cancer, malignant pleural mesothelioma, colon and rectal cancer, hepatocellular carcinoma, and non-small cell lung cancer (NSCLC).[2]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Yervoy. Because of the specialized skills required for evaluation and diagnosis of patients treated with Yervoy as well as the monitoring required for adverse events and long-term efficacy, approval requires the medication to be prescribed by or in consultation with a prescriber who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Yervoy is recommended in those who meet the following criteria:

FDA-Approved Indications

25. Colon or Rectal Cancer, Microsatellite Instability-High (MSI-H) or Mismatch Repair Deficient (dMMR). Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- **A)** Patient is ≥ 12 years of age; AND
- **B)** Patient meets ONE of the following criteria (i or ii):
  - **i.** Patient has tried chemotherapy; OR
    Note: Examples of chemotherapy are fluoropyrimidine such as 5-fluorouracil [5-FU], capecitabine~~,~~ oxaliplatin, irinotecan, or an adjunctive chemotherapy regimen such as FOLFOX [5-FU, leucovorin, and oxaliplatin] or CapeOX [capecitabine and oxaliplatin]).
  - **ii.** Patient has unresectable or metastatic disease and is not a candidate for intensive therapy, according to the prescriber; AND
- **C)** The medication will be used in combination with Opdivo (nivolumab intravenous injection); AND
- **D)** The medication is prescribed by or in consultation with an oncologist.

26. Hepatocellular Carcinoma. Approve for 4 months if the patient meets ALL of the following (A, B, and C):
- **A)** The medication is used in combination with Opdivo (nivolumab for injection); AND
- **B)** Patient has tried at least one tyrosine kinase inhibitor (TKI); AND
  Note: Examples are Nexavar (sorafenib tablets), Lenvima (levatinib capsules).
- **C)** The medication is prescribed by or in consultation with an oncologist.

27. Melanoma [Note: This includes cutaneous melanoma, brain metastases due to melanoma, and uveal melanoma]. Approve if the patient meets ALL of the following (A, B, and C):
- **A)** Patient is ≥ 12 years of age; AND
- **B)** Patient meets ONE of the following (i or ii):
  - **i.** Approve for 4 months if the patient has unresectable or metastatic melanoma; OR
  - **ii.** Approve for 1 year if Yervoy will be used as adjuvant treatment; AND
    Note: For example, in patients with cutaneous melanoma who have undergone complete resection, including total lymphadenectomy.
- **C**) The medication is prescribed by or in consultation with an oncologist.

28. Malignant Pleural Mesothelioma. Approve for 1 year if the patient meets the following (A, B, C, and D):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has unresectable disease; AND
- **C)** The medication will be used in combination with Opdivo (nivolumab for intravenous injection); AND
- **D)** The medication is prescribed by or in consultation with an oncologist.

29. Non-Small Cell Lung Cancer (NSCLC). Approve for 1 year if the patient meets ALL of the following (A, B, C, D, E, and F):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has metastatic disease; AND
- **C)** Patient's tumor is negative for a targetable mutation; AND
  Note: Examples of targetable mutations include sensitizing epidermal growth factor receptor (*EGFR*) mutation, anaplastic lymphoma kinase (*ALK*) fusions, *ROS1*, *BRAF*, *MET 14* skipping mutation, *RET* rearrangement.
- **D)** The medication is used in combination with Opdivo (nivolumab for injection); AND
- **E)** Patient meets one of the following criteria (i or ii):
  - **i.** Patient's tumor expresses programmed death-ligand 1 (PD-L1) ≥ 1% as determined by an approved test; OR
  - **ii.** The medication is used in combination with platinum-doublet chemotherapy; AND

Note: Examples of platinum-doublet chemotherapies are carboplatin and Alimta (pemetrexed for injection), cisplatin and Alimta, carboplatin and paclitaxel.

F) The medication is prescribed by or in consultation with an oncologist.

30. Renal Cell Carcinoma. Approve for 4 months if the patient meets the following criteria (A, B, and C):

K) Patient has advanced (e.g., relapsed, Stage IV, metastatic) disease; AND

L) The medication will be used in combination with Opdivo (nivolumab for intravenous injection); AND

C) The medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

7. Small Bowel Adenocarcinoma. Approve for 1 year if the patient meets the following (A, B, C, and D):

A) Patient has advanced or metastatic disease; AND

B) The tumor is microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR); AND

C) The medication will be used in combination with Opdivo (nivolumab for intravenous injection); AND

D) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Yervoy is not recommended in the following situations:

284. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
New Policy	New criteria	09/25/2019
Annual Revision	• **Hepatocellular Carcinoma:** Added new FDA-approved indication. • **Malignant Pleural Mesothelioma:** Moved from "Other Uses with Supportive Evidence" to FDA-approved use. Deleted criteria requiring prior therapy since it's approved for first-line use in adults. Added age criteria. • **Non-Small Cell Lung Cancer:** Added new FDA-approved indication. • **Small Bowel Adenocarcinoma:** Moved "Microsatellite Instability-High (MSI-H) or Mismatch Repair Deficient (dMMR)" from indication to list it as criteria. • **Small Cell Lung Cancer:** Deleted approval condition since this indication is no longer supported in compendium/guidelines.	10/07/2020

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Yescarta® (axicabtagene ciloleucel suspension for intravenous infusion – Kite Pharma)

DATE REVIEWED: 04/29/2020

OVERVIEW

Yescarta, a CD19-directed genetically modified autologous T cell immunotherapy, is indicated for the treatment of adult patients with relapsed or refractory large B-cell lymphoma after two or more lines of systemic therapy, including diffuse B-cell lymphoma (DLBCL) not otherwise specified, primarily mediastinal large B-cell lymphoma, high-grade B-cell lymphoma, and DLBCL arising from follicular lymphoma.[1] Yescarta has a Boxed Warning regarding cytokine release syndrome (CRS) and neurological toxicities. Due to these risks, Yescarta is only available through a restricted program under a Risk Evaluation and Mitigation Strategy (REMS) called Yescarta REMS.[1]

Yescarta is supplied as an infusion bag containing approximately 68 mL of frozen suspension of genetically modified autologous T cells in 5% DMSO and 2.5% albumin (human).[1] Yescarta is stored in the vapor phase of liquid nitrogen (less than or equal to minus 150°C) and supplied in a liquid nitrogen dry shipper.

Clinical Efficacy

The efficacy of Yescarta was established in one single-arm, open-label, Phase II, multicenter trial that included adult patients with relapsed or refractory aggressive B-cell non-Hodgkin lymphoma (NHL) [ZUMA-1].[1-2] Yescarta was given as a single infusion after lymphodepleting chemotherapy. In total, 101 of 111 patients who underwent leukapheresis received Yescarta and most (76%) had DLBCL, 16% of patients had transformed follicular lymphoma, and 8% of patients had primary mediastinal large B-cell lymphoma. The median number of prior therapies was three. The median dose was 2.0×10^6 CAR-positive viable T cells.[1-2]

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for B-cell lymphoma (version 1.2020 – January 22, 2020) recommend Yescarta for the treatment of a variety of B-cell lymphomas in patients with relapsed or refractory disease and after at least two chemotherapy regimens.[3,4] Recommended indications include DLBCL which transformed from follicular lymphoma or nodal marginal zone lymphoma, DLBCL, primary mediastinal large B-cell lymphoma, high-grade B-cell lymphoma, AIDS-related B-cell lymphoma, human herpes virus 8 (HHV8)-positive DLBCL, and post-transplant lymphoproliferative disorders (category 2A).

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Yescarta. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Yescarta as well as the monitoring required for adverse events and long-term efficacy, approval requires Yescarta to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Yescarta is recommended in those who meet the following criteria:

FDA-Approved Indications

28. B-Cell Lymphoma. Approve a single dose if the patient meets the following criteria (A, B, C, D, E, and F):

C) The patient meets one of the following diagnoses (i, ii, iii, iv, v, vi, vii, viii, or ix):

i. Large B-cell lymphoma; OR
ii. Diffuse large B-cell lymphoma; OR
iii. Primary mediastinal large B-cell lymphoma; OR
iv. High-grade B-cell lymphoma; OR
v. Diffuse large B-cell lymphoma arising from follicular lymphoma; OR
vi. Diffuse large B-cell lymphoma arising from nodal marginal zone lymphoma; OR
vii. Acquired immune deficiency syndrome (AIDS)-related B-cell lymphoma; OR
viii. Human herpes virus 8-positive diffuse large B-cell lymphoma; OR
ix. Post-transplant lymphoproliferative disorders; AND

D) The patient is ≥ 18 years of age; AND
E) Yescarta is prescribed by or in consultation with an oncologist; AND
F) Yescarta is being used for disease that is relapsed or refractory after two or more lines of systemic therapy; AND
G) The patient received lymphodepleting chemotherapy prior to Yescarta infusion; AND
H) The patient has not been previously treated with Yescarta or Kymriah® (tisagenlecleucel injection).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Yescarta has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

206. Re-treatment with Yescarta. Yescarta is for one time use, repeat dosing is not approvable.

207. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Zaltrap Prior Authorization Policy

- Zaltrap® (ziv-aflibercept injection for intravenous infusion – Regeneron Pharmaceuticals, Inc./Sanofi-Aventis)

REVIEW DATE: 09/23/2020

OVERVIEW

Zaltrap, a recombinant fusion protein, in combination with FOLFIRI (5-fluorouracil [5-FU], leucovorin, and irinotecan), is indicated for patients with metastatic colorectal cancer (mCRC) that is resistant to or has progressed following an oxaliplatin-containing regimen.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) colon cancer guidelines (version 4.2020 – June 15, 2020)[2] and rectal cancer guidelines (version 6.2020 – June 25, 2020)[3] recommend Zaltrap as 1) primary treatment for patients with unresectable metachronous metastases and previous adjuvant FOLFOX (5-FU, leucovorin, and oxaliplatin) or CapeOX (capecitabine and oxaliplatin) regimens within the past 12 months in combination with irinotecan OR with FOLFIRI, or 2) subsequent therapy after first progression of unresectable advanced or metastatic disease in combination with irinotecan or with FOLFIRI for disease not previously treated with an irinotecan-based regimen.[2-4] Both of these uses have a category 2A recommendation. In patients with advanced or metastatic disease, Zaltrap is not listed as an option for initial therapy. Zaltrap has a category 2B recommendation for use as adjuvant therapy, in combination with FLOFIRI or irinotecan for unresectable metachronous metastases that convert to resectable disease after primary treatment.

Zaltrap has only been effective when given with FOLFIRI in FOLFIRI-naïve patients.[2,3] There are no data suggesting activity of Zaltrap plus FOLFIRI in patients who progressed on FOLFIRI plus Avastin or vice versa. No data suggest that single-agent Zaltrap has therapeutic activity. The NCCN panel includes Zaltrap as a second-line option in combination with FOLFIRI or irinotecan only after progression on therapy that does not include irinotecan. The NCCN panels on colon and rectal cancers prefer bevacizumab over Zaltrap and Cyramza® (ramucirumab injection for intravenous use) as an anti-angiogenic agent based on toxicity and cost.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Zaltrap. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Zaltrap as well as the monitoring required for adverse events and long-term efficacy, approval requires Zaltrap to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zaltrap is recommended in those who meet the following criteria:

FDA-Approved Indications

228. Colon and Rectal Cancer. Approve for 1 year if the patient meets the following criteria (A, B, C, D, and E):

30. Patient has advanced or metastatic disease; AND

31. Patient has been previously treated with an oxaliplatin- or fluoropyrimidine-containing regimen; AND

Note: Fluoropyrimidines include 5-fluorouracil (5-FU) and capecitabine.

32. Patient has not previously been treated with FOLFIRI; AND

Note: FOLFIRI includes 5-fluorouracil (5-FU), leucovorin, and irinotecan.

33. Zaltrap will be used in combination with 5-fluorouracil (5-FU) or capecitabine and/or irinotecan; AND

34. The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Zaltrap is not recommended in the following situations:

208. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Zepzelca Prior Authorization Policy

- Zepzelca™ (lurbinectedin injection – Jazz Pharmaceuticals)

REVIEW DATE: 07/01/2020

OVERVIEW

Zepzelca, an alkylating drug, is indicated for the treatment of metastatic small cell lung cancer in adults with disease progression on or after platinum-based chemotherapy.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) Small Cell Lung Cancer guidelines recommend Zepzelca as a single agent for the treatment of relapsed disease following a complete or partial response, or stable disease with initial treatment, or for the treatment of primary progressive disease.[2,3]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Zepzelca. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Zepzelca as well as the monitoring required for adverse events and long-term efficacy, approval requires Zepzelca to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zepzelca is recommended in those who meet the following criteria:

FDA-Approved Indications

229. Small Cell Lung Cancer. Approve for 1 year if the patient meets the following criteria (A, B, and C):

- **A)** Patient has metastatic disease; AND
- **B)** Patient has previously received platinum-based chemotherapy; AND
  Note: Examples of platinum medications include cisplatin and carboplatin.
- **C)** Zepzelca is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Zepzelca is not recommended in the following situations:

209. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Other) – Jelmyto™ (mitomycin solution for pyelocalyceal administration – UroGen Pharma)

DATE REVIEWED: 05/20/2020

OVERVIEW

Jelmyto, an alkylating agent, is indicated for the treatment of adult patients with low-grade upper tract urothelial cancer (LG-UTUC).[1]

Dosing Information

Jelmyto is for pyelocalyceal use only.[1] The recommended dose is 4 mg/mL of mitomycin administered by ureteral catheter or a nephrostomy tube, with total instillation volume determined on volumetric measurements using pyelography, not to exceed 15 mL (60 mg of mitomycin). The dose is instilled once weekly for 6 weeks and in patients with a complete response 3 months after initiating Jelmyto, therapy can continue once a month for an additional 11 instillations.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for Bladder Cancer (Version 4.2020 – April 28, 2020) recommend Jelmyto as a primary treatment for upper urinary tract tumors.[2,3] Jelmyto is recommended following complete or near complete endoscopic resection or ablation of a low-grade, low volume, solitary tumor in patients not a candidate for or seeking definitive treatment with nephroureterectomy.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Jelmyto. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Jelmyto as well as the monitoring required for adverse events and long-term efficacy, approval requires Jelmyto to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Jelmyto is recommended in those who meet the following criteria:

FDA-Approved Indications

230. Upper Tract Urothelial Cancer, Low-Grade. Approve for 1 year if the patient meets the following criteria (A, B, C, and D):
- **A)** The patient is ≥ 18 years of age; AND
- **B)** The patient has non-metastatic disease; AND
- **C)** The patient has undergone endoscopic resection or ablation; AND
- **D)** Jelmyto is prescribed by or in consultation with an oncologist or urologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Jelmyto has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

210. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Other) – Valrubicin Products Prior Authorization Policy
- Valrubicin solution for intravesical use (Valstar® – Endo Pharmaceuticals Solution, generics)

REVIEW DATE: 10/28/2020

OVERVIEW

Valrubicin (Valstar), an anthracycline topoisomerase inhibitor, is indicated for intravesical therapy of BCG-refractory **carcinoma *in situ* (CIS) of the urinary bladder** in patients for whom immediate cystectomy would be associated with unacceptable morbidity or mortality.[1]

Guidelines

The National Comprehensive Cancer Network guidelines for **bladder cancer** (version 6.2020 – July 16, 2020) recommend intravesical valrubicin in the event of a Bacillus Calmette-Guerin (BCG) shortage and for recurrent or persistent BCG-refractory carcinoma *in situ* (Tis) disease.[2,3]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of valrubicin. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Because of the specialized skills required for evaluation and diagnosis of patients treated with valrubicin as well as the monitoring required for adverse events and long-term efficacy, approval requires valrubicin to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of valrubicin is recommended in those who meet the following criteria:

FDA-Approved Indications

231. Bladder Cancer. Approve for 2 months if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient meets one of the following (i or ii):
  - **i.** Patient has recurrent or persistent Bacillus Calmette-Guerin (BCG)-refractory carcinoma; OR
  - **ii.** According to the prescriber, valrubicin will be used due to a Bacillus Calmette-Guerin (BCG) shortage; AND
- **C)** The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of valrubicin is not recommended in the following situations:

211. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmic for Dry Eye Disease – Cyclosporine Products Prior Authorization Policy
- Cequa™ (cyclosporine topical solution – Sun Pharmaceuticals)
- Restasis and Restasis Multidose™ (cyclosporine topical emulsion – Allergan)

REVIEW DATE: 08/19/2020

OVERVIEW

Restasis (cyclosporine topical emulsion), an immunosuppressive agent, is indicated to increase tear production in patients whose tear production is presumed to be suppressed due to ocular inflammation associated with

keratoconjunctivitis sicca.[1,2] The safety and efficacy of Restasis have not been established in pediatric patients < 16 years of age.

Cequa is a topical solution of cyclosporine, with the same active ingredient and mechanism as Restasis.[3] Although Cequa is approved for patients ≥ 18 years of age per product labeling, it has the same active chemical moiety as Restasis, which is approved in patients ≥ 16 years of age.[1-3] Cequa has a novel formulation in which the hydrophobic cyclosporine molecules are encased in nanomicelles with a hydrophilic exterior.[4] This facilitates crossing of the corneal barrier and penetration of the aqueous humor to reach ocular tissues.

Other Uses with Supportive Evidence

Systemic Inflammatory Diseases

Patients with primary Sjögren syndrome have nonclassifiable systemic disease, whereas patient with secondary Sjögren syndrome have a distinct autoimmune disease such as rheumatoid arthritis, systemic lupus erythematosus, or scleroderma. A 2010 systematic review of randomized controlled trials for the treatment of primary Sjögren syndrome found topical cyclosporine to be effective for moderate or severe dry eye symptoms.[7]

Ocular Surface Diseases

There are some efficacy data to support the off-label use of topical cyclosporine in the treatment of immune-mediated ocular surface diseases such as ocular rosacea and atopic keratoconjunctivitis.[6,8-11] A review article noted that dosing of Restasis at a frequency greater than twice daily (BID) regimen may be beneficial for patients with severe dry eye disease, such as ocular graft versus host disease (GVHD), if they do not initially respond to the BID regimen.[12] Also, it has been suggested that initiation of topical cyclosporine prior to bone marrow transplantation may reduce inflammatory response in the lacrimal gland and could reduce dry eye symptoms post-transplant.

Guidelines

The American Academy of Ophthalmology (AAO) published Preferred Practice Pattern® (2018) for the treatment of dry eye syndrome.[5] The AAO classifies dry eye as mild, moderate, or severe, based on signs and symptoms of the disease. Treatment recommendations of dry eye disease are listed in a four step progression but specific therapies may be chosen from any category regardless of the level of disease severity, depending on provider experience and patient preference. Topical nonglucocorticoid immunomodulatory drugs (such as cyclosporine) are staged as a Step 2 recommendation within the guidelines. The AAO recommends the use of topical cyclosporine as one of the treatment options for Sjögren syndrome. The AAO states that topical cyclosporine may be useful in some patients with posterior blepharitis, in active ocular GVHD, and as adjunctive treatment in atopic/vernal conjunctivitis.[13-14]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Restasis and Cequa. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Restasis and Cequa is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Dry Eye Conditions due to Ocular Inflammation Associated with Keratoconjunctivitis Sicca (e.g., dry eye syndrome or dry eye disease).** Approve for 3 years if the patient is ≥ 16 years of age.

Other Uses with Supportive Evidence

2. **Dry Eye Conditions due to Systemic Inflammatory Diseases (e.g., Sjögren syndrome, rheumatoid arthritis, systemic lupus erythematosus).** Approve for 3 years if the patient is ≥ 16 years of age.

3. **Dry Eye Conditions due to Ocular Surface Diseases (e.g., ocular rosacea, atopic keratoconjunctivitis, acute corneal graft rejection, blepharitis, herpetic stromal keratitis, conjunctival graft versus host disease).** Approve for 3 years if the patient is ≥ 16 years of age.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Restasis and Cequa is not recommended in the following situations:

212. **Concomitant use with Xiidra™ (lifitegrast ophthalmic solution).** There are no data to support the concomitant use of Restasis or Cequa and Xiidra.

213. **Concomitant use of Cyclosporine Products.** There is no evidence to support additive efficacy of combining Restasis and Cequa.

214. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmic for Dry Eye Disease – Eysuvis Prior Authorization Policy

- Eysuvis™ (loteprednol etabonate 0.25% ophthalmic suspension – Kala Pharmaceuticals)

REVIEW DATE: 12/09/2020

OVERVIEW

Eysuvis, an ophthalmic corticosteroid, is indicated for the **short-term (up to 2 weeks) treatment of the signs and symptoms of dry eye disease**.[1]

Eysuvis is a topical, anti-inflammatory, nanoparticle suspension of loteprednol etabonate with proprietary mucus-penetrating particle technology synthesized through structural modifications of prednisolone-related compounds so that it will undergo a predictable transformation to an inactive metabolite.[1,2] Eysuvis inhibits the edema, fibrin deposition, capillary dilation, leukocyte migration, capillary proliferation, fibroblast proliferation, deposition of collagen, and scar formation associated with inflammation.

Guidelines

Eysuvis is not addressed in guidelines. The American Academy of Ophthalmology (AAO) published a Preferred Practice Pattern® (2018) for the treatment of dry eye syndrome.[3] Some risk factors for dry eye syndrome include aging, female gender, decrease in supportive factors such as androgen hormones, radiation therapy, surgeries that disrupt the trigeminal afferent sensory nerves (e.g., laser-assisted in situ keratomileusis [LASIK]) or systemic inflammatory conditions such as rheumatoid arthritis. For mild dry eyes, education and environmental modifications, artificial tear solutions and eyelid therapy (warm compresses and eyelid scrubs) are listed as some of the treatment options. Guidelines noted a commercially available loteprednol etabonate 0.5% was used in a prospective, randomized study for a 2-week period. The study found a favorable effect in patients' dry eye symptoms and conjunctival hyperemia findings, but not in ocular surface staining, Schirmer test results, or use of artificial tears.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Eysuvis. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Eysuvis is recommended in those who meet the following criteria:

FDA-Approved Indications

232. Dry Eye Disease (Short-term Treatment). Approve for 1 month if the patient meets the following (A and B):

A) Patient has tried artificial tears; AND

B) Patient has tried one other formulation of ophthalmic loteprednol etabonate.
Note: Examples of other ophthalmic loteprednol etabonate formulations include Alrex® 0.2% suspension, Inveltys® 1% suspension, loteprednol etabonate 0.5% suspension (Lotemax®, generics), Lotemax® 0.5% gel, Lotemax® SM 0.38% gel, and Lotemax® 0.5% ointment.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Eysuvis is not recommended in the following situations:

215. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmic for Dry Eye Disease – Lacrisert Prior Authorization Policy

- Lacrisert® (hydroxypropyl cellulose ophthalmic insert – Bausch & Lomb)

REVIEW DATE: 12/02/2020

OVERVIEW

Lacrisert, an ophthalmic insert made of hydroxypropyl cellulose, is indicated for the following uses:[1]

- **Decreased corneal sensitivity**.
- **Exposure keratitis**.
- **Moderate to severe dry eye syndromes**, including keratoconjunctivitis sicca.
- **Recurrent corneal erosions**.

Lacrisert acts to stabilize and thicken the precorneal tear film and prolong the tear film breakup time which is usually accelerated in patients with dry eye states.[1] Lacrisert also acts to lubricate and protect the eye. Lacrisert usually reduces the signs and symptoms resulting from moderate to severe dry eye syndromes, such as conjunctival hyperemia,

corneal and conjunctival staining with rose bengal, exudation, itching, burning, foreign body sensation, smarting, photophobia, dryness and blurred or cloudy vision. Progressive visual deterioration which occurs in some patients may be slowed, halted, or sometimes reversed.

Guidelines

The American Academy of Ophthalmology (AAO) published Preferred Practice Pattern® (2018) for the treatment of dry eye syndrome.[2] The AAO classifies dry eye as mild, moderate, or severe, based on signs and symptoms of the disease. Treatment recommendations of dry eye disease are listed in a four step progression but specific therapies may be chosen from any category regardless of the level of disease severity, depending on provider experience and patient preference. Slow-release hydroxypropyl cellulose inserts are recommended within the guidelines for moderate dry eye as occasionally helpful for patients who are unable to apply artificial tears.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Lacrisert. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Lacrisert is recommended in those who meet the following criteria:

FDA-Approved Indications

233. Ocular Conditions Associated with Moderate to Severe Dry Eye (e.g., decreased corneal sensitivity, dry eye syndrome, exposure keratitis, keratoconjunctivitis sicca, recurrent corneal erosions). Approve for 1 year if the patient has tried artificial tears.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Lacrisert is not recommended in the following situations:

216. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmic for Dry Eye Disease – Xiidra Prior Authorization Policy

- Xiidra™ (lifitegrast ophthalmic solution – Novartis)

REVIEW DATE: 08/19/2020

OVERVIEW
Xiidra, a lymphocyte function-associated antigen-1 (LFA-1) antagonist, is indicated for the treatment of the signs and symptoms of dry eye disease.[1]

Guidelines
The American Academy of Ophthalmology (AAO) published Preferred Practice Pattern® (2018) for the treatment of dry eye syndrome.[2] The AAO classifies dry eye as mild, moderate, or severe, based on signs and symptoms of the disease. Treatment recommendations of dry eye disease are listed in a four step progression but specific therapies may be chosen from any category regardless of the level of disease severity, depending on provider experience and patient preference. Topical LFA-1 antagonist drugs (such as lifitegrast) are staged as a Step 2 recommendation within the guidelines.

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of Xiidra. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Xiidra is recommended in those who meet the following criteria:

FDA-Approved Indications

~~73.~~70. **Dry Eye Disease (e.g., dry eye syndrome).** Approve for 3 years if the patient is ≥ 18 years of age.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Coverage of Xiidra is not recommended in the following situations:

217. **Concomitant use with an ophthalmic cyclosporine product (Restasis®, Cequa™).** There are no data to support the concomitant use of Restasis or Cequa and Xiidra.

218. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmic Prostaglandins

- Bimatoprost 0.03% ophthalmic solution (generic to discontinued Lumigan® 0.03% ophthalmic solution) – Lupin Pharmaceuticals, others
- Lumigan® (bimatoprost 0.01% ophthalmic solution – Allergan)
- Rocklatan™ (netarsudil 0.02%/latanoprost 0.005% ophthalmic solution – Aerie Pharmaceuticals)
- Travatan® Z (travoprost 0.004% ophthalmic solution [benzalkonium chloride-free] – Alcon, generics)
- Vyzulta™ (latanoprostene bunod 0.024% ophthalmic solution – Bausch & Lomb)
- Xalatan® (latanoprost 0.005% ophthalmic solution – Pharmacia & Upjohn, generics)
- Xelpros™ (latanoprost 0.005% ophthalmic emulsion – Sun Pharmaceuticals)
- Zioptan® (tafluprost 0.0015% ophthalmic solution – Merck)

DATE REVIEWED: 04/22/2020

OVERVIEW

Ophthalmic prostanoids include prostaglandin analogues (latanoprost, travoprost 0.004% ophthalmic solution (generic to Travatan Z), Vyzulta, and Zioptan,) and prostamides (Lumigan and bimatoprost 0.03% [generic to discontinued Lumigan 0.03%]). All of the ophthalmic products included in this policy are single-entity products, except Rocklatan, which contains netarsudil, a Rho kinase inhibitor, and latanoprost. All of these are indicated for the reduction of elevated intraocular pressure (IOP) in patients with open angle glaucoma or ocular hypertension.[1-8] Bimatoprost 0.03% ophthalmic solution is also marketed as Latisse®, indicated to treat hypotrichosis of the eyelashes by increasing their growth including length, thickness, and darkness.[9] (Note: Latisse is not included in this PA Policy).

Glaucoma, a disease that damages the eye's optic nerve, is the leading cause of blindness in people > 60 years old.[10] Reduction of IOP, regardless of the pretreatment IOP, reduces the risk of disease progression.[11] In addition, IOP reduction may prevent the onset to early glaucoma in patients with ocular hypertension.

Normal-tension glaucoma is a form of open-angle glaucoma (OAG) characterized by glaucomatous optic neuropathy in patients with IOP measurements consistently < 21 mmHg.[12] According to the Glaucoma Research Foundation, normal-tension glaucoma is also referred to as low-tension glaucoma or normal-

pressure glaucoma.[13] Additionally, the American Academy of Ophthalmology (AAO) guidelines on primary open-angle glaucoma include normal-tension glaucoma in the recommendations for care, stating that lowering IOP reduces the risk of developing primary open-angle glaucoma and slows the progression of primary open-angle glaucoma, including normal-tension open-angle glaucoma.[11]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of ophthalmic prostaglandins. An age edit for patients < 60 years of age is used to monitor for appropriate use and to screen for cosmetic use. Prescription benefit coverage of these products for cosmetic conditions is not recommended. All approvals are provided for 3 years unless otherwise noted below. Prior authorization and prescription benefit coverage is not recommended for Latisse.

Automation: If the patient is < 60 years of age and does not have a history of one ophthalmic glaucoma agent within the 130-day look-back period, coverage will be determined by prior authorization criteria.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of ophthalmic prostaglandins is recommended in those who meet the following criteria:

FDA-Approved Indication

33. Reduction of Intraocular Pressure (IOP) in Patients with Open Angle Glaucoma or Ocular Hypertension. Approve.
Note: Open angle glaucoma includes normal-tension glaucoma, which is also referred to as low-tension glaucoma or normal-pressure glaucoma.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of the ophthalmic prostaglandins is not recommended in the following circumstances. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

285. Cosmetic Conditions (e.g., eyelash growth). Cosmetic use is not recommended for coverage as this indication is excluded from coverage in a typical pharmacy benefit.

286. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Durysta™ (bimatoprost implant, for intracameral administration – Allergan)

DATE REVIEWED: 04/22/2020

OVERVIEW

Durysta, a prostaglandin analog, is indicated for the reduction of intraocular pressure (IOP) in patients with open-angle glaucoma or ocular hypertension.[1]

Glaucoma, a disease that damages the eye's optic nerve, is the leading cause of blindness in people > 60 years of age.[2] Reduction of IOP, regardless of the pretreatment IOP, reduces the risk of disease progression.[3] In addition, IOP reduction may prevent the onset of early glaucoma in patients with ocular hypertension.

Ophthalmic prostaglandins, beta-blockers, alpha-agonist (brimonidine), carbonic anhydrase inhibitors, rho kinase inhibitor (netarsudil), and fixed combination products are used to treat glaucoma.[3,4] The choice of product is influenced by potential cost, adverse event profile, dosing schedule, and the degree of pressure lowering needed.[3]

Dosing Considerations

Durysta, a biodegradable implant, is given as a single intracameral administration.[1] Durysta should not be re-administered to an eye that was previously treated with Durysta.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Durysta. Because of the specialized skills required for evaluation and diagnosis of patients treated with Durysta, as well as the monitoring required for adverse events and long-term efficacy, approval requires Durysta to be prescribed by, or in consultation with, a physician who specializes in the condition being treated. All approvals are provided for one implant per treated eye (i.e., one implant per treated eye; maximum of two implants per patient). Note that a 1-month (30 days) approval duration is applied to allow for the one-time treatment of one or both eye(s).

Automation: None

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Durysta is recommended in those who meet the following criteria:

FDA-Approved Indications

6. Reduction of Intraocular Pressure (IOP) in Patients with Open-Angle Glaucoma or Ocular Hypertension. Approve for a one-time use in each treated eye (i.e., one implant per treated eye; a total of two implants per patient) if the patient meets ALL of the following criteria (A, B, C, D, and E):

- **A)** The patient is ≥ 18 years of age; AND
- **B)** The patient is not receiving re-treatment of eye(s) previously treated with Durysta; AND
- **C)** The patient meets the following criteria (i and ii):
  - **i.** The patient has tried at least two ophthalmic prostaglandins (either as monotherapy or as concomitant therapy) for the treatment of open-angle glaucoma or ocular hypertension.
    Note: Examples of ophthalmic prostaglandins include bimatoprost 0.03% ophthalmic solution, latanoprost 0.005% ophthalmic solution, travoprost 0.004% ophthalmic solution; Lumigan® (bimatoprost 0.01% ophthalmic solution), Vyzulta® (latanoprostene bunod 0.024% ophthalmic solution), Xelpros™ (latanoprost 0.005% ophthalmic emulsion), and Zioptan® (tafluprost 0.0015% ophthalmic solution); AND
  - **ii.** The patient has tried at least two ophthalmic products (either as monotherapy or as concomitant therapy) from two different pharmacological classes for the treatment of open-angle glaucoma or ocular hypertension.
    Note: Examples of pharmacological classes of ophthalmic products for the treatment of open-angle glaucoma or ocular hypertension include beta-blockers, alpha-agonist (brimonidine), carbonic anhydrase inhibitors, and rho kinase inhibitor (netarsudil); AND
- **D)** For each of the ophthalmic medications that were tried, the patient meets ONE of the following criteria (i or ii):
  - **i.** The patient has had inadequate efficacy to the previously-tried ophthalmic products, according to the prescriber; OR
  - **ii.** The patient has experienced adverse event(s) severe enough to warrant discontinuation of the previously-tried ophthalmic products, according to the prescriber; AND
- **E)** Durysta is prescribed by, or in consultation with, an ophthalmologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Durysta has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

219. Re-Treatment of Previously-Treated Eye(s). Durysta is approved for a one-time use in each treated eye. Repeat administration in previously treated eye(s) is not approvable.

220. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Luxturna Prior Authorization Policy

- Luxturna™ (voretigene neparvovec-rzyl intraocular suspension for subretinal injection – Spark Therapeutics)

REVIEW DATE: 02/17/2021

OVERVIEW

Luxturna, an adeno-associated virus vector-based gene therapy, is indicated for the treatment of patients with **confirmed biallelic human retinal pigment epithelial 65 kDa protein (RPE65) mutation-associated retinal dystrophy**.[1] Patients must have viable retinal cells as determined by the treating physician(s).

Luxturna is made up of a live, non-replicating adeno-associated virus serotype 2 which has been genetically modified to express the human RPE65 gene.[1] Luxturna is designed to deliver a normal copy of the gene encoding RPE65 to cells of the retina in patients with reduced or absent levels of biologically active RPE65.

Disease Overview

Inherited retinal dystrophies are a broad group of genetic retinal disorders that are associated with progressive visual dysfunction.[2] RPE65 mutation-associated retinal dystrophy is associated with at least 125 discrete gene mutations and affects 1,000 to 2,000 patients in the US.[2,3] Mutations in the RPE65 gene lead to reduced or absent levels of RPE65 isomerohydrolase activity.[1] The absence of RPE65 leads to the accumulation of toxic precursors, damage to RPE-producing cells, and, over time, damage to photoreceptors, progressing to near total blindness in most patients. The retinal anatomy is preserved for a relatively long period, and supplying the missing enzyme can result in restoration of the visual cycle and improvement in vision.[3]

Dosing Information

The recommended dose of Luxturna for each eye is 1.5×10^{11} vector genomes (vg) administered once per eye by subretinal injection.[1] After completing a vitrectomy (removal of the vitreous gel that fills the eye cavity) and under direct visualization, a small amount of Luxturna is injected slowly until an initial subretinal bleb is observed; the remaining volume is then injected slowly until the total 0.3 mL is delivered. Luxturna should be injected into each eye on separate days within a close interval, but no less than 6 days apart. Luxturna is not recommended for patients < 12 months of age, because the retinal cells are still undergoing cell proliferation, and Luxturna would potentially be diluted or lost during cell proliferation.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Luxturna. Because of the specialized skills required for evaluation and diagnosis of patients treated with Luxturna as well as the specialized training required for administration of Luxturna, approval requires Luxturna to be prescribed by a physician who specializes in the condition being treated. All approvals are provided for one injection

per eye. Note: A 1-month (30 days) approval duration is applied to allow for the one-time treatment of both eyes.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Luxturna is recommended in those who meet the following criteria:

FDA-Approved Indications

3. **Biallelic Human Retinal Pigment Epithelial 65 kDa Protein (RPE65) Mutation-Associated Retinal Dystrophy.** Approve for one-time treatment course (i.e., a total of two injections, one injection in each eye) if the patient meets the following criteria (A, B, C, D, and E):
   - **G)** According to the prescribing physician, the patient has a genetically-confirmed diagnosis of biallelic RPE65 mutation-associated retinal dystrophy; AND
   - **H)** Patient is ≥ 12 months of age; AND
   - **I)** Luxturna is administered by a retinal specialist; AND
   - **J)** Patient must have viable retinal cells as determined by the treating physician; AND
   - **K)** Patient is not receiving re-treatment of eye(s) previously treated with Luxturna.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Luxturna is not recommended in the following situations:

287. Re-treatment of previously treated eye(s). Luxturna is for one time use in each eye. Repeat dosing in previously treated eye(s) is not approvable.

288. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Oxervate Prior Authorization Policy

- Oxervate™ (cenegermin-bkbj ophthalmic solution – Dompé farmaceutici S.p.A)

REVIEW DATE: 11/18/2020

OVERVIEW

Oxervate, a recombinant human nerve growth factor, is indicated for the treatment of **neurotrophic keratitis**.[1]

Disease Overview

Neurotrophic keratitis, a rare degenerative disease, is characterized by corneal epithelium breakdown, impairment of corneal healing, and development of corneal ulceration, melting, and perforation.[2-4] Corneal epithelial cells release various neurotrophic growth factors, including nerve growth factors, which are important in maintaining the integrity and function of the ocular surface and in stimulating both epithelial and nerve fiber proliferation and survival.[5,6] When corneal sensory innervation is impaired, reduction of both protective reflexes and trophic neuromodulators essential for the vitality, metabolism, and wound healing of the ocular surface tissues results. *In vivo* studies have shown that increasing nerve growth factor concentration after injury can accelerate healing.[3,6]

Guidelines/Recommendations

Prior to the approval of Oxervate, there were no approved pharmacologic therapies for the treatment of neurotrophic keratitis.[2] If neurotrophic keratitis is left untreated, the condition can progress to anatomical loss of the eye; even with treatment, loss of vision is common.[5] Current treatment options are supportive and do not improve the speed of healing. Treatment should target corneal sensory innervation impairment to restore corneal integrity; treatment goals are to stop progression and reverse damage from neurotrophic keratitis.

Regardless of disease severity/stage, all topical medications should be discontinued to avoid topical drug toxicity on the corneal epithelium.[3,4] Additionally, preservative-free artificial tears should be used to improve lubrication. Prophylactic topical antibiotics can be considered to prevent superinfections. Associated ocular surface disease, such as exposure keratitis, dry eye, or limbal stem cell deficiency, should be treated to improve the prognosis of neurotrophic keratitis. Therapeutic contact lenses can be used to promote corneal healing.[6] Surgical interventions are reserved for refractory cases.[3,4.6]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Oxervate. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Oxervate as well as the monitoring required for adverse events and long-term efficacy, approval requires Oxervate to be prescribed by, or in consultation with, a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Oxervate is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Neurotrophic Keratitis.** Approve for 2 months if Oxervate is prescribed by or in consultation with an ophthalmologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Oxervate is not recommended in the following situations:

11. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Tepezza Prior Authorization Policy

- Tepezza™ (teprotumumab injection for intravenous use – Horizon Therapeutics)

REVIEW DATE: 01/13/2021

OVERVIEW

Tepezza, an insulin-like growth factor-1 receptor (IGF-1R) antagonist, is indicated for the treatment of **thyroid eye disease**.[1]

Disease Overview

Thyroid eye disease is a progressive, vision-threatening autoimmune inflammatory disease of the eye and orbital tissues with predominant features of fibrosis and adipogenesis.[2] It is also recognized in literature as Graves' ophthalmopathy, Graves' orbitopathy, thyroid-associated ophthalmopathy, and thyroid orbitopathy. Thyroid eye disease is most commonly related with Graves' disease, it can also develop in patients with other thyroid diseases (e.g., Hashimoto's thyroiditis) and has a higher prevalence in women than men (16 per 100,000 vs. 3 per 100,000, respectively).[3] In active disease, orbital fibroblasts appear responsible for soft tissue enlargement by expressing potential pathogenic autoantigens, such as thyrotropin receptor and IGF-1R.[2] Activation of orbital fibroblasts leads to increased hyaluronic acid production, proinflammatory cytokine synthesis, and enhanced differentiation into either myofibroblasts or adipocytes. These processes result in inflammation, enlargement of extraocular muscles and expansion of orbital tissue and fat, which in turn cause forward displacement of the eye, resulting in proptosis and inflammation.[4] The degree of severity can be staged as mild, moderate-to-severe, or sight-threatening, following

quantitative assessment of lid aperture width, proptosis measurement, diplopia score, degrees of abduction in eye muscle movement, examination of the cornea for evidence of exposure keratitis or ulceration, and assessment of optic nerve function.

Dosing Information

The recommended dose is 10 mg/kg administered by intravenous (IV) infusion for the initial dose, followed by 20 mg/kg by IV infusion administered once every 3 weeks for seven additional doses.[1] Data for retreatment with Tepezza is still ongoing and are not yet available.[5]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Tepezza. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Tepezza as well as the monitoring required for adverse events and long-term efficacy, approval requires Tepezza to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tepezza is recommended in those who meet the following criteria:

FDA-Approved Indications

234. Thyroid Eye Disease. Approve for 6 months if the patient meets the following criteria (A, B, C, and D):

Note: Thyroid Eye Disease is also recognized as Graves' ophthalmopathy, Graves' orbitopathy, thyroid-associated ophthalmopathy, and thyroid orbitopathy.

A) Patient is ≥ 18 years of age; AND

B) Patient has been assessed as having active disease of at least moderate severity based on signs and symptoms (e.g., the degree of inflammation, degree of proptosis, presentation of diplopia, etc.), according to the prescriber; AND

C) Patient has not received 8 doses (total) of Tepezza per treated eye; AND

Note: The maximum recommended treatment is for 8 doses per affected eye. For a patient who has started therapy but has not completed 8 doses, approve the number of doses required for the patient to receive a total of 8 doses per affected eye.

D) The medication is prescribed by or in consultation with an ophthalmologist, endocrinologist, or a physician who specializes in thyroid eye disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tepezza is not recommended in the following situations:

221. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Annual Revision	**Thyroid Eye Disease:** Criteria was revised to add "Patient has not received 8 doses (total) of Tepezza per treated eye". For a patient who has started therapy but has not completed 8 doses, the number of doses required for the patient to receive a total of 8 doses per affected eye are approved.	01/13/2021

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Upneeq Prior Authorization Policy

- Upneeq™ (oxymetazoline hydrochloride 0.1% ophthalmic solution – Osmotica/RVL Pharmaceuticals)

REVIEW DATE: 08/19/2020

OVERVIEW

Upneeq, an alpha-adrenergic agonist, is indicated for the treatment of acquired blepharoptosis in adults.[1]

Disease Overview and Clinical Efficacy

Blepharoptosis, also known as ptosis, is an abnormal low-lying upper eyelid margin, which can decrease or even completely occlude vision.[2] Two vehicle-controlled pivotal studies were conducted; results are not published at this time.[3,4] The primary outcome of change in Leicester Peripheral Field Test (a measurement of superior peripheral vision) was assessed up to Day 14. Statistically significant, but numerically small, improvements vs. vehicle were noted. As a secondary endpoint, marginal reflex distance of the upper lid (MRD_1) was assessed up to Day 42. The relative improvement in MRD_1 was statistically significant favoring Upneeq over vehicle, but the treatment difference vs. vehicle was small (approximately 0.5 mm). Both pivotal trials were 6 weeks in duration; long-term efficacy beyond 6 weeks has not been evaluated.

Guidelines

Upneeq is not addressed in guidelines. The American Academy of Ophthalmology issued a report in 2011 detailing functional indications for upper eyelid ptosis and blepharoplasty surgery.[5] Ptosis and upper eyelid blepharoplasty surgery were found to be functionally beneficial under the following circumstances:

- $MRD_1 \leq 2$ mm measured in primary gaze; or
- Superior visual field loss of 12 degrees or 24%; or
- Down-gaze ptosis impairing reading documented by $MRD_1 \leq 2$ mm measured in down gaze; or
- Self-reported functional impairment from upper eyelid droop; or
- Chin-up backward head tilt induced by visual field impairment caused by lids; or
- Interference with occupational duties and safety resulting from visual impairment caused by the upper lids; or
- Symptoms of discomfort, eye strain, or visual interference due to upper eyelid position.

POLICY STATEMENT

Due to insufficient clinical efficacy data, **approval is not recommended** for Upneeq.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

None.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Upneeq is not recommended in the following situations:

222. Blepharoptosis. Due to insufficient clinical efficacy data, approval is not recommended for Upneeq.

223. Conjunctivitis. A lower strength of oxymetazoline solution (0.025%) has been evaluated for treatment of allergic and non-infectious conjunctivitis and was previously marketed over-the-counter under the name Visine® Long Lasting (no longer marketed). Oxymetazoline solution 0.1% has not been evaluated for conjunctivitis. Other over-the-counter alpha-adrenergic agonists are available as

eye drops, including Visine® (tetrahydrolozine hydrochloride 0.05%) and Naphcon-A® (naphazoline hydrochloride 0.025%).

224. Cosmetic uses. Coverage of Upneeq for cosmetic uses (i.e., blepharoptosis when functional limitation is absent) is not recommended as cosmetic uses are excluded from coverage in a typical pharmacy benefit.

225. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Vascular Endothelial Growth Factor Inhibitors – Beovu Prior Authorization Policy

- Beovu® (brolucizumab for intravitreal injection – Novartis)

REVIEW DATE: 11/04/2020

OVERVIEW

Beovu, a vascular endothelial growth factor (VEGF) inhibitor, is indicated for the treatment of neovascular (wet) age-related macular degeneration.[1] The recommended dose for Beovu is 6 mg administered by intravitreal (IVT) injection every month (every 25 to 31 days) for the first 3 doses, followed by 6 mg IVT injection once every 8 to 12 weeks.

Other Uses with Supportive Evidence

Overproduction of VEGF may lead to other eye conditions, including neovascular glaucoma, retinopathy of prematurity, and other retinal and choroidal neovascular conditions affecting the eye, the VEGF inhibitors also have the potential to be used off-label and reduce vision loss associated with other eye conditions related to increased VEGF production.[2,3] The use of anti-VEGF agents have been shown to stop the angiogenic process and maintain visual acuity and improve vision in patients with certain neovascular ophthalmic conditions; therefore, research is rapidly evolving on the use of VEGF inhibitors in other neovascular ophthalmic conditions which threaten vision.[4,5] Anti-VEGF therapy has the potential to be used off-label in other neovascular conditions affecting the eye and may prevent or slow visual impairment.[2,4,5]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Beovu. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with

Beovu as well as the monitoring required for adverse events and long-term efficacy, approval requires Beovu to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Beovu is recommended in those who meet the following criteria:

FDA-Approved Indications

235. Neovascular (Wet) Age-Related Macular Degeneration. Approve for 1 year if administered by or under the supervision of an ophthalmologist.

Other Uses with Supportive Evidence

236. Other Neovascular Diseases of the Eye (e.g., neovascular glaucoma, retinopathy of prematurity, sickle cell neovascularization, choroidal neovascular conditions, etc.). Approve for 1 year if administered by or under the supervision of an ophthalmologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Beovu is not recommended in the following situations:

226. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Vascular Endothelial Growth Factor Inhibitors – Eylea Prior Authorization Policy

- Eylea® (aflibercept for intravitreal injection – Regeneron)

REVIEW DATE: 11/04/2020

OVERVIEW

Eylea, a vascular endothelial growth factor (VEGF) inhibitor, is indicated for the following uses:[1]

- **Diabetic macular edema**.
- **Diabetic retinopathy**.
- **Macular edema following retinal vein occlusion**.
- **Neovascular (wet) age-related macular degeneration**.

The recommended dose for Eylea is 2 mg administered by intravitreal injection. Frequency of the dose does vary depending on the condition, although all conditions state some patients may need upper limit dosing of once every 4 weeks (approximately every 25 days, monthly).

Other Uses with Supportive Evidence

Overproduction of VEGF may lead to other eye conditions, including neovascular glaucoma, retinopathy of prematurity, and other retinal and choroidal neovascular conditions affecting the eye, the VEGF inhibitors also have the potential to be used off-label and reduce vision loss associated with other eye conditions related to increased VEGF production.[2,3] The use of anti-VEGF agents have been shown to stop the angiogenic process and maintain visual acuity and improve vision in patients with certain neovascular ophthalmic conditions; therefore, research is rapidly evolving on the use of VEGF inhibitors in other neovascular ophthalmic conditions which threaten vision.[4,5] Anti-VEGF therapy has the potential to be used off-label in other neovascular conditions affecting the eye and may prevent or slow visual impairment.[2,4,5]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Eylea. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Eylea as well as the monitoring required for adverse events and long-term efficacy, approval requires Eylea to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Eylea is recommended in those who meet the following criteria:

FDA-Approved Indications

237.Diabetic Macular Edema. Approve for 1 year if administered by or under the supervision of an ophthalmologist.

238. Diabetic Retinopathy. Approve for 1 year if administered by or under the supervision of an ophthalmologist.

239. Macular Edema Following Retinal Vein Occlusion. Approve for 1 year if administered by or under the supervision of an ophthalmologist.

240. Neovascular (Wet) Age-Related Macular Degeneration. Approve for 1 year if administered by or under the supervision of an ophthalmologist.

Other Uses with Supportive Evidence

5. Other Neovascular Diseases of the Eye (e.g., neovascular glaucoma, retinopathy of prematurity, sickle cell neovascularization, choroidal neovascular conditions, etc.). Approve for 1 year if administered by or under the supervision of an ophthalmologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Eylea is not recommended in the following situations:

227. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Ophthalmology – Vascular Endothelial Growth Factor Inhibitors – Lucentis Prior Authorization Policy

- Lucentis® (ranibizumab for intravitreal injection – Genentech)

REVIEW DATE: 11/04/2020

OVERVIEW

Lucentis, a vascular endothelial growth factor (VEGF) inhibitor, is indicated for the following uses:[1]

- **Diabetic macular edema** (DME).
- **Diabetic retinopathy** (DR).
- **Macular edema following retinal vein occlusion** (RVO).
- **Myopic choroidal neovascularization** (mCNV).
- **Neovascular (wet) age-related macular degeneration** (AMD).

The recommended dose for Lucentis in DME and DR is 0.3 mg administered by intravitreal injection once every month (approximately 28 days). The recommended dose for Lucentis in wet AMD, macular edema following RVO, and mCNV is 0.5 mg administered by intravitreal injection once every month (approximately 28 days).

Other Uses with Supportive Evidence

Overproduction of VEGF may lead to other eye conditions, including neovascular glaucoma, retinopathy of prematurity, and other retinal and choroidal neovascular conditions affecting the eye, the VEGF inhibitors also have the potential to be used off-label and reduce vision loss associated with other eye conditions related to increased VEGF production.[2,3] The use of anti-VEGF agents have been shown to stop the angiogenic process and maintain visual acuity and improve vision in patients with certain neovascular ophthalmic conditions; therefore, research is rapidly evolving on the use of VEGF inhibitors in other neovascular ophthalmic conditions which threaten vision.[4,5] Anti-VEGF therapy has the potential to be used off-label in other neovascular conditions affecting the eye and may prevent or slow visual impairment.[2,4,5]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Lucentis. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Lucentis as well as the monitoring required for adverse events and long-term efficacy, approval requires Lucentis to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Lucentis is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Diabetic Macular Edema.** Approve for 1 year if administered by or under the supervision of an ophthalmologist.

2. **Diabetic Retinopathy.** Approve for 1 year if administered by or under the supervision of an ophthalmologist.

3. **Macular Edema Following Retinal Vein Occlusion.** Approve for 1 year if administered by or under the supervision of an ophthalmologist.

4. **Myopic Choroidal Neovascularization.** Approve for 1 year if administered by or under the supervision of an ophthalmologist.

5. **Neovascular (Wet) Age-Related Macular Degeneration.** Approve for 1 year if administered by or under the supervision of an ophthalmologist.

Other Uses with Supportive Evidence

6. **Other Neovascular Diseases of the Eye (e.g., neovascular glaucoma, retinopathy of prematurity, sickle cell neovascularization, choroidal neovascular conditions, etc.).** Approve for 1 year if administered by or under the supervision of an ophthalmologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Lucentis is not recommended in the following situations:

228. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Opioids – Fentanyl Transmucosal Drugs Prior Authorization Policy

- Abstral® (fentanyl sublingual tablet – Novartis/ProStrakan)
- Actiq® (oral transmucosal fentanyl citrate – Cephalon, generics)
- Fentora® (fentanyl buccal tablet – Cephalon, authorized generic)
- Lazanda® (fentanyl nasal spray – Depomed)
- Subsys® (fentanyl sublingual spray – Insys)

REVIEW DATE: 10/21/2020

OVERVIEW

The transmucosal fentanyl drugs are indicated only for the management of breakthrough pain in patients with cancer who are already receiving and who are tolerant to opioid therapy for their underlying persistent cancer pain.[1-6]

Actiq (generics), Abstral, Fentora, and Subsys are immediate-release oral transmucosal formulations of fentanyl citrate.[1-5] Lazanda is a nasal spray intended for intranasal transmucosal administration.[6] Patients considered opioid tolerant are those who are taking at least 60 mg of oral morphine daily, at least 25 mcg of transdermal fentanyl/hour, at least 30 mg of oxycodone daily, at least 8 mg oral hydromorphone daily, at least 25 mg oral oxymorphone daily, or an equianalgesic dose of another opioid for a week or longer. The appropriate dosing and safety of Actiq (generics) in opioid tolerant children with breakthrough cancer pain have not been established in those below 16 years of age.[1,3] The safety and efficacy of Abstral, Fentora, Subsys, and Lazanda have not been established in pediatric patients below 18 years of age.[2,4-6]

The transmucosal fentanyl drugs are contraindicated in the management of acute or postoperative pain and in patients with known intolerance or hypersensitivity to any components or the drug fentanyl.[1-6] In addition, these products must not be used in opioid non-tolerant patients (contraindicated). The transmucosal fentanyl drugs are approved for use only in the care of cancer patients and only by healthcare professionals[1-5] (oncologists and pain specialists)[2,3,6] who are knowledgeable of and skilled in the use of Schedule II opioids to treat cancer pain. Because of the risk of misuse, abuse, addition, and overdose, these products are available only through a restricted program under a Risk Evaluation and Mitigation Strategy (REMS) called the Transmucosal Immediate-Release Fentanyl (TIRF) REMS ACCESS program. Under the TIFR REMS ACCESS program, outpatients, prescribers who prescribe to outpatients, pharmacies, and distributors must enroll in the program.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of fentanyl transmucosal drugs. All approvals are provided for the duration noted below.

Automation: If the patient has a prescription for a cancer medication (see Appendix A) within a 180-day period, the claim will adjudicate. When available, the ICD-10 codes for cancer will be used as part of automation to allow approval of the requested medication (see Appendix B).

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of fentanyl transmucosal drugs is recommended for those who meet one of the following criteria:

FDA-Approved Indications

1. **Breakthrough Pain in Patients with Cancer.** Approve for 1 year if the patient meets the following criteria (A and B):
   - **A)** Patient meets ONE of the following conditions (i or ii):
     - **i.** Patient is unable to swallow, has dysphagia, esophagitis, mucositis, or uncontrollable nausea/vomiting; OR
     - **ii.** Patient is unable to take two other short-acting narcotics secondary to allergy or severe adverse events; AND

Note: Examples of short-acting narcotics include immediate-release formulations of oxycodone, morphine sulfate, hydromorphone, etc.

B) Patient is on or will be on an oral or transdermal long-acting narcotic, or the patient is on intravenous, subcutaneous, or spinal (intrathecal, epidural) narcotics.
Note: Examples of long-acting narcotics include Duragesic, OxyContin, and morphine extended-release. Examples of intravenous, subcutaneous, or spinal narcotics include morphine sulfate, hydromorphone, and fentanyl citrate.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of fentanyl transmucosal drugs is not recommended in the following situations:

1. **Acute and/or Postoperative Pain.** This includes surgery/post-surgery, trauma/post-trauma, acute medical illness (acute abdominal pain, pelvic pain, muscle spasm), Actiq (generics), Abstral, Fentora, Lazanda, and Subsys are contraindicated for use in the management of acute or postoperative pain, including migraine headache pain.[1-6] A case series reported the efficacious outpatient use (75% reduction in pain intensity at 2 hours; n = 18) of Actiq for the management of treating an acute, refractory migraine headache in 20 patients.[7] Actiq was used as a rescue medication for management of a moderate to severe migraine after ineffective treatment with the patients' usual antimigraine therapy. All of these patients were managed by a headache clinic and had undergone a full evaluation of their medical history, vital signs, and physical and neurological examinations. In addition, all 20 patients had been previously treated with multiple other therapies (e.g., 5-hydroxytryptamine $[5\text{-HT}]_1$ receptor agonists, ergots, antiemetics, prescription and over-the-counter analgesics, and anti-inflammatory drugs) and all had previously received outpatient opioid therapies in an attempt to manage their migraine pain. All patients were also known responders to use of parenteral opioid therapy. Side effects reported included nausea (n = 3), vomiting (n = 1), somnolence (n = 2), itching (n = 1), and dry mouth (n = 1). Controlled research is needed to fully determine the role of Actiq for the management of acute, refractory migraine.

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Opioids – Long-Acting Products

Note: This is not an inclusive list. As new products become available, they will roll into this policy and the list will be updated periodically.

- Buprenorphine (i.e., Belbuca®, Butrans®)
- Fentanyl transdermal (Duragesic®, generics)
- Hydrocodone extended-release (e.g., Hysingla™ ER, Zohydro® ER)
- Hydromorphone extended-release (e.g., Exalgo® [brand discontinued 2019], generics)
- Methadone (e.g., Diskets®, Dolophine®, Methadose™, generics)
- Morphine sulfate extended-release (e.g., Arymo® ER, Embeda® [brand discontinued 2019], Kadian®, MS Contin®, generics)
- Oxycodone extended-release (e.g., Xtampza® ER, OxyContin®)
- Oxymorphone extended-release (e.g., generics [generics are not AB-rated to the discontinued Opana® ER formulation])
- Tapentadol extended-release (e.g., Nucynta® ER)
- Tramadol extended-release (e.g., Conzip®, Ultram® ER, generics)

DATE REVIEWED: 04/29/2020

OVERVIEW

Opioid analgesics are commonly used for the management of pain.[1] An estimated 20% of patients presenting to physician offices with pain symptoms or pain-related diagnoses (including acute and chronic pain) unrelated to cancer receive an opioid prescription.

The currently available long-acting (due to either an extended-release formulation or a long half-life [i.e., methadone]) opioids are buprenorphine, fentanyl, hydrocodone, hydromorphone, methadone, morphine sulfate, oxycodone, oxymorphone, tapentadol, and tramadol.[2-17] All of the long-acting opioids are indicated for the management of pain severe enough to require daily, around-the-clock, long-term opioid treatment and for which alternative treatment options are inadequate. Extended-release opioid dosage forms offer a long duration of effect, reduce severity of end-of-dose pain, and allow many patients to sleep through the night. OxyContin is the only product specifically indicated in pediatric patients 11 years to 18 years of age.[7] Nucynta ER is the only product also indicated for the management of neuropathic pain associated with diabetic peripheral neuropathy in adults.[2]

These medications produce the majority of their effects by binding to μ, κ, and δ receptors in the central nervous system.[3-17] However, Nucynta ER and Ultram ER/Conzip have a unique dual mechanism of action.[2,14] They demonstrate μ-opioid agonist activity and inhibition of norephinephrine reuptake (and serotonin reuptake for tramadol). Methadone has additional indications for the treatment and maintenance treatment of opioid addiction (i.e., heroin or other morphine-like drugs).[17] Note that methadone products

when used for the treatment of opioid addiction in detoxification or maintenance programs, shall be dispensed only by opioid treatment programs (and agencies, practitioners or institutions by formal agreement with the program sponsor) certified by the Substance Abuse and Mental Health Services Administration and approved by the designated state authority.

Since the 1990s, opioid use and abuse have risen markedly in the US.[18] An estimated 3.3 million people aged ≥ 12 years in 2016 were current misusers of pain relievers, which represents 1.2% of the population aged ≥ 12 years.[19] In 2016, an estimated 239,000 adolescents aged 12 years to 17 years (1%), 631,000 young adults aged 18 years to 25 years (1.8%), and 2.5 million adults aged ≥ 26 years (1.2%) were current misusers of pain relievers.

In 2016, the Centers for Disease Control (CDC) published a guideline for prescribing opioids for chronic pain.[1,20] The guideline provides recommendations for primary care providers who are prescribing opioids for chronic pain outside of active cancer treatment, palliative care, and end-of-life care. In the guideline, chronic pain is defined as pain that typically lasts greater than 3 months or past the time of normal tissue healing, resulting from an underlying medical disease or condition, injury, medical treatment, inflammation, or an unknown cause. To support the guideline an updated review of long-term opioid therapy for chronic pain outside of end-of-life care was undertaken and the results revealed that evidence remains limited, with insufficient evidence to determine long-term benefits of chronic opioid therapy versus no opioid therapy. However, the evidence did suggest a risk for serious harms with long-term opioid therapy that appears to be dose-dependent.

The CDC guideline recommendations are grouped into three areas: when to initiate or continue opioids for chronic pain; opioid selection, dosage, duration, follow-up, and discontinuation; and assessing risk and addressing harms of opioid use.[1] Nonpharmacologic therapy and non-opioid pharmacologic therapy are preferred for chronic pain; if opioids are used, they should be combined with nonpharmacologic therapy and non-opioid pharmacologic therapy, as appropriate. Before starting and periodically during opioid therapy, healthcare providers should discuss with their patient the risks and realistic benefits of opioid therapy and also the shared responsibilities for managing therapy. When starting opioid therapy for chronic pain, immediate-release opioids should be prescribed at the lowest effective dosage instead of initiating therapy with extended-release/long-acting opioids. Carefully reassess individual benefits and risks when increasing opioid dosages to ≥ 50 morphine milligram equivalents (MME)/day and avoid increasing dosage to ≥ 90 MME/day whenever possible. Healthcare providers should evaluate benefits and harms with patients within 1 to 4 weeks of starting opioid therapy or of dose escalation and evaluate continued therapy with patients at least every 3 months. If benefits do not outweigh harms of continued opioid therapy, other therapies should be optimized and opioid doses tapered to lower dosages and/or discontinued. Before starting and periodically during continuation of opioid therapy, healthcare providers should evaluate risk factors for opioid-related harms and incorporate strategies into the management plan to mitigate risk, including offering naloxone. The patient's history of controlled substance prescriptions should be periodically reviewed using state prescription drug monitoring program (PDMP) data to determine whether the patient is receiving opioid dosages or dangerous combinations putting them at high risk for overdose. Urine drug testing is recommended before starting opioid therapy and at least annually to assess for prescribed medications as well as other controlled prescription drugs and illicit drugs; treatment should be offered to and/or arranged for patients with opioid use disorder.

The CDC guideline states that long-term opioid use often begins with treatment of acute pain.[1] When opioids are used for acute pain, clinicians should prescribe the lowest effective dose of immediate-release opioids and should prescribe no greater quantity than needed for the expected duration of pain severe enough to require opioids (i.e., ≤ 3 days and only rarely > 7 days).

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of long-acting opioids. Long-acting opioids are controlled substances (CII with the exception of tramadol-containing products which are CIV) which can be misused and abused. This policy includes long-acting formulations of the medications listed on page 1; the list is not inclusive. As new products become available, they will roll into this policy and the list will be updated periodically. All approvals are provided for 1 year in duration unless otherwise noted below.

Automation: Patients with a history of a long-acting opioid within the 130-day look-back period are excluded from prior authorization. If the patient has a prescription for a cancer medication (see Appendix A) within a 180-day period, the claim will adjudicate. When available, the ICD-10 codes for cancer will be used as part of automation to allow approval of the requested medication (see Appendix B).

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of long-acting opioids is recommended in those who meet the following criteria:

A. Coverage of all long-acting opioids, except fentanyl transdermal products, is recommended in those who meet the following criteria:

FDA-Approved Indications

27. Pain Severe Enough to Require Daily, Around-the-Clock, Long-Term Opioid Treatment. Approve for 1 year if the patient meets ONE of the following criteria (A, B or C):

- **A)** The patient has a cancer diagnosis; OR
- **B)** The patient is in a hospice program, end-of-life care, or palliative care; OR
- **C)** The patient has chronic pain but does not have a cancer diagnosis. Approve for 1 year if the patient meets ALL of the following criteria (i, ii, iii, iv, and v):
  - **i.** Patient is not opioid naïve; AND
  - **ii.** Non-opioid therapies (e.g., non-opioid medications [e.g., nonsteroidal anti-inflammatory drugs {NSAIDs}, tricyclic antidepressants, serotonin and norepinephrine reuptake inhibitors {SNRIs}, anticonvulsants], exercise therapy, weight loss, cognitive behavioral therapy) have been optimized and are being used in conjunction with opioid therapy according to the prescribing physician; AND
  - **iii.** The patient's history of controlled substance prescriptions has been checked using the state prescription drug monitoring program (PDMP), unless unavailable in the state (see note below), according to the prescribing physician; AND
  - **iv.** Risks (e.g., addiction, overdose) and realistic benefits of opioid therapy have been discussed with the patient according to the prescribing physician; AND
  - **v.** Treatment plan (including goals for pain and function) is in place and reassessments (including pain levels and function) are scheduled at regular intervals according to the prescribing physician.

Note: As of 04/24/2020, the state of Missouri is the only state in the US that does not have a statewide PDMP program in place.

2. Opioid Addiction (Dependence) [methadone products only]. Approve methadone for 1 year if ONE of the following criteria (A or B) is met:

- **A)** Methadone is dispensed by an opioid treatment program certified by the Substance Abuse and Mental Health Services Administration and approved by the designated state authority; OR

B) Methadone is being prescribed during an emergency period of ≤ 3 days while definitive care for the addiction is being sought in an appropriately licensed facility.

B. Coverage of fentanyl transdermal products is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Pain Severe Enough to Require Daily, Around-the-Clock, Long-Term Opioid Treatment.** Approve for 1 year if the patient has a cancer diagnosis.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Long-acting opioids have not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

289. **Acute pain.** According to the CDC guideline for prescribing opioids for chronic pain, clinicians should not prescribe extended-release/long-acting opioids for the treatment of acute pain due to the longer half-lives and longer duration of effects (e.g., respiratory depression) with extended-release/long-acting opioids.[1]

290. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Date Reviewed
Selected revision	Removing criterion requiring a concurrent prescription for a short-acting opioid. The intent of this criterion was to assure that new users to LA opioid therapy had been initiated on therapy with a short-acting opioid; however, some long-term users of LA opioids are also being reviewed through PA. Fentanyl transdermal products were separated out and will be approved only for use in cancer patients or in patients in a hospice program, end-of-life care, or palliative care. The Automation section was updated to reflect existing automation, "Patients with a history of a long-acting opioid within the 130-day look-back period are excluded from prior authorization."	01/24/2018
Selected revision	Approval criterion for fentanyl transdermal products was changed to approve only for patients with cancer. Automation for this policy will only look back for cancer medications and/or ICD-9/ICD-10 codes for cancer.	02/07/2018
Annual revision	No changes to criteria.	03/21/2018
DEU revision	05/02/2018: Modification of the list of drugs included in this policy and addition of a statement in the Policy Statement indicating that this policy includes long-acting formulations of the medications listed on page 1; the list is not inclusive. As new products become available, they will roll into this policy and the list will be updated periodically. Similarly, the list in Appendix A is not inclusive.	--
Annual revision	STC code H868 was added to Appendix A. No change to criteria.	04/10/2019
Annual revision	No changes to criteria. Four new STC codes were added to Appendix A, and the ICD-9 codes were removed from Appendix B because they are no longer used.	04/29/2020

APPENDIX A

Note: This list is not inclusive. As new STCs become available, they will roll into this policy and the list will be updated periodically.

PRIOR AUTHORIZATION POLICY

POLICY: Opioids – Tramadol Extended-Release Prior Authorization Policy

- ConZip® (tramadol hydrochloride extended-release capsules – Vertical)
- Tramadol extended-release capsules – various (brand products)
- Tramadol hydrochloride extended-release tablets – generics to the discontinued product Ultram® ER
- Tramadol hydrochloride extended-release tablets – generics to the discontinued product Ryzolt

REVIEW DATE: 08/19/2020

OVERVIEW

Tramadol extended-release tablets, tramadol extended-release capsules, and ConZip are indicated for the management of pain severe enough to require daily around-the-clock, long-term opioid treatment and for which alternative treatment options are inadequate.[1-3]

Tramadol is a centrally acting synthetic opioid analgesic.[1-3] The extended-release tramadol products differ in their extended-release mechanism. ConZip contains a total dose of tramadol in a combination of immediate-release and extended-release components. However, ConZip is bioequivalent to a reference extended-release tramadol product under fasting conditions. Therefore, clinical efficacy was based on a reference extended-release tramadol product.

Guidelines

In 2016, the Centers for Disease Control (CDC) published a guideline for prescribing opioids for chronic pain.[4,5] The guideline provides recommendations for primary care providers who are prescribing opioids for chronic pain outside of active cancer treatment, palliative care, and end-of-life care. In the guideline, chronic pain is defined as pain that typically lasts greater than 3 months or past the time of normal tissue healing, resulting from an underlying medical disease or condition, injury, medical treatment, inflammation, or an unknown cause. To support the guideline an updated review of long-term opioid therapy for chronic pain outside of end-of-life care was undertaken and the results revealed that evidence remains limited, with insufficient evidence to determine long-term benefits of chronic opioid therapy versus no opioid therapy. However, the evidence did suggest a risk for serious harms with long-term opioid therapy that appears to be dose-dependent.

The CDC guidelines recommend non-pharmacologic therapy and non-opioid pharmacologic therapy for chronic pain; if opioids are used, they should be combined with non-pharmacologic therapy and non-opioid pharmacologic therapy, as appropriate.[4] Before starting and periodically during opioid therapy, healthcare providers should discuss with their patient the risks and realistic benefits of opioid therapy and also the shared responsibilities for managing therapy. When starting opioid therapy for chronic pain, immediate-release opioids should be prescribed at the lowest effective dosage instead of initiating therapy with extended-release/long-acting opioids. Before starting and periodically during continuation of opioid therapy, healthcare providers should evaluate risk factors for opioid-related harms and incorporate

strategies into the management plan to mitigate risk, including offering naloxone. The patient's history of controlled substance prescriptions should be periodically reviewed using state prescription drug monitoring program (PDMP) data to determine whether the patient is receiving opioid dosages or dangerous combinations putting them at high risk for overdose. Urine drug testing is recommended before starting opioid therapy and at least annually to assess for prescribed medications as well as other controlled prescription drugs and illicit drugs; treatment should be offered to and/or arranged for patients with opioid use disorder.

The CDC guideline states that long-term opioid use often begins with treatment of acute pain.[4] When opioids are used for acute pain, clinicians should prescribe the lowest effective dose of immediate-release opioids and should prescribe no greater quantity than needed for the expected duration of pain severe enough to require opioids, i.e., ≤ 3 days and only rarely > 7 days.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of tramadol extended-release products. Tramadol extended-release products are controlled substances (C-IV) which can be misused and abused. Additionally, due to the availability of generic tramadol extended-release tablets, approval of a branded tramadol extended-release product requires a previous trial of the generic. All approvals are provided for the duration noted below.

Automation: If a generic tramadol extended-release product is requested and the patient has history of a generic tramadol extended-release product within the 130-day look-back period, a prescription for a cancer medication (see Appendix A) within a 180-day period, or an ICD-10 code for cancer (see Appendix B), the claim will adjudicate.

RECOMMENDED CRITERIA

Coverage of a tramadol extended-release product is recommended in those who meet the following criteria:

FDA-Approved Indications

28. Pain Severe Enough to Require Daily, Around-the-Clock, Long-Term Opioid Treatment. Approve for 1 year if the patient meets ONE of the following criteria (A, B or C) AND D:

- **D)** Patient has a cancer diagnosis; OR
- **E)** Patient is in hospice program, end-of-life care, or palliative care; OR
- **F)** Patient has chronic pain but does not have a cancer diagnosis. Approve for 1 year if the patient meets ALL of the following criteria (i, ii, iii, iv, and v):
  - **vi.** Patient is not opioid naïve; AND
  - **vii.** Non-opioid therapies have been optimized and are being used in conjunction with opioid therapy according to the prescriber; AND
    Note: Examples of non-opioid therapies include non-opioid medications (e.g., nonsteroidal anti-inflammatory drugs, tricyclic antidepressants, serotonin and norepinephrine reuptake inhibitors, anticonvulsants), exercise therapy, weight loss, and cognitive behavioral therapy.
  - **viii.** Patient's history of controlled substance prescriptions has been checked using the state prescription drug monitoring program (PDMP), unless unavailable in the state (see note below), according to the prescriber; AND
    Note: As of 08/19/2020, the state of Missouri is the only state in the US that does not have a statewide PDMP program in place.
  - **ix.** Risks (e.g., addiction, overdose) and realistic benefits of opioid therapy have been discussed with the patient according to the prescriber; AND

x. Treatment plan (including goals for pain and function) is in place and reassessments (including pain levels and function) are scheduled at regular intervals according to the prescriber.

