Revised: 3/29/2021

PRIOR AUTHORIZATION POLICY

POLICY: Acthar Gel Prior Authorization Policy
- H.P. Acthar® Gel (repository corticotropin injection for intramuscular or subcutaneous use – Mallinckrodt)

REVIEW DATE: 03/25/2020; selected revision 12/16/2020

OVERVIEW

H.P. Acthar gel (Acthar), an adrenocorticotropic hormone (ACTH) analog, is indicated for the following uses:[1]

- **Infantile spasms** in infants and children less than 2 years of age.
- **Multiple sclerosis (MS) exacerbations** in adults.

Although data are limited, the prescribing information notes that Acthar may also be used for the following disorders and diseases:[1]

- **Allergic states**, such as serum sickness.
- **Collagen diseases**, during an exacerbation or as a maintenance therapy in selected cases of systemic lupus erythematosus and systemic dermatomyositis (polymyositis).
- **Dermatologic diseases**, such as severe erythema multiforme and Stevens-Johnson syndrome.
- **Edematous state** including to induce a diuresis or a remission of proteinuria in the nephrotic syndrome without uremia of the idiopathic type or that due to lupus erythematosus.
- **Respiratory diseases** such as symptomatic sarcoidosis.
- **Rheumatoid disorders**, as an adjunctive therapy for short-term administration (to tide the patient over an acute episode or exacerbation) in psoriatic arthritis, rheumatoid arthritis (including juvenile rheumatoid arthritis) [selected cases may require low-dose maintenance therapy], and ankylosing spondylitis.
- **Ophthalmic diseases** including severe acute and chronic allergic and inflammatory processes involving the eye and its adnexa such as keratitis, iritis, iridocyclitis, diffuse posterior uveitis and choroiditis, optic neuritis, chorioretinitis, and anterior segment inflammation.

Guidelines

Several guidelines discuss Acthar.

- **American Academy of Neurology and the Child Neurology Society** published an evidence-based guideline for the medical treatment of infantile spasms (2012).[2] ACTH is a first-line agent for the short-term treatment of infantile spasms.
- **Infantile Spasms Working Group** published a US consensus report on infantile spasms in 2010.[3] Most patients with this condition (90%) present within the first year of life. ACTH is an effective first-line therapy for infantile spasms.
- **Kidney Disease Improving Global Outcomes (KDIGO)** published clinical practice guidelines for glomerulonephritis (2012).[6] Due to limited data, recommendations cannot be made regarding ACTH.
- **National MS Society** has recommendations regarding corticosteroids in the management of MS (2008).[4] High-dose corticosteroids are the accepted standard of care short-term. The most common regimen is 500 to 1,000 mg of intravenous methylprednisolone given daily for 3 to 5 days, with or without an oral steroid tapering regimen (most often prednisone) for 1 to 3 weeks. Acthar and high-dose intravenous methylprednisolone have been shown to possess similar efficacy in the management of MS relapses.[5]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Acthar. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Acthar as well as monitoring required for adverse events and efficacy, approval requires Acthar to be prescribed by or in consultation with a physician who specializes in the conditions being treated. All denials will be forwarded to the Medical Director.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Acthar is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **Infantile Spasms, Treatment.** Approve Acthar for 1 month if the patient meets the following criteria (A and B):
   A) Child is less than 2 years of age; AND
   B) Medication is prescribed by a physician who has consulted with or specializes in neurology.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Acthar is not recommended in the following situations:

1. **Multiple Sclerosis (MS) as "Pulse Therapy" on a Monthly Basis.** Preliminary data have investigated use of Acthar given as 80 units administered intramuscularly once a day for 3 days once a month.[7] This is not an accepted use of Acthar and more data are needed.

2. **Treatment of Proteinuria in Diabetic Nephropathy.** At this time, limited data are available[8] and Acthar is not established for this use.

3. **Treatment of Nephrotic Syndrome.** Very limited data have investigated the use of Acthar in patients with diagnoses including idiopathic membranous nephropathy, membranoproliferative glomerulonephritis, focal segmental glomerulosclerosis, minimal change disease, immunoglobulin A nephropathy, class V SLE glomerulonephritis, monoclonal diffuse proliferative glomerulonephritis, and lupus nephritis.[9-25] Recommendations for use cannot be made at this time.

4. **Dermatomyositis or Polymyositis.** Data are limited in this clinical scenario[26,27] and controlled trials are needed before Acthar can be considered an established or recommended therapy.

5. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Selected Revision	Documentation is now required to confirm that the patient is treating an acute exacerbation of multiple sclerosis.	07/11/2018
Early Annual Revision	No criteria changes	07/25/2018
Early Annual Revision	The criteria regarding the treatment of acute exacerbations of multiple sclerosis in adults were removed. No recent quality data have emerged regarding this condition of use and other agents, such as intravenous methylprednisolone, are preferred in these clinical scenarios. Individual circumstances should be reviewed on a case-by-case basis, as needed.	04/10/2019 (effective 7/1/2019)
Selected Revision	The following criteria changes were made: 1. **Infantile Spasms, Treatment:** The criterion regarding age was changed from patients < 5 years of age to < 2 years of age. Regarding the requirement of a specialist, an epileptologist was removed from the criteria; the requirement that the medication be prescribed by or in consultation with a neurologist remains.	09/25/2019
Annual Revision	In the Policy Statement, wording was added that all reviews will be forwarded to the Medical Director.	03/25/2020 (effective 4/1/2020)
Update	08/26/2020: No criteria changes. The Policy Statement was change to reflect that all denials will be forwarded to the Medical Director. Previously all reviews were going to the medical director.	08/26/2020
Selected Revision	**Infantile Spasms – Treatment:** Criteria for specialist changed from "Acthar is prescribed by or in consultation with a neurologist" to "Medication is prescribed by a physician who has consulted with or specializes in neurology."	12/16/2020

PRIOR AUTHORIZATION POLICY

POLICY: Allergen Immunotherapy – Grass Pollen Sublingual Products Prior Authorization Policy

- Grastek® (Timothy grass pollen allergen extract sublingual tablets – ALK-Abello)
- Oralair® (Sweet Vernal, Orchard, Perennial Rye, Timothy, and Kentucky Blue Grass mixed pollens allergen extract sublingual tablets – Stallergenes/Greer)

REVIEW DATE: 08/05/2020

OVERVIEW

Grastek and Oralair are grass pollen allergen extract sublingual tablets.[1,2] Grastek is a Timothy grass pollen allergen extract.[1] Oralair is a five-grass mixed pollen allergen extract.[2] Grastek and Oralair are indicated for:

- **Allergic rhinitis**, with or without conjunctivitis, that has been confirmed by a positive skin test or *in vitro* test for pollen-specific immunoglobulin E (IgE) antibodies for Timothy grass or cross reactive grass pollens (Grastek) or any of the five grasses contained in the product (Oralair). These products are indicated in patients 5 through 65 years of age.

Per product labeling, Grastek must be initiated 12 weeks before the expected onset of each grass pollen season and Oralair must be initiated 4 months before the expected onset of each grass pollen season.[1,2] Both must be continued throughout the season.

Clinical Efficacy

In clinical trials, therapy with the grass pollen sublingual immunoallergen agents prior to and during a single grass pollen season resulted in a 23% to 30% improvement in patients' Total Combined Score (TCS) [a

measurement of both allergic rhinitis with or without conjunctivitis symptoms and relief medication use] compared with placebo.[1,2] Longer-term data demonstrate a 38% to 40% improvement in the TCS with these agents vs. placebo.

Guidelines

Numerous guidelines address allergic rhinitis and allergen immunotherapy. In general, allergen immunotherapy should be considered for patients with allergic rhinitis or allergic asthma and an inadequate response to medical therapy who have evidence of specific IgE antibodies to clinically relevant allergens.[3,4] Grass pollen sublingual immunotherapy tablets are recommended for both short-term and long-term benefit in grass pollen-induced allergic rhinitis with or without conjunctivitis.[5,6]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Grastek and Oralair. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Grastek and Oralair is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Grass Pollen-Induced Allergic Rhinitis.** Approve for 1 year if the patient meets ALL of the following criteria (A, B and C):
   - **A)** Patient is ≥ 5 years of age; AND
   - **B)** The timing of prescribing meets ONE of the following criteria (i or ii):
     - **i.** Grastek: Therapy is initiated 12 weeks prior to the expected onset of the grass pollen season or therapy is being dosed daily continuously for consecutive grass pollen seasons; OR
     - **ii.** Oralair: Therapy is initiated 4 months prior to the expected onset of the grass pollen season; AND
   - **C)** The diagnosis of grass pollen-induced allergic rhinitis is confirmed by meeting ONE of the following conditions (i or ii):
     - **i.** Patient has a positive skin test response to a grass pollen from the Pooideae subfamily of grasses (this includes, but is not limited to: sweet vernal, Kentucky blue grass, Timothy grass, orchard, or perennial rye grass); OR
     - **ii.** Patient has a positive *in vitro* test (i.e., a blood test) for allergen-specific immunoglobulin E (IgE) antibodies for a grass in the Pooideae subfamily of grasses (see examples above).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Grastek and Oralair is not recommended in the following situations:

6. **Concurrent Use of Grastek or Oralair with Subcutaneous Allergen Immunotherapy (e.g., Allergy Shots) or Sublingual Allergen Immunotherapy (e.g., Odactra™ [house dust mite {*Dermatophagoides farina* and *Dermatophagoides pteronyssinus*} allergen extract sublingual tablets], Ragwitek® [short ragweed pollen allergen extract sublingual tablets]).** The efficacy of Grastek and Oralair has not been evaluated in patients who are receiving concomitant allergen immunotherapy.[1] Approved product labeling for both Grastek and Oralair states that concomitant dosing with other allergen immunotherapy may increase the risk of local or systemic adverse events to

either subcutaneous or sublingual allergen immunotherapy. A Joint Practice Parameter specifically addressing sublingual immunotherapy (2017) highlights that no studies have evaluated the efficacy of multiple sublingual immunotherapy tablets administered together.[5] There is a need for further investigation to determine efficacy and optimal formulations for multi-allergen sublingual immunotherapy.

7. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Allergen Immunotherapy - Odactra Prior Authorization Policy

- Odactra™ (house dust mite [*Dermatophagoides farina* and *Dermatophagoides pteronyssinus*] allergen extract sublingual tablets – Merck)

REVIEW DATE: 08/05/2020

OVERVIEW

Odactra is a house dust mite allergen extract sublingual tablet indicated as immunotherapy for house dust mite-induced allergic rhinitis, with or without conjunctivitis, confirmed by *in vitro* testing for immunoglobulin E (IgE) antibodies to house dust mites or skin testing to licensed house dust mite allergen extracts.[1] It is approved for use in patients 18 to 65 years of age. Odactra is not indicated for the immediate relief of allergic symptoms.

Clinical Efficacy

In clinical trials involving adult patients (one pivotal study included a small number of pediatric patients), 52 weeks of therapy with Odactra resulted in a 17% to 18% improvement in patients' average Total Combined Rhinitis Score (TCRS) [a measurement of both rhinitis symptoms and relief medication use] compared with placebo.[2,3] In a 24-week environmental exposure chamber study, Odactra therapy resulted in a 48.6% improvement in the average total nasal symptom score (TNSS) compared with placebo.[4] There are limited data with Odactra in patients < 18 years of age as well; however, the safety and efficacy has not been established at this time.[5,6,13]

Guidelines

Several guidelines address allergic rhinitis with or without conjunctivitis, house dust mite allergy, and sublingual immunotherapy. In general, it is recommended that allergen immunotherapy should be considered for patients with allergic rhinitis or allergic asthma and an inadequate response to medical therapy who have evidence of specific IgE antibodies to clinically relevant allergens.[7,8,14] House dust mite sublingual allergen immunotherapy is recommended for long-term benefit in house dust mite-induced allergic rhinitis with or without conjunctivitis (in select guidelines).[9] There is more evidence supporting the use of subcutaneous immunotherapy and therefore, these agents are more widely recommended.[10] However, sublingual immunotherapy is noted to be safe and effective. Additionally, in patients with house-dust mite-driven allergic asthma, house dust mite sublingual immunotherapy tablets have demonstrated a robust effect on several critical asthma parameters (e.g., exacerbations, control, and safety) in adult patients.[11,12] Therefore, house dust mite sublingual immunotherapy is recommended as an add-on to standard asthma therapy in house dust mite-sensitized adults who continue to have asthma exacerbations despite standard therapy.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Odactra. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Odactra is recommended in those who meet the following criteria:

FDA-Approved Indications

2. **House Dust Mite-Induced Allergic Rhinitis.** Approve for 1 year if the patient meets ALL of the following criteria (A and B):
   - **D)** Patient is ≥ 18 years of age; AND
   - **E)** The diagnosis of house dust mite-induced allergic rhinitis is confirmed by meeting ONE of the following conditions (i or ii):
     - **i.** Patient has a positive skin test response to house dust mite allergen extracts; OR
     - **ii.** Patient has a positive *in vitro* test (i.e., a blood test for allergen-specific IgE antibodies) for house dust mite.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Odactra is not recommended in the following situations:

8. **Concurrent Use of Odactra with Subcutaneous Allergen Immunotherapy (e.g., Allergy Shots) or Sublingual Allergen Immunotherapy (e.g., Grastek® [Timothy grass pollen allergen extract sublingual tablets], Oralair® [Sweet Vernal, Orchard, Perennial Rye, Timothy, and Kentucky Blue Grass mixed pollens allergen extract sublingual tablets], Ragwitek® [short ragweed pollen allergen extract sublingual tablets]).** The efficacy and safety of Odactra have not been evaluated in patients who are receiving concomitant allergen immunotherapy.[1] Approved product labeling for Odactra states that concomitant dosing with other allergen immunotherapy may increase the risk of local or systemic adverse events to either the subcutaneous or sublingual allergen immunotherapy.

9. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Allergen Immunotherapy – Palforzia Prior Authorization Policy

- Palforzia® (peanut [*Arachis hypogaea*] allergen powder-dnfp for oral administration – Aimmune Therapeutics)

REVIEW DATE: 02/17/2021

OVERVIEW

Palforzia, an oral immunotherapy, is indicated for the **mitigation of allergic reactions**, including anaphylaxis, that may occur with accidental exposure to peanut.[1] It is approved for use in patients with a confirmed diagnosis of peanut allergy. Initial Dose Escalation may be administered to patients 4 through 17 years of age; Up-Dosing and Maintenance may be continued in patients ≥ 4 years of age. Palforzia is to be used in conjunction with a peanut-avoidant diet. It is not indicated for the emergency treatment of allergic reactions, including anaphylaxis. Prior to initiation, the prescriber should verify that the patient has injectable epinephrine and has been instructed on its appropriate use.

Clinical Efficacy

The Palforzia pivotal study, PALISADE (published) [n = 551 {n = 496 patients 4 to 17 years of age in the intent-to-treat (ITT) analysis}], included patients were required to have a diagnosis of peanut allergy supported by either a serum peanut-specific immunoglobulin E (psIgE) level of ≥ 0.35 allergen-specific unit per liter (kU_A/L) or a mean wheal diameter of at least 3 mm larger than the negative control to a skin-prick test (SPT) for peanut.[2] Additionally, to be eligible for randomization, patients had to have an allergic reaction (with dose-limiting symptoms) to a dose of 100 mg or less of peanut protein (equivalent to approximately one-third of a peanut kernel) during a double-blind, placebo-controlled food challenge (DBPCFC) at screening. Eligible patients were randomized (3:1) to receive either Palforzia or matching placebo administered once daily (QD). Following Initial dose Escalation, Up-Dosing, and 24 weeks of Maintenance Dosing, patients underwent an exit DBPCFC to assess their tolerance to peanut protein. In patients 4 to 17 years of age, 67.2% of patients receiving Palforzia (n = 250/372) were able to tolerate the single dose of 600 mg of peanut protein or more during the exit DBPCFC, compared with 4.0% (n = 5/124) with placebo (treatment difference: 63.2%; P < 0.001).

Guidelines

According to guidelines for the Diagnosis and Management of Food Allergy in the US from the National Institute of Allergy and Infectious Diseases (NIAID) expert panel (2010; 2017 addendum for the prevention of peanut allergy), medical history and a physical examination should guide the diagnosis, but parent and patient reports of food allergy must be confirmed, as 50% to 90% of patient-reported food allergies are not IgE-mediated food allergies.[4] An SPT and allergen-specific IgE testing are each recommended as a method to identify food that provoke allergic reactions. However, each test alone cannot be considered to be diagnostic for food allergy. The NIAID guidelines[3,4], as well as a Joint Task Force practice parameter on food allergy from the American Academy of Allergy, Asthma & Immunology (AAAAI) and the American College of Allergy, Asthma & Immunology (ACAAI)[5] and food allergy and anaphylaxis guidelines from the European Academy of Allergy and Immunology (EAACI) [2014][6] all recommend strict avoidance of peanut as the primary treatment for peanut allergy; anaphylaxis should be managed with epinephrine. These guidelines were published prior to the approval of Palforzia.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Palforzia. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Palforzia as well as the monitoring required for adverse events and long-

term efficacy, approval requires Palforzia to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Palforzia is recommended in those who meet the following criteria:

FDA-Approved Indication

3. Peanut Allergy. Approve for 1 year if the patient meets ALL of the following criteria (A, B, C, D, E, and F):

F) Patient meets ONE of the following (i or ii):
- **i.** Patient is 4 to 17 years of age; OR
- **ii.** Patient is ≥ 18 years of age AND has been previously started on therapy with Palforzia prior to becoming 18 years of age; AND

G) Per the prescriber, the patient has a history of an allergic reaction to peanut that met each of the following (i, ii, and iii):
- **i.** Patient demonstrated signs and symptoms of a significant systemic allergic reaction; AND
  Note: Signs and symptoms of a significant systemic allergic reaction include hives, swelling, wheezing, hypotension, and gastrointestinal symptoms.
- **ii.** This reaction occurred within a short period of time following a known ingestion of peanut or peanut-containing food; AND
- **iii.** The prescriber deemed this reaction significant enough to require a prescription for an epinephrine auto-injector; AND
  Note: Examples of epinephrine auto-injectors include EpiPen, EpiPen Jr., Auvi-Q, and generic epinephrine auto-injectors.

H) Patient has a positive skin prick test (SPT) response to peanut with a wheal diameter ≥ 3 mm larger than the negative control; AND

I) Patient has a positive *in vitro* test (i.e., a blood test) for peanut-specific IgE (psIgE) with a level ≥ 0.35 kU_A/L; AND

J) Per the prescriber, Palforzia will be used in conjunction with a peanut-avoidant diet; AND

K) The medication is prescribed by or in consultation with an allergist or immunologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Palforzia is not recommended in the following situations:

10. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Allergen Immunotherapy – Ragwitek Prior Authorization Policy

- Ragwitek® (short ragweed pollen allergen extract sublingual tablets – ALK-Abello)

REVIEW DATE: 08/05/2020

OVERVIEW

Ragwitek is a ragweed pollen allergen extract sublingual tablet indicated as immunotherapy for the treatment of patients 18 to 65 years of age with short ragweed pollen-induced allergic rhinitis with or without conjunctivitis confirmed by a positive skin test or *in vitro* test for pollen-specific immunoglobulin E (IgE) antibodies for short ragweed pollen.[1] Ragwitek is not indicated for the immediate relief of allergy symptoms. Ragwitek is dosed once daily and must be initiated at least 12 weeks before the expected onset of ragweed pollen season and continued throughout the season.