G) If a branded tramadol extended-release product is requested, the patient has tried generic tramadol extended-release tablets.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of a tramadol extended-release product is not recommended in the following situations:

291. Acute pain. According to the CDC guideline for prescribing opioids for chronic pain, clinicians should not prescribe extended-release/long-acting opioids for the treatment of acute pain due to the longer half-lives and longer duration of effects (e.g., respiratory depression) with extended-release/long-acting opioids.[4]

292. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Selected Revision	The Automation section was updated to reflect existing automation, "Patients with a history of a generic tramadol ER product within the 130-day look-back period are excluded from prior authorization." Hospice ICD-9/ICD-10 codes removed from Automation to be consistent with the Long-Acting Opioids PA policy. Removed the criterion requiring a concomitant prescription for a short-acting opioid.	02/07/2018
Update	2/21/2018: Clarification to Automation that the use of a history of a generic tramadol extended-release product, cancer medications, or ICD-9/ICD-10 codes for cancer is only for patients prescribed a generic tramadol extended-release product.	--
Annual Revision	No change to criteria.	08/01/2018
Annual Revision	No change to criteria. Removed the obsolete branded Ultram ER product from the policy. In the approval condition "Pain Severe Enough to Require Daily, Around-the-Clock, Long-Term Opioid Treatment", the date of the Note was updated.	08/07/2019
Annual Revision	No change to criteria. Four new STC codes were added to Appendix A, and the ICD-9 codes were removed from Appendix B because they are no longer used. For the approval condition of Pain Severe Enough to Require Daily, Around-the-Clock, Long-Term Opioid Treatment, examples of non-opioid therapies were moved to a note.	08/19/2020

APPENDIX A

Note: This list is not inclusive. As new STCs become available, they will roll into this policy and the list will be updated periodically.

PRIOR AUTHORIZATION POLICY

POLICY: Parkinson's Disease – Amantadine Extended-Release Drugs Prior Authorization with Step Therapy Policy
- Gocovri™ (amantadine extended-release capsules – Adamas Pharma)
- Osmolex ER™ (amantadine extended-release tablets – Vertical Pharmaceuticals)

REVIEW DATE: 12/16/2020; selected revision 02/10/2021

OVERVIEW

Gocovri, an extended-release capsule formulation of amantadine, is indicated for **patients with Parkinson's disease** the following uses:[1]
- **Dyskinesia**, in patients receiving levodopa-based therapy, with or without concomitant dopaminergic medications.
- **"Off" episodes**, as adjunctive treatment to levodopa/carbidopa.

Osmolex ER, an extended-release tablet formulation of amantadine, is indicated for the following uses:[2]
- **Drug-induced extrapyramidal reactions**, in adult patients.
- **Parkinson's disease**, in adult patients.

Amantadine hydrochloride is available as immediate-release capsules, tablets, and oral solution.[3-5] The amantadine immediate-release products are indicated for the prophylaxis and treatment of signs and symptoms of infection caused by various strains of influenza A virus; idiopathic Parkinson's disease [Paralysis Agitans], post-encephalitic parkinsonism, symptomatic parkinsonism which may follow injury to the nervous system by carbon monoxide intoxication, and in those elderly patients believed to develop parkinsonism in association with cerebral arteriosclerosis; and drug-induced extrapyramidal reactions.

Guidelines

The International Parkinson and Movement Disorder Society published an evidence-based review for treatment for motor symptoms of Parkinson's disease (2018). Amantadine is addressed, however specific formulations are not. The review categorically divides treatment recommendations by Parkinson's disease characteristics. Amantadine was noted to be likely efficacious and possibly useful in treatment for symptomatic monotherapy and symptomatic adjunct therapy in early or stable Parkinson's disease. For treatment of dyskinesia, amantadine was identified to be efficacious and clinically useful.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of amantadine extended-release products. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with amantadine extended-release products as well as the monitoring required for adverse events and long-term efficacy, approval requires amantadine extended-release products to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

I. Coverage of Gocovri is recommended in those who meet the following criteria:

FDA-Approved Indications

~~74.~~71. **Parkinson's Disease.** Approve if patient meets ONE of the following (A or B):
- **A)** Initial Therapy. Approve for 3 months if the patient meets the following criteria (i, ii, iii , and iv):
  - **i.** Patient meets ONE of the following criteria (a or b):
    - **a)** Patient is experiencing dyskinesia; OR
    - **b)** Patient is experiencing "off" episodes; AND
      Note: Examples of "off" episodes include muscle stiffness, slow movements, or difficulty starting movements.
  - **ii.** Patient is currently receiving levodopa-based therapy (e.g., carbidopa/levodopa); AND
  - **iii.** Patient has tried immediate-release amantadine capsules, tablets, or oral solution and meets ONE of the following criteria (a or b):
    - **a)** Patient derived benefit from immediate-release amantadine but had intolerable adverse events, as determined by the prescriber; OR
    - **b)** Patient could not achieve a high enough dosage to gain adequate benefit, as determined by the prescriber; AND
  - **iv.** The medication is prescribed by or in consultation with a neurologist.
- **B)** Patients is Currently Receiving Gocovri. Approve for 1 year if the patient meets the following criteria (i, ii, iii, and iv):
  - **i.** Patient is currently receiving levodopa-based therapy (e.g., carbidopa/levodopa); AND
  - **ii.** Patient has tried immediate-release amantadine capsules, tablets, or oral solution and meets ONE of the following criteria (a or b):
    - **a)** Patient derived benefit from immediate-release amantadine but had intolerable adverse events, as determined by the prescriber; OR
    - **b)** Patient could not achieve a high enough dosage to gain adequate benefit, as determined by the prescriber; AND
  - **iii.** Patient has had a response to therapy (e.g., decrease in dyskinesia, decrease in "off" episodes), as determined by the prescriber; AND
    Note: Examples of "off" episodes include muscle stiffness, slow movements, or difficulty starting movements.
  - **iv.** The medication is prescribed by or in consultation with a neurologist.

II. Coverage of Osmolex ER is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Drug-Induced Extrapyramidal Reactions.** Approve if patient meets ONE of the following (A or B):
   - **A)** Initial Therapy. Approve for 3 months if the patient meets the following criteria (i and ii):
     - **i.** Patient has tried immediate-release amantadine capsules, tablets, or oral solution and meets ONE of the following criteria (a or b):
       - **a)** Patient derived benefit from immediate-release amantadine but had intolerable adverse events, as determined by the prescriber; OR
       - **b)** Patient could not achieve a high enough dosage to gain adequate benefit, as determined by the prescriber; AND
     - **ii.** The medication is prescribed by or in consultation with a neurologist.
   - **B)** Patient is Currently Receiving Osmolex ER. Approve for 1 year if the patient meets the following criteria (i, ii, and iii):
     - **i.** Patient has tried immediate-release amantadine capsules, tablets, or oral solution and meets ONE of the following criteria (a or b):

a) Patient derived benefit from immediate-release amantadine but had intolerable adverse events, as determined by the prescriber; OR
b) Patient could not achieve a high enough dosage to gain adequate benefit, as determined by the prescriber; AND

ii. Patient has had a response to therapy (e.g., decrease in extrapyramidal reactions), as determined by the prescriber; AND
iii. The medication is prescribed by or in consultation with a neurologist.

2. Parkinson's Disease. Approve if patient meets ONE of the following (A or B):
A) Initial Therapy. Approve for 3 months if the patient meets the following criteria (i and ii):
i. Patient has tried immediate-release amantadine capsules, tablets, or oral solution and meets ONE of the following criteria (a or b):
a) Patient derived benefit from immediate-release amantadine but had intolerable adverse events, as determined by the prescriber; OR
b) Patient could not achieve a high enough dosage to gain adequate benefit, as determined by the prescriber; AND
ii. The medication is prescribed by or in consultation with a neurologist.
B) Patient is Currently Receiving Osmolex ER. Approve for 1 year if the patient meets the following criteria (i, ii, and iii):
i. Patient has tried immediate-release amantadine capsules, tablets, or oral solution and meets ONE of the following criteria (a or b):
a) Patient derived benefit from immediate-release amantadine but had intolerable adverse events, as determined by the prescriber; OR
b) Patient could not achieve a high enough dosage to gain adequate benefit, as determined by the prescriber; AND
ii. Patient has had a response to therapy (e.g., decrease in dyskinesia), as determined by the prescriber; AND
iii. The medication is prescribed by or in consultation with a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of amantadine extended-release products is not recommended in the following situations:

229. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Parkinson's Disease – Apokyn Prior Authorization Policy

- Apokyn® (apomorphine hydrochloride for subcutaneous injection)

REVIEW DATE: 08/19/2020; selected revision 10/21/2020

OVERVIEW

Apokyn, a non-ergoline dopamine agonist, is indicated for the acute, intermittent treatment of hypomobility, "off" episodes ("end-of-dose wearing off" and unpredictable "on/off" episodes) associated with advanced Parkinson's disease.[1]

Guidelines

The American Academy of Neurology published guidelines in 2006 on the treatment of Parkinson's disease with motor fluctuations and dyskinesia.[2] The guidelines are dated and do not include more recently approved medications. It is recommended to offer entacapone and rasagiline to reduce "off" time (Level A). Pergolide (withdrawn from the market in 2007 due to risk of valvular fibrosis), pramipexole, ropinirole, and tolcapone (used with caution; requires monitoring for hepatotoxicity) should be considered to reduce "off" time (Level B). Apokyn® (apomorphine hydrochloride injection), cabergoline, and selegiline may be used to reduce "off" time (Level C). According to the guidelines, the available evidence does not establish superiority of one medication over another in reducing "off" time (Level B). Sustained-release levodopa/carbidopa and bromocriptine should not be considered to reduce "off" time (Level C). Amantadine may be used to reduce dyskinesia (Level C).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Apokyn. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Apokyn as well as the monitoring required for adverse events and long-term efficacy, approval requires Apokyn to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Apokyn is recommended in those who meet the following criteria:

FDA-Approved Indications

29. Parkinson's Disease. Approve for 1 year if the patient meets the following criteria (A, B, C, and D):

- **i.** Patient is experiencing "off" episodes such as muscle stiffness, slow movements, or difficulty starting movements; AND
- **ii.** Patient is currently receiving carbidopa/levodopa therapy; AND

iii. Patient has previously tried one other treatment for "off" episodes and meets ONE of the following criteria (i or ii):

a) Patient had significant intolerance, according to the prescriber; OR

b) Patient had inadequate efficacy, according to the prescriber; AND

Note: Examples of treatment for "off" episodes include entacapone, rasagiline, pramipexole, ropinirole, tolcapone, cabergoline, selegiline, Kynmobi™ (apomorphine hydrochloride sublingual film), Ongentys® (opicapone capsules), or Xadago® (safinamide tablets).

D) Apokyn is being prescribed by, or in consultation with, a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Apokyn is not recommended in the following situations:

230. Concurrent Use with a Serotonin 5-HT3 Antagonist. Administration of Apokyn in conjunction with a serotonin 5-HT3 antagonist (e.g., ondansetron, granisetron, dolasetron, palonosetron, alosetron) can result in extreme lowering of blood pressure and loss of consciousness and is considered an absolute contraindication.[1]

231. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
New Policy	--	08/28/2019
Annual Revision	**Parkinson's Disease.** For the requirement of previously tried treatments, the number of medications was changed from two treatments to one and criteria for significant intolerance and inadequate efficacy for those treatments was added. Kynmobi and Ongentys were added to the Note of previously tried Parkinson's disease treatments.	08/19/2020
Selected Revision	**Parkinson's Disease.** The requirement for the patient to have advanced Parkinson's disease was removed from criteria.	10/21/2020

PRIOR AUTHORIZATION POLICY

POLICY: Parkinson's Disease – Duopa Prior Authorization Policy

- Duopa™ (carbidopa and levodopa enteral suspension – AbbVie)

REVIEW DATE: 08/19/2020

OVERVIEW

Duopa, a combination of carbidopa (an aromatic amino acid decarboxylation inhibitor) and levodopa (an aromatic amino acid), is indicated for the treatment of motor fluctuations in patients with advanced Parkinson's disease.[1] Duopa is administered over a 16 hours/day infusion period through a naso-jejunal tube (short-term administration) or a percutaneous endoscopic gastrostomy-jejunostomy (long-term administration) using a CADD-Legacy® 1400 pump.

Guidelines

The American Academy of Neurology published guidelines in 2006 on the treatment of Parkinson's disease with motor fluctuations and dyskinesia.[2] The guidelines are dated and do not include more recently approved medications. It is recommended to offer entacapone and rasagiline to reduce "off" time (Level A). Pergolide (withdrawn from the market in 2007 due to risk of valvular fibrosis), pramipexole, ropinirole, and tolcapone (used with caution; requires monitoring for hepatotoxicity) should be considered to reduce "off" time (Level B). Apokyn® (apomorphine hydrochloride injection), cabergoline, and selegiline may be used to reduce "off" time (Level C). According to the guidelines, the available evidence does not establish superiority of one medication over another in reducing "off" time (Level B). Sustained-release levodopa/carbidopa and bromocriptine should not be considered to reduce "off" time (Level C). Amantadine may be used to reduce dyskinesia (Level C).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Duopa. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Duopa as well as the monitoring required for adverse events and long-term efficacy, approval requires Duopa to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Duopa is recommended in those who meet the following criteria:
FDA-Approved Indications

241. Parkinson's Disease. Approve for 1 year if the patient meets the following criteria (A, B, C, D, and E):

- **A)** Patient is diagnosed with advanced Parkinson's disease; AND
- **B)** Patient is experiencing "off" episodes such as muscle stiffness, slow movements, or difficulty starting movements; AND
- **C)** Patient has tried an oral extended-release carbidopa/levodopa therapy and meets one of the following criteria (i or ii):
  - **i.** Patient had significant intolerance, according to the prescriber; OR
  - **ii.** Patient had inadequate efficacy, according to the prescriber; AND
- **D)** Patient has previously tried three other treatments for "off" episodes; AND
  Note: Examples of treatment for "off" episodes include entacapone, rasagiline, pramipexole, ropinirole, tolcapone, cabergoline, selegiline, Kynmobi™ (apomorphine hydrochloride sublingual film), Ongentys® (opicapone capsules), or Xadago® (safinamide tablets).
- **E)** Duopa is being prescribed by, or in consultation with, a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Duopa is not recommended in the following situations:

232. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Parkinson's Disease – Inbrija Prior Authorization Policy

- Inbrija™ (levodopa inhalation powder for oral inhalation use – Acorda)

REVIEW DATE: 08/19/2020

OVERVIEW

Inbrija, an aromatic amino acid, is indicated for the intermittent treatment of "off" episodes in patients with Parkinson's disease treated with carbidopa-levodopa.[1] Inbrija should be taken when symptoms of an "off" period start to return. The recommended dosage of Inbrija is 84 mg (two 42 mg capsules) as needed, up to five times daily. Inbrija capsules are for oral inhalation only and should be used only with the Inbrija inhaler. Inbrija capsules must not be swallowed. Patients are instructed to load one capsule into the inhaler and breathe in; then remove the used capsule and load the second capsule into the inhaler and breathe in. The Inbrija inhaler is breath-actuated by the patient.

Guidelines

The American Academy of Neurology published guidelines in 2006 on the treatment of Parkinson's disease with motor fluctuations and dyskinesia.[2] The guidelines are dated and do not include more recently approved medications. It is recommended to offer entacapone and rasagiline to reduce "off" time (Level A). Pergolide (withdrawn from the market in 2007 due to risk of valvular fibrosis), pramipexole, ropinirole, and tolcapone (used with caution; requires monitoring for hepatotoxicity) should be considered to reduce "off" time (Level B). Apokyn® (apomorphine hydrochloride injection), cabergoline, and selegiline may be used to reduce "off" time (Level C). According to the guidelines, the available evidence does not establish superiority of one medication over another in reducing "off" time (Level B). Sustained-release levodopa/carbidopa and bromocriptine should not be considered to reduce "off" time (Level C). Amantadine may be used to reduce dyskinesia (Level C).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Inbrija. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Inbrija as well as the monitoring required for adverse events and long-term efficacy, approval requires Inbrija to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Inbrija is recommended in those who meet the following criteria:

FDA-Approved Indications

242. Parkinson's Disease. Approve for 1 year if the patient meets the following criteria (A, B, C, D, and E):

- **A)** Patient is currently taking carbidopa-levodopa; AND
- **B)** Patient is experiencing "off" episodes such as muscle stiffness, slow movements, or difficulty starting movements; AND
- **C)** Patient has previously tried one other treatment for "off" episodes and meets ONE of the following criteria (i or ii):
  - **i.** Patient had significant intolerance, according to the prescriber; OR
  - **ii.** Patient had inadequate efficacy, according to the prescriber; AND

  Note: Examples of treatments for "off" episodes are entacapone, rasagiline, pramipexole, ropinirole, tolcapone, Apokyn, cabergoline, selegiline, Ongentys, Kynmobi, or Xadago.
- **D)** Patient does not have asthma, chronic obstructive pulmonary disease, or other chronic underlying lung disease; AND
- **E)** Inbrija is prescribed by or in consultation with a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Inbrija is not recommended in the following situations:

233. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Annual Revision	Moved examples of treatments for "off" episodes out of the criteria for Parkinson's Disease, Patients with "Off" Episodes and into a Note.	01/29/2020
Early Annual Revision	**Parkinson's Disease.** Patients with "Off" Episodes was removed from the condition title and placed in criteria as patient is experiencing "off" episodes such as muscle stiffness, slow movements, or difficulty starting movements. For the requirement of previously tried treatments, criteria for significant intolerance and inadequate efficacy for those treatments was added. Kynmobi and Ongentys were added to the Note of previously tried Parkinson's disease medications.	08/19/2020

PRIOR AUTHORIZATION POLICY

POLICY: Parkinson's Disease – Lodosyn Prior Authorization Policy

- Lodosyn® (carbidopa tablets, generics)

REVIEW DATE: 08/19/2020

OVERVIEW

Lodosyn, an aromatic amino acid decarboxylation inhibitor, indicated for use with carbidopa-levodopa or with levodopa in the treatment of the symptoms of idiopathic Parkinson's disease (paralysis agitans), postencephalitic parkinsonism, and symptomatic parkinsonism, which may follow injury to the nervous system by carbon monoxide intoxication and/or manganese intoxication.[1]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Lodosyn. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Lodosyn as well as the monitoring required for adverse events and long-term efficacy, approval requires Lodosyn to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Lodosyn is recommended in those who meet the following criteria:

FDA-Approved Indications

243. Parkinson's Disease. Approve for 1 year if the patient meets both of the following criteria (A and B):
- **A)** Patient is currently receiving carbidopa/levodopa therapy; AND
- **B)** Lodosyn is being prescribed by, or in consultation with, a neurologist.

244. Postencephalitic Parkinsonism. Approve for 1 year if the patient meets both of the following criteria (A and B):
- **A)** Patient is currently receiving carbidopa/levodopa therapy; AND
- **B)** Lodosyn is being prescribed by, or in consultation with, a neurologist.

245. Symptomatic Parkinsonism. Approve for 1 year if the patient meets both of the following criteria (A and B):
- **A)** Patient is currently receiving carbidopa/levodopa therapy; AND
- **B)** Lodosyn is being prescribed by, or in consultation with, a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Lodosyn is not recommended in the following situations:

234. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Parkinson's Disease – Nourianz Prior Authorization Policy

- Nourianz™ (istradefylline tablets – Kyowa Kirin)

REVIEW DATE: 08/19/2020

OVERVIEW

Nourianz, an adenosine receptor antagonist, is indicated as adjunctive treatment to levodopa/carbidopa in adult patients with Parkinson's disease experiencing "off" episodes.[1]

Guidelines

The American Academy of Neurology published guidelines in 2006 on the treatment of Parkinson's disease with motor fluctuations and dyskinesia.[2] The guidelines are dated and do not include more recently approved medications. It is recommended to offer entacapone and rasagiline to reduce "off" time (Level A). Pergolide (withdrawn from the market in 2007 due to risk of valvular fibrosis), pramipexole, ropinirole, and tolcapone (used with caution; requires monitoring for hepatotoxicity) should be considered to reduce "off" time (Level B). Apokyn® (apomorphine hydrochloride injection), cabergoline, and selegiline may be used to reduce "off" time (Level C). According to the guidelines, the available evidence does not establish superiority of one medication over another in reducing "off" time (Level B). Sustained-release levodopa/carbidopa and bromocriptine should not be considered to reduce "off" time (Level C). Amantadine may be used to reduce dyskinesia (Level C).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Nourianz. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Nourianz as well as the monitoring required for adverse events and long-term efficacy, approval requires Nourianz to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Nourianz is recommended in those who meet the following criteria:

FDA-Approved Indications

246. Parkinson's Disease. Approve Nourianz for 1 year if patient meets both of the following (A and B):

F) Patient is currently taking carbidopa-levodopa; AND

G) Patient is experiencing "off" episodes such as muscle stiffness, slow movements, or difficulty starting movements; AND

H) Nourianz is prescribed by or in consultation with a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Nourianz is not recommended in the following situations:

235. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Parkinson's Disease – Nuplazid Prior Authorization Policy

- Nuplazid® (pimavanserin capsules and tablets – Acadia)

REVIEW DATE: 08/19/2020

OVERVIEW

Nuplazid, a selective serotonin 5-HT_{2A} inverse agonist, is indicated for the treatment of hallucinations and delusions associated with Parkinson's disease psychosis.[1]

Safety

Nuplazid has a Boxed Warning regarding increased mortality in elderly patients with dementia-related psychosis.[1] Nuplazid is not approved for the treatment of patients with dementia-related psychosis unrelated to the hallucinations and delusions associated with Parkinson's disease psychosis.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Nuplazid. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with

Nuplazid as well as the monitoring required for adverse events and long-term efficacy, approval requires Nuplazid to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Nuplazid is recommended in those who meet the following criteria:

FDA-Approved Indications

~~75.~~72. **Parkinson's Disease Psychosis.** Approve for 1 year if the patient meets all of the following criteria (A, B, and C):

30. Patient has hallucinations and delusions associated with Parkinson's disease pychosis; AND

31. Patient does not have dementia-related psychosis unrelated to the hallucinations and delusions associated with Parkinson's disease psychosis; AND

32. Nuplazid is prescribed by or in consultation with a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Nuplazid is not recommended in the following situations:

236. Dementia-Related Psychosis. Nuplazid prescribing information has a Boxed Warning regarding increased mortality in elderly patients with dementia-related psychosis.[1] Elderly patients with dementia-related psychosis treated with antipsychotic drugs are at an increased risk of death.

237. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Parkinson's Disease – Tolcapone Products Prior Authorization Policy

- Tasmar® (tolcapone tablets, generics [100 mg strength only])

REVIEW DATE: 08/19/2020

OVERVIEW

Tolcapone, an inhibitor of catechol-O-methyltransferase, is used in the treatment of Parkinson's disease as an adjunct to levodopa/carbidopa therapy.[1]

Guidelines

The American Academy of Neurology published guidelines in 2006 on the treatment of Parkinson's disease with motor fluctuations and dyskinesia.[2] The guidelines are dated and do not include more recently approved medications. It is recommended to offer entacapone and rasagiline to reduce "off" time (Level A). Pergolide (withdrawn from the market in 2007 due to risk of valvular fibrosis), pramipexole, ropinirole, and tolcapone (used with caution; requires monitoring for hepatotoxicity) should be considered to reduce "off" time (Level B). Apokyn® (apomorphine hydrochloride injection), cabergoline, and selegiline may be used to reduce "off" time (Level C). According to the guidelines, the available evidence does not establish superiority of one medication over another in reducing "off" time (Level B). Sustained-release levodopa/carbidopa and bromocriptine should not be considered to reduce "off" time (Level C). Amantadine may be used to reduce dyskinesia (Level C).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of tolcapone products. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with tolcapone products as well as the monitoring required for adverse events and long-term efficacy, approval requires tolcapone products to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of tolcapone products is recommended in those who meet the following criteria:

FDA-Approved Indications

247. Parkinson's Disease. Approve for 1 year if the patient meets all of the following criteria (A, B, and C):

- **A)** Patient is currently receiving carbidopa/levodopa therapy; AND
- **B)** Patient has tried an entacapone product and meets ONE of the following criteria (i or ii):
  - **i.** Patient had significant intolerance, according to the prescriber; OR
  - **ii.** Patient had inadequate efficacy, according to the prescriber; AND
- **C)** Tolcapone is being prescribed by, or in consultation with, a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of tolcapone products is not recommended in the following situations:

238. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Parkinson's Disease – Zelapar Prior Authorization Policy
- Zelapar® (selegiline hydrochloride tablets, orally disintegrating)

REVIEW DATE: 08/19/2020

OVERVIEW
Zelapar, an irreversible inhibitor of monoamine oxidase, is indicated as an adjunct in the management of patients with Parkinson's disease being treated with levodopa/carbidopa who exhibit deterioration in the quality of their response to this therapy.[1] Zelapar is an oral disintegrating tablet that dissolves in the mouth seconds after placement on the tongue and is rapidly absorbed.

Guidelines
The American Academy of Neurology published guidelines in 2006 on the treatment of Parkinson's disease with motor fluctuations and dyskinesia.[2] The guidelines are dated and do not include more recently approved medications. It is recommended to offer entacapone and rasagiline to reduce "off" time (Level A). Pergolide (withdrawn from the market in 2007 due to risk of valvular fibrosis), pramipexole, ropinirole, and tolcapone (used with caution; requires monitoring for hepatotoxicity) should be considered to reduce "off" time (Level B). Apokyn® (apomorphine hydrochloride injection), cabergoline, and selegiline may be used to reduce "off" time (Level C). According to the guidelines, the available evidence does not establish superiority of one medication over another in reducing "off" time (Level B). Sustained-release levodopa/carbidopa and bromocriptine should not be considered to reduce "off" time (Level C). Amantadine may be used to reduce dyskinesia (Level C).

POLICY STATEMENT
Prior Authorization is recommended for prescription benefit coverage of Zelapar. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Zelapar as well as the monitoring required for adverse events and long-term efficacy, approval requires Zelapar to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Zelapar is recommended in those who meet the following criteria:

FDA-Approved Indications

248. Parkinson's Disease. Approve for 1 year if the patient meets all of the following criteria (A, B, C, and D):
- **A)** Patient is experiencing "off" episodes such as muscle stiffness, slow movements, or difficulty starting movements; AND
- **B)** Patient is currently receiving carbidopa/levodopa therapy; AND
- **C)** Patient has tried one of the oral selegiline tablets, selegiline capsules, or rasagiline tablets and meets ONE of the following criteria (i or ii):
  - **i.** Patient had significant intolerance, according to the prescriber; OR
  - **ii.** Patient has difficulty swallowing tablets or capsules; AND
- **D)** Zelapar is being prescribed by, or in consultation with, a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Zelapar is not recommended in the following situations:

239. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Parkinson's Disease – Kynmobi Prior Authorization Policy

- Kynmobi™ (apomorphine sublingual film – Sunovion Pharmaceuticals)

REVIEW DATE: 07/15/2020; selected revision 08/19/2020; selected revision 10/21/2020

OVERVIEW

Kynmobi, a non-ergoline dopamine agonist, is indicated for the acute, intermittent treatment of "off" episodes in patients with Parkinson's disease.[1]

Guidelines

The American Academy of Neurology published guidelines in 2006 on the treatment of Parkinson's disease with motor fluctuations and dyskinesia.[2] The guidelines are dated and do not include more recently approved medications, including Kynmobi. It is recommended to offer entacapone and rasagiline to reduce "off" time (Level A). Pergolide (withdrawn from the market in 2007 due to risk of valvular fibrosis), pramipexole, ropinirole, and tolcapone (used with caution; requires monitoring for hepatotoxicity) should be considered to reduce "off" time (Level B). Apokyn® (apomorphine hydrochloride injection), cabergoline, and selegiline may be used to reduce "off" time (Level C). According to the guidelines, the available evidence does not establish superiority of one medication over another in reducing "off" time (Level B). Sustained-release levodopa/carbidopa and bromocriptine should not be considered to reduce "off" time (Level C). Amantadine may be used to reduce dyskinesia (Level C).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Kynmobi. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Kynmobi as well as the monitoring required for adverse events and long-term efficacy, approval requires Kynmobi to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Kynmobi is recommended in those who meet the following criteria:

FDA-Approved Indications

249. Parkinson's Disease. Approve for 1 year if the patient meets all of the following criteria (A, B, C, and D):

A) Patient is experiencing "off" episodes such as muscle stiffness, slow movements, or difficulty starting movements; AND

B) Patient is currently receiving carbidopa/levodopa therapy; AND

C) Patient has previously tried one other treatment for "off" episodes and meets ONE of the following criteria (i or ii):

i. Patient had significant intolerance, according to the prescriber; OR

ii. Patient had inadequate efficacy, according to the prescriber; AND

Note: Examples of treatment for "off" episodes include entacapone, rasagiline, pramipexole, ropinirole, tolcapone, cabergoline, Ongentys, selegiline, Xadago.

D) Kynmobi is prescribed by or in consultation with a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Kynmobi is not recommended in the following situations:

240. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Parkinson's Disease – Ongentys Prior Authorization Policy

- Ongentys® (opicapone capsules – Neurocrine Biosciences)

REVIEW DATE: 07/15/2020; selected revision 08/19/2020

OVERVIEW

Ongentys, a peripheral, selective and reversible catechol-o-methyltransferase inhibitor, is indicated for adjunctive treatment to levodopa/carbidopa in patients with Parkinson's disease experiencing "off" episodes.[1]

Guidelines

The American Academy of Neurology published guidelines in 2006 on the treatment of Parkinson's disease with motor fluctuations and dyskinesia.[2] The guidelines are dated and do not include more recently approved medications, including Ongentys. It is recommended to offer entacapone and rasagiline to reduce "off" time (Level A). Pergolide (withdrawn from the market in 2007 due to risk of valvular fibrosis), pramipexole, ropinirole, and tolcapone (used with caution; requires monitoring for hepatotoxicity) should be considered to reduce "off" time (Level B). Apokyn® (apomorphine hydrochloride injection), cabergoline, and selegiline may be used to reduce "off" time (Level C). According to the guidelines, the available evidence does not establish superiority of one medication over another in reducing "off" time (Level B). Sustained-release levodopa/carbidopa and bromocriptine should not be considered to reduce "off" time (Level C). Amantadine may be used to reduce dyskinesia (Level C).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Ongentys. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Ongentys as well as the monitoring required for adverse events and long-term efficacy, approval requires Ongentys to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Ongentys is recommended in those who meet the following criteria:

FDA-Approved Indications

250. Parkinson's Disease. Approve for 1 year if the patient meets all of the following criteria (A, B, and C):
- **A)** Patient is currently receiving carbidopa/levodopa therapy; AND
- **B)** Patient meets ONE of the following criteria (i or ii):
  - **i.** Patient has tried an entacapone product and meets ONE of the following criteria (a or b):
    - **a)** Patient had significant intolerance, according to the prescriber; OR
    - **b)** Patient had inadequate efficacy, according to the prescriber; OR
  - **ii.** Patient is currently receiving Ongentys; AND
- **C)** Ongentys is prescribed by or in consultation with a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Ongentys is not recommended in the following situations:

241. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

HISTORY

Type of Revision	Summary of Changes	Review Date
New Policy	--	07/15/2020
Selected Revision	**Parkinson's Disease.** For patients currently receiving Ongentys therapy, criteria was added to allow for continuation without trial of entacapone. For patients with a trial of entacapone, wording of "unacceptable tolerability" was changed to "significant intolerance" and "could not achieve adequate benefit" was changed to "had inadequate efficacy".	08/19/2020

PRIOR AUTHORIZATION POLICY

POLICY: Pegylated Interferons
- Pegasys® (peginterferon alfa-2a injection for subcutaneous use – Hoffman-La Roche/Genentech)
- PegIntron® (peginterferon alfa-2b injection for subcutaneous use – Schering)

TAC APPROVAL DATE: 08/28/2019

OVERVIEW

Pegasys and PegIntron are pegylated interferons (peginterferons) indicated for the treatment of chronic hepatitis C virus (HCV) infection in adults and children.[1-2] The standard of care in hepatitis C is rapidly evolving and the place in therapy for peginterferon very small. The approval of direct-acting antiviral agents (DAAs) has eliminated the need for peginterferon in the majority of patients. Because none of the DAAs are indicated in pediatric patients, peginterferons still have a role in the treatment of pediatric patients

with HCV. In the past, the standard of care for patients with HCV consisted of peginterferon and ribavirin (PR) generally administered for 24 to 48 weeks depending on patient factors and genotype.

Clinical Efficacy Data

The clinical efficacy of peginterferon(in combination with ribavirin) has been demonstrated in a variety of clinical settings: treatment-naïve patients, patients previously treated with peginterferon or interferon for hepatitis C, pediatric patients with hepatitis C, and in other special populations including patients with human immunodeficiency virus (HIV) co-infection, cirrhosis/fibrosis, and in patients slow to respond to therapy. In addition, the peginterferons have also been studied in combination with the DAAs (these studies are detailed in the *Hepatitis C Direct-Acting Antiviral Therapy Class Summary*).

None of the DAAs are indicated in pediatric patients < 18 years of age. Pegasys (alone or in combination with ribavirin) and PegIntron (in combination with ribavirin) are indicated for the treatment of chronic HCV in patients ≥ 5 years and ≥ 3 years of age, respectively with compensated liver disease previously untreated with interferon alfa.[1-2] Limited data are available for retreatment in children.

Guidelines

For a summary of American Association for the Study of Liver Diseases (AASLD) guidelines please see *Hepatitis C Direct-Acting Antiviral Therapy Class Summary*. In summary, peginterferons are no longer recommended.[3]

The North American Society for Pediatric Gastroenterology, Hepatology and Nutrition (NASPGHAN) practice guidelines for the diagnosis and management of hepatitis C infection in infants, children and adolescents (2012) recommend that children with hepatitis C who demonstrate persistently elevated serum aminotransferases or those with progressive disease (i.e., liver fibrosis) should be considered for treatment.[4] The NASPGHAN guidelines state that the recommended therapy for children ages 3 to 17 years of age is with PR. The recommended length of therapy is 48 weeks for children with genotype 1 or 4 CHC and 24 weeks for genotype 2 or 3 CHC. In children and adolescents, NASPGHAN recognizes that although rare in children, pediatric liver transplant recipients for end-stage liver disease (ESLD) due to chronic HCV demonstrate allograft survival rates of 72% and 55%, respectively, at 5 years.[4] Following re-transplantation, these rates decrease to 55% and 34%, respectively. The risk of HCV recurrence in pediatric orthotopic liver transplant recipients is high and is associated with a high rate of re-transplantation. If a decision is made to treat pediatric liver transplant recipients, very close monitoring is warranted.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Pegasys and PegIntron (collectively referred to as "peginterferons" in these criteria) for HCV infection. The intent of this policy is to provide recommendations for use in hepatitis C *only*. Because of the specialized skills required for evaluation and diagnosis of patients treated with the peginterferons as well as the monitoring required for adverse events (AEs) and efficacy, approval requires peginterferons to be prescribed by or in consultation with a gastroenterologist, hepatologist, infectious diseases physician, or liver transplant physician. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Pegasys and PegIntron ("peginterferon[s]") is recommended in patients who meet one of the criteria below (1 through 6).

FDA-Approved Indications

1. **Chronic Hepatitis C Virus (HCV) Genotype 1, 2, 3, 4, 5, or 6.** Approve peginterferon for up to 48 weeks in patients who meet ALL of the following criteria (A, B, and C):
   A) The patient is ≥ 2 years of age; AND
   B) Peginterferon is prescribed by or in consultation with a gastroenterologist, hepatologist, infectious diseases physician, or liver transplant physician; AND
   C) Peginterferon is prescribed in combination with ribavirin.

Other Uses with Supportive Evidence (in the Treatment of Hepatitis C)

2. **Recurrent Hepatitis C Virus (HCV) Post-Liver Transplantation, Pediatric and Adolescent (≥ 2 years and ≤ 17 years of age).** Approve peginterferon for 48 weeks in patients who meet ALL of the following criteria (A, B, and C):
   A) The patient is ≥ 2 years of age and < 17 years of age; AND
   B) Peginterferon is prescribed by or in consultation with one of the following prescribers who is affiliated with a transplant center: a gastroenterologist, hepatologist, infectious diseases physician, or liver transplant physician; AND
   C) Peginterferon is prescribed in combination with ribavirin unless there is a contraindication or intolerance to ribavirin according to the prescribing physician.

   In the opinion of specialist physicians reviewing the data, we have adopted these criteria.

3. **Chronic Hepatitis C Virus (HCV) – Awaiting Liver Transplantation, Any Viral Genotype - Pediatric and Adolescents (≥ 2 years and ≤ 17 years of age).** Approve peginterferon for 12 months in patients who meet ALL of the following criteria (A, B, and C).
   A) The patient is ≥ 2 years of age and ≤ 17 years of age; AND
   B) Peginterferon is prescribed by or in consultation with one of the following prescribers who is affiliated with a liver transplant center: a gastroenterologist, hepatologist, infectious diseases physician, or liver transplant physician; AND
   C) Peginterferon is prescribed in combination with ribavirin unless there is a contraindication or intolerance to ribavirin according to the prescribing physician.

4. **Patient has Been Started on Pegasys.** Approve for an indication or condition addressed as an approval in the Recommended Authorization Criteria section (FDA-Approved Indications or Other Uses with Supportive Evidence). Authorization duration will vary based on the indication but should not exceed a total duration of 12 months.

5. **Patient has Been Started on PegIntron.** Approve for an indication or condition addressed as an approval in the Recommended Authorization Criteria section (FDA-Approved Indications or Other Uses with Supportive Evidence). Authorization duration will vary based on the indication but should not exceed a total duration of 12 months.

6. **Indications other than Hepatitis C.** Approve for 12 months. Pegasys and PegIntron have been used for many off-label indications in adults and for few indications in children.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

The peginterferons have not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

1. **Hepatitis C Virus (HCV), Maintenance Therapy.** Evidence does not support use. Major published trials have failed to demonstrate a consistent benefit of maintenance therapy in the prevention of hepatocellular carcinoma (HCC).[3-7]

   In the opinion of a specialist physician reviewing the data, we have adopted this criterion.

2. **Life Expectancy < 12 Months Due to Non-Liver Related Co-Morbidities.** Patients with a limited life expectancy that cannot be remediated by HCV treatment, liver transplantation, or another directed therapy do not require antiviral treatment.[3] Patients with a short life expectancy owing to liver disease should be managed in consultation with an expert. Little evidence exists to support initiation of HCV treatment in patients with a limited life expectancy (< 12 months) owing to non-liver-related comorbid conditions. For these patients, the benefits of HCV treatment are unlikely to be realized and palliative care strategies should take precedence.

History

Type of Revision	Summary of Changes*	TAC Approval Date
Itegrated Policy	--	06/12/2012
Selected Revision	--	08/29/2012
Annual Revision	--	06/05/2013
Annual Revision	1. Genotype 1,4,5,6**:** Reference to "treatment-naïve" was removed; the "note" that a Week 12 titer is needed to determine therapy beyond 48 weeks was removed; a liver transplant physician was added to the list of prescribers. 2. Genotype 2, 3: Reference to "treatment-naïve" was removed; a liver transplant physician was added to the list of prescribers; a 48-week approval was removed for patients with HBV co-infection, HIV co-infection, and genotype 3 with high viral load or fibrosis/cirrhosis. 3. Retreatment: This indication was removed and these patients are encompassed in criteria based on genotype (note: patients with genotype 2, 3 no longer are approved for 48 weeks for re-treatment). 4. Extending therapy for 72 weeks (Genotype 1, 4, 5, 6): This indication was removed. Acute Hepatitis C: A liver transplant physician was added to the list of prescribers. 5. Recurrent HCV: "or in consultation with one of the following prescribers who is affiliated with a transplant center" was added; the requirement for patients to have grade 2 fibrosis or greater was removed. 6. Patients awaiting liver transplant: "or in consultation with one of the following prescribers who is affiliated with a transplant center" was added. 7. Patients already started on Pegasys or PegIntron. The authorization was changed not to exceed 48 weeks (previously 72 weeks).	06/25/2014
Selected revision	Limitations on who to treat were added to the following approval indications: Genotype 1, 2, 3, 4, 5, and 6 CHC adults. Criteria for children 2 through 17 years of age are addressed separately. Exclusion criteria were added for patients with life expectancy < 12 months due to a non-liver related cause.	09/10/2014
Annual revision	1. Chronic Hepatitis C (CHC) Genotype 1, 4, 5, or 6 Chronic Hepatitis C (CHC) – Adults (≥ 18 years of age). -Patients with genotype 1 CHC taking pegylated interferon in combination with Olysio: The approval duration is 48 weeks for prior null or partial responders and 24 weeks for treatment-naïve or relapse patients. -Patients with genotype 1, 4, 5, or 6 CHC taking pegylated interferon in combination with Sovaldi. The approval duration is 12 weeks. -The exception to using ribavirin in combination with pegylated interferon in patients with a contraindication or intolerance to ribavirin according to the prescribing physician was removed from the criteria. 2. CHC Genotype 2 or 3 – Adults (≥ 18 years of age). The approval duration was changed to 12 weeks. A requirement was added that patients take pegylated interferon with Sovaldi and ribavirin (previously ribavirin only), and criteria allowing exceptions for using ribavirin were removed. 3. Acute Hepatitis C (i.e., Infection within 6 Months of Exposure). The timeframe patients must wait prior to treatment to allow for spontaneous resolution was changed to 12 weeks (previously 8 weeks). 4. Recurrent HCV Post-Liver Transplantation, Any Viral Genotype. This indication was changed to "Recurrent HCV Post-Liver Transplantation", "any viral genotype" was removed. For patients ≥	07/15/2015

	18 years of age, this indication is only approved for genotypes 5 and 6 (previously all genotypes were approved). For patients ≥ 2 years of age and ≤ 17 years of age, any viral genotype continues to be approved. 5. CHC – Awaiting Liver Transplantation, Any Viral Genotype. This indication was modified to "CHC – Awaiting Liver Transplantation, Any Viral Genotype - Pediatric and Adolescents (≥ 2 years and ≤ 17 years of age)". The criterion for age was changed to only approve in patients ≥ 2 years and ≤ 17 years of age.	
Annual revision	Genotype 1, 4, 5, or 6 chronic HCV, adults: -Added genotype 2 or 3 chronic HCV to this indication (previously, this was a separate indication). -Approval duration changed from 12 to 48 weeks to up to 48 weeks. -Age requirement changed from ≥ 18 years to ≥ 2 years of age. -Requirement for Metavir score F3/F4 or exceptions to Metavir score removed. -Requirement for concomitant therapy (Olysio or Sovaldi) removed from the policy. Genotype 1, 4, 5, or 6 chronic HCV, pediatric and adolescent: -This indication was combined with the prior adult indication (as detailed above). Genotype 2 or 3 chronic HCV, adults: -This indication was combined with genotype 1, 4, 5, and 6 chronic HCV (see above). -Approval duration changed from 12 weeks to up to 48 weeks. -Age requirement changed from ≥ 18 years to ≥ 2 years of age. -Requirement for Metavir score F3/F4 or exceptions to Metavir score removed. Genotype 2 or 3 chronic HCV, pediatric and adolescent: -This indication was combined with genotype 1, 4, 5, and 6 chronic HCV (see above). -Approval duration changed from 24 or 48 weeks to up to 48 weeks. Acute Hepatitis C: - This indication was removed from the policy.	08/10/2016
Annual Revision	No criteria changes	08/16/2017
Annual Revision	Recurrent Hepatitis C Virus (HCV) Post-Liver Transplantation: Criteria to approve in adults with genotypes 5 and 6 were removed.	08/15/2018

TAC – Therapeutic Assessment Committee; DEU – Drug Evaluation Unit; * For a further summary of criteria changes, refer to respective TAC minutes available at: http://esidepartments/sites/Dep043/Committees/TAC/Forms/AllItems.aspx; HIV – Human immunodeficiency virus; HBV – Hepatitis B virus; HCV – Hepatitis C virus.

POLICY: Pegylated Interferons Prior Authorization Policy

- Pegasys® (peginterferon alfa-2a injection for subcutaneous use – Hoffman-La Roche/Genentech)
- PegIntron® (peginterferon alfa-2b injection for subcutaneous use – Schering)

REVIEW DATE: 10/14/2020

OVERVIEW

Pegasys and PegIntron are pegylated interferons (peginterferons) indicated for the treatment of chronic hepatitis C virus (HCV) infection in adults and children.[1-2] Pegasys (alone or in combination with ribavirin)

and PegIntron (in combination with ribavirin) are indicated for the treatment of chronic HCV in patients ≥ 5 years of age and ≥ 3 years of age, respectively, with compensated liver disease previously untreated with interferon alfa. In the past, the standard of care for patients with HCV consisted of peginterferon and ribavirin generally administered for 24 to 48 weeks depending on patient factors and genotype. However, with the approval of direct-acting antivirals, pegylated interferons no longer have a role in the management of HCV for adults or pediatric patients.

Guidelines

Peginterferons are no longer addressed by the American Association for the Study of Liver Diseases recommendations for testing, managing, and treating HCV.[3] Further, direct-acting antiviral treatment with an approved regimen is recommended for all children and adolescents with HCV infection ≥ 3 years of age as they will benefit from antiviral therapy, regardless of disease severity.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Pegasys and PegIntron (collectively referred to as "peginterferons" in these criteria) for HCV infection. The intent of this policy is to provide recommendations for use in **hepatitis C *only***. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with the peginterferons as well as the monitoring required for adverse events AEs and efficacy, approval requires peginterferons to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Pegasys and PegIntron (peginterferon[s]) is recommended in those who meet the following criteria:

FDA-Approved Indications

251. Chronic Hepatitis C Virus (HCV) Genotype 1, 2, 3, 4, 5, or 6. Approve for up to 48 weeks in patients who meet all of the following criteria (A, B, and C):
- **A)** Patient is ≥ 2 years of age; AND
- **B)** The medication is prescribed in combination with ribavirin; AND
- **C)** The medication is prescribed by or in consultation with a gastroenterologist, hepatologist, infectious diseases physician, or liver transplant physician.

Other Uses with Supportive Evidence (in the Treatment of Hepatitis C)

252. Recurrent Hepatitis C Virus (HCV) Post-Liver Transplantation, Pediatric and Adolescent (≥ 2 Years and ≤ 17 Years of Age). Approve for 48 weeks in patients who meet all of the following criteria (A, B, and C):
- **A)** Patient is ≥ 2 years of age and < 17 years of age; AND
- **B)** The medication is prescribed in combination with ribavirin unless there is a contraindication or intolerance to ribavirin according to the prescriber; AND
- **C)** The medication is prescribed by or in consultation with one of the following prescribers who is affiliated with a transplant center: a gastroenterologist, hepatologist, infectious diseases physician, or liver transplant physician.

253. Chronic Hepatitis C Virus (HCV) – Awaiting Liver Transplantation, Any Viral Genotype - Pediatric and Adolescents (≥ 2 years and ≤ 17 years of age). Approve for 12 months in patients who meet all of the following criteria (A, B, and C):
- **A)** Patient is ≥ 2 years of age and ≤ 17 years of age; AND

B) The medication is prescribed in combination with ribavirin unless there is a contraindication or intolerance to ribavirin according to the prescriber; AND

C) The medication is prescribed by or in consultation with one of the following prescribers who is affiliated with a liver transplant center: a gastroenterologist, hepatologist, infectious diseases physician, or liver transplant physician.

254. Patient has Been Started on Pegasys. Approve for an indication or condition addressed as an approval in the Recommended Authorization Criteria section (FDA-Approved Indications or Other Uses with Supportive Evidence). Authorization duration will vary based on the indication but should not exceed a total duration of 12 months.

255. Patient has Been Started on PegIntron. Approve for an indication or condition addressed as an approval in the Recommended Authorization Criteria section (FDA-Approved Indications or Other Uses with Supportive Evidence). Authorization duration will vary based on the indication but should not exceed a total duration of 12 months.

256. Indications Other Than Hepatitis C. Approve for 12 months. Pegasys and PegIntron have been used for many off-label indications in adults and for few indications in children.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Pegasys and PegIntron (peginterferon[s]) is not recommended in the following situations:

1. **Hepatitis C Virus (HCV), Maintenance Therapy.** Evidence does not support use. Major published trials have failed to demonstrate a consistent benefit of maintenance therapy in the prevention of hepatocellular carcinoma (HCC).[3-7]

2. **Life Expectancy < 12 Months Due to Non-Liver Related Co-Morbidities.** Patients with a limited life expectancy that cannot be remediated by HCV treatment, liver transplantation, or another directed therapy do not require antiviral treatment.[3] Patients with a short life expectancy owing to liver disease should be managed in consultation with an expert. Little evidence exists to support initiation of HCV treatment in patients with a limited life expectancy (< 12 months) owing to non-liver-related comorbid conditions. For these patients, the benefits of HCV treatment are unlikely to be realized and palliative care strategies should take precedence.

3. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Phenylketonuria – Kuvan® (sapropterin dihydrochloride tablets and powder for oral solution – BioMarin Pharmaceuticals) Prior Authorization Policy

REVIEW DATE: 06/17/2020

OVERVIEW

Kuvan is indicated to reduce blood phenylalanine (Phe) levels in patients with hyperphenylalaninemia (HPA) due to tetrahydrobiopterin-(BH4) responsive phenylketonuria (PKU).[1] The medication should be used with a Phe-restricted diet. Kuvan works by increasing phenylalanine hydroxylase (PAH). It is a synthetic preparation of naturally occurring BH4, which is a cofactor for the enzyme PAH. PAH hydroxylates Phe in an oxidative reaction to form tyrosine. In patients with PKU, PAH activity is deficient or absent. Treatment with BH4 can activate residual PAH enzyme, improve the normal oxidative metabolism of Phe, and decrease Phe levels in some patients.

PKU is the most prevalent disorder due to an inborn error in amino acid metabolism.[3] It is caused by mutations in the PAH gene.[3] The annual incidence is about 1:15,000 births in the US. Genotypes of the disease range from a mild increase in blood Phe concentrations to a severe classic phenotype with very pronounced increases in HPA, which if not treated, can result in profound and irreversible mental disability.[3] Dietary restrictions in Phe are a mainstay in PKU management. Patients with PKU have to intake Phe-free formula and avoid foods that are protein-rich (e.g., meats, fish, eggs, standard bread, most cheeses, nuts and seeds). Other foods and beverages that contain aspartame, flour, soy, beer, or cream should be avoided. Low-protein foods that are natural may be consumed in restricted amounts, such as potatoes, some vegetables, and most cereals. During infancy, adherence to dietary restrictions is more manageable but as children grow older and become adults the dietary limitations can become burdensome.

Dose Titration

In patients with PKU who are responsive to treatment, blood Phe levels decrease within 24 hours after administration, although maximal effect on Phe levels may take up to 1 month. Blood Phe levels should be checked after 1 week of treatment and periodically for 1 month. If blood Phe does not decrease from baseline at the 10 mg/kg/day dose, the dose may be increased to 20 mg/kg/day. Patients whose blood Phe does not decrease after 1 month of treatment at 20 mg/kg/day are non-responders and treatment with Kuvan should be discontinued. Once responsiveness has been determined, the dose may be adjusted within the range of 5 to 20 mg/kg/day.

Guidelines/Recommendations

According to the European guidelines for phenylketonuria (2017), there is consensus in the literature that patients with blood phenylalanine concentration > 600 µmol/L should be treated.[8] There is also consensus that patients with blood Phe concentration < 360 µmol/L can remain untreated, but should be monitored.

Patients with blood Phe concentration between 360 to 600 µmol/L should be treated until 12 years of age. Treatment for life is recommended for any patient with PKU; however, it is also noted that patients ≥ 12 years of age with blood Phe concentration < 600 µmol/L do not require treatment. All adults with PKU should have lifelong systematic follow-ups in specialized metabolic centers, due to specific risks which may occur during adulthood. With regards to target Phe levels, in treated PKU patients up to 12 years of age, the target Phe levels should be 120 to 360 µmol/L; in treated PKU patients ≥ 12 years of age, the target Phe levels should be 120 to 600 µmol/L.

The American College of Medical Genetics and Genomics (ACMG) published practice guidelines (2014) for the diagnosis and management of PAH deficiency.[9] The guidelines recommend initiating treatment as early as possible, preferably within the first week of life with a goal of having blood Phe levels in the treatment range within the first 2 weeks. Dietary restriction of Phe intake is the mainstay of therapy for PKU. Blood Phe levels in all patients should be maintained in the range of 120 to 360 µmol/L. Newly diagnosed infants should be monitored at least weekly for their levels at least until 1 year of age. For children 1 through 12 years of age, biweekly to monthly monitoring of levels is adequate and for adolescents and adults who are stable and well-controlled, monthly testing is usually adequate. The guidelines state that approximately 25% to 50% of patients with PAH deficiency are responsive to Kuvan. A significant decline in blood Phe level is expected in responders once treatment is initiated (with Phe-restricted diet); however, patients in the lower end of the treatment range (≤ 180 µmol/L) rarely show a decrease in blood Phe level even if they are responsive to Kuvan. In these patients, responsiveness is determined by adding Phe to the diet in a stepwise method. An improvement in neuropsychiatric symptoms or increase in Phe tolerance without a decrease in blood Phe levels is sufficient reasoning to continue therapy. According to the guidelines, there is strong evidence to support life-long treatment and maintenance of metabolic control in patients with PAH deficiency.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Kuvan tablets and powder for oral solution. Because of the specialized skills required for evaluation and diagnosis of patients treated with Kuvan as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Kuvan to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for 1 year in duration unless otherwise noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Kuvan tablets or Kuvan powder for oral solution is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Phenylketonuria.** Approve for the duration noted if the patient meets the following criteria (A or B):
   - **A)** Initial Therapy: Approve for 12 weeks if the patient meets the following criteria (i and ii):
     - **i.** Kuvan is prescribed in conjunction with a phenylalanine (Phe)-restricted diet; AND
     - **ii.** The medication is prescribed by or in consultation with a metabolic disease specialist (or specialist who focuses in the treatment of metabolic diseases).
   - **B)** Patients Continuing Therapy: Approve for 1 year if the patient meets the following criteria (i and ii):

     Note: Patients who have received < 12 weeks of therapy or those who are restarting therapy with Kuvan should be considered under criterion 1A (Phenylketonuria – Initial Therapy).

i. The patient meets one of the following (a, b, or c):
   a) The patient has had a clinical response (e.g., cognitive and/or behavioral improvements) as determined by the prescriber; OR
   b) The patient has achieved a ≥ 20% reduction in blood phenylalanine concentration from pre-treatment baseline (i.e., blood phenylalanine concentration before starting Kuvan therapy); OR
   c) Treatment with Kuvan has resulted in an increase in dietary phenylalanine tolerance, according to the prescriber; AND

ii. The patient is not receiving concomitant Palynziq.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Kuvan has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

12. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual revision	No criteria changes	04/25/2018
Selected revision	Added "[Maintenance Therapy]" qualifier to patients continuing Kuvan indication. Added "pre-treatment" before baseline in patients continuing therapy criteria. Also defined pre-treatment baseline as prior to starting Kuvan therapy. Under Conditions Not Recommended for Approval, added concomitant therapy with Palynziq and Kuvan.	05/30/2018
Annual revision	No criteria changes	05/15/2019
Annual revision	**Phenylketonuria – Initial Therapy:** The approval condition was re-worded as listed; previously this was titled "Hyperphenylalaninemia due to Phenylketonuria – Initial Therapy".	06/17/2020

	Phenylketonuria – Patients Continuing Therapy: The approval condition was re-worded as listed; previously this was titled "Hyperphenylalaninemia due to Phenylketonuria – Patients Continuing Therapy (Maintenance Therapy)". A note was added that patients who have received less than 12 weeks of Kuvan or who are restarting Kuvan should refer to Initial Therapy criteria. "Prescribing physician" was updated to "prescriber" throughout criteria. A criterion was added allowing continued use of Kuvan if treatment with Kuvan has resulted in an increase in dietary phenylalanine concentration, according to the prescriber. Additionally, a criterion was added that concomitant use of Palynziq is not permitted (previously this was addressed under Conditions Not Recommended for Approval). **Concomitant Therapy with Kuvan and Palynziq® (pegvaliase-pqpz for injection):** Removed from policy. This is now addressed in criteria under the approval condition of "Phenylketonuia – Patients Continuing Therapy".	

PRIOR AUTHORIZATION POLICY

POLICY: Phenylketonuria – Palynziq® (pegvaliase-pqpz injection for subcutaneous use – BioMarin Pharmaceuticals) Prior Authorization Policy

REVIEW DATE: 06/17/2020

OVERVIEW

Palynziq is indicated to reduce blood phenylalanine concentrations in adult patients with phenylketonuria (PKU) who have uncontrolled blood phenylalanine concentrations greater than 600 micromol/L (µmol/L) on existing management.[1] Treatment with Palynziq should be managed by a healthcare provider experienced in the management of PKU. Baseline blood phenylalanine concentrations should be obtained before initiating treatment.

Dose Titration

Palynziq is titrated up over a period of 9 weeks to the maintenance dose of 20 mg administered subcutaneously (SC) once daily (QD). Therapeutic response may not be achieved until the patient is titrated to an effective maintenance dosage. Palynziq 20 mg SC QD should be maintained for at least 24 weeks. The dose can be increased to a maximum dose of Palynziq 40 mg SC QD in patients who have been maintained continuously on the 20 mg QD dose for at least 24 weeks and who have not achieved either a 20% reduction in blood phenylalanine concentration from pre-treatment baseline levels or a blood phenylalanine concentration ≤ 600 µmol/L. Palynziq should be discontinued in patients who have not achieved a response after 16 weeks of continuous treatment with the maximum dosage of 40 mg QD. In patients who experience blood phenylalanine concentrations < 30 µmol/L during the titration and maintenance phase, the dosage of Palynziq may be reduced and/or dietary protein and phenylalanine intake may be modified to maintain phenylalanine levels within a clinically acceptable range and above 30 µmol/L. Because of the risk of anaphylaxis Palynziq is available only through a restricted Risk Evaluation and Mitigation Strategy (REMS) program. It was unclear from the Palynziq clinical trials if all patients had tried and were non-responders to Kuvan.

Guidelines/Recommendations

The American College of Medical Genetics and Genomics (ACMG) published practice guidelines (2014) for the diagnosis and management of phenylalanine hydroxylase (PAH) deficiency.[2] The guidelines recommend initiating treatment as early as possible, preferably within the first week of life. Dietary restriction of phenylalanine intake is the mainstay of therapy for PKU. Blood phenylalanine levels in all

patients should be maintained in the range of 120 to 360 µmol/L. The guidelines state that approximately 25% to 50% of patients with PAH deficiency are responsive to Kuvan™ (sapropterin dihydrochloride tablets and powder for oral solution). A significant decline in blood phenylalanine level is expected in responders once treatment is initiated (with phenylalanine-restricted diet). An improvement in neuropsychiatric symptoms or increase in phenylalanine tolerance without a decrease in blood levels is sufficient reasoning to continue therapy. According to the guidelines, there is strong evidence to support life-long treatment and maintenance of metabolic control in patients with PAH deficiency.

According to the European guidelines for phenylketonuria (2017), there is consensus in the literature that patients with blood phenylalanine concentration > 600 µmol/L should be treated.[3] There is also consensus that patients with blood Phe concentration < 360 µmol/L can remain untreated, but should be monitored. Patients with blood Phe concentration between 360 to 600 µmol/L should be treated until 12 years of age. Treatment for life is recommended for any patient with PKU; however, it is also noted that patients ≥ 12 years of age with blood Phe concentration < 600 µmol/L do not require treatment. All adults with PKU should have lifelong systematic follow-ups in specialized metabolic centers, due to specific risks which may occur during adulthood. With regards to target Phe levels, in treated PKU patients up to 12 years of age, the target Phe levels should be 120 to 360 µmol/L; in treated PKU patients ≥ 12 years of age, the target Phe levels should be 120 to 600 µmol/L.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Palynziq. Because of the specialized skills required for evaluation and diagnosis of patients treated with Palynziq as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Palynziq to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for 1 year in duration unless otherwise noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Palynziq is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Phenylketonuria.** Approve for the duration noted if the patient meets one of the following (A or B):
   - **A)** Initial Therapy: Approve for 1 year if the patient meets the following criteria (i, ii, and iii):
     - **i.** The patient is ≥ 18 years of age; AND
     - **ii.** The patient has uncontrolled blood phenylalanine concentrations greater than 600 micromol/L on at least one existing treatment modality; AND
       Note: Examples of treatment modalities include restriction of dietary phenylalanine and protein intake and prior treatment with Kuvan (sapropterin dihydrochloride tablets and powder for oral solution).
     - **iii.** The medication is prescribed by or in consultation with a metabolic disease specialist (or specialist who focuses in the treatment of metabolic diseases).
   - **B)** Patients Continuing Therapy: Approve for 1 year if the patient meets the following criteria (i, ii, and iii):
     Note: Patients who have received < 1 year of therapy or those who are restarting therapy with Palynziq should be considered under criterion 1 (Phenylketonuria – Initial Therapy).

i. The patient is ≥ 18 years of age; AND

ii. The patient meets one of the following (a or b):

a) The patient's blood phenylalanine concentration is ≤ 600 micromol/L; OR

b) The patient has achieved a ≥ 20% reduction in blood phenylalanine concentration from pre-treatment baseline (i.e., blood phenylalanine concentration before starting Palynziq therapy); AND

iii. The patient is not receiving concomitant therapy with sapropterin dihydrochloride (Kuvan).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Palynziq has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

13. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
New Policy	New criteria	05/30/2018
Annual revision	No criteria changes	05/15/2019
Annual revision	**Phenylketonuria – Initial Therapy:** The phrase "in adults" was removed from the approval condition; instead, a criterion was added to verify that the patient is ≥ 18 years of age. Examples of prior treatment modalities were moved to a note. **Phenylketonuria – Patients Continuing Therapy:** The phrase "in adults" was removed from the approval condition and moved into criteria as ≥ 18 years of age. Additionally, "[Maintenance therapy]" was removed from the approval condition; this is not needed. A note was added that patients who have received less than 1 year of Palynziq or who are restarting Palynziq should refer to Initial Therapy criteria. A criterion was added that concomitant use of Kuvan is not permitted (previously this was addressed under Conditions Not Recommended for Approval). **Concomitant Therapy with Palynziq and Kuvan:** Removed from policy. This is now addressed in criteria under the approval condition of "Phenylketonuia – Patients Continuing Therapy".	06/17/2020

PRIOR AUTHORIZATION POLICY

POLICY: Pheochromocytoma – Metyrosine Capsules and Phenoxybenzamine Capsules Prior Authorization Policy

- Metyrosine Capsules (Demser®, generics – Bausch Health, generics)

- Phenoxybenzamine capsules (Dibenzyline® – Concordia Pharmaceuticals, generics)

REVIEW DATE: 09/09/2020

OVERVIEW

Metyrosine capsules, a tyrosine hydroxylate inhibitor, is indicated for the treatment of patients with pheochromocytoma for:[1]

- **Preoperative preparation of patients for surgery**.
- **Management of patients when surgery is contraindicated**.
- **Chronic treatment of patients with malignant pheochromocytoma**.

Phenoxybenzamine capsules, a long-acting, adrenergic, alpha-receptor blocking agent, is indicated for the treatment of pheochromocytoma to control episodes of hypertension and sweating. If tachycardia is excessive, it may be necessary to use a beta-blocking agent concomitantly.[2]

Guidelines

A clinical practice guideline was published in 2014 from the Endocrine Society regarding from pheochromocytoma and paraganglioma.[3] The guidelines recommend preoperative alpha$_1$-adrenergic receptor blockers as the first choice to control blood pressure and prevent a hypertensive crisis. Both selective and non-selective alpha-blockers have been used (e.g., phenoxybenzamine, doxazosin, prazosin, and terazosin). Calcium channel blockers are the most often used add-on drug class to further improve blood pressure control in patients already treated with alpha-adrenergic receptor blockers. Preoperative co-administration of beta-adrenergic receptor blockers (e.g., atenolol, metoprolol, and propranolol) is utilized to control tachycardia after administration of alpha-adrenergic receptor blockers. Demser may be used in combination with alpha-adrenergic receptor blockers for a short period before surgery to further stabilize blood pressure to reduce blood loss and volume depletion during surgery.

The National Comprehensive Cancer Network (NCCN) guidelines for Neuroendocrine and Adrenal Tumors (version 2.2020 – July 24, 2020) address pheochromocytoma and paragangliomas.[4] Alpha blockade (e.g., terazosin, doxazosin, and prazosin) is recommended first-line for all hormonally-secreting pheochromocytomas and paragangliomas. After alpha blockade, if additional blood pressure support is required, the additional of dihydropyridine calcium channel blockers can be considered. Metyrosine can be used in addition to alpha blockage to stabilize blood pressure.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of metyrosine and phenoxybenzamine. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with metyrosine and phenoxybenzamine as well as the monitoring required for adverse events and long-term efficacy, approval requires metyrosine and phenoxybenzamine to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

Documentation: Documentation will be required where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes, prescription claims records, and prescription receipts.

RECOMMENDED AUTHORIZATION CRITERIA

FDA-Approved Indications

I. Coverage of phenoxybenzamine is recommended in those who meet the following criteria:

3. Pheochromocytoma. Approve phenoxybenzamine for 1 year if the patient meets the following criteria (A and B):

H) If brand Dibenzyline is requested, patient has tried AND cannot take generic phenoxybenzamine due to a formulation difference in the inactive ingredient(s) (e.g., difference in dyes, fillers, preservatives) between the brand and the bioequivalent generic product which, according to the prescriber, would result in a significant allergy or a serious adverse reaction **[documentation required]**.

I) The medication is prescribed by, or in consultation with, an endocrinologist or a physician who specializes in the management of pheochromocytoma.

II. Coverage of metyrosine is recommended in those who meet the following criteria:

1. Pheochromocytoma. Approve for the duration noted if the patient meets ONE of the following criteria (A or B):

A) Initial therapy. Approve for 1 year if the patient meets all of the following criteria (i, ii, and iii):

i. Patient has tried a selective alpha blocker (e.g., doxazosin, terazosin or prazosin); AND

ii. Patient has tried phenoxybenzamine (brand or generic); AND

iii. The medication is prescribed by, or in consultation with, an endocrinologist or a physician who specializes in the management of pheochromocytoma.

B) Patient is currently receiving metyrosine or has received metyrosine in the past. Approve for 1 year if prescribed by, or in consultation with, an endocrinologist or a physician who specializes in the management of pheochromocytoma.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of metyrosine and phenoxybenzamine is not recommended in the following situations:

242. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	No criteria changes.	08/29/2018
Annual Revision	**1. Pheochromocytoma:** For phenoxybenamine, the wording in reference to the criteria that listed a reason for use of Brand over generic was changed to "per the prescribing physician" was changed to "per the prescriber".	08/28/2019
Annual Revision	Generic metyrosine was added to the policy to align with brand Demser.	09/09/2020

PRIOR AUTHORIZATION POLICY

POLICY: Proprotein Convertase Subtilisin Kexin Type 9 Inhibitors – Praluent Prior Authorization Policy

- Praluent® (alirocumab injection for subcutaneous use – sanofi-aventis/Regeneron)

REVIEW DATE: 06/10/2020

OVERVIEW

Praluent, a proprotein convertase subtilisin kexin type 9 (PCSK9) inhibitor antibody, is indicated for the following uses:[1]

- **Established cardiovascular (CV) disease**, in adults to reduce the risk of myocardial infarction (MI), stroke, and unstable angina requiring hospitalization.
- **Primary hyperlipidemia** (including **heterozygous familial hypercholesterolemia [HeFH]**), in adults as an adjunct to diet, alone or in combination with other lipid-lowering therapies (e.g., statins, ezetimibe) to reduce low-density lipoprotein cholesterol (LDL-C).

The safety and efficacy of Praluent in children have not been established.[1] Repatha® (evolocumab injection for subcutaneous use) is another PCSK9 inhibitor that carries similar indications to Praluent.[2] Repatha is also indicated as an adjunct to diet and other low-density lipoprotein (LDL) therapies (e.g., statins ezetimibe, LDL apheresis) in patients with homozygous familial hypercholesterolemia (HoFH) who require additional lowering of LDL-C.

Guidelines

Many guidelines are available regarding the treatment of patients with dyslipidemia.[3-9] For patients with elevated LDL-C, statins are the cornerstone of therapy and recommended first-line to be used at maximally tolerated doses due to the established benefits regarding the reduction of CV risks. Atorvastatin 40 mg to

80 mg once daily (QD) and rosuvastatin 20 mg to 40 mg QD are considered high-intensity statins as they achieve LDL-C lowering of ≥ 50%. The American Heart Association/American College of Cardiology guidelines on the management of blood cholesterol (2018) defines atherosclerotic cardiovascular disease (ACSVD) as acute coronary syndrome (ACS), those with a history of MI, stable or unstable angina or coronary or other revascularizations, stroke, transient ischemic attack (TIA), or peripheral arterial disease (PAD).[3,4] Although LDL-C thresholds are not always recognized, in general, an LDL-C < 70 mg/dL is recommended for most patients with ASCVD to reduce CV risk. Use of a PCSK9 as an adjunct is justified if this goal is not met with maximally tolerated statins. Additionally, guidelines and reviews have recognized that patients with a coronary artery calcium or calcification score ≥ 300 Agatston units are at an increased risk of CV events.[10-13]

The National Lipid Association (NLA) published guidelines for the screening, diagnosis, and management of pediatric and adult patients with familial hypercholesterolemia (2011).[14] Familial hypercholesterolemia encompasses a group of genetic defects that cause severe elevations in LDL-C levels, as well as other lipid parameters. HeFH occurs in approximately 1 in 300 to 500 patients and is present in childhood. Total cholesterol (total-C) levels in HeFH range from 350 to 550 mg/dL, which can result in premature ASCVD. Aggressive lipid-lowering therapy is recommended to achieve LDL-C reductions of at least 50%. Both children and adults with LDL-C levels ≥ 190 mg/dL following lifestyle modifications will require medication therapy. Statins are the initial treatment for all adults with familial hypercholesterolemia. High or moderate intensity statins are recommended; low potency statins are generally inadequate for patients with familial hypercholesterolemia due to the markedly elevated LDL-C levels. In the pivotal trials for Praluent, HeFH was diagnosed utilizing Simon Broome criteria or Dutch Lipid Clinical Network criteria.[1] In an AHA scientific statement, it describes the Dutch Lipid Clinical Network Criteria and states that a score of > 5 on the scale makes the diagnosis of familial hypercholesterolemia highly probable.[15] Also, genetic testing can reveal a diagnosis of HeFH and clinical manifestations (e.g., tendon xanthomata) are highly suggestive of the condition.[15,16] Also, patients with an untreated LDL-C ≥ 190 mg/dL suggest familial hypercholesterolemia. In general, for patients with HeFH who have not yet manifested ASCVD, LDL-C levels ≤ 100 mg/dL are recommended. The addition of a PCSK9 inhibitor to statin therapy can be considered if this goal is not achieved.