Clinical Efficacy

Clinical trials enrolled adults with allergic rhinitis with or without conjunctivitis to have their diagnosis confirmed by a positive skin prick test and positive *in vitro* testing for serum IgE antibodies for short ragweed. In these patients, therapy with Ragwitek prior to and during the ragweed pollen season resulted in a 24% to 27% improvement in patients' Total Combined Score (a measurement of both allergic rhinitis with or without conjunctivitis symptoms and relief medication use) compared with placebo.[2,3] Ragwitek has also been evaluated in pediatric patients 5 to 17 years of age with allergic rhinitis with or without conjunctivitis; however, it is not indicated in this patient population.[1,8]

Guidelines

Numerous guidelines address allergic rhinitis and allergen immunotherapy. In general, allergen immunotherapy should be considered for patients with allergic rhinitis or allergic asthma and an inadequate response to medical therapy who have evidence of specific IgE antibodies to clinically relevant allergens.[4-7] FDA-approved sublingual immunotherapy agents, including Ragwitek, are recommended to be used only for the treatment of allergic rhinitis with or without conjunctivitis and not for other off-label conditions.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Ragwitek. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Ragwitek is recommended in those who meet the following criteria:

FDA-Approved Indications

4. Short Ragweed Pollen-Induced Allergic Rhinitis. Approve for 1 year if the patient meets ALL of the following criteria (A, B and C):
- **L)** Patient is ≥ 18 years of age;[1] AND
- **M)** Ragwitek therapy is initiated 12 weeks prior to the expected onset of the short ragweed pollen season; AND
- **N)** The diagnosis of short ragweed pollen-induced allergic rhinitis is confirmed by meeting ONE of the following conditions (i or ii):
  - **i.** Patient has a positive skin test response to short ragweed pollen; OR
  - **ii.** Patient has a positive *in vitro* test (i.e., a blood test) for allergen-specific immunoglobulin E (IgE) antibodies for short ragweed pollen.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Ragwitek is not recommended in the following situations:

11. Concurrent Use of Ragwitek with Subcutaneous Allergen Immunotherapy (e.g., allergy shots) or Sublingual Allergen Immunotherapy (e.g., Grastek® [Timothy grass pollen allergen extract sublingual tablets], Oralair® [Sweet Vernal, Orchard, Perennial Rye, Timothy, and Kentucky Blue Grass mixed pollens allergen extract sublingual tablets], Odactra™ [house dust mite {*Dermatophagoides farina* and *Dermatophagoides pteronyssinus*} allergen extract sublingual tablets]). The efficacy of Ragwitek has not been evaluated in patients who are receiving concomitant allergen immunotherapy.[1] Approved product labeling for Ragwitek states that concomitant dosing with other allergen immunotherapy may increase the risk of local or systemic adverse events to either subcutaneous or sublingual allergen immunotherapy. A Joint Practice Parameter specifically addressing sublingual immunotherapy (2017) highlights that no studies have evaluated the efficacy of multiple sublingual immunotherapy tablets administered together.[8] There is a need for further investigation to determine efficacy and optimal formulations for multi-allergen sublingual immunotherapy.

12. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Alpha$_1$-Proteinase Inhibitor Products Prior Authorization Policy

- Aralast NP™ (alpha$_1$-proteinase inhibitor [human] lyophilized powder – Shire)
- Glassia™ (alpha$_1$-proteinase inhibitor [human] solution – Shire)
- Prolastin®-C and Prolastin®-C Liquid (alpha$_1$-proteinase inhibitor [human] lyophilized powder and solution – Grifols Therapeutics)
- Zemaira® (alpha$_1$-proteinase inhibitor [human] lyophilized powder – CSL Behring)

REVIEW DATE: 10/21/2020

OVERVIEW

Alpha$_1$-proteinase inhibitor (also known as alpha$_1$-antitrypsin [AAT]), is indicated for use as a chronic augmentation and maintenance therapy in adults with alpha$_1$-proteinase deficiency and clinical evidence of emphysema.[1-5] The following products are available commercially in the US: Prolastin-C (also available as Prolastin-C Liquid), Aralast NP, Zemaira, and Glassia. The products vary in their availability and in some of their purification and viral inactivation processes.

Disease Overview

AAT deficiency is a rare, chronic, hereditary, autosomal co-dominant disorder marked by low concentrations of AAT which leads to progressive, severe emphysema that often does not manifest until the third to fourth decades of life.[1] One of the principal functions of AAT is the inhibition of neutrophil elastase, which is responsible for proteolytic degradation of matrix proteins.[6] When AAT is deficient, neutrophil elastase predominates and leads to breakdown of tissues, particularly in the parenchyma of the lungs. AAT can also predispose to liver disease since the protein is synthesized and can accumulate in hepatocytes. A large number of phenotypic variants exist, which have different clinical consequences.[6,7] This disease is most severe in those with null phenotypes (with no detectable circulating AAT in the plasma) or the PI*ZZ variant (AAT levels typically < 35% of normal).[1,7]

The goal of treatment is to increase AAT levels in the lungs to provide adequate anti-elastase activity. Treatment is aimed at raising serum levels of AAT above a theoretical protective threshold of 11 µM, which is equivalent to the tenth percentile of the AAT range of PI*SZ individuals; epidemiological data suggest lower probability of COPD above this level.[6] Of note, older laboratory techniques (e.g., radial immunodiffusion) measured non-purified levels of AAT, which tend to overestimate the concentration by 35% to 40%. To distinguish between non-purified and purified standards, the former are expressed in mg/dL and the latter are expressed in µM. An AAT level of 80 mg/dL measured by radial immunodiffusion corresponds to a plasma AAT level of 11 µM. Alpha$_1$-proteinase inhibitor is the only treatment approved

to correct AAT deficiency. The approved dosage regimen to achieve adequate concentrations in the lung is 60 mg/kg of body weight administered intravenously (IV) once weekly.

Guidelines

A European Respiratory Society (ERS) statement addresses diagnosis and treatment of pulmonary disease in alpha$_1$-antitrypsin deficiency (2017).[8] It is noted that augmentation therapy has been shown to reduce progression of emphysema in severe AATD deficiency. There is no evidence to support efficacy of AAT augmentation therapy for current smokers of any phenotype. These guidelines support earlier American Thoracic Society (ATS)/ERS guidelines (2003) which state that intravenous augmentation therapy is recommended for individuals with established airflow obstruction from AAT deficiency.[7]

The Canadian Thoracic Society updated its guidelines (2012) regarding AAT deficiency testing and augmentation therapy.[9] The guidelines state that evidence supports the consideration of AAT augmentation therapy in non-smoking or ex-smoking patients with COPD due to emphysema and a documented AAT deficiency (level $\leq$ 11 μmol/L). Patients should also be receiving other pharmacological and non-pharmacologic therapies, including comprehensive case management and pulmonary rehabilitation.

The Medical and Scientific Advisory Committee of the Alpha-1 Foundation guidelines (2016) provide similar recommendations.[10] Intravenous alpha$_1$-antitrypsin augmentation is strongly recommended in non-smoking or ex-smoking patients with forced expiratory volume (FEV_1) 30 to 65% of predicted due to well-documented benefit in this group. Weaker recommendations also support treatment of patients with FEV_1 below 30% of predicted or above 65% of predicted. Usual management of COPD should also be provided, with strong emphasis on facilitating tobacco cessation. Of note, AAT replacement therapy is not recommended for patients who continue to smoke.

Other Uses with Supportive Evidence

Although not indicated for this use, alpha$_1$-proteinase inhibitor therapy has been utilized for AAT-associated panniculitis, a rare complication characterized by erythematous nodules and plaques located on subcutaneous (skin) tissue in wide areas of the lower extremities, arms, trunk, and/or face.[11-16] The literature mainly documents case reports.[11-19] In the ATS/ERS 2003 guidelines, it is stated that AAT replacement therapy is a reasonable option for AAT deficiency-associated panniculitis.[7] Although no controlled trials provide a clear treatment recommendation, augmentation therapy with purified human alpha$_1$-proteinase inhibitor or fresh frozen plasma to restore plasma and local tissue levels of AAT appears to be rational, safe, and effective. In a review of treatment options for panniculitis in AAT deficiency, augmentation therapy with alpha$_1$-proteinase inhibitor was noted to be the most successful medical treatment.[20]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of alpha$_1$-proteinase inhibitor. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of alpha$_1$-proteinase inhibitor (e.g., Aralast NP, Glassia, Prolastin-C, Prolastin-C Liquid, Zemaira) is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Alpha$_1$-Antitrypsin Deficiency with Emphysema (or Chronic Obstructive Pulmonary Disease).** Approve for 1 year if the patient meets the following criteria (A, B, and C):
   A) Patient is ≥ 18 years of age; AND
   B) Patient has a baseline (pretreatment) AAT serum concentration of < 80 mg/dL or 11 μM (11 μmol/L); AND
   C) According to the prescriber, the patient is a current non-smoker.

Other Uses with Supportive Evidence

2. **Alpha$_1$-Antitrypsin Deficiency-Associated Panniculitis.** Approve for 1 year if the patient is ≥ 18 years of age.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of alpha1-proteinase inhibitor is not recommended in the following situations:

1. **Alpha$_1$-Antitrypsin Deficiency without Lung Disease, even if Deficiency-Induced Hepatic Disease is Present**. The ATS/ERS standards for the diagnosis and management of individuals with AAT deficiency (2003) state that the pathophysiology of liver disease in AAT deficiency is different from that of lung disease, and the use of alpha$_1$-proteinase inhibitor is not discussed for these patients.[7] There is an absence of information that suggests alpha$_1$-proteinase inhibitor is useful in patients with AAT deficiency-related liver disease.

2. **Bronchiectasis (without alpha$_1$-antitrypsin deficiency).** Studies have not demonstrated alpha$_1$ proteinase inhibitor to be effective for this condition. The ATS/ERS standards for the diagnosis and management of individuals with AAT deficiency (2003) state that despite the well-recognized association between AAT deficiency and the early development of emphysema, only a limited number of studies have assessed the association between AAT deficiency and bronchiectasis.[7] Studies suggest that bronchiectasis is more a result of emphysematous changes in the parenchyma than of AAT deficiency.

3. **Chronic Obstructive Pulmonary Disease (COPD) without Alpha$_1$-Antitrypsin Deficiency.** The Global Initiative for Chronic Obstructive Lung Disease (GOLD) guidelines for the diagnosis, management, and prevention of COPD, updated in 2019, state that never or ex-smokers with an FEV_1 of 35 to 60% of predicted have been suggested as most suitable for AAT deficiency augmentation therapy; newer evidence suggests that individuals with higher FEV_1 values may also be candidates.[21] However, this therapy is not recommended for COPD that is unrelated to AAT deficiency.

4. **Cystic Fibrosis.** The use of alpha$_1$-proteinase inhibitor is considered investigational due to the lack of literature available regarding use of the agent for this disease state and many studies utilized an investigational aerosolized AAT delivery mechanism.[22-23]

5. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Amifampridine Products Prior Authorization Policy

- Firdapse® (amifampridine tablets – Catalyst Pharmaceuticals)
- Ruzurgi® (amifampridine tablets – Jacobus Pharmaceutical)

REVIEW DATE: 06/24/2020

OVERVIEW

Amifampridine is a broad spectrum potassium channel blocker.[1,2] The mechanism by which amifampridine exerts its therapeutic effect in patients with Lambert-Eaton myasthenic syndrome (LEMS) has not been fully elucidated.

- Firdapse is indicated for the treatment of LEMS in adults.[1]
- Ruzurgi is indicated for the treatment of LEMS in patients 6 years to < 17 years of age.[2]

Disease Overview

LEMS is a rare autoimmune disorder affecting the connection between nerves and muscles and causing proximal muscle weakness, autonomic dysfunction, and areflexia.[3,4] LEMS can occur at any age. The prevalence of LEMS specifically in pediatric patients is not known, but the overall prevalence of LEMS is estimated to be three per million individuals worldwide.[3] The characteristic weakness is thought to be caused by antibodies generated against the P/Q-type voltage-gated calcium channels (VGCC) present on presynaptic nerve terminals and by diminished release of acetylcholine (ACh).[4] More than half of LEMS cases are associated with small cell lung carcinoma (SCLC), which expresses functional VGCC. The diagnosis of LEMS is confirmed by electrodiagnostic studies, including repetitive nerve stimulation (RNS), or anti-P/Q-type VGCC antibody testing to confirm the diagnosis.

Clinical Efficacy

Firdapse was approved based on two pivotal trials.[1,5] One pivotal trial enrolled both amifampridine-naïve and treatment-experienced patients; patients were initially entered into an open-label run-in phase lasting 90 days.[5] During the open-label run-in phase, Firdapse was titrated for each individual patient to a dose that produced optimal neuromuscular benefit and tolerability in the opinion of the investigator. In order to continue in the study, treatment-naïve patients were required to have an improvement of at least three points in the quantitative myasthenia gravis score from the initial evaluation.

Although Ruzurgi is indicated for use in children, the efficacy of Ruzurgi for the treatment of LEMS was established in one randomized, double-blind, placebo-controlled, withdrawal study in adults with an established diagnosis of LEMS (n = 32).[2] Patients were required to be on an adequate and stable dosage for ≥ 3 months of Ruzurgi prior to entering the study. The efficacy of Ruzurgi in patients 6 to < 17 years of age is supported by evidence from adequate and well-controlled studies of Ruzurgi in adults with LEMS, pharmacokinetic data in adult patients, pharmacokinetic modeling and simulation to identify the dosing regimen in pediatric patients, and safety data from pediatric patients 6 to < 17 years of age.

Safety

Firdapse and Ruzurgi are contraindicated in patients with a history of seizures.[1,2] There is also a Warning/Precaution in the prescribing information for these medications because seizures have been observed in patients with and without a history of seizures taking amifampridine at the recommended doses. Many of these patients were taking medications or had comorbidities that may have lowered their seizure threshold. Seizures may be dose-dependent.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of amifampridine. Because of the specialized skills required for evaluation and diagnosis of patients treated with amifampridine as well as the monitoring required for adverse events and long-term efficacy, initial approval requires amifampridine to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of amifampridine is recommended in those who meet the following criteria:

FDA-Approved Indications

5. **Lambert-Eaton Myasthenic Syndrome (LEMS).** Approve amifampridine for the duration noted if the patient meets ONE of the following criteria (A or B):
   - **A)** Initial therapy. Approve amifampridine for 3 months if the patient meets the following criteria (i, ii, iii, and iv):
     - **i.** Patient is ≥ 6 years of age; AND
     - **ii.** Patient has confirmed LEMS based on at least one electrodiagnostic study (e.g., repetitive nerve stimulation) or anti-P/Q-type voltage-gated calcium channels antibody testing, according to the prescriber; AND
     - **iii.** Patient does not have a history of seizures; AND
     - **iv.** Amifampridine is being prescribed by or in consultation with a neurologist or a neuromuscular specialist; OR
   - **B)** Patient is Currently Receiving amifampridine. Approve amifampridine for 1 year if the patient is continuing to derive benefit from amifampridine, according to the prescriber.
     Note: Examples of continued benefit include improved muscle strength and improvements in mobility.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of amifampridine is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REVIEW DATE: 10/28/2020

OVERVIEW

Onpattro, a lipid nanoparticle formulated RNA interference (RNAi) therapeutic, is indicated for treatment of adults with **polyneuropathy of hereditary amyloid transthyretin amyloidosis (hATTR)**.[1] hATTR is a rare, inherited, rapidly-progressive, debilitating, life-threatening disease.[2-4] It is a multisystem condition caused by mutation in the transthyretin (TTR) gene that results in misfolded TTR protein accumulation (as amyloid) in the nerves, heart, and other areas of the body. Onpattro targets hepatic production of mutant TTR. By reducing the unstable circulating TTR tetramers, organ deposition of amyloid is prevented, thus, stabilizing or improving symptoms of neuropathy.

Guidelines

There is a European consensus for diagnosis, management, and treatment of transthyretin familial amyloid polyneuropathy (2016). Symptomatic management associated with sensory-motor neuropathy and autonomic dysfunction should be started at diagnosis.[3] This may include painkillers, antidiarrheal drugs, treatment of symptomatic orthostatic hypotension, diuretics for heart failure, prophylactic pacemaker implantation for conduction disorders, and/or vitrectomy/trabeculectomy for ocular amyloidosis or glaucoma. Tetramer stabilizers (tafamidis and diflunisal) are mentioned as treatment options that slow the rate of amyloidogenesis by preventing the dissociation, misfolding, and misassembly of mutated TTR. Tafamidis is recommended for use in patients with Stage 1 disease. Those presenting with Stage 2 disease are recommended for a clinical trial with an antisense oligonucleotide, small interfering RNA, doxycycline-tauroursodeoxycholic acid, or off-label use of diflunisal. For symptomatic relief of neuropathic pain due to hATTR, pregabalin, gabapentin, amitriptyline, and duloxetine are potential treatments.[5,6] Prior to the availability of drug therapies, liver transplantation (which removes the main source of mutated TTR) was the only treatment option for hATTR.[2]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Onpattro. All approvals are provided for the duration noted below. Because of the of the specialized skills required for evaluation and diagnosis of patients treated with Onpattro as well as the monitoring required for adverse events and long-term efficacy, approval requires Onpattro to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Onpattro is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **Polyneuropathy of Hereditary Transthyretin-Mediated Amyloidosis (hATTR).** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, E, and F):
   - **A)** Patient is ≥18 years of age; AND
   - **B)** Patient has a transthyretin (TTR) mutation as confirmed by genetic testing; AND
   - **C)** Patient has symptomatic polyneuropathy; AND
     Note: Examples of symptomatic polyneuropathy include reduced motor strength/coordination, and impaired sensation (e.g., pain, temperature, vibration, touch). Examples of assessments for symptomatic disease include history and clinical exam, electromyography, or nerve conduction velocity testing.
   - **D)** Patient has tried or is currently receiving at least one systemic agent for symptoms of polyneuropathy from one of the following pharmacologic classes: a gabapentin-type product, duloxetine, or a tricyclic antidepressant; AND
     Note: Examples of gabapentin-type products include gabapentin (Neurontin) and pregabalin (Lyrica). Examples of tricyclic antidepressants include amitriptyline and nortriptyline.
   - **E)** The patient does not have a history of liver transplantation; AND
   - **F)** The medication is prescribed by or in consultation with a neurologist, geneticist, or a physician who specializes in the treatment of amyloidosis.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Onpattro is not recommended in the following situations:

13. **Concomitant Use With Tegsedi (inotersen subcutaneous injection) or a Tafamidis Product.** Note: Examples of tafamidis products are Vyndaqel and Vyndamax. There are insufficient data supporting the safety and efficacy of concurrent use of these agents for ATTR-PN. The Vyndaqel/Vyndamax pivotal trial, which took place prior when Onpattro and Tegsedi were under investigation for amyloidosis, did not include patients who were taking investigational drugs. The pivotal trials for Onpattro and Tegsedi did not allow concurrent use of tetramer stabilizers (e.g., tafamidis, diflunisal). A Phase II open-label extension study (n = 27) included 13 patients who were treated concomitantly with Onpattro and tafamidis.[7] Following 24 months of treatment, there was no significant difference in the median serum TTR percent change from baseline with concomitant Onpattro and tafamidis (-80%) vs. Onpattro monotherapy (-88%).

14. Coverage is not recommended for circumstances *not* listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Early Annual Revision	**Polyneuropathy of Hereditary Transthyretin-Mediated Amyloidosis:** Add criteria to require patients to have tried or be currently taking a gabapentin-type product or a tricyclic antidepressant.	10/03/2018
Update	10/30/2018: For hereditary transthyretin-mediated amyloidosis, remove the word "documentation" from criterion that requires genetic testing for the transthyretin (TTR) gene mutation. This edit is intended to clarify that documentation is not required to be submitted for approval.	N/A
Annual Revision	**Polyneuropathy of Hereditary Transthyretin-Mediated Amyloidosis:** The dose was clarified to be up to the maximum dose and shortest treatment interval. Duloxetine was added as a systemic agent that may be tried prior to Onpattro. **Conditions Not Recommended for Approval:** Concomitant use with Tegsedi or tafamidis products was added to the list of conditions not recommended for coverage.	10/16/2019
Annual Revision	**Polyneuropathy of Hereditary Transthyretin-Mediated Amyloidosis:** To align with the approved labeling, criteria for symptomatic disease was reworded to require polyneuropathy (previously required peripheral neuropathy). Clinical exam, electromyography, or nerve conduction velocity testing were added as examples of assessments to confirm systematic disease. A criterion was also added to require that the patient does not have a history of liver transplantation.	10/28/2020

PRIOR AUTHORIZATION POLICY

POLICY: Amyloidosis – Tafamidis Products

- Vyndaqel (tafamidis meglumine capsules – Pfizer)
- Vyndamax (tafamidis capsules – Pfizer)

REVIEW DATE: 10/28/2020

OVERVIEW

Vyndaqel and Vyndamax, selective stabilizers of transthyretin (TTR), are indicated for the treatment of the **cardiomyopathy of wild-type or hereditary TTR-mediated amyloidosis** (ATTR-CM) in adults to reduce cardiovascular mortality and cardiovascular-related hospitalization.[1] Studies excluded patients with New York Heart Association class IV disease.[2]

Disease Overview

In ATTR-CM, there is misfolding of the TTR protein resulting in accumulation of amyloid in the heart causing thickening of both ventricles.[2-6] ATTR-CM may be suspected following cardiac imaging (e.g., echocardiogram, cardiac magnetic imaging). Subsequent testing (e.g., scintigraphy or biopsy) confirms the diagnosis of ATTR-CM. Endomyocardial biopsy is almost 100% sensitive for diagnosis of transthyretin amyloidosis and is the gold standard for diagnosis. Biopsy can confirm if ATTR-CM is due to a hereditary mutant variant of TTR vs. an acquired wild-type variant. In patients with confirmed cardiac amyloidosis, TTR gene sequencing aids in treatment decisions and is necessary for genetic counseling in relatives of patients with a TTR variant. Although many mutations have been identified, mutation of V122I is the most common in the US. This mutation is present in 3% to 4% of African Americans and is associated with amyloid cardiomyopathy. Vyndaqel and Vyndamax bind to TTR at the thyroxine binding sites and stabilize the tetramer. This slows dissociation into monomers, which is the rate-limiting step in the amyloidogenic process.[1]

Guidelines

The Cleveland Clinic amyloidosis center has an update on the diagnosis and treatment of cardiac amyloidosis (2017), published prior to approval of Vyndaqel and Vyndamax in the US.[5] Treatment of

ATTR-CM focuses on management of cardiac symptoms and treating the underlying disease. Liver transplantation is a potential treatment for the hereditary mutant variant of TTR but not for wild-type disease. Heart transplantation (sometimes in combination with liver transplantation) is a treatment option for patients with both wild-type and hereditary variants of ATTR-CM. Although limited data are available, the following three pharmacologic classes were discussed for treatment or future treatment of the underlying ATTR-CM disease process: 1) agents that block TTR synthesis; 2) therapies that stabilize the TTR tetramer (e.g., tafamidis, diflunisal); and 3) agents that disrupt and clear the ATTR amyloid fibril (e.g., doxycycline).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of tafamidis products (Vyndaqel and Vyndamax). Because of the specialized skills required for evaluation and diagnosis of patients treated with Vyndaqel and Vyndamax as well as the monitoring required for adverse events and long-term efficacy, initial approval requires the agent to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Vyndaqel and Vyndamax is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Cardiomyopathy of Wild-Type or Hereditary Transthyretin Amyloidosis.** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):
   - **A)** Patient is 18 years of age or older; AND
   - **B)** The diagnosis was confirmed by one of the following (i, ii, or iii):
     - **i.** A technetium pyrophosphate scan (i.e., nuclear scintigraphy); OR
     - **ii.** Amyloid deposits are identified on cardiac biopsy; OR
     - **iii.** Patient had genetic testing which, according to the prescriber, identified a transthyretin (TTR) mutation; AND
       Note: Examples of TTR mutations include Val122Ile mutation and Thr60Ala mutation. If the patient has wild-type amyloidosis, this is **not** a TTR mutation.
   - **C)** Diagnostic cardiac imaging has demonstrated cardiac involvement; AND
     Note: Examples of cardiac imaging include echocardiogram and cardiac magnetic imaging. Examples of cardiac involvement on imaging include increased thickness of the ventricular wall or interventricular septum.
   - **D)** Patient has heart failure, but does **not** have New York Heart Association class IV disease; AND
   - **E)** The medication is prescribed by or in consultation with a cardiologist or a physician who specializes in the treatment of amyloidosis.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tafamidis products (Vyndaqel and Vyndamax) is not recommended in the following situations:

15. **Concomitant Use With Onpattro (patisiran lipid complex intravenous infusion) or Tegsedi (inotersen subcutaneous injection).** There are no data supporting the safety and efficacy of concurrent use with Vyndaqel/Vyndamax. The Vyndaqel/Vyndamax pivotal trial, which took place

prior when Onpattro and Tegsedi were under investigation for amyloidosis, did not include patients who were taking investigational drugs. The pivotal trials for Onpattro and Tegsedi did not allow concurrent use of tetramer stabilizers (e.g., tafamidis, diflunisal). A Phase II open-label extension study, included 13 patients who were treated with concomitantly with Onpattro and tafamidis.[7] Following 24 months of treatment, there was not significant difference in the median serum TTR percent change from baseline with comcomitant Onpattro and tafamidis (-80%) vs. Onpattro monotherapy (-88%).

16. **Concurrent Use of Vyndaqel and Vyndamax.** There are no data available to support concomitant use.

17. **Polyneuropathy of Hereditary Transthyretin–Mediated Amyloidosis (hATTR)** [Note: For patients with hATTR and cardiomyopathy or mixed phenotype {concurrent cardiomyopathy and polyneuropathy}, refer to FDA-Approved Indication, above]. Neither Vndaqel nor Vyndamax are indicated for treatment of symptoms of polyneuropathy associated with hATTR.

18. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Amyloidosis – Tegsedi Utilization Review Medical Policy

- Tegsedi® (inotersen injection for subcutaneous use – Ionis/Akcea Therapeutics)

REVIEW DATE: 10/28/2020

OVERVIEW

Tegsedi, an antisense oligonucleotide indicated for treatment of adults with **polyneuropathy of hereditary transthyretin-mediated amyloidosis (hATTR)**.[1] hATTR is a rare, inherited, rapidly-progressive, debilitating, life-threatening disease.[2-3] It is a multisystem condition caused by mutation in the transthyretin (TTR) gene that results in misfolded TTR protein accumulation (as amyloid) in the nerves, heart, and other areas of the body. Tegsedi binds to TTR messenger RNA, causing degradation of mutant and wild-type TTR mRNA. This reduces serum TTR protein and TTR protein deposits in tissues.[1]

Guidelines

A European consensus for diagnosis, management, and treatment of transthyretin familial amyloid polyneuropathy (2016) was published prior to approval of Tegsedi and Onpattro.[2] Symptomatic management associated with sensory-motor neuropathy and autonomic dysfunction should be started at diagnosis. This may include painkillers, antidiarrheal drugs, treatment of symptomatic orthostatic hypotension, diuretics for heart failure, prophylactic pacemaker implantation for conduction disorders, and/or vitrectomy/trabeculectomy for ocular amyloidosis or glaucoma. Tetramer stabilizers (tafamidis and diflunisal) are mentioned as treatment options that slow the rate of amyloidogenesis by preventing the dissociation, misfolding, and misassembly of mutated TTR. Tafamidis is recommended for use in patients with Stage 1 disease. Those presenting with Stage 2 disease are recommended for a clinical trial with an antisense oligonucleotide, small interfering RNA, doxycycline-tauroursodeoxycholic acid, or off-

label use of diflunisal. For the clinical symptoms associated with neuropathic pain due to hATTR, pregabalin, gabapentin, amitriptyline, and duloxetine are potential treatments.[5,6] Prior to the availability of drug therapies, liver transplantation (which removes the main source of mutated TTR) was the only treatment option for hATTR.[2]

Safety

Tegsedi has a Boxed Warning regarding sudden and unpredictable thrombocytopenia which may be life-threatening.[1] It is contraindicated in patients with a platelet count less than 100 x 10^9/L. Based on monitoring, Tegsedi may need to be interrupted or discontinued. Following discontinuation, continue to monitor platelet counts for 8 weeks (or longer if platelet count is less than 100 x 10^9/L). Tegsedi also has a Boxed Warning regarding glomerulonephritis, which may require immunosuppressive treatment and may lead to dialysis-dependent renal failure. Due to the risks and frequent monitoring for both serious bleeding caused by severe thrombocytopenia and because of glomerulonephritis, Tegsedi is only available through a restricted distribution program under the Tegsedi REMS (Risk Evaluation and Mitigation Strategy).

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Tegsedi. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Tegsedi as well as the monitoring required for adverse events and long-term efficacy, approval requires Tegsedi to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tegsedi is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **Polyneuropathy of Hereditary Transthyretin–Mediated Amyloidosis (hATTR).** Approve for 1 year if the patient meets ALL of the following (A, B, C, D, E, and F):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has a transthyretin (TTR) mutation as confirmed by genetic testing; AND
   - **C)** Patient has symptomatic polyneuropathy; AND
     Note: Examples of polyneuropathy include reduced motor strength/coordination, and impaired sensation (e.g., pain, temperature, vibration, touch). Examples of assessments for symptomatic disease include history and clinical exam, electromyography, or nerve conduction velocity testing.
   - **D)** Patient has tried or is currently receiving at least one systemic agent for symptoms of polyneuropathy from one of the following pharmacologic classes: a gabapentin-type product, duloxetine, or a tricyclic antidepressant; AND
     Note: Examples of gabapentin-type products include gabapentin (Neurontin) and pregabalin (Lyrica). Examples of tricyclic antidepressants include amitriptyline and nortriptyline.
   - **E)** Patient does not have a history of liver transplantation; AND
   - **F)** The medication is prescribed by or in consultation with a neurologist, geneticist, or a physician who specializes in the treatment of amyloidosis.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tegsedi is not recommended in the following situations:

19. **Concomitant Use With Onpattro (patisiran lipid complex intravenous infusion) or a Tafamidis Product.** Note: Examples of tafamidis products are Vyndaqel and Vyndamax. There are insufficient data supporting the safety and efficacy of concurrent use of these agents for ATTR-PN. The Vyndaqel/Vyndamax pivotal trial, which took place prior when Onpattro and Tegsedi were under investigation for amyloidosis, did not include patients who were taking investigational drugs. The pivotal trials for Onpattro and Tegsedi did not allow concurrent use of tetramer stabilizers (e.g., tafamidis, diflunisal). There is a Phase II open-label extension study (n = 27) using

Onpattro that included 13 patients who were treated concomitantly with tafamidis.[7] Following 24 months of treatment, there was no significant difference in the median serum TTR percent change from baseline with concomitant Onpattro and tafamidis (-80%) vs. Onpattro monotherapy (-88%).

20. Coverage is not recommended for circumstances *not* listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Antibiotics – Linezolid (Zyvox), Sivextro Prior Authorization Policy

- Linezolid tablets, oral suspension (Zyvox® – Pfizer, generics)
- Sivextro™ (tedizolid phosphate tablets – Cubist Pharmaceuticals)

REVIEW DATE: 10/14/2020

OVERVIEW

Linezolid (Zyvox) and Sivextro are synthetic oxazolidinone antimicrobial agents.[1-2] Both agents have clinical utility in the treatment of infections caused by aerobic Gram-positive bacteria. Cross-resistance between linezolid or Sivextro and other classes of antibiotics is unlikely because the mechanism of action for both of these agents differs from that of other antibacterial agents.

Linezolid is indicated in adults and children for the treatment of the following infections caused by susceptible strains of the designated microorganisms:[1]

- **Community-acquired pneumonia** (CAP), caused by *S. pneumoniae*, including cases with concurrent bacteremia, or *S. aureus* (MSSA only);
- **Complicated skin and skin structure infections** (cSSTIs), including diabetic foot infections, without concomitant osteomyelitis caused by *S. aureus* (MSSA and MRSA), *Streptococcus pyogenes,* or *Streptococcus agalactiae.* Zyvox has not been studied in the treatment of decubitus ulcers;
- **Nosocomial pneumonia**, caused by *Staphylococcus aureus* (methicillin-susceptible [MSSA] and methicillin-resistant strains [MRSA]), or *Streptococcus pneumoniae*;
- **Uncomplicated skin and skin structure infections** (SSTIs), caused by *S. aureus* (MSSA only) or *S. pyogenes*;
- **Vancomycin-resistant *Enterococcus faecium* (VRE) infections**, including cases with concurrent bacteremia.

Sivextro is indicated for the treatment of acute bacterial skin and skin structure infections (ABSSSI) in adults and pediatric patients ≥ 12 years of age that are caused by susceptible isolates of the following Gram-positive microorganisms: *S. aureus* (MRSA and MSSA), *S. pyogenes*, *S. agalactiae*, *Streptococcus anginosus* Group (including *S. anginosus*, *Streptococcus intermedius*, and *Streptococcus constellatus*), and *Enterococcus faecalis*.[2]

Although linezolid and Sivextro are indicated for susceptible strains of MSSA and drug-resistant strains of *S. pneumoniae* in some situations, it is not the optimal drug or drug of first-choice for these microorganisms.[3-4] Other antibiotics may be used. In efforts to reduce the development of drug-resistant bacteria and maintain effectiveness of linezolid and Sivextro, both antibiotics should be used only to treat infections that are proven or strongly suspected to be caused by susceptible bacteria.[1,2] When culture and susceptibility information are available, they should be considered in selecting or modifying antibacterial therapy. In the absence of such data, local epidemiology and susceptibility patterns may contribute to the empiric selection of therapy.

Guidelines

Diabetic Foot Infections

A clinical practice guideline for the diagnosis and treatment of diabetic foot infections (Infectious Diseases Society of America [IDSA] 2012) notes that diabetic foot infections of moderate severity may be treated with oral or initial parenteral therapy, while severe infections should be treated with parenteral therapy.[6] Linezolid, Cubicin® (daptomycin injection), and intravenous (IV) vancomycin are listed as therapy options for infections caused by MRSA (linezolid is the only oral therapy in this grouping).

Infective Endocarditis

Treatment guidelines, from the American Heart Association and endorsed by the IDSA (2015), recommend linezolid as a treatment option for patients with infective endocarditis caused by *Enterococcus* species that is resistant to penicillin, aminoglycosides, and vancomycin.[9]

MRSA

The 2011 IDSA guidelines for the treatment of MRSA infections recognize linezolid as a treatment option for other infections including infections of the central nervous system (e.g., meningitis, brain abscess), osteomyelitis, and septic arthritis.[5]

Pneumonia

Guidelines from the American Thoracic Society (ATS) and IDSA (2016) recommend that MRSA hospital-acquired pneumonia (HAP) or ventilator-associated pneumonia (VAP) be treated with either vancomycin or linezolid rather than other antibiotics or other antibiotic combinations.[4] The choice between vancomycin and linezolid may be guided by patient-specific factors such as blood cell counts, concurrent prescriptions for serotonin-reuptake inhibitors, renal function, and cost. The available evidence indicates that vancomycin and linezolid are roughly similar and no alternative agent or regimen is clearly superior to these two products. Guidelines from the IDSA/ATS (2019) for CAP recommend vancomycin or linezolid for the treatment of community-acquired MRSA.[3] In addition, the Pediatric Infectious Disease Society and the IDSA guidelines (2011) for the treatment of CAP in infants and children > 3 months of age recommend linezolid as an alternative to vancomycin for treatment of MRSA, and as an alternative to ceftriaxone for the treatment of *S. pneumoniae* resistant to penicillin.[8]

Skin and Soft Tissue Infections (SSTIs)

According to the IDSA guidelines (2014) for the diagnosis and management of SSTIs, for mild nonpurulent (i.e., necrotizing infection, cellulitis, erysipelas) SSTI, oral antibiotics such as penicillin VK, cephalosporin, dicloxacillin, or clindamycin can be used.[7] For moderate nonpurulent SSTI, IV antibiotics such as penicillin, ceftriaxone, cefazolin, or clindamycin are recommended. For moderate purulent SSTIs, empiric treatment can be started with trimethoprim/sulfamethoxazole (TMP/SMX) or doxycycline. For MRSA infections, TMP/SMX is the recommended therapy. Cephalexin or dicloxacillin are usually effective for MSSA infections. For severe purulent SSTI, empiric therapy with IV vancomycin, Cubicin, linezolid, Vibativ® (telavancin powder for injection), or Teflaro® (ceftaroline powder for injection) are recommended. All of these agents are active against MRSA strains. For severe purulent SSTI caused by MSSA, therapy can be switched to nafcillin, cefazolin, or clindamycin.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of linezolid and Sivextro. All approvals are provided for the duration noted below. In cases where approval is in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

A. Coverage of linezolid is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Vancomycin-Resistant *Enterococcus* (VRE) Species Infection, Treatment**. Approve for 1 month.

2. **Methicillin-Resistant *Staphylococcus* Species Infection, Treatment**. Approve for 1 month.

Other Uses with Supportive Evidence

3. **Continuation of Linezolid Therapy.** Approve for 1 month in patients who meet ONE of the following criteria (a or b):
   - **a)** Patient is transitioning from intravenous (IV) linezolid or IV vancomycin to oral linezolid therapy; OR
   - **b)** Patient was started on oral linezolid in an inpatient facility and is continuing therapy.

4. **Treatment of an Infection that is Resistant to Other Antibiotics, but the Organism is Sensitive to Linezolid.** Approve for 1 month.

5. **There is Insufficient Information Available to Make a Determination Regarding Coverage and the Prescriber or Representative Cannot be Contacted.** Approve for up to 2 weeks of therapy.

   To avoid delays or disruption in therapy for the patient, if there is insufficient information available to make a determination regarding coverage and the prescriber or representative of the prescriber cannot be contacted, approve linezolid for up to 2 weeks.

B. Coverage of Sivextro is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Acute Bacterial Skin and Skin Structure Infections (ABSSSI) Caused by Methicillin-Resistant *Staphylococcus aureus* (MRSA), Selected *Streptococcus* Species (i.e., *Streptococcus pyogenes*, *Streptococcus agalactiae, Streptococcus anginosus* Group) and *Enterococcus faecalis*.** Approve for up to 6 days of therapy.

Other Uses with Supportive Evidence

2. **Continuation of Sivextro Therapy in the Outpatient Setting.** Approve for up to 6 days of therapy in patients transitioning from Sivextro IV therapy to oral therapy.

3. **There is Insufficient Information Available to Make a Determination Regarding Coverage and the Prescriber or Representative Cannot be Contacted.** Approve for up to 6 days of therapy.

   To avoid delays or disruption in therapy for the patient, if there is insufficient information available to make a determination regarding coverage and the prescriber or representative of the prescriber cannot be contacted, approve Sivextro. Since the available data for Sivextro only supports up to 6 days of therapy for the ABSSSI indication, we are limiting approval to this duration.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of linezolid and Sivextro is not recommended in the following situations:

21. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria for both linezolid and Sivextro. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Antibiotics – Synercid® (quinupristin and dalfopristin powder for injection – Pfizer)

DATE REVIEWED: 06/10/2020

OVERVIEW

Synercid is a combination of two streptogramin antibiotics, quinupristin and dalfopristin mixed in a 30:70 ratio.[1] Dalfopristin and quinupristin work synergistically in the bacterial ribosome where it inhibits early and late phase protein synthesis, respectively. Synercid is bactericidal against methicillin-susceptible and methicillin-resistant staphylococci.

Synercid is indicated in adults for the treatment of complicated skin and skin structure infections caused by *Staphylococcus aureus* (methicillin-susceptible) or *Streptococcus pyogenes*.[1] To reduce the development of drug-resistant bacteria and maintain effectiveness of Synercid, it should only be used to treat or prevent infections that are proven or strongly suspected to be caused by susceptible bacteria. Synercid should be continued for a minimum of 7 days for the treatment of complicated skin and skin structure infections.

Guidelines

Skin and Soft Tissue Infections (SSTIs)

According to the IDSA guidelines (2014) for the diagnosis and management of SSTIs, for mild nonpurulent (i.e., necrotizing infection, cellulitis, erysipelas) SSTI, oral antibiotics such as penicillin VK, cephalosporin, dicloxacillin, or clindamycin can be used.[2] For moderate nonpurulent SSTI, IV antibiotics such as penicillin, ceftriaxone, cefazolin, or clindamycin are recommended. For moderate purulent SSTIs, empiric treatment can be started with trimethoprim/sulfamethoxazole (TMP/SMX) or doxycycline. For methicillin-resistant *Staphylococcus aureus* (MRSA) infections, TMP/SMX is the recommended therapy. Cephalexin or dicloxacillin are usually effective for methicillin-susceptible *Staphylococcus aureus* (MSSA) infections. For severe purulent SSTI, empiric therapy with IV vancomycin, Cubicin, Zyvox, Vibativ® (telavancin powder for injection), or Teflaro® (ceftaroline powder for injection) are recommended. All of these agents are active against MRSA strains. For severe purulent SSTI caused by MSSA, therapy can be switched to nafcillin, cefazolin, or clindamycin. Synercid is recommended as an alternative in patients with severe penicillin hypersensitivity for the treatment of necrotizing infections of the skin, fascia, and muscle.

Other Uses With Supportive Evidence

In pooled data from two prospective, emergency-use studies conducted simultaneously, the safety and efficacy of Synercid was assessed in the treatment of patients (n = 396) with infections caused by vancomycin-resistant *Enterococcus faecium* infection and other gram-positive bacteria.[3] The most common types of infection were intra-abdominal, bacteremia, and urinary tract infections. Patients received Synercid 7.5 mg/kg intravenously (IV) once every 8 hours for a mean of 14.5 ± 10.7 days (range, 1 day to 108 days). The clinical success rate was 73.6% and the microbiologic success rate was 70.5% in the evaluable population. In another prospective, emergency-use study, the safety and efficacy of Synercid was assessed in the treatment of patients (n = 396) with infections caused by vancomycin-resistant *Enterococcus faecium* infection.[4] Bacteremia, intra-abdominal, and skin and skin-structure infections were the most common types of infection. Patients received Synercid 7.5 mg/kg IV every 8 hours for a mean of 13.7 ± 11 days. In the evaluable population, the clinical response rate was 68.8% and the microbiologic response rate was 68.0%. In an open-label trial, patients with nosocomial pneumonia caused by gram-positive bacteria were randomized to Synercid 7.5 mg/kg IV every 8 hours (n = 150) for a mean of 10.1 ± 4.0 days or vancomycin 1 gm every 12 hours (n = 148) for a mean of 9.5 ± 4.1 days.[5] In the bacteriologically evaluable group, clinical success was achieved by 56.3% of the patients receiving Synercid and in 58.3% of the patients receiving vancomycin (difference -2.0%; 95% confidence interval [CI]: -16.8%, 12.8%).