In 2019 the AHA issued a scientific statement regarding statin safety and associated adverse events.[17] In general, statins are well-tolerated agents that have successfully led to decreased LDL-C levels which reduce CV events (e.g., MI, ischemic stroke). The risk of serious statin-induced muscle injury (e.g., rhabdomyolysis) is low (< 0.01%). In US clinical practice, about 10% of patients stop taking statin therapy due to subjective complaints, of which muscle symptoms without significantly raised creatine kinase levels are noted. Data suggest that the muscle symptoms that occur among patients are not caused by the pharmacologic effects of the statin and restarting statin therapy for these patients is important, especially among patients at high risk of CV events, for whom CV event prevention is important. Several studies have shown that patients believed that they were "statin intolerant". However, many patients were able to subsequently tolerate a statin upon rechallenge and receive the benefits provided with these agents. Other data support this occurrence.[18-20]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Praluent. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and monitoring of this new therapy, approval requires Praluent to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Documentation: None required.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Praluent is recommended in those who meet the following criteria:

FDA-Approved Indications

~~76.~~73. **Atherosclerotic Cardiovascular Disease (ASCVD) [Clinical].*** Approve for 3 years if the patient meets the following criteria (A, B, C, and D):

G) Patient is ≥ 18 years of age; AND

H) Patient has had one of the following conditions or diagnoses (i, ii, iii, iv, or v):

- **i.** A previous myocardial infarction (MI) or a history of an acute coronary syndrome (ACS); OR
- **ii.** Angina (stable or unstable); OR
- **iii.** A past history of stroke or transient ischemic attack (TIA); OR
- **iv.** Peripheral arterial disease (PAD); OR
- **v.** Patient has undergone a coronary or other arterial revascularization procedure in the past; AND
  Note: Examples include coronary artery bypass graft (CABG) surgery, percutaneous coronary intervention (PCI), angioplasty, and coronary stent procedures.

I) Patient meets one of the following criteria (i or ii):

- **i.** Patient meets both of the following (a and b):
  - **a)** Patient has tried one high-intensity statin therapy (i.e., atorvastatin ≥ 40 mg daily; rosuvastatin ≥ 20 mg daily [as a single-entity or as a combination product]) for ≥ 8 weeks; AND
  - **b)** Low-density lipoprotein cholesterol (LDL-C) level after this treatment remains ≥ 70 mg/dL; OR
- **ii.** Patient has been determined to be statin intolerant by meeting one of the following criteria (a or b):
  - **a)** Patient experienced statin-related rhabdomyolysis; OR
    Note: Rhabdomyolysis is statin-induced muscle breakdown that is associated with markedly elevated creatine kinase (CK) levels (at least 10 times the upper limit of normal), along with evidence of end organ damage which can include signs of acute renal injury (noted by substantial increases in serum creatinine [Scr] levels [a ≥ 0.5 mg/dL increase in Scr or doubling of the Scr] and/or myoglobinuria [myoglobin present in urine]).
  - **b)** Patient meets all of the following [(1), (2), and (3)]:
    - **(1)** Patient experienced skeletal-related muscle symptoms; AND
      Note: Examples of skeletal-related muscle symptoms include myopathy (muscle weakness) or myalgia (muscle aches, soreness, stiffness, or tenderness).
    - **(2)** The skeletal-related muscle symptoms occurred while receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products); AND
    - **(3)** When receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products) the skeletal-related muscle symptoms resolved upon discontinuation of each respective statin therapy (atorvastatin and rosuvastatin); AND

J) Medication is prescribed by, or in consultation with, a cardiologist; an endocrinologist; or a physician who focuses in the treatment of cardiovascular (CV) risk management and/or lipid disorders.

~~77.~~74. **Heterozygous Familial Hypercholesterolemia [HeFH].*** Approve for 3 years if the patient meets the following criteria (A, B, C, and D):

33. Patient is ≥ 18 years of age; AND

34. Patient meets one of the following criteria (i, ii, iii, iv, or v):

i. Patient has an untreated low-density lipoprotein cholesterol (LDL-C) level ≥ 190 mg/dL (prior to treatment with antihyperlipidemic agents); OR

ii. Patient has genetic confirmation of HeFH by mutations in the low-density lipoprotein receptor (LDLR), apolipoprotein B (APOB), proprotein convertase subtilisin kexin type 9 (PCSK9) or low-density lipoprotein receptor adaptor protein 1 (LDLRAP1) gene; OR

iii. Patient has been diagnosed with HeFH meeting one of the following diagnostic criteria thresholds (a or b):

a) Patient meets both of the following [(1) and (2)]:

(1) Prescriber used the Dutch Lipid Network criteria to diagnose HeFH; AND

(2) Patient has a score > 5; OR

b) Patient meets both of the following [(1) and (2)]:

(1) Prescriber used the Simon Broome criteria to diagnose HeFH; AND

(2) Patient met the threshold for "definite" or "possible" familial hypercholesterolemia; OR

iv. Patient has a treated low-density lipoprotein cholesterol (LDL-C) level ≥ 100 mg/dL (after treatment with antihyperlipidemic agents but prior to PCSK9 inhibitor therapy such as Praluent [alirocumab injection for subcutaneous use] or Repatha [evolocumab injection for subcutaneous use]); OR

v. Patient has clinical manifestations of HeFH; AND

Note: Examples of clinical manifestations of HeFH include cutaneous xanthomas, tendon xanthomas, arcus cornea, tuberous xanthomas or xanthelasma.

35. Patient meets one of the following criteria (i or ii):

i. Patient meets both of the following criteria (a and b):

a) Patient has tried one high-intensity statin therapy (i.e., atorvastatin ≥ 40 mg daily; rosuvastatin ≥ 20 mg daily [as a single-entity or as a combination product]) for ≥ 8 continuous weeks; AND

b) Low-density lipoprotein cholesterol (LDL-C) level after this treatment remains ≥ 70 mg/dL; OR

ii. Patient has been determined to be statin intolerant by meeting one of the following criteria (a or b):

a) Patient experienced statin-related rhabdomyolysis; OR

Note: Rhabdomyolysis is statin-induced muscle breakdown that is associated with markedly elevated creatine kinase (CK) levels (at least 10 times the upper limit of normal), along with evidence of end organ damage which can include signs of acute renal injury (noted by substantial increases in serum creatinine [Scr] levels [a ≥ 0.5 mg/dL increase in Scr or doubling of the Scr] and/or myoglobinuria [myoglobin present in urine]);

b) Patient meets all of the following [(1), (2), and (3)]:

(1) Patient experienced skeletal-related muscle symptoms; AND

Note: Examples of skeletal-related muscle symptoms include myopathy (muscle weakness) or myalgia (muscle aches, soreness, stiffness, or tenderness).

(2) The skeletal-related muscle symptoms occurred while receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products); AND

(3) When receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products) the skeletal-related muscle symptoms resolved upon discontinuation of each respective statin therapy (atorvastatin and rosuvastatin); AND

36. Medication is prescribed by, or in consultation with, a cardiologist; an endocrinologist; or a physician who focuses in the treatment of cardiovascular (CV) risk management and/or lipid disorders.

~~78.~~75. Primary Hyperlipidemia.* Approve for 3 years if the patient meets the following criteria (A, B, C, and D):

Note: This is not associated with atherosclerotic cardiovascular disease (ASCVD) or heterozygous familial hypercholesterolemia (HeFH) and may be referred to as combined hyperlipidemia, hypercholesterolemia (pure, primary), dyslipidemia, or increased/elevated low-density lipoprotein cholesterol (LDL-C) levels.

A) Patient is ≥ 18 years of age; AND

B) Patient has a coronary artery calcium or calcification (CAC) score ≥ 300 Agatston units; AND

C) Patient meets one of the following criteria (i or ii):

- **i.** Patient meets all of the following criteria (a, b and c):
  - **a)** Patient has tried one high-intensity statin therapy (i.e., atorvastatin ≥ 40 mg daily; rosuvastatin ≥ 20 mg daily [as a single-entity or as a combination product]); AND
  - **b)** Patient has tried the one high-intensity statin therapy above along with ezetimibe (as a single-entity or as a combination product) for ≥ 8 continuous weeks; AND
  - **c)** Low-density lipoprotein cholesterol (LDL-C) level after this treatment regimen remains ≥ 100 mg/dL; OR
- **ii.** Patient has been determined to be statin intolerant by meeting one of the following criteria (a or b):
  - **a)** Patient experienced statin-related rhabdomyolysis; OR
    Note: Rhabdomyolysis is statin-induced muscle breakdown that is associated with markedly elevated creatine kinase (CK) levels (at least 10 times the upper limit of normal), along with evidence of end organ damage which can include signs of acute renal injury (noted by substantial increases in serum creatinine [Scr] levels [a ≥ 0.5 mg/dL increase in Scr or doubling of the Scr] and/or myoglobinuria [myoglobin present in urine]).
  - **b)** Patient meets all of the following [(1), (2), and (3)]:
    - **(1)** Patient experienced skeletal-related muscle symptoms; AND
      Note: Examples of skeletal-related muscle symptoms include myopathy (muscle weakness) or myalgia (muscle aches, soreness, stiffness or tenderness).
    - **(2)** The skeletal-related muscle symptoms occurred while receiving separate trials of both atorvastatin and rosuvastatin (as single-entity combination product); AND
    - **(3)** When receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products) the skeletal-related muscle symptoms (e.g., myopathy, myalgia) resolved upon discontinuation of each respective statin therapy (atorvastatin and rosuvastatin); AND

D) Medication is prescribed by, or in consultation with, a cardiologist; an endocrinologist; or a physician who focuses in the treatment of cardiovascular (CV) risk management and/or lipid disorders.

Note:

* Patients may have a diagnoses that pertain to more than one FDA-approved indication, therefore, consider review under different approval conditions, if applicable. (e.g., patients with HeFH have had a clinical ASCVD event, patients with primary hyperlipidemia may have HeFH).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Praluent is not recommended in the following situations:

293. **Concurrent use of Praluent with Repatha® (evolocumab injection for SC use) or Juxtapid® (lomitapide capsules).** Repatha is another PCSK9 inhibitor and should not be used with Praluent.[2] Juxtapid, a microsomal triglyceride transfer protein inhibitor, is indicated as an adjunct to lipid-lowering medications and diet to modify lipid parameters (e.g., reduce LDL-C levels) in patients with

homozygous familial hypercholesterolemia (HoFH).[21] The efficacy and safety of Repatha or Juxtapid in combination with Praluent have not been established.

294. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date

Early Annual Revision	Documentation removed from the Policy that was set to be effective on 7/1/2018.	05/16/2018
Annual Revision	1. **Primary Hyperlipidemia** (not associated with ASCVD, HeFH, or Homozygous Familial Hypercholesterolemia): This new FDA-approved indication was added as an approval for a 3-years duration in patients ≥ 18 years of age who meet several other required criteria. See policy for details. 2. **Conditions Not Recommended for Approval**: Kynamro was removed from the list of agents in which Praluent should not be used with concomitantly because this product is no longer available.	06/12/2019
Annual Revision	The following changes were made: 1. **ASCVD:** Examples of coronary or other arterial revascularization procedures were removed from the criteria and placed in a note. Regarding the definition of rhabdomyolysis, the word "usually" was removed from the explanation associated with markedly elevated CK levels. Examples of skeletal-related muscle symptoms were removed from the criteria and placed in a note. 2. **HeFH:** Examples of clinical manifestations of HeFH were removed from the criteria and placed in a note. Regarding the definition of rhabdomyolysis, the word "usually" was removed from the explanation associated with markedly elevated CK levels. Examples of skeletal-related muscle symptoms were moved from the criteria to a note. 3. **Primary Hyperlipidemia:** The parameters surrounding the definition of primary hyperlipidemia were removed from the indication and placed in a note. Regarding the definition of rhabdomyolysis, the word "usually" was removed from the explanation associated with markedly elevated CK levels. Examples of skeletal-related muscle symptoms were removed from the criteria and placed in a note. Wording was clarified regarding the therapy requirement that the patient must try a high-intensity statin along with ezetimibe for 8 continuous weeks.	06/10/2020

ASCVD – Atherosclerotic cardiovascular disease; LDL-C – Low-density lipoprotein cholesterol; PCSK9 – Proprotein convertase subtilisin kexin type 9; HeFH – Heterozygous familial hypercholesterolemia; FDA – Food and Drug Administration; CK – Creatine kinase.

APPENDIX A.

Simon Broome Register Diagnostic Criteria.[15]

Definite Familial Hypercholesterolemia
Raised cholesterol
--Total cholesterol greater than 6.7 mmol/L (260 mg/dL) or LDL-C > 4.0 mmol/L (155 mg/dL) in a child < 16 years; OR
--Total cholesterol > 7.5 mmol/L (290 mg/dL) or LDL-C > 4.9 mmol/L (190 mg/dL) in an adult (aged > 16 years);
AND
--Tendon xanthomas in the patient or in a first (parent, sibling, or child) or second-degree relative (grandparent, aunt, or uncle);
OR
DNA-based evidence of LDL-receptor, familial defective APOB, or PCSK9 mutation.
Possible Familial Hypercholesterolemia
Raised cholesterol
--Total cholesterol greater than 6.7 mmol/L (260 mg/dL) or LDL-C > 4.0 mmol/L (155 mg/dL) in a child < 16 years; OR
--Total cholesterol > 7.5 mmol/L (290 mg/dL) or LDL-C > 4.9 mmol/L (190 mg/dL) in an adult (aged > 16 years);
AND
Family history of premature myocardial infarction younger than 50 years of age in second-degree relative or younger than 60 years of age in first-degree relative;
OR
Raised cholesterol
--Total cholesterol greater than 6.7 mmol/L (260 mg/dL) or LDL-C > 4.0 mmol/L (155 mg/dL) in a child < 16 years; OR
--Total cholesterol > 7.5 mmol/L (290 mg/dL) or LDL-C > 4.9 mmol/L (190 mg/dL) in an adult (aged > 16 years);
AND
Family history of raised cholesterol > 7.5 mmol (290 mg/dL) in adult first-degree or second-degree relative or > 6.7 mmol/L (260 mg/dL) in child or sibling aged < 16 years.

LDL-C – Low-density lipoprotein cholesterol; LDL – Low-density lipoprotein; APOB – Apolipoprotein B; PCSK9 – Proprotein convertase subtilisin kexin type 9.

APPENDIX B.

Dutch Lipid Network Criteria for Familial Hypercholesterolemia.[16]

Criteria	Score
Family History	
First-degree relative with known premature coronary and/or vascular disease (men < 55 years, women < 60 years)	1
First degree relative with known LDL-C > 95th percentile for age and sex	1
First-degree relative with tendon xanthomata and/or arcus cornealis, OR	2
Children aged < 18 years with LDL-C > 95th percentile for age and sex	2
Clinical History	
Patient with premature CAD (age as above)	2
Patient with premature cerebral or peripheral vascular disease (age as above)	1
Physical Examination	
Tendon xanthomas	6
Arcus cornealis at age < 45 years	4
LDL-C	
LDL-C ≥ 8.5 mmol/L (330 mg/dL)	8
LDL-C 6.5 to 8.4 mmol/L (250 to 329 mg/dL)	5
LDL-C 5.0 to 6.4 mmol/L (190 to 249 mg/dL)	3
LDL-C 4.0 to 4.9 mg/dL (155 to 189 mg/dL)	1
DNA analysis	
Functional mutation LDLR, APOB or PCSK9 gene	8
Stratification	**Total score**
Definite familial hypercholesterolemia	> 8
Probable familial hypercholesterolemia	6 to 8
Possible familial hypercholesterolemia	3 to 5
Unlikely familial hypercholesterolemia	< 3

LDL-C – Low-density lipoprotein cholesterol; CAD – Coronary artery disease; LDLR – Low-density lipoprotein receptor; APOB – Apolipoprotein B; PCSK9 – Proprotein convertase subtilisin kexin type 9.

PRIOR AUTHORIZATION POLICY

POLICY: Proprotein Convertase Subtilisin Kexin Type 9 Inhibitors – Repatha Prior Authorization Policy

- Repatha® (evolocumab injection for subcutaneous use [single-use prefilled syringes and Pushtronex™ system] – Amgen)

REVIEW DATE: 06/10/2020

OVERVIEW

Repatha, a proprotein convertase subtilisin kexin type 9 (PCSK9) inhibitor antibody, is indicated for the following uses:[1]

- **Established cardiovascular (CV) disease**, in adults to reduce the risk of myocardial infarction (MI), stroke, and coronary revascularization.
- **Primary hyperlipidemia (including heterozygous familial hypercholesterolemia [HeFH]),** in adults as an adjunct to diet, alone or in combination with other lipid-lowering therapies (e.g., statins, ezetimibe) to reduce low-density lipoprotein cholesterol (LDL-C).
- **Homozygous familial hypercholesterolemia (HoFH),** as an adjunct to diet and other low-density lipoprotein (LDL)-lowering therapies (e.g., statins, ezetimibe, LDL apheresis) **in patients** who require additional lowering of LDL-C.

The safety and effectiveness of Repatha have not been established in pediatric patients with primary hyperlipidemia or HeFH. The safety and effectiveness of Repatha have not been established in pediatric patients with HoFH aged < 13 years.[1] Another PCSK9 inhibitor that is available is Praluent® (alirocumab injection for subcutaneous use).[2]

Guidelines

Many guidelines are available regarding the treatment of patients with dyslipidemia.[3-10] For patients with elevated LDL-C, statins are the cornerstone of therapy and recommended first-line to be used at maximally tolerated doses due to the established benefits regarding the reduction of CV risks. Atorvastatin 40 mg to 80 mg once daily (QD) and rosuvastatin 20 mg to 40 mg QD are considered high-intensity statins as they achieve LDL-C lowering of ≥ 50%. The American Heart Association/American College of Cardiology guidelines on the management of blood cholesterol (2018) defines atherosclerotic cardiovascular disease (ASCVD) as an acute coronary syndrome (ACS), those with a history of MI, stable or unstable angina or coronary or other revascularizations, stroke, transient ischemic attack (TIA), or peripheral arterial disease (PAD).[10] Although LDL-C thresholds are not always recognized, in general, an LDL-C < 70 mg/dL is recommended for most patients with ASCVD to reduce CV risk. Use of a PCSK9 as an adjunct is justified if this goal is not met with maximally tolerated statins.[10] Additionally, guidelines and reviews have recognized that patients with a coronary artery calcium or calcification score ≥ 300 Agatston units are at an increased risk of CV events.[10-13]

The National Lipid Association (NLA) published guidelines for the screening, diagnosis, and management of pediatric and adult patients with familial hypercholesterolemia (2011).[14] Familial hypercholesterolemia encompasses a group of genetic defects that cause severe elevations in LDL-C levels, as well as other lipid parameters. HeFH occurs in approximately 1 in 300 to 500 patients and is present in childhood. Total cholesterol (total-C) levels in HeFH range from 350 to 550 mg/dL, which can result in premature ASCVD. Aggressive lipid-lowering therapy is recommended to achieve LDL-C reductions of at least 50%. Both children and adults with LDL-C levels ≥ 190 mg/dL following lifestyle modifications will require medication therapy. Statins are the initial treatment for all adults with familial hypercholesterolemia. High or moderate intensity statins are recommended; low potency statins are generally inadequate for patients with familial hypercholesterolemia due to the markedly elevated LDL-C levels. In the pivotal trials for Praluent, HeFH was diagnosed utilizing Simon Broome criteria or Dutch Lipid Clinical Network criteria.[1] In an AHA scientific statement, it describes the Dutch Lipid Clinical Network Criteria and states that a score of > 5 on the scale makes the diagnosis of familial hypercholesterolemia highly probable.[15] Also, genetic testing can reveal a diagnosis of HeFH and clinical manifestations (e.g., tendon xanthomata) are highly suggestive of the condition. Also, patients with an untreated LDL-C ≥ 190 mg/dL suggest familial hypercholesterolemia.[15-17] In general, for patients with HeFH who have not yet manifested ASCVD, LDL-C levels ≤ 100 mg/dL are recommended. The addition of a PCSK9 inhibitor to statin therapy can be considered if this goal is not achieved.

In 2019 the AHA issued a scientific statement regarding statin safety and associated adverse events.[18] In general, statins are well-tolerated agents that have successfully led to decreased LDL-C levels which reduce CV events (e.g., MI, ischemic stroke). The risk of serious statin-induced muscle injury (e.g., rhabdomyolysis) is low (< 0.01%). In US clinical practice, about 10% of patients stop taking statin therapy due to subjective complaints, of which muscle symptoms without significantly raised creatine kinase levels are noted. Data suggests that the muscle symptoms that occur among patients are not caused by the pharmacologic effects of the statin and restarting statin therapy for these patients is important, especially among patients at high risk of CV events, for whom CV event prevention is important. Several studies have shown that patients believed that they were "statin intolerant". However, many patients were able to subsequently tolerate a statin upon rechallenge and receive the benefits provided with these agents. Other data support this occurrence.[19,20]

The 2014 HoFH position paper from the Consensus Panel on familial hypercholesterolemia of the European Atherosclerosis Society states the diagnosis of HoFH is made based on genetic or clinical criteria.[17] A definitive diagnosis can be made by genetic confirmation of two mutant alleles at the low density lipoprotein receptor, apolipoprotein B, PCSK9, or low-density lipoprotein receptor adaptor protein 1 gene locus. However, in some patients genetic confirmation remains elusive. Historically, HoFH has been commonly diagnosed based on LDL-C levels such as an untreated LDL-C > 500 mg/dL, or a treated LDL-C ≥ 300 mg/dL. Also confirming the diagnosis is the presence of xanthomas (cutaneous or tendinous) before the age of 10 years or a family history of elevated LDL-C levels consistent with HeFH in both parents.[17] Other clinical manifestations of HoFH include arcus cornea or xanthelasma.[14,17]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Repatha. All approvals are provided for the duration noted below. Due to the specialized skills required for evaluation and monitoring of this new therapy, approval requires Repatha to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Documentation: None required.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Repatha is recommended in those who meet the following criteria:

FDA-Approved Indications

~~79.~~76. **Atherosclerotic Cardiovascular Disease (ASCVD) [Clinical].*** Approve for 3 years if the patient meets the following criteria (A, B, C, and D):

K) Patient is ≥ 18 years of age; AND

L) Patient has had one of the following conditions or diagnoses (i, ii, iii, iv or v):

- **i.** A previous myocardial infarction (MI) or has a history of an acute coronary syndrome (ACS); OR
- **ii.** Angina (stable or unstable); OR
- **iii.** A past history of stroke or transient ischemic attack (TIA); OR
- **iv.** Peripheral arterial disease (PAD); OR
- **v.** Patient has undergone a coronary or other arterial revascularization procedure in the past; AND
  Note: Examples include coronary artery bypass graft (CABG) surgery, percutaneous coronary intervention (PCI), angioplasty, and coronary stent procedures.

M) Patient meets one of the following criteria (i or ii):

- **i.** Patient meets both of the following (a and b):
  - **a)** Patient has tried one high-intensity statin therapy (i.e., atorvastatin ≥ 40 mg daily; rosuvastatin tablets ≥ 20 mg daily [as a single-entity or as a combination product]) for ≥ 8 continuous weeks; AND
  - **b)** Low-density lipoprotein cholesterol (LDL-C) level after this treatment remains ≥ 70 mg/dL; OR
- **ii.** Patient has been determined to be statin intolerant by meeting one of the following criteria (a or b):
  - **a)** Patient experienced statin-related rhabdomyolysis; OR
    Note: Rhabdomyolysis is statin-induced muscle breakdown that is associated with markedly elevated creatine kinase (CK) levels (at least 10 times the upper limit of normal), along with evidence of end organ damage which can include signs of acute renal injury

(noted by substantial increases in serum creatinine [Scr] levels [a ≥ 0.5 mg/dL increase in Scr or doubling of the Scr] and/or myoglobinuria [myoglobin present in urine]); OR

b) Patient meets all of the following [(1), (2), and (3)]:

(1) Patient experienced skeletal-related muscle symptoms; AND

(2) Note: Examples of skeletal-related muscle symptoms include myopathy (muscle weakness) or myalgia (muscle aches, soreness, stiffness, or tenderness).

(3) The skeletal-related muscle symptoms occurred while receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products); AND

(4) When receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products) the skeletal-related muscle symptoms resolved upon discontinuation of each respective statin therapy (atorvastatin and rosuvastatin); AND

N) Medication is prescribed by, or in consultation with, a cardiologist; an endocrinologist; or a physician who focuses in the treatment of cardiovascular (CV) risk management and/or lipid disorders.

~~80.~~77. **Heterozygous Familial Hypercholesterolemia (HeFH).*** Approve for 3 years if the patient meets the following criteria (A, B, C, and D):

37. Patient is ≥ 18 years of age; AND

38. Patient meets one of the following criteria (i, ii, iii, iv or v):

i. Patient has an untreated low-density lipoprotein cholesterol (LDL-C) ≥ 190 mg/dL (prior to treatment with antihyperlipidemic agents); OR

ii. Patient has genetic confirmation of HeFH by mutations in the low-density lipoprotein receptor (LDLR), apolipoprotein B (APOB), proprotein convertase subtilisin kexin type 9 (PCSK9) or low-density lipoprotein receptor adaptor protein 1 (LDLRAP1) gene; OR

iii. Patient has been diagnosed with HeFH meeting one of the following diagnostic criteria thresholds (a or b):

a) Patient meets both of the following [(1) and (2)]:

(1) Prescriber used the Dutch Lipid Network criteria to diagnose HeFH; AND

(2) Patient had a score> 5; OR

b) Patient meets both of the following [(1) and (2)]:

(1) Prescriber used the Simon Broome criteria to diagnose HeFH; AND

(2) Patient met the threshold for "definite" or "possible" familial hypercholesterolemia; OR

iv. Patient has a treated low-density lipoprotein cholesterol (LDL-C) level ≥ 100 mg/dL (after treatment with antihyperlipidemic agents but prior to PCSK9 inhibitor therapy such as Praluent® [alirocumab injection for SC use] or Repatha); OR

v. Patient has clinical manifestations of HeFH; AND

Note: Examples of clinical manifestations of HeFH include cutaneous xanthomas, tendon xanthomas, arcus cornea, tuberous xanthomas or xanthelasma.

39. Patient meets one of the following criteria (i or ii):

i. Patient meets both of the following criteria (a and b):

~~**a)**~~ Patient has tried one high-intensity statin therapy (i.e., atorvastatin ≥ 40 mg daily; rosuvastatin tablets ≥ 20 mg daily [as a single-entity or as a combination product]) for ≥ 8 continuous weeks; AND

~~**b)**~~ Low-density lipoprotein cholesterol (LDL-C) level after this treatment remains ≥ 70 mg/dL; OR

ii. Patient has been determined to be statin intolerant by meeting one of the following criteria (a or b):

a) Patient experienced statin-related rhabdomyolysis; OR

Note: Rhabdomyolysis is statin-induced muscle breakdown that is associated with markedly elevated creatine kinase (CK) levels (at least 10 times the upper limit of normal),

along with evidence of end organ damage which can include signs of acute renal injury (noted by substantial increases in serum creatinine [Scr] levels [a ≥ 0.5 mg/dL increase in Scr or doubling of the Scr] and/or myoglobinuria [myoglobin present in urine]); OR

b) Patient meets all of the following [(1), (2), and (3)]:

(1) Patient experienced skeletal-related muscle symptoms; AND
Note: Examples of skeletal-related muscle symptoms include myopathy (muscle weakness) or myalgia (muscle aches, soreness, stiffness, or tenderness).

(2) The skeletal-related muscle symptoms occurred while receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products); AND

(3) When receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products) the skeletal-related muscle symptoms resolved upon discontinuation of each respective statin therapy (atorvastatin and rosuvastatin); AND

40. Medication is prescribed by, or in consultation with, a cardiologist; an endocrinologist; or a physician who focuses in the treatment of cardiovascular (CV) risk management and/or lipid disorders.

~~81.~~78. Homozygous Familial Hypercholesterolemia (HoFH).* Approve for 3 years if the patient meets the following criteria (A, B, C, and D):

A) Patient is ≥ 13 years of age; AND

B) Patient meets one of the following (i, ii, iii or iv):

i. Patient has genetic confirmation of two mutant alleles at the low-density lipoprotein receptor (LDLR), apolipoprotein B (APOB), proprotein convertase subtilisin kexin type 9 (PCSK9) or low-density lipoprotein receptor adaptor protein 1 (LDLRAP1) gene locus; OR

ii. Patient has an untreated low-density lipoprotein (LDL-C) level > 500 mg/dL (prior to treatment with antihyperlipidemic agents); OR

iii. Patient has a treated low-density lipoprotein cholesterol (LDL-C) level ≥ 300 mg/dL (after treatment with antihyperlipidemic agents but prior to agents such as Repatha or Juxtapid® [lomitapide capsules]); OR

iv. Patient has clinical manifestations of HoFH; AND
Note: Examples of clinical manifestation of HoFH include cutaneous xanthomas, tendon xanthomas, arcus cornea, tuberous xanthomas or xanthelasma.

C) Patient meets one of the following criteria (i or ii):

i. Patient meets both of the following (a and b):

a) Patient has tried one high-intensity statin therapy (i.e., atorvastatin ≥ 40 mg daily; rosuvastatin ≥ 20 mg daily [as a single-entity or as a combination product]) for ≥ 8 continuous weeks; AND

b) Low-density lipoprotein cholesterol (LDL-C) level after this treatment remains ≥ 70 mg/dL; OR

ii. Patient has been determined to be statin intolerant by meeting one of the following criteria (a or b):

a) Patient experienced statin-related rhabdomyolysis; OR
Note: Rhabdomyolysis is statin-induced muscle breakdown that is associated with markedly elevated creatine kinase (CK) levels (at least 10 times the upper limit of normal), along with evidence of end organ damage which can include signs of acute renal injury (noted by substantial increases in serum creatinine [Scr] levels [a ≥ 0.5 mg/dL increase in Scr or doubling of the Scr] and/or myoglobinuria [myoglobin present in urine]); OR

b) Patient meets all of the following criteria [(1), (2), and (3)]:

(1) Patient experienced skeletal-related muscle symptoms; AND
Note: Examples of skeletal-related muscle symptoms include myopathy (muscle weakness) or myalgia (muscle aches, soreness, stiffness, or tenderness).

(2) The skeletal-related muscle symptoms occurred while receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products); AND

(3) When receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products) the skeletal-related muscle symptoms resolved upon discontinuation of each respective statin therapy (atorvastatin and rosuvastatin); AND

D) Medication is prescribed by, or in consultation with, a cardiologist; an endocrinologist; or a physician who focuses in the treatment of cardiovascular (CV) risk management and/or lipid disorders.

~~82.~~79. **Primary Hyperlipidemia.*** Approve for 3 years if the patient meets the following criteria (A, B, C, and D):

Note: This is not associated with atherosclerotic cardiovascular disease (ASCVD), heterozygous familial hypercholesterolemia (HeFH), or homozygous familial hypercholesterolemia (HoFH) and may be referred to as combined hyperlipidemia, hypercholesterolemia (pure, primary), dyslipidemia, or increased/elevated low-density lipoprotein cholesterol (LDL-C) levels.

E) Patient is ≥ 18 years of age; AND

F) Patient has a coronary artery calcium or calcification (CAC) score ≥ 300 Agatston units; AND

G) Patient meets one of the following criteria (i or ii):

i. Patient meets all of the following criteria (a, b, and c):

~~**a)**~~ Patient has tried one high-intensity statin therapy (i.e., atorvastatin ≥ 40 mg daily; rosuvastatin tablets ≥ 20 mg daily [as a single-entity or as a combination product]); AND

~~**b)**~~ Patient has tried one high-intensity statin therapy above along with ezetimibe (as a single-entity or as a combination product) for ≥ 8 continuous weeks; AND

~~**c)**~~ Low-density lipoprotein cholesterol (LDL-C) level after this treatment regimen remains ≥ 100 mg/dL; OR

ii. Patient has been determined to be statin intolerant by meeting one of the following criteria (a or b):

a) Patient experienced statin-related rhabdomyolysis; OR

Note: Rhabdomyolysis is statin-induced muscle breakdown that is associated with markedly elevated creatine kinase (CK) levels (at least 10 times the upper limit of normal), along with evidence of end organ damage which can include signs of acute renal injury (noted by substantial increases in serum creatinine [Scr] levels [a ≥ 0.5 mg/dL increase in Scr or doubling of the Scr] and/or myoglobinuria [myoglobin present in urine]); OR

b) Patient meets all of the following [(1), (2), and (3)]:

(1) Patient experienced skeletal-related muscle symptoms; AND

Note: Examples of skeletal-related muscle symptoms include myopathy (muscle weakness) or myalgia (muscle aches, soreness, stiffness, or tenderness).

(2) The skeletal-related muscle symptoms occurred while receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products); AND

(3) When receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products) the skeletal-related muscle symptoms resolved upon discontinuation of each respective statin therapy (atorvastatin and rosuvastatin); AND

H) Medication is prescribed by, or in consultation with, a cardiologist; an endocrinologist; or a physician who focuses in the treatment of cardiovascular (CV) risk management and/or lipid disorders.

Note:

* Patients may have a diagnoses that pertain to more than one FDA-approved indication, therefore, consider review under different approval conditions, if applicable (e.g., patients with HeFH have had a clinical ASCVD event, patients with primary hyperlipidemia may have HeFH).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Repatha is not recommended in the following situations:

295. Concurrent use of Repatha with Praluent® (alirocumab injection for subcutaneous use use) or Juxtapid (lomitapide capsules). Praluent is another PCSK9 inhibitor and should not be used with Repatha.[2] Juxtapid, a microsomal triglyceride transfer protein inhibitor, is indicated as an adjunct to lipid-lowering medications and diet to modify lipid parameters (e.g., reduce LDL-C levels) in patients with HoFH.[21] The efficacy and safety of using Praluent or Juxtapid in combination with Repatha have not been established.

296. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Early Annual Revision	Documentation removed from the Policy that was set to be effective on 7/1/2018.	05/16/2018
Annual Revision	**Conditions Not Recommended for Approval:** Kynamro was removed from the list of agents in which Repatha should not be used with concomitantly because this product is no longer available.	06/12/2019
Annual Revision	The following changes were made: 1. **ASCVD:** Examples of coronary or other arterial revascularization procedures were removed from the criteria and placed in a note. Regarding the definition of rhabdomyolysis, the word "usually" was removed from the explanation associated with markedly elevated CK levels. Examples of skeletal-related muscle symptoms were removed from the criteria and placed in a note. 2. **HeFH:** Examples of clinical manifestations of HeFH were removed from the criteria and placed in a note. Regarding the definition of rhabdomyolysis, the word "usually" was removed from the explanation associated with markedly elevated CK levels. Examples of skeletal-related muscle symptoms were moved from the criteria to a note. 3. **HoFH:** Examples of clinical manifestations of HoFH were removed from the criteria and placed in a note. Regarding the definition of rhabdomyolysis, the word "usually" was removed from the explanation associated with markedly elevated CK levels. Examples of skeletal-related muscle symptoms were moved from the criteria to a note. 4. **Primary Hyperlipidemia:** The parameters surrounding the definition of primary hyperlipidemia were removed from the indication and placed in a note. Regarding the definition of rhabdomyolysis, the word "usually was removed from the explanation associated with markedly elevated CK levels. Examples of skeletal-related muscle symptoms were removed from the criteria and placed in a note. Wording was clarified regarding the therapy requirement that the patient must try a high-intensity statin along with ezetimibe for 8 continuous weeks.	06/10/2020

ASCVD – Atherosclerotic cardiovascular disease; LDL-C – Low-density lipoprotein cholesterol; PCSK9 – Proprotein convertase subtilisin kexin type 9; FDA – Food and Drug Administration; HeFH – Heterozygous familial hypercholesterolemia; HoFH – Homozygous familial hypercholesterolemia; CK – Creatine kinase.

APPENDIX A

Simon Broome Register Diagnostic Criteria.[15]

Definite Familial Hypercholesterolemia
Raised cholesterol
--Total cholesterol greater than 6.7 mmol/L (260 mg/dL) or LDL-C > 4.0 mmol/L (155 mg/dL) in a child < 16 years; OR
--Total cholesterol > 7.5 mmol/L (290 mg/dL) or LDL-C > 4.9 mmol/L (190 mg/dL) in an adult (aged > 16 years);
AND
--Tendon xanthomas in the patient or in a first (parent, sibling, or child) or second-degree relative (grandparent, aunt, or uncle);
OR
DNA-based evidence of LDL-receptor, familial defective APOB, or PCSK9 mutation.
Possible Familial Hypercholesterolemia
Raised cholesterol
--Total cholesterol greater than 6.7 mmol/L (260 mg/dL) or LDL-C > 4.0 mmol/L (155 mg/dL) in a child < 16 years; OR
--Total cholesterol > 7.5 mmol/L (290 mg/dL) or LDL-C > 4.9 mmol/L (190 mg/dL) in an adult (aged > 16 years);
AND
Family history of premature myocardial infarction younger than 50 years of age in second-degree relative or younger than 60 years of age in first-degree relative;
OR
Raised cholesterol
--Total cholesterol greater than 6.7 mmol/L (260 mg/dL) or LDL-C > 4.0 mmol/L (155 mg/dL) in a child < 16 years; OR
--Total cholesterol > 7.5 mmol/L (290 mg/dL) or LDL-C > 4.9 mmol/L (190 mg/dL) in an adult (aged > 16 years);
AND
Family history of raised cholesterol > 7.5 mmol (290 mg/dL) in adult first-degree or second-degree relative or > 6.7 mmol/L (260 mg/dL) in child or sibling aged < 16 years.

LDL-C – Low-density lipoprotein cholesterol; LDL – Low-density lipoprotein; APOB – Apolipoprotein B; PCSK9 – Proprotein convertase subtilisin kexin type 9.

APPENDIX B.

Dutch Lipid Network Criteria for Familial Hypercholesterolemia.[16]

Criteria	Score
Family History	
First-degree relative with known premature coronary and/or vascular disease (men < 55 years, women < 60 years)	1
First degree relative with known LDL-C > 95th percentile for age and sex	1
First-degree relative with tendon xanthomata and/or arcus cornealis, OR	2
Children aged < 18 years with LDL-C > 95th percentile for age and sex	2
Clinical History	
Patient with premature CAD (age as above)	2
Patient with premature cerebral or peripheral vascular disease (age as above)	1
Physical Examination	
Tendon xanthomas	6
Arcus cornealis at age < 45 years	4
LDL-C	
LDL-C ≥ 8.5 mmol/L (330 mg/dL)	8
LDL-C 6.5 to 8.4 mmol/L (250 to 329 mg/dL)	5
LDL-C 5.0 to 6.4 mmol/L (190 to 249 mg/dL)	3
LDL-C 4.0 to 4.9 mg/dL (155 to 189 mg/dL)	1
DNA analysis	
Functional mutation LDLR, APOB or PCSK9 gene	8
Stratification	**Total score**
Definite familial hypercholesterolemia	> 8
Probable familial hypercholesterolemia	6 to 8
Possible familial hypercholesterolemia	3 to 5
Unlikely familial hypercholesterolemia	< 3

LDL-C – Low-density lipoprotein cholesterol; CAD – Coronary artery disease; LDLR – Low-density lipoprotein receptor; APOB – Apolipoprotein B; PCSK9 – Proprotein convertase subtilisin kexin type 9.

PRIOR AUTHORIZATION POLICY

POLICY: Psychiatry – Spravato Prior Authorization Policy

- Spravato™ (esketamine nasal spray – Janssen)

REVIEW DATE: 03/25/2020; selected revision 08/05/2020 and 09/16/2020

OVERVIEW

Spravato, a non-competitive N-methyl D-aspartate (NMDA) receptor antagonist, is indicated in conjunction with an oral antidepressant for the treatment of:[1]

- Depressive symptoms in adults with **major depressive disorder (MDD) with acute suicidal ideation or behavior**.
- **Treatment-resistant depression** (TRD) in adults.

Limitation of Use: The effectiveness of Spravato in preventing suicide or in reducing suicidal ideation or behavior has not been demonstrated. Use of Spravato does not preclude the need for hospitalization if clinically warranted, even if patients experience improvement after an initial dose of Spravato. Spravato is not approved as an anesthetic agent. The safety and effectiveness of Spravato as an anesthetic agent have not been established.

Spravato should be administered in conjunction with an oral antidepressant.[1] For MDD with acute suicidal ideation or behavior, the recommended dosage is 84 mg twice weekly for 4 weeks. The dosage may be reduced to 56 mg twice weekly based on tolerability. After 4 weeks of treatment, evidence of therapeutic benefit should be evaluated to determine need for continued treatment. The use of Spravato, in conjunction with an oral antidepressant, beyond 4 weeks has not been systematically evaluated in the treatment of depressive symptoms in patients with MDD with acute suicidal ideation or behavior. For treatment-resistant depression, the recommended dose is 56 mg intranasally

on Day 1, followed by 56 mg or 84 mg intranasally twice weekly for Weeks 1 to 4. On Weeks 5 to 8, Spravato should be administered once weekly at a dose of 56 mg or 84 mg intranasally. On Week 9 and thereafter, the dosing frequency should be individualized to the least frequent dosing to maintain remission/response (either every 2 weeks or once weekly) at a dose of 56 mg or 84 mg. Spravato must be administered under the direct supervision of a healthcare provider.

Disease Overview

Major depressive disorder is a serious, life-threatening condition with high rates of morbidity and a chronic disease course.[2] Major depressive disorder is considered the leading cause of disability worldwide and is also associated with increased mortality rates.[3,4] About 30% to 40% of patients with major depressive disorder fail to respond to first-line treatments including oral antidepressant medications of all classes (e.g., selective serotonin reuptake inhibitors [SSRIs], serotonin-norepinephrine reuptake inhibitors [SNRIs], tricyclic antidepressants [TCAs], bupropion) and/or psychotherapy.[2,5] In addition, the onset of treatment response for these modalities, even when effective, often takes ≥ 4 weeks, leading to greater suffering, expense, and risk. For regulatory purposes, the FDA considers patients to have treatment-resistant depression if they have MDD and they have not responded to treatment despite trials of at least two antidepressants given at adequate doses for an adequate duration in the current episode.[2]

The available treatments for treatment-resistant depression are limited.[2] Prior to the approval of Spravato, only one medication was FDA-approved for treatment-resistant depression, Symbyax® (olanzapine and fluoxetine capsules). Symbyax is indicated for treatment-resistant depression (major depressive disorder in patients who do not respond to two separate trials of different antidepressants of adequate dose and duration in the current episode) and acute depressive episodes in bipolar I disorder.[6]

Guidelines

According to the American Psychiatric Association practice guideline for the treatment of patients with major depressive disorder (2010), the effectiveness of antidepressants is generally comparable between classes and within classes.[7] Therefore, the initial selection of antidepressant will largely be based on the anticipated side effects, the safety or tolerability of these side effects for the individual patient, pharmacological properties of the medication (e.g., half-life, drug interactions), and additional factors such as medication response in prior episodes, cost, and patient preference. In patients with depression who either have not responded or have had trouble tolerating one SSRI agent, a trial of another SSRI (or another antidepressant) may be effective and/or better tolerated. Patients who have had a partial response to antidepressant monotherapy can be augmented with another antidepressant from a different pharmacological class or with another non-antidepressant medication, such as lithium, thyroid hormone, an anticonvulsant, a psychostimulant, or an atypical antipsychotic.

Abuse and Misuse

Spravato contains esketamine, a Schedule III controlled substance (CIII), which may be subject to abuse and diversion.[1] Assess each patient's risk for abuse or misuse prior to prescribing Spravato. All patients receiving Spravato should be monitored for the development of these behaviors or conditions, including drug-seeking behavior, while on therapy. Patients with a history of drug abuse or dependence are at greater risk. Careful consideration should be given prior to prescribing Spravato to individuals with a history of substance use disorder.

Safety

Spravato labeling includes a Boxed Warning regarding sedation, dissociation, abuse and misuse, and suicidal thoughts and behaviors in pediatric and young adult patients.[1] The most common psychological effects of Spravato were dissociative or perceptual changes (including distortion of time, space and illusions), derealization and depersonalization (61% to 84% of patients treated with Spravato developed dissociative or perceptual changes based on the Clinician-Administered Dissociative States Scale). Given its potential to induce dissociative effects, carefully assess patients with psychosis before administering Spravato; treatment should be initiated only if the benefit outweighs the risk.

Because of the risks of serious adverse outcomes resulting from sedation, dissociation, and abuse and misuse, Spravato is only available through a restricted program under a Risk Evaluation and Mitigation Strategy (REMS).[1] Healthcare settings must be certified in the program and ensure that Spravato is only dispensed in healthcare settings and administered to patients who are enrolled in the program, administered by patients under the direct observation of a

healthcare provider, and that patients are monitored by a healthcare provider for at least 2 hours after administration of Spravato. Pharmacies must be certified in the REMS and must only dispense Spravato to healthcare settings that are certified in the program.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Spravato. Because of the specialized skills required for evaluation and diagnosis of patients treated with Spravato as well as the monitoring required for adverse events and efficacy, approval requires Spravato to be prescribed by a physician who specializes in the condition being treated. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Spravato is recommended in those who meet the following criteria:

FDA-Approved Indications

257. Major Depressive Disorder with Acute Suicidal Ideation or Behavior. Approve for 2 months if the patient meets the following criteria (A, B, C, D, and E):

A) Patient is ≥ 18 years of age; AND

B) Patient has major depressive disorder that is considered to be severe, according to the prescriber; AND

C) Patient is concomitantly receiving at least one oral antidepressant; AND
Note: Antidepressants may include, but are not limited to, selective serotonin reuptake inhibitors (SSRIs), serotonin-norepinephrine reuptake inhibitors (SNRIs), tricyclic antidepressants (TCAs), mirtazapine, and bupropion.

D) Patient has one of the following (i or ii):
- **i.** No history of psychosis; OR
- **ii.** History of psychosis and the prescriber believes that the benefits of Spravato outweigh the risks; AND

E) The medication is prescribed by a psychiatrist.

258. Treatment-Resistant Depression. Approve for 6 months if the patient meets the following criteria (A, B, C, D, E, and F):

A) Patient is ≥ 18 years of age; AND

B) Patient meets both of the following (i and ii):
- **i.** Patient has demonstrated nonresponse (≤ 25% improvement in depression symptoms or scores) to at least two different antidepressants, each from a different pharmacologic class, according to the prescriber; AND

  Note: Different pharmacologic classes of antidepressants include selective serotonin reuptake inhibitors (SSRIs), serotonin-norepinephrine reuptake inhibitors (SNRIs), tricyclic antidepressants (TCAs), bupropion, mirtazapine, etc.
- **ii.** Each antidepressant was used at therapeutic dosages for at least 6 weeks in the current episode of depression, according to the prescriber; AND

C) Patient is concomitantly receiving at least one oral antidepressant; AND
Note: Antidepressants may include, but are not limited to, selective serotonin reuptake inhibitors (SSRIs), serotonin-norepinephrine reuptake inhibitors (SNRIs), tricyclic antidepressants (TCAs), mirtazapine, and bupropion.

D) Patient has one of the following (i or ii):
- **i.** No history of psychosis; OR

ii. History of psychosis and the prescriber believes that the benefits of Spravato outweigh the risks; AND

E) The patient's history of controlled substance prescriptions has been checked using the state prescription drug monitoring program (PDMP), unless unavailable in the state (see note below), according to the prescriber; AND

Note: As of 03/25/2020, the state of Missouri is the only state in the US that does not have a PDMP program in place.

F) The medication is prescribed by a psychiatrist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Spravato is not recommended in the following situations:

243. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Annual Revision	No change to criteria.	03/25/2020
Selected Revision	Addition of criteria for a new indication for Acute Suicidal Ideation or Behavior in adults with major depressive disorder receiving at least one oral antidepressant. For the Treatment-Resistant Depression criteria, prescribing physician was changed to prescriber and examples of different pharmacologic classes of antidepressants were moved to a Note.	08/05/2020
Selected Revision	**Acute Suicidal Ideation or Behavior**: Approval condition was changed to "**Major Depressive Disorder with Acute Suicidal Ideation or Behavior**" and the criterion for "major depressive disorder" was modified to include "that is considered to be severe, according to the prescriber".	9/16/2020

PRIOR AUTHORIZATION POLICY

POLICY: Psychiatry – Zulresso™ (brexanolone injection for intravenous use – Sage Therapeutics)

DATE REVIEWED: 05/13/2020

OVERVIEW

Zulresso, a neuroactive steroid gamma-aminobutric acid (GABA) A receptor positive modulator, is indicated for the treatment of postpartum depression in adults.[1] Zulresso was approved under a priority review by the FDA and was granted a breakthrough therapy designation. The active ingredient of Zulpressa, brexanolone, is chemically identical to endogenous allopregnanolone. Plasma concentrations of allopregnanolone increase during pregnancy and decrease substantially after childbirth in both rodents and humans, and fluctuations in allopregnanolone have demonstrated effects on anxiety and depression in animal models.[2] The mechanism of action of Zulresso is not fully understood but it has been shown to modulate GABA-mediated currents from recombinant human $GABA_A$ receptors in mammalian cells expressing $\alpha_1\beta_2\gamma_2$, $\alpha_4\beta_3\delta$, and $\alpha_6\beta_3\delta$ receptor subunits.[1]

The efficacy of Zulresso was established in two Phase III, US-only, randomized, double-blind, placebo-controlled, multicenter, pivotal studies in patients with moderate to severe postpartum depression initiating treatment within 6 months of delivery.[2] Zulresso is administered as a one-time, continuous intravenous (IV) infusion over 60 hours.[1]

Disease Overview

Postpartum (or peripartum) depression is a major depressive episode with onset during pregnancy or within 4 weeks of delivery that can have serious effects on the maternal-infant bond and later infant development.[3] Postpartum depression is estimated to affect 10% to 20% of women who give birth worldwide and occurs in low- to high-income countries.[2] Approximately 40% to 80% of cases of postpartum depression are considered moderate to severe. In the US, the estimated prevalence of postpartum depression in new mothers varies by state from 8% to 20%, with an overall prevalence of approximately 12%.

Postpartum depression is symptomatically indistinguishable from major depression.[3] However, the timing of its onset has led to the acknowledgement of it potentially being a unique illness. As with other forms of depression, it is characterized by sadness and/or loss of interest in activities that one used to enjoy and a decreased ability to feel pleasure and may present with symptoms such as cognitive impairment, feelings of worthlessness or guilt, or suicidal ideation.[4] Because of the risk of suicide, postpartum depression is considered a life-threatening condition.[3]

Abuse and Misuse

Zulresso is a CIV controlled substance.[1] In a human abuse potential study, 3% of volunteers administered Zulresso 90 mcg/kg and 13% of volunteers administered Zulresso 270 mcg/kg (three times the maximum recommended infusion rate) reported euphoric mood compared with no volunteers administered placebo over a 1 hour infusion.

Safety

Based on findings from animal studies of other drugs that enhance GABAergic inhibition, Zulresso may cause fetal harm.[1] Currently, there are no available data on Zulresso use in pregnant women to determine a drug-associated risk of major birth defects, miscarriage, or adverse maternal or fetal outcomes. A pregnancy exposure registry is available to monitor pregnancy outcomes in women exposed to antidepressants during pregnancy.

Zulresso has a Boxed Warning regarding excessive sedation and sudden loss of consciousness.[1] Because of the risk of serious harm, patients must be monitored for excessive sedation and sudden loss of consciousness and have continuous pulse oximetry monitoring. Patients must be accompanied during interactions with their children. During the infusion, patients must be monitored for sedative effects every 2 hours during planned, non-sleep periods. If there are signs or symptoms of excessive sedation, the infusion must be stopped immediately. After symptom resolution, the infusion may be restarted at the same or a lower dose.

Due to the risks of serious adverse events resulting from excessive sedation and sudden loss of consciousness, Zulresso is only available through a restricted distribution system under a REMS.[1,5] The Zulresso REMS requires healthcare facilities be enrolled in the program and ensure that Zulresso is only administered to patients enrolled in the program. Pharmacies are required to be certified and can only dispense Zulresso to certified healthcare facilities. Patients must enroll in the program prior to administration of Zulresso. The REMS requires the prescriber and the patient sign the Patient Enrollment Form that clearly states that the patient understands the risk of excessive sedation and loss of consciousness associated with Zulresso. A healthcare provider must be available on site to monitor the patient for the duration of the infusion. Patients must be monitored for hypoxia using continuous pulse oximetry and for excessive sedation every 2 hours during planned, non-sleep periods.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Zulresso. Because of the specialized skills required for evaluation and diagnosis of patients treated with Zulresso as well as the monitoring required for adverse events and long-term efficacy, approval requires Zulresso to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Note that a 1-month (30 days) approval duration is applied to allow for the scheduling and administration of the one-time, 60-hour infusion of Zulresso.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zulresso is recommended in those who meet the following criteria:

FDA-Approved Indications

259. Postpartum Depression. Approve for 1 month if the patient meets the following criteria (A, B, C, D, and E):

- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has been diagnosed with moderate to severe depression; AND
- **C)** Patient is ≤ 6 months postpartum; AND
- **D)** Patient is not currently pregnant; AND
- **E)** Zulresso is being prescribed by, or in consultation with, a psychiatrist or an obstetrician-gynecologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Zulresso has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

244. Previous Treatment with Zulresso During the Current Episode of Postpartum Depression.

245. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Annual revision	No change to criteria.	05/13/2020

PRIOR AUTHORIZATION POLICY

POLICY: Pulmonary – Corticosteroid/Long-Acting Beta$_2$-Agonist Combination Inhalers

- Advair Diskus® (fluticasone propionate/salmeterol inhalation powder – GlaxoSmithKline; generics [including Wixela™ Inhub™])
- Advair® HFA (fluticasone propionate/salmeterol inhalation aerosol – GlaxoSmithKline)
- AirDuo® Digihaler™ (fluticasone propionate/salmeterol inhalation powder – Teva)
- AirDuo® RespiClick® (fluticasone propionate/salmeterol inhalation powder – Teva; generic)
- Breo® Ellipta® (fluticasone furoate/vilanterol inhalation powder – GlaxoSmithKline)
- Dulera® (mometasone furoate/formoterol fumarate inhalation aerosol – Merck)
- Symbicort® (budesonide/formoterol fumarate inhalation aerosol – AstraZeneca; generic)

REVIEW DATE: 07/01/2020; selected revision 09/16/2020

OVERVIEW

Fluticasone propionate and salmeterol inhalation powder (Advair Diskus, generics [including Wixela Inhub]), Advair HFA, AirDuo Digihaler, AirDuo RespiClick (and authorized generic), Breo Ellipta, Dulera, and Symbicort (and authorized generic) are inhaled corticosteroid (ICS) and long-acting beta-agonist (LABA) combination products that exert local anti-inflammatory effects in the lungs and produce bronchial smooth muscle relaxation.[1-6] All of the corticosteroid/long-acting beta$_2$-agonist combination inhalers are indicated for the treatment of asthma.[1-6] Age indications vary by agent. Fluticasone propionate and salmeterol inhalation powder (Advair Diskus, generics [including Wixela Inhub]), Breo Ellipta, and Symbicort are also indicated for the maintenance treatment of airflow obstruction and reducing exacerbations in patients with chronic obstructive lung disease (COPD), including chronic bronchitis and/or emphysema.[1,3,5] Advair HFA and Dulera are not FDA-approved for the treatment of COPD; however, both products have been studied for this use.[2,4,7-9] The AirDuo products also have not specifically been studied in patients with COPD. However, these agents were filed as a New Drug Application under Section 505(b)(2) of the Federal Food, Drug, and Cosmetic Act.[6] This approval pathway relies in part upon evidence not developed by

the applicant. In the case of these agents, the literature and safety and effectiveness evidence supporting the approval and use of Advair Diskus (indicated in patients with COPD) are considered part of the evidence supporting the approval and use of the AirDuo products.

Guidelines

The 2020 Global Initiative for Chronic Obstructive Lung Disease (GOLD) guidelines for the diagnosis, management, and prevention of COPD support the use of combination ICS/LABA therapy in select highly symptomatic patients who are at high risk for COPD exacerbations.[10] The 2020 Global Initiative for Asthma (GINA) Global Strategy for Asthma Management and Prevention states that low-dose ICS/LABA combination therapy is the preferred treatment for adults and adolescents when low-dose ICS monotherapy fails to control the patient's asthma.[29] Certain low-dose ICS/LABA combinations (i.e., those containing formoterol) are also recommended as initial maintenance and reliever therapy for asthma as well. European Respiratory Society (ERS) guidelines on the diagnosis and treatment of chronic cough in adults and children recommend a short-term trial (2 to 4 weeks) of ICS and long-acting bronchodilator (e.g. a LABA) combination in adults with chronic cough and fixed airflow obstruction.[20]

Other Uses with Supportive Evidence

There are also data to support the use of ICS/LABA inhalers in patients with postinfectious cough. Subacute postinfectious cough may have multiple possible underlying etiologies, including asthma.[11,12] The underlying cause of the cough must be determined before making therapeutic decisions. In this situation, ICS/LABA combination therapy may be used as diagnostic empiric therapy in determining the cause of cough (i.e., rule out asthma). When a patient with subacute cough presents with wheezes, rhonchi, or crackles with a normal chest radiograph, it may be a reasonable option to consider therapy with an inhaled bronchodilator and ICS. If cough following an upper respiratory tract infection persists for > 8 weeks, diagnoses other than postinfectious cough should be considered.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of fluticasone propionate and salmeterol inhalation powder (Advair Diskus, generics [including Wixela Inhub]), Advair HFA, AirDuo Digihaler, AirDuo RespiClick, fluticasone and salmeterol inhalation powder (authorized generic of AirDuo RespiClick), Breo Ellipta, Dulera, Symbicort, and budesonide/formoterol fumarate inhalation aerosol (authorized generic of Symbicort). The purpose of this policy is to support the use of the corticosteroid/long-acting beta$_2$-agonist combination inhalers in chronic conditions where the products are indicated or their use is appropriate. All approvals are provided for the duration listed below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: Prescription claims (prior 130 days) for respiratory medications (e.g., leukotriene receptor antagonists; xanthines; inhaled mast cell stabilizers; oral and inhaled beta-agonists; inhaled corticosteroids, inhaled anticholinergic agents) are used as a surrogate marker for a diagnosis of asthma or chronic obstructive pulmonary disease (COPD). If use of these medications is not met at the point-of-service, coverage will be determined by prior authorization criteria. When available, the ICD-10 codes for asthma and COPD (including chronic bronchitis/emphysema) will also be used in automation to generate an approval of the requested medication (see Appendix A).

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of fluticasone propionate and salmeterol inhalation powder (Advair Diskus, generics [including Wixela Inhub]), Advair HFA, AirDuo Digihaler, AirDuo RespiClick, fluticasone and salmeterol inhalation powder (authorized generic of AirDuo RespiClick), Breo Ellipta, Dulera, Symbicort, or budesonide/formoterol fumarate inhalation aerosol (authorized generic of Symbicort) is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Asthma/Reactive Airway Disease.** Approve for 3 years.
2. **Chronic Obstructive Pulmonary Disease.** Approve for 3 years.
3. **Chronic Bronchitis.** Approve for 3 years.
4. **Emphysema.** Approve for 3 years.

Other Uses with Supportive Evidence

5. **Postinfectious Cough.** Approve for 2 months.
   Note: Postinfectious cough is cough that persists after an acute respiratory infection has resolved.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of fluticasone propionate and salmeterol inhalation powder (Advair Diskus, generics [including Wixela Inhub]), Advair HFA, AirDuo Digihaler, AirDuo RespiClick, fluticasone and salmeterol inhalation powder (authorized generic of AirDuo RespiClick), Breo Ellipta, Dulera, and Symbicort is not recommended in the following situations:

297. **Acute Cough Associated with the Common Cold.** Note: This includes symptoms associated with a current rhinovirus infection.
   There are no data to support the use of ICS/LABA combination therapy in treating this condition. American College of Chest Physicians (ACCP) guidelines for the treatment of acute cough associated with the common cold do not recommend using an ICS or a bronchodilator in treating this condition.[11,26] Over-the-counter (OTC) cough and cold preparations are recommended, as is honey in pediatric patients.

298. **Chronic Cough due to Gastroesophageal Reflux Disease (GERD).** There are no data to support the use of ICS/LABA combination therapy in treating this condition. The ACCP guidelines for the management of chronic cough due to GERD recommend treatment of the underlying condition and do not mention the use of any inhaled therapies.[13,24]

299. **Acute Cough due to an Acute Respiratory Infection.** Note: Examples of an acute respiratory infection are acute bronchitis, sinusitis, influenza, or pneumonia. An acute exacerbation of chronic bronchitis is not the same as acute bronchitis.
   ACCP guidelines for the management of acute cough due to acute bronchitis in immunocompetent adult outpatients do not recommend routine use of inhaled corticosteroids and inhaled beta-agonists.[14] Current evidence is not sufficient to prove that these therapies are safe and effective at reducing the severity and duration of cough in this setting. Bronchodilators are also not a recommended therapeutic option in treating cough associated with acute bacterial sinusitis.[12] Additional ACCP guidelines for the management of acute cough due to suspected pneumonia or influenza state that there is insufficient evidence on the use of nonantibiotic symptomatic therapies such as ICSs or bronchodilators.[26] There are no data to support the use of ICS/LABA combination therapy in treating these conditions.

300. **Chronic Cough due to Non-Asthmatic Eosinophilic Bronchitis (NAEB).** There are no data to support the use of ICS/LABA combination therapy in treating this condition. Per the guidelines for the management of chronic cough due to NAEB from ACCP ICSs are the recommended first-line treatment.[11,23] One of the clinical characteristics of NAEB is chronic cough without evidence of variable airflow obstruction or airway hyperresponsiveness. As a result, a beta-agonist bronchodilator would not be expected to be useful in treating this condition.

301. **Chronic Cough due to Bronchiolitis.** The ACCP guidelines do not recommend bronchodilators as a therapeutic option in treating bronchiolitis.[11,15] Use of asthma medications is discouraged unless other evidence of asthma is present. Guidelines from the American Academy of Pediatrics regarding the diagnosis and management of bronchiolitis (2014) also do not recommend inhaled corticosteroids or bronchodilators be routinely used in the management of bronchiolitis.[16]

302. **Chronic Cough due to Bronchiectasis.** Limited data are available with budesonide/formoterol (foreign formulation of Symbicort) for the treatment of non-cystic fibrosis (CF) bronchiectasis.[17,18] ACCP guidelines note that in patients with bronchiectasis due to CF or other causes, treatment of respiratory infections and airway clearance techniques are the mainstays of management.[27] In patients with airflow obstruction and/or bronchial hyperreactivity (e.g., asthma and/or COPD), bronchodilators may be of benefit.[11,19] However, the ACCP guidelines and the British Thoracic Society (BTS) guidelines do not recommend treatment with ICSs. Bronchiectasis guidelines from the European Respiratory Society also recommend against offering ICSs to adult

patients with bronchiectasis.[20] There may be a role for combination ICS/LABA therapy in patients with coexisting asthma or COPD, but there is no evidence to support this therapy in patients without these concomitant conditions.[19,20]

303. Whooping Cough/Pertussis. There are no data to support the use of ICS/LABA combination therapy in treating this condition. According to the ACCP guidelines, LABAs and corticosteroids should not be offered to patients with whooping cough as there is no evidence to suggest benefit.[11] Although short-acting beta-agonists (SABA) [along with other treatments] have been proposed as standard treatment for whooping cough, one review article reported that treatment with the SABA salbutamol resulted in no change in coughing.[21]

304. Angiotensin-Converting Enzyme (ACE) Inhibitor-Induced Cough. There are no data to support the use of ICS/LABA combination therapy in treating this condition. Discontinuation of the ACE inhibitor is the only uniformly effective treatment for ACE inhibitor-induced cough. In those patients in whom the ACE inhibitor cannot be discontinued, pharmacologic therapy aimed at suppressing cough should be attempted. ICSs and beta-agonists are not recommended therapeutic options.[11]

305. Psychogenic Cough/Habit Cough/Tic Cough. There are no data to support the use of ICS/LABA combination therapy in treating these conditions. Non-pharmacological therapies, such as behavior modification, hypnosis and psychiatric therapy are the mainstays of treatment.[11,22]

306. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	No changes.	05/23/2018
Annual Revision	Policy updated to include generics to Advair Diskus.	06/12/2019
Update	8/26/2019: • Automation: removed "inhaled combinations of these agents" as surrogate markers for the diagnosis of asthma or COPD.	NA
Annual Revision	• Policy Statement: o Noted that Wixela Inhub, a generic to Advair Diskus with its own brand name, is included in the policy. • Automation: o Added specific ICD-10 codes used in Automation to Appendix A. • Conditions Recommended for Approval: o Moved Chronic Bronchitis and Emphysema from "Other Uses with Supportive Evidence" to "FDA-Approved Indications". • Conditions Not Recommended for Approval: o Changed "Treatment of Symptoms Associated with a Current Rhinovirus Infection/Cough Associated with a Current Episode of the Common Cold" to "Acute Cough Associated with the Common Cold". o Changed "Treatment of Chronic Cough due to Gastroesophageal Reflux Disease (GERD): to "Chronic Cough due to Gastroesophageal Reflux Disease (GERD)". o Changed "Treatment of Symptoms due to an Acute Respiratory Infection" to "Acute Cough due to an Acute Respiratory Infection". o Changed "Treatment of Chronic Cough due to Bronchiolitis" to "Chronic Cough due to Bronchiolitis". o Changed "Treatment of Chronic Cough due to Bronchiectasis" to "Chronic Cough due to Bronchiectasis".	07/01/2020
Selected Revision	Policy updated to include AirDuo Digihaler.	09/16/2020
Update	Date: 12/01/2020 No criteria changes. Policy updated to include budesonide/formoterol fumarate inhalation aerosol (authorized generic to Symbicort).	NA

APPENDIX A

ICD-10 Codes Automated for Asthma and COPD

ICD-10 Codes	Code Description
J41*	Simple and mucopurulent chronic bronchitis
J41.0	Simple chronic bronchitis
J41.1	Mucopurulent chronic bronchitis
J41.8	Mixed simple and mucopurulent chronic bronchitis
J42	Unspecified chronic bronchitis
J43*	Emphysema
J43.0	Unilateral pulmonary emphysema (MacLeod's syndrome)
J43.1	Panlobular emphysema
J43.2	Centrilobular emphysema
J43.8	Other emphysema
J43.9	Emphysema, unspecified
J44*	Other chronic obstructive pulmonary disease
J44.0	Chronic obstructive pulmonary disease with (acute) lower respiratory infection
J44.1	Chronic obstructive pulmonary disease with (acute) exacerbation
J44.9	Chronic obstructive pulmonary disease, unspecified
J45*	Asthma
J45.2*	Mild intermittent asthma
J45.20	Mild intermittent asthma, uncomplicated
J45.21	Mild intermittent asthma with (acute) exacerbation
J45.22	Mild intermittent asthma with status asthmaticus
J45.3*	Mild persistent asthma
J45.30	Mild persistent asthma, uncomplicated
J45.31	Mild persistent asthma with (acute) exacerbation
J45.32	Mild persistent asthma with status asthmaticus
J45.4*	Moderate persistent asthma
J45.40	Moderate persistent asthma, uncomplicated
J45.41	Moderate persistent asthma with (acute) exacerbation
J45.42	Moderate persistent asthma with status asthmaticus
J45.5*	Severe persistent asthma
J45.50	Severe persistent asthma, uncomplicated
J45.51	Severe persistent asthma with (acute) exacerbation
J45.52	Severe persistent asthma with status asthmaticus
J45.9*	Other and unspecified asthma
J45.90*	Unspecified asthma
J45.901	Unspecified asthma with (acute) exacerbation
J45.902	Unspecified asthma with status asthmaticus
J45.909	Unspecified asthma, uncomplicated
J45.99*	Other asthma
J45.990	Exercise induced bronchospasm
J45.991	Cough variant asthma
J45.998	Other asthma

COPD – Chronic obstructive pulmonary disease; * Indicates the inclusion of subheadings.

PRIOR AUTHORIZATION POLICY

POLICY: Pulmonary – Daliresp Prior Authorization Policy

- Daliresp® (roflumilast tablets – Astra Zeneca)

REVIEW DATE: 11/11/2020

OVERVIEW

Daliresp, a selective phosphodiesterase-4 (PDE-4) inhibitor, is indicated as a treatment to reduce the risk of **chronic obstructive pulmonary disease** (COPD) exacerbations in patients with severe COPD

associated with chronic bronchitis and a history of exacerbations.[1] Daliresp is not a bronchodilator and is not indicated for the relief of acute bronchospasm.

Clinical Efficacy

Daliresp has been studied in patients currently receiving treatment with bronchodilators (e.g., long-acting $beta_2$-agonists [LABAs]) and inhaled corticosteroids (ICSs) with or without additional therapy with a long-acting muscarinic antagonist (LAMA).[2-7] Five placebo-controlled clinical trials evaluated the effect of Daliresp on COPD exacerbations.[1-7] Two of these studies initially included patients with severe COPD with chronic bronchitis and/or emphysema; in both studies, Daliresp did not demonstrate a significant reduction in COPD exacerbation rates. An exploratory analysis of these trials found that in the subgroup of patients with severe COPD who had chronic bronchitis and exacerbations within the previous year, Daliresp resulted in better exacerbation reduction than in the overall population. Two subsequent trials were conducted involving patients with severe COPD, chronic bronchitis, and at least one COPD exacerbation within the previous year. In both trials, Daliresp demonstrated a significant reduction in the rate of moderate or severe exacerbations compared to placebo.

Guidelines

The 2020 Global Initiative for Chronic Obstructive Lung Disease (GOLD) guidelines for the diagnosis, management, and prevention of COPD recommend bronchodilators and inhaled corticosteroids as initial pharmacological treatment.[8] Following initiation, therapies should be adjusted as needed based on symptom severity and exacerbation risk. Daliresp is recommended in patients who continue to experience exacerbations despite LAMA/ LABA combination therapy and have a blood eosinophil level < 100 cells/microliter. Low blood eosinophils are predictive of an insufficient response to ICS therapy, thereby making Daliresp a good option. Daliresp is also listed as a possible therapeutic option in patients receiving triple therapy with an ICS/LAMA/LABA who have an forced expiratory volume in 1 second (FEV_1) < 50% and chronic bronchitis, and continue to experience exacerbations (especially if the patient has been hospitalized for one or more COPD exacerbations in the past year).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Daliresp. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Daliresp is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Chronic Obstructive Pulmonary Disease (COPD).** Approve Daliresp for 3 years if the patient meets the following criteria (A, B, C, and D):
   - **A)** Patient has severe COPD or very severe COPD, according to the prescriber; AND
   - **B)** Patient has a history of exacerbations; AND
   - **C)** Patient meets ONE of the following (i or ii):
     - **i.** Patient has chronic bronchitis AND has tried an inhaled long-acting $beta_2$-agonist, an inhaled long-acting muscarinic antagonist, and an inhaled corticosteroid concomitantly; OR
     - **ii.** Patient has tried an inhaled long-acting muscarinic antagonist and long-acting $beta_2$-agonist concomitantly AND has a blood eosinophil level < 100 cells/microliter.

Note: Use of a combination inhaler containing multiple agents from the medication classes listed would fulfil the requirement. Examples of an inhaled long-acting beta$_2$-agonists include Arcapta Neohaler, Serevent Diskus, Striverdi Respimat, Brovana, and Perforomist. Examples of a long-acting muscarinic antagonists include Incruse Ellipta, Seebri Neohaler, Spiriva HandiHaler, Spiriva Respimat, Tudorza Pressair, Lonhala Magnair, and Yupelri. Examples of inhaled corticosteroids include Alvesco, ArmonAir Digihaler, Arnuity Ellipta, Asmanex Twisthaler/HFA, Flovent Diskus/HFA, Pulmicort Flexhaler, Qvar RediHaler, and budesonide suspension for inhalation (Pulmicort Respules, generics). Examples of inhaled corticosteroid/long-acting beta$_2$-agonist combination inhalers include Advair Diskus (generic Wixela Inhub; authorized generics), Breo Ellipta, and Symbicort. Examples of long-acting muscarinic antagonist/long-acting beta$_2$-agonist combination inhalers include Anoro Ellipta, Bevespi Aerosphere, Duaklir Pressair, Stiolto Respimat, and Utibron Neohaler. Examples of corticosteroid/long-acting beta$_2$-agonist/long-acting muscarinic antagonist combination inhalers are Breztri Aerosphere and Trelegy Ellipta.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Daliresp is not recommended for the following situations:

307. **Asthma.** The efficacy of roflumilast (formulation not specified) in patients with asthma[9-11], allergic asthma[12,13], and exercise-induced asthma[14] has been evaluated. More data are needed to define the place in therapy of Daliresp in the treatment of asthma. Current asthma guidelines from the Global Initiative for Asthma Prevention (GINA) [2020] and the European Respiratory Society (ERS)/American Thoracic Society (ATS) [2014] Global Strategy for Asthma Management and Prevention do not address Daliresp as a recommended therapy for asthma management.[15,16]

308. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	**Chronic Obstructive Pulmonary Disease (COPD):** Criteria updated to clarify that patient must try LABA, LAMA, and ICS together as combination therapy prior to approval of Daliresp.	10/24/2018
Annual Revision	**Chronic Obstructive Pulmonary Disease (COPD):** Added criteria to allow for approval for patients who have chronic bronchitis AND has tried an inhaled long-acting beta$_2$-agonist, an inhaled long-acting muscarinic antagonist, and an inhaled corticosteroid concomitantly (previously in place) OR patients who have tried an inhaled long-acting muscarinic antagonist and long-acting beta$_2$-agonist concomitantly AND has a blood eosinophil level < 100 cells/microliter. Wording in reference to "according to the prescribing physician" was changed to "according to the prescriber".	10/23/2019
Annual Revision	**Chronic Obstructive Pulmonary Disease (COPD):** No changes to criteria. Updated list of examples of inhaled long-acting beta$_2$-agonists, long-acting muscarinic antagonists, and corticosteroids.	11/11/2020

COPD – Chronic obstructive pulmonary disease; LABA – Long-acting beta agonist; LAMA – Long-acting muscarinic antagonist; ICS – Inhaled corticosteroid.