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Synercid. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Synercid is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Skin and Skin Structure Infections, Complicated.** Approve for 1 month if the patient meets the following criteria (A and B):
   - **A)** The patient has an infection that is proven or strongly suspected to be caused by *Staphylococcus aureus* (methicillin-susceptible) or *Streptococcus pyogenes*; AND
   - **B)** The patient has severe penicillin hypersensitivity.

Other Uses with Supportive Evidence

2. **Treatment of an Infection Caused by a Microorganism that is Resistant to At Least Two Other Antibiotics, but the Organism is Sensitive to Synercid**. Approve for 1 month.

3. **Continuation of Synercid Therapy.** Approve for 1 month if the patient was started on Synercid and is continuing a course of therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Synercid has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Antibiotics – Vancomycin Capsules Prior Authorization Policy

- Vancocin® (vancomycin capsules – Ani Pharmaceuticals; generics)

REVIEW DATE: 08/19/2020

OVERVIEW

Vancomycin capsules, an antimicrobial, are indicated for the treatment of *Clostridiodes difficile*- (formerly known as *Clostridium difficile)*-associated diarrhea and for the treatment of enterocolitis caused by *Staphylococcus aureus* (including methicillin-resistant strains).[1] The usual duration of therapy for the treatment of *C. difficile*-associated diarrhea in adults is 10 days and for pediatric patients, the duration is typically 7 to 10 days. The usual duration of therapy for the treatment of Staphylococcal enterocolitis in adults is 7 to 10 days.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of vancomycin capsules when being used in a compounded formulation for foot baths or other formulations co-formulated with one or more of the following: topical clindamycin products, topical clotrimazole products, topical ketoconazole products, and/or topical mupirocin products. All approvals are provided for the duration noted below.

Automation: This Prior Authorization policy will apply to vancomycin capsules when there is a prescription history of topical clindamycin products, topical clotrimazole products, topical ketoconazole products, and/or topical mupirocin products in the past 180 days. Prescriptions for vancomycin capsules without a claims history for topical clindamycin, topical clotrimazole, topical ketoconazole, and/or topical mupirocin products in the past 180 days are excluded from the Prior Authorization policy.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of vancomycin capsules is recommended in those who meet the following criteria:

FDA-Approved Indications

1. ***Clostridiodes Difficile* – Associated Diarrhea.** Approve for 2 weeks.

2. **Enterocolitis – Caused by *Staphylococcus aureus*.** Approve for 2 weeks.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of vancomycin capsules is not recommended in the following situations.

22. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Antibiotics – Xifaxan Prior Authorization Policy

- Xifaxan® (rifaximin tablets – Salix Pharmaceuticals)

REVIEW DATE: 11/18/2020

OVERVIEW

Xifaxan, a rifamycin antibiotic, is indicated for the following uses:[1]

- **Hepatic encephalopathy**, to reduce the risk of overt disease in adults.
- **Irritable bowel syndrome (IBS) with diarrhea**, in adults.
- **Traveler's diarrhea**, caused by noninvasive *Escherichia coli* in patients ≥ 12 years of age.

To reduce the development of drug-resistant bacteria and maintain the effectiveness of Xifaxan and other antibacterial drugs, Xifaxan when used to treat infection should be used only to treat or prevent infections that are proven or strongly suspected to be caused by susceptible bacteria.[1] When culture and susceptibility information are available, they should be considered in selecting or modifying antibacterial therapy. In the absence of such data, local epidemiology and susceptibility patterns may contribute to the empiric selection of therapy.

Limitations of Use: Xifaxan should not be used in patients with diarrhea complicated by fever or blood in the stool or diarrhea due to pathogens other than *E. coli*.[1]

Clinical Efficacy

The efficacy of Xifaxan for the treatment of small intestinal bacterial overgrowth (SIBO) was established in four clinical trials.[2-4] In two prospective, parallel-group trials, the efficacy of Xifaxan was assessed in 170 patients with a diagnosis of SIBO established with a glucose breath test (GBT).[2,3] Patients were randomized to rifaximin 600 mg/day, 800 mg/day, 1,200 mg/day, or 1,600 mg/day for 7 days. One month after treatment, the GBT normalization rate was 58% to 60% with 1,200 mg/day and 80% with 1,600 mg/day. In a clinical trial, 142 patients with SIBO were randomized to Xifaxan 1,200 mg/day or metronidazole 750 mg/day, both given for 7 days.[4] The GBT normalization rate, 1 month after treatment, was significantly higher with Xifaxan compared with metronidazole (63.4% vs. 43.7% odds ratio: 1.50; 95% confidence interval: 1.14, 4.38; $P < 0.05$). In a prospective trial, 50 consecutive children (mean age: 9.9 years; range: 3.2 to 15 years) with IBS were screened for SIBO.[5] There were 33 patients with SIBO and all patients were treated with rifaximin 600 mg/day for 7 days. Normalization of the lactulose breath test occurred in 64% of the patients with SIBO.

Guidelines

- **Hepatic Encephalopathy**: The American Association for the Study of Liver Diseases and the European Association for the Study of the Liver (AASLD/EASL) developed practice guidelines for the management of hepatic encephalopathy (2014).[6] The AASLD/ESLD guidelines state that Xifaxan add-on to lactulose is effective for the prevention of overt hepatic encephalopathy and for the prevention of recurrent episodes of hepatic encephalopathy after the second episode.
- **Irritable Bowel Syndrome with Diarrhea (IBS-D)**: The American College of Gastroenterology (ACG) guidelines for the management of IBS (2018) suggest Xifaxan to reduce the global symptoms of IBS and to reduce bloating in non-constipated IBS patients.[7] In addition, the

American Gastroenterological Association (AGA) guidelines on the management of IBS (2014) suggest Xifaxan over no drug treatment for patients with IBS-D.[8]

- **Small Intestine Bacterial Overgrowth:** Clinical guidelines from the ACG (2020) list Xifaxan 550 mg three times daily as a suggested antibiotic for the treatment of SIBO.[9] ACG also states that the diagnosis of SIBO can be made with breath testing (glucose hydrogen or lactulose hydrogen), or by small bowel aspiration and culture. In addition, practice guidelines from the AGA (2020) list Xifaxan 800 – 1,200 mg/day as an option for the treatment of SIBO.[10]
- **Travelers' Diarrhea**: The Centers for Disease Control and Prevention (CDC) Yellow Book – Health Information for International Travel (2020) state that Xifaxan may be used for the treatment of moderate, noninvasive travelers' diarrhea and may be used for the treatment of severe, nondysenteric travelers' diarrhea.[11] In addition, guidelines developed by an expert panel (2017) state that Xifaxan is appropriate for moderate or severe, nondysenteric travelers' diarrhea, and when indicated for the prophylaxis of travelers' diarrhea.[12]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Xifaxan. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

FDA-Approved Indications

4. **Hepatic Encephalopathy.** Approve Xifaxan 550 mg tablets for 6 months if the patient meets the following criteria (A, B, and C):
   A) Patient is ≥ 18 years of age; AND
   B) According to the prescriber, the patient has previously had overt hepatic encephalopathy; AND
   C) Xifaxan will be used concomitantly with lactulose.

5. **Irritable Bowel Syndrome with Diarrhea.** Approve Xifaxan 550 mg tablets for 14 days if the patient is ≥ 18 years of age.

6. **Traveler's Diarrhea**. Approve Xifaxan 200 mg tablets for 3 days if the patient meets the following criteria (A, B, and C):
   A) Patient is ≥ 12 years of age; AND
   B) According to the prescriber, the patient is afebrile; AND
   C) According to the prescriber, the patient does not have blood in the stool.

Other Uses with Supportive Evidence

4. **Small Intestine Bacterial Overgrowth:** Approve Xifaxan (either strength) for 14 days if small intestine bacterial overgrowth is diagnosed by ONE of the following criteria (A, B or C):
   A) Glucose hydrogen breath test; OR
   B) Lactulose hydrogen breath test; OR
   C) Small bowel aspiration and culture.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Xifaxan is not recommended in the following situations:

3. ***Helicobacter pylori* Infection**. There are limited data assessing the efficacy of Xifaxan in the treatment of *H. pylori* infection in adults.[7-9] The available studies are small, of poor quality, and none of the studies were conducted in the United States. In addition, treatment guidelines from the American College of Gastroenterology do not address the use of Xifaxan for the treatment of *H. pylori*.

4. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
New Policy	--	11/18/2020

PRIOR AUTHORIZATION POLICY

POLICY: Antibiotics (Inhaled) – Arikayce Prior Authorization Policy

- Arikayce® (amikacin liposome inhalation suspension for oral inhalation – Insmed)

REVIEW DATE: 10/28/2020

OVERVIEW

Arikayce is indicated for the treatment of ***Mycobacterium avium* complex (MAC) lung disease**, in adults who have limited or no alternative treatment options, as part of a combination antibacterial regimen in patients who do not achieve negative sputum cultures after at least six consecutive months of a background multidrug regimen (MDR) therapy.[1] As only limited clinical safety and efficacy data is available, reserve Arikayce for adults with limited or no other treatment options.

This indication is approved under accelerated approval based on achieving sputum culture conversion (defined as three consecutive negative monthly sputum cultures) by Month 6.[1]

Limitation of Use: Arikayce has only been studied in patients with refractory MAC lung disease defined as not achieving culture negativity after at least 6 months of background MDR treatment.[1] Arikayce is not recommended in patients with non-refractory MAC lung disease.

Disease Overview

Nontuberculous mycobacteria (NTM) are ubiquitous environmental microorganisms that are routinely found in soil and water, including both natural and treated water.[2-4] In susceptible people, NTM can cause pulmonary and extra-pulmonary disease.[2] MAC is by far, the most common NTM causing pulmonary nontuberculosis mycobacterial disease (PNTM) with *M. kansassii* and *M. abscessus* the second and third most common causes of PNTM.[2] The prevalence is higher in women than men,[2,3,5] and in the Southeast and the West.[3] The prevalence of PNTM increases with increasing age,[3] is associated with chronic obstructive pulmonary disease (COPD),[4] and 90% of the cases of PNTM occur in Caucasians, followed by Asians/Pacific Islanders and Blacks in the US.[3] Studies from North America have found the annual rate of isolation of NTM to range from 6 to 22 per 100,000 persons and the annual rate of PNTM to range from 5 to 10 per 100,000 persons.[5]

Treatment recommendations for MAC lung disease are based on disease severity and previous therapies received and almost all are three drug regimens.[6] For those with nodular/bronchiectatic disease or with fibrocavitary disease who cannot tolerate daily treatment, a three times weekly (TIW), three-drug regimen is recommended. The TIW regimen consists of azithromycin 500 to 600 mg or clarithromycin 1,000 mg, ethambutol 25 mg/kg, and rifampin 600 mg. For select patients with nodular/bronchiectatic disease (mild disease, medication intolerance, or goal of therapy is disease suppression), a two drug regimen consisting of azithromycin or clarithromycin plus ethambutol daily is acceptable. For patients with fibrocavitary disease or severe nodular/bronchiectatic disease, daily administration of azithromycin 250 to 300 mg or clarithromycin 500 to 1,000 mg, ethambutol 15 mg/kg, and rifampin 600 mg is recommended. Treatment recommendations for patients with severe or previously treated disease include azithromycin 250 to 300 mg or clarithromycin 500 to 1,000 mg, ethambutol 15 mg/kg, and rifabutin 150 to 300 mg or rifampin 600 mg daily. Intermittent IV amikacin or streptomycin are recommended for the first 2 to 3 months in patients with cavitary disease, or previous treatment failure. Patients should be treated for 12 months beyond the time that the sputum cultures convert to negative. For most patients conversion occurs within 6 months of initiation of treatment.

Guidelines

The American Thoracic Society (ATS), the European Respiratory Society (ERS), the European Society of Clinical Microbiology and Infectious Disease (ESCMID), and the Infectious Disease Society of America (IDSA) developed clinical practice guidelines for the treatment of nontuberculous mycobacterial pulmonary disease (2020 version).[6] The guidelines recommend the addition of liposomal amikacin to guideline-based therapy, in patients with MAC pulmonary disease who have failed treatment after ≥ 6 months of treatment with guideline-based therapy. Liposomal amikacin is not recommended for the initial treatment of MAC pulmonary disease.

The US Cystic Fibrosis Foundation and the European Cystic Fibrosis Society (2016 version) developed consensus recommendations on the treatment of NTM lung disease in which nebulized amikacin is listed as a treatment option for MAC and *M. abscessus* lung disease in cystic fibrosis (CF) patients.[7] The guidelines recommend that inhaled amikacin be used in conjunction with other NTM antibiotics.

Other Uses with Supportive Evidence

The efficacy of Arikayce in the treatment of *Pseudomonas aeruginosa* infection in CF patients has been assessed in three studies.[8] In a Phase III, randomized, open-label, non-inferiority study, 302 patients with CF were randomized to Arikayce 590 mg once daily (QD) or tobramycin inhalation solution (TIS) 300 mg twice daily. Patients received three cycles of treatment which consisted of 28 days on treatment followed by 28 days off treatment. The primary endpoint of the study was the relative change from baseline to the end of the 24-week study in forced expiratory volume in 1 second (FEV_1). Secondary endpoints included change in FEV_1 and forced expiratory volume % (FEV_1 %) predicted at various time points, change in CF Questionnaire-Revised (CFQ-R), time to first exacerbation, change in $\log_{10}$ colony-forming units (CFU), and all-cause hospitalization. The improvement in least squares mean FEV_1 at Day 168 was similar between Arikayce and TIS. The mean difference was -1.31% meeting the prespecified criteria for non-inferiority (lower bound of the 95% CI ≥ -5.0%). Change in FEV_1 at the end of each treatment course (Day

28, 84, and 140) and change in FEV_1 % predicted at the midpoint of cycle 1 (Day 14) and at the end of each treatment course were similar between treatment groups. More patients receiving Arikayce experienced pulmonary exacerbations compared with TIS; however, fewer patients required all-cause hospitalization. Change in CFQ-R was similar between groups at the end of each treatment course. Mean reductions in *P. aeruginosa* $\log_{10}$ CFU was similar for Arikayce and TIS at Day 28 and at Day 140.

A pooled report included 24 patients from two Phase Ib/IIa pharmacokinetic/pharmacodynamic studies with chronic *P. aeruginosa* infection.[9] Patients received liposomal amikacin 500 mg QD by inhalation for 14 days. Statistically significant changes from baseline to Days 7 and 14 were seen in FEV_1, FEV_1 % predicted, and forced expiratory flow between 25% and 75% of forced vital capacity. Another report included pooled data from two dose-ranging studies (one Phase Ib/IIa and one Phase IIa) in patients with CF (n = 105) chronically infected with *P. aeruginosa*.[9] Patients received 70, 140, 280 or 560 of liposomal amikacin or placebo QD for 28 days and followed for an additional 28 days. In repeated-measures mixed-effect models, the 560 mg dose was associated with statistically significant improvements in FEV_1, and FEV_1 % predicted and a reduction in $\log_{10}$ CFUs.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Arikayce. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Arikayce as well as the monitoring required for adverse events and long-term efficacy, approval requires Arikayce to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Arikayce is recommended in those who meet the following criteria:

FDA-Approved Indications

7. ***Mycobacterium avium* Complex (MAC) Lung Disease.** Approve for 1 year if the patient meets the following criteria (A, B, C, and D):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has NOT achieved negative sputum cultures for *Mycobacterium avium* complex within the past 3 months after completion of ≥ 6 consecutive months of a background multidrug regimen; AND
     Note: A multidrug regimen typically includes a macrolide (azithromycin or clarithromycin), ethambutol, and a rifamycin (rifampin or rifabutin).
   - **C)** Arikayce will be used in conjunction to a background multidrug regimen; AND
     Note: A multidrug regimen typically includes a macrolide (azithromycin or clarithromycin), ethambutol, and a rifamycin (rifampin or rifabutin).
   - **D)** The medication is prescribed by a pulmonologist, infectious diseases physician or a physician who specializes in the treatment of *Mycobacterium avium* complex lung infections.

Other Uses with Supportive Evidence

8. **Cystic Fibrosis**. Approve for 1 year if the patient meets the following criteria (A and B):
   - **A)** Patient has *Pseudomonas aeruginosa* in culture of the airway (e.g., sputum culture, oropharyngeal culture, bronchoalveolar lavage culture); AND
   - **B)** The medication is prescribed by or in consultation with a pulmonologist or a physician who specializes in the treatment of cystic fibrosis.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Arikayce is not recommended in the following situations:

5. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Annual Revision	Removed cystic fibrosis from the list of Conditions Not Recommended for Approval and added it to Other Uses with Supportive Evidence.	10/23/2019
Selected Revision	*Mycobacterium avium* complex (MAC) lung disease: Added "within the past 3 months after completion of" to the criteria for sputum cultures.	06/24/2020
Annual Revision	No criteria changes.	10/28/2020

PRIOR AUTHORIZATION POLICY

POLICY: Antibiotics (Inhaled) – Cayston® (aztreonam inhalation solution – Gilead Sciences)

DATE REVIEWED: 04/08/2020

OVERVIEW

Cayston (aztreonam) is a monobactam antibiotic which inhibits bacterial cell wall synthesis by binding to penicillin-binding proteins in susceptible organisms, including *Pseudomonas aeruginosa*, leading to cell death.[1] The presence of cystic fibrosis (CF) lung secretions does not reduce the activity of aztreonam.

Cayston is indicated to improve respiratory symptoms in CF patients with *P. aeruginosa*.[1] Safety and efficacy has not been established in pediatric patients below the age of 7 years, in patients with forced expiratory volume in 1 second (FEV_1) < 25% or > 75% predicted, or in patients colonized with *Burkholderia cepacia*.

To reduce the development of drug-resistant bacteria and maintain the effectiveness of Cayston and other antibiotics, Cayston should be used to treat patients with CF known to have *P. aeruginosa* in the lungs.[1]

Disease Overview

CF is a complex, chronic, multi-organ, inherited disorder.[2] Lung disease accounts for nearly 85% of mortality in patients with CF. Lung destruction in CF is caused by obstruction of the airways due to dehydrated and thickened secretions, resultant endobronchial infection, and an exaggerated inflammatory response leading to development of bronchiectasis and progressive obstructive airway diseases. In patients with CF, there are a number of maintenance treatments that may be prescribed, including inhaled antibiotics.

Aerosolized delivery of antimicrobial agents for pulmonary infections provides an ideal method for achieving high local drug concentration in the lungs while minimizing systemic exposure.[3] It has been estimated that by 18 years of age, 80% of patients with CF have *P. aeruginosa* infection. Once *P. aeruginosa* is established in the respiratory tract of a patient with CF, the clinical course of the disease can worsen. Although many organisms can be found in the lower respiratory tract of patients who have CF, infection with mucoid *P. aeruginosa* is common and is associated with poorer outcomes.[4] Infection with chronic mucoid *P. aeruginosa* is associated with poor growth, more rapid decline in lung function, increased need for antibiotic treatment and hospitalization, and earlier death. In addition, mucoid *P. aeruginosa* (characterized by its biofilm) is more resistant to antibiotics than non-mucoid *P. aeruginosa*. Therefore, effective antimicrobial therapies targeting *P. aeruginosa* are central to the management of CF.

Clinical Efficacy

An open-label study assessed inhaled aztreonam for the eradication of newly acquired *P. aeruginosa* in children aged 3 months to < 18 years of age (n = 105).[5] In total, 49 patients < 6 years of age were included in the study. Patients received inhaled aztreonam 75 mg three times daily for 28 days. At the end of treatment with inhaled aztreonam, 91.5% of the patients (n = 43/47) < 6 years of age were culture-negative for *P. aeruginosa* and 76.6% of patients (n = 36/47) < 6 years of age remained culture-negative 4 weeks after completing the course of therapy.