PRIOR AUTHORIZATION POLICY

POLICY: Pulmonary Arterial Hypertension – Adempas Prior Authorization Policy
- Adempas® (riociguat tablets – Bayer)

REVIEW DATE: 09/23/2020

OVERVIEW

Adempas, a soluble guanylate cyclase (sGC) stimulator, is indicated for the treatment of adults with:[1]
- **Chronic thromboembolic pulmonary hypertension** (CTEPH) [World Health Organization {WHO} Group 4], persistent/recurrent, after surgical treatment, or inoperable CTEPH, to improve exercise capacity and WHO functional class.
- **Pulmonary Arterial Hypertension** (PAH) [WHO Group 1), to improve exercise capacity, WHO functional class, and to delay clinical worsening.

Disease Overview

PAH is a serious but rare condition impacting approximately fewer than 20,000 patients in the US. It is classified within Group 1 pulmonary hypertension among the five different groups that are recognized. In this progressive disorder the small arteries in the lungs become narrowed, restricted, or blocked causing the heart to work harder to pump blood, leading to activity impairment.[2,3] In time, right-sided heart failure and/or death may occur. Common PAH symptoms include shortness of breath, fatigue, chest pain, dizziness and fainting, along with impairment in activity tolerance. It is more prevalent in women. Patients of all

ages may develop the disease; however, the mean age of diagnosis typically happens between 36 to 50 years. Children may also have PAH. The condition may occur due to various underlying medical conditions or as a disease that uniquely impacts the pulmonary circulation; both genetic and environmental factors may be involved. PAH is defined as a mean pulmonary artery pressure (mPAP) ≥ 25 mmHg with a pulmonary capillary wedge pressure (PCWP) ≤ 15 mmHg measured by cardiac catheterization. The prognosis in PAH has been described as poor, with the median survival being approximately 3 years. However, primarily due to advances in pharmacological therapies, the long-term prognosis has improved. Lung transplantation may be recommended if pharmacological or medical therapies fail, based upon patient status. The WHO categorizes PAH into stages, which is also referred to as the functional class (Class I to IV) and is an adaptation of the New York Heart Association (NYHA) system to evaluate activity tolerance.

CTEPH is a persistent obstruction of pulmonary arteries and is often a complication of pulmonary embolism.[4,5] It is classified within Group 4 pulmonary hypertension. Symptoms include progressive dyspnea on exertion, as well as fatigue, syncope, hemoptysis, and signs of right heart failure. Pulmonary endarterectomy is the treatment of choice for most patients with CTEPH. However, around 40% of patients are deemed inoperable for various reasons. Medication therapy, including Adempas, may also be recommended. Anticoagulant therapy is also given.

Guidelines

In 2019, an updated CHEST guideline and Expert Panel Report regarding therapy for pulmonary arterial hypertension in adults was released.[5] Evidence for use of the many medications available is also detailed. Adempas is cited as a vital therapy in the management of PAH with several benefits in a variety of clinical scenarios.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Adempas. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Adempas as well as the monitoring required for adverse events and long-term efficacy, approval requires these agents to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Documentation: In the *Pulmonary Arterial Hypertension – Adempas Prior Authorization Policy*, documentation is required for initiation of therapy where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes and catheterization laboratory reports. For a patient case in which the documentation requirement of the right heart catheterization upon prior authorization coverage review for a different medication indicated for WHO Group 1 PAH has been previously provided, the documentation requirement in this *Pulmonary Arterial Hypertension – Adempas Prior Authorization Policy* is considered to be met.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Adempas is recommended in those who meet the following criteria:

FDA-Approved Indication

34. **Chronic Thromboembolic Pulmonary Hypertension (CTEPH).** Approve for 3 years if prescribed by, or in consultation with, a pulmonologist or a cardiologist.

35. Pulmonary Arterial Hypertension (PAH) [World Health Organization {WHO} Group 1]. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 years if the patient meets all of the following criteria (i, ii, and iii):
- **i.** Patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND
- **ii.** Patient meets the following criteria (a and b):
  - **a)** Patient has had a right heart catheterization **[documentation required]** (see documentation section above); AND
  - **b)** Results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND
- **iii.** Medication is prescribed by, or in consultation with, a cardiologist or a pulmonologist.

B) Patient is Currently Receiving Adempas. Approve for 3 years if the patient meets all of the following criteria (i, ii, and iii):
- **i.** Patient has a diagnosis of WHO Group 1 PAH; AND
- **ii.** Patient meets the following criteria (a and b):
  - **a)** Patient has had a right heart catheterization; AND
  - **b)** Results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND
- **iii.** Medication is prescribed by, or in consultation with, a cardiologist or a pulmonologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Adempas is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	For initial review, documentation is required for the right heart catheterization. For patients who are currently receiving Adempas, the wording "or who are receiving another medication for WHO Group 1 PAH" was removed, along with the cited alternatives. Also, the requirement was added that the patient has had a right heart catheterization and that the results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH. A note was added in the documentation section that for a patient case in which the documentation requirement of the right heart catheterization upon prior authorization coverage review for a different medication indicated for WHO Group 1 PAH has been previously provided, the documentation requirement is considered to be met.	08/22/2018
Annual Revision	No criteria changes.	09/11/2019
Annual Revision	No criteria changes.	09/23/2020

PRIOR AUTHORIZATION POLICY

POLICY: Pulmonary Arterial Hypertension – Endothelin Receptor Antagonists
- Letairis® (ambrisentan tablets – Gilead, generics)
- Opsumit® (macitentan tablets – Actelion)
- Tracleer® (bosentan tablets [generic] and tablets for oral suspension – Actelion)

REVIEW DATE: 09/23/2020

OVERVIEW

Letairis, Opsumit and Tracleer are oral endothelin receptor antagonists indicated for the treatment of pulmonary arterial hypertension (PAH) World Health Organization (WHO) Group 1.[1-3] Letairis is indicated to improve exercise ability and delay clinical worsening as well as for use in combination with tadalafil to reduce the risks of disease progression and hospitalization for worsening PAH, and to improve exercise ability.[2] Opsumit is noted to reduce the risks of disease progression and hospitalization for PAH.[3] Tracleer is indicated in adults to improve exercise ability and decrease the rate of clinical worsening and in pediatric patients ≥ 3 years of age with idiopathic or congenital PAH to improve pulmonary vascular resistance (PVR), which is expected to result in an improvement in exercise ability.[1]

The BENEFiT (Bosentan Effects in iNopErable Forms of chronic Thromboembolic pulmonary hypertension) study was a double-blind trial involving patients with chronic thromboembolic pulmonary hypertension (CTEPH) who were randomized to Tracleer or placebo for 16 weeks (n = 156). Benefits were noted in some hemodynamic parameters (e.g., decreased PVR).[4] Adempas® (riociguat tablets), a soluble guanylate cyclase stimulator, is the only agent indicated for the treatment of adults with CTEPH (WHO Group 4) after surgical treatment, or inoperable CTEPH, to improve exercise capacity and WHO functional class.[5] The agent is also indicated for the treatment of adults with PAH (WHO Group 1). Adempas has a Boxed Warning regarding embryofetal toxicity and is contraindicated in patients using nitrates or nitric oxide donors in any forms, as well as in patients using phosphodiestase inhibitors. The main adverse event associated with Adempas is symptomatic hypotension.

Tracleer has been used in patients with systemic sclerosis who have digital ulcers.[6-13] In a prospective, multicenter, placebo-controlled, double-blind study patients (n = 122) with limited or diffuse systemic sclerosis (scleroderma) were randomized in a 2:1 ratio to receive Tracleer or placebo for 16 weeks.[6] Patients receiving Tracleer had a 48% reduction in the mean number of new ulcerations (1.4 vs. 2.7 new ulcers; P = 0.0083), the primary efficacy endpoint. The effect was more substantial in patients with digital ulcers at study entry. However, no differences were noted in the healing of established ulcers.[6] Another trial showed a reduction in the occurrence of new digital ulcers in patients given Tracleer for 24 weeks.[10] Many other agents are utilized in digital ulcers.[8,14,15]

Disease Overview

PAH is a serious but rare condition impacting approximately fewer than 20,000 patients in the US. It is classified within Group 1 pulmonary hypertension among the five different groups that are recognized. In this progressive disorder the small arteries in the lungs become narrowed, restricted, or blocked causing the heart to work harder to pump blood, leading to activity impairment.[16,17] In time, right-sided heart failure and/or death may occur. Common PAH symptoms include shortness of breath, fatigue, chest pain, dizziness and fainting, along with impairment in activity tolerance. It is more prevalent in women. Patients of all ages may develop the disease; however, the mean age of diagnosis typically happens between 36 to 50 years. Children may also have PAH. The condition may occur due to various underlying medical

conditions or as a disease that uniquely impacts the pulmonary circulation; both genetic and environmental factors may be involved. PAH is defined as a mean pulmonary artery pressure (mPAP) ≥ 25 mmHg with a pulmonary capillary wedge pressure (PCWP) ≤ 15 mmHg measured by cardiac catheterization. The prognosis in PAH has been described as poor, with the median survival being approximately 3 years. However, primarily due to advances in pharmacological therapies, the long-term prognosis has improved. Lung transplantation may be recommended if pharmacological or medical therapies fail, based upon patient status. The WHO categorizes PAH into stages, which is also referred to as the functional class (Class I to IV) and is an adaptation of the New York Heart Association (NYHA) system to evaluate activity tolerance.

CTEPH is a persistent obstruction of pulmonary arteries and is often a complication of pulmonary embolism.[18,19] It is classified within Group 4 pulmonary hypertension. Symptoms include progressive dyspnea on exertion, as well as fatigue, syncope, hemoptysis, and signs of right heart failure. Pulmonary endarterectomy is the treatment of choice for most patients with CTEPH. However, around 40% of patients are deemed inoperable for various reasons. Medication therapy may also be recommended. Anticoagulant therapy is also given.

Guidelines

Various guidelines address endothelin receptor antagonists.

- **Pulmonary Arterial Hypertension:** In 2019, an updated CHEST guideline and Expert Panel Report regarding therapy for pulmonary arterial hypertension in adults details many medications. It was noted that endothelin receptor antagonists play a vital role and have various benefits in the management of PAH.[17]
- **Systemic Sclerosis:** In 2017 the European League Against Rheumatism (EULAR) updated recommendations for the treatment of systemic sclerosis.[12] Tracleer should be considered to reduce the number of new digital ulcers in systemic sclerosis, especially in patients who have multiple digital ulcers despite use of calcium channel blockers, phosphodiesterase type 5 inhibitors or iloprost therapy.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Letairis, Opsumit, and Tracleer. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with these agents, as well as the monitoring required for adverse events and long-term efficacy, approval requires the agents to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Documentation: In the *Pulmonary Arterial Hypertension – Endothelin Receptor Antagonists Prior Authorization Policy*, documentation is required for initiation of therapy where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes and catheterization laboratory reports. For a patient case in which the documentation requirement of the right heart catheterization upon Prior Authorization coverage review for a different medication indicated for WHO Group 1 PAH has been previously provided, the documentation requirement in this *Pulmonary Arterial Hypertension – Endothelin Receptor Antagonist Prior Authorization Policy* is considered to be met.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Letairis, Opsumit, and Tracleer is recommended in those who meet the following criteria:

FDA-Approved Indication

36. Pulmonary Arterial Hypertension (PAH) [World Health Organization {WHO} Group 1]. Approve for the duration noted if the patient meets ONE of the following (A or B):

C) Initial Therapy. Approve for 3 years if the patient meets all of the following criteria (i, ii, and iii).

i. Patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND

ii. Patient meets the following criteria (a and b):

a) Patient has had a right heart catheterization **[documentation required]** (see documentation section above); AND

b) Results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND

iii. The medication is prescribed by or in consultation with a cardiologist or a pulmonologist.

D) Patient is Currently Receiving the Requested Endothelin Receptor Antagonist (i.e., Letairis, Opsumit, or Tracleer). Approve for 3 years if the patient meets the following criteria (i, ii, and iii):

iv. Patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND

v. Patient meets the following criteria (a and b):

a) Patient has had a right heart catheterization; AND

b) Results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND

vi. The medication is prescribed by, or in consultation with, a cardiologist or a pulmonologist.

Other Uses with Supportive Evidence

Coverage of Tracleer is also recommended in those who meet the following criteria:

37. Chronic Thromboembolic Pulmonary Hypertension (CTEPH). Approve Tracleer for 3 years if the patient meets the following criteria (A and B):

A) Patient meets one of the following criteria (i, ii, or iii):

i. Patient has tried Adempas; OR

ii. Patient has a specific contraindication to use of Adempas according to the prescriber; OR
Note: Examples of contraindications to use of Adempas include that the patient is receiving nitrates or nitric oxide donors, the patient is receiving a phosphodiesterase inhibitor such as sildenafil or tadalafil, or that the patient is hypotensive or is at risk for hypotension.

iii. Patient is currently receiving Tracleer.

B) The medication is prescribed by, or in consultation with, a cardiologist or a pulmonologist.

38. Digital Ulcers/Systemic Sclerosis. Approve Tracleer for 3 years if the patient meets the following criteria (A or B):

A) Patient has tried two other therapies for this condition such as calcium channel blockers (CCBs), phosphodiesterase type 5 (PDE5) inhibitors, alpha-adrenergic blockers, nitroglycerin, or angiotensin converting enzyme (ACE) inhibitors; OR
Note: Examples of CCBs include amlodipine, felodipine, and nifedipine; an example of an alpha-adrenergic blocker is prazosin; and examples of PDE5 inhibitors include sildenafil and Levitra® (vardenafil tablets).

B) Patient has tried one vasodilator/prostanoid therapy.
Note: Examples of vasodilator/prostanoid therapies include epoprostenol injection and alprostadil injection.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Letairis, Opsumit, and Tracleer is not recommended in the following situations:

309. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Selected Revision	Selected revision to add Tracleer oral suspension to the policy. No criteria changes were made.	02/07/2018
Annual Revision	For initial review, documentation is required for the right heart catheterization. For patients who are currently receiving the requested endothelin receptor antagonist, the wording "or who are receiving another medication for WHO Group 1 PAH" was removed, along with the cited alternatives. Also, the requirement was added that the patient has had a right heart catheterization and that the results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH. A note was added in the documentation section that for a patient case in which the documentation requirement of the right heart catheterization upon prior authorization coverage review for a different medication indicated for WHO Group 1 PAH has been previously provided, the documentation requirement is considered to be met.	08/22/2018
Update	04/10/2019: No criteria changes. Selected revision to add that generics are available to Letairis (tablets).	---
Annual Revision	No criteria changes. Medication alternatives are now listed as notes.	09/11/2019

Annual Revision	**Chronic Thromboembolic Pulmonary Hypertension:** For Tracleer the criteria regarding "patient has a specific contraindication to use of Adempas" wording was changed from "according to the prescribing physician" to "according to the prescriber."	09/23/2020

WHO – World Health Organization; PAH – Pulmonary arterial hypertension.

PRIOR AUTHORIZATION POLICY

POLICY: Pulmonary Arterial Hypertension – Epoprostenol Products Prior Authorization Policy

- Flolan® (epoprostenol injection – GlaxoSmithKline, generic)
- Veletri® (epoprostenol injection – Actelion)

REVIEW DATE: 09/23/2020

OVERVIEW

Epoprostenol injection, a prostacyclin vasodilator, is indicated for the treatment of pulmonary arterial hypertension (PAH) [World Health Organization {WHO} Group 1] to improve exercise capacity.[1-3]

Epoprostenol injection has been used with varying results in patients with chronic thromboembolic pulmonary hypertension (CTEPH).[4-6] It is sometimes used as a bridge prior to surgery. Limited options are available for patients with CTEPH.

Disease Overview

PAH is a serious but rare condition impacting fewer than 20,000 patients in the US. It is classified within Group 1 pulmonary hypertension among the five different groups that are recognized. In this progressive disorder the small arteries in the lungs become narrowed, restricted, or blocked causing the heart to work harder to pump blood, leading to activity impairment.[7,8] In time, right-sided heart failure and/or death may occur. Common PAH symptoms include shortness of breath, fatigue, chest pain, dizziness and fainting, along with impairment in activity tolerance. It is more prevalent in women. Patients of all ages may develop the disease; however, the mean age of diagnosis typically happens between 36 to 50 years. Children may also have PAH. The condition may occur due to various underlying medical conditions or as a disease that uniquely impacts the pulmonary circulation; both genetic and environmental factors may be involved. PAH is defined as a mean pulmonary artery pressure $\geq$ 25 mmHg with a pulmonary capillary wedge pressure $\leq$ 15 mmHg measured by cardiac catheterization. The prognosis in PAH has been described as poor, with the median survival being approximately 3 years. However, primarily due to advances in pharmacological therapies, the long-term prognosis has improved. Lung transplantation may be recommended if pharmacological or medical therapies fail, based upon patient status. The WHO categorizes PAH into stages, which is also referred to as the functional class (Class I to IV) and is an adaptation of the New York Heart Association system to evaluate activity tolerance.

CTEPH is a persistent obstruction of pulmonary arteries and is often a complication of pulmonary embolism.[9,10] It is classified within Group 4 pulmonary hypertension. Symptoms include progressive dyspnea on exertion, as well as fatigue, syncope, hemoptysis, and signs of right heart failure. Pulmonary endarterectomy is the treatment of choice for most patients with CTEPH. However, around 40% of patients are deemed inoperable for various reasons. Medication therapy may also be recommended. Anticoagulant therapy is also given.

Guidelines

In 2019, and updated CHEST guideline and Expert Panel Report regarding therapy for pulmonary arterial hypertension in adults was released.[8] Evidence for use of the many medications available is also detailed. In the absence of contraindications, patients with PAH should undergo acute vasoreactivity testing utilizing a short-acting agent (e.g., calcium channel blockers). For patients in Functional Class II, oral therapies are recommended such as endothelin receptor antagonists (Letairis® [ambrisentan tablets], Tracleer® [bosentan tablets], Opsumit® [macitentan tablets]), phosphodiesterase type 5 (PDE 5) inhibitors (tadalafil, sildenafil), and Adempas® (riociguat tablets). It is suggest that parenteral or inhaled prostanoids not be chosen as initial therapy for treatment naïve-patients with PAH with WHO Functional Class II symptoms or as second-line agents for patients with PAH with WHO Functional Class II who have not met their treatment goals. Parenteral prostanoids are recommended for patients with PAH in Functional Class III and IV.

Safety

Epoprostenol should not be abruptly discontinued or have the dose rapidly decreased as rebound pulmonary hypertension may occur.[1-3]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of epoprostenol injection. All approvals are provided for 1 year in duration unless otherwise noted below. Specifically, approvals will remain at 14 days for patients currently receiving the agent with inadequate information or if the criteria are not met. Because of the specialized skills required for evaluation and diagnosis of patients treated with epoprostenol injection as well as the monitoring required for adverse events and long-term efficacy, approval requires epoprostenol injection to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Documentation: In the *Pulmonary Arterial Hypertension – Epoprostenol Prior Authorization Policy*, documentation is required for initiation of therapy where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes and catheterization laboratory reports. For a patient case in which the documentation requirement of the right heart catheterization upon prior authorization coverage review for a different medication indicated for WHO Group 1 PAH has been previously provided, the documentation requirement in this *Pulmonary Arterial Hypertension – Epoprostenol Prior Authorization Policy* is considered to be met.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of epoprostenol injection is recommended in those who meet the following criteria:

FDA-Approved Indication

39. Pulmonary Arterial Hypertension (PAH) [World Health Organization {WHO} Group 1]. Approve for the duration noted if the patient meets ONE of the following (A or B):

- **A)** Initial Therapy. Approve for 1 year if the patient meets all of the following criteria (i, ii, iii, iv, and v):
  - **i.** Patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND
  - **ii.** Patient meets the following criteria (a and b):
    - **a)** Patient has had a right heart catheterization **[documentation required]** (see documentation section above); AND

b) Results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND

iii. Patient meets ONE of the following criteria (a or b):

a) Patient is in Functional Class III or IV; OR

b) Patient is in Functional Class II and meets ONE of the following criteria [(1) or (2)]:

(1) Patient has tried or is currently receiving one oral agent for PAH; OR
Note: Examples of oral agents for PAH include Tracleer® (bosentan tablets), Letairis® (ambrisentan tablets [generic]), Opsumit® (macitentan tablets), Adempas® (riociguat tablets), Revatio® (sildenafil tablets and suspension [generics]), Adcirca® (tadalafil tablets [generic]), Orenitram® (treprostinil extended-release tablets), Alyq™ (tadalafil tablets), and Uptravi® (selexipag tablets).

(2) Patient has tried one inhaled or parenteral prostacyclin product for PAH; AND
Note: Examples of inhaled and parenteral prostacyclin products for PAH include Remodulin® (treprostinil injection [generic]), Ventavis® (iloprost inhalation solution), and Tyvaso® (treprostinil inhalation solution).

iv. Patient with idiopathic PAH must meet ONE of the following criteria (a, b, c, d, or e):

a) Patient must meet both of the following [(1) and (2)]:

(1) According to the prescriber, the patient has had an acute response to vasodilator testing that occurred during the right heart catheterization; AND
Note: An example of a response can be defined as a decrease in mean pulmonary artery pressure of at least 10 mm Hg to an absolute mean pulmonary artery pressure of less than 40 mm Hg without a decrease in cardiac output.

(2) Patient has tried one oral calcium channel blocker (CCB) therapy; OR
Note: Examples of CCBs include amlodipine and nifedipine extended-release tablets.

b) According to the prescriber, the patient did not have an acute response to vasodilator testing; OR

c) According to the prescriber, the patient cannot undergo a vasodilator test; OR

d) Patient cannot take CCB therapy; OR
Note: Examples of reasons a patient cannot take CCB therapy include right heart failure or decreased cardiac output.

e) Patient has tried one CCB; AND
Note: Examples of CCBs include amlodipine and nifedipine extended-release tablets.

v. Medication is prescribed by or in consultation with a cardiologist or a pulmonologist; OR

B) Patient Currently Receiving Epoprostenol. Approve for the duration noted below if the patient meets the following criteria (i or ii):

i. Approve for 1 year if the patient meets ALL of the following conditions (a, b, and c):

a) Patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND

b) Patient meets the following criteria [(1) and (2)]:

(1) Patient has had a right heart catheterization; AND

(2) Results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND

c) Medication is prescribed by, or in consultation with, a cardiologist or a pulmonologist; OR

ii. Approve a short-term supply of epoprostenol for up to 14 days if the patient does not meet the criteria in 1Bi above or if there is insufficient information available. These cases must be forwarded immediately to the pharmacist for review.
Note: A 14-day supply should be sufficient to address coverage issues. However, multiple short-term approvals are allowed if a coverage determination cannot be made. Abrupt discontinuation of epoprostenol therapy may have severe adverse consequences.

Other Uses with Supportive Evidence

40. **Chronic Thromboembolic Pulmonary Hypertension (CTEPH).** Approve for 1 year if prescribed by, or in consultation with, a pulmonologist or a cardiologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of epoprostenol injection (Flolan, Veletri, generics) is not recommended in the following situations:

1. **Chronic Obstructive Pulmonary Disease (COPD) in a Patient Without PAH (WHO Group 1).** COPD is classified as Group 3 Pulmonary Hypertension (pulmonary hypertension associated with lung diseases and/or hypoxia). Pulmonary hypertension may develop late in the course of COPD, but medications used for the treatment of PAH (WHO Group 1) are not recommended therapies.[11]

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	For initial review, documentation is required for the right heart catheterization and the result confirms the diagnosis of WHO Group 1 PAH. The specific values required from the heart catheterization test were removed. For patients currently receiving epoprostenol a right heart catheterization is required and the results should confirm the diagnosis of WHO Group 1 PAH, but documentation is not required, nor are the specific values required. For patients in Functional Class II, the exceptions to use of other medications was removed as these can be handled on a case by case basis. Viagra and Cialis were removed from the listing of medications for WHO Group 1 PAH. A note was added in the documentation section that for a patient case in which the documentation requirement of the right heart catheterization upon prior authorization coverage review for a different medication indicated for WHO Group 1 PAH has been previously provided, the documentation requirement is considered to be met. Criteria	08/22/2018

	that provided a 14 day approval for patients currently receiving epoprostenol for any indication were removed.	
Annual Revision	For the indications for PAH (WHO Group 1) and chronic thromboembolic pulmonary hypertension, the approval durations were changed from 3 years to 1 year. However, the short-term up to 14 day approval duration for PAH still remains for patients who are receiving therapy but do not meet criteria or in those with insufficient information. Listing of examples of medications are in criteria are now listed in notes.	09/11/2019
Annual revision	The word "Products" was added to the Policy name. For criteria regarding patients with idiopathic PAH, the wording "According to the prescriber" was added for the criterion regarding that the patient has had an acute response to vasodilator testing that occurred during the right heart catheterization. Also, examples of a definition of response were moved from the criteria to a Note. Also, the wording "According to the prescriber" were added to the criterion stating that the patient did not have an acute response to vasodilator testing, as well as to the criterion that the patient cannot undergo a vasodilator test. For the criterion stating that the "Patient cannot take a calcium channel blocker therapy", examples were moved from the criteria to a Note. Alyq (tadalafil tablets) was added as an example of oral agent used for PAH in the note for the criteria regarding PAH.	09/23/2020

PAH – Pulmonary arterial hypertension WHO – World Health Organization.

PRIOR AUTHORIZATION POLICY

POLICY: Pulmonary Arterial Hypertension – Inhaled Prostacyclin Products

- Ventavis® (iloprost inhalation solution – Actelion)
- Tyvaso® (treprostinil inhalation solution – United Therapeutics)

REVIEW DATE: 09/23/2020

OVERVIEW

Ventavis and Tyvaso are both inhaled prostacyclin vasodilators indicated for the treatment of pulmonary arterial hypertension (PAH).[1,2] Ventavis is indicated for the treatment of PAH (World Health Organization [WHO] Group 1) to improve a composite endpoint consisting of exercise tolerance, symptoms (based on New York Heart Association [NYHA] Class), and lack of deterioration. Tyvaso is indicated for the treatment of PAH (WHO Group 1) to improve exercise ability.[2]

Disease Overview

PAH is a serious but rare condition impacting approximately fewer than 20,000 patients in the US. It is classified within Group 1 pulmonary hypertension among the five different groups that are recognized. In this progressive disorder the small arteries in the lungs become narrowed, restricted, or blocked causing the heart to work harder to pump blood, leading to activity impairment.[3,4] In time, right-sided heart failure and/or death may occur. Common PAH symptoms include shortness of breath, fatigue, chest pain, dizziness and fainting, along with impairment in activity tolerance. It is more prevalent in women. Patients of all ages may develop the disease; however, the mean age of diagnosis typically happens between 36 to 50 years. Children may also have PAH. The condition may occur due to various underlying medical conditions or as a disease that uniquely impacts the pulmonary circulation; both genetic and environmental factors may be involved. PAH is defined as a mean pulmonary artery pressure (mPAP) $\geq$ 25 mmHg with a pulmonary capillary wedge pressure (PCWP) $\leq$ 15 mmHg measured by cardiac catheterization. The prognosis in PAH has been described as poor, with the median survival being approximately 3 years. However, primarily due to advances in pharmacological therapies, the long-term prognosis has improved. Lung transplantation may be recommended if pharmacological or medical therapies fail, based upon patient status. The WHO categorizes PAH into stages, which is also referred to as the functional class (Class I to IV) and is an adaptation of the New York Heart Association (NYHA) system to evaluate activity tolerance.

Guidelines

An updated treatment algorithm (2013) by the 2nd World Symposium on Pulmonary Hypertension (WSPH) states that patients with Functional Class II should be treated initially with oral therapies (e.g., Adempas® [riociguat tablets], Revatio® (sildenafil tablets and suspension [generics] {Note: brand name Revatio injection also available}), Adcirca® [tadalafil tablets {generic}], Opsumit® [macitentan tablets], Tracleer® [bosentan tablets], and Letairis® [ambrisentan tablets]).[5] Ventavis and Tyvaso are recommended for patients in Functional Class III and IV. In situations of inadequate response, combination therapy (including double or triple therapy) is recommended.

In 2019, and updated CHEST guideline and Expert Panel Report regarding therapy for pulmonary arterial hypertension in adults was released.[4] Evidence for use of the many medications available is also detailed. One recommendation is that parenteral or inhaled prostanoids should not be used as initial therapy for patients with PAH who are treatment naïve with WHO Functional Class II symptoms or as second-line agents for patients with PAH with WHO Functional Class II symptoms who have not met original treatment goals.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Ventavis and Tyvaso. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Ventavis and Tyvaso as well as the monitoring required for adverse events and long-term efficacy, approval requires these agents to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Documentation: In the *Pulmonary Arterial Hypertension – Inhaled Prostacyclin Products Prior Authorization Policy*, documentation is required for initiation of therapy where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes and catheterization laboratory reports. For a patient case in which the documentation requirement of the right heart catheterization upon prior authorization coverage review for a different medication indicated for WHO Group 1 PAH has been previously provided, the documentation requirement in this *Pulmonary Arterial Hypertension – Inhaled Prostacyclin Products Prior Authorization Policy* is considered to be met.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Ventavis and Tyvaso is recommended in those who meet the following criteria:

FDA-Approved Indications

41. Pulmonary Arterial Hypertension (PAH) [World Health Organization {WHO} Group 1]. Approve for the duration noted if the patient meets ONE of the following (A or B):

- **A)** Initial Therapy. Approve for 3 years if the patient meets the following criteria (i, ii, iii, and iv):
  - **i.** Patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND
  - **ii.** Patient meets one of the following (a or b):
    - **a)** Patient is in Functional Class III or IV; OR
    - **b)** Patient is in Functional Class II and meets ONE of the following criteria [(1) or (2)]:
      - **(1)** Patient has tried or is currently receiving one oral agent for PAH; OR
        Note: Examples of oral agents for PAH include Tracleer® (bosentan tablets), Letairis® (ambrisentan tablets [generic]), Opsumit® (macitentan tablets), Revatio® (sildenafil

tablets and suspension [generics]), Adcirca® (tadalafil tablets [generic]), Alyq™ (tadalafil tablets), Adempas® (riociguat tablets), Orenitram® (treprostinil extended-release tablets), and Uptravi® (selexipag tablets).

(2) Patient has tried one inhaled or parenteral prostacyclin product for PAH; AND
Note: Examples of inhaled and parenteral prostacyclin products for PAH include Tyvaso® (treprostinil inhalation solution), Ventavis® (iloprost inhalation solution), Remodulin® (treprostinil injection [generic]), and epoprostenol injection (Flolan®, Veletri®, generics); AND

iii. Patient meets the following criteria (a and b):
- **a)** The patient has had a right heart catheterization **[documentation required]** (see documentation section above); AND
- **b)** The results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND

iv. Medication is prescribed by, or in consultation with, a cardiologist or a pulmonologist.

B) Patient is Currently Receiving the Requested Inhaled Prostacyclin for PAH (i.e., Ventavis or Tyvaso). Approve for 3 years if the patient meets the following criteria (i, ii, and iii):

i. Patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND

ii. Patient meets the following criteria (a and b):
- **a)** Patient has had a right heart catheterization; AND
- **b)** Results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND

iii. Medication is prescribed by, or in consultation with, a cardiologist or a pulmonologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Ventavis and Tyvaso are not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	For initial review, documentation is required for the right heart catheterization. Also, in the criteria for initial therapy, for patients in functional class II for the criteria that requires a trial of an oral agent, the exceptions to use of therapy were removed (the patient is unable to take any of the oral agents [e.g., those with liver abnormalities {Tracleer}, patient of childbearing potential {Tracleer, Letairis}, concomitant use with nitrates {sildenafil, Adcirca/Cialis}, hypotension, drug-drug interactions) as these can	08/22/2018

	be handled on an exception basis. For this criteria, Viagra and Cialis were removed as oral options (Revatio and Adcirca are now available as generics). For patients who are currently receiving the requested inhaled prostacyclin product, the wording "or who are receiving another medication for WHO Group 1 PAH" was removed, along with the cited alternatives. Also, the requirement was added that the patient has had a right heart catheterization and that the results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH. A note was added in the documentation section that for a patient case in which the documentation requirement of the right heart catheterization upon prior authorization coverage review for a different medication indicated for WHO Group 1 PAH has been previously provided, the documentation requirement is considered to be met.	
Annual Revision	No criteria changes. Medication alternatives are now listed as notes.	09/11/2019
Annual Revision	No criteria changes. Alyq (tadalafil tablets) listed as an example of an oral medication for PAH in a Note.	09/23/2020

PAH – Pulmonary arterial hypertension; WHO – World Health Organization.

PRIOR AUTHORIZATION POLICY

POLICY: Pulmonary Arterial Hypertension – Orenitram Prior Authorization Policy

- Orenitram® (treprostinil extended-release tablets – United Therapeutics)

REVIEW DATE: 09/23/2020

OVERVIEW

Orenitram, prostacyclin mimetic, is indicated for the treatment of pulmonary arterial hypertension (PAH) World Health Organization (WHO) Group 1 to delay disease progression and to improve exercise capacity.[1]

Disease Overview

PAH is a serious but rare condition impacting approximately fewer than 20,000 patients in the US. It is classified within Group 1 pulmonary hypertension among the five different groups that are recognized. In this progressive disorder the small arteries in the lungs become narrowed, restricted, or blocked causing the heart to work harder to pump blood, leading to activity impairment.[2,3] In time, right-sided heart failure and/or death may occur. Common PAH symptoms include shortness of breath, fatigue, chest pain, dizziness and fainting, along with impairment in activity tolerance. It is more prevalent in women. Patients of all ages may develop the disease; however, the mean age of diagnosis typically happens between 36 to 50 years. Children may also have PAH. The condition may occur due to various underlying medical conditions or as a disease that uniquely impacts the pulmonary circulation; both genetic and environmental factors may be involved. PAH is defined as a mean pulmonary artery pressure (mPAP) $\geq$ 25 mmHg with a pulmonary capillary wedge pressure (PCWP) $\leq$ 15 mmHg measured by cardiac catheterization. The prognosis in PAH has been described as poor, with the median survival being approximately 3 years. However, primarily due to advances in pharmacological therapies, the long-term prognosis has improved. Lung transplantation may be recommended if pharmacological or medical therapies fail, based upon patient status. The WHO categorizes PAH into stages, which is also referred to as the functional class (Class I to IV) and is an adaptation of the New York Heart Association (NYHA) system to evaluate activity tolerance.

Guidelines

In 2019, an updated CHEST guideline and Expert Panel Report regarding therapy for pulmonary arterial hypertension in adults was released.[3] Many other agents other than Orenitram are recommended as initial and subsequent therapy such as endothelin receptor antagonists (Letairis® [ambrisentan tablets], Tracleer® [bosentan tablets], Opsumit® [macitentan tablets], phosphodiesterase type 5 [PDE 5] inhibitors [tadalafil, sildenafil), and Adempas® (riociguat tablets). The addition of an oral prostanoid product is recommended

in patients with PAH who are in Functional Class III without evidence of rapid disease progression or a poor prognosis among those not willing or able to manage parenteral prostanoids.

Safety

Abrupt discontinuation or sudden large reductions in the dosage of Orenitram may cause PAH symptoms to worsen.[1] In the event of a planned short-term treatment interruption for patients unable to take oral medication, consider a temporary infusion of subcutaneous or intravenous treprostinil.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Orenitram. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Orenitram as well as the monitoring required for adverse events and long-term efficacy, approval requires Orenitram to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Documentation: In the *Pulmonary Arterial Hypertension – Orenitram Prior Authorization Policy*, documentation is required for initiation of therapy where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes and catheterization laboratory reports. For a patient case in which the documentation requirement of the right heart catheterization upon prior authorization coverage review for a different medication indicated for WHO Group 1 PAH has been previously provided, the documentation requirement in this *Pulmonary Arterial Hypertension – Orenitram Prior Authorization Policy* is considered to be met.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Orenitram is recommended in those who meet the following criteria:

FDA-Approved Indication

42. Pulmonary Arterial Hypertension (World Health Organization [WHO] Group 1). Approve for the duration noted if the patient meets ONE of the following (A or B):

E) Initial Therapy. Approve for 3 years if the patient meets all of the following criteria (i, ii, iii, and iv):

- **i.** Patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND
- **ii.** Patient meets the following criteria (a and b):
  - **a)** Patient has had a right heart catheterization **[documentation required]** (see documentation section above); AND
  - **b)** Results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND
- **iii.** Patient meets one of the following conditions (a or b):
  - **a)** Patient has tried two oral therapies for PAH (or is currently receiving them) from two of the three following different categories (either alone or in combination) each for ≥ 60 days: one phosphodiesterase type 5 (PDE5) inhibitor, one endothelin receptor antagonist (ERA), or Adempas (riociguat tablets); OR
    Note: Examples of PDE5 inhibitors include Revatio® (sildenafil tablets and suspension [generic]), Adcirca® (tadalafil tablets [generic]) and Alyq™ (tadalafil tablets) and examples of ERAs include Tracleer® (bosentan tablets), Letairis® (ambrisentan tablets [generic]), and Opsumit® (macitentan tablets).
  - **b)** Patient is receiving or has received in the past one PAH prostacyclin therapy or a prostacyclin receptor agonist (i.e., Uptravi® [selexipag tablets]) for PAH; AND
    Note: Examples of prostacyclin therapies for PAH include Tyvaso® (treprostinil inhalation solution), Ventavis® (iloprost inhalation solution), Remodulin® (treprostinil injection [generic]), and epoprostenol injection [Flolan, Veletri, generics]); AND
- **iv.** Medication is prescribed by or in consultation with a cardiologist or a pulmonologist.

F) Patient is Currently Receiving Orenitram. Approve for 3 years if the patient meets all of the following criteria (i, ii, and iii):

vii. Patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND

viii. Patient meets the following criteria (a and b):

a) Patient has had a right heart catheterization; AND

b) Results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH); AND

ix. The medication is prescribed by, or in consultation with, a cardiologist or a pulmonologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Orenitram is not recommended in the following situations:

310. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

WHO – World Health Organization; PAH – Pulmonary arterial hypertension.

PRIOR AUTHORIZATION POLICY

POLICY: Pulmonary Arterial Hypertension – Phosphodiesterase Type 5 Inhibitors Prior Authorization Policy

- Adcirca® (tadalafil tablets [generic] – Eli Lilly/United Therapeutics)
- Alyq™ (tadalafil tablets [generic] – Teva)
- Revatio® (sildenafil tablets [generic], suspension [generic], and injection – Pfizer)

REVIEW DATE: 09/23/2020

OVERVIEW

Adcirca and Revatio and are phosphodiesterase type 5 (PDE5) inhibitors indicated for the treatment of pulmonary arterial hypertension (PAH).[1,2] Alyq is a generic to Adcirca.[3] Adcirca and Alyq are indicated for the treatment of PAH (WHO Group I) to improve exercise ability.[2,3] Revatio is indicated for the treatment of PAH (World Health Organization [WHO] Group I) in adults to improve exercise ability and delay clinical worsening.

Disease Overview

PAH is a serious but rare condition impacting approximately fewer than 20,000 patients in the US. It is classified within Group 1 pulmonary hypertension among the five different groups that are recognized. In this progressive disorder the small arteries in the lungs become narrowed, restricted, or blocked causing the heart to work harder to pump blood, leading to activity impairment.[4,5] In time, right-sided heart failure and/or death may occur. Common PAH symptoms include shortness of breath, fatigue, chest pain, dizziness and fainting, along with impairment in activity tolerance. It is more prevalent in women. Patients of all ages may develop the disease; however, the mean age of diagnosis typically happens between 36 to 50 years. Children may also have PAH. The condition may occur due to various underlying medical conditions or as a disease that uniquely impacts the pulmonary circulation; both genetic and environmental factors may be involved. PAH is defined as a mean pulmonary artery pressure (mPAP) $\geq$ 25 mmHg with a pulmonary capillary wedge pressure (PCWP) $\leq$ 15 mmHg measured by cardiac catheterization. The prognosis in PAH has been described as poor, with the median survival being approximately 3 years. However, primarily due to advances in pharmacological therapies, the long-term prognosis has improved. Lung transplantation may be recommended if pharmacological or medical therapies fail, based upon patient status. The WHO categorizes PAH into stages, which is also referred to as the functional class (Class I to IV) and is an adaptation of the New York Heart Association (NYHA) system to evaluate activity tolerance.

Guidelines

In 2019, an updated CHEST guideline and Expert Panel Report regarding therapy for pulmonary arterial hypertension in adults was released.[5] Evidence for use of the many medications available is also detailed. PDE5 inhibitors are a vital therapy in the management of PAH with several benefits in a variety of clinical scenarios.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Adcirca, Alyq, and Revatio. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Adcirca, Alyq, and Revatio, as well as the monitoring required for adverse events and long-term efficacy, approval requires these agents to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Documentation: In the *Pulmonary Arterial Hypertension – Phosphodiesterase Type 5 Inhibitors Prior Authorization Policy*, documentation is required for initiation of therapy where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes and catheterization laboratory reports. For a patient case in which the documentation requirement of the right heart catheterization upon Prior Authorization coverage review for a different medication indicated for WHO Group 1 PAH has been previously provided, the documentation requirement in this *Pulmonary Arterial Hypertension – Phosphodiesterase Type 5 Inhibitors Prior Authorization Policy* is considered to be met.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Revatio tablets, Revatio suspension, sildenafil suspension, Revatio injection, Adcirca, and Alyq is recommended in those who meet the following criteria:

FDA-Approved Indication

I. Coverage of Adcirca tablets, Alyq tablets, Revatio suspension, Revatio tablets, and sildenafil suspension is recommended in those who meet the following criteria:

43. Pulmonary Arterial Hypertension (PAH) [World Health Organization {WHO} Group 1]. Approve for the duration noted if the patient meets ONE of the following (A or B):

G) Initial Therapy. Approve for 3 years if the patient meets all of the following criteria (i, ii, and iii):

- **i.** Patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND
- **ii.** Patient meets the following criteria (a and b):
  - **a)** Patient has had a right heart catheterization **[documentation required]** (see documentation section above); AND
  - **b)** Results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND
- **iii.** The medication is prescribed by, or in consultation with, a cardiologist or a pulmonologist.

H) Patient Currently Receiving the Requested Phosphodiesterase Type 5 (PDE5) inhibitor (i.e., Adcirca, Alyq, Revatio suspension, Revatio tablets, or sildenafil suspension). Approve for 3 years if the patient meets the following criteria (i, ii, and iii):

- **x.** Patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND
- **xi.** Patient meets the following criteria (a and b):
  - **a)** Patient has had a right heart catheterization; AND
  - **b)** Results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND
- **xii.** The medication is prescribed by, or in consultation with, a cardiologist or a pulmonologist.

II. Coverage of Revatio injection is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **Pulmonary Arterial Hypertension (PAH) [World Health Organization {WHO} Group 1].** Approve for the duration noted if the patient meets ONE of the following (A or B):
   - **A)** Initial Therapy. Approve Revatio injection for 3 years if the patient meets the following criteria (i, ii, iii, and iv):
     - **i.** Patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND
     - **ii.** Patient is unable to take an oral PDE5 inhibitor indicated for WHO Group 1 PAH; AND
       Note: Examples of oral PDE5 inhibitors for PAH include Revatio® (sildenafil tablets or suspension or suspension [generics]), Adcirca® (tadalafil tablets [generic]), and Alyq™ (tadalafil tablets]).
     - **iii.** Patient meets the following criteria (a and b):
       - **a)** Patient has had a right heart catheterization **[documentation required]** (see documentation section above); AND
       - **b)** Results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND
     - **iv.** The medication is prescribed by, or in consultation with, a cardiologist or a pulmonologist.
   - **B)** Patient Currently Receiving Revatio Injection. Approve Revatio injection for 3 years if the patient meets the following criteria (i, ii, iii, and iv):
     - **i.** Patient has a diagnosis of World Health Organization (WHO) Group 1 PAH; AND
     - **ii.** Patient is unable to take an oral PDE5 inhibitor indicated for WHO Group 1 PAH; AND
       Note: Examples of oral PDE5 inhibitors for PAH include Adcirca® (tadalafil tablets [generic]), Alyq™ (tadalafil tablets), and Revatio® (sildenafil tablets or suspension [generics]); AND
     - **iii.** Patient meets the following criteria (a and b):
       - **a)** Patient has had a right heart catheterization; AND
       - **b)** Results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND
     - **iv.** The medication is prescribed by, or in consultation with, a cardiologist or a pulmonologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Adcirca, Alyq, Revatio injection, Revatio suspension, Revatio tablets, and sildenafil suspension is not recommended in the following situations:

2. **Erectile Dysfunction.** Coverage is not recommended. Patients should use other PDE5 inhibitors indicated for erectile dysfunction (i.e., Viagra® [sildenafil tablets], Cialis® [tadalafil tablets]).[6,7]

3. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Pulmonary Arterial Hypertension – Remodulin Prior Authorization Policy

- Remodulin® (treprostinil injection for subcutaneous or intravenous use – United Therapeutics Corporation, generic)

REVIEW DATE: 09/23/2020

OVERVIEW

Treprostinil injection, a prostacyclin vasodilator, is indicated for the treatment of pulmonary arterial hypertension (PAH) [World Health Organization {WHO} Group 1] to:[1,2]

- **Diminish symptoms associated** with exercise.
- **Reduce the rate of clinical deterioration** for patients who require transition from epoprostenol.

Treprostinil injection has been used with varying results in patients with chronic thromboembolic pulmonary hypertension (CTEPH).[3-7] Benefits noted include improvement in functional class, six-minute walk distance, and in hemodynamic parameters. Treprostinil injection is sometimes used as a bridge prior to surgery. Limited options are available for patients with CTEPH.

Disease Overview

PAH is a serious but rare condition impacting fewer than 20,000 patients in the US. It is classified within Group 1 pulmonary hypertension among the five different groups that are recognized. In this progressive

disorder the small arteries in the lungs become narrowed, restricted, or blocked causing the heart to work harder to pump blood, leading to activity impairment.[8,9] In time, right-sided heart failure and/or death may occur. Common PAH symptoms include shortness of breath, fatigue, chest pain, dizziness and fainting, along with impairment in activity tolerance. It is more prevalent in women. Patients of all ages may develop the disease; however, the mean age of diagnosis typically happens between 36 to 50 years. Children may also have PAH. The condition may occur due to various underlying medical conditions or as a disease that uniquely impacts the pulmonary circulation; both genetic and environmental factors may be involved. PAH is defined as a mean pulmonary artery pressure $\geq$ 25 mmHg with a pulmonary capillary wedge pressure $\leq$ 15 mmHg measured by cardiac catheterization. The prognosis in PAH has been described as poor, with the median survival being approximately 3 years. However, primarily due to advances in pharmacological therapies, the long-term prognosis has improved. Lung transplantation may be recommended if pharmacological or medical therapies fail, based upon patient status. The WHO categorizes PAH into stages, which is also referred to as the functional class (Class I to IV) and is an adaptation of the New York Heart Association system to evaluate activity tolerance.

CTEPH is a persistent obstruction of pulmonary arteries and is often a complication of pulmonary embolism.[10,11] It is classified within Group 4 pulmonary hypertension. Symptoms include progressive dyspnea on exertion, as well as fatigue, syncope, hemoptysis, and signs of right heart failure. Pulmonary endarterectomy is the treatment of choice for most patients with CTEPH. However, around 40% of patients are deemed inoperable for various reasons. Medication therapy may also be recommended. Anticoagulant therapy is also given.

Guidelines

In 2019, and updated CHEST guideline and Expert Panel Report regarding therapy for PAH in adults was released.[9] Evidence for use of the many medications available is also detailed. In the absence of contraindications, patients with PAH should undergo acute vasoreactivity testing utilizing a short-acting agent (e.g., calcium channel blockers). For patients in Functional Class II, oral therapies are recommended such as endothelin receptor antagonists (Letairis® [ambrisentan tablets], Tracleer® [bosentan tablets], Opsumit® [macitentan tablets]), phosphodiesterase type 5 (PDE 5) inhibitors (tadalafil, sildenafil), and Adempas® (riociguat tablets). It is suggested that parenteral or inhaled prostanoids not be chosen as initial therapy for treatment naïve patients with PAH with WHO Functional Class II symptoms or as second-line agents for patients with PAH with WHO Functional Class II who have not met their treatment goals. Parenteral prostanoids are recommended for patients with PAH in Functional Class III and IV.

Safety

Treprostinil injection should not be abruptly discontinued or have the dose rapidly decreased as rebound pulmonary hypertension may occur.[1,2]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of treprostinil injection. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with treprostinil injection as well as the monitoring required for adverse events and long-term efficacy, approval requires treprostinil injection to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Documentation: In the *Pulmonary Arterial Hypertension – Remodulin Authorization Policy*, documentation is required for initiation of therapy where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes and catheterization laboratory reports. For a patient case in which the documentation requirement of the right heart catheterization upon Prior Authorization coverage review for a different medication indicated for WHO Group 1 PAH has been previously provided, the documentation requirement in this *Pulmonary Arterial Hypertension – Remodulin Prior Authorization Policy* is considered to be met.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of treprostinil injection is recommended in those who meet the following criteria:

FDA-Approved Indication

44. Pulmonary Arterial Hypertension (PAH) [World Health Organization {WHO} Group 1]. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 1 year if the patient meets all of the following criteria (i, ii, iii, iv, and v):

- **i.** Patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND
- **ii.** Patient meets the following criteria (a and b):
  - **a)** Patient has had a right heart catheterization **[documentation required]** (see documentation section above); AND

b) Results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND

iii. Patient meets ONE of the following criteria (a or b):

a) Patient is in Functional Class III or IV; OR

b) Patient is in Functional Class II and meets ONE of the following criteria [(1) or (2)]:

(1) Patient has tried or is currently receiving one oral agent for PAH; OR
Note: Examples of oral agents for PAH include Tracleer® (bosentan tablets), Letairis® (ambrisentan tablets [generic]), Opsumit® (macitentan tablets), Adempas® (riociguat tablets), Revatio® (sildenafil tablets and oral suspension [generics]), Adcirca® (tadalafil tablets [generic]), Alyq™ (tadalafil tablets), Orenitram® (treprostinil extended-release tablets) and Uptravi® (selexipag tablets).

(2) Patient has tried one inhaled or parenteral prostacyclin product for PAH; AND
Note: Examples of inhaled and parenteral prostacyclin products for PAH include Ventavis® (iloprost inhalation solution), Tyvaso® (treprostinil inhalation solution), and epoprostenol injection (Flolan, Veletri, generic).

iv. Patient with idiopathic PAH must meet ONE of the following criteria (a, b, c, d, or e):

a) Patient meets both of the following criteria [(1) and (2)]:

(1) According to the prescriber, the patient has had an acute response to vasodilator testing that occurred during the right heart catheterization; AND
Note: An example of a response can be defined as a decrease in mean pulmonary artery pressure of at least 10 mm Hg to an absolute mean pulmonary artery pressure of less than 40 mm Hg without a decrease in cardiac output.

(2) Patient has tried one calcium channel blocker (CCB) therapy; OR
Note: Examples of CCBs include amlodipine and nifedipine extended-release tablets.

b) According to the prescriber, the patient did not have an acute response to vasodilator testing; OR

c) According to the prescriber, the patient cannot undergo a vasodilator test; OR

d) Patient cannot take CCB therapy; OR
Note: Examples of reasons a patient cannot take CCB therapy include right heart failure or decreased cardiac output.

e) Patient has tried one CCB; AND
Note: Examples of CCBs include amlodipine and nifedipine extended-release tablets.

v. Medication is prescribed by, or in consultation with, a cardiologist or a pulmonologist; OR

B) Patient Currently Receiving Remodulin. Approve for the duration noted below if the patient meets the following criteria (i or ii):

iii. Approve for 1 year if the patient meets ALL of the following conditions (a, b, and c):

d) Patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND

e) Patient meets the following criteria [(1) and (2)]:

(1) Patient has had a right heart catheterization; AND

(2) Results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND

f) Medication is prescribed by, or in consultation with, a cardiologist or a pulmonologist; OR

iv. Approve a short-term supply of Remodulin for up to 14 days if the patient does not meet the criteria in 1Bi above or if there is insufficient information available. These cases must be forwarded immediately to the pharmacist for review.
Note: A 14-day supply should be sufficient to address coverage issues. However, multiple short-term approvals are allowed if a coverage determination cannot be made. Abrupt discontinuation of Remodulin therapy may have severe adverse consequences.

Other Uses with Supportive Evidence

45. Chronic Thromboembolic Pulmonary Hypertension (CTEPH). Approve for 1 year if prescribed by or in consultation with a pulmonologist or a cardiologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of treprostinil injection is not recommended in the following situations:

3. Chronic Obstructive Pulmonary Disease (COPD) in a Patient without PAH (WHO Group 1). COPD is classified as Group 3 Pulmonary Hypertension (pulmonary hypertension associated with lung diseases and/or hypoxia). Pulmonary hypertension may develop late in the course of COPD, but medications used for the treatment of PAH (WHO Group 1) are not recommended therapies.[12]

4. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	For initial review, documentation is required for the right heart catheterization and the results confirm the diagnosis of WHO Group 1 PAH. The specific values required from the heart catheterization test were removed. For patients currently receiving Remodulin, a right heart catheterization is required and the results should confirm the diagnosis of WHO Group 1 PAH, but documentation is not required, nor are the specific values required. For patients in Functional Class II, the exceptions to use of other medications was removed as these can be handled on a case by case basis. Viagra and Cialis were removed from the listing of medications for WHO Group 1 PAH as Revatio and Adcirca are available generically. A note was added in the documentation section that for a patient case in which the documentation requirement of the right heart	08/22/2018

	catheterization upon prior authorization coverage review for a different medication indicated for WHO Group 1 PAH has been previously provided, the documentation requirement is considered to be met. Criteria that provided a 14-day approval for patients currently receiving Remodulin for any indication were removed.	
Update	04/10/2019: No criteria changes. Note that Remodulin is available as a generic.	--
Annual Revision	For the indications for PAH (WHO Group 1) and chronic thromboembolic pulmonary hypertension, the approval durations were changed from 3 years to 1 year. However, the short-term up to 14-day approval duration for PAH still remains for patients who are receiving therapy but do not meet criteria or in those with insufficient information. The medication examples are now listed as a note.	09/11/2019
Annual Revision	For criteria regarding patients with idiopathic PAH, the wording "According to the prescriber" was added for the criterion regarding that the patient has had an acute response to vasodilator testing that occurred during the right heart catheterization. Also, examples of a definition of response were moved from the criteria to a Note. Also, the wording "According to the prescriber" were added to the criterion stating that the patient did not have an acute response to vasodilator testing, as well as to the criterion that the patient cannot undergo a vasodilator test. For the criterion stating that the "Patient cannot take a calcium channel blocker therapy", examples were moved from the criteria to a Note. Alyq™ (tadalafil tablets) was added as an example of an oral agent used for PAH in the note for the criteria regarding PAH.	09/23/2020

PAH – Pulmonary arterial hypertension; WHO – World Health Organization.

PRIOR AUTHORIZATION POLICY

POLICY: Pulmonary Arterial Hypertension – Uptravi Prior Authorization Policy

- Uptravi® (selexipag tablets – Actelion)

REVIEW DATE: 09/23/2020

OVERVIEW

Uptravi, a prostacycline receptor agonist, is indicated for the treatment of pulmonary arterial hypertension (PAH) World Health Organization (WHO) Group 1 to delay disease progression and reduce the risk of hospitalization for PAH.[1]

Disease Overview

PAH is a serious but rare condition impacting approximately fewer than 20,000 patients in the US. It is classified within Group 1 pulmonary hypertension among the five different groups that are recognized. In this progressive disorder the small arteries in the lungs become narrowed, restricted, or blocked causing the heart to work harder to pump blood, leading to activity impairment.[2,3] In time, right-sided heart failure and/or death may occur. Common PAH symptoms include shortness of breath, fatigue, chest pain, dizziness and fainting, along with impairment in activity tolerance. It is more prevalent in women. Patients of all ages may develop the disease; however, the mean age of diagnosis typically happens between 36 to 50 years. Children may also have PAH. The condition may occur due to various underlying medical conditions or as a disease that uniquely impacts the pulmonary circulation; both genetic and environmental factors may be involved. PAH is defined as a mean pulmonary artery pressure (mPAP) $\geq$ 25 mmHg with a pulmonary capillary wedge pressure (PCWP) $\leq$ 15 mmHg measured by cardiac catheterization. The prognosis in PAH has been described as poor, with the median survival being approximately 3 years. However, primarily due to advances in pharmacological therapies, the long-term prognosis has improved. Lung transplantation may be recommended if pharmacological or medical therapies fail, based upon patient status. The WHO categorizes PAH into stages, which is also referred to as the functional class (Class I to IV) and is an adaptation of the New York Heart Association (NYHA) system to evaluate activity tolerance.

Guidelines/Recommendations

In 2019, an updated CHEST guideline and Expert Panel Report regarding therapy for pulmonary arterial hypertension in adults was released.[3] Many other agents other than Uptravi are recommended as initial and subsequent therapy such as endothelin receptor antagonists (Letairis® [ambrisentan tablets], Tracleer® [bosentan tablets], Opsumit® [macitentan tablets], phosphodiesterase type 5 [PDE 5] inhibitors [tadalafil, sildenafil), and Adempas® (riociguat tablets). The addition of an oral prostanoid product is recommended in patients with PAH who are in Functional Class III without evidence of rapid disease progression or a poor prognosis among those not willing or able to manage parenteral prostanoids.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Uptravi. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Uptravi as well as the monitoring required for adverse events and long-term efficacy, approval requires Uptravi to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Documentation: In the *Pulmonary Arterial Hypertension – Uptravi Prior Authorization Policy*, documentation is required for initiation of therapy where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes and catheterization laboratory reports. For a patient case in which the documentation requirement of the right heart catheterization upon Prior Authorization coverage review for a different medication indicated for WHO Group 1 PAH has been previously provided, the documentation requirement in this *Pulmonary Arterial Hypertension – Uptravi Prior Authorization Policy* is considered to be met.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Uptravi is recommended in those who meet the following criteria:

FDA-Approved Indication

46. Pulmonary Arterial Hypertension (PAH) [World Health Organization {WHO} Group 1]. Approve for the duration noted if the patient meets ONE of the following (A or B):

I) Initial Therapy. Approve for 3 years if the patient meets the following criteria (i, ii, iii, and iv):

i. Patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND

ii. Patient meets the following criteria (a and b):

a) Patient has had a right heart catheterization **[documentation required]** (see documentation section above); AND

b) Results for the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND

iii. Patient meets ONE the of following conditions (a or b):

a) Patient has tried or is currently receiving at least one oral medication for PAH from one of the three following different categories (either alone or in combination) each for ≥ 60 days: one phosphodiesterase type 5 (PDE5) inhibitor, one endothelin receptor antagonist (ERA), or Adempas® (riociguat tablets); OR

Note: Examples of PDE5 inhibitors include Revatio® (sildenafil tablets and suspension [generic]), Adcirca® (tadalafil tablets [generic]) and Alyq™ (tadalafil tablets) and examples of ERAs include Tracleer® (bosentan tablets), Letairis® (ambrisentan tablets [generic]), and Opsumit® (macitentan tablets).

b) Patient is currently receiving, or has a history of receiving, one prostacyclin therapy for PAH; AND

Note: Examples of prostacyclin therapies for PAH include Orenitram® (treprostinil tablets), Tyvaso® (treprostinil inhalation solution), Ventavis® (iloprost inhalation solution), Remodulin® (treprostinil injection [generics]), and epoprostenol injection [Flolan, Veletri, generics]); AND

iv. The medication is prescribed by, or in consultation with, a cardiologist or a pulmonologist.

J) Patients Currently Receiving Uptravi. Approve for 3 years if the patient meets all of the following criteria (i, ii, and iii):

i. Patient has a diagnosis of World Health Organization (WHO) Group 1 pulmonary arterial hypertension (PAH); AND

ii. Patient meets the following criteria (a and b):

a) Patient has had a right heart catheterization; AND

b) Results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH; AND

iii. The medication is prescribed by, or in consultation with, a cardiologist or a pulmonologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Uptravi is recommended in those who meet the following criteria:

311. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	No criteria changes	02/14/2018
Annual Revision	For initial review, documentation is required for the right heart catheterization. The criteria were deleted regarding patients "who are receiving another medication for WHO Group 1 PAH". For patients who are currently receiving Uptravi, the requirement was added that the patient has had a right heart catheterization and that the results of the right heart catheterization confirm the diagnosis of WHO Group 1 PAH. A note was added in the documentation section that for patients who had previously provided documentation of the right heart catheterization upon coverage review for a different medication indicated for WHO Group 1 PAH, this documentation requirement is considered to be met.	08/22/2018
Annual Revision	No criteria changes. Medication alternatives are now cited as a note.	09/11/2019
Selected Revision	For patients receiving initial therapy for PAH, the criteria were changed from requiring two oral medications from three of the following categories for ≥ 60 days (i.e., one phosphodiesterase type 5 [PDE5] inhibitor, one endothelin receptor antagonist [ERA]), or Adempas® [riociguat tablets]) to at least one oral medication from the previous list for ≥ 60 days.	02/12/2020
Annual Revision	No criteria changes. Alyq (tadalafil tablets) was added to the list of examples of oral a phosphodiesterase type 5 inhibitor used in PAH.	09/23/2020

WHO – World Health Organization; PAH – Pulmonary Arterial Hypertension.

POLICY: Qbrexza Prior Authorization Policy

- Qbrexza™ (glycopyrronium cloth 2.4% for topical use – Dermira)

REVIEW DATE: 10/21/2020

OVERVIEW

Qbrexza, an anticholinergic, is indicated for the topical treatment of primary axillary (i.e., underarm) hyperhidrosis in adult and pediatric patients ≥ 9 years of age.[1] Qbrexza is applied topically once every 24 hours to clean dry skin on the underarm areas only; it is not for use on other body areas.

Guidelines

There are currently no guidelines for the treatment of hyperhidrosis published by a professional society. However, the International Hyperhidrosis Society, an independent, non-profit organization, provides an algorithm for the treatment of axillary hyperhidrosis (updated 2018).[2] Topical antiperspirant therapy or Qbrexza are both listed as initial treatment choices.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Qbrexza. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Qbrexza is recommended in those who meet the following criteria:

FDA-Approved Indications

~~83.~~80. **Hyperhidrosis, Primary Axillary.** Approve for 1 year if the patient is ≥ 9 years of age.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Qbrexza is not recommended in the following situations:

312. **Hyperhidrosis, other than Primary Axillary.** Qbrexza is not intended for application to areas other than the axillae.[1]

313. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Rituximab Intravenous Products Prior Authorization Policy

- Rituxan® (rituximab intravenous infusion – Genentech)
- Riabni™ (rituximab-arrx intravenous infusion – Amgen)
- Ruxience™ (rituximab-pvvr intravenous infusion – Pfizer)
- Truxima® (rituximab-abbs intravenous infusion – Celltrion/Teva)

REVIEW DATE: 06/03/2020; selected revision 01/06/2021

OVERVIEW

Rituximab products are CD20-directed cytolytic antibodies. All approved rituximab intravenous products are indicated for treatment of the following conditions:

- **Chronic lymphocytic leukemia** (CLL), in combination with fludarabine and cyclophosphamide (FC) for the treatment of patients with previously untreated and previously treated CD20-positive disease.
- **Granulomatosis with polyangitis** (GPA) [Wegener's granulomatosis {WG}] and **microscopic polyangiitis** (MPA) in adults, in combination with glucocorticoids.
- **Non-Hodgkin lymphoma** (NHL), for the following uses:
  - previously untreated follicular, CD20-positive disease, in combination with first-line chemotherapy, and in patients achieving a complete or partial response to rituximab in combination with chemotherapy, as a single-agent maintenance therapy.
  - for relapsed or refractory, low-grade or follicular, CD20-positive, B-cell, disease.
  - for non-progressing (including stable disease) low-grade, CD20-positive, B-cell disease as a single agent after first-line cyclophosphamide/vincristine/prednisone (CVP) chemotherapy.
  - for previously untreated diffuse large B-cell, CD20-positive disease, in combination with cyclophosphamide/doxorubicin/vincristine/prednisone (CHOP) or other anthracycline-based chemotherapy regimens.

In addition to the above indications, Rituxan intravenous and Truxima are also indicated for treatment of the following condition:

- **Rheumatoid arthritis**, in adult patients with moderately to severely active disease, in combination with methotrexate for patients who have had an inadequate response to one or more tumor necrosis factor inhibitors (TNFis).

In addition to the above indications, Rituxan intravenous is also indicated for treatment of the following conditions:

- **Granulomatosis with polyangitis** (GPA) [Wegener's granulomatosis {WG}] and **microscopic polyangiitis** (MPA) in patients ≥ 2 years of age, in combination with glucocorticoids.
- **Pemphigus vulgaris**, for adults with moderate to severe.

Rituximab products are monoclonal antibody directed specifically against the CD20 antigen found on the surface of normal and malignant B lymphocytes.[1-3] The antigen CD20 is expressed on > 90% of B-cell

NHLs. B-cells are thought to play a role in the pathogenesis of rheumatoid arthritis and associated chronic synovitis.

Ruxience and Truxima are approved as biosimilar to Rituxan intravenous, indicating no clinically meaningful differences in safety and effectiveness and the same mechanism of action, route of administration, dosage form, and strength as Rituxan IV. However, minor differences in clinically inactive components are allowed. At this time, Ruxience and Truxima has only demonstrated biosimilarity, not interchangeability.

Guidelines

The use of rituximab is supported in clinical guidelines in numerous situations, both as first-line therapy and in patients who are refractory or have relapsed following treatment with other therapies.[4-21]

- **Immune Thrombocytopenia (ITP):** Guidelines from the American Society of Hematology (ASH) for ITP (2011) mention rituximab as an appropriate agent for children and adolescents with ITP who have significant on-going bleeding despite treatment with intravenous immunoglobulin G (IVIG), anti-D, or corticosteroids.[17] Rituximab is also appropriate as an alternative to splenectomy in children/adolescents with chronic ITP or in patient who do not respond to splenectomy. In adults, rituximab in recommended for patients with ITP who are at risk for bleeding and who have failed one other line of therapy (e.g., corticosteroids, IVIG, splenectomy).
- **Multiple Sclerosis (MS):** In June 2019, a consensus paper was updated by the MS Coalition that discusses the use of disease-modifying therapies in MS.[18] Rituximab is listed among various options, involving different mechanisms of action and modes of administration, which have shown benefits in patients with MS. The American Academy of Neurology has practice guidelines regarding disease-modifying therapies for adults with MS.[19] The guidelines mention rituximab for use in MS.
- **Neuromyelitis Optica Spectrum Disorders:** A review article lists rituximab as an effective treatment for neuromyelitis optica.[20]
- Oncology indications covered in National Comprehensive Cancer Network (NCCN) guidelines:[6]
    - **Acute Lymphoblastic Leukemia (ALL):** Guidelines (version 1.2020 – January 15, 2020) list rituximab in multiple induction regimens for Philadelphia chromosome (Ph)-negative disease.[11] In those with Ph-positive disease, rituximab should be considered in addition to chemotherapy for those with CD20-positive disease, especially in those < 60 years of age. Rituximab is also included in a regimen for relapsed/refractory disease for those with Ph-positive or –negative disease.
    - **B-Cell Lymphomas:** In the guidelines (version 1.2020 – January 22, 2020), rituximab is included in multiple treatment regimens across the spectrum of disease.[8] Guidelines for pediatric aggressive mature B-cell lymphomas (version 2.2020 – April 10, 2020) include rituximab intravenous among treatment regimens for induction therapy/initial treatment and as subsequent therapy for relapsed or refractory disease.[9] For primary cutaneous lymphomas (version 2.2020 – April 10, 2020), rituximab is a treatment option for patients with primary cutaneous B-cell lymphoma.[10]
    - **CLL/Small Lymphocytic Lymphoma:** Rituximab features prominently in the guidelines (version 4.2020 – December 20, 2019) and is included in multiple treatment regimens across the spectrum of disease.[7]
    - **Graft-Versus-Host Disease (GVHD):** Guidelines (version 2.2020 – March 23, 2020) list rituximab among the agents used for steroid-refractory chronic GVHD.[15]
    - **Hairy Cell Leukemia:** Guidelines (version 1.2020 – August 23, 2019) recommend rituximab in multiple regimens for relapsed/refractory disease, including in patients with progressive disease after relapsed/refractory therapy.[12]
    - **Hodgkin Disease:** Guidelines (version 2.2020 – April 17, 2020) recommend rituximab ± chemotherapy (depending on the clinical presentation) in the first-line setting for nodular

lymphocyte-predominant disease.[13] Rituximab is also used for relapsed/refractory disease and for maintenance.
    - **Waldenstrom Macroglobulinemia/lymphoplasmacytic lymphoma:** Guidelines (version 2.2020 – April 15, 2020) include rituximab in regimens across the spectrum of disease (primary therapy, previously treated disease, and maintenance).[14]
- **Rheumatoid Arthritis:** Guidelines from the American College of Rheumatology (ACR) [2015] have tumor inhibitors and non-TNF biologics (including rituximab), equally positioned following a trial of a conventional synthetic disease-modifying antirheumatic drug (DMARD).[16]
- **Systemic Lupus Erythematous (SLE):** European league Against Rheumatism (EULAR) recommendations for the management of systemic lupus erythematosus (2019) mention rituximab as a therapeutic option for patients who are refractory to standard immunosuppressive therapies.[21]
- **Vasculitis:** EULAR and European Renal Association/European Dialysis and Transplant Association (ERA-EDTA) recommendations for antineutrophil cytoplasmic antibody (ANCA)-associated vasculitis mention rituximab in combination with low-dose corticosteroids as a potential treatment option for remission-maintenance therapy.[4] Remission-maintenance therapy is recommended for at least 24 months following induction of sustained remission. British guidelines for use of rituximab in ANCA-associated vasculitis recommend rituximab for maintenance of remission to reduce the risk of relapse and its consequences.[5]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of rituximab intravenous products. Because of the specialized skills required for evaluation and diagnosis of patients treated with rituximab as well as the monitoring required for adverse events and long-term efficacy, initial approval requires rituximab IV products to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration listed below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of rituximab intravenous products is recommended in those who meet the following criteria:

FDA-Approved Indications

29. Antineutrophil Cytoplasmic Antibody (ANCA)-Associated Vasculitis. Approve for the duration noted if the patient meets ONE of the following (A or B):

B) Induction Treatment. Approve for 1 month if the patient meets ALL of the following (i, ii, and iii):
   a. Patient has an ANCA-associated vasculotide; AND
      Note: Examples of ANCA-associated vasculitis include granulomatosis with polyangiitis (GPA) [Wegener's granulomatosis] or microscopic polyangiitis (MPA).
   ~~b.~~ The medication is being administered in combination with glucocorticoids; AND
   c. The medication is prescribed by or in consultation with a rheumatologist, nephrologist, or immunologist.

~~C)~~ Follow-Up Treatment of Patients Who Have Received Induction Treatment for ANCA-Associated Vasculitis. Approve for 1 year if the patient meets BOTH of the following (i and ii):
   Note: This includes a patient who received induction treatment using a rituximab product or other standard of care immunosuppressants.
   ~~a.~~ According to the prescriber, the patient achieved disease control with induction treatment; AND

~~b.~~ If the patient previously received a course of therapy, at least 16 weeks will elapse between courses.

30. B-Cell Lymphoma. Approve for 1 year if prescribed by or in consultation with an oncologist.
Note: Examples of B Cell Lymphomas include Follicular Lymphoma, Diffuse Large B-Cell Lymphoma, Acquired Immune Deficiency [AIDS]-Related B-Cell Lymphoma, Burkitt Lymphoma, Castleman's Disease, Marginal Zone Lymphoma (e.g., extranodal or MALT [gastric or nongastric], nodal, or splenic marginal zone lymphoma), Primary Mediastinal Large B-Cell Lymphoma, Mantle Cell Lymphoma, Post-Transplant Lymphoproliferative Disorders, Gray Zone Lymphoma, Primary Cutaneous B-Cell Lymphoma, Pediatric Aggressive Mature B-cell Lymphomas.

31. Chronic Lymphocytic Leukemia or Small Lymphocytic Lymphoma. Approve for 1 year if prescribed by or in consultation with an oncologist.

32. Pemphigus Vulgaris. Approve for the duration noted if the patient meets ONE of the following (A or B):
A) Initial Treatment. Approve for 1 month (which is adequate duration to administer one course of therapy) if the patient meets BOTH of the following (i and ii):
i. Therapy is initiated in combination with a corticosteroid unless contraindicated; AND
Note: An example of a corticosteroid is prednisone.
ii. The medication is prescribed by or in consultation with a dermatologist.
B) Patient is Being Treated of a Relapse or for Maintenance of Pemphigus Vulgaris. Approve for 1 year if the patient meets BOTH of the following (i and ii):
i. Subsequent infusions of will be administered no sooner than 16 weeks following the previous infusion of a rituximab product; AND
ii. The medication is prescribed by or in consultation with a dermatologist.

33. Rheumatoid Arthritis. Approve for the duration noted if the patient meets ONE of the following (A or B):
A) Initial Therapy. Approve for 1 month (which is adequate duration to administer one course of therapy) if the patient meets ALL of the following conditions (i, ii, and iii):
i. Patient has tried ONE conventional synthetic disease-modifying antirheumatic drug (DMARD) for at least 3 months; AND
Note: Examples of conventional synthetic disease-modifying antirheumatic drugs include methotrexate [oral or injectable], leflunomide, hydroxychloroquine, and sulfasalazine. An exception to the requirement for a trial of one conventional synthetic DMARD can be made if the patient has already has a 3-month trial at least one biologic. These patients who have already tried a biologic are not required to "step back" and try a conventional synthetic DMARD.
ii. The medication will not be used concurrently with another biologic or with a targeted synthetic DMARD; AND
Note: Examples of biologics include Cimzia, adalimumab products, etanercept products, infliximab products, Simponi Aria or subcutaneous, Actemra intravenous or subcutaneous, Kevzara, Kineret, and Orencia intravenous or subcutaneous. Examples of targeted synthetic DMARDs include Xeljanz/XR, Oluminat, and Rinvoq.
iii. The medication is prescribed by or in consultation with a rheumatologist.
B) Patient has already Received One or More Courses of a Rituximab Product for Rheumatoid Arthritis. Approve for 1 month (which is adequate duration to administer one course of therapy) if the patient meets BOTH of the following conditions (i and ii):
i. 16 weeks or greater will elapse between treatment courses; AND

Note: For example, there will be a minimum of 16 weeks since the first dose of the previous course and the first dose of the next course of a rituximab product.

ii. If the patient has already received two or more courses of therapy, the patient has responded to therapy as determined by the prescriber.
Note: Examples of a response include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improved laboratory values; reduced dosage of corticosteroids).

Other Uses with Supportive Evidence

6. Acute Lymphoblastic Leukemia. Approve for 1 year if the patient meets ALL of the following (A and B):
- **A)** Patient has CD20-positive disease; AND
- **B)** The medication is prescribed by or in consultation with an oncologist.

2. Graft-Versus-Host Disease. Approve for 1 year if the patient meets BOTH of the following (A and B):
- **i.** Patient has tried at least one conventional systemic treatment for graft versus host disease; AND
  Note: Examples include systemic corticosteroids (methylprednisolone, prednisone), cyclosporine, tacrolimus, mycophenolate mofetil, Imbruvica® (ibrutinib capsules and tablets), imatinib. antithymocyte globulin, Nipent® (pentostatin infusion), or an infliximab product.
- **ii.** The medication is prescribed by or in consultation with an oncologist, hematologist, or a physician affiliated with a transplant center.

3. Hairy Cell Leukemia. Approve for 1 year if the patient meets BOTH of the following conditions (A and B):
- **A)** Patient has relapsed/refractory hairy cell leukemia; AND
- **B)** The medication is prescribed by or in consultation with an oncologist.

4. Hodgkin Lymphoma. Approve for 1 year if the patient meets BOTH of the following (A and B):
- **A)** Patient has nodular lymphocyte-predominant disease; AND
- **B)** The medication is prescribed by or in consultation with an oncologist.

10. Immune Thrombocytopenia (ITP). Approve if the patient meets ONE of the following (A or B):
- **A)** Initial Therapy. Approve for 1 month if the patient meets BOTH of the following (i and ii):
  - **i.** Patient has tried one other therapy; AND
    Note: Examples of therapies for ITP include intravenous immunoglobulin (IVIG), anti-D (RHO) immunoglobulin, corticosteroids, and splenectomy.
  - **ii.** The agent is prescribed by or in consultation with a hematologist.
- **B)** Patient has Already Received a Course of a Rituximab Product for ITP. Approve for 1 month if the patient meets ALL of the following (i, ii, and iii):
  - **i.** At least 6 months will elapse between treatment courses; AND
    Note: For example, there will be a minimum of 6 months separating the first dose of the previous course and the first dose of the requested course of a rituximab product.
  - **ii.** Patient responded to therapy as determined by the prescriber; AND
    Note: Examples of a response include a platelet count increase from baseline following treatment with a rituximab product.
  - **iii.** The prescriber has determined that the patient has relapsed.
    Note: Examples of a relapse include the patient experiences thrombocytopenia after achievement of a remission.

11. Multiple Sclerosis. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):

A) Patient has had an inadequate response or was unable to tolerate at least ONE other disease-modifying agent for multiple sclerosis; AND

B) The medication will not be used concurrently with another disease-modifying agent used for multiple sclerosis; AND

Note: Examples of disease-modifying agents for multiple sclerosis include Ocrevus (ocrelizumab IV infusion), Avonex (interferon beta-1a for intramuscular injection), Rebif (interferon beta-1a SC injection), Betaseron (interferon beta-1b SC injection), Extavia (interferon beta-1b SC injection), Copaxone (glatiramer acetate SC injection), Glatopa (glatiramer acetate SC injection), Plegridy (peginterferon beta-1a SC injection), Gilenya (fingolimod capsules), Aubagio (teriflunomide tablets), Tecfidera (dimethyl fumarate delayed-release capsules), or Lemtrada (alemtuzumab IV injection), mitoxantrone IV (Novantrone, generics), Tysabri (natalizumab IV injection), and Mavenclad (cladribine tablets).

C) The medication is prescribed by or in consultation with a physician who specializes in the treatment of MS and/or a neurologist; AND

D) At least 6 months will elapse between treatment courses.

Note: For example, if the patient has already received a course of therapy there will be a minimum of 6 months separating the first dose of the previous course and the first dose of the requested course of therapy.

1. Neuromyelitis Optica Spectrum Disorder. Approve for 1 month if prescribed by or in consultation with a neurologist.

13. Systemic Lupus Erythematous (SLE) [Lupus]. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 1 month (adequate duration to receive one course) if the patient meets BOTH of the following (i and ii):

i. Patient has tried at least ONE standard immunomodulating or immunosuppressant agent; AND
Note: Examples of standard immunomodulating or immunosuppressant agents include hydroxychloroquine, corticosteroids (e.g., prednisone, methylprednisolone), methotrexate, azathioprine, mycophenolate, and cyclophosphamide.

ii. The medication is prescribed by or in consultation with a rheumatologist, nephrologist, or neurologist.

B) Patient has Already Received a Course of a Rituximab Product for SLE. Approve for 1 month (adequate duration to receive one course) if 6 months or greater will elapse between treatment courses (i.e., there will be a minimum of 6 months separating the first dose of the previous rituximab course and the first dose of the requested course of rituximab).

14. Waldenstrom's Macroglobulinemia/Lymphoplasmacytic Lymphoma. Approve for 1 year if prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of rituximab intravenous products is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
New Policy	New policy to replace the Inflammatory Conditions – Rituximab Intravenous Products for Rheumatoid Arthritis on 07/01/2020.	06/03/2020
Selected Revision	**Riabni:** This newly approved biosimilar was added to the policy. There are no changes to the criteria, which apply to all rituximab products included in this policy.	01/06/2021

APPENDIX

	Mechanism of Action	Examples of Inflammatory Indications for Products*
Biologics		
Adalimumab SC Products (Humira®, biosimilars)	Inhibition of TNF	AS, CD, PJIA, PsO, PsA, RA, SJIA, UC
Cimzia® (certolizumab pegol SC injection)	Inhibition of TNF	AS, CD, PsO, PsA, RA
Etanercept SC Products (Enbrel®, biosimilars)	Inhibition of TNF	AS, PJIA, PsO, PsA, RA, SJIA
Infliximab IV Products (Remicade®, biosimilars)	Inhibition of TNF	AS, CD, PJIA, PsO, PsA, RA, SJIA, UC
Simponi®, Simponi® Aria™ (golimumab SC injection, golimumab IV infusion)	Inhibition of TNF	SC formulation: AS, PsA, RA, UC
		IV formulation: AS, PsA, RA
Actemra® (tocilizumab IV infusion, tocilizumab SC injection)	Inhibition of IL-6	SC formulation: PJIA, RA, SJIA
		IV formulation: PJIA, RA, SJIA
Kevzara® (sarilumab SC injection)	Inhibition of IL-6	RA
Orencia® (abatacept IV infusion, abatacept SC injection)	T-cell costimulation modulator	SC formulation: PJIA, PSA, RA
		IV formulation: PJIA, PsA, RA
Rituximab IV Products (Rituxan®, biosimilars)	CD20-directed cytolytic antibody	RA
Ilaris (canakinumab SC injection**)**	Inhibition of IL-1β	SJIA
Kineret® (anakinra SC injection)	Inhibition of IL-1	RA, SJIA^
Stelara® (ustekinumab SC injection, ustekinumab IV infusion)	Inhibition of IL-12/23	SC formulation: CD, PsO, PsA, UC
		IV formulation: CD, UC
Siliq™ (brodalumab SC injection)	Inhibition of IL-17	PsO
Cosentyx™ (secukinumab SC injection)	Inhibition of IL-17A	AS, PsO, PsA
Taltz® (ixekizumab SC injection)	Inhibition of IL-17A	AS, PsO, PsA
Ilumya™ (tildrakizumab-asmn SC injection)	Inhibition of IL-23	PsO
Skyrizi™ (risankizumab-rzza SC injection)	Inhibition of IL-23	PsO
Tremfya™ (guselkumab SC injection)	Inhibition of IL-23	PsO
Entyvio™ (vedolizumab IV infusion)	Integrin receptor antagonist	CD, UC
Targeted Synthetic DMARDs		
Otezla® (apremilast tablets)	Inhibition of PDE4	PsO, PsA
Olumiant® (baricitinib tablets)	Inhibition of the JAK pathways	RA
Rinvoq® (upadacitinib extended-release tablets)	Inhibition of the JAK pathways	RA
Xeljanz®, Xeljanz XR (tofacitinib tablets, tofacitinib extended-release tablets)	Inhibition of the JAK pathways	RA, PsA, UC

* Not an all-inclusive list of indication (e.g., oncology indications and rare inflammatory conditions are not listed). Refer to the prescribing information for the respective agent for FDA-approved indications; SC – Subcutaneous; TNF – Tumor necrosis factor; IV – Intravenous, IL – Interleukin; PDE4 – Phosphodiesterase 4; JAK – Janus kinase; AS – Ankylosing spondylitis; CD – Crohn's disease; PJIA – Polyarticular juvenile idiopathic arthritis; PsO – Plaque psoriasis; PsA – Psoriatic arthritis; RA – Rheumatoid arthritis; SJIA – Systemic juvenile idiopathic arthritis; UC – Ulcerative colitis; ^ Off-label use of SJIA supported in guidelines.

PRIOR AUTHORIZATION POLICY

POLICY: Scenesse Prior Authorization Policy

- Scenesse® (afamelanotide implant for subcutaneous use – Clinuvel)

REVIEW DATE: 02/10/2021

OVERVIEW

Scenesse, a melanocortin 1 receptor agonist, is indicated to increase pain-free light exposure in adults with a history of phototoxic reactions from **erythropoietic protoporphyria (EPP)**.[1] Scenesse is a controlled-release dosage form that is implanted subcutaneously (SC). Scenesse should be administered by a healthcare professional. A single implant which contains 16 mg of afamelanotide is inserted SC above the anterior supra-iliac crest once every 2 months.

Disease Overview

Porphyrias are disorders caused by enzyme defects in heme biosynthesis.[2] There are at least eight different types of porphyrias, which are classified as cutaneous or acute depending on the specific enzyme that is deficient. EPP is a cutaneous porphyria characterized by extreme photosensitivity. It is estimated to occur in 2 to 5 in 1,000,000 individuals.[3]

EPP occurs due to excessive accumulation of protoporphyrin, a heme precursor. Classic EPP is autosomal recessive and occurs due to a defect in the enzyme ferrochelatase, the final enzymatic step in heme biosynthesis.[4] An X-linked subtype of EPP, often referred as X-linked protoporphyria (XLP), accounts for 2% to 10% of all EPP cases. This type develops due to a gain-of-function mutation in an upstream enzyme in heme biosynthesis, leading to excess protoporphyrin production.[3,4] The two subtypes share the same biochemical and clinical features, although females with XLP may be less severely affected. Diagnosis is confirmed by one or both of the following: 1) biochemically via markedly elevated free erythrocyte protoporphyrin, and/or 2) molecular genetic testing.[2,3]

In both EPP subtypes, protoporphyrin accumulation in superficial skin vessels leads to phototoxicity upon light exposure, resulting in the hallmark symptoms of burning, tingling, and itching, which often occur without visible damage.[2-4] Phototoxic pain is not responsive to analgesics, including narcotics; management is focused on prevention of phototoxic episodes.[3]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Scenesse. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Scenesse as well as the monitoring required for adverse events and long-term efficacy, approval requires Scenesse to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Scenesse is recommended in those who meet the following criteria:

FDA-Approved Indications

260. Erythropoietic Protoporphyria (Including X-Linked Protoporphyria). Approve for 1 year if the patient meets the following criteria (A, B, C, and D):

- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has a history of at least one porphyric phototoxic reaction; AND
- **C)** The diagnosis is confirmed by at least one of the following (i or ii):
  - **i.** Free erythrocyte protoporphyrin level above the normal reference range for the reporting laboratory; OR
  - **ii.** Molecular genetic testing consistent with the diagnosis; AND
- **D)** The agent is prescribed by or in consultation with a dermatologist, gastroenterologist, hepatologist, or physician specializing in the treatment of cutaneous porphyrias.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Scenesse is not recommended in the following situations:

246. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

- temazepam (Restoril® – Mallinckrodt, generics)
- triazolam (Halcion® – Pfizer, generics)

DATE REVIEWED: 05/27/2020

OVERVIEW

Eszopiclone, zaleplon, zolpidem immediate-release (IR), zolpidem extended-release (ER), zolpidem sublingual tablets, Edluar, and Zolpimist are all non-benzodiazepine sedative hypnotics used for the treatment of insomnia.[1-7] These agents interact with gamma-aminobutyric acid (GABA) receptor complexes located closely to benzodiazepine receptors; the chemical structures of these agents are unrelated to the benzodiazepines. All are schedule IV controlled substances. Rozerem, another non-benzodiazepine sedative hypnotic, is a melatonin receptor agonist.[8] Silenor is a tricyclic compound that acts as a histamine H_1 receptor antagonist.[9] Neither Rozerem nor Silenor are controlled substances. Belsomra and Dayvigo are first-in-class orexin receptor antagonists and are schedule IV controlled substances.[10,11] Estazolam, flurazepam, Doral, temazepam, and triazolam are benzodiazepine sedative hypnotics indicated for the treatment of insomnia.[12] Benzodiazepines bind to receptors on the postsynaptic GABA neuron, and their effects appear to be linked to the GABA-A receptors.

Zolpidem IR, Edluar, Zolpimist, zaleplon, and the benzodiazepine sedative hypnotics are indicated for the short-term treatment of insomnia.[1,3,5,6,12] Zolpidem ER, eszopiclone, Silenor, and Rozerem are also indicated for the treatment of insomnia, but their product labeling does not specifically limit their use to short-term.[2,4,8,9] All of the agents in this category have been shown to decrease sleep latency. Zaleplon and Rozerem are specifically indicated for the treatment of insomnia characterized by difficulty with sleep onset.[3,8] Zolpidem IR, zolpidem ER, Silenor, and eszopiclone have also been shown to improve sleep maintenance or increase the duration of sleep.[1,2,4,9] Belsomra and Dayvigo are indicated for the treatment of insomnia, characterized by difficulties with sleep onset and/or sleep maintenance.[10,11] Zolpidem sublingual tablets are indicated for use as needed for the treatment of insomnia when a middle-of-the-night (MOTN) awakening is followed by difficulty returning to sleep.[7] However, zolpidem sublingual tablets are not indicated for treatment of MOTN insomnia when the patient has fewer than 4 hours of bedtime remaining before the planned time of waking. Doxepin is also available generically as oral capsules (10, 25, 50, 75, 100, and 150 mg) and oral solution (10 mg/mL).[12] These higher dose formulations are recommended for use in patients with depression and/or anxiety of varying etiologies.

Disease Overview

Insomnia is defined in the International Classification of Sleep Disorders, Third Edition, as a complaint of trouble initiating or maintaining sleep, resulting in daytime consequences (e.g., daytime fatigue, irritability, and decreased concentration) which is not attributable to environmental circumstances or inadequate opportunity for sleep.[13] Specific sleep complaints of patients with insomnia include delayed sleep onset, frequent awakenings, early morning awakenings, and waking up feeling unrefreshed. A wide array of terminology exists for defining the duration of insomnia symptoms. Generally, transient insomnia lasts less than 1 week, short-term (acute) insomnia lasts up to 3 months, and chronic insomnia lasts more than 3 months at a frequency of at least three times per week.[13,14] Symptoms of insomnia commonly wax and wane over time, and manifestations of insomnia often change over time (e.g., difficulty falling to sleep changes to difficulty staying asleep, or vice versa). Insomnia is often subtyped by the predominant symptom, either sleep onset or sleep maintenance.[15]

Guidelines

The American Academy of Sleep Medicine (AASM) published a clinical guideline for the evaluation and management of chronic insomnia in adults (2008).[16] Insomnia is primarily diagnosed by clinical evaluation through a thorough sleep history and detailed medical, substance, and psychiatric history. The evaluation and differential diagnosis of insomnia can be aided by self-administered questionnaires, at-home sleep logs, symptom checklists, psychological

screening tests, and bed partner interviews. At a minimum, patients should complete a general medical/psychiatric questionnaire to identify comorbid disorders; a sleepiness assessment (e.g., Epworth Sleepiness Scale) to identify sleepy patients and comorbid disorders of sleepiness; and a 2-week sleep log to identify general patterns of sleep-wake times and day-to-day variability. A sleep diary should be maintained prior to and during the course of active treatment and in the case of relapse or reevaluation in the long-term. The primary treatment goals are to improve sleep quality and quantity and to improve insomnia related daytime impairments. Initial approaches to treatment should include at least one behavioral intervention such as stimulus control therapy or relaxation therapy, or the combination of cognitive therapy, stimulus control therapy, sleep restriction therapy with or without relaxation therapy. Patients should be instructed to keep a regular schedule; have a healthy diet, regular daytime exercise, and a quiet sleep environment; and avoid napping, caffeine, other stimulants, nicotine, alcohol, excessive fluids, or stimulating activities before bedtime. Short-term hypnotic treatment should be supplemented with behavioral and cognitive therapies when possible. Chronic hypnotic medication may be indicated for long-term use in patients with severe or refractory insomnia or chronic comorbid illness. Whenever possible, patients should receive an adequate trial of cognitive behavioral treatment during long-term pharmacotherapy. Long-term prescribing should be accompanied by regular follow-up, ongoing assessment of effectiveness, monitoring for adverse events, and evaluation for new onset or exacerbation of existing comorbid disorders.

The AASM published an updated clinical practice guideline for the pharmacologic treatment of chronic insomnia in adults (2017).[13] The recommendations are intended as a guide for choosing a specific pharmacological agent (vs. no treatment) for treatment of chronic insomnia in adults, when such treatment is indicated. Each of the recommendations listed is weak, meaning it reflects a lower degree of certainty in the outcome and appropriateness of the patient care strategy for all patients but should not be construed as an indication of ineffectiveness. The guideline suggests that clinicians can use Belsomra as a treatment for sleep maintenance insomnia; eszopiclone can be used as a treatment for sleep onset and sleep maintenance insomnia; zaleplon can be used as a treatment for sleep onset insomnia; zolpidem can be used as a treatment for sleep onset and sleep maintenance insomnia; triazolam can be used as a treatment for sleep onset insomnia; temazepam can be used as a treatment for sleep onset and sleep maintenance insomnia; ramelteon can be used as a treatment for sleep onset insomnia; and Silenor can be used as a treatment for sleep maintenance insomnia. The guideline suggested that clinicians not use trazodone, tiagabine, diphenhydramine, melatonin, tryptophan, or valerian as a treatment for sleep onset or sleep maintenance insomnia. The authors note that cognitive behavioral therapy for insomnia (CBT-I) is a standard of care for this condition; however, the AASM guideline does not address the relative benefits of CBT-I vs. pharmacotherapy.

The American College of Physicians (ACP) developed a guideline on the management of chronic insomnia disorder in adults (2016).[17,18] Chronic insomnia can be managed with psychological therapy, pharmacologic therapy, or a combination of both. Psychological therapy options include CBT-I and other interventions, such as stimulus control, relaxation strategies, and sleep restriction. ACP recommends that all adults receive CBT-I as the initial treatment for chronic insomnia disorder (strong recommendation, moderate-quality evidence). ACP recommends that clinicians use a shared decision-making approach, including a discussion of the benefits, harms, and costs of short-term use of medications, to decide whether to prescribe a medication in adults with chronic insomnia disorder in whom CBT-I alone was unsuccessful (weak recommendation, low-quality evidence). A review of the evidence found that eszopiclone, zolpidem, Belsomra, and Silenor may improve short-term global and sleep outcomes for adults with insomnia disorder (low- to moderate-quality evidence), but the comparative effectiveness and long-term efficacy of pharmacotherapies for insomnia are unknown. ACP also notes that pharmacotherapies for insomnia may cause cognitive and behavioral changes and may be associated with infrequent but serious harms.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of sedative hypnotics. All approvals are provided for the duration noted below.

Automation: Patients who use at least 180 days of a sedative/hypnotic medication in a 365-day time period will require prior authorization. If the patient has a prescription for a cancer medication (see Appendix A) within a 180-day period, the claim will adjudicate. When available, the ICD-10 codes for cancer will be used as part of automation to allow approval of the requested medication (see Appendix B).

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of a sedative hypnotic is recommended in those who meet the following criteria:

FDA-Approved Indications

41. Chronic Insomnia. Approve for 1 year if the patient meets ONE of the following criteria (A or B):

H) The patient has a cancer diagnosis; OR

I) The patient meets ALL of the following criteria (i, ii, iii, and iv):

E) Patient has tried at least one form of behavioral therapy for insomnia; AND

Note: Examples of behavioral therapy for insomnia include relaxation training, stimulus control therapy, or sleep restriction therapy.

F) Patient is not currently taking prescription stimulants (e.g., methylphenidate, amphetamine products); AND

G) Underlying psychiatric and/or medical conditions that may cause or exacerbate insomnia have been evaluated and are currently being addressed, according to the prescriber; AND

H) Patient's sleep quality and quantity and/or insomnia-related daytime impairments continue to improve or remain stable, according to the prescriber.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Sedative hypnotics have not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

247. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Sickle Cell Disease – Adakveo Prior Authorization Policy

- Adakveo® (crizanlizumab-tmca injection, for intravenous use – Novartis)

REVIEW DATE: 12/02/2020

OVERVIEW

Adakveo, a monoclonal antibody, is indicated to **reduce the frequency of vasocclusive crises** in patients aged 16 years and older with **sickle cell disease**.[1]

DISEASE OVERVIEW

Sickle cell disease, a multisystem disorder, is the most common condition caused by a single gene mutation.[2] In the US, population estimates suggest that a total of 100,000 persons have the disease. Approximately 300,000 babies are born with sickle cell anemia each year and it is estimated that the number could be as high as 400,000 by 2050.

Sickle cell disease is characterized by the presence of abnormal erythrocytes damaged by the sickle hemoglobin gene – this variant of the normal adult hemoglobin can be inherited from both parents or from one parent along with another variant, such as hemoglobin C or with β-thalassemia.[2] Complications of sickle cell disease include vaso-occlusion (which can result in pain and organ failure), hemolytic anemia, and large-vessel vasculopathy (cerebrovascular disease, pulmonary hypertension, ischemic organ damage hyposplenism, renal failure, bone disease, liver failure).

Guidelines

Adakveo has not been added to guidelines. The National Institutes of Health – National Heart, Lung, and Blood Institute issued the Evidence-Based Management of Sickle Cell Disease, Expert Panel Report in 2014.[3] There are two effective disease-modifying therapies for sickle cell disease: hydroxyurea and chronic blood transfusions. Hydroxyurea has been shown to reduce: the frequency of painful episodes, incidence of acute coronary syndrome events, and the need for transfusions and hospitalizations.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Adakveo. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Adakveo as well as the monitoring required for adverse events and long-term efficacy, approval requires Adakveo to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Adakveo is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Sickle Cell Disease.** Approve for 1 year if the patient meets ONE of the following criteria (A or B):
   - **A)** Initial Therapy. Approve if the patient meets ALL of the following criteria (i, ii, iii, and iv):
     - **i.** Patient is ≥ 16 years of age; AND
     - **ii.** Patient has had at least one sickle-cell related crisis in the previous 12-month period; AND
     - **iii.** Patient meets one of the following criteria (a, b, or c):
       - **a.** Patient is currently receiving a hydroxyurea product; OR
       - **b.** According to the prescriber, patient has tried a hydroxyurea product and has experienced inadequate efficacy or significant intolerance; OR
       - **c.** According to the prescriber, patient is not a candidate for hydroxyurea therapy; AND
         Note: Examples of patients who are not candidates for hydroxyurea therapy include patients who are pregnant or who are planning to become pregnant and patients with an immunosuppressive condition (such as cancer).
     - **iv.** The medication is prescribed by or in consultation with a physician who specializes in sickle cell disease (e.g., a hematologist).
   - **B)** Patient is Currently Receiving Adakveo. Approve for 1 year if the patient meets ALL of the following criteria (i, ii, and iii):
     - ~~**84.**~~**81.** Patient is ≥ 16 years of age; AND
     - ~~**85.**~~**82.** According to the prescriber, patient is receiving clinical benefit from Adakveo therapy; AND
       Note: Examples of clinical benefit include reduction in the number of vaso-occlusive crises/sickle cell-related crises; delay in time to sickle cell-related crises; and reduction in the number of days in the hospital.
     - ~~**86.**~~**83.** The medication is prescribed by or in consultation with a physician who specializes in sickle cell disease (e.g., a hematologist).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Adakveo is not recommended in the following situations:

248. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
New Policy	--	11/20/2019
Update	12/04/2019: Changed name of policy from "Hematology – Adakveo PA" to "Sickle Cell Disease – Adakveo PA".	NA
Annual Revision	The criteria were separated as two sets, one for Initial Therapy and one for a Patient Currently Receiving Therapy. • For Initial Therapy, it was added that the patient has a history of at least one sickle cell-related crisis in the previous 12-month period. Also, a patient must currently be receiving a hydroxyurea product; or the patient has tried a hydroxyurea product and has experienced inadequate efficacy or significant intolerance, according to the prescriber; or the patient is not a candidate for hydroxyurea therapy, according to the prescriber. A Note was added citing examples of patients who are not candidates for hydroxyurea therapy. • For a patient Currently Receiving Adakveo, criteria were added to approve for 1 year if the patient meets all of the following: patient is ≥ 16 years of age; patient is receiving clinical benefit, according to the prescriber; and the medication is prescribed by or in consultation with a physician who specializes in sickle cell disease (e.g., a hematologist). Also, examples of clinical benefit were provided in a Note.	12/02/2020

NA – Not applicable.

PRIOR AUTHORIZATION POLICY

POLICY: Sickle Cell Disease – Endari Prior Authorization Policy
- Endari™ (L-glutamine oral powder – Emmaus Medical)

REVIEW DATE: 11/11/2020

OVERVIEW

Endari is indicated to **reduce the acute complications of sickle cell disease** in adults and pediatric patients ≥ 5 years of age.[1]

L-glutamine is an essential amino acid and serves as a precursor of nucleic acids and nucleotides including the pyridine nucleotides (nicotinamide adenine dinucleotide and reduced nicotinamide adenine dinucleotide).[1,2] These pyridine nucleotides play key roles in the regulation and prevention of oxidative damage in red blood cells and studies have shown that oxidative phenomena may play a significant role in the pathophysiology of sickle cell disease.

Disease Overview

Sickle cell disease, a multisystem disorder, is the most common condition caused by a single gene mutation.[3] In the US, population estimates suggest that a total of 100,000 persons have the disease. Approximately 300,000 babies are born with sickle cell anemia each year and it is estimated that the number could be as high as 400,000 by 2050.

Sickle cell disease is characterized by the presence of abnormal erythrocytes damaged by the sickle hemoglobin gene – this variant of the normal adult hemoglobin can be inherited from both parents or from one parent along with another variant, such as hemoglobin C or with β-thalassemia.[3] Complications of sickle cell disease include vaso-occlusion (which can result in pain and organ failure), hemolytic anemia, and large-vessel vasculopathy (cerebrovascular disease, pulmonary hypertension, ischemic organ damage, hyposplenism, renal failure, bone disease, liver failure).

Guidelines

The National Institutes of Health – National Heart, Lung, and Blood Institute issued the Evidence-Based Management of Sickle Cell Disease, Expert Panel Report in 2014.[4] The use of L-glutamine products in sickle cell disease is not mentioned (guidelines were published before the approval of Endari). Hydroxyurea has been shown to reduce the frequency of painful episodes and acute coronary syndrome events and reduce the need for transfusions and hospitalizations.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Endari. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Endari as well as the monitoring required for adverse events and long-term efficacy, approval requires Endari to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Documentation: Documentation is required for use of Endari as noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes, prescription claims records, prescription receipts, and/or other information.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Endari is recommended in those who meet the following criteria:

FDA-Approved Indication

~~87.~~84. **Sickle Cell Disease [documentation required].** Approve for 1 year if the patient meets the following criteria (A and B):

B) Patient is ≥ 5 years of age; AND

C) The medication is prescribed by or in consultation with a physician who specializes in sickle cell disease (e.g., a hematologist).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Endari is not recommended in the following situations:

314. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Sickle Cell Disease – Oxbryta Prior Authorization Policy

- Oxbryta™ (voxelotor tablets – Global Blood Therapeutics)

REVIEW DATE: 12/02/2020

OVERVIEW

Oxbryta, a hemoglobin S (or sickle hemoglobin) polymerization inhibitor, is indicated for the **treatment of sickle cell disease** in adults and pediatric patients 12 years of age and older.[1]

Disease Overview

Sickle cell disease, a multisystem disorder, is the most common condition caused by a single gene mutation.[2] In the US, population estimates suggest 100,000 persons have the disease. Approximately 300,000 babies are born with sickle cell anemia each year and it is estimated that the number could be as high as 400,000 by 2050.

Sickle cell disease is characterized by the presence of abnormal erythrocytes damaged by the sickle hemoglobin gene – this variant of the normal adult hemoglobin can be inherited from both parents or from one parent along with another variant, such as hemoglobin C or with β-thalassemia.[2] Complications of sickle cell disease include vaso-occlusion (which can result in pain and organ failure), hemolytic anemia, and large-vessel vasculopathy (cerebrovascular disease, pulmonary hypertension, ischemic organ damage, hyposplenism, renal failure, bone disease, liver failure).

Guidelines

Oxbryta has not been added to guidelines. The National Institutes of Health – National Heart, Lung, and Blood Institute issued the Evidence-Based Management of Sickle Cell Disease, Expert Panel Report in 2014.[3] There are two effective disease-modifying treatments for sickle cell disease: hydroxyurea and chronic blood transfusions. Hydroxyurea has been shown to reduce: the frequency of painful episodes, incidence of acute coronary syndrome events, and the need for transfusions and hospitalizations.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Oxbryta. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Oxbryta as well as the monitoring required for adverse events and long-term efficacy, approval requires Oxbryta to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Oxbryta is recommended in those who meet the following criteria:

FDA-Approved Indication

~~88.~~85. **Sickle Cell Disease.** Approve for 1 year if the patient meets ONE of the following criteria (A or B):

D) Initial Therapy. Approve if the patient meets ALL of the following criteria (i, ii, iii, iv and v):
- **i.** Patient is ≥ 12 years of age; AND
- **ii.** Patient has had at least one sickle cell-related crisis in the previous 12-month period; AND
- **iii.** Patient's baseline hemoglobin level was ≤ 10.5 g/dL (before initiating Oxbryta therapy); AND
- **iv.** Patient meets one of the following criteria (a, b, or c):
  - **a.** Patient is currently receiving a hydroxyurea product; OR
  - **b.** According to the prescriber, patient has tried a hydroxyurea product and has experienced inadequate efficacy or significant intolerance; OR
  - **c.** According to the prescriber, patient is not a candidate for hydroxyurea therapy; AND
    Note: Examples of patients who are not candidates for hydroxyurea therapy include patients who are pregnant or who are planning to become pregnant and patients with an immunosuppressive condition (such as cancer).
- **v.** The medication is prescribed by or in consultation with a physician who specializes in sickle cell disease (e.g., a hematologist).

B) Patient is Currently Receiving Oxbryta. Approve for 1 year if the patient meets ALL of the following criteria (i, ii, and iii):
- **i.** Patient is ≥ 12 years of age; AND
- **ii.** According to the prescriber, patient is receiving clinical benefit from Oxbryta therapy; AND
  Note: Examples of clinical benefit include reduction in the number of vaso-occlusive crises/sickle cell-related crises, delay in time to sickle cell-related crises; and reduction in the number of days in the hospital.
- **iii.** The medication is prescribed by or in consultation with a physician who specializes in sickle cell disease (e.g., a hematologist).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Oxbryta is not recommended in the following situations:

249. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
New Policy	--	12/04/2019
Annual Revision	The criteria were separated as two sets, one for Initial Therapy and one for a Patient Currently Receiving Therapy. • For Initial Therapy, it was added that the patient has a history of at least one sickle cell-related crisis in the previous 12-month period and has a baseline hemoglobin level ≤ 10.5 g/dL. Also, that patient must currently be receiving a hydroxyurea product; or the patient has tried a hydroxyurea product and has experienced inadequate efficacy or significant intolerance, according to the prescriber; or the patient is not a candidate for hydroxyurea therapy, according to the prescriber. A Note was added citing examples of patients who are not candidates for hydroxyurea therapy. • For a patient Currently Receiving Oxbryta, criteria were added to approve for 1 year if the patient meets all of the following: patient is ≥ 12 years of age; patient is receiving clinical benefit, according to the prescriber; and the medication is prescribed by or in consultation with a physician who specializes in sickle cell disease (e.g., a hematologist). Also, examples of clinical benefit were provided in a Note.	12/02/2020

PRIOR AUTHORIZATION POLICY

POLICY: Somatostatin Analogs – Mycapssa Prior Authorization Policy

- Mycapssa® (octreotide delayed-release capsules – Chisama)

REVIEW DATE: 09/02/2020

OVERVIEW

Mycapssa, a somatostatin analog, is indicated for long-term maintenance treatment in acromegaly patients who have responded to and tolerated treatment with octreotide or lanreotide.[1] Mycapssa maintained growth hormone and insulin-like growth factor 1 levels in patients with acromegaly.

GUIDELINES

The Endocrine Society Clinical Practice Guidelines for Acromegaly (2014) recommend medical therapy as adjuvant treatment after surgical intervention.[2] Mycapssa is not addressed in the guidelines. Primary medical therapy with somatostatin analogs (no preferred agent) can be recommended for some patients (e.g., surgery is not curative or patient is a poor surgical candidate). Updated recommendations to the 2014 guidelines on therapeutic outcomes for patients with acromegaly were created by the Acromegaly Consensus Group (2017).[3] The statement recommends Somatuline Depot and Sandostatin LAR Depot as first-line medical therapies in patients with persistent disease after surgery. Signifor LAR is recommended as a second-line medical therapy due to its potential for hyperglycemic-associated adverse events.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Mycapssa. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Mycapssa as well as the monitoring required for adverse events and long-term efficacy, approval requires Mycapssa to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Mycapssa is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Acromegaly.** Approve for 1 year if the patient meets the following criteria (A, B, and C):
   - **A)** Patient has (or had) a pre-treatment (baseline) insulin-like growth factor 1 (IGF-1) level above the upper limit of normal based on age and gender for the reporting laboratory; AND
     Note: Pre-treatment (baseline) refers to the IGF-1 level prior to the initiation of a somatostatin analog (e.g., Mycapssa® [octreotide delayed-release capsules], an octreotide acetate injection product [e.g., Bynfezia Pen™, Sandostatin® {generics}, Sandostatin® LAR Depot], Signifor® LAR [pasireotide injection], Somatuline® Depot [lanreotide injection], dopamine agonist [e.g., cabergoline, bromocriptine], or Somavert® [pegvisomant injection]). Reference ranges for IGF-1 vary among laboratories.
   - **B)** According to the prescriber, patient has responded to one octreotide acetate injection product or Somatuline® Depot (lanreotide injection); AND
   - **C)** The medication is prescribed by or in consultation with an endocrinologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Mycapssa is not recommended in the following situations:

250. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

386. Mycapssa capsules [prescribing information]. Needham, MA: Chiasma; April 2019.

HISTORY

Type of Revision	Summary of Changes	Review Date
New Policy	--	09/02/2020

PRIOR AUTHORIZATION POLICY

POLICY: Somatostatin Analogs – Sandostatin® LAR Depot Prior Authorization Policy

- Sandostatin® LAR Depot (octreotide acetate for injectable suspension – Novartis)

REVIEW DATE: 08/05/2020

OVERVIEW

Sandostatin LAR Depot, a somatostatin analog, is indicated for the following uses:[1]

- **Acromegaly**, in patients who have had an inadequate response to surgery and/or radiotherapy, or for whom surgery and/or radiotherapy, is not an option. The goal of treatment in acromegaly is to reduce growth hormone and insulin-like growth factor-1 levels to normal.
- **Carcinoid tumors**, in patients with severe diarrhea and flushing episodes associated with metastatic carcinoid tumors.
- **Vasoactive intestinal peptide tumors (VIPomas)**, in patients with profuse watery diarrhea associated with vasoactive intestinal peptide (VIP)-secreting tumors.

Guidelines

National Comprehensive Cancer Network (NCCN) guidelines support use of Sandostatin LAR Depot in multiple conditions.

- **Central Nervous System Cancers:** Guidelines (version 2.2020 – April 30, 2020) recommend Sandostatin LAR Depot for the treatment of meningiomas that recur despite surgery and/or radiation therapy, or are not amenable to treatment with surgery or radiation therapy.[2]
- **Neuroendocrine and Adrenal Tumors:** Guidelines (version 1.2020 – July 10, 2020) recommend Sandostatin LAR Depot for the management of carcinoid syndrome, tumors of the gastrointestinal tract, lung, thymus (carcinoid tumors), and pancreas (including glucagonomas, gastrinomas, VIPomas, insulinomas), pheochromocytomas, and paragangliomas.[3] Patients who have local unresectable disease and/or distant metastases and clinically significant tumor burden or progression should be started on therapy with a somatostatin analog to potentially control tumor growth. The North American Neuroendocrine Tumor Society (NANETS) consensus guidelines for the surveillance and medical management of midgut NETs (2017) also recommend Sandostatin LAR Depot as a first-line initial therapy in most patients with metastatic midgut NETs for control of carcinoid syndrome and inhibition of tumor growth.[4]
- **Thymomas and Thymic Carcinomas:** Guidelines (version 1.2020 – November 27, 2019) recommend Sandostatin LAR Depot as a second-line systemic therapy option with or without concomitant prednisone therapy.[5] In patients with thymoma who have positive octreotide scan or symptoms of carcinoid syndrome, octreotide therapy may be useful.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Sandostatin LAR Depot. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Sandostatin LAR Depot as well as the monitoring required for adverse events and long-term efficacy, approval requires Sandostatin LAR Depot to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Sandostatin LAR Depot is recommended in those who meet the following criteria:

FDA-Approved Indications

2. Acromegaly. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **D)** Patient meets ONE of the following (i, ii, or iii):
  - **i.** Patient has had an inadequate response to surgery and/or radiotherapy; OR
  - **ii.** Patient is NOT an appropriate candidate for surgery and/or radiotherapy; OR
  - **iii.** Patient is experiencing negative effects due to tumor size (e.g., optic nerve compression); AND
- **E)** Patient has (or had) a pre-treatment (baseline) insulin-like growth factor-1 (IGF-1) level above the upper limit of normal based on age and gender for the reporting laboratory; AND
  Note: Pre-treatment (baseline) refers to the IGF-1 level prior to the initiation of any somatostatin analog (e.g., Mycapssa® [octreotide delayed-release capsules], an octreotide acetate injection product [e.g., Bynfezia Pen™, Sandostatin® {generics}, Sandostatin® LAR Depot], Signifor® LAR [pasireotide injection], Somatuline® Depot [lanreotide injection], dopamine agonist [e.g., cabergoline, bromocriptine], or Somavert® [pegvisomant injection]). Reference ranges for IGF-1 vary among laboratories.
- **F)** The medication is prescribed by or in consultation with an endocrinologist.

2. Neuroendocrine Tumor(s) [NETs] of the Gastrointestinal Tract, Lung, Thymus (Carcinoid Tumors), and Pancreas (including glucagonomas, gastrinomas, vasoactive intestinal peptides-secreting tumors [VIPomas], insulinomas). Approve for 1 year if the medication is prescribed by or in consultation with an oncologist, endocrinologist, or gastroenterologist.

Other Uses with Supportive Evidence

~~89.~~**86. Meningioma.** Approve for 1 year if the medication is prescribed by or in consultation with an oncologist, radiologist, or neurosurgeon.

~~90.~~**87. Thymoma and Thymic Carcinoma.** Approve for 1 year if the medication is prescribed by or in consultation with an oncologist.

~~91.~~**88. Pheochromocytoma and Paraganglioma.** Approve for 1 year if the medication is prescribed by or in consultation with an endocrinologist, oncologist, or neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Sandostatin LAR Depot is not recommended in the following situations:

251. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual revision	Added more specific conditions to the indication: "Neuroendocrine Tumor(s) [NETs] of the Gastrointestinal Tract, Lung, Thymus (Carcinoid Tumors), and Pancreas (including glucagonomas, gastrinomas, vasoactive intestinal peptides-secreting tumors [VIPomas], insulinomas)". Deleted "Note" that described the different types of neuroendocrine tumors since now it's in the approval condition. Also added criteria requiring specialist physician for NETs, meningiomas, and thymic carcinoma indications. Changed approval duration from 3 years to 1 year.	08/22/2018
Annual revision	Addition of indication for pheochromocytoma/paraganglioma to approval criteria.	07/31/2019
Annual Revision	**Acromegaly.** In the Note section referring to the pre-treatment (baseline) insulin-like growth factor-1 (IGF-1) level, Mycapssa® (octreotide delayed-release capsules) and octreotide acetate injection products (Bynfezia Pen™, Sandostatin® [generics]) were added as examples of a somatostatin analog.	08/05/2020

PRIOR AUTHORIZATION POLICY

POLICY: Somatostatin Analogs – Signifor LAR Prior Authorization Policy

- Signifor® LAR (pasireotide injectable suspension – Recordati Rare Diseases)

REVIEW DATE: 08/05/2020

OVERVIEW

Signifor LAR, a somatostatin analog, is indicated for the following uses:[1]

- **Acromegaly**, in patients who have had an inadequate response to surgery and/or for whom surgery is not an option. In vivo studies show that Signifor LAR lowers growth hormone and insulin-like growth factor-1 levels in patients with acromegaly.
- **Cushing's disease**, in patients for whom pituitary surgery is not an option or has not been curative.

Cushing's Syndrome/Disease

Cushing's syndrome refers to the general state of excessive levels of cortisol (hypercortisolism) in the blood.[2,3] Hypercortisolism can occur for reasons that are either endogenous or exogenous in nature (e.g., Cushing's disease, cortisol-containing medications, adrenal gland tumor, certain cancers). Endogenous Cushing's syndrome can be divided into adrenocorticotropic hormone (ACTH)-dependent and ACTH-independent, with the majority of cases

being ACTH-dependent (80%). Cushing's disease (hypercortisolism caused by pituitary adenomas) is the most common type of ACTH-dependent Cushing's syndrome. Treatment for Cushing's syndrome requires a multi-modal approach. The goals of treatment are normalization of cortisol excess, long-term disease control, avoidance of recurrence, and reversal of clinical features.[4]

Guidelines

The Endocrine Society published clinical practice guidelines (2015) for the treatment of Cushing's syndrome.[5] Signifor LAR is not addressed in the guidelines. Treatment goals for Cushing's syndrome are to normalize cortisol levels or its action at the receptors to eliminate signs and symptoms of Cushing's syndrome. Best practice adjunctive management includes treating comorbidities associated with hypercortisolism (psychiatric disorders, diabetes, hypertension, hypokalemia, infections, dyslipidemia, osteoporosis, and poor physical fitness). First-line treatment involves resection of the tumor, unless surgery is not possible or is unlikely to meaningfully reduce excess glucocorticoid levels. Specifically for Cushing's disease, transsphenoidal selective adenomectomy by a surgeon with extensive experience in pituitary surgery is recommended. In patients with ACTH-dependent Cushing's syndrome who underwent non-curative surgery or for whom surgery was not possible, the guidelines advocate several second-line therapies (e.g., repeat transsphenoidal surgery, radiotherapy, medical therapy, and bilateral adrenalectomy). For Cushing's disease, the guidelines recommend all medical therapies as second-line options after transsphenoidal surgery: steroidogenesis inhibitors (ketoconazole, Metopirone, Lysodren, etomidate) in patients either with or without radiotherapy/radiosurgery; pituitary-directed medical treatments (cabergoline, Signifor) in patients who are not surgical candidates or who have persistent disease; and Korlym in patients with diabetes or glucose intolerance who are not surgical candidates or who have persistent disease after transsphenoidal surgery.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Signifor LAR. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Signifor LAR as well as the monitoring required for adverse events and long-term efficacy, approval requires Signifor LAR to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Signifor LAR is recommended in those who meet the following criteria:

FDA-Approved Indications

3. Acromegaly. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **G)** Patient meets ONE of the following (i, ii, or iii):
  - **i.** Patient has had an inadequate response to surgery and/or radiotherapy; OR
  - **ii.** Patient is NOT an appropriate candidate for surgery and/or radiotherapy; OR
  - **iii.** Patient is experiencing negative effects due to tumor size (e.g., optic nerve compression); AND
- **H)** Patient has (or had) a pre-treatment (baseline) insulin-like growth factor-1 (IGF-1) level above the upper limit of normal based on age and gender for the reporting laboratory; AND
  Note: Pre-treatment (baseline) refers to the IGF-1 level prior to the initiation of any somatostatin analog (e.g., Mycapssa® [octreotide delayed-release capsules], an octreotide acetate injection product [e.g., Bynfezia Pen™, Sandostatin® {generics}, Sandostatin® LAR Depot], Signifor® LAR [pasireotide injection], Somatuline® Depot [lanreotide injection], dopamine agonist [e.g., cabergoline, bromocriptine], or Somavert® [pegvisomant for injection]). Reference ranges for IGF-1 vary among laboratories.
- **I)** The medication is prescribed by or in consultation with an endocrinologist.

2. Cushing's Disease. Approve for the duration noted if the patient meets the following criteria (A or B):
- **A)** Initial Therapy. Approve for 4 months of initial therapy if the patient meets the following criteria (i and ii):
  - **i.** According to the prescriber, patient is not a candidate for surgery, or surgery has not been curative; AND
    Note: For patients with Cushing's disease/syndrome awaiting surgery, see *Other Uses with Supportive Evidence.*
  - **ii.** Signifor LAR is prescribed by or in consultation with an endocrinologist or a physician who specializes in the treatment of Cushing's disease.
- **B)** Patient is Currently Receiving Signifor LAR/Signifor. Approve for 1 year of continuation therapy if the patient has responded to Signifor/Signifor LAR, as determined by the prescriber.
  Note: An example of patient response is decrease in the mean urinary free cortisol level.

Other Uses with Supportive Evidence

3. **Cushing's Disease/Syndrome – Patients Awaiting Surgery.** Approve for 4 months if Signifor LAR is prescribed by or in consultation with an endocrinologist or a physician who specialized in the treatment of Cushing's disease/syndrome.

4. **Cushing's Disease/Syndrome – Patients Awaiting Therapeutic Response After Radiotherapy.** Approve for 4 months if Signifor LAR is prescribed by or in consultation with an endocrinologist or a physician who specialized in the treatment of Cushing's disease/syndrome.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Signifor LAR is not recommended in the following situations:

252. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Selected Revision	Criteria created for the following FDA-approved diagnosis: Patients with Cushing's disease for whom pituitary surgery is not an option or has not been curative. Criteria created for Other Uses with Supportive Evidence: Cushing's disease, awaiting surgery.	08/01/2018
Annual Revision	Specified Cushing's Disease/"Syndrome" to approval condition and added "Patients" awaiting surgery. Approval duration increased from 2 months to 4 months to align. Created separate approval condition for Cushing's Disease/Syndrome – Patients Awaiting Therapeutic Response from Radiotherapy with 4 month approval duration. Initial therapy approval criteria for Cushing's Disease changed to 4 months.	08/22/2018
Annual Revision	No criteria changes.	07/31/2019
Annual Revision	**Acromegaly.** In the Note section referring to the pre-treatment (baseline) insulin-like growth factor-1 (IGF-1) level, Mycapssa® (octreotide delayed-release capsules) and octreotide acetate injection products (Bynfezia Pen™, Sandostatin® [generics]) were added as examples of a somatostatin analog. **Cushing's Disease.** For the exception applying to a patient who is not a candidate for surgery or surgery has not been curative, wording was updated to more generally allow this determination by the prescriber (criteria previously specified this was according to the prescribing physician).	08/05/2020

PRIOR AUTHORIZATION POLICY

POLICY: Somatostatin Analogs – Somatuline® Depot Prior Authorization Policy

- Somatuline Depot (lanreotide injection – Ipsen)

REVIEW DATE: 08/05/2020

OVERVIEW

Somatuline Depot, a somatostatin analog, is indicated for the following uses:[1]

- **Acromegaly**, in patients who have had an inadequate response to surgery and/or radiotherapy, or for whom surgery and/or radiotherapy, is not an option. The goal of treatment in acromegaly is to reduce growth hormone and insulin-like growth factor-1 levels to normal.
- **Carcinoid syndrome**, in adult patients.
- **Gastroenteropancreatic neuroendocrine tumors (GEP-NETs)**, in adult patients with unresectable, well or moderately differentiated, locally advanced or metastatic GEP-NETs to improve progression-free survival.

Guidelines

According to the National Comprehensive Cancer Network (NCCN) guidelines for neuroendocrine and adrenal tumors (version 1.2020 – July 10, 2020) recommend Somatuline Depot for the management of carcinoid syndrome, tumors of the gastrointestinal tract, lung, thymus (carcinoid tumors), and pancreas (including glucagonomas, gastrinomas, VIPomas, insulinomas), pheochromocytomas and paragangliomas.[2] Patients who have local unresectable disease and/or distant metastases and clinically significant tumor burden or progression should be started on therapy with a somatostatin analog to potentially control tumor growth.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Somatuline Depot. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Somatuline Depot as well as the monitoring required for adverse events and long-term efficacy, approval requires Somatuline Depot to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Somatuline Depot is recommended in those who meet the following criteria:

FDA-Approved Indications

4. Acromegaly. Approve for 1 year if the patient meets the following criteria (A, B, and C):

A) Patient meets ONE of the following (i, ii, or iii):

i. Patient has had an inadequate response to surgery and/or radiotherapy; OR

ii. Patient is NOT an appropriate candidate for surgery and/or radiotherapy; OR

iii. Patient is experiencing negative effects due to tumor size (e.g., optic nerve compression); AND

B) Patient has (or had) a pre-treatment (baseline) insulin-like growth factor-1 (IGF-1) level above the upper limit of normal (ULN) based on age and gender for the reporting laboratory; AND

Note: Pre-treatment (baseline) refers to the IGF-1 level prior to the initiation of any somatostatin analog (e.g., Mycapssa® [octreotide delayed-release capsules], an octreotide acetate injection product [e.g., Bynfezia Pen™, Sandostatin® {generics}, Sandostatin® LAR Depot], Signifor® LAR [pasireotide injection], Somatuline® Depot [lanreotide injection], dopamine agonist [e.g., cabergoline, bromocriptine], or Somavert® [pegvisomant injection]). Reference ranges for IGF-1 vary among laboratories.

C) The medication is prescribed by or in consultation with an endocrinologist.

2. Neuroendocrine Tumor(s) [NETs] of the Gastrointestinal Tract, Lung, Thymus (Carcinoid Tumors), and Pancreas (including glucagonomas, gastrinomas, vasoactive intestinal peptides-secreting tumors [VIPomas], insulinomas). Approve for 1 year if the medication is prescribed by or in consultation with an oncologist, endocrinologist, or gastroenterologist.

~~92.~~89. **Carcinoid Syndrome.** Approve for 1 year if the medication is prescribed by or in consultation with an oncologist, endocrinologist, or gastroenterologist.

Other Uses with Supportive Evidence

~~93.~~90. **Pheochromocytoma and Paraganglioma.** Approve for 1 year if the medication is prescribed by or in consultation with an endocrinologist, oncologist, or neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Somatuline Depot is not recommended in the following situations:

253. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Somavert Prior Authorization Policy

- Somavert® (pegvisomant for injection – Pfizer)

REVIEW DATE: 08/05/2020

OVERVIEW

Somavert, a growth hormone-receptor antagonist, is indicated for the treatment of acromegaly in patients who have had inadequate response to surgery and/or radiation therapy and/or other medical therapies, or for whom these therapies are not appropriate.[1] The goal of treatment is to normalize serum insulin-like growth factor-I levels.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Somavert. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Somavert as well as the monitoring required for adverse events and long-term efficacy, approval requires Somavert to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Somavert is recommended in those who meet the following criteria:

FDA-Approved Indications

5. Acromegaly. Approve for 1 year if the patient meets the following criteria (A, B, and C):

J) Patient meets ONE of the following (i, ii, or iii):

i. Patient has had an inadequate response to surgery and/or radiotherapy; OR

ii. Patient is NOT an appropriate candidate for surgery and/or radiotherapy; OR

iii. Patient is experiencing negative effects due to tumor size (e.g., optic nerve compression); AND

K) Patient has (or had) a pre-treatment (baseline) insulin-like growth factor-1 (IGF-1) level above the upper limit of normal (ULN) based on age and gender for the reporting laboratory; AND

Note: Pre-treatment (baseline) refers to the IGF-1 level prior to the initiation of any somatostatin analog (e.g., Mycapssa® [octreotide delayed-release capsules], an octreotide acetate injection product [e.g., Bynfezia Pen™, Sandostatin® {generics}, Sandostatin® LAR Depot], Signifor® LAR [pasireotide for injectable

suspension], Somatuline® Depot [lanreotide subcutaneous injection]), dopamine agonist (e.g., cabergoline, bromocriptine), or Somavert® (pegvisomant for injection). Reference ranges for IGF-1 vary among laboratories.

L) The agent is prescribed by or in consultation with an endocrinologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Somavert is not recommended in the following situations:

254. Treatment of excess growth hormone associated with McCune-Albright syndrome (MAS). Five patients with growth hormone excess due to MAS were treated with 20 mg of Somavert daily for 12 weeks in a randomized double-blind placebo-controlled trial at the National Institutes of Health.[2] Somavert reduced IGF-1 and IGF binding protein-3 (IGFBP-3) in these patients but had no effect on fibrous dysplasia.

255. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Spinal Muscular Atrophy – Evrysdi Prior Authorization Policy

- Evrysdi® (risdiplam oral solution – Genentech/Roche)

REVIEW DATE: 08/12/2020; selected revision 09/30/2020 and 11/18/2020

OVERVIEW

Evrysdi, a survival motor neuron 2 (SMN2) splicing modifier, is indicated for the **treatment of spinal muscular atrophy** in patients 2 months of age and older.[1]

The recommended dosing is as follows:

- 0.2 mg/kg once daily (QD) for patients 2 months to < 2 years of age
- 0.25 mg/kg QD for patients ≥ 2 years of age and < 20 kg
- 5 mg for patients ≥ 2 years of age and ≥ 20 kg

Disease Overview

Spinal muscular atrophy is a genetic, autosomal recessive muscular disorder caused by deletion or loss of function mutation in the survival motor neuron 1 (SMN1) gene.[2-5] The reduced levels of survival motor neuron (SMN) protein causes degeneration of lower motor neurons.[5] Although the condition is a multisystem disorder, it is clinically

characterized by progressive muscle weakness and atrophy. Patients have difficulties with ambulation, head control, feeding and respiration. Cognitive development is not impacted. In the US, spinal muscular atrophy affects approximately one in 11,000 infants and has an average carrier frequency of one in 54 individuals; as many as 10,000 to 20,000 children and adults in the US may be impacted.[5] Although the condition can be present in individuals of any age, it is more frequently diagnosed in infants and children, as it is more severe in this population.[2-5] The phenotypic expression of the disease is impacted by the presence of the SMN2 gene copy number. SMN1 is responsible for producing most of the effective SMN protein, although some SMN protein can be made by the SMN2 gene. Therefore, patients with a deletion of the SMN1 gene may have the potential for making some SMN protein through the SMN2 gene copy, although in most cases the resulting protein made by this gene is truncated and is not as effective or functional. Data have shown that patients with a higher number of SMN2 copies generally have a more mild phenotypic disease expression. Gene deletion testing for spinal muscular atrophy can be performed at many diagnostic laboratories. Table 1 describes disease types. A different manner of categorization classifies the main three most common types as follows: Type 1 patients are "non-sitters", Type 2 patients are "sitters", and Type 3 patients are "walkers".[3,5]

Table 1. Types of Spinal Muscular Atrophy.[2-5]

SMA Type	Age at Onset	Features/Clinical Presentation	Lifespan	SMN2 Copy Gene Number
0	Prenatal	Severe hypotonia and weakness; respiratory failure at birth. There is no achievement of motor milestones.	A few weeks to < 6 months	0 to 1
1	< 6 months	Poor muscle tone, lack of movement, and respiratory assistance needed at birth. Patients are never able to sit.	< 2 years	1 to 2
2	Before 18 months	Patients are able to sit. However, patients are unable to walk or stand without assistance.	75% of patients are alive at 25 years of age	2 to 3
3	> 18 months	Walks independently but may lose this ability as the disease progresses.	Normal	3 to 4

Table 1 (continued). Types of Spinal Muscular Atrophy.[2-5]

SMA Type	Age at Onset	Features/Clinical Presentation	Lifespan	SMN2 Copy Gene Number
4	Adulthood	Walk until adulthood.	Normal lifespan	≥ 4

SMA – Spinal muscular atrophy; SMN2 – Survival motor neuron 2.

Besides Evrysdi, other therapies are available. **Spinraza®** (nusinersen injection for intrathecal use), a SMN2-directed antisense oligonucleotide, is indicated for the treatment of spinal muscular atrophy in pediatric and adult patients.[6] Spinraza is given by intrathecal injection. Although studies and experience continue, the primary pivotal data include infantile-onset (Type 1) and later-onset (Type 2 and Type 3) spinal muscular atrophy primarily in children. Trials are evolving with Spinraza in adults. Data are also available in presymptomatic infants who were genetically diagnosed with spinal muscular atrophy.

Zolgensma® (onasemnogene abeparvovec-xioi suspension for intravenous infusion), an adeno-associated virus vector-based gene therapy, is indicated for the treatment of pediatric patients < 2 years of age with spinal muscular atrophy with bi-allelic mutations in the SMN1 gene.[7] The agent works by providing a copy of the gene encoding the SMN protein, which increases its production. Zolgensma is administered as a single-dose intravenous infusion over 60 minutes. Pivotal studies mainly involve infants with two or three SMN2 gene copies with primarily Type 1 or Type 2 disease.

Clinical Efficacy

The efficacy of Evrysdi for the treatment of patients with infantile-onset (Type 1) and later-onset (Type 2 and 3) spinal muscular atrophy is being evaluated in two ongoing pivotal clinical trials.[1] **FIREFISH** is an open-label, two-part study designed to investigate the efficacy, safety, pharmacokinetics, and pharmacodynamics of Evrysdi in patients with Type 1 spinal muscular atrophy who had symptom onset between 28 days and 3 months of age. Genetic confirmation of homozygous deletion or compound heterozygosity predictive or loss of function of the SMN1 gene was required for trial entry. Patients had two SMN2 gene copies. In Part 1 of the trial, the median age at enrollment was 6.7 months. For this population, of the patients who received the recommended dosage of Evrysdi (0.2 mg/kg QD) [n = 17], many patients gained improvements in the ability to sit for at least 5 seconds independently, as well as

in the percentages of patients who were alive without permanent ventilation. **SUNFISH** is a two-part, multicenter trial assessing the efficacy, safety, pharmacokinetics, and pharmacodynamics of Evrysdi in patients with later-onset (Type 2 or Type 3) spinal muscular atrophy. Most patients (90.2%) had three SMN2 gene copies; 7.8% and 2.0% of patients had four and two SMN2 gene copies, respectively. Part 2 of the study involved 180 nonambulatory patients who were randomized to receive Evrysdi at the FDA-approved dose or placebo. Benefits were noted at Month 12 in motor function as well as in upper limb motor performance. Of note, in general, the onset of effect with Evrysdi was observed after approximately 4 months of therapy.

Guidelines

Evrysdi is not addressed in guidelines. The Spinal Muscular Atrophy Newborn Screening Multidisciplinary Working Group is comprised of clinicians and geneticists with expertise in spinal muscular atrophy who developed a treatment algorithm in 2018 for infants who have positive results from a newborn screening test for spinal muscular atrophy.[8] Spinal muscular atrophy Types 1 and 2 comprise a large majority of cases and account for many patients who screen positively for spinal muscular atrophy with three or fewer SMN2 gene copies. Immediate treatment is recommended in patients with two or three SMN2 gene copies. Treatment recommendations for patients who screen positive for spinal muscular atrophy and have only one SMN2 gene copy is more complicated. It is likely that patients with only one SMN2 gene copy will likely be symptomatic at birth and the physician should determine if treatment is warranted.[8] In 2020, the Working Group updated recommendations that infants diagnosed with spinal muscular atrophy via newborn screening with four SMN2 gene copies should receive immediate treatment.[9] Also, patients with five (or more) SMN2 gene copies should observed and screened for symptoms.

Safety

Based on animal data, Evrysdi may cause fetal harm if given to a pregnant women.[1] Pregnancy testing is recommended for females of reproductive potential prior to initiating Evrysdi. Advise females of reproductive potential to use effective contraception during treatment with Evrysdi and for at least 1 month after the last dose. Because the efficacy and safety of Evrysdi in patients with hepatic impairment have not been studied, avoid use of this agent in patients with impaired hepatic function.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Evrysdi. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Evrysdi as well as the monitoring required for adverse events and long-term efficacy, approval requires Evrysdi to be prescribed by or in consultation with a physician who specializes in the condition being treated. For certain criteria, verification is required as noted by **[verification required by prescriber]**. All reviews will be forwarded to the Medical Director for evaluation.

Automation: None.

Documentation: Documentation is required where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes, laboratory tests, claims records, and/or other information. Subsequent coverage reviews for a patient who has previously met the documentation requirements and related criteria in the *Spinal Muscular Atrophy – Evrysdi Prior Authorization Policy* through the Coverage Review Department, and who is requesting reauthorization, the criteria utilized do NOT require re-submission of documentation for reauthorization, except for the criterion requiring documentation of response or benefit to Evrysdi therapy.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Evrysdi is recommended in those who meet the following criteria:

FDA-Approved Indications

261. Spinal Muscular Atrophy – Treatment. Approve if the patient meets ONE of the following criteria (A or B):

A) Initial Therapy. Approve for 4 months if the patient meets all of the following criteria (i, ii, iii, iv, v, vi, vii, viii, and ix):

i. Patient is ≥ 2 months to ≤ 25 years of age; AND

ii. Patient has had a genetic test confirming the diagnosis of spinal muscular atrophy with bi-allelic mutations in the survival motor neuron 1 (SMN1) gene reported as at least one of the following: homozygous deletion, homozygous mutation, or compound heterozygous mutation **[documentation required]**; AND

iii. Patient meets both of the following (a and b):

a) Patient has two to four survival motor neuron 2 (SMN2) gene copies **[documentation required]**; AND

b) According to the prescriber, the patient has objective signs consistent with spinal muscular atrophy Types 1, 2, or 3 **[documentation required]**; AND

iv. For a patient currently receiving or who has received prior treatment with Spinraza® (nusinersen injection for intrathecal use), the prescriber attests that further therapy with Spinraza will be discontinued; AND

v. Patient has not received Zolgensma® (onasemnogene abeparvovec-xioi suspension for intravenous infusion) in the past **[verification required by prescriber]**; AND

Note: Verify through claims history that the patient has NOT previously received Zolgensma AND, if no claim for Zolgensma is present, the prescriber must attest that the patient has not previously received Zolgensma.

vi. Females of current reproductive potential must have the prescriber confirm BOTH of the following (a and b):

a) Patient is not currently pregnant; AND

b) Effective contraception will be utilized during treatment and for 1 month after the last Evrysdi dose; AND

vii. According to the prescriber, the patient does not have evidence of hepatic impairment; AND

viii. Dosing of Evrysdi meets ONE of the following based on the current (within the past 1 month) kg weight (a, b, or c):

a) 0.2 mg/kg once daily if the patient is 2 months to < 2 years of age; OR

b) 0.25 mg/kg once daily for patients ≥ 2 years of age who weigh < 20 kg; OR

c) 5 mg once daily for patients ≥ 2 years of age who weigh ≥ 20 kg; AND

ix. Medication is prescribed by a physician who has consulted with or who specializes in the management of patients with spinal muscular atrophy and/or neuromuscular disorders; OR

B) Patient is Currently Receiving Evrysdi. Approve for 4 months if the patient meets all of the following criteria (i, ii, iii, iv, v, vi, vii, viii, and ix):

i. Patient has had a genetic test confirming the diagnosis of spinal muscular atrophy with bi-allelic mutations in the survival motor neuron 1 (SMN1) gene reported as at least one of the following: homozygous deletion, homozygous mutation, or compound heterozygous mutation **[documentation required]**; AND

ii. Patient meets BOTH of the following (a and b):

a) Patient has two to four survival motor neuron 2 (SMN2) gene copies **[documentation required]**; AND

b) According to the prescriber, the patient has objective signs consistent with spinal muscular atrophy Types 1, 2, or 3 **[documentation required]**; AND

iii. For a patient currently receiving or who has received prior treatment with Spinraza® (nusinersen injection for intrathecal use), the prescriber attests that further therapy with Spinraza will be discontinued; AND

iv. Patient has NOT received Zolgensma® (onasemnogene abeparvovec-xioi suspension for intravenous infusion) in the past **[verification required by the prescriber]**; AND

Note: Verify through claims history that the patient has NOT previously received Zolgensma AND, if no claim for Zolgensma is present, the prescriber must attest that the patient has not previously received Zolgensma.

v. Females of current reproductive potential must have the prescriber confirm BOTH of the following (a and b):
- **a)** Patient is not currently pregnant; AND
- **b)** Effective contraception will be utilized during treatment and for 1 month after the last Evrysdi dose; AND

vi. According to the prescriber, the patient does not have evidence of hepatic impairment; AND

vii. Dosing of Evrysdi meets ONE of the following based on the current (within the past 1 month) kg weight (a, b, or c):
- **a)** 0.2 mg/kg if the patient is 2 months to < 2 years of age; OR
- **b)** 0.25 mg/kg for patients ≥ 2 years of age who weigh < 20 kg; OR
- **c)** 5 mg for patients ≥ 2 years of age who weigh ≥ 20 kg; AND

viii. Medication is prescribed by a physician who has consulted with or who specializes in the management of patients with spinal muscular atrophy and/or neuromuscular disorders; AND

ix. According to the prescriber, the patient has responded to Evrysdi or continues to have benefit from ongoing Evrysdi therapy by the most recent (within the past 4 months) objective measurement and/or assessment tool **[documentation required]**.

Note: Examples of improvement, achievement, and/or maintenance in motor milestones should be demonstrated and can be evaluated by tests such as the Bayley Scales of Infant and Toddler Development, Third Edition (BSID-III) [Item 22], Motor Function Measure-32 Items (MFM-32), Hammersmith Infant Neurologic Exam (HINE) [section 2], Hammersmith Functional Motor Scale Expanded (HFMSE), Children's Hospital of Philadelphia Test of Neuromuscular Disorders (CHOP-INTEND), as well as other physician monitoring tools (pulmonary function tests showing improvement, bulbar function results, reduced need for respiratory support, and/or prevention of permanent assisted ventilation).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Evrysdi is not recommended in the following situations:

256. Patient has Complete Paralysis of All Limbs. Data are needed to determine if this patient population with advanced spinal muscular atrophy would derive benefits from Evrysdi.

257. Patient has Permanent Ventilator Dependence. Data are needed to determine if this patient population with advanced spinal muscular atrophy would derive benefits from Evrysdi.

258. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
New Policy	--	08/12/2020
Selected Revision	**Spinal Muscular Atrophy – Treatment:** For a patient using Evrysdi for spinal muscular atrophy (treatment) who are currently receiving Evrysdi, the requirement that the patient is ≥ 2 months of age and ≤ 25 years of age was removed. Also, regarding the criteria pertaining to Spinraza, wording was added to include not only those who have received prior treatment with Spinraza, but also those "currently receiving" the therapy; it should be attested that the therapy will not be further given with Spinraza use. A slight change was made to the documentation statement. For this related criterion regarding patients currently receiving Evrysdi therapy, it was specified that "the most recent (within the last 4 months)" objective measurement and/or assessment tool will be utilized. **Documentation:** Wording was added that for subsequent coverage reviews for a patient who has previously met the documentation requirements and related criteria in the *Spinal Muscular Atrophy – Evrysdi Prior Authorization Policy* through the Coverage Review Department, and who is requesting reauthorization, the criteria utilized do NOT require re-submission of documentation for reauthorization, except for the criterion requiring documentation of response or benefit to Evrysdi therapy.	09/30/2020
Selected Revision	**Spinal Muscular Atrophy – Treatment:** The criteria that requires the medication to be prescribed by or in consultation with a with a physician who specializes in the management of patients with spinal muscular atrophy and/or neuromuscular disorders was changed to "medication is prescribed by a physician who has consulted with or who specializes in the management of patients with spinal muscular atrophy and/or neuromuscular disorders".	11/18/2020

PRIOR AUTHORIZATION POLICY

POLICY: Spinal Muscular Atrophy – Spinraza Prior Authorization Policy
- Spinraza® (nusinersen injection for intrathecal use – Biogen)

REVIEW DATE: 6/03/2020; selected revision 08/12/2020, 09/09/2020 and 11/18/2020

OVERVIEW

Spinraza, a survival motor neuron 2 (SMN2)-directed antisense oligonucleotide, is indicated for the treatment of spinal muscular atrophy in pediatric and adult patients.[1]

Disease Overview

Spinal muscular atrophy is a genetic, autosomal recessive muscular disorder caused by deletion or loss of function mutation in the survival motor neuron 1 (SMN1) gene.[2-5] The reduced levels of survival motor neuron (SMN) protein causes degeneration of lower motor neurons.[5] Although the condition is a multisystem disorder, it is clinically characterized by progressive muscle weakness and atrophy. Patients have difficulties with ambulation, head control, feeding, and respiration. Cognitive development is not impacted. In the US, spinal muscular atrophy affects approximately one in 11,000 infants and has an average carrier frequency of one in 54 individuals; as many as 10,000 to 20,000 children and adults in the US may be impacted.[5] Although the condition can be present in individuals of any age, it is more frequently diagnosed in infants and children, as it is more severe in this population.[2-5] The phenotypic expression of

the disease is impacted by the presence of the SMN2 gene copy number. SMN1 is responsible for producing most of the effective SMN protein, although some SMN protein can be made by the SMN2 gene. Therefore, patients with a deletion of the SMN1 gene may have the potential for making some SMN protein through the SMN2 gene copy, although in most cases the resulting protein made by this gene is truncated and is not as effective or functional. Data have shown that patients with a higher number of SMN2 copies generally have a more mild phenotypic disease expression. Gene deletion testing for spinal muscular atrophy can be performed at many diagnostic laboratories. Table 1 describes disease types. A different manner of categorization classifies the three most common types as follows: Type 1 patients are "non-sitters", Type 2 patients are "sitters", and Type 3 patients are "walkers".[3,5]

Table 1. Types of Spinal Muscular Atrophy.[2-5]

SMA Type	Age at Onset	Features/Clinical Presentation	Lifespan	SMN2 Copy Gene Number
0	Prenatal	Severe hypotonia and weakness; respiratory failure at birth. There is no achievement of motor milestones.	A few weeks to < 6 months	0 to 1
1	< 6 months	Poor muscle tone, lack of movement, and respiratory assistance needed at birth. Patients are never able to sit.	< 2 years	1 to 2
2	Before 18 months	Patients are able to sit. However, patients are unable to walk or stand without assistance.	75% of patients are alive at 25 years of age	2 to 3
3	> 18 months	Walks independently but may lose this ability as the disease progresses.	Normal	3 to 4
4	Adulthood	Walk until adulthood.	Normal lifespan	≥ 4

SMA – Spinal muscular atrophy; SMN2 – Survival motor neuron 2.