Guidelines

The Cystic Fibrosis Foundation (CFF) established a Pulmonary Therapeutics Committee which provided recommendations, based on available evidence (2007) for the use of medications intended to maintain lung health.[2] In 2013 the Committee published updated recommendations for the use of chronic medications in the management of CF lung disease.[6] In patients ≥ 6 years of age with CF and moderate-to-severe lung disease with *P. aeruginosa* persistently present in cultures of the airways, the chronic use of inhaled aztreonam is strongly recommended to improve lung function and quality of life (QoL). For mild disease, the Committee recommends chronic use of inhaled aztreonam for patients with CF ≥ 6 years of age with *P. aeruginosa* persistently present in cultures of the airways, to improve lung function and QoL.

The CFF published a systematic review of the literature regarding eradication of initial *P. aeruginosa* infections to develop guidelines for effective prevention (2014).[7] The recommendations pertaining to inhaled antibiotics are as follows: 1) Inhaled antibiotic therapy is recommended for the treatment of initial or new growth of *P. aeruginosa* (the favored antibiotic regimen is tobramycin [300 mg BID] for 28 days); and 2) Prophylactic antipseudomonal antibiotics to prevent the acquisition of *P. aeruginosa* are not recommended.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Cayston. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Cayston as well as the monitoring required for adverse events and long-term efficacy, approval requires Cayston to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Cayston is recommended in those who meet the following criteria:

FDA-Approved Indications

9. Cystic Fibrosis. Approve for 1 year if the patient meets the following criteria (A and B):
   A) The patient has *Pseudomonas aeruginosa* in culture of the airway (e.g., sputum culture, oropharyngeal culture, bronchoalveolar lavage culture); AND
   B) Cayston is prescribed by or in consultation with a pulmonologist or a physician who specializes in the treatment of cystic fibrosis.

Other Uses with Supportive Evidence

10. Continuation of Cayston. Approve for 1 month if the patient was started on Cayston and is continuing course of therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Cayston has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

6. Nasal Rinse. Cayston is not approvable for compounding of aztreonam nasal rinse.

7. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Antibiotics (Inhaled) – TOBI® Podhaler (tobramycin inhalation powder – Novartis Pharmaceuticals)

DATE REVIEWED: 04/08/2020

OVERVIEW

Tobramycin is an aminoglycoside antibiotic which disrupts protein synthesis ultimately leading to cell death.[1] *In vitro,* tobramycin is bactericidal at concentration at or just above the minimum inhibitory concentration and has activity against gram-negative microorganisms including *Pseudomonas aeruginosa*.

TOBI Podhaler is indicated for the management of cystic fibrosis (CF) in patients with *P. aeruginosa*.[1] Safety and efficacy have not been demonstrated in patients < 6 years of age, patients with forced expiratory volume in 1 second (FEV1) < 25% or > 80% predicted, or patients colonized with *Burkholderia cepacia.*

Disease Overview

CF is a complex, chronic, multi-organ, inherited disorder.[2] Lung disease accounts for nearly 85% of mortality in patients with CF. Lung destruction in CF is caused by obstruction of the airways due to dehydrated and thickened secretions, resultant endobronchial infection, and an exaggerated inflammatory response leading to development of bronchiectasis and progressive obstructive airway diseases. In patients with CF, there are a number of maintenance treatments that may be prescribed, including inhaled antibiotics.

Aerosolized delivery of antimicrobial agents for pulmonary infections provides an ideal method for achieving high local drug concentration in the lungs while minimizing systemic exposure.[3] It has been estimated that by 18 years of age, 80% of patients with CF have *P. aeruginosa* infection. Once *P. aeruginosa* is established in the respiratory tract of a patient with CF, the clinical course of the disease can worsen. Although many organisms can be found in the lower respiratory tract of patients who have CF, infection with mucoid *P. aeruginosa* is common and is associated with poorer outcomes.[4] Infection with chronic mucoid *P. aeruginosa* is associated with poor growth, more rapid decline in lung function, increased need for antibiotic treatment and hospitalization, and earlier death. In addition, mucoid *P. aeruginosa* (characterized by its biofilm) is more resistant to antibiotics than non-mucoid *P. aeruginosa*. Therefore, effective antimicrobial therapies targeting *P. aeruginosa* are central to the management of CF.

Guidelines

The Cystic Fibrosis Foundation (CFF) established a Pulmonary Therapeutics Committee which provided recommendations, based on available evidence (2007) for the use of medications intended to maintain lung health.[2] In 2013 the Committee published updated recommendations for the use of chronic medications in the management of CF lung disease.[5] In patients ≥ 6 years of age with CF and moderate-to-severe lung disease with *P. aeruginosa* persistently present in cultures of the airways, the chronic use of inhaled tobramycin is strongly recommended to improve lung function, quality of life, and reduce exacerbations. For mild disease, the Committee recommends chronic use of inhaled tobramycin for patients with CF ≥ 6 years of age with *P. aeruginosa* persistently present in cultures of the airways, to reduce exacerbations.

The CFF published a systematic review of the literature regarding eradication of initial *P. aeruginosa* infections to develop guidelines for effective prevention (2014).[6] The recommendations pertaining to inhaled antibiotics are as follows: 1) Inhaled antibiotic therapy is recommended for the treatment of initial or new growth of *P. aeruginosa* (the favored antibiotic regimen is tobramycin [300 mg BID] for 28 days); and 2) Prophylactic antipseudomonal antibiotics to prevent the acquisition of *P. aeruginosa* are not recommended.

The American Thoracic Society (ATS) published a clinical review (2013) of non-cystic fibrosis bronchiectasis on their webpage.[7] The review lists nebulized antibiotics (e.g., colistin, gentamicin, tobramycin) as treatment options for the eradication or suppression of *P. aeruginosa*. The European Respiratory Society (ERS) have published guidelines (2017) for the management of adult bronchiectasis and recommend patients with a new isolate of *P. aeruginosa* be offered eradication antibiotic treatment which includes nebulized antibiotics (e.g., colistin, gentamicin, tobramycin).[8] Neither the ATS or the ERS guidelines include Tobi Podhaler® (tobramycin inhalation powder) as a treatment option for bronchiectasis and no clinical trials have been published with Tobi Podhaler for treatment of non-cystic fibrosis bronchiectasis.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of TOBI Podhaler. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with TOBI Podhaler as well as the monitoring required for adverse events and long-term efficacy, approval requires TOBI Podhaler to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of TOBI Podhaler is recommended in those who meet the following criteria:

FDA-Approved Indications

11. Cystic Fibrosis. Approve for 1 year if the patient meets the following criteria (A, B and C):
- **A)** The patient is ≥ 6 years of age; AND
- **B)** The patient has *Pseudomonas aeruginosa* in culture of the airway (e.g., sputum culture, oropharyngeal culture, bronchoalveolar lavage culture); AND
- **C)** TOBI Podhaler is prescribed by or in consultation with a pulmonologist or a physician who specializes in the treatment of cystic fibrosis.

Other Uses with Supportive Evidence

12. Continuation of TOBI Podhaler. Approve for 1 month if the patient was started on TOBI Podhaler and is continuing course of therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

TOBI Podhaler has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

8. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Antibiotics (Inhaled) – Tobramycin Inhalation Solution

- Bethkis® (tobramycin inhalation solution – Chiesi USA/Catalent Pharma Solutions)
- Kitabis™ (tobramycin inhalation solution – Catalent Pharma Solutions, authorized generic)
- TOBI® (tobramycin inhalation solution – Novartis Pharmaceuticals, generics)

DATE REVIEWED: 04/08/2020

OVERVIEW

Tobramycin is an aminoglycoside antibiotic which disrupts protein synthesis ultimately leading to cell death.[1] *In vitro*, tobramycin is bactericidal at concentration at or just above the minimum inhibitory concentration and has activity against gram-negative microorganisms including *Pseudomonas aeruginosa*.

TOBI and Kitabis are indicated for the management of cystic fibrosis (CF) in adults and pediatric patients ≥ 6 years of age with *P. aeruginosa*.[1,2] Safety and efficacy have not been demonstrated in patients < 6 years of age, patients with forced expiratory volume in 1 second (FEV1) < 25% or > 75% predicted, or patients colonized with *Burkholderia cepacia.*

Bethkis is indicated for the management of CF patients with *P. aeruginosa*.[3] Safety and efficacy have not been demonstrated in patients < six years of age, patients with FEV1 < 40% or > 80% predicted, or patients colonized with *B. cepacia*.

Disease Overview

CF is a complex, chronic, multi-organ, inherited disorder.[4] Lung disease accounts for nearly 85% of mortality in patients with CF. Lung destruction in CF is caused by obstruction of the airways due to dehydrated and thickened secretions, resultant endobronchial infection, and an exaggerated inflammatory response leading to development of bronchiectasis and progressive obstructive airway diseases. In patients with CF, there are a number of maintenance treatments that may be prescribed, including inhaled antibiotics.

Aerosolized delivery of antimicrobial agents for pulmonary infections provides an ideal method for achieving high local drug concentration in the lungs while minimizing systemic exposure.[5] It has been estimated that by 18 years of age, 80% of patients with CF have *P. aeruginosa* infection. Once *P. aeruginosa* is established in the respiratory tract of a patient with CF, the clinical course of the disease can worsen. Although many organisms can be found in the lower respiratory tract of patients who have CF, infection with mucoid *P. aeruginosa* is common and is associated with poorer outcomes.[6] Infection with chronic mucoid *P. aeruginosa* is associated with poor growth, more rapid decline in lung function, increased need for antibiotic treatment and hospitalization, and earlier death. In addition, mucoid *P. aeruginosa* (characterized by its biofilm) is more resistant to antibiotics than non-mucoid *P. aeruginosa*. Therefore, effective antimicrobial therapies targeting *P. aeruginosa* are central to the management of CF.

Guidelines

The Cystic Fibrosis Foundation (CFF) established a Pulmonary Therapeutics Committee which provided recommendations, based on available evidence (2007) for the use of medications intended to maintain lung health.[4] In 2013 the Committee published updated recommendations for the use of chronic medications in the management of CF lung disease.[7] In patients ≥ 6 years of age with CF and moderate-to-severe lung disease with *P. aeruginosa* persistently present in cultures of the airways, the chronic use of inhaled tobramycin is strongly recommended to improve lung function, quality of life and reduce exacerbations. For mild disease, the Committee recommends chronic use of inhaled tobramycin for patients with CF ≥ 6 years of age with *P. aeruginosa* persistently present in cultures of the airways, to reduce exacerbations.

The CFF published a systematic review of the literature regarding eradication of initial *P. aeruginosa* infections to develop guidelines for effective prevention (2014).[8] The recommendations pertaining to inhaled antibiotics are as follows: 1) Inhaled antibiotic therapy is recommended for the treatment of initial or new growth of *P. aeruginosa* (the favored antibiotic regimen is tobramycin [300 mg BID] for 28 days); and 2) Prophylactic antipseudomonal antibiotics to prevent the acquisition of *P. aeruginosa* are not recommended.

Other Uses With Supportive Evidence

A few trials support the efficacy of tobramycin inhalation solution (TIS) for the treatment of bronchiectasis with *P. aeruginosa* infection. In a randomized, double-blind, placebo-controlled study, patients received either TIS 300 mg (n = 37) or placebo (n = 37) twice daily (BID) for 4 weeks and were followed for an additional 2 weeks off treatment.[9] At Week 4, the TIS group had a mean 4.54 $\log_{10}$ decrease in *P. aeruginosa* colony-forming units (CFU)/g of sputum compared with no change in the placebo group (P < 0.01). At Week 6, complete eradication of *P. aeruginosa* occurred in 35% of the patients in the TIS group compared with none in the placebo group, and 62% of patient in the TIS group vs. 38% of the placebo group had improvements in their general health (odds ratio 2.7; 95% confidence interval: 1.1, 6.9).

In a randomized, single-blind study, patients received TIS 300 mg (n = 16) or placebo (n = 19) BID for 3 months following a 14-day course of intravenous ceftazidime and tobramycin and were followed for an additional 12 months.[10] At the end of the study, 54.5% of the TIS group (n = 6/11) and 29.4% of the placebo group (n = 5/17) were free of *P. aeruginosa* (P = 0.048). In addition, patients in the TIS group had significantly fewer exacerbations (1.27 vs. 2.5; P = 0.044), hospital admissions (0.06 vs. 0.47; P = 0.037), and hospital days (0.9 vs. 13.56; P = 0.034) than the placebo group, respectively. No significant difference was found in pulmonary function tests.

A double-blind, placebo-controlled, crossover study randomized 30 patient to initial TIS 300 mg or placebo BID for 6 months, followed by a 1 month washout period and 6 months of therapy with the other treatment.[11] During the first treatment period, TIS treatment resulted in a significant reduction in *P. aeruginosa* density compared with placebo (P = 0.038). During both treatment periods, patients treated with TIS had fewer admissions (0.15 vs. 0.75; P = 0.038) and hospital days (2.05 vs. 12.65; P = 0.047) than patients treated with placebo, respectively. No significant changes occurred with number of exacerbations and pulmonary function tests.

In an open-label trial, 41 patients received three cycles of TIS 300 mg BID for 14 days followed by 14 days off therapy.[12] Patients were followed for an additional 40 weeks after the three cycles of treatment with TIS. At Week 10, there was a significant improvement from baseline (mean change 1.5 points; P = 0.006) in the composite pulmonary symptom score which included cough, shortness of breath, sputum production, fatigue, and wheezing. Quality of life, assessed using the St. George's Respiratory Questionnaire, was significantly improved at Week 10 (mean change 9.8; P < 0.001) compared with baseline. At Week 12, 22.2% of patients (n = 6/27) were considered to have *P. aeruginosa* eradicated from sputum cultures.

The American Thoracic Society (ATS) published a clinical review (2013) of non-cystic fibrosis bronchiectasis on their webpage.[13] The review lists nebulized antibiotics (e.g., colistin, gentamicin, tobramycin) as treatment options for the eradication or suppression of *P. aeruginosa*. The European Respiratory Society (ERS) have published guidelines (2017) for the management of adult bronchiectasis and recommend patients with a new isolate of *P. aeruginosa* be offered eradication antibiotic treatment which includes nebulized antibiotics (e.g., colistin, gentamicin, tobramycin).[14] While both the ATS and ERS list nebulized colistin and gentamicin as treatment options for non-cystic fibrosis bronchiectasis, neither drug has a commercially available formulation for nebulization.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of tobramycin inhalation solution. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with tobramycin inhalation solution as well as the monitoring required for adverse events and long-term efficacy, approval requires tobramycin inhalation solution to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of tobramycin inhalation solution is recommended in those who meet the following criteria:

FDA-Approved Indications

13. Cystic Fibrosis. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** The patient has *Pseudomonas aeruginosa* in culture of the airway (e.g., sputum culture, oropharyngeal culture, bronchoalveolar lavage culture); AND
- **B)** Tobramycin inhalation solution is prescribed by or in consultation with a pulmonologist or a physician who specializes in the treatment of cystic fibrosis.

Other Uses with Supportive Evidence

14. Bronchiectasis, Non-Cystic Fibrosis. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** The patient is ≥ 18 years of age; AND
- **B)** The patient has *Pseudomonas aeruginosa* in culture of the airway (e.g., sputum culture, oropharyngeal culture, bronchoalveolar lavage culture); AND
- **C)** Tobramycin inhalation solution is prescribed by or in consultation with a pulmonologist.

15. Continuation of Tobramycin Inhalation Solution Therapy. Approve for 1 month if the patient was started on tobramycin inhalation solution and is continuing course of therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Tobramycin inhalation solution has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

9. Nasal Rinse. Tobramycin inhalation solution is not approvable for compounding of tobramycin nasal rinse.

10. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Azithromycin lyophilized powder for injection	Zithromax®	Pfizer, others
Erythrocin lactobionate lyophilized powder for injection		various
Miscellaneous		
Aztreonam lyophilized powder for injection	Azactam®	Bristol-Myers Squibb, others
Colistimethate sodium powder for injection	Coly-Mycin® M	Par Pharmaceuticals, others
Daptomycin lyophilized powder for injection	Cubicin®	Merck, others
Metronidazole solution for injection		Various
Quinupristin/dalfopristin lyophilized powder for injection	Synercid® (brand only)	Pfizer
Sulfamethoxazole-trimethoprim solution for injection		various
Tigecycline lyophilized powder for injection	Tygacil®	Wyeth Pharmaceuticals, others
Oxazolidiones		
Linezolid solution for injection	Zyvox® (brand only)	Pharmacia & Upjohn, others
Tedizolid phosphate lyophilized powder for injection	Sivextro® (brand only)	Merck
Penicillins		
Ampicillin sodium powder for injection		various
Ampicillin sodium/sulbactam	Unasyn®	Pfizer, others
Nafcillin sodium powder for injection		various
Oxacillin sodium powder for injection		various
Penicillin G benzathine suspension for injection		various
Penicillin G procaine suspension for injection		various
Penicillin G potassium solution for injection		various
Penicillin G sodium powder for injection		various
Piperacillin sodium/tazobactam suspension for injection	Zosyn®	Wyeth Pharmaceuticals, others
Quinolones		
Ciprofloxacin solution for injection	Cipro® IV	Bayer, others
Delafloxacin meglumine suspension for injection	Baxdela® (brand only)	Melinta Therapeutics, Inc
Levofloxacin solution for injection		various
Moxifloxacin solution for injection	Avelox® IV	Bayer, others
Tetracyclines		
Eravacycline di-hydrochloride lyophilized powder for injection	Xerava (brand only)	Tetraphase Pharmaceuticals, Inc
Doxycycline hyclate lyophilized powder for injection	Doxy 100™	Fresenius Kabi, others
Minocycline hydrochloride powder for injection	Minocin® (brand only)	Melinta Therapeutics Inc

Generic	Brand	Manufacturer
Omadacycline tosylate lyophilized powder for injection	Nuzyra® (brand only)	Paratek Pharmaceuticals, Inc

REVIEW DATE: 08/19/2020

OVERVIEW

Injectable antibiotics are used to treat moderate to severe bacterial infections.[1] In addition, injectable antibiotics can also be used for prophylactic indications (e.g., before surgeries; in immunocompromised patients [e.g., patients with cancer]).

Recently, some injectable antibiotics are being used with nasal or nebulized corticosteroids to compound nasal rinses and nasal irrigations. There are no data to support the use of these products.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of the injectable antibiotics listed above, when these products are prescribed in conjunction with nasal or nebulized dosage forms of beclomethasone, budesonide, ciclesonide, flunisolide, fluticasone, mometasone, or triamcinolone. The list of injectable antibiotics in this policy is not inclusive; other injectable antibiotics may also be targeted in this edit. Approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: This Prior Authorization policy will apply to injectable antibiotics when there is a prescription history of a nasal or nebulized formulation of the selected corticosteroid (beclomethasone, budesonide, ciclesonide, flunisolide, fluticasone, mometasone, triamcinolone) in the past 180 days. Prescriptions for injectable antibiotics without a claims history for nasal or nebulized corticosteroids in the past 180 days are excluded from the Prior Authorization policy.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of injectable antibiotics is recommended in those who meet the following criteria:

FDA-Approved Indications

3. Systemic Bacterial Infections (Prophylaxis or Treatment). Approve for 3 months.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of injectable antibiotics is not recommended in the following situations:

23. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Anticoagulants – Eliquis Prior Authorization Policy

- Eliquis® (apixaban tablets – Bristol-Myers Squibb/Pfizer)

REVIEW DATE: 11/18/2020

OVERVIEW

Eliquis, a Factor Xa inhibitor, is indicated for the following[1]:

- **Non-valvular atrial fibrillation**, to reduce the risk of stroke and systemic embolism.
- **Prophylaxis of deep vein thrombosis (DVT)**, which may lead to pulmonary embolism (PE), in patients who have undergone hip or knee replacement surgery.
- **Treatment of DVT and PE**, as well as **reduction in the risk of recurrence of DVT and PE** following initial therapy.

Guidelines

Guidelines are available which support the use of direct oral anticoagulants (DOACs) in their commonly used clinical settings, such as DVT/PE[2-4] and atrial fibrillation[5,6]. In patients who are eligible for a DOAC, these are generally preferred over vitamin K antagonists (e.g., warfarin). It is noted that in the randomized trials in atrial fibrillation, DOACs were consistently at least non-inferior to warfarin regarding the composite of stroke or systemic embolism and were associated with lower risk of serious bleeding.[6]

Anticoagulants and Coronavirus Disease 19 (COVID-19)

Several clinical practice guidelines have been published with regard to use of anticoagulant therapy in the management of COVID-19. In a guideline from the American College of Chest Physicians (CHEST) [June 2, 2020], anticoagulant thromboprophylaxis is suggested over no prophylaxis for acutely ill hospitalized patients with COVID-19.[7] Extended thromboprophylaxis after hospital discharge is not routinely recommended but may be considered for a patient with low bleeding risk, if emerging data on the post-discharge risk of venous thromboembolism (VTE) and bleeding indicate a net benefit of such prophylaxis. Randomized, controlled trials have not been conducted to evaluate the efficacy of various anticoagulants or placebo in COVID-19 patients; however, the guideline notes that most patients with COVID-19 would have been eligible to participate in landmark trials of anticoagulant thromboprophylaxis in acutely ill medical inpatients. According to guidance from the International Society of Thrombosis and Hemostasis (May 27, 2020), extended post-discharge thromboprophylaxis should be considered for all hospitalized patients with COVID-19 who meet high VTE risk criteria.[8] Xarelto® (rivaroxaban tablets) and Bevyxxa® (betrixaban capsules) are cited as treatment options for extended-duration thromboprophylaxis. Likewise, guidance from the Anticoagulation Forum (May 21, 2020) states that for a COVID-19 patient in whom post-discharge prophylaxis is deemed reasonable, an adequately studied and/or approved agent such as Bevyxxa or Xarelto is recommended.