Besides Spinraza, other therapies are available. **Evrysdi®** (risdiplam oral solution), a SMN2 splicing modifier, is indicated for the treatment of spinal muscular atrophy in patients 2 months of age and older.[6] The primary pivotal data include infantile-onset (Type 1) and later-onset (Type 2 and Type 3) spinal muscular atrophy primarily in children and adults up to 25 years of age. Trials are ongoing in older adults, as well as in presymptomatic infants who were genetically diagnosed with spinal muscular atrophy.

Zolgensma® (onasemnogene abeparvovec-xioi suspension for intravenous infusion), an adeno-associated virus vector-based gene therapy, is indicated for the treatment of pediatric patients < 2 years of age with spinal muscular atrophy with bi-allelic mutations in the SMN1 gene.[7] The agent works by providing a copy of the gene encoding the SMN protein, which increases its production. Zolgensma is administered as a single-dose intravenous infusion over 60 minutes. Pivotal studies mainly involve infants with two or three SMN2 gene copies with primarily Type 1 or Type 2 disease.

Clinical Efficacy

Spinraza was investigated in a pivotal trial called ENDEAR, which was a Phase III, multicenter, multinational, randomized, double-blind, sham-procedure controlled study involving 121 symptomatic infants diagnosed with infantile-onset spinal muscular atrophy (Type I).[1,8] Patients were randomized 2:1 to receive either Spinraza (n = 80) or sham injection (n = 41).[1] Eligible patients were ≤ 7 months of age at the time of the first dose and diagnosed with spinal muscular atrophy with a symptom onset prior to 6 months of age. A planned interim efficacy analysis was performed based on patients who died, withdrew, or completed at least 183 days of treatment. Baseline demographics were balanced between the Spinraza and control groups with the exception of age at first treatment (median age of 175 and 206 days, respectively).[1] At baseline, all infants were symptomatic, hypotonic and weak, which are features consistent with a phenotype that is most likely to be categorized as spinal muscular atrophy Type 1.[8] Patients had two SMN2 gene copies. The median time of treatment was 261 days (range 6 to 442 days).[1] Those who received Spinraza compared with sham-control experienced improvement on achieving motor

milestone responses. Outcomes assessing survival also revealed improvements for patients receiving Spinraza vs. sham control.

CHERISH was a multicenter, double-blind, sham-controlled, Phase III trial which involved children with symptomatic later-onset spinal muscular atrophy who were 2 to 12 years of age (n = 126) with likely Type 2 or 3 disease (symptom onset after 6 months of age).[1,9] Patients were randomized (2:1) to receive Spinraza or sham injection. Patients had genetically-confirmed 5q spinal muscular atrophy.[9] Three SMN2 gene copies were reported among 88% of patients; approximately 8% of patients had two SMN2 gene copies. The median age at screening was 4 years and 3 years in the Spinraza and sham procedure control groups, respectively.[1,9] Patients who received Spinraza experienced more improvement in motor milestones compared with sham control.

NURTURE was an open-label uncontrolled trial involving patients with presymptomatic spinal muscular atrophy who ranged in age from 3 days to 42 days at the time of the first dose (n = 25).[1,10] For study inclusion, patients were required to have two or three SMN2 gene copies.[10] Some patients who were given Spinraza prior to the onset of symptoms related to spinal muscular atrophy survived without requiring permanent ventilation beyond what would be anticipated based on their SMN2 copy number. Also, some patients also met age-appropriate growth and development motor milestones (e.g., ability to sit unassisted, stand, or walk). Data are available from almost a median of 3-year follow-up.

Other data with Spinraza are also available and data are accumulating in adults.[11-18] Follow-up is available for up to 4 years. Patients experienced a reversal of decline, achieved milestones, and experienced additional improvement in scales assessing motor function.

Dosing

Spinraza is given intrathecally by, or under the direction of, healthcare professionals experienced in performing lumbar punctures.[1] The recommended dosage is 12 mg (5 mL) per administration. Initiate Spinraza treatment with four loading doses. The first three loading doses should be administered at 14-day intervals. The fourth loading dose should be given 30 days after the third dose. A maintenance dose should be given once every 4 months thereafter. The safety and effectiveness of Spinraza in pediatric patients from newborn to 17 years of age have been established.

Guidelines

The Spinal Muscular Atrophy Newborn Screening Multidisciplinary Working Group is comprised of clinicians and geneticists with expertise in spinal muscular atrophy who developed a treatment algorithm in 2018 for infants who have positive results from a newborn screening test for spinal muscular atrophy.[19] Spinal muscular atrophy Types 1 and 2 comprise a large majority of cases and account for many patients who screen positively for spinal muscular atrophy with three or fewer SMN2 gene copies. Immediate treatment is recommended in patients with two or three SMN2 gene copies. Treatment recommendations for patients who screen positive for spinal muscular atrophy and have only one SMN2 gene copy is more complicated. It is likely that patients with only one SMN2 gene copy will likely be symptomatic at birth and the physician should determine if treatment is warranted.[19] In 2020, the Working Group updated recommendations that infants diagnosed with spinal muscular atrophy via newborn screening with four SMN2 gene copies should receive immediate treatment.[20] Also, patients with five (or more) SMN2 gene copies should be observed and screened for symptoms.

Safety

Spinraza has Warnings/Precautions regarding thrombocytopenia and coagulation abnormalities, as well as renal toxicity. Due to the increased risk of bleeding complications and renal toxicity, testing is required at baseline and prior to each dose. The following laboratory tests should be performed at baseline and prior to each Spinraza dose, and as clinically needed: platelet count; prothrombin time; activated partial thromboplastin time; and quantitative spot urine protein testing.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Spinraza. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Due to the specialized skills required for evaluation and diagnosis of patients treated with Spinraza, as well as the monitoring required for adverse events and long-term efficacy, approval requires Spinraza to be prescribed by or in consultation with a physician who specializes in the condition being treated. All reviews will be forwarded to the Medical Director for evaluation.

Documentation: Documentation is required where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes, laboratory tests, claims records, and/or other information. Subsequent coverage reviews for a patient who has previously met the documentation requirements and related criteria in the *Spinal Muscular Atrophy – Spinraza Prior Authorization Policy* through the Coverage Review Department, and who is requesting reauthorization, the criteria utilized do NOT require re-submission of documentation for reauthorization, except for the criterion requiring documentation of response or benefit to Spinraza therapy. For certain criteria, verification is required as noted by **[verification required by prescriber]**. All reviews will be forwarded to the Medical Director for evaluation.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Spinraza is recommended in those who meet the following criteria:

FDA-Approved Indication

~~94.~~91. **Spinal Muscular Atrophy** – **Treatment.** Approve for the duration noted if the patient meets ONE of the following (A or B):

D) Initial Therapy. Approve for 3 months if the patient meets all of the following criteria (i, ii, iii, iv, v, and vi):

i. Patient has had a genetic test confirming the diagnosis of spinal muscular atrophy with bi-allelic mutations in the survival motor neuron 1 (SMN1) gene reported as at least one of the following: homozygous deletion, homozygous mutation, or compound heterozygous mutation **[documentation required]**; AND

ii. Patient meets one of the following (a or b):

a) Patient has two or three survival motor neuron 2 (SMN2) gene copies **[documentation required]**; OR

b) Patient meets both of the following criteria [(1) and (2)]:

(1) The patient has four survival motor neuron 2 (SMN2) gene copies **[documentation required]**; AND

(2) According to the prescriber, the patient has objective signs consistent with spinal muscular atrophy Types 1, 2, or 3 **[documentation required]**; AND

iii. For a patient currently receiving or who has received prior treatment with Evrysdi® (risdiplam oral solution), the prescriber attests that further therapy with Evrysdi will be discontinued; AND

iv. Patient has not received Zolgensma® (onasemnogene abeparvovec-xioi suspension for intravenous infusion) in the past **[verification required by prescriber]**; AND

Note: Verify through claims history that the patient has not previously received Zolgensma AND, if no claim for Zolgensma is present, the prescriber must attest that the patient has not previously received Zolgensma.

v. The following laboratory tests will be evaluated prior to the administration of Spinraza (a, b, and c):

a) Prothrombin time and/or activated partial thromboplastin time; AND

b) Platelet count; AND

c) Quantitative spot urine protein testing; AND

vi. Medication is prescribed by a physician who has consulted with or who specializes in the management of patients with spinal muscular atrophy and/or neuromuscular disorders; OR

E) Patients Currently Receiving Spinraza Therapy. Approve one dose (for a dose to be used once within the next 4 months as maintenance therapy) if the patient meets all of the following criteria (i, ii, iii, iv, v, vi, and vii):

i. Patient has had a genetic test confirming the diagnosis of spinal muscular atrophy with bi-allelic mutations in the survival motor neuron 1 (SMN1) gene reported as at least one of the following: homozygous deletion, homozygous mutation, or compound heterozygous mutation **[documentation required]**; AND

ii. Patient meets one of the following (a or b):

a) Patient has two or three survival motor neuron 2 (SMN2) gene copies **[documentation required]**; OR

b) Patient meets both of the following [(1) and (2)]:

(1) Patient has four survival motor neuron 2 (SMN2) gene copies **[documentation required]**; AND

(2) According to the prescriber the patient has objective signs consistent with spinal muscular atrophy Types 1, 2, or 3 **[documentation required]**; AND

iii. For a patient currently receiving or who has received prior treatment with Evrysdi® (risdiplam oral solution), the prescriber attests that further therapy with Evrysdi will be discontinued; AND

iv. Patient has not received Zolgensma® (onasemnogene abeparvovec-xioi suspension for intravenous infusion) in the past **[verification required by prescriber]**; AND
Note: Verify through claims history that the patient has not previously received Zolgensma AND, if no claim for Zolgensma is present, the prescriber must attest that the patient has not previously received Zolgensma.

v. The following laboratory tests will be evaluated prior to administration of Spinraza (a, b, and c):
- **a)** Prothrombin time and/or activated partial thromboplastin time; AND
- **b)** Platelet count; AND
- **c)** Quantitative spot urine protein testing; AND

vi. Medication is prescribed a physician who has consulted with or who specializes in the management of patients with spinal muscular atrophy and/or neuromuscular disorders; AND

vii. According to the prescriber, the patient has responded to Spinraza or continues to have benefit from ongoing Spinraza therapy by the most recent (i.e., within the past 3 months) objective measurement and/or assessment tool **[documentation required]**.
Note: Examples of improvement, achievement, and/or maintenance in motor milestones should be demonstrated and can be evaluated by tests such as the Bayley Scales of Infant and Toddler Development, Third Edition (BSID-III) [Item 22], Motor Function Measure-32 Items (MSM-32), Hammersmith Infant Neurologic Exam (HINE) [section 2], Hammersmith Functional Motor Scale Expanded (HFMSE), Children's Hospital of Philadelphia Test of Neuromuscular Disorders (CHOP-INTEND) as well as other physician monitoring tools (pulmonary function tests showing improvement, bulbar function tests, reduced need for respiratory support, and/or prevention of permanent assisted ventilation).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Spinraza is not recommended in the following situations:

259. Patient has Complete Paralysis of All Limbs. Data are needed to determine if this patient population with advanced spinal muscular atrophy would derive benefits from Spinraza.

260. Patient has Permanent Ventilator Dependence. Data are needed to determine if this patient population with advanced spinal muscular atrophy would derive benefits from Spinraza.

261. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Date Reviewed
Update	5/24/2019: No criteria changes. The title Spinal Muscular Atrophy was added to the name of the policy.	--
Annual revision	All Spinraza reviews will be done by the Medical Director. Changes below in criteria are described below. **Spinal Muscular Atrophy, Treatment:** The same criteria changes were made for patients who were receiving initial therapy and in patients currently receiving Spinraza Therapy. The notation of Type I, II, or III spinal muscular atrophy was removed. The criteria regarding the genetic test had the term "bi-allelic mutations" added. Criteria were added that the patient has two or three survival motor neuron 2 (SMN2) gene copies (with documentation required) or that the patient has four or more SMN2 gene copies (with documentation required) AND according to the prescribing physician the patient has symptoms consistent with Types 1, 2, or 3 spinal muscular atrophy. Criteria were added that the patient has not received Zolgensma® (onasemnogene abeparvovec-xioi suspension for intravenous infusion) in the past. It was added that the following laboratory tests will be evaluated prior to the administration of Spinraza: a) Prothrombin time and/or activated partial thromboplastin time; b) Platelet count; and c) Quantitative spot urine protein testing. **Conditions Not Recommended for Approval:** A criterion was added to not approve Spinraza if the patient has complete paralysis of limbs to suggest advanced spinal muscular atrophy. Additionally, a criterion was added to not approve Spinraza if the patient has permanent ventilator dependence to suggest advanced spinal muscular atrophy. In these clinical scenarios, data are needed to determine if this patient population would derive benefits from Spinraza.	06/18/2019
Selected revision	"Prescriber" replaced the phrase "prescribing physician" in applicable places in the criteria. For patients currently receiving Spinraza therapy that was approved through a request from the ESI coverage review department, a note was added stating to provide an exception to the requirement of SMN2 gene copy information if, according to the prescriber, the patient has symptoms consistent with spinal muscular atrophy Types 1, 2 or 3.	01/15/2020
Selected revision	Approval for initial therapy was changed from 12 months to 3 months. Approval for patients currently receiving Spinraza therapy was changed from 12 months to one dose (for a dose to be used once within the next 4 months for maintenance therapy). For the criteria that requires that the patient has not received Zolgensma in the past, a note was added to verify through claims history that the patient has not previously received Zolgensma AND, if no claim for Zolgensma is present, the prescriber must attest that the patient has not previously received Zolgensma. For the requirement for patients who are currently receiving therapy that the patient has responded to Spinraza, a documentation requirement was added. Also, examples of response to therapy was moved from the criteria to a note.	03/25/2020
Annual revision	No criteria changes.	06/03/2020

HISTORY (CONTINUED)

Type of Revision	Summary of Changes	Date Reviewed
Selected revision	**Spinal Muscular Atrophy – Treatment:** Criteria regarding survival motor neuron 2 (SMN2) gene copies for patients receiving initial therapy and for those currently receiving Spinraza therapy were altered such that the patient must have between two to four SMN2 gene copies and have objective signs consistent with spinal muscular atrophy Type 1, 2 or 3; documentation is required for these criteria. Previously, a patient with two or three SMN2 gene copies was approved (with documentation required) whereas a patient with four or more SMN2 gene copies had to also have symptoms consistent with spinal muscular atrophy Types 1, 2 or 3. A requirement was added that for a patient who has received prior treatment with Evrysdi (risdiplam oral solution), the prescriber attests that further therapy with Evrysdi will be discontinued. It was emphasized that verification is required by the prescriber that the patient has not received Zolgensma in the past. For a patient who has been previously receiving Spinraza, wording of the criteria were altered from "the patient has responded to Spinraza therapy" to "the patient has responded to Spinraza or continues to have benefit from ongoing Spinraza therapy by an objective measurement and/or assessment tool". Also, additional scales and tests were added to the Note that provides examples of improvement achievement and/or maintenance in motor milestones. **Conditions Not Recommended for Approval:** The condition regarding paralysis of limbs was simplified from "The patient has complete paralysis of limbs to suggest advanced spinal muscular atrophy" to "Patient has Complete Paralysis of All Limbs". The condition regarding permanent ventilator dependence was simplified from "The patient has permanent ventilator dependence to suggest advanced spinal muscular atrophy" to "Patient has Permanent Ventilator Dependence."	08/12/2020
Selected revision	A change was made to the criteria regarding the diagnosis of Spinal Muscular Atrophy – Treatment. Patients with two or three SMN2 gene copies are no longer required to have objective signs consistent with spinal muscular atrophy; patients with four SMN2 gene copies still must meet this criterion. Also, regarding the criteria pertaining to Evrysdi, wording was added to include not only those who have received prior treatment with Evrysdi, but also those "currently receiving" the therapy; it should be attested that the therapy will not be further given with Spinraza use. A slight change was made to the documentation statement. Wording was added that for subsequent coverage reviews for a patient who has previously met the documentation requirements and related criteria in the *Spinal Muscular Atrophy – Spinraza Prior Authorization Policy* through the Coverage Review Department, and who is requesting reauthorization, the criteria utilized do NOT require re-submission of documentation for reauthorization, "except for the criterion requiring documentation of response or benefit to Spinraza therapy." For this related criterion regarding patients currently receiving Spinraza therapy, it was specified that "the most recent (within the last 3 months)" objective measurement and/or assessment tool will be utilized.	09/09/2020
Selected Revision	**Spinal Muscular Atrophy – Treatment:** The criteria that requires the medication to be prescribed by or in consultation with a physician who specializes in the management of patients with spinal muscular atrophy and/or neuromuscular disorders was changed to "medication is prescribed by a physician who has consulted with or who specializes in the management of patients with spinal muscular atrophy and/or neuromuscular disorders". In patients currently receiving therapy, the Note was removed that stated that "if the patient is currently receiving Spinraza that was approved through a request from the coverage review department, an exception to the requirement of SMN2 gene copy information may be granted if, according to the prescriber, the patient has objective signs consistent with spinal muscular atrophy Types 1, 2, or 3."	11/18/2020

SMN2 – Survival motor neuron 2.

PRIOR AUTHORIZATION POLICY

POLICY: Spinal Muscular Atrophy – Zolgensma Prior Authorization Policy

- Zolgensma® (onasemnogene abeparvovec-xioi suspension for intravenous infusion – AveXis)

OVERVIEW

Zolgensma, an adeno-associated virus vector-based gene therapy, is indicated for the treatment of pediatric patients less than 2 years of age with spinal muscular atrophy with bi-allelic mutations in the survival motor neuron 1 (SMN1) gene.[1]

Limitations of use are that the safety and effectiveness of repeat administration of Zolgensma have not been evaluated.[1] The use of Zolgensma in patients with advanced spinal muscular atrophy (e.g., complete paralysis of limbs, permanent ventilator dependence) has not been assessed. Use of Zolgensma in premature neonates before reaching full-term gestational age is not recommended because concomitant treatment with corticosteroids may adversely affect neurological development. Zolgensma therapy should be delayed until full-term gestational age is achieved.[1] The definition of full-term pregnancy commences at 39 weeks and 0 days gestation.[2]

Disease Overview

Spinal muscular atrophy is a genetic, autosomal recessive muscular disorder caused by deletion or loss of function mutation in the SMN1 gene.[3-6] The reduced levels of survival motor neuron (SMN) protein causes degeneration of lower motor neurons.[6] Although the condition is a multisystem disorder, it is clinically characterized by progressive muscle weakness and atrophy. Patients have difficulties with ambulation, head control, feeding and respiration. Cognitive development is not impacted. In the US, spinal muscular atrophy affects approximately one in 11,000 infants and has an average carrier frequency of one in 54 individuals; as many as 10,000 to 20,000 children and adults in the US may be impacted.[6] Although the condition can be present in individuals of any age, it is more frequently diagnosed in infants and children, as it is more severe in this population.[3-6] The phenotypic expression of the disease is impacted by the presence of the SMN2 gene copy number. SMN1 is responsible for producing most of the effective SMN protein, although some SMN protein can be made by the SMN2 gene. Therefore, patients with a deletion of the SMN1 gene may have the potential for making some SMN protein through the survival motor neuron 2 (SMN2) gene copy, although in most cases the resulting protein made by this gene is truncated and is not as effective or functional. Data have shown that patients with a higher number of SMN2 gene copies generally have a more mild phenotypic disease expression. Gene deletion testing for spinal muscular atrophy can be performed at many diagnostic laboratories. Table 1 describes disease types. A different manner of categorization classifies the main three most common types as follows: Type 1 patients are "non-sitters", Type 2 patients are "sitters", and Type 3 patients are "walkers".[4,6]

Table 1. Types of Spinal Muscular Atrophy.[3-6]

SMA Type	Age at Onset	Features/Clinical Presentation	Lifespan	SMN2 Gene Copy Number
0	Prenatal	Severe hypotonia and weakness; respiratory failure at birth. There is no achievement of motor milestones.	A few weeks to < 6 months	0 to 1
1	< 6 months	Poor muscle tone, lack of movement, and respiratory assistance needed at birth. Patients are never able to sit.	< 2 years	1 to 2

Table 1 (continued). Types of Spinal Muscular Atrophy.[2-5]

SMA Type	Age at Onset	Features/Clinical Presentation	Lifespan	SMN2 Gene Copy Number
2	Before 18 months	Patients are able to sit. However, patients are unable to walk or stand without assistance.	75% of patients are alive at 25 years of age	2 to 3
3	> 18 months	Walks independently but may lose this ability as the disease progresses.	Normal	3 to 4
4	Adulthood	Walk until adulthood.	Normal lifespan	≥ 4

SMA – Spinal muscular atrophy; SMN2 – Survival motor neuron 2.

Besides Zolgensma, other therapies are available. **Spinraza®** (nusinersen injection for intrathecal use), a SMN2-directed antisense oligonucleotide, is indicated for the treatment of spinal muscular atrophy in pediatric and adult

patients.[7] Spinraza is given by intrathecal injection. Although studies and experience continue, the primary pivotal data include infantile-onset (Type 1) and later-onset (Type 2 and Type 3) spinal muscular atrophy primarily in children. Trials are evolving with Spinraza in adults. Data are also available in presymptomatic infants who were genetically diagnosed with spinal muscular atrophy.

Evrysdi® (risdiplam oral solution), a SMN2 splicing modifier, is indicated for the treatment of spinal muscular atrophy in patients 2 months of age and older.[8] The primary pivotal data include infantile-onset (Type 1) and later-onset (Type 2 and Type 3) spinal muscular atrophy primarily in children and adults up to 25 years of age. Trials are ongoing in older adults, as well as in presymptomatic infants who were genetically diagnosed with spinal muscular atrophy.

Clinical Efficacy

The efficacy of Zolgensma was established in patients less than 2 years of age with spinal muscular atrophy who had bi-allelic mutations in the SMN1 gene.[1,9] One trial was an open-label, single-arm study which is ongoing and the other was an open-label, single-arm, ascending-dose clinical trial.[1] Symptoms onset occurred before patients were 6 months of age. All patients had genetically confirmed bi-allelic SMN1 gene deletions and two SMN2 gene copies. In both trials, Zolgensma was given as a single-dose intravenous infusion. Efficacy was assessed on parameters such as survival and achievement of developmental motor milestones (e.g., sitting without support). The definition of survival was at the time from birth to either death or permanent ventilation. Other efficacy parameters were evaluated (e.g., assessment of Children's Hospital of Philadelphia Infant Test of Neuromuscular Disorders [CHOP-INTEND] scores, evaluation of ventilator use). The ongoing clinical trial involved 21 patients with infantile-onset spinal muscular atrophy. The mean CHOP-INTEND score was 31.0 (range, 18 to 47). The mean patient age at the time of treatment was 3.9 months (range, 0.5 to 5.9 months). As of the March 2019 cutoff date, 19 patients were alive without permanent ventilation. Compared with natural history data Zolgensma is effective as more patients attained the ability to sit without support.[1] The completed clinical trial involved 15 patients with infantile-onset spinal muscular atrophy.[1,9] Three patients were in a low-dose cohort and 12 patients were in a high-dose cohort.[1] At the time of treatment, the mean age of patients in the low-dose cohort was 6.3 months (range, 5.9 to 7.2 months) and 3.4 months (range, 0.9 to 7.9 months) in the high-dose group. The dose in the low-dose cohort was approximately one-third of the dosage received by patients in the high-dose cohort. At 24 months following Zolgensma infusion, one patient in the low-dose cohort met the endpoint of permanent ventilation; all 12 patients in the high-dose cohort were alive without permanent ventilation. In the high-dose cohort, 9 of 12 patients (75%) were able to stand and walk without assistance.[1,9] Additional data supports benefits in patients in the high-dose cohort.[10-12]

Guidelines

The Spinal Muscular Atrophy Newborn Screening Multidisciplinary Working Group is comprised of clinicians and geneticists with expertise in spinal muscular atrophy who developed a treatment algorithm in 2018 for infants who have positive results from a newborn screening test for spinal muscular atrophy.[13] Spinal muscular atrophy Types 1 and 2 comprise a large majority of cases and account for many patients who screen positively for spinal muscular atrophy with three or fewer SMN2 gene copies. Immediate treatment is recommended in patients with two or three SMN2 gene copies. Treatment recommendations for patients who screen positive for spinal muscular atrophy and have only one SMN2 gene copy is more complicated. It is likely that patients with only one SMN2 gene copy will likely be symptomatic at birth and the physician should determine if treatment is warranted.[13] In 2020, the Working Group updated recommendations that infants diagnosed with spinal muscular atrophy via newborn screening with four SMN2 gene copies should receive immediate treatment.[14] Also, patients with five (or more) SMN2 gene copies should be observed and screened for symptoms.

Dosing

The recommended dose of Zolgensma is 1.1 x 10^{14} vector genomes (vg) per kg of body weight.[1] Administer Zolgensma as an intravenous infusion over 60 minutes. Starting 1 day prior to Zolgensma infusion, give systemic corticosteroids equivalent to oral prednisolone 1 mg/kg of body weight for a total of 30 days. Examine liver function after this juncture and follow recommended guidelines.

Safety

Zolgensma has a Boxed Warning regarding acute serious liver injury.[1] Elevated aminotransferases can occur with Zolgensma. Patients with preexisting liver impairment may be at higher risk. Prior to infusion, evaluate liver function in all patients by clinical examination and laboratory testing. One day before Zolgensma infusion, commence administration of systemic corticosteroids equivalent to oral prednisolone at 1 mg per kg of body weight per day for a total of 30 days. Transient decreases in platelet counts may occur. Therefore, measure platelet counts prior to the infusion, weekly for the first month, and then once every other week for the second and third month until platelet counts return to baseline. Also, temporary increases in cardiac troponin-I levels were noted with Zolgensma administration. Therefore, assess troponin-I prior to the infusion, as well as weekly for the first month and then monthly for the second and third until troponin-I level returns to baseline. Perform baseline anti-AAV9 antibody testing prior to Zolgensma infusion. Patients in the Zolgensma trials were required to have baseline anti-AAV9 antibody titers of ≤ 1:50.

POLICY STATEMENT

Prior authorization is recommended for benefit coverage of Zolgensma. Approval is recommended for those who meet the Criteria for the listed indication(s). Because of the of the specialized skills required for evaluation and diagnosis of patients treated with Zolgensma as well as the specialized training required for administration of Zolgensma, approval requires Zolgensma to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for one dose per lifetime. All reviews (approvals and denials) will be forwarded to the Medical Director for evaluation. For certain criteria, verification is required as noted by **[verification required by prescriber]**.

Documentation: Documentation is required where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to chart notes and/or laboratory data.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zolgensma is recommended in those who meet the following criteria:

FDA-Approved Indication

35. **Spinal Muscular Atrophy – Treatment.** Approve for a one-time per lifetime dose if the patient meets the following criteria (A, B, C, D, E, F, G, H, I, J, K, and L):
    A) Patient is less than 2 years of age; AND

B) If the patient is a premature neonate, full-term gestational age of 39 weeks and 0 days has been met; AND

C) Patient has had a genetic test confirming the diagnosis of spinal muscular atrophy with bi-allelic mutations in the survival motor neuron 1 (SMN1) gene reported as at least one of the following: homozygous deletion, homozygous mutation, or compound heterozygous mutation **[documentation required]**; AND

D) Patient has three or fewer survival motor neuron 2 (SMN2) gene copies **[documentation required]**; AND

E) Patient has started or will receive systemic corticosteroids equivalent to oral prednisolone at a dose of 1 mg/kg per day commencing 1 day prior to Zolgensma infusion and for a total of 30 days; AND

F) Baseline anti-AAV9 antibody titers are ≤ 1:50; AND

G) The following laboratory tests will be evaluated prior to administration of Zolgensma (i, ii, and iii):

- **i.** Baseline liver function testing (e.g., aspartate aminotransferase, alanine aminotransferase, total bilirubin, prothrombin time); AND
- **ii.** Platelet count; AND
- **iii.** Troponin-I levels; AND

H) The patient has not received Zolgensma in the past **[verification required by prescriber]**; AND
Note: Verify through claims history that the patient has not previously received Zolgensma AND, if no claim for Zolgensma is present, the prescriber must attest that the patient has not previously received Zolgensma.

I) For a patient currently receiving or who has received prior treatment with Spinraza® (nusinersen injection for intrathecal use), the prescriber attests that further therapy with Spinraza will be discontinued; AND

J) For a patient currently receiving or who has received prior treatment with Evrysdi® (risdiplam oral solution), the prescriber attests that further therapy with Evrysdi will be discontinued; AND

K) Medication is prescribed by a physician who has consulted with or who specializes in the management of patients with spinal muscular atrophy and/or neuromuscular disorders; AND

L) If criteria A through K are met, approve one dose (kit) of Zolgensma based on the current weight in kg (within the past 14 days) **[documentation required]** per the cited NDC as in Table 2 below.

Table 2. Dose of Zolgensma Based on Availability.[1]

Patient Weight Range (kg)	Dose Volume (mL)*	Zolgensma Kit Configuration			NDC Number
		5.5 mL vial	8.3 mL vial	Total Vials per Kit	
2.6 to 3.0	16.5	0	2	2	71894-120-02
3.1 to 3.5	19.3	2	1	3	71894-121-03
3.6 to 4.0	22.0	1	2	3	71894-122-03
4.1 to 4.5	24.8	0	3	3	71894-123-03
4.6 to 5.0	27.5	2	2	4	71894-124-04
5.1. to 5.5	30.3	1	3	4	71894-125-04
5.6 to 6.0	33.0	0	4	4	71894-126-04
6.1 to 6.5	35.8	2	3	5	71894-127-05
6.6 to 7.0	38.5	1	4	5	71894-128-05
7.1 to 7.5	41.3	0	5	5	71894-129-05
7.6 to 8.0	44.0	2	4	6	71894-130-06
8.1 to 8.5	46.8	1	5	6	71894-131-06
8.6 to 9.0	49.5	0	6	6	71894-132-06
9.1 to 9.5	52.3	2	5	7	71894-133-07
9.6 to 10.0	55.0	1	6	7	71894-134-07
10.1 to 10.5	57.8	0	7	7	71894-135-07
10.6 to 11.0	60.5	2	6	8	71894-136-08
11.1 to 11.5	63.3	1	7	8	71894-137-08
11.6 to 12.0	66.0	0	8	8	71894-138-08
12.1 to 12.5	68.8	2	7	9	71894-139-09
12.6 to 13.0	71.5	1	8	9	71894-140-09
13.1 to 13.5	74.3	0	9	9	71894-141-09
≥ 13.6 kg†	Refer to the medical director for approval of specific NDCs				

* Dose volume is calculated using the upper limit of the patient weight range for pediatric patients less than 2 years of age between 2.6 kg and 13.5 kg; † Dose volume for pediatric patients less than 2 years of age weighing equal to or greater than 13.6 kg will require a combination of Zolgensma kits.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Zolgensma is not recommended in the following situations:

262. Patient has Four or More Survival Motor Neuron 2 (SMN2) Gene Copies. These patients were not studied and guidance does not recommend treatment.

263. Patient has Complete Paralysis of All Limbs. This is cited as a limitation of use in the Zolgensma prescribing information.[1] Data are needed to determine if this patient population would derive benefits from Zolgensma.

264. Patient has Permanent Ventilator Dependence. This is cited as a limitation of use in the Zolgensma prescribing information.[1] Data are needed to determine if this patient population would derive benefits from Zolgensma.

265. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
New Policy	Not applicable	05/24/2019
Selected Revision	**Spinal Muscular Atrophy, Treatment:** A documentation requirement was added in the criterion that requires that the patient has three or fewer survival motor neuron 2 (SMN2) gene copies. Regarding the laboratory tests criteria, the wording was changed from "assessments have been completed or will be performed" to "tests will be evaluated". A criterion was added that for patients who have received prior treatment with Spinraza® (nusinersen injection for intrathecal use) further therapy with Spinraza will be discontinued. **Conditions Not Recommended for Approval:** The criterion in this section stating to not approve Zolgensma for patients with complete paralysis of limbs and/or permanent ventilator dependence was split into two different criteria. The criterion in this section stating to not approve if the patient is currently receiving Spinraza was deleted as this is addressed in the approval conditions above.	06/18/2019
Annual Revision	The following changes was made: **Spinal Muscular Atrophy:** Criteria were added that if the patient is a premature neonate, full term gestational age of 39 weeks and 0 days has been met.	06/03/2020
Selected Revision	**Spinal Muscular Atrophy – Treatment:** In the duration of approval the wording "per lifetime" was added to describe the one-time dose. Regarding the criteria that the patient has not received Zolgensma, a notation that requires [verification by the prescriber] was added, as well as a Note to verify through claims history that the patient has not previously received Zolgensma AND, if no claim for Zolgensma is present, the prescriber must attest that the patient has not previously received Zolgensma. For the criterion that addresses if the patient has received prior treatment with Spinraza and that this therapy will be discontinued, wording was added that the prescriber attests to this. The requirement was added that for a patient who has received prior treatment with Evrysdi (risdiplam oral solution), that the prescriber attests that further therapy with Evrysdi will be discontinued. **Conditions Not Recommended for Approval:** The condition regarding paralysis of limbs was simplified from "The patient has complete paralysis of limbs to suggest advanced spinal muscular atrophy" to "Patient has Complete Paralysis of All Limbs". The condition regarding permanent ventilator dependence was simplified from "The patient has permanent ventilator dependence to suggest advanced spinal muscular atrophy" to "Patient has Permanent Ventilator Dependence."	08/12/2020
Selected Revision	**Spinal Muscular Atrophy – Treatment:** The criteria that requires the medication to be prescribed by or in consultation with a physician who specializes in the management of patients with spinal muscular atrophy and/or neuromuscular disorders was changed to "medication is prescribed by a physician who has consulted with or who specializes in the management of patients with spinal muscular atrophy and/or neuromuscular disorders". Also, regarding the criteria pertaining to not using Evrysdi concurrently, wording was added to include not only those who have received prior treatment with	11/18/2020

	Evrysdi, but also those "currently receiving" the therapy. Also, regarding the criteria pertaining to not using Spinraza after Zolgensma therapy, wording was added to include not only those who have received prior treatment with Spinraza, but also those "currently receiving" the therapy.	

PRIOR AUTHORIZATION POLICY

POLICY: Synagis Prior Authorization Policy
- Synagis® (palivizumab for intramuscular injection)

REVIEW DATE: 10/28/2020

OVERVIEW

Synagis, a respiratory syncytial virus (RSV) F protein inhibitor monoclonal antibody, is indicated for the **prevention of serious lower respiratory tract disease caused by RSV in children at high risk of RSV disease**.[1] Safety and efficacy were established in children with bronchopulmonary dysplasia, infants with a history of premature birth, and children with hemodynamically significant congenital heart disease.

The safety and efficacy of Synagis for the treatment of RSV have not been established.[1] The recommended dose is 15 mg/kg intramuscularly once monthly (every 30 days). The first dose of Synagis should be administered prior to commencement of the RSV season and the remaining doses should be administered monthly throughout the RSV season.

RSV Seasonality

The CDC National Respiratory and Enteric Virus Surveillance System provides reports determining RSV seasonality, nationally and by region.[5] For the 2014 to 2017 seasons, median RSV onset occurred mid-October and lasted 31 weeks until early May. The median national peak occurred in early February. Many factors might influence national, regional, and county-level RSV activity, including social and demographic factors, population density, pollution, and climate.

Patterns of weekly RSV circulation in Florida are different from regional and national patterns.[2] Across the 2014 to 2017 seasons, the median onset for Florida was mid-September and the season continued through mid-April. Despite varying onset and offset dates of the RSV season in different regions of Florida, a maximum of five monthly doses will be adequate for qualifying infants for most RSV seasons in Florida.[3] Even if the first of five monthly doses is administered in July, protective serum concentrations of Synagis will be present for most infants and young children for at least 6 months and likely into February. More than five monthly doses are not recommended, despite the detection of a small number of cases of RSV infection outside this time window. A small number of sporadic RSV hospitalizations occur before or after the main season in many areas of the US, but maximum benefit from prophylaxis is derived during the peak of the season and not when the incidence of RSV hospitalization is low.

Guidelines

The AAP Policy Statement on the Updated Guidance for Synagis Prophylaxis Among Infants and Young Children at Increased Risk of Hospitalization for RSV Infection was updated on August 1, 2014.[3] Additionally, the AAP Red Book was updated in 2018.[4] The AAP Red Book provides eligibility criteria for prophylaxis of high-risk infants and children in the following situations: preterm infants with chronic lung disease, infants with congenital heart disease (including those who undergo cardiac transplantation during the RSV season), preterm infants (before 29 weeks, 0 days' gestation) without chronic lung disease or congenital heart disease, children with anatomic pulmonary abnormalities or neuromuscular disorders, and immunocompromised children. Data are insufficient to justify a recommendation for routine use of

prophylaxis in patients with Down syndrome or among those with cystic fibrosis, unless other indications are present.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Synagis. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Because five monthly doses of Synagis at 15 mg/kg per dose will provide more than 6 months of serum Synagis concentrations for most infants, administration of more than five monthly doses is not recommended within the continental US. Children who qualify for five monthly doses of Synagis should receive the first dose at the time of onset of the RSV season. For qualifying infants born during the RSV season, fewer than five monthly doses will be needed to provide protection until the RSV season ends in their region (maximum of five monthly doses).

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Synagis is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Respiratory Syncytial Virus (RSV), Prevention in a Patient with Chronic Lung Disease**. Approve for a maximum of 5 months during the RSV season if the patient meets one of the following criteria (A or B):
   - **A)** Patient is < 12 months of age at the start of the RSV season and meets the following criteria (i and ii):
     - **i.** Patient was born at < 32 weeks, 0 days gestation; AND
     - **ii.** Patient required > 21% oxygen for at least 28 days after birth; OR
   - **B)** Patient is ≥12 months of age but < 24 months of age at the start of the RSV season and meets the following criteria (i, ii, and iii):
     - **i.** Patient was born at < 32 weeks, 0 days gestation; AND
     - **ii.** Patient required > 21% oxygen for at least 28 days after birth; AND
     - **iii.** Patient has required medical therapy (i.e., supplemental oxygen, diuretic therapy, or chronic corticosteroid therapy) during the 6 months before the start of the second RSV season.

2. **Respiratory Syncytial Virus (RSV), Prevention in a Patient with Congenital Heart Disease.** Approve for a maximum of 5 months during the RSV season if the patient meets the following criteria (A, B, and C):
   - **A)** Patient is < 12 months of age at the start of the RSV season; AND
   - **B)** According to the prescriber, patient meets one of the following criteria (i, ii, iii, or iv):
     - **i.** Patient is considered to have hemodynamically significant cyanotic CHD; OR
     - **ii.** Patient meets all of the following (a, b, and c):
       - **a)** Patient has acyanotic heart disease; AND
       - **b)** Patient is receiving medication to control heart failure; AND
       - **c)** Patient will require cardiac surgical procedures; OR
     - **iii.** Patient has moderate to severe pulmonary hypertension; OR
     - **iv.** Patient meets both of the following (a and b):
       - **a)** Patient has lesions that have been adequately corrected by surgery; AND

b) Patient continues to require medication for congestive heart failure; AND

C) Synagis is prescribed by or in consultation with a cardiologist or intensivist.

3. **Respiratory Syncytial Virus (RSV), Prevention in a Patient Born Prematurely.** Approve for a maximum of 5 months during the RSV season if the patient meets the following criteria (A and B):
   A) Patient is < 12 months of age at the start of the RSV season; AND
   B) Patient was born before 29 weeks, 0 days gestation (≤ 28 weeks, 6 days gestation).

Other Uses with Supportive Evidence

4. **Respiratory Syncytial Virus (RSV), Prevention in a Patient with Anatomic Pulmonary Abnormalities or a Neuromuscular Disorder.** Approve for a maximum of 5 months during the RSV season if the patient meets the following criteria (A and B):
   A) Patient is < 12 months of age at the start of the RSV season; AND
   B) According to the prescriber, the patient's condition compromises the handling of respiratory secretions.

5. **Respiratory Syncytial Virus (RSV), Prevention in an Immunocompromised Patient.** Approve for a maximum of 5 months during the RSV season if the patient meets the following criteria (A, B, and C):
   Note: Examples of immunocompromised patients include those receiving chemotherapy and those with hematopoietic stem cell transplant or solid organ transplant.
   A) Patient is < 24 months of age at the start of the RSV season; AND
   B) According to the prescriber, the patient is/will be profoundly immunocompromised during the RSV season; AND
   C) Synagis is prescribed by or in consultation with an immunologist or an infectious diseases specialist.

6. **Respiratory Syncytial Virus (RSV), Prevention in a Patient with Cardiac Transplant.** Approve for a maximum of 5 months during the RSV season if the patient meets the following criteria (A, B, and C):
   Note: A patient with cardiac transplant may also be immunocompromised. In a patient who does not meet criteria for cardiac transplant below, please see criterion 5 above (Respiratory Syncytial Virus [RSV], Prevention in an Immunocompromised Patient).
   A) Patient is < 24 months of age at the start of the RSV season; AND
   B) Patient has undergone or will undergo cardiac transplantation during the current RSV season; AND
   C) Synagis is prescribed by or in consultation is a cardiologist, intensivist, or transplant physician.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Synagis is not recommended in the following situations:

1. **Respiratory Syncytial Virus (RSV), Prevention in a Patient with Cystic Fibrosis Who Does Not Meet Any of the Approval Criteria.** The AAP guidelines for RSV note that routine use of Synagis prophylaxis in patients with cystic fibrosis, including neonates diagnosed with cystic fibrosis by newborn screening, is not recommended unless other indications are present.[4] Available studies indicate the incidence of RSV hospitalization in children with cystic fibrosis is uncommon and unlikely to be different from children without cystic fibrosis.[3] A Cochrane Review identified one trial (presented in poster/abstract form) eligible for their review of Synagis prophylaxis in children with cystic fibrosis.[7]

In this prospective, double-blind, placebo-controlled, multi-center study, 14.1% vs. 14.9% of Synagis and placebo-treated patients, respectively were hospitalized within the first 6 months, and only one patient in each group was identified with RSV infection. There were no deaths in either group of patients during the first 6 months follow-up; this outcome was not reported at 12 months follow-up.

2. **Respiratory Syncytial Virus (RSV), Prevention in a Patient with Down Syndrome <u>Who Does Not Meet Any of the Approval Criteria.</u>** Data suggest that children with Down syndrome have a slightly higher hospitalization rate for RSV, but the absolute number of hospitalizations is small, and a number of children with Down syndrome are at increased risk because of other qualifying risk factors (e.g., congenital heart disease, abnormalities of the respiratory tract, muscle dystonia).[2]

3. **Respiratory Syncytial Virus (RSV), Treatment of Disease.** There are limited data investigating Synagis for the treatment of established RSV infections. Passive antibody administration is not effective in treatment of RSV disease and is not approved or recommended for this indication.[2,6] If any infant or young child receiving monthly Synagis prophylaxis experiences a breakthrough RSV hospitalization, monthly prophylaxis should be discontinued because of the extremely low likelihood of a second RSV hospitalization (< 0.5%).[6]

4. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Testosterone Injectable Products

- Depo® - Testosterone (testosterone cypionate injection – Pfizer, generics)
- Delatestryl® (testosterone enanthate injection – Westward, generics only)
- Aveed™ (testosterone undecanoate injection – Endo Pharmaceuticals Inc.)
- Testopel® (testosterone pellet – Endo Pharmaceuticals Inc.)
- Xyosted™ (testosterone enanthate injection – Antares Pharma Inc.)

REVIEW DATE: 09/09/2020

OVERVIEW

Testosterone regimens can be administered orally, parenterally, or transdermally. Injectable testosterone replacement products include Depo-Testosterone (testosterone cypionate) for intramuscular (IM) use, Delatestryl (testosterone enanthate) for IM use, Aveed (testosterone undecanoate) for IM use, Xyosted (testosterone enanthate) for subcutaneous (SC) use, and Testopel (testosterone pellet) for SC implantation.[1-5] All the injectable agents are indicated for testosterone replacement therapy in adult males for conditions associated with a deficiency or absence of endogenous testosterone.[1-5] The prescribing information define those patients and/or conditions for which use of testosterone replacement products are indicated:

- **Primary hypogonadism (congenital or acquired):** testicular failure due to cryptorchidism, bilateral torsion, orchitis, vanishing testis syndrome, or orchiectomy.

- **Hypogonadotropic hypogonadism (congenital or acquired):** gonadotropin or luteinizing hormone-releasing hormone (LHRH) deficiency or pituitary-hypothalamic injury from tumors, trauma, or radiation.

The diagnosis of male hypogonadism is based on both signs/symptoms and low testosterone levels. By restoring normal levels of testosterone, the replacement regimens correct symptoms of hypogonadism, which can include malaise, loss of muscle strength, depressed mood, and decreased libido.[6]

Testopel and Delatestryl (testosterone enanthate) are also indicated for **delayed puberty**.[2,3] Delatestryl (testosterone enanthate) [per the product labeling] may also be used secondarily in **women with advanced inoperable metastatic mammary cancer** that are 1 to 5 years postmenopausal.[2] The goal of therapy is ablation of ovaries. Per labeling, it also can be used in premenopausal women with breast cancer that have benefited from oophorectomy and are considered to have hormone-responsive tumors.

Guidelines

- **Hypogonadism:** Guidelines from the American Urological Association (2018) note that clinicians should use a total testosterone level below 300 ng/dL as a reasonable cut-off in support of the diagnosis of low testosterone.[7] The guidelines additionally note that a diagnosis of low testosterone should be made only after two total testosterone measurements are taken on separate occasions with both conducted in an early morning fashion and that a clinical diagnosis should be made when patients have low testosterone levels combined with signs and symptoms. The Endocrine Society guidelines on testosterone therapy in men with hypogonadism (2018) recommend diagnosing hypogonadism in men with symptoms and signs of testosterone deficiency and unequivocally and consistently low serum total testosterone and/or free testosterone concentrations (when indicated).[8]
- **Gender-Dysphoric/Gender-Incongruent Persons; Persons Undergoing Female-To-Male (FTM) Gender Reassignment (i.e., Endocrinologic Masculinization):** A clinical practice guideline published by the Endocrine Society (2017), recommends that, prior to initiation of hormonal therapy, the treating endocrinologist should confirm the diagnostic criteria of gender dysphoria/gender incongruence and the criteria for the endocrine phase of gender transition.[9] The clinical should also evaluate and address medical conditions that can be exacerbated by hormone depletion and treatment with sex hormones of the affirmed gender before beginning treatment. Guidelines mention that clinicians can use either parenteral or transdermal preparations to achieve appropriate testosterone values.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of injectable testosterone. All approvals are provided for the duration noted below. In the clinical criteria, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: males are defined as individuals with the biological traits of a male, regardless of the individual's gender identity or gender expression; females are defined as individuals with the biological traits of a female, regardless of the individual's gender identity or gender expression. Because of the specialized skills required for evaluation and diagnosis of some patients treated with testosterone, certain approval requires testosterone to be prescribed by or in consultation with a physician who specializes in the conditions being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of injectable testosterone is recommended in those who meet the following criteria:

FDA-Approved Indications

262. Hypogonadism (Primary or Secondary) in Males* [Testicular Hypofunction/Low Testosterone with Symptoms]. Approve for 1 year if the patient meets the following criteria (A or B):

A) Initial Therapy. Approve in patients with hypogonadism as confirmed by the following criteria (i, ii, and iii):

- **i.** Patient has had persistent signs and symptoms of androgen deficiency (pre-treatment); AND
  Note: Signs and symptoms of androgen deficiency include depressed mood, decreased energy, progressive decrease in muscle mass, osteoporosis, and loss of libido.
- **ii.** Patient has had two pre-treatment serum testosterone (total or bioavailable) measurements, each taken in the morning, on two separate days; AND
- **iii.** The two serum testosterone levels are both low, as defined by the normal laboratory reference values.

B) Patients Continuing Therapy. Approve if the patient meets the following criteria (i and ii):

- **i.** Patient has had persistent signs and symptoms of androgen deficiency (pre-treatment); AND
  Note: Signs and symptoms of androgen deficiency include depressed mood, decreased energy, progressive decrease in muscle mass, osteoporosis, and loss of libido.
- **ii.** Patient has had at least one pre-treatment serum testosterone (total or bioavailable) level, which was low, as defined by the normal laboratory reference values.

* Refer to the Policy Statement

Note: The pre-treatment timeframe refers to sign and symptoms of androgen deficiency and serum testosterone levels prior to the initiation of any testosterone therapy.

263. Delayed Puberty or Induction of Puberty in Males* 14 years of Age or Older. Approve Depo-Testosterone (testosterone cypionate), Delatestryl (testosterone enanthate), or Testopel for 6 months.

*Refer to the Policy Statement

264. Breast Cancer in Females*. Approve Delatestryl (testosterone enanthate) injection in women for 6 months if it is prescribed by or in consultation with an oncologist.

*Refer to the Policy Statement.

Other Uses with Supportive Evidence

265. Gender-Dysphoric/Gender-Incongruent Persons; Persons Undergoing Female-to-Male (FTM) Gender Reassignment (i.e., Endocrinologic Masculinization). Approve for 1 year if prescribed by or in consultation with an endocrinologist or a physician who specializes in the treatment of transgender patients.

Note: For patients who have undergone gender reassignment, use this FTM criterion for hypogonadism indication.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of injectable testosterone is not recommended in the following situations:

266. To Enhance Athletic Performance. Injectable testosterone products are not recommended for approval because this indication is excluded from coverage in a typical pharmacy benefit.

267. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REVIEW DATE: 09/09/2020

OVERVIEW

The oral, topical, and nasal testosterone replacement products are all indicated for testosterone replacement therapy in adult males for conditions associated with a deficiency or absence of endogenous testosterone.[1-10] The prescribing information for the FDA-approved products define those patients and/or conditions for which use of testosterone replacement products are indicated:

- **Primary hypogonadism (congenital or acquired):** testicular failure due to conditions such as cryptorchidism, bilateral torsion, orchitis, vanishing testis syndrome, orchiectomy, Klinefelter's syndrome, chemotherapy, or toxic damage from alcohol or heavy metals. These men usually have low serum testosterone concentrations and gonadotropins (follicle-stimulating hormone [FSH], luteinizing hormone [LH]) above the normal.
- **Hypogonadotropic hypogonadism (congenital or acquired):** gonadotropin or luteinizing hormone-releasing hormone (LHRH) deficiency or pituitary-hypothalamic injury from tumors, trauma, or radiation. These men have low testosterone serum concentrations, but have gonadotropins in the normal or low range.

The diagnosis of male hypogonadism is based on both signs/symptoms and low testosterone levels. By restoring normal levels of testosterone, the replacement regimens correct symptoms of hypogonadism, which can include malaise, loss of muscle strength, depressed mood, and decreased libido.[12]

Guidelines

- **Hypogonadism:** Guidelines from the American Urological Association (2018) note that clinicians should use a total testosterone level below 300 ng/dL as a reasonable cut-off in support of the diagnosis of low testosterone.[13] The guidelines additionally note that a diagnosis of low testosterone should be made only after two total testosterone measurements are taken on separate occasions with both conducted in an early morning fashion and that a clinical diagnosis should be made when patients have low testosterone levels combined with signs and symptoms. The Endocrine Society guidelines on testosterone therapy in men with hypogonadism (2018) recommend diagnosing hypogonadism in men with symptoms and signs of testosterone deficiency and unequivocally and consistently low serum total testosterone and/or free testosterone concentrations (when indicated).[11]
- **Gender-Dysphoric/Gender-Incongruent Persons; Persons Undergoing Female-To-Male (FTM) Gender Reassignment (i.e., Endocrinologic Masculinization):** A clinical practice guideline published by the Endocrine Society (2017), recommends that, prior to initiation of hormonal therapy, the treating endocrinologist should confirm the diagnostic criteria of gender dysphoria/gender incongruence and the criteria for the endocrine phase of gender transition.[14] The clinician should also evaluate and address medical conditions that can be exacerbated by hormone depletion and treatment with sex hormones of the affirmed gender before beginning treatment. Guidelines mention that clinicians can use either parenteral or transdermal preparations to achieve appropriate testosterone values.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of oral, topical and nasal testosterone products. In the approval indications, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: males are defined as individuals with the biological traits of a male, regardless of the individuals' gender identity or gender expression. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of some patients treated with testosterone, certain approval requires testosterone to be prescribed by or in consultation with a physician who specializes in the conditions being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of oral, topical, and nasal testosterone products is recommended in those who meet the following criteria:

FDA-Approved Indications

266. Hypogonadism (Primary or Secondary) in Males* [Testicular Hypofunction/Low Testosterone with Symptoms]. Approve for 1 year if the patient meets the following criteria (A or B):

Note: The pre-treatment timeframe refers to signs and symptoms of androgen deficiency and serum testosterone levels prior to the initiation of any testosterone therapy.

A) Initial Therapy: Patients with hypogonadism as confirmed by the following criteria (i, ii, and iii):
- **i.** Patient has had persistent signs and symptoms of androgen deficiency (pre-treatment); AND
  Note: Signs and symptoms of androgen deficiency include depressed mood, decreased energy, progressive decrease in muscle mass, osteoporosis, and loss of libido.
- **ii.** Patient has had two pre-treatment serum testosterone (total or bioavailable) measurements, each taken in the morning, on two separate days; AND
- **iii.** The two serum testosterone levels are both low, as defined by the normal laboratory reference values.

B) Patients Continuing Therapy. Approve if the patient meets the following criteria (i and ii):
- **i.** Patient has had persistent signs and symptoms of androgen deficiency (pre-treatment); AND
  Note: Signs and symptoms of androgen deficiency include depressed mood, decreased energy, progressive decrease in muscle mass, osteoporosis, and loss of libido.
- **ii.** Patient has had at least one pre-treatment serum testosterone (total or bioavailable) level, which was low, as defined by the normal laboratory reference values.

*Refer to the Policy Statement.

Other Uses with Supportive Evidence

267. Gender-Dysphoric/Gender-Incongruent Persons; Persons Undergoing Female-To-Male (FTM) Gender Reassignment (i.e., Endocrinologic Masculinization). Approve for 1 year if prescribed by or in consultation with an endocrinologist or a physician who specializes in the treatment of transgender patients.

Note: For patients who have undergone gender reassignment, use this FTM criterion for hypogonadism indication.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of oral, topical, and nasal testosterone products is not recommended in the following situations:

268. To Enhance Athletic Performance. Topical testosterone products are not recommended for approval because this indication is excluded from coverage in a typical pharmacy benefit.

269. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Thrombocytopenia – Doptelet Prior Authorization Policy

- Doptelet® (avatrombopag tablets for oral use – Dova/AkaRx)

REVIEW DATE: 03/17/2021

OVERVIEW

Doptelet, a thrombopoietin receptor agonist, is indicated for the treatment of:[1]

- **Immune thrombocytopenia (ITP)**, chronic, in adults who have had an insufficient response to a previous treatment.
- **Chronic liver disease,** adults with thrombocytopenia who are scheduled to undergo a procedure.

For chronic ITP, Doptelet should be discontinued if the platelet count does not increase to $\geq 50 \times 10^9$/L within 4 weeks at the maximum dose of 40 mg once daily (QD). The safety and efficacy of Doptelet have not been established in pediatric patients. For chronic liver disease in patients undergoing a procedure, Doptelet is given as a 5-day course beginning 10 to 13 days before the scheduled procedure. In general, patients in the pivotal studies had a platelet count $< 50 \times 10^9$/L.

Guidelines

In 2019 the American Society of Hematology updated guidelines for ITP.[4] Doptelet is not addressed specifically, but there are several recommendations. For adults with ITP for at least 3 months who are corticosteroid-dependent or unresponsive to corticosteroid, a thrombopoietin receptor agonist (either Promacta® [eltrombopag tablets and oral suspension] or Nplate® [romiplostim injection for subcutaneous use]) or a splenectomy are recommended. In children with newly diagnosed ITP who have non-life-threatening mucosal bleeding, corticosteroids are recommended. For children who have non-life-threatening mucosal bleeding and do not respond to first-line treatment, thrombopoietin receptor agonists are recommended. Other treatment options in children and adults include intravenous immunoglobulin, anti-D immunoglobulin, and rituximab.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Doptelet. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Doptelet as well as the monitoring required for adverse events and long-term efficacy, approval may require Doptelet to be prescribed by or in consultation with a physician who specializes in the condition being treated in certain indications.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Doptelet is recommended in those who meet the following criteria:

FDA-Approved Indications

~~95.~~92. **Chronic Immune Thrombocytopenia.** Approve if the patient meets the following criteria (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets all of the following (i, ii, iii, and iv):
- **i.** Patient is ≥ 18 years of age; AND
- **ii.** Patient meets one of the following (a or b):
  - **a)** Patient has a platelet count < 30 x 10^9/L (< 30,000/mcL); OR
  - **b)** Patient meets both of the following [(1) and (2)]:
    - **(1)** Patient has a platelet count < 50 x 10^9/L (< 50,000/mcL); AND
    - **(2)** According to the prescriber, the patient is at an increased risk of bleeding; AND
- **iii.** Patient meets one of the following (a or b):
  - **a)** Patient has tried at least one other therapy; OR
    Note: Examples of therapies are systemic corticosteroids, intravenous immunoglobulin, anti-D immunoglobulin, Promacta (eltrombopag tablets and oral suspension), Nplate (romiplostim injection for subcutaneous use), Tavalisse (fostamatinib tablets), and rituximab.
  - **b)** Patient has undergone splenectomy; AND
- **iv.** The medication is prescribed by or in consultation with a hematologist; OR

B) Continuation of Therapy. Approve for 1 year if the patient meets both of the following criteria: (i and ii):
- **i.** According to the prescriber, the patient demonstrates a beneficial clinical response; AND
  Note: A beneficial response can include increased platelet counts, maintenance of platelet counts, and/or a decreased frequency of bleeding episodes.
- **ii.** Patient remains at risk for bleeding complications.

~~96.~~93. **Thrombocytopenia in a Patient with Chronic Liver Disease.** Approve for 5 days if the patient meets the following criteria (A, B, and C):

42. Patient is ≥ 18 years of age; AND

43. Patient has a current platelet count < 50 x 10^9/L (< 50,000/mcL); AND

44. Patient is scheduled to undergo a procedure within 10 to 13 days after starting Doptelet therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Doptelet is recommended in the following situations:

315. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	**Chronic Immune Thrombocytopenia:** Criteria were added based on the new indication for use in adults with chronic immune thrombocytopenia in patients who have had an insufficient response to a previous treatment. **Conditions Not Recommended for Approval:** The condition of chronic immune thrombocytopenia was removed as it is now an FDA-approved indication.	07/03/2019
Early Annual Revision	**Chronic Immune Thrombocytopenia:** Criteria were divided into Initial Therapy and Continuation of Therapy. For Initial Therapy, the approval duration is for 3 months. Criteria were added that the patient has a platelet count < 30 x 10^9/L (< 30,000/µL) or that the patient had a platelet count < 50 x 10^9/L (< 50,000/µL) and according to the prescriber the patient is at an increased risk of bleeding. Also, regarding the requirement of a trial of at least one therapy, the word "systemic" was added before the word corticosteroids. Continuation of therapy is approved for 1 year in duration if, according to the prescriber, the patient demonstrates a beneficial clinical response (e.g., increase in platelet counts); AND the patient remains at risk for bleeding complications.	03/11/2020
Annual Revision	**Chronic Immune Thrombocytopenia:** For the Continuation of Therapy criteria, the example of increased platelet counts to denote an example of a beneficial response was moved from an example within the criteria to a Note: Also, maintenance of platelet counts, and/or a decreased frequency of bleeding episodes were also added as examples to the Note as well.	03/17/2021

PRIOR AUTHORIZATION POLICY

POLICY: Thrombocytopenia – Mulpleta Prior Authorization Policy

- Mulpleta® (lusutrombopag tablets for oral use – Shionogi/Quotient)

REVIEW DATE: 03/11/2020

OVERVIEW

Mulpleta is a thrombopoietin receptor agonist (TPO-RA) indicated for the treatment of thrombocytopenia in adults with chronic liver disease who are scheduled to undergo a procedure.[1] Begin Mulpleta dosing 8 to 14 days before the scheduled procedure. The recommended dose is 3 mg once daily (QD) with or without food for 7 days. Patients should undergo their procedure 2 to 8 days after the last Mulpleta dose. The safety and efficacy in pediatric patients have not been established.

Clinical Efficacy

The efficacy of Mulpleta for the treatment of thrombocytopenia in patients with chronic liver disease who were scheduled to undergo a procedure was established in two randomized, double-blind, placebo-controlled trials (L-PLUS 1 [n = 97] and L-PLUS 2 [n = 215]).[1-3] Patients with chronic liver disease who were to be undergoing an invasive procedure were required to have a platelet count < 50 x 10^9/L to participate. The median patient age was 60 years (range, 18 to 88 years). In L-PLUS 1, the major efficacy outcome was the proportion of patients who did not require a platelet transfusion prior to the primary invasive procedure. In L-PLUS 2, the major efficacy outcome was the proportion of patients who did not require a platelet transfusion before the procedure and no rescue therapy for bleeding (i.e., platelet preparations, other blood preparations [including red blood cells and plasma, volume expanders]) from randomization through 7 days following the primary invasive procedure. Other endpoints were also assessed. In L-PLUS 1, 78% of patients given Mulpleta (n = 38/49) compared with 13% of patients randomized to placebo (n = 6/48) did not require a platelet transfusion prior to the invasive procedure (P < 0.0001). In L-PLUS 2, the proportion of patients not requiring a platelet transfusion prior to the invasive procedure or rescue therapy for bleeding from randomization through 7 days following the invasive procedure was 65% in the Mulpleta group vs. 29% (n = 31/107) in the placebo group (P < 0.0001).

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Mulpleta. Approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Mulpleta is recommended in those who meet the following criteria:

FDA-Approved Indication

~~97.~~94. **Thrombocytopenia in Patients with Chronic Liver Disease.** Approve for 7 days if the patient meets the following criteria (A, B and C):

45. Patient is ≥ 18 years of age; AND

46. Patient has a current platelet count < 50 x 10^9/L (< 50,000/µL); AND

47. Patient is scheduled to undergo a procedure within 8 to 14 days after starting Mulpleta therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Mulpleta is recommended in those who meet the following criteria:

316. Chronic Immune Thrombocytopenia. Data are not available regarding use of Mulpleta in patients with persistent and chronic ITP. Many other agents are FDA-approved for this condition and are recommended in standard guidelines and have established efficacy and safety.[4]

317. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Thrombocytopenia – Nplate Prior Authorization Policy

- Nplate® (romiplostim injection for subcutaneous use – Amgen)

REVIEW DATE: 03/17/2021

OVERVIEW

Nplate, a thrombopoietin receptor agonist, is indicated for the treatment of:[1]

- **Hematopoietic Syndrome of Acute Radiation Syndrome (HS-ARS)**, to increase survival in adults and pediatric patients (including term neonates) acutely exposed to myelosuppressive doses of radiation.
- **Immune thrombocytopenia (ITP), in adults** who have had an insufficient response to corticosteroids, immunoglobulins, or splenectomy.
- **Immune thrombocytopenia (ITP), in pediatric patients ≥ 1 year of age** with ITP for at least 6 months who have had an insufficient response to corticosteroids, immunoglobulins, or splenectomy.

Nplate should only be utilized in patients with ITP whose degree of thrombocytopenia and clinical condition increase the risk for bleeding. Nplate should not be used in an attempt to normalize platelet counts.

Guidelines

Nplate is mentioned in guidelines related to ITP, as well as in myelodysplastic syndrome (MDS).

- **Immune Thrombocytopenia:** The American Society of Hematology updated guidelines for ITP (2019). For adults with ITP for at least 3 months who are corticosteroid-dependent or unresponsive to corticosteroid, a thrombopoietin receptor agonist (Nplate or Promacta® [eltrombopag tablets and oral suspension]) or a splenectomy are recommended.[2] In children with newly diagnosed ITP who have non-life-threatening mucosal bleeding, corticosteroids are recommended. For children who have non-life-threatening mucosal bleeding and do not respond to first-line treatment thrombopoietin receptor agonists are recommended.
- **Myelodysplastic Syndrome (MDS):** National Comprehensive Cancer Network recommendations regarding MDS (version 3.2021 – January 15, 2021) state to consider treatment with a thrombopoietin receptor agonist in patients with lower-risk MDS who have severe or life-threatening thrombocytopenia.[3] Data are available that describe the use of Nplate in patients with MDS.[4-13] The data with Nplate are discussed noting an increased rate of platelet response and decreased overall bleeding events among patients with low to intermediate risk MDS.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Nplate. All approvals are provided for the duration noted below. Regarding the approval duration of one dose, the approval is for 30 days, which is an adequate duration for the patient to receive one dose. Because of the specialized skills required for evaluation and diagnosis of patients treated with Nplate as well as the monitoring required for adverse events and efficacy, approval for some indications requires Nplate to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Nplate is recommended in those who meet the following criteria:

FDA-Approved Indication

47. Hematopoietic Syndrome of Acute Radiation Syndrome. Approve for one dose if the patient has been acutely exposed to myelosuppressive doses of radiation.

48. Immune Thrombocytopenia. Approve if the patient meets one of the following criteria (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets all of the following criteria (i, ii, and iii):

i. Patient meets one of the following (a or b):

a) Patient has a platelet count < 30 x 10^9/L (< 30,000/mcL); OR

b) Patient meets both of the following [(1) and (2)]:

(1) Patient has a platelet count < 50 x 10^9/L (< 50,000/mcL); AND

(2) According to the prescriber the patient is at an increased risk of bleeding; AND

ii. Patient meets one of the following (a or b):

a) Patient has tried at least one other therapy; OR

Note: Examples of therapies are systemic corticosteroids, intravenous immunoglobulin, anti-D immunoglobulin, Promacta® (eltrombopag tablets and oral suspension), Tavalisse™ (fostamatinib tablets), Doptelet® (avatrombopag tablets), or ritixumab.

b) Patient has undergone splenectomy; AND

iii. Medication is prescribed by or in consultation with a hematologist; OR

B) Continuation of Therapy. Approve for 1 year if the patient meets both of the following criteria: (i and ii):

iii. According to the prescriber the patient demonstrates a beneficial clinical response; AND

Note: A beneficial response can include increased platelet counts, maintenance of platelet counts, and/or a decreased frequency of bleeding episodes.

iv. Patient remains at risk for bleeding complications.

Other Uses with Supportive Evidence

2. Thrombocytopenia in Myelodysplastic Syndrome (MDS). Approve if the patient meets one the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets all of the following criteria (i, ii, and iii):

i. Patient has low- to intermediate-risk myelodysplastic syndrome; AND

ii. Patient meets one of the following (a or b):

a) Patient has a platelet count < 30 x 10^9/L (< 30,000/mcL); OR

b) Patient meets both of the following [(1) and (2)]:

(1) Patient has a platelet count < 50 x 10^9/L (< 50,000/mcL); AND

(2) According to the prescriber the patient is at an increased risk for bleeding; AND

iii. Medication is prescribed by or in consultation with a hematologist or an oncologist; OR

B) Continuation of Therapy. Approve for 1 year if the patient meets both of the following criteria (i and ii):

i. According to the prescriber the patient demonstrates a beneficial clinical response; AND

Note: A beneficial response can include increased platelet counts, maintenance of platelet counts, and/or decreased frequency of bleeding episodes.

ii. Patient remains at risk for bleeding complications.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Nplate is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	The following criteria changes were made: **1. Chronic Immune Thrombocytopenia:** The approval duration was changed from 3 years to 1 year. Doptelet was added to the list of alternatives that count towards the criteria that requires a trial of one other therapy.	07/03/2019
Early Annual Revision	The following criteria changes were made: 1. **Chronic Immune Thrombocytopenia:** Criteria were divided into Initial Therapy and Continuation of Therapy. For Initial Therapy, the approval duration was changed from 1 year to 3 months. Criteria were added that the patient has a platelet count < 30 x 10^9/L (< 30,000/µL) or that the patient had a platelet count < 50 x 10^9/L (< 50,000/µL) and, according to the prescriber, the patient is at an increased risk of bleeding. Also, regarding the requirement of a trial of at least one therapy, the descriptor "systemic" was added in reference to corticosteroids. Continuation of therapy is approved for a 1-year duration if, according to the prescriber, the patient demonstrates a beneficial clinical response (e.g., increase in platelet counts) and the patient remains at risk for bleeding complications. **2. Thrombocytopenia in Myelodysplastic Syndrome:** Criteria were divided into Initial Therapy and Continuation of Therapy. For Initial Therapy, the approval duration was changed from 1 year to 3 months. Criteria were added that the patient has a platelet count < 30 x 10^9/L (< 30,000/µL) or that the patient had a platelet count < 50 x 10^9/L (< 50,000/µL) and, according to the prescriber, the patient is at an increased risk of bleeding. Previously, the criteria just required that the patient had clinically significant thrombocytopenia (e.g., low platelet counts [< 30 x 10^9/L {< 30,000/µL} {pretreatment}]; is platelet transfusion-dependent; active bleeding, and/or a history of bleeding at low platelet counts). Continuation of therapy is approved for a 1-year if, according to the prescriber, the patient demonstrates a beneficial clinical response (e.g., increase in platelet counts) and the patient remains at risk for bleeding complications).	03/11/2020
Annual Revision	The following changes were made: 1. **Hematopoietic Syndrome of Acute Radiation Syndrome:** Criteria were added for this recently FDA-approved use to approve for one dose if the patient has been acutely exposed to myelosuppressive doses of radiation. Also, a Note was added to the Policy Statement that approval is for 30 days which is an adequate duration for the patient to receive one dose. 2. **Immune Thrombocytopenia:** The word "Chronic" was removed from the indication of use. For the Continuation of Therapy criteria, the example of increased platelet counts to denote an example of a beneficial response was moved from an example within the criteria to a Note. Also, maintenance of platelet counts, and/or a decreased frequency of bleeding episodes were also added as examples to the Note as well. **3. Thrombocytopenia in Myelodysplastic Syndrome:** For the Continuation of Therapy criteria, the example of increased platelet counts to denote an example of a beneficial response was moved from an example within the criteria to a Note. Also, maintenance of platelet counts, and/or a decreased frequency of bleeding episodes were also added as examples to the Note as well.	03/17/2021

FDA – Food and Drug Administration.

PRIOR AUTHORIZATION POLICY

POLICY: Thrombocytopenia – Promacta Prior Authorization Policy

- Promacta® (eltrombopag tablets and oral suspension – Novartis)

REVIEW DATE: 03/17/2021

OVERVIEW

Promacta, a thrombopoietin receptor agonist, is indicated for the treatment of:[1]

- **Aplastic anemia**, severe, in combination with standard immunosuppressive therapy for the first-line treatment of adult and pediatric patients ≥ 2 years of age as well as for patients who have had an insufficient response to immunosuppressive therapy.
- **Chronic hepatitis C, treatment of thrombocytopenia** to allow the initiation and maintenance of interferon-based therapy.
- **Immune thrombocytopenia (ITP), in adult and pediatric patients ≥ 1 year of age** with persistent or chronic ITP whose degree of thrombocytopenia and clinical condition increase the risk for bleeding.

For patients with refractory severe aplastic anemia, if no hematologic response has occurred after 16 weeks of treatment with Promacta, discontinue therapy. For ITP, Promacta should be discontinued if the platelet count does not increase to a level sufficient to avoid clinically important bleeding after 4 weeks of therapy with Promacta at the maximum daily dose of 75 mg. Use Promacta only in patients with chronic hepatitis C whose degree of thrombocytopenia prevents the initiation of interferon-based therapy or limits the ability to maintain interferon-based therapy.[1] The safety and efficacy of Promacta have not been established in combination with direct-acting antiviral agents used without interferon for the treatment of chronic hepatitis C infection. For the management of chronic hepatitis C, Promacta should be stopped upon discontinuation of antiviral treatment futility.

Guidelines

Promacta is addressed in several guidelines.

- **Aplastic Anemia:** Guidelines for the diagnosis and management of adult aplastic anemia are also available from the British Society for Standards in Hematology (2016).[2] Immunosuppressive therapy is recommended first-line for non-severe aplastic anemia in patients requiring treatment, severe or very severe aplastic anemia in patients who lack a matched sibling donor, and severe or very severe aplastic anemia in patients > 35 to 50 years of age. Other immunosuppressive recommended have been studied (e.g., mycophenolate mofetil, sirolimus, corticosteroids) but expertise should be provided prior to consideration of such agents. Hematopoietic stem cell transplantation (HSCT) is also recommended in certain circumstances. Promacta is an option is some clinical scenarios (e.g., heavily pre-treated patients, those unsuitable for HSCT).
- **Immune Thrombocytopenia (ITP):** The 2019 the American Society of Hematology updated guidelines for ITP.[3] There are several recommendations. For adults with ITP for at least 3 months who are corticosteroid-dependent or unresponsive to corticosteroid, a thrombopoietin receptor agonist (Promacta or Nplate® [romiplostim injection for subcutaneous use]) or a splenectomy are recommended. In children with newly diagnosed ITP who have non-life-threatening mucosal bleeding, corticosteroids are recommended. For children who have non-life-threatening mucosal bleeding and do not respond to first-line treatment, thrombopoietin receptor agonists are recommended. Other treatment options in children and adults include intravenous immunoglobulin, anti-D immunoglobulin, and rituximab.
- **Myelodysplastic Syndrome (MDS):** Current recommendations from the National Comprehensive Cancer Network for MDS (version 3.2021 – January 15, 2021) state to consider treatment with a thrombopoietin receptor agonist in patients with lower-risk MDS who have severe or life-threatening thrombocytopenia.[4] The data with Promacta are discussed noting increased rate of platelet response and decreased overall bleeding events among patients with low- to intermediate-risk MDS. Other data are also available that describe the use of Promacta in patients with MDS.[5-7]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Promacta. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Promacta as well as the monitoring required for adverse events and efficacy, approval requires Promacta to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Promacta is recommended in those who meet the following criteria:

FDA-Approved Indications

49. Aplastic Anemia. Approve if the patient meets one of the following (A or B):

A. Initial Therapy. Approve for 4 months if the patient meets the following criteria (i, ii, and iii):

i. Patient has low platelet counts at baseline (pretreatment); AND
Note: An example of a low platelet count is < 30 x 10^9/L (< 30,000/mcL).

ii. Patient meets one of the following (a or b):

a) Patient had tried at least one immunosuppressant therapy; OR
Note: Examples of therapies are cyclosporine, Atgam® (lymphocyte immune globulin, anti-thymocyte globulin [equine] sterile solution for intravenous use only), mycophenolate moefetil, or sirolimus.

b) Patient will be using Promacta in combination with standard immunosuppressive therapy; AND
Note: Examples of therapies are cyclosporine, Atgam® (lymphocyte immune globulin, anti-thymocyte globulin [equine] sterile solution for intravenous use only), mycophenolate moefetil, or sirolimus.

iii. Promacta is prescribed by or in consultation with a hematologist; OR

B. Continuation of Therapy. Approve for 1 year if, according to the prescriber, the patient demonstrates a beneficial clinical response.
Note: Examples include increases in platelet counts, reduction in red blood cell transfusions, hemoglobin increase, and/or absolute neutrophil count increase.

50. Immune Thrombocytopenia. Approve if the patient meets one the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets all of the following (i, ii, and iii):

i. Patient meets one of the following (a or b):

a) Patient has a platelet count < 30 x 10^9/L (< 30,000/mcL); OR

b) Patient meets both of the following [(1) and (2)]:

(1) Patient has a platelet count < 50 x 10^9/L (< 50,000/mcL); AND

(2) According to the prescriber the patient is at an increased risk for bleeding; AND

ii. Patient meets one of the following (a or b):

a) Patient has tried at least one other therapy; OR
Note: Examples of therapies are systemic corticosteroids, intravenous immunoglobulin, anti-D immunoglobulin, Nplate (romiplostim injection for subcutaneous use), Tavalisse (fostamatinib tablets), Doptelet (avatrombopag tablets), or rituximab.

b) Patient has undergone splenectomy; AND

iii. The medication is prescribed by, or in consultation with, a hematologist; OR

B) Continuation of Therapy. Approve for 1 year if the patient meets both of the following criteria (i and ii):

i. According to the prescriber, the patient demonstrates a beneficial clinical response; AND

Note: A beneficial response can include increased platelet counts, maintenance of platelet counts, and/or a decreased frequency of bleeding episodes.

ii. Patient remains at risk for bleeding complications.

51. Thrombocytopenia in a Patient with Chronic Hepatitis C. Approve Promacta for 1 year if the patient meets the following criteria (A, B, and C):

A) Patient has low platelet counts at baseline (pretreatment); AND
Note: An example of a low platelet count is < 75 x 10^9/L (< 75,000/mcL).

B) Patient will be receiving interferon-based therapy for chronic hepatitis C; AND
Note: Examples of therapies are pegylated interferon (Pegasys® [peginterferon alfa-2a injection], PegIntron® [peginterferon alfa-2b injection]), or Intron A® (interferon alfa-2b).

C) The medication is prescribed by or in consultation with either a gastroenterologist, a hepatologist, or a physician who specializes in infectious disease.

Other Uses with Supportive Evidence

4. Thrombocytopenia in Myelodysplastic Syndrome. Approve if the patient meets one of the following (A or B):

B) Initial Therapy. Approve for 3 months if the patient meets the following criteria (i, ii, and iii):

a. Patient has low- to intermediate-risk myelodysplastic syndrome; AND

b. Patient meets one of the following (a or b):

a) Patient has a platelet count < 30 x 10^9/L (< 30,000/mcL); OR

b) Patient meets one of the following [(1) and (2)]:

i. Patient has a platelet count < 50 x 10^9/L (< 50,000/mcL); AND

ii. According to the prescriber, the patient is at an increased risk for bleeding; AND

c. The medication is prescribed by or in consultation with a hematologist or an oncologist; OR

B) Continuation of Therapy. Approve for 1 year if the patient meets both of the following criteria (i and ii):

iii. According to the prescriber the patient demonstrates a beneficial clinical response; AND
Note: A beneficial response can include increased platelet counts, maintenance of platelet counts, and/or decreased frequency of bleeding episodes.

iv. Patient remains at risk for bleeding complications.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Promacta is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	**Chronic Immune Thrombocytopenia:** Doptelet was added to the list of alternatives that count towards the criteria that requires a trial of one other therapy. The approval duration was changed from 3 years to 1 year.	07/03/2019
Early Annual Revision	**Aplastic Anemia:** Criteria were divided into Initial Therapy and continuation of therapy. Initial approval duration was changed from 1 year to 4 months. Continuation of Therapy were added that approves for 1 year if, according to the prescriber, the patient demonstrates a beneficial clinical response. A Note was added that cites examples of a clinical response which includes increases in platelet counts, reduction in red blood cell transfusions, hemoglobin increase, and/or absolute neutrophil count increase. **Chronic Immune Thrombocytopenia:** Criteria were divided into Initial Therapy and Continuation of Therapy. For Initial Therapy, the approval duration was changed from 1 year to 3 months. Criteria were added that the patient has a platelet count < 30 x 10^9/L (< 30,000/µL) or that the patient has a platelet count < 50 x 10^9/L (< 50,000/µL) and according to the prescriber the patient is at an increased risk of bleeding. Also, regarding the requirement of a trial of at least one therapy, the word "systemic" was added before the word corticosteroids. Continuation of therapy is approved for a 1-year duration if, according to the prescriber, the patient demonstrates a beneficial clinical response (e.g., increase in platelet counts) AND the patient remains at risk for bleeding complications. **Thrombocytopenia in Myelodysplastic Syndrome:** Criteria were divided into Initial Therapy and Continuation of Therapy. For Initial Therapy the approval duration was changed from 1 year to 3 months. Criteria were added that the patient has a platelet count < 30 x 10^9/L (< 30,000/µL) or that the patient had a platelet count < 50 x 10^9/L (< 50,000/µL) and, according to the prescriber, the patient is at an increased risk of bleeding. Previously, the criteria just required that the patient had clinically significant thrombocytopenia (e.g., low platelet counts [< 30 x 10^9/L {< 30,000/µL} {pretreatment}]; is platelet transfusion-dependent; active bleeding, and/or a history of bleeding at low platelet counts). Continuation of therapy is approved for a 1-year duration if the, according to the prescriber, the patient demonstrates a beneficial clinical response (e.g., increase in platelet counts) and the patient remains at risk for bleeding complications.	03/11/2020
Annual Revision	**Aplastic Anemia:** The provided value as an example of a low platelet count was moved from the criteria to a Note. **Immune Thrombocytopenia:** The word "Chronic" was removed from the indication of use. For the Continuation of Therapy criteria, the example of increased platelet counts to denote an example of a beneficial response was moved from an example within the criteria to a Note. Also, maintenance of platelet counts, and/or a decreased frequency of bleeding episodes were also added as examples to the Note as well. **Thrombocytopenia in a Patient with Chronic Hepatitis C:** The provided value as an example of a low platelet count was moved from the criteria to a Note. **Thrombocytopenia in Myelodysplastic Syndrome:** For the Continuation of Therapy criteria, the example of increased platelet counts to denote an example of a beneficial response was moved from an example within the criteria to a Note. Also, maintenance of platelet counts, and/or a decreased frequency of bleeding episodes were also added as examples to the Note as well.	03/17/2021

PRIOR AUTHORIZATION POLICY

POLICY: Thrombocytopenia – Tavalisse Prior Authorization Policy

- Tavalisse® (fostamatinib disodium hexahydrate tablets – Rigel/Patheon Whitby)

REVIEW DATE: 03/17/2021

OVERVIEW

Tavalisse, a tyrosine kinase inhibitor with demonstrated activity against spleen tyrosine kinase, is indicated for the treatment of thrombocytopenia in adults with **chronic immune thrombocytopenia** (ITP) who have had an insufficient response to a previous treatment.[1]

The safety and efficacy of Tavalisse have not been established in pediatric patients. Use of Tavalisse is not recommended for patients < 18 years of age because adverse events on actively growing bones were observed in nonclinical studies. Discontinue Tavalisse if after 12 weeks of treatment the platelet count does not increase to a sufficient level to control bleeding.

Guidelines

In 2019 the American Society of Hematology updated guidelines for ITP.[2] Tavalisse is noted as an agent that has been studied in the third-line setting and its role is not specifically addressed. However, there are several other recommendations. For adults with ITP for at least 3 months who are corticosteroid-dependent or unresponsive to corticosteroid, a thrombopoietin receptor agonist (either Promacta® [eltrombopag tablets and oral suspension] or Nplate® [romiplostim injection for subcutaneous use]) or a splenectomy are recommended. Other treatment options in children and adults include intravenous immunoglobulin, anti-D immunoglobulin, and rituximab.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Tavalisse. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Tavalisse as well as the monitoring required for adverse events and long-term efficacy, approval requires Tavalisse to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tavalisse is recommended in those who meet the following criteria:

FDA-Approved Indication

~~98.~~95. **Chronic Immune Thrombocytopenia.** Approve if the patient meets one of the following criteria (A or B):

48. Initial Therapy. Approve for 3 months if the patient meets all of the following criteria (i, ii, iii, and iv):

i. Patient is ≥ 18 years of age; AND

ii. Patient meets one of the following (a or b):

- **a)** Patient has a platelet count < 30 x 10^9/L (< 30,000/mcL): OR
- **b)** Patient meets both of the following [(1) and (2)]:
  - **(1)** The patient has a platelet count < 50 x 10^9/L (< 50,000/mcL); AND
  - **(2)** According to the prescriber, the patient is at an increased risk of bleeding; AND

iii. Patient meets one of the following criteria (a or b):

- **a)** Patient has tried at least one other therapy; OR
  Note: Examples of therapies are systemic corticosteroids, intravenous immunoglobulin, anti-D immunoglobulin, Promacta® (eltrombopag tablets and oral suspension), Nplate® (romiplostim injection for subcutaneous use), Doptelet® (avatrombopag tablets), or rituximab.
- **b)** Patient has undergone splenectomy; AND

iv. Medication is prescribed by or in consultation with a hematologist; OR

B. Continuation of Therapy. Approve for 1 year if the patient meets both of the following criteria (i and ii):

iii. According to the prescriber, the patient demonstrates a beneficial clinical response; AND
Note: A beneficial response can include increased platelet counts, maintenance of platelet counts, and/or a decreased frequency of bleeding episodes; AND

iv. Patient remains at risk for bleeding complications.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tavalisse is not recommended in the following situations:

5. B-Cell Lymphomas. Tavalisse has been investigated in patients with various B-cell lymphomas (e.g., non-Hodgkin's lymphoma, diffuse large B-cell lymphoma [DLBCL]).[3,4] Many other therapies are available for this use.

6. Rheumatoid Arthritis. Tavalisse has been studied in patients with rheumatoid arthritis.[5-9] However, other therapies are more well-established and are recommended in guidelines.

7. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Annual Revision	**Chronic Immune Thrombocytopenia:** For the Continuation of Therapy criteria, the example of increased platelet counts to denote an example of a beneficial response was moved from an example within the criteria to a Note. Also, maintenance of platelet counts, and/or a decreased frequency of bleeding episodes were also added as examples to the Note as well.	03/17/2021

PRIOR AUTHORIZATION POLICY

POLICY: Tolvaptan Products – Jynarque® (tolvaptan tablets – Otsuka)

DATE REVIEWED: 06/10/2020

OVERVIEW

Jynarque, a selective vasopressin V_2-receptor antagonist, is indicated to slow kidney function decline in adults at risk of rapidly-progressing autosomal dominant polycystic kidney disease (ADPKD).[1]

Disease Overview

ADPKD is a heterogeneous, inherited kidney disorder associated with the development of kidney cysts, which result in kidney pain, hypertension, renal failure, and other clinical sequelae.[5-8] The condition is a common cause of end-stage renal disease (ESRD); however, other organs are also impacted (e.g., hepatic and vascular systems). Progressive kidney enlargement occurs; however, manifestations generally do not occur until later in life (fourth decade) due to compensatory renal mechanisms. If a parent has the condition, a child has a 50% chance of inheritance. Approximately 600,000 people in the US have this condition.

Clinical Efficacy

Jynarque was shown to slow the rate of decline in renal function in adults at risk of rapidly-progressing ADPKD in two trials.[1-4] TEMPO 3:4 (n = 1,445) [published] involved adults (18 to 50 years of age) with early, rapidly-progressing (total kidney volume ≥ 750 mL and aged < 51 years) ADPKD who received Jynarque or placebo for up to 3 years.[1-2] Patients had an average estimated glomerular filtration rate (eGFR) of 82 mL/min/1.73 m^2. The prespecified primary endpoint of 3-year change in total kidney volume was achieved with Jynarque therapy ($P < 0.0001$).[1] During the 3-year period, total kidney volume increased by 2.8% per year with Jynarque vs. 5.5% per year with placebo ($P < 0.001$). [2] The difference in total kidney volume occurred mainly in Year 1, with little additional differences noted in Year 2 and 3.[1] The relative rate of ADPKD-related events were decreased by 13.5% in patients randomized to Jynarque compared with placebo (44 vs. 50 events per 100 person-years; $P = 0.0095$). This composite endpoint was primarily driven by decreases in worsening kidney function and kidney pain events.[1-2] TEMPO 4:4 (n = 871) [published] involved patients completing TEMPO 3:4 and provided an additional 2 years of data regarding the effects of Jynarque, as all patients were given active therapy.[1,3] The difference between groups in total kidney volume was not maintained.[1] The percent changes in total kidney volume from the baseline of TEMPO 3:4 to Month 24 of TEMPO 4:4 were 29.9% among those previously receiving Jynarque vs. 31.6% who were given placebo prior [$P = 0.38$]).

REPRISE (n = 1,370) [published] involved adults (18 to 65 years of age) with later stage ADPKD who received Jynarque or placebo for up to 1 year.[1,4] The trial included a prerandomization phase to assess tolerability, as well as a 3-week randomized withdrawal period to evaluate renal function. Patients had an average eGFR of 41 mL/min/1.73 m^2. In the randomized period, the change in eGFR from pretreatment

baseline to post-treatment follow-up was -2.3 mL/min/1.73 m^2/year with Jynarque compared with -3.6 mL/min/1.73 m^2/year with placebo, with a treatment effect of 1.3 mL/min/1.73 m^2/year ($P < 0.0001$). The eGFR slope (with adjustment per trial duration), a key secondary endpoint, also demonstrated a difference between treatment groups of 1.0 mL/min/m^2/year ($P < 0.0001$).

Guidelines

The European Renal Association-European Dialysis and Transplant Association (ERA-EDTA) Working Groups on Inherited Kidney Disorders and European Renal Best Practice published a position statement regarding use of tolvaptan in ADPKD (2016).[10] A confirmed eGFR decline ≥ 5 mL/min/1.73 m^2 in 1 year, and/or ≥ 2.5 mL/min/1.73 m^2 per year over a period of 5 years defines rapid progression. Also, a total kidney volume increase > 5% per year by repeated measurements (preferably three or more, each at least 6 months apart and by magnetic resonance imaging) defines rapid progression.[10] The pivotal trials for Jynarque did not involve patients with Stage 5 CKD (glomerular filtration rate [GFR] < 15 mL/min/1.73 m^2 or receiving dialysis).

The National Kidney Foundation and the Polycystic Kidney Disease Foundation, list tolvaptan as an FDA-approved treatment option for patient with ADPKD.[8,11]

Safety

Jynarque has a Boxed Warning regarding a risk of serious liver injury which can be fatal.[1] Monitor transaminases and bilirubin levels prior to therapy initiation, at 2 weeks and 4-weeks after initiation, then continuing monthly for the first 18 months and once every 3 months thereafter.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Jynarque. All approvals are provided for the duration noted below. Due to the specialized skills required for evaluation and diagnosis of patients treated with Jynarque as well as the monitoring required for adverse events and long-term efficacy, approval requires Jynarque to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Jynarque is recommended in those who meet the following criteria:

FDA-Approved Indication

~~99.~~96. **Autosomal Dominant Polycystic Kidney Disease.** Approve for 1 year if the patient meets the following criteria (A, B, C and D):

49. The patient is ≥ 18 years of age; AND

50. The agent is prescribed by or after consultation with a nephrologist; AND

51. According to the prescribing physician, the patient has rapidly-progressing autosomal dominant polycystic kidney disease (e.g., reduced or declining renal function, high or increasing total kidney volume [height adjusted]); AND

52. The patient does not have Stage 5 chronic kidney disease (glomerular filtration rate < 15 mL/min/1.73 m^2 or receiving dialysis).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Jynarque has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below.

8. **Patient is Currently Receiving Samsca® (tolvaptan tablets).** Samsca is a tolvaptan product that is indicated for the treatment of clinically-significant hypervolemic and euvolemic hyponatremia, including patients with heart failure and syndrome of inappropriate antidiuretic hormone.[9] Concomitant use is not recommended.

9. **Hyponatremia.** Samsca is another tolvaptan product indicated for the treatment of clinically-significant hypervolemic and euvolemic hyponatremia (serum sodium < 125 mEq/L or less marked hyponatremia that is symptomatic and has resisted correction and fluid restriction), including patients with heart failure and syndrome of inappropriate antidiuretic hormone (SIADH). Samsca should be used for this condition.

10. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Tolvaptan Products – Tolvaptan tablets (Samsca® – Otsuka; generics)

DATE REVIEWED: 06/10/2020

OVERVIEW

Samsca, a selective vasopressin V_2-receptor antagonist, is indicated for the treatment of clinically significant hypervolemic and euvolemic hyponatremia (serum sodium < 125 mEq/L or less marked hyponatremia that is symptomatic and has resisted correction with fluid restriction), including patients with heart failure (HF) and syndrome of inappropriate antidiuretic hormone (SIADH). Patients requiring intervention to raise serum sodium urgently to prevent or to treat serious neurological symptoms should not be treated with Samsca. It has not been established that raising serum sodium with Samsca provides a symptomatic benefit to patients.

Clinical Data

Two trials (Study of Ascending Levels of Tolvaptan in Hyponatremia 1 and 2 [SALT-1 and SALT-2; n = 424]) demonstrated that Samsca increased serum sodium effectively in patients with euvolemic or hypervolemic hyponatremia that was due to many underlying causes (e.g., HF, liver cirrhosis, SIADH).[1,2] Patients (aged ≥ 18 years) received therapy for 30 days with Samsca or placebo and were followed for an additional 7 days after study withdrawal. Patients in the trial had a serum sodium < 135 mEq/L at study entry (baseline 129 mEq/L). In both trials, Samsca therapy led to a greater increase in serum sodium ($P < 0.0001$) compared with baseline for the measured endpoints at Day 4 and Day 30. The effects of sustained serum sodium were demonstrated for up to 1 year in an open-label study.[1] Another long-term analysis (the Safety and sodium Assessment of Long-term Tolvaptan With hyponatremia: A year-long, open-label Trial to gain Experience under Real-world conditions [SALTWATER]) showed that in 111 patients who received Samsca for approximately 1 year, increases in serum sodium were maintained.[1,3]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Samsca. All approvals are provided for up to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Samsca is recommended in those who meet the following criteria:

FDA-Approved Indications

52. Hyponatremia. Approve for up to 30 days if patient meets ONE of the following criteria (A, B, or C):

- **A)** The patient has a serum sodium < 125 mEq/L at baseline; OR
- **B)** The patient meets the following criteria (i and ii):
  - **i.** The patient has less marked hyponatremia, defined as serum sodium < 135 mEq/L at baseline; AND
  - **ii.** The patient has symptomatic hyponatremia.
    Note: Symptoms of hyponatremia include nausea, vomiting, headache, lethargy, confusion; OR
- **C)** The patient has already been started on Samsca and has received < 30 days of therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Samsca has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

11. **Autosomal Dominant Polycystic Kidney Disease (ADPKD).** Jynarque (tolvaptan tablets) is another tolvaptan product that is indicated to slow kidney function decline in adults at risk of rapidly-progressing ADPKD. The recommended dosing differs.[4] The Samsca prescribing information states that tolvaptan should not be prescribed or used to treat ADPKD outside of the FDA-approved REMS for ADPKD.

12. **Patient is Currently Receiving Jynarque® (tolvaptan tablets).** Jynarque is another tolvaptan product that is indicated to slow kidney function decline in adults at risk of rapidly-progressing ADPKD. Concomitant use is not recommended.

13. **Patients Requiring Intervention to Raise Serum Sodium Urgently to Prevent or to Treat Serious Neurological Symptoms.** Samsca has not been studied in a setting of urgent need to raise serum sodium acutely.[1]

14. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Topical Acne – Winlevi Prior Authorization Policy

- Winlevi® (clascoterone cream 1% – Cassiopea Inc)

REVIEW DATE: 12/16/2020

OVERVIEW

Winlevi, an androgen receptor inhibitor, is indicated for the **topical treatment of acne vulgaris** in patients ≥ 12 years of age.[1]

Safety

Winlevi is the only topical acne product with a warning about hypothalamic-pituitary-adrenal (HPA) axis suppression.[1] This may result when Winlevi is used over large surface areas or if use is prolonged. In addition, pediatric patients may be more susceptible. This adverse event was not observed in the pivotal studies or in the long-term open-label extension study. However, it was observed in a small group of patients on Day 14 in a pharmacokinetic study. Normal HPA axis function was observed at follow-up at 4 weeks after end of treatment.

Guidelines

Winlevi has not been added to the American Academy of Dermatology guidelines for the management of acne (2016).[2] Topical therapies, either as monotherapy, or in combination with other topical agents or oral agents are recommended for initial control and maintenance therapy of acne. Topical retinoids are the cornerstone of acne management due to their comedolytic and anti-inflammatory properties.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Winlevi. All approvals are provided for the duration noted below.

Automation: None

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Winlevi is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **Acne Vulgaris.** Approve for 1 year if the patient meets the following criteria (A, B, and C):
   - **53.** Patient is ≥ 12 years of age; AND
   - **54.** Patient has tried at least one prescription topical retinoid.
     Note: Examples of a prescription topical retinoid are adapalene, Aklief® [trifarotene cream 0.005%], tazarotene (Tazorac® 0.1% cream [generics], Tazorac 0.1% gel), and tretinoin; AND
   - **55.** Patient has tried at least three other prescription topical therapies.
     Note: Examples of other prescription topical therapies for acne include: Aczone® (dapsone gel 7.5%; dapsone gel 5% [generics]), Azelex® (azelaic acid cream 20%), topical clindamycin, topical erythromycin, and topical minocycline (Amzeeq™ [minocycline foam 4%]).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Winlevi is not recommended in the following situations:

- **15.** Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Topical Acyclovir Cream and Ointment Prior Authorization Policy
- Zovirax® (acyclovir 5% cream – Valeant, generics)
- Zovirax® (acyclovir 5% ointment – Valeant, generics)

REVIEW DATE: 06/24/2020

OVERVIEW

Acyclovir 5% cream (Zovirax, generics) is indicated for the treatment of recurrent herpes labialis (cold sores) in immunocompetent adults and adolescents 12 years of age and older.[1] Acyclovir 5% ointment (Zovirax, generics) is indicated in the management of initial genital herpes and in limited non-life-threatening mucocutaneous herpes simplex virus infections in immunocompromised patients.[2]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of acyclovir 5% cream and acyclovir 5% ointment. All approvals are provided for the duration noted below. For the ointment, a trial of generic acyclovir 5% ointment is required prior to approval of brand Zovirax 5% ointment.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

I. Coverage of acyclovir 5% cream (Zovirax 5% cream, generics) is recommended in those who meet the following criterion:

FDA-Approved Indication

28. Herpes Labialis (Cold Sores). Approve for 1 year if the patient meets both of the following criteria (A and B):
- **a)** Patient is ≥ 12 years of age; AND
- **b)** Patient is immunocompetent.

II. Coverage of acyclovir 5% ointment (Zovirax 5% ointment, generics) is recommended in those who meet the following criteria:

FDA-Approved Indications

29. Genital Herpes. Approve for 1 year if the patient meets one of the following criteria (A or B):
- a. Generic acyclovir 5% ointment is requested; OR
- b. If brand Zovirax 5% ointment is requested, the patient meets both of the following criteria (i and ii):
  - i. Patient has tried generic acyclovir 5% ointment; AND
  - ii. Patient cannot use the generic product to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the brand and the bioequivalent generic

product which, per the prescriber, would result in a significant allergy or serious adverse reaction.

30. Limited Non-Life-Threatening Mucocutaneous Herpes Simplex Virus Infections. Approve for 1 year if the patient meets one of the following criteria (A and B):
   a. Patient is immunocompromised; AND
   b. Patient meets one of the following criteria (i or ii):
      i. Generic acyclovir 5% ointment is requested; OR
      ii. If brand Zovirax 5% ointment is request, the patient meets both of the following criteria (a and b):
         1. Patient has tried generic acyclovir 5% ointment; AND
         2. Patient cannot use the generic product due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the brand and the bioequivalent generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of acyclovir 5% cream and acyclovir 5% ointment are not recommended in the following situation:

13. Shingles. Shingles is a viral infection caused by the varicella-zoster virus, the same virus that causes chickenpox.[3,4] The Centers for Disease Control and Prevention (CDC) and the National Institute of Health (NIH), National Institute of Neurological Disorders and Stroke (NINDS) cite the use of oral antivirals (acyclovir capsules/tablets/suspension [Zovirax, generics], famciclovir tablets [Famvir®, generics], and valacyclovir caplets [Valtrex®, generics]) for the treatment of shingles. Oral antivirals speed healing and reduce the risk of complications. Topical antivirals are not noted as treatment options for shingles.

14. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

POLICY: Topical Alpha-Adrenergic Agonists for Rosacea
- Mirvaso® (brimonidine gel, 0.33% – Galderma)
- Rhofade™ (oxymetazoline hydrochloride cream, 1% – EPI Health)

DATE REVIEWED: 05/27/2020

OVERVIEW

The topical alpha-adrenergic agonists, Mirvaso and Rhofade, are indicated for the topical treatment of persistent facial erythema associated with rosacea in adults ≥ 18 years of age.[1,2]

Mirvaso is an alpha$_2$-adrenergic agonist and Rhofade is an alpha$_{1A}$-adrenergic agonist. Both of these products have been shown to decrease the erythema associated with rosacea; neither has been shown to exert any beneficial effects on inflammatory lesions.[1-4]

Rosacea, a chronic, inflammatory facial skin disorder, affects approximately 16 million people in the US.[5-7] The hallmark of rosacea is centrofacial persistent erythema, typically affecting the cheeks, chin, forehead, and nose; the perioral and periocular regions are generally unaffected.[6] Patients with rosacea typically present with clinical manifestations that include flushing, persistent facial erythema, dryness, burning and stinging skin, inflammatory papules and pustules, telangiectasia or dilation of blood vessels, and watery or irritated eyes.[7] Diffuse centrofacial erythema is almost universally present in all patients with rosacea; it generally intensifies in magnitude during a flare and persists between flares at a lesser degree of intensity.[8]

The American Acne & Rosacea Society (AARS) published consensus guidelines on the management of rosacea in 2014.[3,4] The panel notes that a gentle skin care and photoprotection regimen is recommended for all patients. A topical alpha-adrenergic agonist is recommended for use as monotherapy in patients with centrofacial erythema without papulopustular lesions or in combination with an anti-inflammatory (e.g., topical metronidazole, azelaic acid 15% gel [Finacea®, generics], Finacea® foam [azelaic acid], ivermectin 1% cream [Soolantra®, generics]) in patients with centrofacial erythema and papulopustular lesions. The topical alpha-agonists should not be considered as alternatives to anti-inflammatory therapies.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of the topical alpha-adrenergic agonists. All approvals are provided for 1 year in duration.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Mirvaso or Rhofade is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Facial Erythema Due to Rosacea in Adults ≥ 18 years of age.** Approve for 1 year.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Neither Mirvaso nor Rhofade has been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

16. Erythema Caused by Conditions Other Than Rosacea.

17. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Topical Diclofenac Sodium Gel (Solaraze) Prior Authorization Policy

- Solaraze® (diclofenac sodium 3% gel – PharmaDerm, generics)

REVIEW DATE: 06/24/2020

OVERVIEW

Diclofenac sodium 3% gel (Solaraze®, generics) is a topical nonsteroidal anti-inflammatory drug (NSAID) indicated for the topical treatment of actinic keratoses (AK).[1] It is also noted in the labeling that sun avoidance is indicated during therapy. The mechanism of action of diclofenac sodium in the treatment of AK is unknown or not completely understood; however, it is hypothesized that diclofenac sodium may clear AK lesions via cell signaling mechanisms and possibly may play a part in the reduction of angiogenesis and induction of apoptosis (either directly or through a cytotoxic independent pathway).[2]

There are other topical NSAIDs commercially available in the US: diclofenac sodium topical 1% gel (Voltaren® Gel, generics) which is indicated for the relief of the pain of osteoarthritis (OA) of joints amenable to topical treatment, such as the knees and those of the hands; Flector® Patch (diclofenac epolamine 1.3% topical patch) which is indicated for the topical treatment of acute pain due to minor strains, sprains, and contusions; and Pennsaid® (diclofenac sodium 2% w/w topical solution) which is indicated for the treatment of the pain of OA of the knee(s).[3-5]

Other Uses

There are data to support the use of diclofenac sodium 3% gel for the treatment of actinic cheilitis (actinic keratosis of the lips). In a study where 31 patients with actinic cheilitis were treated with diclofenac 3% gel for a period of 90 days, ten patients showed total remission and three patients showed partial improvement.[6] A report of six cases treated with diclofenac sodium 3% gel demonstrated complete response for five patients and partial response for one patient, after 6 weeks of treatment.[7] In an open-label study involving 27 patients with actinic cheilitis who completed 30 to 180 days of therapy with diclofenac 3% in 2.5% hyaluronic acid gel, complete remission was observed in 44% of patients (n = 12/27) and a significant improvement in 56% (n = 15/27) of patients was observed.[8] Another open-label study demonstrated efficacy with diclofenac sodium 3% gel when used for 90 days in 19 patients with actinic cheilitis.[9]

Diclofenac can also be used for the treatment of Bowen's disease, a form of squamous cell carcinoma in situ.[10,11] There are two published case series (one involving two patients, another involving five patients) which demonstrated clinical and histological resolution of Bowen's disease in all seven patients. In one case series, patients were treated for 90 days, while in the other case series, patients were treated for 8 weeks. Available guidelines detailing management of Bowen's disease note that evaluation of studies on the treatment of Bowen's disease can be problematic due to the varying healing and success rates with the varying locations of the lesions/patches.[12,13] In addition, the management of Bowen's disease employs several different types of treatment and, like the management of AK, selection of therapy depends on various factors such as lesion characteristics, lesion location, etc. The main treatment options used for Bowen's disease include topical fluorouracil (5-FU), imiquimod, cryotherapy, curettage, excision, photodynamic therapy, radiotherapy, and laser.[12]

The use of diclofenac sodium 3% gel has been studied in a small open-label study (exact formulation not specified) and in one case series for the management of patients with disseminated superficial actinic porokeratosis (DSAP).[14,15] In the open-label study, 17 adults with DSAP initially received 12 weeks of therapy with diclofenac sodium 3% gel and could continue for an additional 12 weeks.[14] At 12 weeks, the target area lesions (treated lesions) had a mean reduction of 4% vs. a 12% mean increase in the total body (global) lesions. For those ten patients who received 24 weeks of therapy, there was a mean increase in the target area lesions of 10% vs. a mean increase of 19% for the total body (global) lesions at that time point. Only three of the ten patients who completed 24 weeks of therapy had a reduction in their number of lesions. In the eight patient case series, all patients received diclofenac sodium 3% gel for at least 6 months.[15] All of these DSAP patients had tried at least one other therapy (mean was three previous therapies) prior to diclofenac sodium 3% gel. Only two of the eight patients (25%) had a partial response at 6 months. Three other patients received more than 6 months of treatment (7 or 13 months), but none experienced a response. As is typical of other therapies tried for the management of DSAP, results with diclofenac sodium 3% gel demonstrated limited, if not marginal, effectiveness. Most of the therapies tried for DSAP (e.g., cryotherapy, topical 5-FU, topical vitamin D_3 analogs, retinoids, keratolytics, imiquimod, laser, and photodynamic therapy) are ineffective.[14-16]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of diclofenac sodium 3% gel. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of diclofenac sodium 3% gel is recommended in those who meet the following criteria:

FDA-Approved Indications

56. Actinic Keratoses. Approve for 6 months.

Other Uses with Supportive Evidence

57. Actinic Cheilitis (Actinic Keratoses of the Lip[s]). Approve for 6 months.

3. Bowen's Disease. Approve for 6 months after a trial of at least one other therapy used for the management of Bowen's disease.
Note: Examples of therapies for Bowen's disease include: topical 5-fluorouracil [5-FU], imiquimod, cryotherapy, photodynamic therapy, curettage, excision, laser, or radiotherapy.

4. Disseminated Superficial Actinic Porokeratosis. Approve for 6 months after a trial of at least two other therapies used for the management of disseminated superficial actinic porokeratosis.
Note: Examples of therapies for management of disseminated superficial actinic porokeratosis: topical 5-fluorouracil [5-FU], imiquimod, topical corticosteroids, topical vitamin D_3 analogs, topical or oral retinoids, cryotherapy, photodynamic therapy, and laser.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of diclofenac sodium 3% gel is not recommended in the following situations:

18. Osteoarthritis (OA). The benefit of topical diclofenac therapy in osteoarthritis is uncertain. There has been one small, randomized, placebo-controlled study assessing the efficacy of a topical diclofenac 3%/sodium hyaluronate 2.5% gel (Canadian formulation) applied as 2 grams four times daily to one joint for 2 weeks in patients (n = 119) with uncontrolled OA pain despite chronic (≥ 1 month) oral nonsteroidal anti-inflammatory drug (NSAID) use.[17] The addition of topical diclofenac 3%/sodium hyaluronate to oral NSAID therapy resulted in only marginally greater analgesic effect than NSAID alone. Other topical agents are indicated for this use.

19. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Topical Retinoids – Aklief Prior Authorization Policy

- Aklief® (trifarotene cream – Galderma Laboratories)

REVIEW DATE: 12/02/2020

OVERVIEW

Aklief, a topical retinoid, is indicated for the **topical treatment of acne vulgaris** in patients 9 years of age and older.

Aklief has not been added to the guidelines. Topical retinoids are effective for the treatment of acne, both as initial and maintenance therapy. Treatment algorithms and consensus statements do not differentiate between the topical retinoids, but rather refer to them as a therapeutic category.[2-5]

Topical retinoid products (e.g., tretinoin) have been used to treat numerous other medical skin conditions in addition to acne vulgaris.[6] Some indications have minimal published clinical data and thus appear experimental. Topical retinoid products have also been used to treat a variety of cosmetic skin conditions, such as wrinkles, stretch marks, liver spots, premature aging, and photo-aged or photo-damaged skin.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Aklief. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

FDA-Approved Indication

58. Acne Vulgaris. Approve for 3 years.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Aklief is not recommended in the following situations:

20. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Topical Retinoids – Panretin Prior Authorization Policy

- Panretin® (alitretinoin topical gel – Eisai, Inc.)

REVIEW DATE: 06/24/2020

OVERVIEW

Panretin, a topical retinoid, is indicated for topical treatment of cutaneous lesions in patients with Acquired Immunodeficiency Syndrome (AIDS)-related Kaposi sarcoma (KS).[1] It is not indicated when systemic anti-KS therapy is required (e.g., more than 10 new KS lesions in the prior month, symptomatic lymphedema, symptomatic pulmonary KS, or symptomatic visceral involvement). There is no experience to date using Panretin gel with systemic anti-KS treatment.

Disease Overview

KS is a multifocal malignancy of endothelial cells, presenting with characteristic red or brown papules.[2,3] Skin lesions are most common although other areas may be involved, including the oral mucosa and lymphatic system.[4] KS is caused by human herpesvirus 8, which is also known as KS-associated herpesvirus (KSHV).[2] KSHV infections are usually asymptomatic but may lead to disease in immunosuppressed individuals. The incidence of KS in the US is approximately six cases per million people annually.[3] AIDS-related KS, also known as epidemic KS, is the most common type of KS in the United States. In persons infected with HIV, the development of KS is an AIDS-defining illness. Additionally, about one in 200 transplant recipients in the US will develop KS (iatrogenic/transplant-associated KS). In the iatrogenic/transplant-associated form, adequate response is often achieved by reduction or cessation of immunosuppression. Other forms of KS include classic KS and endemic KS, which are not common in the US.

Guidelines

Use of Panretin is addressed in the National Comprehensive Cancer Network (NCCN) guidelines for AIDS-related KS (version 2.2020 – June 1, 2020).[2] For limited cutaneous AIDS-releated KS that is symptomatic and/or cosmetically unacceptable, antiretroviral therapy may be used with or without topical agents (i.e.,

Panretin or imiquimod 5% cream), systemic therapy, intralesional chemotherapy, radiation therapy, or local excision (all category 2A). For patients with advanced cutaneous, oral, visceral, or nodal disease, Panretin is not recommended; a clinical trial, systemic therapy, or radiation treatment may be used (all in conjunction with antiretroviral therapy).

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Panretin. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Panretin, approval requires Panretin to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Prior authorization and prescription benefit coverage are not recommended for cosmetic uses.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Panretin is recommended in those who meet the following criteria:

FDA-Approved Indications

29. Kaposi Sarcoma Related to Acquired Immunodeficiency Syndrome. Approve for 1 year if the patient meets all of the following (A and B):
Note: Kaposi sarcoma related to Acquired Immunodeficiency Syndrome may also be referred to as epidemic Kaposi sarcoma.

H) Patient is not receiving systemic therapy for Kaposi sarcoma; AND

I) Panretin is prescribed by or in consultation with a dermatologist, oncologist, or infectious disease specialist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Panretin is not recommended in the following situations:

7. Cosmetic Uses (e.g., photoaging of the skin). Cosmetic use is not recommended for coverage as this indication is excluded from coverage in a typical pharmacy benefit.

8. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Topical Retinoids – Tazarotene Products Prior Authorization Policy

- Arazlo™ (tazarotene 0.045% lotion – Bausch Health US, LLC)
- Fabior® (tazarotene 0.1% foam – Mayne Pharma)
- Tazorac® (tazarotene 0.05% cream, 0.05% gel and 0.1% cream [generics], 0.1% gel – Allergan)

REVIEW DATE: 07/01/2020

OVERVIEW

Tazorac gel is indicated for the following uses:[1]

- **Plaque psoriasis**, in patients with up to 20% body surface area involvement (0.05% and 0.1% strengths)
- **Facial acne vulgaris,** in patients with mild to moderate severity (0.1% strength only).

Tazorac cream (0.05% and 0.1%) is indicated for the following uses:[2]

- **Plaque psoriasis** involvement (0.05% and 0.1% strengths).
- **Acne vulgaris** (0.1% strength only).

Arazlo lotion is indicated for the topical treatment of acne vulgaris in patients ≥ 9 years of age.[3]

Fabior foam is indicated for the topical treatment of acne vulgaris use in patients ≥ 12 years of age.[4]

In addition to acne vulgaris and plaque psoriasis, topical tazarotene has been used to treat other medical skin conditions, such as basal cell carcinoma and congenital ichthyoses.[5] Topical tazarotene has also been used to treat cosmetic skin conditions such as wrinkles, premature aging, and treatment of photo-aged or photo-damaged skin.

Avage® (tazarotene 0.1% cream) is indicated as an adjunctive agent for the mitigation (palliation) of facial fine wrinkling, facial mottled hyper- and hypo-pigmentation, and benign facial lentigines in patients who use comprehensive skin care and sunlight avoidance programs.[6] Avage is not included in this Prior Authorization policy.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Arazlo, Fabior, and Tazorac. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of topical tazarotene products is recommended for those who meet the following criteria:

FDA-Approved Indications

1. **Acne Vulgaris.** Approve for 3 years.

2. **Plaque Psoriasis (Psoriasis Vulgaris).** Approve for 3 years.

Other Uses with Supportive Evidence

3. **Treatment of Other Non-Cosmetic Conditions Not Listed Above.** Approve for 1 year.
   Note: Examples of other non-cosmetic conditions include: psoriasis of fingernails or toenails, oral lichen planus, congenital ichthyoses (X-linked recessive ichthyosis, non-erythrodermic autosomal recessive lamellar ichthyosis, autosomal dominant ichthyosis vulgaris), basal cell carcinoma, mycosis fungoides, cutaneous T-cell lymphoma, keratosis pilaris (atrophicans), actinic keratoses, skin neoplasms, warts, dermatitis/eczema, folliculitis, acne rosacea, cystic acne, comedonal acne.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of topical tazarotene products is not recommended in the following situations:

1. **Cosmetic Conditions.** Cosmetic use is not recommended for coverage as this indication is excluded from coverage in a typical pharmacy benefit.
   Note: Examples of cosmetic conditions include: alopecia, hyperpigmentation, liver spots, melasma/cholasma, seborrheic keratosis, stretch marks, scarring, wrinkles, premature aging, photo-aged or photo-damaged skin, mottled hyper- and hypopigmentation, benign facial lentigines, roughness, telangiectasia, skin laxity, keratinocytic atypia, melanocytic atypia, dermal elastosis.

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Annual revision	No criteria changes.	07/31/2019
Update	Changed policy name from "Tazarotene (Topical) Products PA Policy" to "Topical Retinoids – Tazarotene Products PA Policy".	11/21/2019
Selected revision	• Addition of Arazlo (tazarotene 0.045% lotion) to the PA Policy. • **Acne vulgaris.** The list of examples of topical retinoid products was removed from the criteria and changed to a note. In addition, Aklief was added to the list of examples of topical retinoid products.	01/29/2020
Annual revision	• **Acne Vulgaris.** Removed the requirement that patient has had a trial with at least one other topical retinoid product. • The lists of examples of "other non-cosmetic conditions" and "cosmetic conditions" were removed from the criteria and changed to a note.	07/01/2020

PRIOR AUTHORIZATION POLICY

POLICY: Topical Retinoid – Tretinoin Products Prior Authorization Policy

- Altreno™ (tretinoin lotion – Dow Pharmaceuticals, a division of Valeant Pharmaceuticals)
- Atralin™ (tretinoin gel – Valeant Pharmaceuticals, generics)
- Avita® (tretinoin cream, gel – Mylan, generics [Avita gel 0.025% is brand only])
- Retin-A® (tretinoin cream, gel – Valeant Pharmaceuticals, generics)
- Retin-A® Micro® (tretinoin gel microsphere – Valeant Pharmaceuticals, generic)
- Retin-A Micro® Pump (tretinoin gel microsphere – Valeant Pharmaceuticals, generics [Retin-A Micro gel 0.06% and 0.08% are branded products only])
- Tretin•X® (tretinoin cream – Onset Dermatologicals)
- Veltin™ (clindamycin phosphate 1.2% and tretinoin 0.025% gel – Aqua Pharmaceuticals)
- Ziana® (clindamycin phosphate 1.2% and tretinoin 0.025% gel – Valeant Pharmaceuticals, generics)

REVIEW DATE: 08/05/2020

OVERVIEW

The following topical tretinoin products are indicated for the topical treatment of acne vulgaris: Altreno, Atralin, Avita, Retin-A, Retin-A Micro, Tretin•X, and generics.[1,2] Renova® and Refissa® are also topical tretinoin products; these products are not indicated for use in the treatment of acne vulgaris.[1]

Ziana and Veltin are combination gel products containing clindamycin phosphate 1.2% and tretinoin 0.025%; these products are indicated for the topical treatment of acne vulgaris in patients aged ≥ 12 years.[1,2]

Topical tretinoin products have been used to treat numerous other medical skin conditions in addition to acne vulgaris. Some indications have minimal published clinical data and thus appear experimental. Topical tretinoin products have also been used to treat a variety of cosmetic skin conditions, such as wrinkles, stretch marks, liver spots, premature aging, and photo-aged or photo-damaged skin.[2]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of topical tretinoin products. All approvals are provided for the duration noted below.

Prior Authorization and prescription benefit coverage is not recommended for Renova or Refissa.

Automation: An age edit targeting patients > 30 years of age is recommended to monitor for appropriate use and to screen for cosmetic use. Therefore, patients ≤ 30 years of age will be approved at the point-of-service. For patients > 30 years of age, coverage will be determined by the prior authorization criteria.

RECOMMENDED AUTHORIZATION CRITERIA

I. Coverage of topical tretinoin products is recommended in those who meet the following criteria:

FDA-Approved Indication

59. Acne Vulgaris. Approve for 3 years.

Other Uses with Supportive Evidence

~~**60.**~~ **Treatment of Other Non-Cosmetic Conditions Not Listed Above**. Approve for 1 year.
Note: Examples of other non-cosmetic conditions include acne rosacea, actinic keratosis/treatment of precancerous lesions, ichthyosis, diabetic foot ulcers, mucositis, warts, lichen planus, lichen sclerosis, pseudofolliculitis, oral leukoplakia, molluscum contagiosum, Darier's disease (keratosis follicularis), dermatitis/eczema, folliculitis, keratosis pilaris, basal cell carcinoma (skin cancer), confluent and reticulated papillomatosis, and cutis laxa.

II. Coverage of clindamycin plus tretinoin combination products (Ziana, generics; Veltin) is recommended in those who meet the following criteria:

FDA-Approved Indication

1. Acne Vulgaris. Approve for 1 year.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of topical tretinoin products and topical clindamycin/tretinoin products is not recommended in the following situations:

21. Cosmetic Conditions. Cosmetic use is not recommended for coverage as this indication is excluded from coverage in a typical pharmacy benefit.
Note: Examples of cosmetic conditions include liver spots, stretch marks, scarring, solar elastosis, premature aging, treatment of photo-aged or photo-damaged skin, solar lentigines, skin roughness, mottled hyperpigmentation, age spots, wrinkles, geographic tongue, hyperpigmentation (caused by folliculitis, acne, or eczema), melasma/cholasma, alopecia androgenetic, alopecia areata, seborrheic keratosis, milia, nevus, poikiloderma (of Civatte), purpura (actinic/solar), keloids, and sebaceous hyperplasia.

22. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Uplizna Prior Authorization Policy

- Uplizna™ (inebilizumab-cdon injection for intravenous use – Viela Bio)

REVIEW DATE: 06/24/2020; selected revision 09/16/2020

OVERVIEW

Uplizna, a CD19-directed cytolytic antibody, is indicated for the treatment of neuromyelitis optica spectrum disorder (NMOSD) in patients ≥ 18 years of age who are anti-aquaporin-4 antibody positive.[1] The recommended dose is 300 mg administered as an intravenous infusion under the close supervision of an experienced healthcare professional. The initial infusion is followed 2 weeks later by a second infusion. Starting 6 months from the first infusion, subsequent doses are administered once every 6 months.

Disease Overview

NMOSD is a rare, relapsing, autoimmune disorder of the brain and spinal cord with optic neuritis and/or myelitis as predominate characteristic symptoms.[2] NMOSD often causes significant, permanent damage to vision and/or spinal cord function causing blindness or impaired mobility.[3] Patients may experience pain, paralysis, loss of bowel and bladder control, loss of visual acuity, uncontrolled motor functions, and complications can cause death. Soliris® (eculizumab injection for intravenous infusion) and Enspryng™ (satralizumab-mwge for subcutaneous injection) are two other FDA-approved medications for treatment of NMOSD in adults who are anti-AQP4 antibody-positive.[4,5] For acute attacks, typical treatment is high-dose intravenous corticosteroids.[6,7] Plasma exchange may be effective in patients who suffer acute severe attacks that do not response to intravenous corticosteroids. For long-term control of the disease a variety of immunosuppressive drugs are utilized as first-line therapy. While all are considered off-label use, corticosteroids, azathioprine, mycophenolate mofetil, and rituximab are treatments prescribed as preventative therapy.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Uplizna. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Uplizna as well as the monitoring required for adverse events and long-term efficacy, approval requires Uplizna to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Uplizna is recommended in those who meet the following criteria:

FDA-Approved Indications

~~100.~~97. **Neuromyelitis Optica Spectrum Disorder**. Approve if the patient meets ONE of the following criteria (A or B):

E) Initial Therapy. Approve for 1 year if the patient meets the following criteria (i, ii, iii, iv, and v):

xi. Patient is ≥ 18 years of age; AND

xii. Neuromyelitis optica spectrum disorder diagnosis was confirmed by blood serum test for anti-aquaporin-4 antibody positive; AND

xiii. Patient is currently receiving or has previously tried two of the following systemic therapies (a, b, c, or d):

a. Azathioprine; OR

b. Corticosteroid; OR

c. Mycophenolate mofetil; OR

d. Rituximab; AND

Note: An exception to the requirement for a trial of a systemic therapy can be made if the patient has already tried Soliris® (eculizumab injection) or Enspryng™ (satralizumab-mwge for subcutaneous injection) for neuromyelitis optica spectrum disorder. Patients who have already tried Soliris or Enspryng for neuromyelitis optica spectrum disorder are not required to try another systemic agent for neuromyelitis optica spectrum disorder.

xiv. Patient has a history of at least 1 relapse in the last 12 months or two relapses in the last 2 years; AND

xv. The medication is being prescribed by or in consultation with a neurologist.

F) Patients Currently Receiving Uplizna. Approve for 1 year if the patient meets the following (i, ii, iii, and iv):

ix. Patient is ≥ 18 years of age; AND

x. Neuromyelitis optica spectrum disorder diagnosis was confirmed by blood serum test for anti-aquaporin-4 antibody positive; AND

xi. According to the prescriber, patient has had clinical benefit from the use of Uplizna; AND

Note: Examples of clinical benefit include reduction in relapse rate, reduction in symptoms (e.g., pain, fatigue, motor function), and a slowing progression in symptoms.

xii. The medication is being prescribed by or in consultation with a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Uplizna is not recommended in the following situations:

270. Concomitant use with a rituximab product, Soliris® (eculizumab injection), or Enspryng™ (satralizumab-mwge injection). There is no evidence to support additive efficacy of combining Uplizna with rituximab, Soliris, or Enspryng.

271. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
New Policy	--	06/24/2020
Selected Revision	**Neuromyelitis Optica Spectrum Disorder.** Criteria was separated into Initial Therapy and Patients Currently Receiving Uplizna. For both sections, criteria for approval duration, age restriction, diagnosis confirmation, and specialist requirement remained the same as before. For Initial Therapy, Soliris was removed as an option for previously tried systemic therapies. A Note was created to allow an exception to previously tried systemic therapies for patients who have tried Enspryng or Soliris. Criteria for a history of previous relapses were added. For Patients Currently Receiving Uplizna, criteria was added to show the patient is receiving a clinical benefit from Uplizna. **Concomitant use with a rituximab product, Soliris® (eculizumab injection), or Enspryng™ (satralizumab-mwge injection)** was added as a condition not recommended for approval.	09/16/2020

PRIOR AUTHORIZATION POLICY

POLICY: Vecamyl™ (mecamylamine hydrochloride tablets – Vyera Pharmaceuticals)

DATE REVIEWED: 05/27/2020

OVERVIEW

Vecamyl is a nicotinic parasympathetic ganglionic blocker indicated for the management of moderately severe to severe essential hypertension and in uncomplicated cases of malignant hypertension.[1, 2] Vecamyl prevents stimulation of postsynaptic receptors by acetylcholine released from presynaptic nerve endings. The hypotensive effect of Vecamyl is attributed to reduction in sympathetic tone, vasodilation, and reduced cardiac output. Vecamyl is considered a nonselective antagonist that easily passes through the blood-brain barrier, and thus, having the potential to affect nicotinic acetylcholine receptors in the central nervous system.

Guidelines

The Clinical Practice Guidelines from the American College of Cardiology/American Heart Association Task Force (2017) state the prevalence of severe hypertension has been declining, but approximately 12.3% of US adults with hypertension have an average systolic blood pressure ≥ 160 mm Hg or average diastolic blood pressure ≥ 100 mm Hg.[3] Numerous classes of antihypertensive agents are available to treat high blood pressure. Vecamyl is not suggested as a primary or secondary agent in the treatment of hypertension. The Evidence-Based Guideline for the Management of High Blood Pressure in Adults from the panel members of the eighth joint national committee (2014 [JNC 8]) advise selection among four specific medication classes (thiazide-type diuretics, calcium channel blockers, angiotensin-converting enzyme inhibitors, or angiotensin receptor blockers) as initial and secondary choices in treatment.[4]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Vecamyl. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Vecamyl as well as the monitoring required for adverse events and long-term efficacy, approval requires Vecamyl to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Vecamyl is recommended in those who meet the following criteria:

FDA-Approved Indications

268. Essential Hypertension, Moderately Severe to Severe. Approve for 1 year if the patient meets the following criteria (A):

A) The patient has tried four antihypertensive therapies each from different pharmacologic classes (e.g., diuretics, calcium channel blockers, angiotensin-converting enzyme inhibitors, and angiotensin receptor blockers [as single-entity or as combination products]) and has had at least one of the following from each of these agents (i or ii)

i. The patient has had inadequate efficacy; OR

ii. The patient has experienced adverse event(s) severe enough to warrant discontinuation of this agent, according to the prescriber.

269. Uncomplicated Malignant Hypertension. Approve for 1 year if the patient meets the following criteria (A):

A) The patient has tried four antihypertensive therapies each from different pharmacologic classes (e.g., diuretics, calcium channel blockers, angiotensin-converting enzyme inhibitors, and angiotensin receptor blockers [as single-entity or as combination products]) and has had at least one of the following from each of these agents (i or ii)

i. The patient has had inadequate efficacy; OR

ii. The patient has experienced adverse event(s) severe enough to warrant discontinuation of this agent, according to the prescriber.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Vecamyl has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

23. Tourette Syndrome. Limited data are available to validate the use of mecamylamine in Tourette Syndrome. A clinical trial has shown mecamylamine to not be an effective treatment for tics or for the total spectrum of symptoms associated with Tourette Syndrome.[5]

24. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Veregen Prior Authorization Policy

- Veregen® (sinecatechins ointment – Fougera Pharmaceuticals)

REVIEW DATE: 01/13/2021

OVERVIEW

Veregen, a botanical drug product, is indicated for the topical treatment of **external genital and perianal warts** (*Condylomata acuminata*) in immunocompetent patients ≥ 18 years of age.[1]

Guidelines

The Centers for Disease Control and Prevention (CDC) Sexually Transmitted Diseases Treatment Guidelines (2015) detail the patient-applied and provider-applied treatment options for the management of genital warts.[2] The CDC guidelines note that treatment should be guided by wart size, number of lesions, location of the wart(s), the preference of the patient, cost of treatment, convenience, adverse effects, and the experience of the health care provider with the various provider-applied options. There is no definitive evidence available which has demonstrated the superiority of one product over others for all patients and all warts. Most patients will require a course of therapy vs. a single-treatment. Most warts will typically respond to therapy in 3 months, but if response does not occur, then treatment options should be reassessed and modified if needed. The CDC recommended patient-applied regimens include: imiquimod 3.75% cream (Zyclara, generics) or 5% cream (Aldara, generics), podofilox 0.5% solution or gel (Condylox, generics for solution available), or sinecatechins 15% ointment (Veregen). The CDC recommended provider-applied regimens include: cryotherapy with liquid nitrogen or cryoprobe, trichloroacetic acid or bichloroacetic acid 80-90%, or surgical removal by tangential scissor excision, tangential shave excision, curettage, or electrosurgery. Alternatives listed are podophyllin resin, intralesional interferon, photodynamic therapy, and topical cidofovir.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Veregen. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Veregen is recommended in those who meet the following criteria:

FDA-Approved Indications

270. Genital or Perianal Warts, External. Approve for 4 months if the patient meets the following criteria (A, B, and C):

A) Patient is ≥ 18 years of age; AND

B) Patient is immunocompetent, according to the prescriber; AND

C) Patient has tried one other treatment for the management of external genital or perianal warts.
Note: Examples of treatment for the management of external genital or perianal warts include imiquimod cream, podofilox gel or solution, cryotherapy, trichloroacetic or bichloroacetic acid, surgical removal, podophyllin resin, intralesional interferon, photodynamic therapy, and topical cidofovir.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Veregen is not recommended in the following situations:

272. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Vesicular Monoamine Transporter Type 2 Inhibitors – Austedo Prior Authorization Policy

- Austedo® (deutetrabenazine tablets – Teva)

REVIEW DATE: 06/10/2020; selected revision 01/20/2021

OVERVIEW

Austedo, a vesicular monoamine transporter type 2 (VMAT2) inhibitor, is indicated for the treatment of:[1]

- **Chorea associated with Huntington's disease** in adults.
- **Tardive dyskinesia** in adults.

Guidelines

According to the American Academy of Neurology (AAN) guidelines on the treatment of chorea of Huntington's disease (2012), if Huntington's disease chorea requires treatment, clinicians should prescribe

tetrabenazine (≤ 100 mg/day), amantadine (300 to 400 mg/day), or riluzole (200 mg/day) [Level B] for varying degrees of expected benefit.[2] Austedo is not addressed in the guidelines.

The AAN published an evidence-based guideline for the treatment of tardive syndromes (TDS) [2013].[3] The authors found that tetrabenazine possibly reduces TDS symptoms (based on two consistent Class III studies). Therefore, tetrabenazine may be considered in treating TDS (Level C). Austedo is not addressed in the guidelines.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Austedo. Because of the specialized skills required for evaluation and diagnosis of patients treated with Austedo as well as the monitoring required for adverse events and long-term efficacy, approval requires Austedo to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Documentation: Documentation is required for the use of Austedo as noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes, prescription claims records, prescription receipts, and/or other information.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Austedo is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Chorea Associated with Huntington's Disease.** Approve for 1 year if the patient meets the following criteria (A, B, C, and D):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has been diagnosed with chorea associated with Huntington's disease **[documentation required]**; AND
   - **C)** Diagnosis of Huntington's disease is confirmed by genetic testing (for example, an expanded HTT CAG repeat sequence of at least 36); AND
   - **D)** The medication is prescribed by or in consultation with a neurologist.

2. **Tardive dyskinesia.** Approve for 1 year if the patient meets the following criteria (A and B):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** The medication is prescribed by or in consultation with a neurologist or psychiatrist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Austedo is not recommended in the following situations:

25. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Vesicular Monoamine Transporter Type 2 Inhibitors – Ingrezza Prior Authorization Policy
- Ingrezza® (valbenazine capsules – Neurocrine Biosciences)

REVIEW DATE: 06/10/2020; selected revision 01/20/2021

OVERVIEW
Ingrezza, a vesicular monoamine transporter type 2 (VMAT2) inhibitor, is indicated for the treatment of **tardive dyskinesia** in adults.[1]

POLICY STATEMENT
Prior Authorization is recommended for prescription benefit coverage of Ingrezza. Because of the specialized skills required for evaluation and diagnosis of patients treated with Ingrezza as well as the monitoring required for adverse events and long-term efficacy, approval requires Ingrezza to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Ingrezza is recommended in those who meet the following criteria:

FDA-Approved Indications

3. Tardive Dyskinesia. Approve for 1 year if the patient meets the following criteria (A and B):
- **2.** Patient is ≥ 18 years of age; AND
- **3.** The medication is prescribed by or in consultation with a neurologist or psychiatrist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Coverage of Ingrezza is not recommended in the following situations:

26. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Vesicular Monoamine Transporter Type 2 Inhibitors – Tetrabenazine Prior Authorization Policy

- Xenazine® (tetrabenazine tablets – Lundbeck, generics)

REVIEW DATE: 06/10/2020; selected revision 01/20/2021

OVERVIEW

Tetrabenazine, a vesicular monoamine transporter type 2 (VMAT2) inhibitor, is indicated for the treatment of **chorea associated with Huntington's disease** in adults.[1]

Beginning in September 2015, tetrabenazine has been available as an AB-rated generic to brand Xenazine. Generic tetrabenazine is FDA-approved and is available in the same tablet dosage form and the same 12.5 mg and 25 mg strengths as brand Xenazine.

Clinical Efficacy

There are multiple controlled and uncontrolled trials conducted with tetrabenazine that included patients with dystonias.[6-10,12,13,16,19,21,22] In retrospective trials, an overall moderate clinical improvement or better was seen in 161 out of 163 patients with dystonia treated with tetrabenazine.[21] A treatment algorithm for secondary dystonias was developed that notes tetrabenazine can be tried following a trial of an anticholinergic in children with severe secondary dystonias.[22] In adults, tetrabenazine can be tried (alone or as combination therapy) following a low-dose trial of anticholinergic.

Tetrabenazine has been studied for the treatment of tardive dyskinesia, either as initial therapy or in patients who have responded poorly to other agents (e.g., reserpine, bromocriptine, clozapine).[5-15]

While most of the data for treatment of Tourette syndrome indicate that antipsychotic medications, both typical and atypical, are most effective, other medications (including tetrabenazine) may be used first to avoid the potential side effects of dopamine blockade.[18]

Guidelines

The American Academy of Neurology (AAN) evidence-based guidelines on pharmacologic treatment of chorea in Huntington's disease (2012) states that if chorea in Huntington's disease requires treatment, clinicians should prescribe tetrabenazine, amantadine, or Rilutek® (riluzole tablets) [Level B].[2]

The AAN published an evidence-based guideline for the treatment of tardive syndromes (TDS) [2013].[3] The authors found that tetrabenazine possibly reduces TDS symptoms (based on two consistent Class III studies). Therefore, tetrabenazine may be considered in treating TDS (Level C).

The AAN published practice guideline recommendations for the treatment of tics in people with Tourette syndrome and chronic tic disorders (2019).[4] The guidelines state that the dopamine depleters, tetrabenazine, deutetrabenazine, and valbenazine, are lacking published, randomized, controlled trials in the treatment of tics but note that these drugs are increasingly used off-label. When appropriately dosed, these drugs are generally well-tolerated but may be associated with drowsiness, depression, and parkinsonism.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of tetrabenazine. Because of the specialized skills required for evaluation and diagnosis of patients treated with tetrabenazine as well as the monitoring required for adverse events and long-term efficacy, approval requires tetrabenazine to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of tetrabenazine is recommended in those who meet the following criteria:

FDA-Approved Indications

4. **Chorea Associated with Huntington's Disease.** Approve for 1 year if the patient meets the following criteria (A, B, and C):
   - **C)** Patient is ≥ 18 years of age; AND
   - **61.** Diagnosis of Huntington's disease is confirmed by genetic testing (for example, an expanded HTT CAG repeat sequence of at least 36); AND
   - **62.** The medication is prescribed by or in consultation with a neurologist.

Other Uses with Supportive Evidence

5. **Hyperkinetic Dystonia.** Approve for 1 year if the patient meets the following criteria (A and B):
   - **4.** Patient is ≥ 18 years of age; AND
   - **5.** The medication is prescribed by or in consultation with a neurologist.

6. **Tardive Dyskinesia.** Approve for 1 year if the patient meets the following criteria (A and B):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** The medication is prescribed by or in consultation with a neurologist or psychiatrist.

7. **Tourette Syndrome and Related Tic Disorders.** Approve for 1 year if the patient meets the following criteria (A and B):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** The medication is prescribed by or in consultation with a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of tetrabenazine is not recommended in the following situations:

27. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	No changes to criteria.	04/25/2018
Selected Revision	Removal of the requirement for a previous trial of generic tetrabenazine if brand Xenazine is requested. This is due to a new VMAT2 Inhibitor Preferred Specialty Management policy.	08/29/2018
Annual Revision	No change to criteria.	05/22/2019
Annual Revision	No change to criteria.	06/10/2020
Selected Revision	**Chorea Associated with Huntington's Disease:** Added criteria for age ≥ 18 years and diagnosis of Huntington's disease confirmed by genetic testing (for example, an expanded HTT CAG repeat sequence of at least 36). **Hyperkinetic Dystonia:** Added criteria for age ≥ 18 years. **Tardive dyskinesia:** Added criteria for age ≥ 18 years.	01/20/2021

	Tourette Syndrome and Related Tic Disorders: Added criteria for age ≥ 18 years.	

PRIOR AUTHORIZATION POLICY

POLICY: Wakefulness-Promoting Agents – Armodafinil, Modafinil Prior Authorization Policy
- Nuvigil® (armodafinil tablets – Cephalon, generics)
- Provigil® (modafinil tablets – Cephalon, generics)

REVIEW DATE: 09/09/2020

OVERVIEW

Armodafinil and modafinil, agents with wake-promoting actions that are similar to sympathomimetic agents (e.g., amphetamine and methylphenidate), are indicated **to improve wakefulness in adults with** the following conditions:[1,2]

- **Excessive sleepiness associated with narcolepsy**.
- **Obstructive sleep apnea/hypoapnea syndrome** (approved as adjunctive therapy).
- **Shift work sleep disorder**.

Armodafinil and modafinil are Schedule IV controlled substances.[1,2] Review of the medical literature notes many other uses of modafinil that are considered off-label or investigational. While armodafinil has not been studied off-label to the same extent as modafinil, it is expected that armodafinil will have similar clinical efficacy for these uses.

Two specialized tests, which can be performed in a sleep disorders clinic, are required to establish a diagnosis of narcolepsy.[46] Polysomnography is an overnight recording of brain and muscle activity, breathing, and eye movements. The multiple sleep latency test (MSLT) assesses daytime sleepiness by measuring how quickly a person falls asleep and whether they enter rapid eye movement (REM) sleep. Polysomnography is routinely indicated for the diagnosis of sleep-related breathing disorders; for continuous positive airway pressure titration in patients with sleep-related breathing disorders; with a MSLT in the evaluation of suspected narcolepsy; and in certain atypical or unusual parasomnias.[47] The MSLT is indicated as part of the evaluation of patients with suspected narcolepsy to confirm the diagnosis. Most patients with narcolepsy have objective evidence of hypersomnia as determined by a mean sleep latency < 5 minutes. In studies, the presence of two or more sleep-onset REM episodes (SOREMPs) was associated with a sensitivity of 0.78 and a specificity of 0.93 for the diagnosis of narcolepsy. SOREMPs do not occur exclusively in patients with narcolepsy, and thus it is important to rule out or treat other sleep disorders before evaluating SOREMPs in the diagnosis of narcolepsy. For this reason, polysomnography and a MSLT performed on the day after the polysomnographic evaluation are routinely indicated in the evaluation of suspected narcolepsy.

Guidelines

According to the American Academy of Sleep Medicine (AASM), continuous positive airway pressure (CPAP) is the most uniformly effective therapy, and, to date, this is the only intervention for obstructive sleep apnea (OSA) shown to have favorable impacts on both cardiovascular and neurobehavioral morbidities.[3] Modafinil, in patients compliant with nasal CPAP, consistently improved subjective and objective sleepiness, quality of life, and vigilance compared with placebo.

According to the American Psychiatric Association (APA) practice guideline for the treatment of patients with major depressive disorder (MDD), modafinil (or methylphenidate) are potential treatments for sedation associated with antidepressant medications.[4] The APA guidelines state that modafinil has shown benefit

when combined with a selective serotonin reuptake inhibitor (SSRI), related to specific effects on residual symptoms such as fatigue and hypersomnolence. The guidelines go on to note that there is no clear guidance regarding the length of time modafinil should be coadministered. Limited data have investigated modafinil as monotherapy for depression.[5] While armodafinil has not been studied for this use, expert opinion considers it to be interchangeable with modafinil for this condition.

Practice parameters from the AASM, last updated in 2007, state that modafinil may be effective for the treatment of daytime sleepiness due to myotonic dystrophy.[12] Results from clinical trials evaluating the effectiveness of modafinil in treating excessive daytime sleepiness associated with myotonic dystrophy are heterogeneous.[7-11] While armodafinil has not been studied for this use, expert opinion considers it to be interchangeable with modafinil for this condition.

Practice parameters from the AASM (2007) state that modafinil may be effective for the treatment of daytime sleepiness due to Parkinson's disease.[12] A practice parameter on the treatment of nonmotor symptoms of Parkinson's disease, published by the American Academy of Neurology (AAN) in 2011, states that for patients with Parkinson's disease and excessive daytime sleepiness, modafinil is effective in improving patients' perception of wakefulness, but is ineffective in objectively improving excessive daytime sleepiness as measured by objective tests.[15] The practice parameter recommendations indicate modafinil should be considered for patients to improve their subjective perception of excessive daytime sleepiness; however, it should be noted that patients may experience an improvement in sleep perception without an actual improvement in objective sleep measurements. Reviews addressing excessive daytime sleepiness and Parkinson's disease recommended modafinil along with other agents such as bupropion and dextroamphetamine, although published data with the latter are limited.[13,14] While armodafinil has not been studied for this use, expert opinion considers it to be interchangeable with modafinil for this condition.

Practice parameters from the AASM (2007) state that modafinil may be effective for the treatment of fatigue due to multiple sclerosis.[12] Although the results with modafinil in clinical trials are heterogeneous, expert opinion considers it to be a first-line anti-fatigue drug for multiple sclerosis patients. While armodafinil has not been studied for this use, expert opinion considers it to be interchangeable with modafinil for this condition.