Other Uses with Supportive Evidence

Although data are not robust regarding use of DOACs in off-label thromboembolic-related conditions, CHEST guidelines (2012) suggest anticoagulation for certain patients with superficial vein thrombosis, symptomatic splanchnic thromboses (portal, mesenteric, and/or splenic vein), or symptomatic hepatic vein thrombosis.[2] The guidelines acknowledge the limited available data in these settings, and all are given Grade 2C recommendations (weak recommendation, low-quality evidence). The 2016 CHEST guideline update did not address these conditions or comment on the role of DOACs.[3] The choice of anticoagulant is often individualized based on patient-specific factors; therefore, for certain patients, DOAC use may be considered in practice. Evidence for DOACs is limited for off-label scenarios; in general, agents such as vitamin K antagonists (e.g., warfarin) and low molecular weight heparin have more clinical experience in these settings.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Eliquis. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Eliquis is recommended in those who meet the following criteria:

FDA-Approved Indications

2. **Atrial Fibrillation (or Atrial Flutter).** Approve for 1 year.

3. **Deep Vein Thrombosis in Patients Undergoing Hip or Knee Replacement Surgery, Prophylaxis.** Approve for 60 days.

4. **Deep Vein Thrombosis or Pulmonary Embolism, Treatment.** Approve for 1 year.

5. **Deep Vein Thrombosis or Pulmonary Embolism to Reduce the Risk of Recurrence.** Approve for 1 year.

Other Uses with Supportive Evidence

6. **Treatment or Prevention of Other Thromboembolic-Related Conditions (e.g., superficial vein thrombosis, splanchnic vein thrombosis, hepatic vein thrombosis, prophylaxis of venous thromboembolism in a high-risk patient).** Approve for 6 months if the patient meets one of the following criteria (A or B):
   - **A)** Patient meets one of the following for the condition (i or ii):
     - **i.** Patient has tried warfarin, fondaparinux injection, or a low molecular weight heparin product (e.g., enoxaparin injection, Fragmin® [dalteparin injection]); OR
     - **ii.** Patient has tried Xarelto® (rivaroxaban tablets), Pradaxa® (dabigatran capsules), or Savaysa® (edoxaban tablets); OR
   - **B)** Patient has been started on Eliquis for the treatment of an acute thromboembolic condition.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Eliquis is not recommended in the following situations:

1. **Venous Thromboembolism in an Acutely Ill Medical Patient, Prophylaxis.** (Note: This includes post-discharge thromboprophylaxis for a patient hospitalized with coronavirus disease 19 [COVID-19]). Eliquis has been compared with enoxaparin for post-discharge prophylaxis in acutely ill medical patients; however, superiority vs. enoxaparin was not achieved, and bleeding was increased with Eliquis.[10] Xarelto and Bevyxxa are labeled for prophylaxis of venous thromboembolism in acutely ill medical patients and are supported in clinical practice guidelines, including guidelines which address prophylaxis of venous thromboembolism in COVID-19 patients.[7-9]

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION WITH STEP THERAPY POLICY

POLICY: Anticoagulants – Pradaxa Prior Authorization with Step Therapy Policy
- Pradaxa® (dabigatran capsules – Boehringer Ingelheim)

REVIEW DATE: 11/18/2020

OVERVIEW

Pradaxa, a direct thrombin inhibitor, is indicated for the following conditions[1]:
- **Non-valvular atrial fibrillation**, to reduce the risk of stroke and systemic embolism.
- **Prophylaxis of DVT and PE**, in patients who have undergone hip replacement surgery.
- **Treatment of deep venous thrombosis (DVT) and pulmonary embolism (PE)** in patients who have been treated with a parenteral anticoagulant for 5 to 10 days, as well as r**eduction in the risk of recurrence of DVT and PE** in patients who have been previously treated.

Guidelines

Guidelines are available which support the use of direct oral anticoagulants (DOACs) in their commonly used clinical settings, such as DVT/PE[2-4] and atrial fibrillation[5,6]. In patients who are eligible for a DOAC, these are generally preferred over vitamin K antagonists (e.g., warfarin). It is noted that in the randomized trials in atrial fibrillation, DOACs were consistently at least non-inferior to warfarin regarding the composite of stroke or systemic embolism and were associated with lower risk of serious bleeding.[6]

Anticoagulants and Coronavirus Disease 19 (COVID-19)

Several clinical practice guidelines have been published with regard to use of anticoagulant therapy in the management of COVID-19. In a guideline from the American College of Chest Physicians (CHEST) [June 2, 2020], anticoagulant thromboprophylaxis is suggested over no prophylaxis for acutely ill hospitalized patients with COVID-19.[7] Extended thromboprophylaxis after hospital discharge is not routinely recommended but may be considered for a patient with low bleeding risk, if emerging data on the post-discharge risk of venous thromboembolism (VTE) and bleeding indicate a net benefit of such prophylaxis. Randomized, controlled trials have not been conducted to evaluate the efficacy of various anticoagulants or placebo in COVID-19 patients; however, the guideline notes that most patients with COVID-19 would

have been eligible to participate in landmark trials of anticoagulant thromboprophylaxis in acutely ill medical inpatients. According to guidance from the International Society of Thrombosis and Hemostasis (May 27, 2020), extended post-discharge thromboprophylaxis should be considered for all hospitalized patients with COVID-19 who meet high VTE risk criteria.[8] Xarelto® (rivaroxaban tablets) and Bevyxxa® (betrixaban capsules) are cited as treatment options for extended-duration thromboprophylaxis. Likewise, guidance from the Anticoagulation Forum (May 21, 2020) states that for a COVID-19 patient in whom post-discharge prophylaxis is deemed reasonable, an adequately studied and/or approved agent such as Bevyxxa or Xarelto is recommended.

Other Uses with Supportive Evidence

Pradaxa has data supporting its use in prophylaxis after knee replacement surgery.[10-12] Although data are not robust regarding use of DOACs in other off-label thromboembolic-related conditions, CHEST guidelines (2012) suggest anticoagulation for certain patients with superficial vein thrombosis, symptomatic splanchnic thromboses (portal, mesenteric, and/or splenic vein), or symptomatic hepatic vein thrombosis.[2] The guidelines acknowledge the limited available data in these settings, and all are given Grade 2C recommendations (weak recommendation, low-quality evidence). The 2016 CHEST guideline update did not address these conditions or comment on the role of DOACs.[3] The choice of anticoagulant is often individualized based on patient-specific factors; therefore, for certain patients, DOAC use may be considered in practice. Evidence for DOACs is limited for off-label scenarios; in general, agents such as vitamin K antagonists (e.g., warfarin) and low molecular weight heparin have more clinical experience in these settings.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Pradaxa. This policy also contains a Step Therapy component, which has been developed to encourage the use of one Step 1 Product (Eliquis® [apixaban tablets] or Xarelto) prior to Pradaxa (Step 2). All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. If the patient meets the criteria for the diagnosis stated but has not tried a Step 1 Product, approvals are provided for both of the Step 1 Products.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Pradaxa is recommended in those who meet the following criteria:

FDA-Approved Indications

7. **Atrial Fibrillation (or Atrial Flutter).** Approve for 1 year if the patient has tried Eliquis or Xarelto.

8. **Deep Vein Thrombosis or Pulmonary Embolism, Treatment.** Approve for 1 year if the patient meets one of the following (A or B):
   A) Patient has tried Eliquis or Xarelto; OR
   B) Patient is currently receiving Pradaxa for this condition.

9. **Deep Vein Thrombosis or Pulmonary Embolism, To Reduce the Risk of Recurrence.** Approve for 1 year if the patient has tried Eliquis or Xarelto.

10. **Deep Vein Thrombosis or Pulmonary Embolism, Prophylaxis Following Hip Replacement Surgery.** Approve for 60 days if the patient meets one of the following (A or B):

A) Patient has tried Eliquis or Xarelto; OR
B) Patient is currently receiving Pradaxa for this condition.

Other Uses with Supportive Evidence

11. Deep Vein Thrombosis in Patients Undergoing Knee Replacement Surgery, Prophylaxis. Approve for 60 days if the patient meets one of the following (A or B):
A) Patient has tried Eliquis or Xarelto; OR
B) Patient is currently receiving Pradaxa for this condition.

12. Treatment or Prevention of Other Thromboembolic-Related Conditions (e.g., superficial vein thrombosis, splanchnic vein thrombosis, hepatic vein thrombosis, prophylaxis of venous thromboembolism in high-risk patients). Approve for 6 months if the patient meets ONE of the following criteria (A or B):
C) Patient meets one of the following for the condition (i or ii):
i. Patient has tried warfarin, fondaparinux, or a low molecular weight heparin (LMWH) product (e.g., enoxaparin, Fragmin® [dalteparin injection]); OR
ii. Patient has tried Eliquis or Xarelto; OR
D) Patient has been started on Pradaxa for the treatment of an acute thromboembolic condition.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Pradaxa is not recommended in the following situations:

3. Venous Thromboembolism in an Acutely Ill Medical Patient, Prophylaxis. (Note: This includes post-discharge thromboprophylaxis for a patient hospitalized with coronavirus disease 19 [COVID-19]). Xarelto and Bevyxxa are labeled for prophylaxis of venous thromboembolism in acutely ill medical patients and are supported in clinical practice guidelines, including guidelines which address prophylaxis of venous thromboembolism in COVID-19 patients.[7-9]

24. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	**Deep Vein Thrombosis (DVT) in Patients Undergoing Knee Replacement Surgery, Prophylaxis:** Added to Other Uses with Supportive Evidence; previously this was grouped under Treatment or Prevention of Other Thromboembolic-Related Conditions (Other Uses with Supportive Evidence, #6). Criteria were updated to allow completion of therapy for patients started on Pradaxa for this indication. **Treatment or Prevention of Other Thromboembolic-Related Conditions:** Examples updated to reflect current clinical practice guidelines and provide consistency across anticoagulant prior authorization policies.	11/28/2018
Annual Revision	No criteria changes.	11/13/2019
Annual Revision	**Mechanical Prosthetic Heart Valves (To Prevent Thromboembolic Complications):** Removed from Conditions Not Recommended for Approval. **Use after Acute Coronary Syndrome to Reduce the Potential for Thrombotic Events:** Removed from Conditions Not Recommended for Approval. **Venous Thromboembolism in an Acutely Ill Medical Patient, Prophylaxis:** This was added to Conditions Not Recommended for Approval. Of note, this includes post-discharge thromboprophylaxis in a patient hospitalized with coronavirus disease 19 (COVID-19).	11/18/2020
DEU Update	**01/26/2021:** No changes to criteria. The policy was renamed to "Anticoagulants – Pradaxa Prior Authorization with Step Therapy Policy".	NA

PRIOR AUTHORIZATION WITH STEP THERAPY POLICY

POLICY: Anticoagulants – Savaysa Prior Authorization with Step Therapy Policy
- Savaysa® (edoxaban tablets – Daiichi Sankyo)

REVIEW DATE: 11/18/2020

OVERVIEW

Savaysa, a Factor Xa inhibitor, is indicated for the following[1]:
- **Non-valvular atrial fibrillation**, to reduce the risk of stroke and systemic embolism.
- **Treatment of deep vein thrombosis (DVT) and pulmonary embolism (PE)**, following 5 to 10 days of initial therapy with a parenteral anticoagulant.

Savaysa has a unique Boxed Warning regarding reduced efficacy in non-valvular atrial fibrillation in patients with a creatinine clearance > 95 mL/min; Savaysa should be avoided in these individuals.

Guidelines

Guidelines are available which support the use of direct oral anticoagulants (DOACs) in their commonly used clinical settings, such as DVT/PE[2-4] and atrial fibrillation[5,6]. In patients who are eligible for a DOAC, these are generally preferred over vitamin K antagonists (e.g., warfarin). It is noted that in the randomized trials in atrial fibrillation, DOACs were consistently at least non-inferior to warfarin regarding the composite of stroke or systemic embolism and were associated with lower risk of serious bleeding.[6] In the setting of cancer-associated venous thromboembolism (VTE), both Savaysa and Eliquis® (apixaban tablets) are supported as category 1 recommendations by the National Comprehensive Cancer Network guidelines (version 1.2020 – April 16, 2020).

Anticoagulants and Coronavirus Disease 19 (COVID-19)

Several clinical practice guidelines have been published with regard to use of anticoagulant therapy in the management of COVID-19. In a guideline from the American College of Chest Physicians (CHEST) [June 2, 2020], anticoagulant thromboprophylaxis is suggested over no prophylaxis for acutely ill hospitalized patients with COVID-19.[7] Extended thromboprophylaxis after hospital discharge is not routinely recommended but may be considered for a patient with low bleeding risk, if emerging data on the post-discharge risk of VTE and bleeding indicate a net benefit of such prophylaxis. Randomized, controlled trials have not been conducted to evaluate the efficacy of various anticoagulants or placebo in COVID-19 patients; however, the guideline notes that most patients with COVID-19 would have been eligible to participate in landmark trials of anticoagulant thromboprophylaxis in acutely ill medical inpatients. According to guidance from the International Society of Thrombosis and Hemostasis (May 27, 2020), extended post-discharge thromboprophylaxis should be considered for all hospitalized patients with COVID-19 who meet high VTE risk criteria.[8] Xarelto® (rivaroxaban tablets) and Bevyxxa® (betrixaban capsules) are cited as treatment options for extended-duration thromboprophylaxis. Likewise, guidance from the Anticoagulation Forum (May 21, 2020) states that for a COVID-19 patient in whom post-discharge prophylaxis is deemed reasonable, an adequately studied and/or approved agent such as Bevyxxa or Xarelto is recommended.[9]

Other Uses with Supportive Evidence

Savaysa has data for prophylaxis of VTE after hip replacement surgery.[10] Although data are not robust regarding use of DOACs in other off-label thromboembolic-related conditions, CHEST guidelines (2012) suggest anticoagulation for certain patients with superficial vein thrombosis, symptomatic splanchnic thromboses (portal, mesenteric, and/or splenic vein), or symptomatic hepatic vein thrombosis.[2] The guidelines acknowledge the limited available data in these settings, and all are given Grade 2C recommendations (weak recommendation, low-quality evidence). The 2016 CHEST guideline update did not address these conditions or comment on the role of DOACs.[3] The choice of anticoagulant is often individualized based on patient-specific factors; therefore, for certain patients, DOAC use may be considered in practice. Evidence for DOACs is limited for off-label scenarios; in general, agents such as vitamin K antagonists (e.g., warfarin) and low molecular weight heparin have more clinical experience in these settings.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Savaysa. This policy also contains a Step Therapy component, which has been developed to encourage the use of one Step 1 Product (Eliquis or Xarelto) prior to Savaysa (Step 2). All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. If the patient meets the criteria for the diagnosis stated but has not tried a Step 1 Product, approvals are provided for both of the Step 1 Products.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Savaysa is recommended in those who meet the following criteria:

FDA-Approved Indications

13. **Atrial Fibrillation (or Atrial Flutter).** Approve for 1 year if the patient meets both of the following criteria (A and B):
    - **C)** Patient has an estimated creatinine clearance (CrCl) ≤ 95 mL/min; AND
    - **D)** Patient has tried Eliquis or Xarelto.

14. **Deep Vein Thrombosis or Pulmonary Embolism, Treatment.** Approve for 1 year if the patient meets one of the following criteria (A or B):
    - **A)** Patient has tried Eliquis or Xarelto; OR
    - **B)** Patient is currently receiving Savaysa for this condition.

Other Uses with Supportive Evidence

15. **Deep Vein Thrombosis in Patients Undergoing Hip Replacement Surgery, Prophylaxis.** Approve for 60 days if the patient meets one of the following criteria (A or B):
    - **C)** Patient has tried Eliquis or Xarelto; OR
    - **D)** Patient is currently receiving Savaysa for this condition.

16. **Treatment or Prevention of Other Thromboembolic-Related Conditions (e.g., superficial vein thrombosis, splanchnic vein thrombosis, hepatic vein thrombosis, prophylaxis of venous thromboembolism in high-risk patients).** Approve for 6 months if the patient meets ONE of the following criteria (A or B):
    - **E)** Patient meets one of the following for the condition (i or ii):
        - **i.** Patient has tried warfarin, fondaparinux, or a low molecular weight heparin product (e.g., enoxaparin, Fragmin® [dalteparin injection]); OR
        - **ii.** Patient has tried Eliquis or Xarelto; OR
    - **F)** Patient has been started on Savaysa for the treatment of an acute thromboembolic condition.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Savaysa is not recommended in the following situations:

25. **Venous Thromboembolism in an Acutely Ill Medical Patient, Prophylaxis.** (Note: This includes post-discharge thromboprophylaxis for a patient hospitalized with coronavirus disease 19 [COVID-19]). Xarelto and Bevyxxa are labeled for prophylaxis of venous thromboembolism in acutely ill medical patients and are supported in clinical practice guidelines, including guidelines which address prophylaxis of venous thromboembolism in COVID-19 patients.[7-9]

26. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	**Deep Vein Thrombosis (DVT) or Pulmonary Embolism (PE), Treatment:** Added criterion to allow Savaysa use without previous trial of Xarelto or Eliquis in patients with DVT/PE associated with cancer, based on preference for Savaysa in this use per NCCN guidelines (2.2018). Combined DVT and PE into one indication for consistency across anticoagulant PA policies. **Deep Vein Thrombosis (DVT) in Patients Undergoing Hip Replacement Surgery, Prophylaxis:** Added to Other Uses with Supportive Evidence; previously this was grouped under Treatment or Prevention of Other Thromboembolic-Related Conditions (Other Uses with Supportive Evidence, #4). Criteria were updated to allow for completion of therapy in patients started on Savaysa for this indication. **Treatment or Prevention of Other Thromboembolic-Related Conditions:** Examples updated to reflect current clinical practice guidelines and provide consistency across anticoagulant PA policies.	11/28/2018
Annual Revision	No criteria changes.	11/13/2019
Annual Revision	**Deep Vein Thrombosis or Pulmonary Embolism, Treatment:** Removed the exception criterion for patients with cancer-associated thromboembolism. This is no longer needed as Eliquis also has a category 1 recommendation for use in this setting. **Use after Acute Coronary Syndrome to Reduce the Potential for Thrombotic Events:** Removed from Conditions Not Recommended for Approval. **Venous Thromboembolism in an Acutely Ill Medical Patient, Prophylaxis:** This was added to Conditions Not Recommended for Approval. Of note, this includes post-discharge thromboprophylaxis in a patient hospitalized with coronavirus disease 19 (COVID-19).	11/18/2020
DEU Update	**01/26/2021:** No changes to criteria. The policy was renamed to "Anticoagulants – Savaysa Prior Authorization with Step Therapy Policy".	NA

PRIOR AUTHORIZATION POLICY

POLICY: Anticoagulants – Xarelto Prior Authorization Policy

- Xarelto® (rivaroxaban tablets – Janssen)

REVIEW DATE: 11/18/2020

OVERVIEW

Xarelto, an oral Factor Xa inhibitor, is indicated for the following[1]:

- **Non-valvular atrial fibrillation**, to reduce the risk of stroke and systemic embolism.
- **Prophylaxis of DVT,** which may lead to PE, in patients undergoing knee or hip replacement surgery.
- **Prophylaxis of venous thromboembolism in acutely ill medical patients** at risk for thromboembolic complications not at high risk of bleeding.
- **Reduction in risk of major adverse cardiovascular (CV) events (CV death, myocardial infarction, and stroke)**, in combination with aspirin, in patients with chronic coronary artery disease or peripheral arterial disease.
- **Treatment of deep vein thrombosis (DVT)** and **pulmonary embolism (PE)**, as well as **reduction in the risk of recurrence of DVT and/or PE** in patients at continued risk for recurrent DVT and/or PE after completion of initial treatment.