Idiopathic hypersomnia, a condition similar to narcolepsy, is characterized by constant or recurrent daytime sleepiness with no other cause of sleepiness, prolonged nocturnal sleep, difficulty awakening with sleep drunkenness, and long unrefreshing naps with no history of cataplexy.[17-19] Practice parameters from the AASM (2007) state that modafinil may be effective for the treatment of daytime sleepiness due to idiopathic hypersomnia.[12] As there may be underlying causes/behaviors associated with excessive daytime sleepiness, a sleep specialist physician has the training to correctly recognize and diagnose this condition. While armodafinil has not been studied for this use, expert opinion considers it to be interchangeable with modafinil for this condition.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Nuvigil (brand and generic) and Provigil (brand and generic). All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of modafinil (brand and generic) and armodafinil (brand and generic) is recommended in those who meet the following criteria:

FDA-Approved Indications

27. Excessive Daytime Sleepiness Associated with Obstructive Sleep Apnea/Hypoapnea Syndrome. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient meets one of the following criteria (i or ii):
  - **i.** Armodafinil/modafinil will be used in conjunction with continuous positive airway pressure; OR
  - **ii.** Patient is unable to initiate or tolerate continuous positive airway pressure therapy; AND
- **C)** If brand Provigil or Nuvigil is being requested, the patient meets both of the following criteria (i and ii):
  - **i.** Patient has tried generic modafinil or generic armodafinil; AND
  - **ii.** Brand product (Nuvigil or Provigil) is being requested due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the corresponding generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.

28. Excessive Sleepiness Associated with Shift Work Sleep Disorder. Approve for 1 year if the patient meets the following criteria (A, B and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient works at least five overnight shifts per month; AND
- **C)** If brand Provigil or Nuvigil is being requested, the patient meets both of the following criteria (i and ii):
  - **i.** Patient has tried generic modafinil or generic armodafinil; AND
  - **ii.** Brand product (Nuvigil or Provigil) is being requested due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the corresponding generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.

29. Excessive Daytime Sleepiness Associated with Narcolepsy. Approve for 1 year if the patient meets both of the following criteria (A, B, C and D):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has been evaluated using polysomnography and a multiple sleep latency test (MSLT); AND
- **C)** Diagnosis of narcolepsy has been confirmed, according to the prescriber; AND
- **D)** If brand Provigil or Nuvigil is being requested, the patient meets both of the following criteria (i and ii):
  - **i.** Patient has tried generic modafinil or generic armodafinil; AND
  - **ii.** Brand product (Nuvigil or Provigil) is being requested due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the corresponding generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.

Other Uses with Supportive Evidence

~~30.~~ Adjunctive/Augmentation Treatment for Depression in Adults. Approve for 1 year if the patient meets the following criteria (A, B and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient is concurrently receiving other medication therapy for depression; AND

Note: Examples of other medications for the treatment of depression include selective serotonin reuptake inhibitors (SSRIs) and serotonin norepinephrine reuptake inhibitors (SNRIs).

C) If brand Provigil or Nuvigil is being requested, the patient meets both of the following criteria (i and ii):

i. Patient has tried generic modafinil or generic armodafinil; AND

ii. Brand product (Nuvigil or Provigil) is being requested due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the corresponding generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.

~~31.~~ **Excessive Daytime Sleepiness Associated with Myotonic Dystrophy.** Approve for 1 year if the patient meets both of the following criteria (A and B):

A) Patient is ≥ 18 years of age; AND

B) If brand Provigil or Nuvigil is being requested, the patient meets both of the following criteria (i and ii):

i. Patient has tried generic modafinil or generic armodafinil; AND

ii. Brand product (Nuvigil or Provigil) is being requested due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the corresponding generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.

~~32.~~ **Excessive Daytime Sleepiness Associated with Parkinson's Disease.** Approve for 1 year if the patient meets both of the following criteria (A and B):

A) Patient is ≥ 18 years of age; AND

B) If brand Provigil or Nuvigil is being requested, the patient meets both of the following criteria (i and ii):

i. Patient has tried generic modafinil or generic armodafinil; AND

ii. Brand product (Nuvigil or Provigil) is being requested due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the corresponding generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.

~~33.~~ **Fatigue Associated with Multiple Sclerosis.** Approve for 1 year if the patient meets both of the following criteria (A and B):

A) Patient is ≥ 18 years of age; AND

B) If brand Provigil or Nuvigil is being requested, the patient meets both of the following criteria (i and ii):

i. Patient has tried generic modafinil or generic armodafinil; AND

ii. Brand product (Nuvigil or Provigil) is being requested due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the corresponding generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.

~~34.~~ **Idiopathic Hypersomnia.** Approve for 1 year if the patient meets both of the following (A, B and C):

~~a)~~ Patient is ≥ 18 years of age; AND

~~b)~~ The diagnosis is confirmed by a sleep specialist physician or at an institution that specializes in sleep disorders (i.e., sleep center); AND

~~c)~~ If brand Provigil or Nuvigil is being requested, the patient meets both of the following criteria (i and ii):

i. Patient has tried generic modafinil or generic armodafinil; AND
ii. Brand product (Nuvigil or Provigil) is being requested due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the corresponding generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of modafinil (brand and generic) and armodafinil (brand and generic) is not recommended in the following situations:

14. **Attention Deficit Hyperactivity Disorder (ADHD).** The American Academy of Pediatrics (AAP) clinical practice guidelines for the treatment of ADHD in children and adolescents (2011 and 2019) do not address the use of modafinil/armodafinil.[20,21] These guidelines note that with the greater availability of approved medications for children/adolescents with ADHD, it has become increasingly unlikely that clinicians need to consider the off-label use of other medications. Two published studies, both of which involved approximately 20 adults with ADHD, preliminarily suggested that modafinil may be useful for this condition.[22,23] However, a 9-week, randomized, double-blind, placebo-controlled, parallel-group, dose-finding study in adults with ADHD (n = 338) evaluated modafinil doses of 255 mg to 510 mg and did not find significant benefit in reducing ADHD symptoms, as measured by the change from baseline at final visit in the Adult ADHD Investigator Symptom Rating Scale (AISRS) total score.[24] Many options exist for the treatment of ADHD in adults (e.g., methylphenidate, dextroamphetamine) and further large scale trials that demonstrate benefit for modafinil in adults with ADHD are needed.

15. **Bipolar Disorder, including Bipolar Depression.** Limited data (one small study [n = 85] and case reports [n = 2]) are available that describe the use of modafinil for bipolar disorder and bipolar depression.[25-27] In one study (n = 257) armodafinil was not more effective than placebo in treating bipolar depression.[28] Only limited data supports modafinil for this condition and more data are needed.

16. **Cancer-Related Fatigue.** The National Comprehensive Cancer Network (NCCN) guidelines on cancer-related fatigue (version 2.2020 – May 4, 2020) no longer consider modafinil to be effective for the treatment of cancer-related fatigue and recommend against its use.[16] A randomized, double-blind, placebo-controlled trial involving 631 patients with cancer receiving chemotherapy found modafinil useful in the control of severe cancer-related fatigue only.[6] Other studies do not support the use of modafinil or armodafinil for cancer-related fatigue.[42-44]

17. **Chronic Fatigue Syndrome.** Limited data characterize modafinil therapy in those with chronic fatigue syndrome.[29] In a randomized, double-blind, crossover study in 14 patients with chronic fatigue syndrome, use of modafinil for 20 days had minimal effects on cognitive function and no significant effects on fatigue, health-related quality of life, or mood.[30] More data are required to assess efficacy in this patient population.

18. **Excessive Daytime Sleepiness Associated with Primary Insomnia.** One randomized, placebo-controlled study found that neither combination therapy with modafinil and cognitive behavioral therapy nor modafinil as monotherapy significantly decreased daytime sleepiness associated with primary insomnia.[31]
19. **Enhancement of Performance in Situations of Induced Sleep Deprivation.** Studies are needed to define the role/appropriateness of modafinil in these situations for the general population (as opposed to military personnel, etc.). Studies have shown that modafinil may enhance performance and sustain alertness in individuals subjected to situations that deprive sleep (e.g., military aviation, emergency

physicians).[32-35] Further studies are needed before its use in the general population in these types of situations can be promoted.

20. **Fatigue and Excessive Daytime Sleepiness in Chronic Traumatic Brain Injury.** A single-center, double-blind, placebo- controlled, crossover trial involving 53 patients suggests that overall, modafinil was not beneficial in relieving fatigue and excessive daytime sleepiness in such patients.[36] In a small (n = 20) randomized, placebo-controlled trial, modafinil improved excessive daytime sleepiness vs. placebo in patients with traumatic brain injury; however, modafinil did not improve fatigue compared with placebo.[37] Additional data are needed to determine effectiveness in this setting.

21. **Fibromyalgia.** Limited data are available regarding the use of modafinil in fibromyalgia with most of the data being observational.[38-40] Larger-sized, randomized, placebo-controlled trials are required to better assess and validate the efficacy of modafinil in patients with fibromyalgia before it can be recommended as a therapeutic modality.

22. **Hypersomnia, Fatigue or Sleepiness Due to Other Conditions (<u>not</u> Idiopathic Hypersomnia, see Other Uses with Supportive Evidence).** More data are needed in specific conditions to define the role of modafinil and armodafinil.

23. **Post-Stroke Sleep-Wake Disorders or Sleep Disorders.** Sleep-wake disorders occur in approximately 20% to 40% of patients that have experienced a stroke, which includes hypersomnia and excessive daytime sleepiness. Very limited data (i.e., case reports and one small study) have explored the use of modafinil in these patients to improve alertness.[41,45] More data are needed to determine effectiveness in this condition.

24. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Update	08/02/2019: Change in the policy name to add the descriptor "Wakefulness-Promoting Agents".	--
Annual Revision	Addition to all approval conditions that requires the patient to have tried generic modafinil or armodafinil if brand Nuvigil or Provigil is being requested AND that the brand product (Provigil or Nuvigil) is being requested due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the corresponding generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction. The policy name was changed from Wakefulness-Promoting Agents – Nuvigil, Provigil to Wakefulness-Promoting Agents – Armodafinil, Modafinil. Removal of automation using ICD-9/ICD-10 codes for narcolepsy without cataplexy and narcolepsy in conditions classified elsewhere without cataplexy to allow approval of the requested medication.	08/21/2019
Selected Revision	Criteria stating that "the patient is ≥ 18 years of age" was added to each of the approval conditions. Patient < 17 years of age was removed from the Conditions Not Recommended for Approval. Added "Excessive Daytime Sleepiness Associated with" to the approval criteria for **Narcolepsy** and also added a requirement that narcolepsy has been confirmed with polysomnography and a multiple sleep latency test (MSLT). Inserted "Daytime" in Excessive Sleepiness and changed "Due to" to "Associated with" for the approval conditions of **Obstructive Sleep Apnea/Hypoapnea Syndrome**, **Shift Work Sleep Disorder**, **Myotonic Dystrophy**, and **Parkinson's Disease**.	03/25/2020
Selected Revision	Removal of the approval condition of **Fatigue or sleepiness associated with chronic use of narcotic analgesics in patients with cancer**. For approval condition of **Excessive Daytime Sleepiness Associated with Shift Work Sleep Disorder**, the word Daytime was removed since these people may use the medication to stay awake during their shift work at night. Under Conditions Not Recommended for Approval, "**Adjunctive therapy in the treatment of schizophrenia**" and "**Spasticity due to cerebral palsy**" were removed.	05/20/2020
Annual Revision	For the approval condition of **Excessive Daytime Sleepiness Associated with Narcolepsy**, the criterion of "Narcolepsy has been confirmed with polysomnography and a multiple sleep latency test (MSLT)" was split into two criteria: "Patient has been evaluated using polysomnography and a multiple sleep latency test (MSLT)" and "Diagnosis of narcolepsy has been confirmed, according to the prescriber". For the approval condition of **Adjunctive/Augmentation Treatment for Depression in Adults**, examples of antidepressant medications were moved to a note.	09/09/2020

PRIOR AUTHORIZATION POLICY WITH STEP THERAPY

POLICY: Wakefulness-Promoting Agents – Sunosi Prior Authorization Policy with Step Therapy

- Sunosi™ (solriamfetol tablets – Jazz Pharmaceuticals)

REVIEW DATE: 07/29/2020

OVERVIEW

Sunosi, a dopamine and norepinephrine reuptake inhibitor (DNRI), is indicated to improve wakefulness in adult patients with excessive daytime sleepiness associated with narcolepsy or obstructive sleep apnea (OSA).[1] Limitations of Use: Sunosi is not indicated to treat the underlying airway obstruction in OSA. The underlying airway obstruction should be treated (e.g., with continuous positive airway pressure [CPAP]) for at least 1 month prior to initiating Sunosi for excessive daytime sleepiness. Modalities to treat the underlying airway obstruction should be continued during treatment with Sunosi. Sunosi is not a substitute for these modalities. The mechanism of action of Sunosi to improve wakefulness in patients with excessive daytime sleepiness associated with narcolepsy or OSA is unclear. Its efficacy is thought to be mediated through its activity as an inhibitor of dopamine and norepinephrine reuptake. Sunosi is a schedule IV controlled substance.

Armodafinil and modafinil are wakefulness-promoting agents with actions similar to sympathomimetic agents (e.g., amphetamine and methylphenidate). They are indicated to improve wakefulness in adult patients with excessive sleepiness associated with narcolepsy, OSA, or shift work disorder (SWD).[2,3] Armodafinil and modafinil are Schedule IV controlled substances. For narcolepsy and OSA, they are dosed QD in the morning. For SWD, they are dosed QD as a single dose approximately 1 hour prior to the start of their work shift. Stimulant medications (e.g., amphetamine, methamphetamine, dextroamphetamine, and methylphenidate) are used off-label for the treatment of daytime sleepiness due to narcolepsy and OSA and are mentioned in guidelines.[4-7]

Disease Overview

Narcolepsy is a rare, chronic neurologic disorder that affects the brain's ability to control sleep-wake cycles.[8] There are two types of narcolepsy: Type 1 narcolepsy (previously termed narcolepsy with cataplexy) and Type 2 narcolepsy (previously termed narcolepsy without cataplexy). People with narcolepsy usually feel rested after waking, but then feel very sleepy throughout much of the day. Sleepiness in narcolepsy is described as a "sleep attack", where an overwhelming sense of sleepiness comes on quickly. People may unwillingly fall asleep even if they are in the middle of an activity like driving, eating, or talking. Symptoms can partially improve over time, but they will never disappear completely. If left undiagnosed or untreated, narcolepsy can interfere with psychological, social, and cognitive function and development and can inhibit academic, work, and social activities.

Two specialized tests, which can be performed in a sleep disorders clinic, are required to establish a diagnosis of narcolepsy.[8] Polysomnogram (PSG) is an overnight recording of brain and muscle activity, breathing, and eye movements. The multiple sleep latency test (MSLT) assesses daytime sleepiness by measuring how quickly a person falls asleep and whether they enter rapid eye movement (REM) sleep. On the day after PSG, the patient is asked to take five short naps separated by two hours over the course of a day. If an individual falls asleep in < 8 minutes on average over the five naps, this indicates excessive daytime sleepiness. However, patients with narcolepsy also have an abnormally quick start to REM sleep. If REM sleep happens within 15 minutes at least two times out of the five naps and the sleep study the night before, this is likely an abnormality caused by narcolepsy.

OSA is a potentially serious sleep disorder, causing breathing to repeatedly stop and start during sleep.[9] Several types of sleep apnea occur, but the most common is OSA. OSA occurs when the muscles in the back of the throat relax too much, inhibiting normal breathing. When the muscles relax, the airway narrows or closes. Breathing may be inadequate for 10 to 20 seconds, lowering the level of oxygen in the blood and causing a buildup of carbon dioxide. The brain senses this impaired breathing and briefly rouses the patient from sleep so that the airway can be reopened. This pattern can repeat itself five to 30 times or more each hour, throughout the night. The disruptions impair the ability to reach the desired deep, restful phases of sleep, resulting in a sleepy feeling during the waking hours. OSA can cause severe daytime drowsiness, fatigue, and irritability; hypertension, which can increase the risk of coronary artery disease, heart attack, heart failure and stroke; and arrhythmias.

CPAP is the most uniformly effective therapy, and to date this is the only intervention for OSA shown to have a favorable impact on both cardiovascular and neurobehavioral morbidities.[6] Oral appliances and surgical procedures to improve upper airway patency are successful in certain subsets of patients, but many do not receive adequate clinical benefit from these approaches. In addition, individuals treated with CPAP therapy may experience residual sleepiness, despite marked improvements in the apnea-hypopnea index. Therefore, medical therapies may be considered for the subsets of patients who will not or cannot use CPAP and for patients with residual sleepiness despite alleviation of upper airway obstruction during sleep by CPAP, oral appliances, or upper airway surgery.

Guidelines

The American Academy of Sleep Medicine (AASM) practice parameters for the treatment of narcolepsy and other hypersomnias of central origin (2007) list modafinil as an effective for treatment of daytime sleepiness due to narcolepsy (Standard) and Xyrem as effective for treatment of cataplexy, daytime sleepiness, and disrupted sleep due to narcolepsy (Standard).[4,5] At the time this practice parameter was written, published studies involving armodafinil were limited.

The AASM has published recommendations for the medical therapy of OSA (2006).[6,7] CPAP is the most uniformly effective therapy and is the only intervention for OSA shown to have favorable impacts on both cardiovascular and neurobehavioral morbidities. When the recommendation was published, there were no widely effective pharmacotherapies for individuals with sleep apnea, with the important exceptions of individuals with hypothyroidism or with acromegaly. Treating the underlying medical condition can have pronounced effects on the apnea/hypopnea index. Stimulant therapy leads to a small but statistically significant improvement in objective sleepiness.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Sunosi. This PA Policy also contains a Step Therapy component. When clinically appropriate, patients are directed to try one Step 1 agent (modafinil or armodafinil) prior to Sunosi (Step 2). All approvals are provided for the duration cited.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Sunosi is recommended in those who meet the following criteria:
FDA-Approved Indications

35. Excessive Daytime Sleepiness Associated with Obstructive Sleep Apnea. Approve for 1 year if the patient meets one of the following criteria (A, B and C):
- **D)** Patient is ≥ 18 years of age; AND
- **E)** Patient meets one of the following criteria (i or ii):
  - **i.** Sunosi will be used in conjunction with continuous positive airway pressure (CPAP); OR
  - **ii.** Patient is unable to initiate or tolerate CPAP therapy; AND
- **F)** Patient has tried generic modafinil or generic armodafinil.
  Note: An exception to this requirement is allowed if the patient has previously tried brand Provigil or Nuvigil.

271. Excessive Daytime Sleepiness Associated with Narcolepsy. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Narcolepsy has been confirmed with polysomnography and a multiple sleep latency test (MSLT); AND
- **C)** Patient has tried generic modafinil or generic armodafinil.
  Note: An exception to this requirement is allowed if the patient has previously tried brand Provigil or Nuvigil.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Sunosi is not recommended in the following situations:

273. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY WITH STEP THERAPY

POLICY: Wakefulness-Promoting Agents – Wakix Prior Authorization Policy with Step Therapy

- Wakix® (pitolisant tablets – Harmony)

REVIEW DATE: 09/09/2020; selected revision 10/28/2020

OVERVIEW

Wakix is indicated for the treatment of:[1]

- **Excessive daytime sleepiness in adults with narcolepsy**.
- **Cataplexy in adults with narcolepsy**.

Wakix is an antagonist/inverse agonist of the histamine-3 (H_3) receptor.[1] Wakix should be titrated up to the recommended dosage range of 17.8 mg to 35.6 mg once daily (QD) in the morning upon wakening. The dose may be adjusted based on patient tolerability. For some patients, it may take up to 8 weeks to achieve a clinical response. Wakix is the only wakefulness-promoting agent that is not a controlled substance.

Armodafinil and modafinil are wakefulness-promoting agents with actions similar to sympathomimetic agents (e.g., amphetamine and methylphenidate). They are indicated to improve wakefulness in adults with excessive sleepiness associated with narcolepsy, obstructive sleep apnea (OSA), or shift work disorder (SWD).[2,3] For narcolepsy and OSA, they are dosed QD in the morning. For SWD, they are dosed QD as a single dose approximately 1 hour prior to the start of their work shift. Sunosi™ (solriamfetol tablets), a dopamine and norepinephrine reuptake inhibitor (DNRI), is indicated to improve wakefulness in adults with excessive daytime sleepiness associated with narcolepsy or OSA.[4] Sunosi whould be titrated to the recommended dose range of 37.5 mg to 150 mg QD, taken upon awakening with or without food. Sunosi should be avoided within 9 hours of planned bedtime because of the potential to interfere with sleep if taken too late in the day. Armodafinil, modafinil, and Sunosi are Schedule IV controlled substances.[2-4] Armodafinil, modafinil, and Sunosi are not indicated for the treatment of cataplexy.

Two specialized tests, which can be performed in a sleep disorders clinic, are required to establish a diagnosis of narcolepsy.[7] Polysomnography is an overnight recording of brain and muscle activity, breathing, and eye movements. The multiple sleep latency test (MSLT) assesses daytime sleepiness by measuring how quickly a person falls asleep and whether they enter rapid eye movement (REM) sleep. Polysomnography is routinely indicated for the diagnosis of sleep-related breathing disorders; for continuous positive airway pressure titration in patients with sleep-related breathing disorders; with a MSLT in the evaluation of suspected narcolepsy; and in certain atypical or unusual parasomnias.[8] The MSLT is indicated as part of the evaluation of patients with suspected narcolepsy to confirm the diagnosis. Most patients with narcolepsy have objective evidence of hypersomnia as determined by a mean sleep latency < 5 minutes. In studies, the presence of two or more sleep-onset REM episodes (SOREMPs) was associated with a sensitivity of 0.78 and a specificity of 0.93 for the diagnosis of narcolepsy. SOREMPs do not occur exclusively in patients with narcolepsy, and thus it is important to rule out or treat other sleep disorders before evaluating

SOREMPs in the diagnosis of narcolepsy. For this reason, polysomnography and a MSLT performed on the day after the polysomnographic evaluation are routinely indicated in the evaluation of suspected narcolepsy.

Guidelines

The American Academy of Sleep Medicine (AASM) published practice parameters in 2007 for the treatment of narcolepsy with and without cataplexy and other hypersomnias of central origin.[5,6] It should be noted that the guidelines are dated and do not include more recently-approved medications. Modafinil is listed as an effective for treatment of daytime sleepiness due to narcolepsy and Xyrem as effective for treatment of cataplexy, daytime sleepiness, and disrupted sleep due to narcolepsy. Amphetamine, methamphetamine, dextroamphetamine, and methylphenidate are considered effective for the treatment of daytime sleepiness due to narcolepsy. Tricyclic antidepressants, selective serotonin reuptake inhibitors (SSRIs), and venlafaxine may be effective for the treatment of cataplexy. Selegiline may be an effective treatment for cataplexy and daytime sleepiness.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Wakix. This Prior Authorization Policy also contains a Step Therapy component. When clinically appropriate, patients are directed to try one Step 1 agent (modafinil or armodafinil for excessive daytime sleepiness in narcolepsy; a tricyclic antidepressant, an SSRI, or venlafaxine for cataplexy in narcolepsy) prior to Wakix (Step 2). All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Wakix is recommended in those who meet the following criteria:

FDA-Approved Indications

36. Excessive Daytime Sleepiness Associated with Narcolepsy. Approve for 1 year if the patient meets one of the following criterion (A, B, C, and D):
- **a)** Patient is ≥ 18 years of age; AND
- **b)** Patient has been evaluated using polysomnography and a multiple sleep latency test (MSLT); AND
- **c)** Diagnosis of narcolepsy has been confirmed, according to the prescriber; AND
- **d)** Patient meets one of the following criteria (i or ii):
  - **i.** Patient has tried generic modafinil or generic armodafinil; OR
    Note: An exception to this requirement is allowed if the patient has previously tried brand Provigil or Nuvigil.
  - **ii.** Patient has a history of misuse or abuse of controlled substances and a wakefulness-promoting agent that is not a controlled substance is necessary, per the prescriber.

2. Cataplexy Treatment in Patients with Narcolepsy. Approve for 1 year if the patient meets the following criteria (A, B, C, and D):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has tried one of the following treatments: a tricyclic antidepressant, a selective serotonin reuptake inhibitor (SSRI), or venlafaxine; AND
  Note: Examples of tricyclic antidepressants include amitriptyline, desipramine, and imipramine. Examples of SSRIs include fluoxetine, sertraline, and paroxetine.
- **C)** Patient has been evaluated using polysomnography and a multiple sleep latency test (MSLT); AND
- **D)** Diagnosis of narcolepsy has been confirmed, according to the prescriber.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Wakix is not recommended in the following situations:

274. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REVIEW DATE 11/18/2020; selected revisions 01/20/2021; selected revision 02/10/2020

OVERVIEW

The appetite suppressant products vary slightly in the wording of their FDA-approved indications.

- **Benzphetamine**, **diethylpropion**, and **phendimetrazine** are indicated for the management of exogenous obesity as a short-term adjunct (a few weeks) to a regimen of weight reduction based on caloric restriction in patients with an initial body mass index (BMI) of ≥ 30 kg/m^2 who have not responded to a weight reducing regimen (diet and/or exercise) alone.[5-7,31]
- **Phentermine** hydrochloride is indicated for short-term (a few weeks) adjunctive therapy in a regimen of weight reduction based on exercise, behavioral modification and caloric restriction in the management of exogenous obesity in those with an initial BMI ≥ 30 kg/m^2, or a BMI ≥ 27 kg/m^2 when other risk factors are present (e.g., controlled hypertension, diabetes mellitus, or dyslipidemia).[8-9,30]
- **Qsymia** and **Contrave** are indicated as an adjunct to a reduced-calorie diet and increased physical activity for chronic weight management in adult patients with an initial BMI of ≥ 30 kg/m^2 (obese), or ≥ 27 kg/m^2 (overweight) in the presence of at least one weight-related comorbid condition (e.g., hypertension, dyslipidemia, type 2 diabetes).[10,26]
- **Saxenda** is indicated as an adjunct to a reduced-calorie diet and increased physical activity for chronic weight management in:
  - Adult patients with an initial BMI ≥ 30 kg/m^2 (obese), or ≥ 27 kg/m^2 (overweight) in the presence of at least one weight-related comorbid condition (e.g., hypertension, dyslipidemia, type 2 diabetes),
  - Pediatric patients ≥ 12 years of age with body weight > 60 kg and an initial BMI corresponding to 30 kg/m^2 for adults (obese) by international cutoffs.[27]
- **Xenical** is indicated for obesity management including weight loss and weight maintenance when used in conjunction with a reduced-calorie diet in patients with an initial body mass index ≥ 30 kg/m^2, or ≥ 27 kg/m^2 in the presence of at least one weight-related comorbidity (e.g., hypertension, diabetes, dyslipidemia), and to reduce the risk for weight gain after prior weight loss.[11]

This policy is limited to prescription medications that are indicated to promote weight loss in obese patients. Obesity in adults is defined as a body mass index (BMI) of ≥ 30 kg/m^2; a BMI of 25 to 29.9 kg/m^2 is termed overweight.[1] The combined prevalence of obesity and overweight is estimated at > 64% of US adults; 4.7% of adults have a BMI ≥ 40 kg/m^2. In the US, an estimated 300,000 adult deaths per year are due to obesity-related causes. With the increase in obesity, treatments for obesity have increased in number and are more commonly used. Diet therapy with a low calorie diet, increased physical activity, and behavioral modification are the mainstays of treatment of overweight and obese adults. Such a regimen should be maintained for at least 6 months before considering pharmacotherapy. The rationale for adding drug therapy to these regimens in selected adults is that a more successful weight loss and maintenance may result.[2-3] Weight loss goals should be individually determined and these goals may include not just weight loss but other parameters, such as improved glucose metabolism, lipid levels, and blood pressure.[1]

Drugs that are indicated for weight loss either: 1) decrease food intake by decreasing appetite or increasing satiety (appetite suppressant, anorectic), or 2) decrease nutrient absorption.[4] The appetite suppressants increase the availability of anorexigenic neurotransmitters (norepinephrine, serotonin, dopamine, or some combination of these) in the central nervous system (CNS). Orlistat acts by inhibiting the absorption of dietary fats and is not an appetite suppressant.[11]

Contrave

The recommended maintenance dose of Contrave is achieved at Week 4.[26] Response to therapy should be evaluated after 12 weeks at the maintenance dosage (Week 16, if dosed according to the prescribing information). If a patient has not lost ≥ 5% of baseline body weight, discontinue Contrave, as it is unlikely that the patient will achieve and sustain clinically meaningful weight loss with continued treatment.

Qsymia

Response to therapy should be evaluated by Week 12.[10] If a patient has not lost ≥ 3% of baseline body weight, discontinue Qsymia or escalate the dose. If a patient has not lost ≥ 5% of baseline body weight after an additional 12 weeks of treatment on the escalated dose, discontinue Qsymia as directed as it is unlikely the patient will achieve and sustain clinically meaningful weight loss with continued treatment.

Saxenda

The change in body weight with Saxenda should be evaluated 16 weeks after initiating Saxenda.[27] If the patient has not lost ≥ 4% of baseline body weight, Saxenda should be discontinued because it is unlikely that the patient will achieve and sustain clinically meaningful weight loss with continued treatment.

Guidelines

The Endocrine Society published a clinical practice guideline (2015) for the pharmacological management of obesity.[28] The guidelines recommend that pharmacotherapy be employed for patients with BMI ≥ 27 kg/m^2 with comorbidity or BMI > 30 kg/m^2 as adjuncts to behavioral modification to reduce food intake and increase physical activity when possible. The Society states that patients who have a history of being unable to successfully lose and maintain weight and who meet label indications are candidates for weight-loss medication. Safety and efficacy is recommended to be assessed monthly for the first three months, and then at least every 3 months in all patients prescribed medications for weight loss. If a patient has an adequate response to weight loss medication (weight loss ≥ 5% at 3 months), medication is recommended to be continued. If deemed to be ineffective (weight loss < 5% at 3 months) or if there are safety or tolerability issues at any time, it is recommended that medication be discontinued and alternative medications or referral for alternative treatment approaches be considered.

Although the noradrenergic weight loss medications are only labeled for short-term use, the Endocrine Society (2015) notes that off-label, long-term prescribing of phentermine is reasonable for most patients, as long as the patient has been informed that other medications for weight loss are FDA-approved for long-term use.[28] According to prescribing information, safety and efficacy have not been established for diethylpropion and phentermine (hydrochloride or resin) in children younger than 16 years,[6,8,9,30] and for benzphetamine, phendimetrazine and Xenical in children < 12 years of age.[5,7,11,31] However, the Endocrine Society has established guidelines for use of Xenical in pediatric patients.[16] Benzphetamine, diethylpropion, phendimetrazine and phentermine are not included in these guidelines.

The American Association of Clinical Endocrinology (AACE)/American College of Endocrinology (ACE) guidelines for medical care of patients with obesity (2016) recommend pharmacotherapy for overweight and obese patients only as an adjunct to lifestyle therapy.[29] Pharmacotherapy should be offered to patients who are obese when the potential benefits outweigh the risks, for the chronic treatment of obesity. Short-term (3 to 6 months) use of weight-loss medications has not been demonstrated to produce longer-term health benefits and cannot be generally recommended.

Guidelines in Pediatric Obesity

A 2017 Endocrine Society clinical practice guideline on pediatric obesity recommends pharmacotherapy in combination with lifestyle modification be considered in obese children or adolescents only after failure of a formal program of intensive lifestyle [dietary, physical activity and behavioral] modification to limit weight gain or to ameliorate comorbidities.[16] The Endocrine Society recommends pharmacotherapy in overweight children and adolescents < 16 years only in the context of a clinical trial. Pharmacotherapy

should be provided only by clinicians who are experienced in the use of antiobesity agents and aware of the potential for adverse events. These guidelines recommend limited use of pharmacotherapy because pediatric obesity should be managed preferably as a serious lifestyle condition with important lifelong consequences.

The Endocrine Society defines overweight as BMI in at least the 85th percentile but less than the 95th percentile, and obesity as BMI in at least the 95th percentile for age and sex against routine endocrine studies, unless the height velocity is attenuated or inappropriate for the family background or stage of puberty.[16] The Centers for Disease Control (CDC) derived normative percentiles are recommended as the appropriate method for determining the BMI in children.[17-18]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of benzphetamine, diethylpropion, phendimetrazine tartrate, phentermine hydrochloride, Qsymia, Contrave, Saxenda, and Xenical. All approvals are provided for the durations noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Prior Authorization and prescription benefit coverage is not recommended for Alli.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

I. Coverage of benzphetamine (including Regimax 25 mg tablets [generics]), diethylpropion, phendimetrazine tartrate, or phentermine hydrochloride is recommended in those who meet all of the following criteria:

FDA-Approved Indications

4. Weight Loss in Patients ≥ 16 Years of Age. Note: For individuals who have not completed the initial 3 months of therapy, criterion (1A) must be met (do not use continuation criteria if the initial 3 months were not completed).

A) Initial Therapy. Approve for 3 months if the patient meets all of the following criteria (i, ii, and iii):

- **i.** Patient currently has a body mass index (BMI) ≥ 30 kg/m^2, or a BMI ≥ 27 kg/m^2 for those with comorbidities besides obesity (Appendix A contains a BMI chart); AND
  Note: Examples of comorbidities include diabetes mellitus, impaired glucose tolerance, dyslipidemia, hypertension, coronary heart disease, sleep apnea.
- **ii.** Patient has engaged in a trial of behavioral modification and dietary restriction for at least 3 months and has failed to achieve the desired weight loss; AND
- **iii.** Patient is currently engaged in behavioral modification and on a reduced calorie diet.

B) Patient is Continuing Therapy. Approve for 12 months if the patient meets all of the following criteria (i, ii, and iii):

- **i.** Patient had an initial BMI ≥ 30 kg/m^2, or a BMI ≥ 27 kg/m^2 for those with comorbidities besides obesity: AND
  Note: Examples of comorbidities include diabetes mellitus, impaired glucose tolerance, dyslipidemia, hypertension, coronary heart disease, sleep apnea.
- **ii.** Patient is currently engaged in behavioral modification and on a reduced calorie diet; AND
- **iii.** Patient has lost ≥ 5% of baseline body weight.

II. Coverage of Contrave is recommended in those who meet all of the following criteria:

FDA-Approved Indications

1. **Weight Loss in Patients ≥ 18 Years of Age.** Note: For individuals who have not completed the initial 4 months of therapy, criterion (1A) must be met (do not use continuation criteria if the initial 4 months were not completed).
   - **A)** Initial Therapy. Approve for 4 months if the patient meets the following criteria (i, ii, and iii):
     - **i.** Patient currently has a body mass index (BMI) ≥ 30 kg/m^2, or a BMI ≥ 27 kg/m^2 for those with comorbidities besides obesity (Appendix A contains a BMI chart); AND
       Note: Examples of comorbidities include diabetes mellitus, impaired glucose tolerance, dyslipidemia, hypertension, coronary heart disease, sleep apnea.
     - **ii.** Patient has engaged in a trial of behavioral modification and dietary restriction for at least 3 months and has failed to achieve the desired weight loss; AND
     - **iii.** Patient is currently engaged in behavioral modification and on a reduced calorie diet.
   - **B)** Patient is Continuing Therapy. Approve for 12 months if the patient meets the following criteria (i, ii, and iii):
     - **i.** Patient had an initial BMI ≥ 30 kg/m^2, or a BMI ≥ 27 kg/m^2 for those with comorbidities besides obesity: AND
       Note: Examples of comorbidities include diabetes mellitus, impaired glucose tolerance, dyslipidemia, hypertension, coronary heart disease, sleep apnea.
     - **ii.** Patient is currently engaged in behavioral modification and on a reduced calorie diet; AND
     - **iii.** Patient has lost ≥ 5% of baseline body weight.

III. Coverage of Qsymia is recommended in those who meet all of the following criteria:

FDA-Approved Indications

1. **Weight Loss in Patients ≥ 18 Years of Age.** Note: For individuals who have not completed the initial 6 months of therapy, criterion (1A) must be met (do not use continuation criteria if the initial 6 months were not completed).
   - **A)** Initial Therapy. Approve for 6 months if the patient meets the following criteria (i, ii, and iii):
     - **i.** Patient currently has a BMI ≥ 30 kg/m^2, or a BMI ≥ 27 kg/m^2 for those with comorbidities besides obesity (Appendix A contains a BMI chart); AND
       Note: Examples of comorbidities include diabetes mellitus, impaired glucose tolerance, dyslipidemia, hypertension, coronary heart disease, sleep apnea.
     - **ii.** Patient has engaged in a trial of behavioral modification and dietary restriction for at least 3 months and has failed to achieve the desired weight loss; AND
     - **iii.** Patient is currently engaged in behavioral modification and on a reduced calorie diet.
   - **B)** Patient is Continuing Therapy. Approve for 12 months if the patient meets the following criteria (i, ii, and iii):
     - **i.** Patient had an initial BMI ≥ 30 kg/m^2, or a BMI ≥ 27 kg/m^2 for those with comorbidities besides obesity; AND
       Note: Examples of comorbidities include diabetes mellitus, impaired glucose tolerance, dyslipidemia, hypertension, coronary heart disease, sleep apnea.
     - **ii.** Patient is currently engaged in behavioral modification and on a reduced calorie diet; AND
     - **iii.** Patient has lost ≥ 5% of baseline body weight.

IV. Coverage of Saxenda is recommended in those who meet all of the following criteria:

1. **Weight Loss in Patients ≥ 18 years of Age.** Note: For individuals who have not completed the initial 4 months of therapy, criterion (1A) must be met (do not use continuation criteria if the initial 4 months were not completed).
   - **A)** Initial Therapy. Approve for 4 months if the patients meets the following criteria (i, ii, and iii):
     - **i.** Patient currently has a BMI ≥ 30 kg/m^2, or a BMI ≥ 27 kg/m^2 for those with comorbidities besides obesity (Appendix A contains a BMI chart); AND
       Note: Examples of comorbidities include diabetes mellitus, impaired glucose tolerance, dyslipidemia, hypertension, coronary heart disease, sleep apnea.
     - **ii.** Patient has engaged in a trial of behavioral modification and dietary restriction for at least 3 months and has failed to achieve the desired weight loss; AND
     - **iii.** Patient is currently engaged in behavioral modification and on a reduced calorie diet.
   - **B)** Patient is Continuing Therapy. Approve for 12 months if the patient meets the following criteria (i, ii, and iii):
     - **i.** Patient had an initial BMI ≥ 30 kg/m^2, or a BMI ≥ 27 kg/m^2 for those with comorbidities besides obesity; AND
       Note: Examples of comorbidities include diabetes mellitus, impaired glucose tolerance, dyslipidemia, hypertension, coronary heart disease, sleep apnea.
     - **ii.** Patient is currently engaged in behavioral modification and on a reduced calorie diet; AND
     - **iii.** Patient has lost ≥ 4% of baseline body weight.

2. **Weight Loss in Patients Aged ≥ 12 to < 18 Years.** Note: For individuals who have not completed the initial 4 months of therapy, criterion (2A) must be met (do not use continuation criteria if the initial 4 months were not completed).
   - **A)** Initial Therapy. Approve for 4 months if the patient meets the following criteria (i, ii, and iii):
     - **i.** Patient currently has a BMI of ≥ 95th percentile for age and sex, or in ≥ 85th percentile but < 95th percentile for age and sex and has at least one comorbidity (type 2 diabetes mellitus, cardiovascular disease [CVD]) or has a strong family history of type 2 diabetes or premature CVD; AND
       Note: Premature cardiovascular disease is defined as cardiovascular disease occurring in a male < 55 years of age or in a female < 65 years of age.
     - **ii.** Patient has engaged in a trial of behavioral modification and dietary restriction for at least 4 months and has failed to limit weight gain or to modify comorbidities; AND
     - **iii.** Patient is currently engaged in behavioral modification and on a reduced calorie diet.
   - **B)** Patient is Continuing Therapy. Approve for 12 months if the patient meets the following criteria (i, ii, iii, and iv):
     - **i.** Patient had an initial BMI of ≥ 95th percentile for age and sex, or ≥ 85th percentile but < 95th percentile for age and sex and has at least one comorbidity (type 2 diabetes or CVD) or strong family history of type 2 diabetes or premature CVD; AND
       Note: Premature cardiovascular disease is defined as cardiovascular disease occurring in a male < 55 years of age or in a female < 65 years of age.
     - **ii.** Patient is currently engaged in behavioral modification and on a reduced calorie diet; AND
     - **iii.** Patient has had a reduction in BMI of ≥ 1% from baseline; AND
     - **iv.** Patient currently has a BMI > 85th percentile.

V. Coverage of Xenical is recommended in those who meet all of the following criteria:

FDA-Approved Indications

1. **Weight Loss in Patients ≥ 18 Years of Age**. Note: For individuals who have not completed the initial 3 months of therapy, criterion (1A) must be met (do not use continuation criteria if the initial 3 months were not completed).
   - **A)** Initial Therapy. Approve for 3 months if the patient meets the following criteria (i, ii, and iii):
     - **i.** Patient meets ONE of the following (a or b):
       - **a)** Patient currently has a BMI ≥ 30 kg/m^2, or a BMI ≥ 27 kg/m^2 for those with comorbidities besides obesity (Appendix A contains a BMI chart); OR
         Note: Examples of comorbidities include diabetes, dyslipidemia, hypertension, coronary heart disease, sleep apnea.
       - **b)** Patient had an initial BMI ≥ 30 kg/m^2, or a BMI ≥ 27 kg/m^2 for those with comorbidities besides obesity if maintaining weight loss after using a low calorie diet; AND
         Note: Examples of comorbidities include diabetes, dyslipidemia, hypertension, coronary heart disease, sleep apnea.
     - **ii.** Patient has engaged in a trial of behavioral modification and dietary restriction for at least 3 months and has failed to achieve the desired weight loss; AND
     - **iii.** Patient is currently engaged in behavioral modification and on a reduced calorie diet.
   - **B)** Patient is Continuing Therapy. Approve for 12 months if the patient meets the following criteria (i, ii, and iii):
     - **i.** Patient had an initial BMI ≥ 30 kg/m^2, or a BMI ≥ 27 kg/m^2 for those with comorbidities besides obesity: AND
       Note: Examples of comorbidities include diabetes mellitus, impaired glucose tolerance, dyslipidemia, hypertension, coronary heart disease, sleep apnea.
     - **ii.** Patient is currently engaged in behavioral modification and on a reduced calorie diet; AND
     - **iii.** Patient has lost ≥ 5% of baseline body weight.

2. **Weight Loss in Patients Aged ≥ 12 to < 18 Years.** Note: For individuals who have not completed the initial 3 months of therapy, criterion (2A) must be met (do not use continuation criteria if the initial 3 months were not completed).
   - **A)** Initial Therapy. Approve for 3 months if the patient meets the following criteria (i, ii, and iii):
     - **i.** Patient currently has a BMI of ≥ 95th percentile for age and sex, or in ≥ 85th percentile but < 95th percentile for age and sex and has at least one comorbidity (type 2 diabetes mellitus, cardiovascular disease [CVD]) or has a strong family history of type 2 diabetes or premature CVD; AND
       Note: Premature cardiovascular disease is defined as cardiovascular disease occurring in a male < 55 years of age or in a female < 65 years of age.
     - **ii.** Patient has engaged in a trial of behavioral modification and dietary restriction for at least 3 months and has failed to limit weight gain or to modify comorbidities; AND
     - **iii.** Patient is currently engaged in behavioral modification and on a reduced calorie diet.
   - **B)** Patient is Continuing Therapy. Approve for 12 months if the patient meets the following criteria (i, ii, iii, and iv):
     - **i.** Patient had an initial BMI of ≥ 95th percentile for age and sex, or ≥ 85th percentile but < 95th percentile for age and sex and has at least one comorbidity (type 2 diabetes or CVD) or strong family history of type 2 diabetes or premature CVD; AND
       Note: Premature cardiovascular disease is defined as cardiovascular disease occurring in a male < 55 years of age or in a female < 65 years of age.
     - **ii.** Patient is currently engaged in behavioral modification and on a reduced calorie diet; AND
     - **iii.** Patient's current BMI percentile has decreased for age and weight (taking into account that the patient is increasing in height and will have a different normative BMI from when Xenical was started); AND

iv. Patient currently has a BMI > 85th percentile.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of benzphetamine, diethylpropion, phendimetrazine tartrate, phentermine hydrochloride, Qsymia, Contrave, Saxenda, and Xenical is not recommended in the following situations:

1. **Combination Appetite Suppressant Therapy**. Appetite suppressants (benzphetamine, diethylpropion, phendimetrazine tartrate, phentermine hydrochloride or resin, Qsymia, Contrave, Saxenda) are indicated *only* as monotherapy and should not be used in combination with other appetite suppressant drugs.[5-10,26-27,30-31] A 12-week, pilot study assessed the addition of phentermine to Saxenda following 1 year of Saxenda treatment.[33] A total of 45 patients were randomized to Saxenda plus phentermine or Saxenda plus placebo. At 12 weeks, the patients in the Saxenda plus phentermine group had numerically, but not statistically, larger reduction in weight compared with the Saxenda plus placebo group (1.6% vs. 0.1%, respectively, P = 0.073). This study was of inadequate size and duration to assess for long-term safety and efficacy, particularly in regard to cardiovascular outcomes.

2. **Simultaneous Use of Xenical with Any of the Following: benzphetamine, diethylpropion, phendimetrazine tartrate, or phentermine hydrochloride or resin, Contrave, Saxenda or Qsymia.** Limited information from published well-controlled studies is available on the combination use of these drugs. Using weight loss drugs one at a time and starting with the lowest effective doses can decrease the chance of adverse effects.[2] Unproven combination therapy is not recommended.[4]

3. **Treatment of Hyperlipidemia in Non-Obese Patients**. Short-term use of Xenical has slightly decreased total and low density lipoprotein (LDL) cholesterol in patients with increased total and LDL cholesterol levels and normal triglyceride levels who were not obese (BMI 19 to 28.7 kg/m^2).[20] Triglycerides were unchanged and high density lipoprotein (HDL) cholesterol tended to decrease. Although not directly compared with other drugs, Xenical's effects on total and LDL cholesterol were less than those observed with hydroxy-methylglutaryl-coenzyme A (HMG-CoA) reductase inhibitors (HMGs) and low dose cholestyramine.

4. **Treatment of Binge-Eating Disorder in Non-Obese Patients (BMI < 30 kg/m^2 or < 27 kg/m^2 for Those with Risk Factors).** In a short term (12 or 24 week) placebo-controlled trial in obese patients (BMI ≥ 30 kg/m^2) with binge eating disorder, Xenical has been effective in producing weight loss.[21-22] In an open-label study, 10 patients with binge eating disorder were treated with Qsymia.[34] Nine of the patients were obesity and one was overweight. After 12 weeks of treatment, the patients on average lost 4.9 kg of body weight. Patients with binge-eating disorder are usually obese and should be reviewed for weight loss therapy using the criteria in the section above.

5. **Prevention of Diabetes in Patients with BMI < 30 kg/m^2.** In a large (n = 3,305) 4-year study, Xenical, in addition to lifestyle changes, led to a 37% risk reduction in the development of type 2 diabetes in obese (BMI ≥ 30 kg/m^2) patients compared with placebo.[13] However, those most affected had impaired glucose tolerance at baseline and these patients achieved a more pronounced weight reduction. Qsymia in addition to lifestyle modification reduced the progression to type 2 diabetes in overweight/obese patients (BMI 27 to 45 kg/m^2) plus at least two weight-related comorbidities with pre-existing prediabetes and/or metabolic syndrome in a 108-week study compared with placebo (n = 475). However, the magnitude of effect for prevention of type 2 diabetes was related to the degree of weight loss achieved in this sub-analysis. Such patients should be evaluated based on overweight or obesity using the appropriate criteria above.

6. **Nonalcoholic Fatty Liver Disease.** In a single-center trial, 52 patients with nonalcoholic fatty liver disease were randomized to Xenical 120 mg three times daily or placebo.[23] Mean BMI was 33 kg/m^2. All patients were in a behavioral weight loss program. Forty-four patients completed 6 months and their results were analyzed. Patients were not well-matched for baseline characteristics (e.g., BMI, waist circumference, glucose and insulin levels were significantly different between groups at baseline). The authors concluded that Xenical improves serum alanine aminotransferase (ALT) and steatosis on ultrasound in these patients beyond its effect on weight reduction. An additional 24 week study, compared Xenical (n = 68) with conventional treatment (n = 102) in patients with nonalcoholic fatty liver disease and a BMI of ≥ 25 kg/m^2 using magnetic resonance imaging-derived proton density fat fraction.[35] After 24 weeks of treatment, patients treated with Xenical had significantly greater reduction in total liver fat compared with the conventional treatment group (-5.45% vs. -1.96%, P < 0.001). In addition, steatosis improved in more patients treated with Xenical compared with the conventional treatment arm (57.3% vs. 23.5%, p < 0.001). Long-term, well-designed trials in a large number of patients are needed to determine if Xenical has a place in therapy for nonalcoholic fatty liver disease. In a small, randomized trial, Saxenda was compared with lifestyle modification in obese patients with nonalcoholic fatty liver disease.[36] After 26 weeks, similar reductions in weight (-3.3 kg vs. -3.0 kg), liver fat fraction (-8.1% vs. -7.0%), alanine aminotransferase (-39 U/L vs. -26 U/L), and caspase-cleaved cytokeratin-18 (-206 U/L vs. -130 U/L) occurred in the lifestyle modification and Saxenda groups, respectively. However, after discontinuing Saxenda, patients regained weight and liver fat fraction at week 52 while patients in the lifestyle modification group maintained the improvements in weight and liver fat fraction. There is very little good quality evidence to support or refute the use of weight reduction as a treatment for nonalcoholic fatty liver disease.[24]

7. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	Brand Bontril PDM and Suprenza removed from policy (obsolete for > 3 years).	10/30/2019
Selected Revision	Removed Belviq and Belviq XR from policy after both were pulled from the market.	3/11/2020
Annual Revision	No criteria changes.	11/18/2020
Update	12/07/2020: Criteria for benzphetamine, diethylpropion, phendimetrazine, phentermine, Contrave, Qsymia, Saxenda, and Xenical in Adults > 18 years of age were revised from: BMI ≥ 27 kg/m^2 for those with "risk factors" besides obesity, TO: BMI ≥ 27 kg/m^2 for those with "comorbidities" besides obesity. Examples in the Note were changed from "risk factors" to "comorbidities".	NA
Selected Revision	**Saxenda**: Added criteria for the use of Saxenda in pediatric patients ≥ 12 and < 18 years of age.	01/20/2021

	Xenical: Criteria for adults was revised by changing risk factors to comorbidities. Criteria for pediatric patients was revised by removing "severe" from criteria – has at least one "severe" comorbidity.	
Selected Revision	**Saxenda, Weight Loss in Patients Aged ≥ 12 to < 18 Years**: Removed "premature" from comorbidities in Initial Therapy and Patient is Continuing Therapy criteria. Now reads as follows: ≥ 85th percentile but < 95th percentile for age and sex and has at least one comorbidity (type 2 diabetes, ~~premature~~ cardiovascular disease). Added Note: Premature cardiovascular disease is defined as cardiovascular disease occurring in males < 55 years of age or in females < 65 years of age. **Xenical, Weight Loss in Patients Aged ≥ 12 to < 18 Years**: Removed "premature" from comorbidities in Initial Therapy and Patient is Continuing Therapy criteria. Now reads as follows: ≥ 85th percentile but < 95th percentile for age and sex and has at least one comorbidity (type 2 diabetes, ~~premature~~ cardiovascular disease). Added Note: Premature cardiovascular disease is defined as cardiovascular disease occurring in males < 55 years of age or in females < 65 years of age.	02/10/2021

BMI – Body mass index.

APPENDIX A

Below is a chart of BMI based on various heights and weights.[2] To use the table, find the appropriate height in the far left column, and move across the row to the given weight; the number at the top of the column is the BMI. For example, a patient who is 5 feet 6 inches in height and weighs 192 pounds has a BMI of 31 kg/m^2.

BMI can also be calculated using the following formula: BMI equals body weight in kilograms divided by height meters squared (m^2), i.e., BMI = kg/m^2.

Body Mass Index

BMI, kg/m^2	25	26	27	28	29	30	31	32	33	34	35	40
Height (feet, inches)	Weight (pounds)

PRIOR AUTHORIZATION POLICY

POLICY: Xiaflex Prior Authorization Policy

- Xiaflex® (collagenase clostridium histolyticum for intralesional injection – Endo Pharmaceuticals)

REVIEW DATE: 02/03/2021

OVERVIEW

Xiaflex, a combination of bacterial collagenases, is indicated for the following:

- **Dupuytren's contracture** with a palpable cord in adults.
- **Peyronie's disease** in adult men with a palpable plaque and curvature deformity of at least 30 degrees at the start of therapy.[1]

Disease Overview

Dupuytren's contracture is a disorder of the palmar and digital fascia of the hand.[2] Abnormal deposition of collagen initially causes nodules in the palm of the hand, which may thicken and lead to formation of cords. As the disease progresses, the cords gradually contract, leading to flexion deformities of the fingers. Joint contractures are typically painless but are associated with significant functional impairment. The exact etiology of Dupuytren's contracture is unknown, although a number of risk factors have been reportedly associated with the condition, including alcohol,

smoking, diabetes, epilepsy, thyroid disorders, and trauma. Prevalence varies widely by age and geographical location but is most common among Caucasian males greater than 50 years of age. Surgical intervention, either by open partial fasciectomy or percutaneous needle fasciotomy, is the mainstay of therapy for severe cases. However, surgery may be associated with complications including neurovascular injury or hematoma, and recurrence after surgery is common. In clinical studies of Dupuytren's contracture, patients were eligible to participate if they had a finger contraction of 20 degrees to 100 degrees in a metacarpophalangeal joint or 20 degrees to 80 degrees in a proximal interphalangeal joint.[1]

Peyronie's disease is an acquired penile abnormality caused by fibrosis of the tunica albuginea, which may lead to pain, deformity, erectile dysfunction, and/or distress.[3] It is thought that repeated minor trauma to the penis initiates a cascade involving extravascular protein deposition, fibrin trapping, and overexpression of cytokines, leading to collagen changes characteristic of the condition. Males around 50 years of age are most commonly affected. Peyronie's disease has a variable course; for most patients, pain will resolve over time without intervention, but curvature deformities are less likely to resolve without treatment. Intralesional therapy with Xiaflex may be used to treat curvature associated with Peyronie's disease and is supported by American Urological Association guidelines (2015).

Dosing Considerations

For treatment of Dupuytren's contracture, the dose of Xiaflex is 0.58 mg per injection into a palpable cord with a contracture of an metacarpophalangeal or proximal interphalangeal joint.[1] Two palpable cords affecting two joints or one palpable cord affecting two joints in the same finger may be injected per treatment visit. Injections may be administered up to three times per cord at approximately 4-week intervals.

For treatment of Peyronie's disease, one treatment course consistent of four cycles.[1] Each cycle consists of two Xiaflex injection procedures (1 to 3 days apart). Up to four cycles of Xiaflex may be administered, given at approximately 6-week intervals. The safety of more than one treatment course (8 total injections) is unknown.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Xiaflex. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Xiaflex, approval requires it to be administered by a healthcare provider with expertise in the condition being treated.

Prior authorization and prescription benefit coverage are not recommended for Xiaflex for cosmetic uses.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Xiaflex is recommended in those who meet the following criteria:

FDA-Approved Indications

7. **Dupuytren's Contracture.** Approve Xiaflex for 3 months if the patient meets all of the following criteria (A, B, C, and D):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** At baseline (prior to initial injection of Xiaflex), the patient had contracture of a metacarpophalangeal or proximal interphalangeal joint of at least 20 degrees; AND
   - **C)** Patient will not be treated with more than a total of three injections (maximum) per affected cord; AND
   - **D)** Xiaflex is administered by a healthcare provider experienced in injection procedures of the hand and in the treatment of Dupuytren's contracture.

8. **Peyronie's Disease.** Approve Xiaflex for 6 months if the patient meets all of the following criteria (A, B, C, and D):

A) Patient is ≥18 years of age; AND
B) Patient meets one of the following (i or ii):
  i. At baseline (prior to use of Xiaflex), the patient has a penile curvature deformity of at least 30 degrees; OR
  ii. In a patient who has received prior treatment with Xiaflex, the patient has a penile curvature deformity of at least 15 degrees; AND
C) Patient has not previously been treated with a complete course (8 injections) of Xiaflex for Peyronie's disease; AND
D) Xiaflex is being administered by a healthcare provider experienced in the treatment of male urological diseases.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Xiaflex is not recommended in the following situations:

275. Cosmetic Uses (e.g., cellulite of buttocks). Cosmetic use is not recommended for coverage as this indication is excluded from coverage in a typical pharmacy benefit.

276. Retreatment (i.e., treatment beyond three injections per affected cord for those with Dupuytren's Contracture or beyond eight injections for Peyronie's Disease). For Dupuytren's contracture, injections and finger extension procedures may be administered up to three times per cord.[1] However, this does not limit treatment of additional cords. For Peyronie's disease, the safety of more than one treatment course (8 injections) is unknown.

277. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY WITH STEP THERAPY

POLICY: Xyrem/Xywav Prior Authorization Policy with Step Therapy
- Xyrem® (sodium oxybate oral solution – Jazz Pharmaceuticals)
- Xywav™ (calcium, magnesium, potassium, and sodium oxybates oral solution – Jazz Pharmaceuticals)

REVIEW DATE: 10/07/2020

OVERVIEW

Xyrem and Xywav, central nervous system (CNS) depressants, are indicated for the following uses:[1,2]

- **Cataplexy treatment in patients with narcolepsy**, in patients ≥ 7 years of age.
- **Excessive daytime sleepiness in narcolepsy**, in patients ≥ 7 years of age.

Xyrem and Xywav have the same oxybate concentration; Xywav includes a mix of calcium, magnesium, potassium and sodium cations, while Xyrem includes only sodium cations.[1,2] Dosing and administration of Xyrem and Xywav are the same.

Xyrem labeling includes a Warning with regard to patients sensitive to high sodium intake which states that Xyrem has a high salt content.[1] In patients sensitive to salt intake (e.g., those with heart failure, hypertension, or renal impairment), consider the amount of daily sodium intake in each dose of Xyrem. According to the manufacturer, Xywav has 92% less sodium (approximately 1,000mg to 1,500mg less per night) than Xyrem.[2]

Two specialized tests, which can be performed in a sleep disorders clinic, are required to establish a diagnosis of narcolepsy.[3] Polysomnography is an overnight recording of brain and muscle activity, breathing, and eye movements. The multiple sleep latency test (MSLT) assesses daytime sleepiness by measuring how quickly a person falls asleep and whether they enter rapid eye movement (REM) sleep. Polysomnography is routinely indicated for the diagnosis of sleep-related breathing disorders; for continuous positive airway pressure titration in patients with sleep-related breathing disorders; with a MSLT in the evaluation of suspected narcolepsy; and in certain atypical or unusual parasomnias.[4] The MSLT is indicated as part of the evaluation of patients with suspected narcolepsy to confirm the diagnosis. Most patients with narcolepsy have objective evidence of hypersomnia as determined by a mean sleep latency < 5 minutes. In studies, the presence of two or more sleep-onset REM episodes (SOREMPs) was associated with a sensitivity of 0.78 and a specificity of 0.93 for the diagnosis of narcolepsy. SOREMPs do not occur exclusively in patients with narcolepsy, and thus it is important to rule out or treat other sleep disorders before evaluating SOREMPs in the diagnosis of narcolepsy. For this reason, polysomnography and a MSLT performed on the day after the polysomnographic evaluation are routinely indicated in the evaluation of suspected narcolepsy.

Guidelines

Guidelines for the treatment of narcolepsy and for cataplexy due to narcolepsy are dated and do not include Xywav.[5,6] The American Academy of Sleep Medicine (AASM) practice parameters for the treatment of narcolepsy and other hypersomnias of central origin (2007) list Xyrem as effective for treatment of cataplexy, daytime sleepiness, and disrupted sleep due to narcolepsy (*Standard*) and modafinil as an effective for treatment of daytime sleepiness due to narcolepsy (*Standard*). Amphetamine, methamphetamine, dextroamphetamine, and methylphenidate are considered effective for the treatment of daytime sleepiness due to narcolepsy (*Guideline*). Tricyclic antidepressants (TCAs), selective serotonin reuptake inhibitors (SSRIs), and venlafaxine may be effective for the treatment of cataplexy (*Guideline*). Selegiline may be an effective treatment for cataplexy and daytime sleepiness (*Option*). *Standard* recommendations are considered to be generally accepted patient-care strategies that reflect a high degree of clinical certainty based on Level I evidence or overwhelming Level II evidence. *Guideline* recommendations are considered to be patient-care strategies that reflect a moderate degree of clinical certainty based on Level II evidence or a consensus of Level III evidence. *Option* recommendations are considered to be patient-care strategies that reflect uncertain clinical use based on inconclusive or conflicting evidence or conflicting expert opinion. At the time this practice parameter was written, published studies involving Nuvigil® (armodafinil tablets) were limited.

The European League Against Rheumatism (EULAR) issued updated evidence-based recommendations for the management of fibromyalgia (2016) stating that initial management should involve patient education and focus on nonpharmacological therapies.[7] In case of non-response, further therapies should be tailored to the specific needs of the individual and may involve psychological therapies (for mood disorders and

unhelpful coping strategies), pharmacotherapy (for severe pain or sleep disturbance) and/or a multimodal rehabilitation program (for severe disability). EULAR notes that the European Medicines Agency and the FDA refused approval of Xyrem for fibromyalgia because of safety concerns. EULAR's position on Xyrem for fibromyalgia is strongly against with 94% agreement.

Safety

Xyrem is the sodium salt of gamma hydroxybutyrate (GHB) and Xywav is a mixed salt formulation of GHB.[1,2] They are both Schedule III controlled substances. Abuse of GHB (a Schedule I controlled substance), either alone or in combination with other CNS depressants, is associated with CNS adverse reactions, including seizure, respiratory depression, decreases in the level of consciousness, coma, and death. Because of the risks of CNS depression, abuse, and misuse, Xyrem and Xywav are available only through a restricted distribution program called the Xyrem/Xywav Success Program, using a centralized pharmacy. Healthcare professionals who prescribe Xyrem or Xywav and patients must enroll in the Xyrem/Xywav Success Program and must comply with the requirements to ensure the drug's safe use.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Xyrem and Xywav. Because Xyrem and Xywav have been associated with significant risks, including CNS and respiratory depression, and have the potential for abuse, misuse, and overdose, approval requires Xyrem and Xywav to be prescribed by a physician who specializes in the condition being treated. When clinically appropriate, patients are directed to try the Preferred Step 1 agent (Xyrem) prior to Xywav (Step 2). All approvals are provided for the duration noted below.

Automation: Grandfathering is not clinically necessary for Xyrem. Refer to the AUM reference guide for additional information.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Xyrem or Xywav is recommended in those who meet the following criteria:

FDA-Approved Indications

37. Cataplexy Treatment in Patients with Narcolepsy. Approve for 1 year if the patient meets the following criteria (A, B, C, D, and E):

- **G)** Patient has tried one of the following treatments: a tricyclic antidepressant (TCA), a selective serotonin reuptake inhibitor (SSRI), or venlafaxine; AND
  Note: Examples of tricyclic antidepressants include amitriptyline, desipramine, and imipramine. Examples of SSRIs include fluoxetine, sertraline, and paroxetine.
- **H)** Patient has been evaluated using polysomnography and a multiple sleep latency test (MSLT); AND
- **I)** Diagnosis of narcolepsy has been confirmed, according to the prescriber; AND
- **J)** The medication has been prescribed by a sleep specialist physician or a neurologist; AND
- **K)** If the request is for Xywav, the patient must meet one of the following (i or ii):
  a. Patient has tried Xyrem and has experienced inadequate efficacy or significant intolerance according to the prescriber; OR
  b. According to the prescriber, the patient has a concomitant diagnosis of heart failure, hypertension, or renal impairment.

38. Excessive Daytime Sleepiness in Patients with Narcolepsy. Approve for 1 year if the patient meets the following criteria (A, B, C, D, and E):

A) Patient has tried one of the following treatments: a central nervous system (CNS) stimulant, modafinil, or armodafinil; AND
Note: Examples of CNS stimulants include methylphenidate, dexmethylphenidate, and dextroamphetamine.
B) Patient has been evaluated using polysomnography and a multiple sleep latency test (MSLT); AND
C) Diagnosis of narcolepsy has been confirmed, according to the prescriber; AND
D) The medication has been prescribed by a sleep specialist physician or a neurologist; AND
E) If the request is for Xywav, the patient must meet one of the following (i or ii):
- **i.** Patient has tried Xyrem and has experienced inadequate efficacy or significant intolerance according to the prescriber; OR
- **ii.** According to the prescriber, the patient has a concomitant diagnosis of heart failure, hypertension, or renal impairment.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Xyrem or Xywav is not recommended in the following situations:

28. Fibromyalgia. The effectiveness of Xyrem in fibromyalgia has been evaluated in clinical trials of varying size.[8-13] However, due to safety concerns, Xyrem is not recommended for approval for fibromyalgia at this time. Duloxetine, Lyrica® (pregabalin capsules and oral solution), and Savella® (milnacipran tablets) are indicated for the treatment of fibromyalgia.[14-16] Other recommended treatments include TCAs (i.e., amitriptyline), cyclobenzaprine, gabapentin, and SSRIs (i.e., fluoxetine, sertraline, paroxetine).[17]

29. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	No change to criteria.	03/07/2018
Selected Revision	Change to criteria for Cataplexy Treatment in Patients with Narcolepsy: removed modafinil and Nuvigil from list of previous treatment options. Added requirement of sleep studies (polysomnography and a MSLT) to both approval conditions. Changed the required number of previous alternative CNS stimulants (e.g., methylphenidate, dexmethylphenidate, dextroamphetamine), modafinil, or armodafinil from one to two for the criterion for Excessive Daytime Sleepiness in Patients with Narcolepsy.	07/25/2018
Annual Revision	No change to criteria.	03/20/2019
Annual Revision	No change to criteria.	03/25/2020
Selected Revision	For the criterion of Excessive Daytime Sleepiness in Patients with Narcolepsy, the required number of previous alternative CNS stimulants, modafinil, or armodafinil was changed from two to one, and the examples of CNS stimulants were moved to a note. For the criterion of Cataplexy Treatment in Patients with Narcolepsy, examples of tricyclic antidepressants and SSRIs were moved to a note.	06/24/2020
Early Annual Revision	Addition of Xywav to the policy as a Step 2 product, requiring a trial of Xyrem (Step 1 product) first, unless the patient has a concomitant diagnosis of heart failure, hypertension, or renal impairment. **Cataplexy Treatment in Patients with Narcolepsy** and **Excessive Daytime Sleepiness Associated with Narcolepsy:** The criterion of "Narcolepsy has been confirmed with polysomnography and a multiple sleep latency test (MSLT)" was split into two criteria: "Patient has been evaluated using polysomnography and a multiple sleep latency test (MSLT)" and "Diagnosis of narcolepsy has been confirmed, according to the prescriber".	10/07/2020

CNS – Central nervous system; SSRIs – Selective serotonin reuptake inhibitors.

PRIOR AUTHORIZATION POLICY

POLICY: Zokinvy Prior Authorization Policy
- Zokinvy™ (lonafarnib capsules – Eiger Biopharmaceuticals)

REVIEW DATE: 01/20/2021

OVERVIEW

Zokinvy, a protein farnesyltransferase inhibitor, is indicated in patients ≥ 12 months of age with a body surface area ≥ 0.39 m^2 for the following conditions:
- **Hutchinson-Gilford Progeria Syndrome** (HGPS), to reduce risk of mortality.
- **Progeroid laminopathies** that are processing-deficient, with either:
  - Heterozygous *LMNA* mutation with progerin-like protein accumulation; or
  - Homozygous or compound heterozygous *ZMPSTE24* mutations.[1]

Disease Overview

Hutchinson-Gilford Progeria Syndrome (HGPS)

HGPS is an ultra-rare, fatal, autosomal dominant genetic disorder with an estimated incidence of 1:4,000,000 live births and prevalence of 1:20,000,000 living individuals.[2] As of September 30, 2020, there were 18 patients identified with HGPS in the US.[3] HGPS results from a heterozygous mutation in *LMNA*, the gene encoding lamin A, a nuclear membrane protein.[4] "Classic" HGPS is caused by a single point mutation in *LMNA* involving c.1824C>T (G608G

mutation) and accounts for 90% of HGPS cases.[4,5] Other *LMNA* mutations have also been identified in either the exon 11 splice junction or intron 11; these increase activation of the cryptic splice site, thus producing progerin. These are referred to as "non-classic" HGPS and comprise the remaining 10% of HGPS cases (refer to Appendix). The mutated prelamin A is referred to as progerin. Accumulation of progerin causes stiffening of the nuclear membrane and disorganized nuclear pores and chromatin, leading to hallmark symptoms including rapidly progressive atherosclerosis. Severe, rapidly progressing atherosclerosis results in an average mortality at 14.6 years of age due to myocardial infarction or stroke.[4] It is estimated that 50% of affected children have had a radiographically detectable stroke by 8 years of age.

Progeroid Laminopathies

To date, over 400 mutations in the LMNA gene have been identified, giving rise to different laminopathies which encompass a range of phenotypes including muscular dystrophy, peripheral neuropathy, lipodystrophy, and premature aging diseases.[4] Some of these may have phenotypic overlap with HGPS ("progeroid" laminopathies).[5,6] In addition, pathogenic variants in *ZMPSTE24* can result in excess prelamin A proteins and a related phenotype. As of September 30, 2020, there were 13 patients identified with progeroid laminopathies in the US.[3] Of note; clinical data are not available regarding effect of Zokinvy in patients with progeroid laminopathies; the pivotal study only included patients with HGPS.

Guidelines

Formal guidelines for progeria are not in place. The Progeria Research Foundation provides a Progeria Handbook (updated March 2019) with information about the disease for patients and families, as well as for healthcare providers.[6] Clinical data with Zokinvy are acknowledged in the handbook as having positive results with regard to cardiovascular, bone, and survival outcomes. Diagnosis is made on the basis of clinical examination and genetic testing. It is noted that other progeroid laminopathies are closely related genetic diseases about which less is known. These conditions may be more or less severe than HGPS. Applying knowledge from classic progeria (i.e., HGPS) to other progeroid syndromes may be helpful, but good judgment must be applied since patients with other progeroid syndromes will have different needs.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Zokinvy. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Zokinvy as well as the monitoring required for adverse events and long-term efficacy, approval requires Zokinvy to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zokinvy is recommended in those who meet the following criteria:

FDA-Approved Indications

272. Hutchinson-Gilford Progeria Syndrome. Approve for 1 year if the patient meets the following criteria (A, B, C, and D):

- **A)** Patient is ≥ 12 months of age; AND
- **B)** Patient has a body surface area of ≥ 0.39 m^2; AND
- **C)** Genetic testing demonstrates a confirmed pathogenic mutation in the *LMNA* gene consistent with Hutchinson-Gilford Progeria Syndrome; AND
  Note: Refer to Appendix for listing of genetic mutations associated with Hutchinson-Gilford Progeria Syndrome.
- **D)** The medication is prescribed by or in consultation with a geneticist or pediatric cardiologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Zokinvy is not recommended in the following situations:

278. Progeroid Laminopathies. The efficacy of Zokinvy has not been established for patients with genetic disorders other than Hutchinson-Gilford Progeria Syndrome.[2] Although FDA labeling includes processing-deficient progeroid laminopathies, there are no clinical data demonstrating a treatment effect of Zokinvy in this population. Zokinvy is not indicated for use in processing-proficient progeroid laminopathies; based on its mechanism of action, Zokinvy would not be expected to be effective in this population.[1]

279. Other Progeroid Syndromes. Zokinvy is not indicated for use in other progeroid syndromes.[1] Based on its mechanism of action, Zokinvy would not be expected to be effective in this population.

280. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
New Policy	--	01/20/2021

APPENDIX

Genetic mutations consistent with a diagnosis of Hutchinson-Gilford Progeria Syndrome are outlined below.[2,3] Of note, all of the following mutations are heterozygous; only one affected gene copy is required for confirmation of the diagnosis.

Appendix Table 1. Genetic Mutations Associated with Hutchinson-Gilford Progeria Syndrome.

Location on *LMNA* Gene	Mutation
Classic Hutchinson-Gilford Progeria Syndrome	
Exon 11	c.1824C>T; p.G608G
Non-Classic Hutchinson-Gilford Progeria Syndrome	
Exon 11	c.1821G>A; p.V607V
Exon 11	c.1822G>A; p.G608S
Exon 11	c.1868C>G; p.T623S
Intron 11	c.1968+1G>A
Intron 11	c.1968+1G>C
Intron 11	c.1968+2T>A
Intron 11	c.1968+2T>C

Intron 11	c.1968+5G>C