Guidelines

Guidelines are available which support the use of direct oral anticoagulants (DOACs) in their commonly used clinical settings, such as DVT/PE[2-4] and atrial fibrillation[5,6]. In patients who are eligible for a DOAC, these are generally preferred over vitamin K antagonists (e.g., warfarin). It is noted that in the randomized trials in atrial fibrillation, DOACs were consistently at least non-inferior to warfarin regarding the composite of stroke or systemic embolism and were associated with lower risk of serious bleeding.[6]

Anticoagulants and Coronavirus Disease 19 (COVID-19)

Several clinical practice guidelines have been published with regard to use of anticoagulant therapy in the management of COVID-19. In a guideline from the American College of Chest Physicians (CHEST) [June 2, 2020], anticoagulant thromboprophylaxis is suggested over no prophylaxis for acutely ill hospitalized patients with COVID-19.[7] Extended thromboprophylaxis after hospital discharge is not routinely recommended but may be considered for a patient with low bleeding risk, if emerging data on the post-discharge risk of venous thromboembolism (VTE) and bleeding indicate a net benefit of such prophylaxis. Randomized, controlled trials have not been conducted to evaluate the efficacy of various anticoagulants or placebo in COVID-19 patients; however, the guideline notes that most patients with COVID-19 would have been eligible to participate in landmark trials of anticoagulant thromboprophylaxis in acutely ill medical inpatients. According to guidance from the International Society of Thrombosis and Hemostasis (May 27, 2020), extended post-discharge thromboprophylaxis should be considered for all hospitalized patients with COVID-19 who meet high VTE risk criteria.[8] Xarelto and Bevyxxa (betrixaban capsules) are cited as treatment options for extended-duration thromboprophylaxis. Likewise, guidance from the Anticoagulation Forum (May 21, 2020) states that for a COVID-19 patient in whom post-discharge prophylaxis is deemed reasonable, an adequately studied and/or approved agent such as Bevyxxa or Xarelto is recommended.

Other Uses with Supportive Evidence

Although data are not robust regarding use of DOACs in off-label thromboembolic-related conditions, CHEST guidelines (2012) suggest anticoagulation for certain patients with superficial vein thrombosis, symptomatic splanchnic thromboses (portal, mesenteric, and/or splenic vein), or symptomatic hepatic vein thrombosis.[2] The guidelines acknowledge the limited available data in these settings, and all are given Grade 2C recommendations (weak recommendation, low-quality evidence). The 2016 CHEST guideline update did not address these conditions or comment on the role of DOACs.[3] The choice of anticoagulant is often individualized based on patient-specific factors; therefore, for certain patients, DOAC use may be considered in practice. Evidence for DOACs is limited for off-label scenarios; in general, agents such as vitamin K antagonists (e.g., warfarin) and low molecular weight heparin have more clinical experience in these settings.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Xarelto. All approvals are provided for the approval duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

FDA-Approved Indications

1. **Atrial Fibrillation (or Atrial Flutter).** Approve for 1 year.

2. **Deep Vein Thrombosis in a Patient Undergoing Knee or Hip Replacement Surgery, Prophylaxis.** Approve for 60 days.

3. **Deep Vein Thrombosis or Pulmonary Embolism, Treatment.** Approve for 1 year.

4. **Deep Vein Thrombosis or Pulmonary Embolism, to Reduce the Risk of Recurrence.** Approve for 1 year.

5. **Reduction in Risk of Major Cardiovascular Events**. Approve for 1 year if the patient meets the following criteria (A and B):
   A) Patient has coronary artery disease or peripheral artery disease; AND
   B) Patient will be taking concomitant aspirin at least 75 mg daily.

6. **Venous Thromboembolism in an Acutely Ill Medical Patient, Prophylaxis.** Approve for 60 days. Note: This includes post-discharge thromboprophylaxis for a patient hospitalized with coronavirus disease 19 (COVID-19).

Other Uses with Supportive Evidence

7. **Treatment or Prevention of Other Thromboembolic-Related Conditions (e.g., superficial vein thrombosis, splanchnic vein thrombosis, hepatic vein thrombosis, prophylaxis of venous thromboembolism in a high-risk patient).** Approve for 6 months if the patient meets ONE of the following criteria (A or B):
   A) Patient meets one of the following for the condition (i or ii):
      i. Patient has tried warfarin, fondaparinux or a low molecular weight heparin product (e.g., enoxaparin, Fragmin® [dalteparin injection]); OR
      ii. Patient has tried Eliquis® (apixaban tablets), Pradaxa® (dabigatran capsules), or Savaysa® (edoxaban tablets); OR
   B) Patient has been started on Xarelto for the treatment of an acute thromboembolic condition.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Xarelto is not recommended in the following situations:

4. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Antiepileptics – Banzel Prior Authorization Policy

- Banzel® (rufinamide tablets and oral suspension – Eisai)

REVIEW DATE: 09/16/2020

OVERVIEW

Banzel is indicated for adjunctive treatment of seizures associated with Lennox-Gastaut Syndrome in pediatric patients ≥ 1 year of age and in adults.[1]

Although Banzel is only FDA-approved for use in Lennox-Gastaut Syndrome, clinical trial data indicate the drug may also be beneficial as adjunctive treatment of refractory focal epilepsy.[2] A review of six clinical trials found that Banzel when used as an add-on treatment was effective in reducing seizure frequency in patients with drug-resistant focal epilepsy.

Banzel is a triazole derivative structurally unrelated to currently marketed antiepileptic drugs (AEDs).[1] The precise mechanism by which rufinamide exerts its antiepileptic effect is not known. *In vitro* studies suggest that the primary mechanism of action of rufinamide is modulation of the activity of sodium channels and, in particular, prolongation of the inactive state of the channel. Banzel is contraindicated for use in patients with Familial Short QT syndrome. Banzel should be used cautiously with other drugs that shorten the QT interval.

Disease Overview

Lennox-Gastaut syndrome (LGS), a severe epileptic and developmental encephalopathy, is associated with a high rate of morbidity and mortality.[3,4] LGS most often begins between 3 years and 5 years of age and

comprises approximately 3% to 4% of childhood epilepsies.[3-6] Affected children experience several different types of seizures, most commonly atonic seizures (sudden loss of muscle tone and limpness, also called drop seizures) and tonic seizures (increased muscle tone and muscle stiffness).[3,6] The three main forms of treatment of LGS are antiepileptic drugs (AEDs), dietary therapy (typically the ketogenic diet), and device/surgery (e.g., vagus nerve stimulation, corpus callosotomy).[6] None of the therapies are effective in all cases of LGS and the disorder has proven particularly resistant to most therapeutic options. The choice of treatment should take into consideration the patient's age and other associated conditions.

Guidelines/Recommendations

Lennox-Gastaut syndrome. Currently, the FDA-approved drugs for this condition are Epidiolex® (cannabidiol oral solution), felbamate, lamotrigine, Banzel, topiramate, and clobazam.[7] Despite the lack of level I or level II evidence, valproic acid remains a mainstay in treatment.[5,6,8] If valproic acid does not provide adequate seizure control, which is almost always the case, lamotrigine should be added as the first adjunctive therapy.[4] If the combination regimen of valproic acid and lamotrigine does not provide adequate control, then Banzel should be initiated and either valproic acid or lamotrigine should be discontinued. If seizure control is still not achieved, the next adjunctive therapies to consider are topiramate, clobazam, and felbamate. There are limited evidence for the use of levetiracetam, zonisamide, and Fycompa® (perampanel tablet, oral suspension). Where possible, no more than two AEDs should be used concomitantly; use of multiple AEDs raise the risk of side effects and/or drug-drug interactions.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Banzel. Because of the specialized skills required for evaluation and diagnosis of patients treated with Banzel as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Banzel to be prescribed by, or in consultation with, a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Banzel is recommended in those who meet the following criteria:

FDA-Approved Indications

4. **Lennox-Gastaut Syndrome.** Approve for the duration noted below if the patient meets ONE of the following criteria (A or B):
   - **A)** Initial Therapy: Approve for 1 year if the patient meets the following criteria (i, ii, and iii):
     - **i.** Patient is ≥ 1 year of age; AND
     - **ii.** Patient has tried and/or is concomitantly receiving at least two other antiepileptic drugs; AND
       Note: Examples of antiepileptic drugs include valproic acid, gabapentin, phenytoin, carbamazepine, oxcarbazepine, lacosamide, levetiracetam, zonisamide, Fycompa (perampanel tablet or oral suspension), vigabatrin, lamotrigine, topiramate, clobazam, Diacomit (stiripentol capsules or oral suspension), Epidiolex (cannabidiol oral solution), and felbamate.
     - **iii.** The medication is prescribed by, or in consultation with, a neurologist.
   - **B)** Patient is Currently Receiving Banzel: Approve for 1 year if the patient is responding to therapy (e.g., reduced seizure severity, frequency, and/or duration) as determined by the prescriber.

Other Uses with Supportive Evidence

2. **Treatment-Refractory Seizures/Epilepsy.** Approve for the duration noted below if the patient meets ONE of the following criteria (A or B):
   - **A)** Initial Therapy: Approve for 1 year if the patient meets the following criteria (i, ii, and iii):
     - **i.** Patient is ≥ 1 years of age; AND
     - **ii.** Patient has tried and/or is concomitantly receiving at least two other antiepileptic drugs; AND
       Note: Examples of antiepileptic drugs include valproic acid, gabapentin, phenytoin, carbamazepine, oxcarbazepine, lacosamide, levetiracetam, zonisamide, Fycompa (perampanel tablet or oral suspension), vigabatrin, lamotrigine, topiramate, clobazam, Diacomit (stiripentol capsules or oral suspension), Epidiolex (cannabidiol oral solution), and felbamate.
     - **iii.** The medication is prescribed by, or in consultation with, a neurologist.
   - **B)** Patient is Currently Receiving Banzel: Approve for 1 year if the patient is responding to therapy (e.g., reduced seizure severity, frequency, and/or duration) as determined by the prescriber.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Banzel is not recommended in the following situations:

27. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Antiepileptics – Clobazam Products Prior Authorization Policy

- Onfi® (clobazam tablets and oral suspension – Lundbeck, generics)
- Sympazan™ (clobazam oral soluble film – Aquestive Therapeutics)

REVIEW DATE: 11/18/2020

OVERVIEW

All forms of clobazam are indicated for the adjunctive treatment of seizures associated with **Lennox-Gastaut syndrome** (LGS) in patients ≥ 2 years of age.[1,2]

Clobazam is a benzodiazepine.[1,2] The exact mechanism of action is not fully understood but is thought to involve potentiation of gamma-aminobutyric acid (GABA)ergic neurotransmission resulting from binding at the benzodiazepine site of the $GABA_A$ receptor.

Disease Overview

Lennox-Gastaut syndrome (LGS), a severe epileptic and developmental encephalopathy, is associated with a high rate of morbidity and mortality.[3,4] LGS most often begins between 3 and 5 years of age and comprises approximately 4% to 10% of childhood epilepsies; the prevalence is 0.26 per 1,000 people.[3-6] Children may develop normally before onset of seizures and then lose previously acquired skills (psychomotor regression), and because the seizures associated with LGS are usually resistant to treatment, intellectual impairment and learning problems may worsen over time.[6] Affected children experience several different types of seizures, most commonly atonic seizures (sudden loss of muscle tone and limpness, also called drop seizures) and tonic seizures (increased muscle tone and muscle stiffness).[3,6] The three main forms of treatment of LGS are antiepileptic drugs (AEDs), dietary therapy (typically the ketogenic diet), and device/surgery (e.g., Vagus nerve stimulation, corpus callosotomy).[6] None of the therapies are effective in all cases of LGS and the disorder has proven particularly resistant to most therapeutic options. The choice of treatment should take into consideration the patient's age and other associated conditions.

Dravet syndrome is a rare genetic epileptic encephalopathy (dysfunction of the brain) marked with frequent and/or prolonged seizures.[7,8] It's been estimated that 1 out of 15,700 infants born in the US are affected with Dravet syndrome. The seizures generally begin in the first year of life in an otherwise healthy infant. Affected individuals can develop many seizure types: myoclonic, tonic-clonic, absence, atypical absence, atonic, focal aware or impaired awareness (previously called partial seizures), and status epilepticus.[8] As the seizures continue, most of the children develop some level of developmental disability and other conditions associated with the syndrome. Two or more AEDs are often needed to control the seizures; most of the seizures are refractory to medications. The goals of treatment are cessation of prolonged convulsions, reductions in overall seizure frequency, and minimization of treatment side effects.[9,10] Some patients respond to the ketogenic diet and/or vagus nerve stimulation.

Guidelines/Recommendations

Lennox-Gastaut Syndrome

Currently, the FDA-approved drugs for this condition are Epidiolex® (cannabidiol oral solution), felbamate, lamotrigine, Banzel® (rufinamide tablet, oral suspension), topiramate, and clobazam.[11] Despite the lack of level I or level II evidence, valproic acid remains a mainstay in treatment.[5,6,12] If valproic acid does not provide adequate seizure control, which is almost always the case, lamotrigine should be added as the first adjunctive therapy.[4] If the combination regimen of valproic acid and lamotrigine does not provide adequate control, then Banzel should be initiated and either valproic acid or lamotrigine should be discontinued. If seizure control is still not achieved, the next adjunctive therapies to consider are topiramate, clobazam, and felbamate. There are limited evidence for the use of levetiracetam, zonisamide, and Fycompa® (perampanel tablet, oral suspension). Where possible, no more than two AEDs should be used concomitantly; use of multiple AEDs raise the risk of side effects and/or drug-drug interactions.

Dravet Syndrome

Valproic acid and clobazam are considered to be the first-line treatment for Dravet syndrome.[7,9,10] If seizure control is suboptimal, Diacomit® (stiripentol capsules), Epidiolex® (cannabidiol oral solution), Fintepla® (fenfluramine oral solution), and topiramate are treatment options. Ketogenic diet is moderately effective

and can also be considered second-line. If control is still inadequate, other therapies to consider are clonazepam, levetiracetam, and zonisamide. Drugs that should be avoided in Dravet syndrome include sodium channel blockers (e.g., carbamazepine, oxcarbazepine, lamotrigine, and phenytoin), Sabril® (vigabatrin tablet, oral packet), and tiagabine.

The American Academy of Neurology (AAN) and the American Epilepsy Society published a guideline update for treatment-resistant epilepsy (2018) stating that clobazam is probably effective as add-on therapy for LGS and is possibly effective as add-on therapy for treatment-resistant adult focal epilepsy.[13] Adjunctive therapy with clobazam has been effective in the treatment of uncontrolled or refractory epilepsy in adults and children.[14] If first-line treatment is ineffective or not tolerated, clobazam has been used as adjunctive treatment of refractory focal seizures (partial seizure and localization-related seizure) in children, young adults, and adults; adjunctive treatment of generalized tonic-clonic seizures in children, young adults, and adults; and adjunctive treatment of children and young adults with benign epilepsy with centrotemporal spikes, Panayiotopoulos syndrome or late-onset childhood occipital epilepsy (Gastaut type).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of clobazam. Because of the specialized skills required for evaluation and diagnosis of patients treated with clobazam as well as the monitoring required for adverse events and long-term efficacy, initial approval requires clobazam to be prescribed by, or in consultation with, a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of clobazam is recommended in those who meet the following criteria:

FDA-Approved Indications

5. Lennox-Gastaut Syndrome. Approve for 1 year if the patient meets ONE of the following criteria (A or B):

C) Initial Therapy. Approve for 1 year if the patient meets the following criteria (i, ii, and iii):
- **i.** Patient is ≥ 2 years of age; AND
- **ii.** Patient has tried and/or is concomitantly receiving at least two other antiepileptic drugs (e.g., valproic acid, levetiracetam, zonisamide, perampanel, vigabatrin, others) OR one of lamotrigine, topiramate, rufinamide, felbamate, or Epidiolex; AND
- **iii.** Clobazam is prescribed by, or in consultation with, a neurologist.

D) Patient is Currently Receiving Clobazam. Approve for 1 year if the patient is responding to therapy, as determined by the prescriber.
Note: Examples of therapy response include reduced seizure severity, frequency, and/or duration from baseline [prior to initiation of clobazam].

Other Uses with Supportive Evidence

6. Dravet Syndrome. Approve for 1 year if the patient meets ONE of the following criteria (A or B):

A) Initial Therapy. Approve for 1 year if the patient meets the following criteria (i and ii)
- **i.** Patient is ≥ 2 years of age; AND
- **ii.** Clobazam is prescribed by, or in consultation with, a neurologist.

B) Patient is Currently Receiving Clobazam. Approve for 1 year if the patient is responding to therapy, as determined by the prescriber.
Note: Examples of therapy response include reduced seizure severity, frequency, and/or duration from baseline [prior to initiation of clobazam].

3. Treatment-Refractory Seizures/Epilepsy. Approve for 1 year if the patient meets ONE of the following criteria (A or B):

C) Initial Therapy. Approve for 1 year if the patient meets the following criteria (i, ii, and iii):
- **i.** Patient is ≥ 2 years of age; AND
- **ii.** Patient has tried and/or is concomitantly receiving at least two other antiepileptic drugs; AND
  Note: Examples are valproic acid, lamotrigine, topiramate, clonazepam, levetiracetam, zonisamide, Banzel, felbamate.
- **iii.** Clobazam is prescribed by, or in consultation with, a neurologist.

D) Patient is Currently Receiving Clobazam. Approve for 1 year if the patient is responding to therapy, as determined by the prescriber.
Note: Examples of therapy response include reduced seizure severity, frequency, and/or duration from baseline [prior to initiation of clobazam].

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of clobazam is not recommended in the following situations:

28. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
New Policy	--	11/07/2018
Annual Revision	In each of the three approved conditions (Lennox-Gastaut Syndrome, Dravet Syndrome, and Treatment-Refractory Seizures/Epilepsy), the term "prescribing physician" is being changed to "prescriber".	11/20/2019
Annual Revision	No criteria changes.	11/18/2020

PRIOR AUTHORIZATION POLICY

POLICY: Antiepileptics – Diacomit Prior Authorization Policy

- Diacomit® (stiripentol capsules and powder for oral suspension – Biocodex)

REVIEW DATE: 02/03/2021

OVERVIEW

Diacomit, an antiepileptic drug (AED), is indicated for the treatment of seizures associated with **Dravet syndrome** in patients ≥ 2 years of age taking clobazam.[1] There are no clinical data to support the use of Diacomit as monotherapy in Dravet syndrome.

Disease Overview

Dravet syndrome is a rare genetic epileptic encephalopathy (dysfunction of the brain) marked with frequent and/or prolonged seizures.[2,3] The seizures generally begin in the first year of life in an otherwise healthy infant. Affected individuals can develop many seizure types: myoclonic, tonic-clonic, absence, atypical absence, atonic, focal aware or impaired awareness (previously called partial seizures), and status epilepticus.[3] Two or more AEDs are often needed to control the seizures; most of the seizures are refractory to medications. The goals of treatment are cessation of prolonged convulsions, reductions in overall seizure frequency, and minimization of treatment side effects.[4,5]

Clinical Efficacy in Other Refractory Seizures

In one study (n = 212), Diacomit was studied in children with different types of epilepsy syndromes (including Lennox-Gastaut Syndrome [LGS]; infantile spasms; infection-related or anoxo-ischemic epilepsy syndromes; tuberous sclerosis complex; Sturge-Weber syndrome; Doose syndrome; cortical malformation/dysplasia; and epilepsy with myoclonic absences) whose seizures were refractory to more than two AEDs (including Sabril).[6] In the 88 patients who completed the 3-month placebo-controlled study, 56.8% of patients with partial epilepsy responded (with 14% becoming seizure free) compared with 41.9% of patients with generalized epilepsy and 38.4% of patients with myoclonic epilepsy. Diacomit has also been administered to patients with epileptic encephalopathies associated with SCN1A mutations or other sodium channel mutations under compassionate use protocalls.[7] A single-blind, exploratory trial evaluated Diacomit in combination with standard treatment in 16 patients with LGS and eight patients with symptomatic generalized epilepsy of the Lennox-Gastaut type.[8] There were 15 evaluable patients with LGS. The overall results identified some benefit for LGS where 60% of patients were responders (based on 50% responder rate). Diacomit treatment produced a mean 62% seizure reduction and median -80% reduction from baseline. Additionally, a published study of Diacomit added to carbamazepine in childhood partial epilepsy (n = 67) demonstrated seizure response in 32 patients with conditions including herpetic encephalitis, LGS, and tuberous sclerosis complex.[9]

Guidelines/Recommendations

At this time, there are three drugs approved for the treatment of seizures associated with Dravet syndrome: Diacomit, Epidiolex® (cannabidiol oral solution), and Fintepla® (fenfluramine oral solution).[1,10,11] An expert panel considers valproic acid and clobazam are considered to be the first-line treatment for Dravet syndrome.[5] If seizure control is suboptimal, Diacomit and topiramate are second-line treatment. Ketogenic diet is moderately effective and can also be considered second-line. The Dravet Foundation states that Diacomit, Epidiolex, and Fintepla are considered first-line agents for the treatment of Dravet syndrome.[2] If control is still inadequate, other therapies to consider are clonazepam, levetiracetam, and zonisamide.[2,4,5] Sodium channel blockers (e.g., carbamazepine, oxcarbazepine, lamotrigine, and phenytoin) can worsen seizures in Dravet syndrome. Additionally, vigabatrin and tiagabine may increase the frequency of myoclonic seizures and should be avoided.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Diacomit. Because of the specialized skills required for evaluation and diagnosis of patients treated with Diacomit as well as the monitoring required for adverse events and efficacy, initial approval requires Diacomit to be prescribed by, or in consultation with, a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Diacomit is recommended in those who meet the following criteria:

FDA-Approved Indications

7. Dravet Syndrome. Approve for 1 year if the patient meets ONE of the following criteria (A or B):

C) Initial Therapy: Approve for 1 year if the patient meets the following criteria (i, ii, and iii):

- **i.** Patient is ≥ 2 years of age; AND
- **ii.** Patient meets ONE of the following criteria (a or b):
  - **a)** Patient is taking concomitant clobazam; OR
  - **b)** Patient is unable to take clobazam due to adverse events as determined by the prescriber; AND
- **iii.** The medication is prescribed by, or in consultation with, a neurologist; OR

D) Patient is Currently Receiving Diacomit: Approve for 1 year if the patient is responding to therapy (e.g., reduced seizure severity, frequency, and/or duration) as determined by the prescriber.

Other Uses with Supportive Evidence

4. Treatment-Refractory Seizures/Epilepsy [specific rare conditions] (i.e., Lennox-Gastaut Syndrome; infantile spasms; tuberous sclerosis complex; Sturge-Weber syndrome; Doose syndrome; infection-related or anoxo-ischemic epilepsy syndromes; cortical malformation/dysplasia; epileptic encephalopathies associated with sodium channel mutations; and epilepsy with myoclonic absences). Approve for 1 year if the patient meets ONE of the following criteria (A or B):

E) Initial Therapy: Approve for 1 year if the patient meets the following criteria (i, ii, and iii)

- **iv.** Patient is ≥ 2 years of age; AND
- **v.** Patient has tried at least two other antiepileptic drugs; AND

Note: Examples of other antiepileptic drugs include valproic acid, lamotrigine, topiramate, clonazepam, Banzel® (rufinamide tablet, oral suspension), felbamate, clobazam, Fycompa® (perampanel tablet, oral suspension), vigabatrin, levetiracetam, zonisamide, others.

vi. The medication is prescribed by, or in consultation with, a neurologist; OR

F) Patient is Currently Receiving Diacomit: Approve for 1 year if the patient is responding to therapy (e.g., reduced seizure severity, frequency, and/or duration) as determined by the prescriber.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Diacomit is not recommended in the following situations:

29. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Antiepileptics – Epidiolex Prior Authorization Policy

- Epidiolex® (cannabidiol oral solution – GW Pharmaceuticals)

REVIEW DATE: 02/03/2021

OVERVIEW

Epidiolex is indicated for the treatment of seizures in patients ≥ 1 years of age associated with:[1]

- **Dravet syndrome**.

- **Lennox-Gastaut syndrome**.
- **Tuberous sclerosis complex**.

Disease Overview

Dravet syndrome is a rare genetic epileptic encephalopathy marked with frequent and/or prolonged seizures.[2,3] The seizures generally begin in the first year of life in an otherwise healthy infant. Affected individuals can develop many seizure types: myoclonic, tonic-clonic, absence, atypical absence, atonic, focal aware or impaired awareness (previously called partial seizures), and status epilepticus.[3] Two or more antiepileptic drugs (AEDs) are often needed to control the seizures; most of the seizures are refractory to medications. The goals of treatment are cessation of prolonged convulsions, reductions in overall seizure frequency, and minimization of treatment side effects.[4,5]

Lennox-Gastaut syndrome, a severe epileptic and developmental encephalopathy, is associated with a high rate of morbidity and mortality.[6,7] Lennox-Gastaut syndrome most often begins between 3 and 5 years of age.[6-9] Affected children experience several different types of seizures, most commonly atonic seizures (sudden loss of muscle tone and limpness) and tonic seizures.[6,9] The three main forms of treatment of Lennox-Gastaut syndrome are AEDs, dietary therapy (typically the ketogenic diet), and device/surgery (e.g., vagus nerve stimulation, corpus callostomy).[9] None of the therapies are effective in all cases of Lennox-Gastaut syndrome and the disorder has proven particularly resistant to most therapeutic options.

Tuberous sclerosis complex is a rare, genetic disease that causes non-cancerous (benign) tumors to grow in the brain and on other vital organs such as the kidneys, heart, eyes, lungs, and skin.[10] It can result in a combination of symptoms including seizures, impaired intellectual development, autism, behavioral problems, skin abnormalities, and kidney disease. Seizures affect most individuals with tuberous sclerosis complex at some point during their life and can be difficult to control.

Clinical Efficacy in Other Refractory Seizures

In 2014, an expanded access program was initiated to provide Epidiolex to patients with treatment-resistant epilepsy. Of the 607 patients included in a published review, 174 patients were diagnosed with Dravet syndrome or Lennox-Gastaut syndrome, and 433 patients were diagnosed with other conditions, including CDKL5 deficiency disorder, Dup15q, Aicardi, and Doose syndromes; febrile infection-related epilepsy syndromes; tuberous sclerosis complex; Sturge-Weber syndrome; lissencephaly; cortical malformation/dysplasia; and myoclonic absence.[14] The patients enrolled in the study had severe, intractable, childhood-onset treatment-resistant epilepsy and were on stable doses of AEDs for 4 weeks before starting Epidiolex as add-on therapy. The initial dose of Epidiolex was 2 to 10 mg/kg/day (taken as two divided doses) and gradually titrated until intolerance or to a maximum dose of 25 mg/kg/day or 50 mg/kg/day, depending upon treatment site. After 12 weeks of treatment, Epidiolex was associated with 51% and 48% reductions in median monthly convulsive and total seizures, respectively. In a cohort of 132 patients (72 children, 60 adults) with treatment-resistant epilepsy, bi-weekly seizure frequency decreased from a mean of 144.4 at entry to 52.2 at 12 weeks ($P = 0.01$) and remained stable thereafter.[15] Of note, patients with a diagnosis of Lennox-Gastaut syndrome or Dravet syndrome were initially excluded because of preferential enrollment into the randomized clinical trials; once these trials were closed for enrollment, patients with these syndromes were also enrolled. In a separate cohort of patients with CDKL5 deficiency disorder and Aicardi, Doose, and Dup15q syndromes ($n = 46$), the percent change in median convulsive seizure frequency decreased from baseline to Week 12 by 51.4% and by 59.1% at Week 48.[16] There was a significant difference between the percent changes in monthly convulsive seizure

frequency during baseline and Week 12 (P = 0.00001), with no difference in seizure percent change between Weeks 12 and 48. Of the 55 patients in the safety group, 27% of patients withdrew by Week 144 due to adverse effects (n = 4), lack of efficacy (n = 9), withdrawn consent (n = 1), and lost to follow-up (n = 1).

Guidelines/Recommendations

Dravet Syndrome

At this time, there are three drugs approved for the treatment of seizures associated with Dravet syndrome: Epidiolex, Diacomit® (stiripentol capsules, powder for oral suspension), and Fintepla® (fenfluramine) oral solution).[1,11,17] An expert panel considers valproic acid and clobazam to be the first-line treatment for Dravet syndrome.[4] If seizure control is suboptimal, Diacomit and topiramate are second-line treatment. Ketogenic diet is moderately effective and can also be considered second-line. The Dravet Foundation states that Diacomit, Epidiolex, and Fintepla are considered first-line agents for the treatment of Dravet syndrome.[2] If control is still inadequate, other therapies to consider are clonazepam, levetiracetam, and zonisamide.[2,4] Sodium channel blockers (e.g., carbamazepine, oxcarbazepine, lamotrigine, and phenytoin can worsen seizures in Dravet syndrome. Additionally, vigabatrin and tiagabine may increase the frequency of myoclonic seizures and should be avoided.

Lennox-Gastaut Syndrome

Currently, the FDA-approved drugs for this condition are felbamate, Banzel® (rufinamide tablet, oral suspension), topiramate, and clobazam.[12] Despite the lack of level I or level II evidence, valproic acid remains a mainstay in treatment.[8,9,13] If valproic acid does not provide adequate seizure control, which is almost always the case, lamotrigine should be added as the first adjunctive therapy.[7] If the combination regimen of valproic acid and lamotrigine does not provide adequate control, then Banzel should be initiated and either valproic acid or lamotrigine should be discontinued. If seizure control is still not achieved, the next adjunctive therapies to consider are topiramate, clobazam, and felbamate. There is limited evidence for the use of levetiracetam, zonisamide, and Fycompa® (perampanel tablet, oral suspension). Where possible, no more than two AEDs should be used concomitantly; use of multiple AEDs raise the risk of side effects and/or drug-drug interactions.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Epidiolex. Because of the specialized skills required for evaluation and diagnosis of patients treated with Epidiolex as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Epidiolex to be prescribed by, or in consultation with, a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Epidiolex is recommended in those who meet the following criteria:

FDA-Approved Indications

8. Dravet Syndrome. Approve if the patient meets ONE of the following criteria (A or B):
E) Initial Therapy: Approve for 1 year if the patient meets the following criteria (i, ii, and iii)
iv. Patient is ≥ 1 years of age; AND
v. Patient meets ONE of the following criteria (a or b):
i. Patient has tried at least two other antiepileptic drugs; OR
Note: Examples of other antiepileptic drugs include valproic acid, topiramate, clonazepam, levetiracetam, zonisamide.
ii. Patient has tried one of Diacomit or clobazam; AND
vi. The medication is prescribed by, or in consultation with, a neurologist.
F) Patient is Currently Receiving Epidiolex: Approve for 1 year if the patient is responding to therapy (e.g., reduced seizure severity, frequency, and/or duration) as determined by the prescriber.

9. Lennox-Gastaut Syndrome. Approve if the patient meets ONE of the following criteria (A or B):
E) Initial Therapy: Approve for 1 year if the patient meets the following criteria (i, ii, and iii)
i. Patient is ≥ 1 years of age; AND
ii. Patient meets ONE of the following criteria (a or b):
a) Patient has tried at least two other antiepileptic drugs; OR
Note: Examples of other antiepileptic drugs include valproic acid, levetiracetam, zonisamide, Fycompa, vigabatrin.
b) Patient has tried one of lamotrigine, topiramate, Banzel, felbamate, clobazam; AND
iii. The medication is prescribed by, or in consultation with, a neurologist.
F) Patient is Currently Receiving Epidiolex: Approve for 1 year if the patient is responding to therapy (e.g., reduced seizure severity, frequency, and/or duration) as determined by the prescriber.

10. Tuberous Sclerosis Complex. Approve if the patient meets ONE of the following criteria (A or B):
A) Initial Therapy: Approve for 1 year if the patient meets the following criteria (i, ii, and iii)
i. Patient is ≥ 1 years of age; AND
ii. Patient has tried at least two other antiepileptic drugs; AND
Note: Examples of other antiepileptic drugs include valproic acid, lamotrigine, topiramate, clonazepam, levetiracetam, zonisamide, Banzel, felbamate, clobazam, Fycompa, vigabatrin, everolimus.
iii. The medication is prescribed by, or in consultation with, a neurologist.
B) Patient is Currently Receiving Epidiolex: Approve for 1 year if the patient is responding to therapy (e.g., reduced seizure severity, frequency, and/or duration) as determined by the prescriber.

Other Uses with Supportive Evidence

5. Treatment-Refractory Seizures/Epilepsy [specific rare conditions] (i.e., CDKL5 deficiency disorder; Dup15q, Aicardi, or Doose syndromes; febrile infection-related epilepsy syndromes; Sturge-Weber syndrome; lissencephaly; cortical malformation/dysplasia; and epilepsy with myoclonic absences). Approve if the patient meets ONE of the following criteria (A or B):
G) Initial Therapy: Approve for 1 year if the patient meets the following criteria (i, ii, and iii):
vii. Patient is ≥ 1 years of age; AND

viii. Patient has tried at least two other antiepileptic drugs; AND

Note: Examples of other antiepileptic drugs include valproic acid, lamotrigine, topiramate, clonazepam, levetiracetam, zonisamide, Banzel, felbamate, clobazam, Fycompa, vigabatrin, others.

ix. The medication is prescribed by, or in consultation with, a neurologist.

H) Patient is Currently Receiving Epidiolex: Approve for 1 year if the patient is responding to therapy (e.g., reduced seizure severity, frequency, and/or duration) as determined by the prescriber.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Epidiolex is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Early Annual Revision	Revised Dravet syndrome criterion regarding previous drug use such that use of clobazam can lead to an approval: Epidiolex can be approved if patient has tried at least two other AEDs (e.g., valproic acid, topiramate, clonazepam, levetiracetam, zonisamide, others) OR one of Diacomit or clobazam	01/03/2019

Annual Revision	"Prescribing physician" was changed to "prescriber" throughout the criteria as needed. Also, examples of other antiepileptic drugs were removed from the criteria and changed to notes in all three of the approved conditions.	01/29/2020
Update	4/9/2020: Epidiolex is no longer a controlled substance, so reference to it being a Schedule V controlled substance was removed.	--
Selected Revision	For the approval condition of Treatment-Refractory Seizures/Epilepsy, this is now limited to specific rare conditions. The specific rare conditions are tuberous sclerosis complex; CDKL5 deficiency disorder; Dup15q, Aicardi, or Doose syndromes; febrile infection-related epilepsy syndromes; Sturge-Weber syndrome; lissencephaly; cortical malformation/dysplasia; and epilepsy with myoclonic absences.	05/20/2020
Selected Revision	Criteria for a new FDA-approved indication was added for tuberous sclerosis complex and this condition was removed from the approval condition of Treatment-Refractory Seizures/Epilepsy [specific rare conditions] under Other Uses with Supportive Evidence. For the approval conditions of Lennox-Gastaut syndrome, Dravet syndrome, and Treatment-Refractory Seizures/Epilepsy [specific rare conditions], criteria was revised to approve for children ≥ 1 year of age from ≥ 2 years of age based on expanded age indications.	08/12/2020
Annual Revision	No criteria changes.	02/03/2021

PRIOR AUTHORIZATION POLICY

POLICY: Antiepileptics – Fintepla Prior Authorization Policy

- Fintepla® (fenfluramine oral solution – Zogenix)

REVIEW DATE: 07/15/2020

OVERVIEW

Fintepla, a serotonin 5-hydroxytryptamine subtype 2 (5-HT_2) agonist, is indicated for the treatment of seizures associated with Dravet syndrome in patients ≥ 2 years of age.[1]

Disease Overview

Dravet syndrome is a rare genetic epileptic encephalopathy (dysfunction of the brain) marked with frequent and/or prolonged seizures.[2,3] It is estimated that 1 out of 15,700 infants born in the US are affected with Dravet syndrome. The seizures generally begin in the first year of life in an otherwise healthy infant. Affected individuals can develop many seizure types: myoclonic, tonic-clonic, absence, atypical absence, atonic, focal aware or impaired awareness (previously called partial seizures), and status epilepticus.[3] As the seizures continue, most of the children develop some level of developmental disability and other conditions associated with the syndrome. Two or more antiepileptic drugs (AEDs) are often needed to control the seizures; most of the seizures are refractory to medications. The goals of treatment are cessation of prolonged convulsions, reductions in overall seizure frequency, and minimization of treatment side effects.[4,5] Some patients respond to the ketogenic diet and/or vagus nerve stimulation.

Guidelines

Fintepla is not mentioned in the treatment recommendations. Clobazam and valproate (all forms) are the optimal first-line medications and treatment should be initiated with one of these agents and the other added if control remains suboptimal.[6] Diacomit® (stiripentol capsule and powder for oral suspension) and topiramate are optimal second-line medications and should be used if seizure control remains poor after use of both first-line therapies. Ketogenic diet is moderately effective and can be considered second-line. Clonazepam, levetiracetam, and zonisamide are moderately effective if patients fail to respond to the first- and second-line therapies. Medical marijuana is moderately effective for Dravet syndrome (although there is no consensus regarding the specific type/concentration of medical marijuana); and all patients need a home rescue medication and seizure protocol. Carbamazepine, oxcarbazepine, lamotrigine, phenytoin, Sabril® (vigabatrin tablet and oral packet), and tiagabine should be avoided in these patients as these medications can exacerbate seizures in Dravet syndrome.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Fintepla. Because of the specialized skills required for evaluation and diagnosis of patients treated with Fintepla as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Fintepla to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Fintepla is recommended in those who meet the following criteria:

FDA-Approved Indications

16. Dravet Syndrome. Approve if the patient meets ONE the following criteria (A or B):

- **A)** Initial Therapy: Approve for 1 year if the patient meets the following (i, ii, and iii):
  - **i.** Patient is ≥ 2 years of age; AND
  - **ii.** Patient meets ONE of the following (a or b):
    - **a)** Patient has tried or is concomitantly receiving at least two other antiepileptic drugs; OR
      Note: Examples of other antiepileptic drugs include valproic acid, clobazam, topiramate, clonazepam, levetiracetam, zonisamide.
    - **b)** Patient has tried or is concomitantly receiving one of Epidiolex or Diacomit; AND
  - **iii.** Fintepla is prescribed by or consultation with a neurologist; OR
- **B)** Patient is Currently Receiving Fintepla: Approve for 1 year if the patient is responding to therapy (e.g., reduced seizure severity, frequency, and/or duration) as determined by the prescriber.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Fintepla is not recommended in the following situations:

11. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Antiepileptics – Nayzilam Prior Authorization Policy

- Nayzilam® (midazolam nasal spray – UCB, Inc.)

REVIEW DATE: 08/19/2020

OVERVIEW

Nayzilam is indicated for the acute treatment of intermittent, stereotypic episodes of frequent seizure activity (i.e., seizure clusters, acute repetitive seizures) that are distinct from a patient's usual seizure pattern in patients with epilepsy ≥ 12 years of age.[1]

Nayzilam is a benzodiazepine which is thought to work by the potentiation of gamma-aminobutyric acid (GABA)ergic neurotransmission resulting from binding at the benzodiazepine site of the $GABA_A$ receptor.[1] The recommended initial dose is one spray (5 mg dose) into one nostril. If needed, the recommended second dose is one additional 5 mg spray into the opposite nostril administered after 10 minutes if the patient has not responded to the initial dose. A second dose of Nayzilam should not be administered if the patient has trouble breathing or if there is excessive sedation that is uncharacteristic of the patient during a seizure cluster episode. No more than two doses of Nayzilam should be used to treat a single episode. It is recommended that Nayzilam be used to treat no more than one episode every 3 days and no more than five episodes per month. Nayzilam is available as a single-dose nasal spray unit containing 5 mg/0.1 mL of midazolam and supplied in boxes of two nasal spray units. Nayzilam is a Schedule C-IV controlled substance.

Disease Overview

Patients with epilepsy can experience acute repetitive seizures or seizure clusters.[2] The prevalence of epilepsy in the US is approximately 3.4 million people, and of these patients, an estimated 36% of patients have uncontrolled disease, a significant risk factor for seizure clusters.[3,4] Seizure clusters are estimated to occur in approximately 15% of adults with uncontrolled epilepsy.[5] No consensus definition of a seizure cluster has been agreed upon, and seizure cluster is not listed in the International League Against Epilepsy commission on classification and terminology.[2] A broad definition of seizure clusters has been proposed to be "acute episodes of deterioration in seizure control". More specifically, they could be defined as a series of grouped seizures that have short interictal periods. However, the number of seizures and the interictal period are the subject of controversy. Seizure clusters can result in increased emergency room visits or hospitalization, and they can disrupt the daily life, studies, and work of patients and caregivers. They are particularly concerning because of their association with status epilepticus, a potentially life-threatening condition. Benzodiazepine rescue medication is the primary acute therapy for management of seizure clusters, helping to abort clusters and reduce emergency department visits.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Nayzilam. Because of the specialized skills required for evaluation and diagnosis of patients treated with Nayzilam as well as the monitoring required for adverse events and efficacy, approval requires Nayzilam to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Nayzilam is recommended in those who meet the following criteria:

FDA-Approved Indications

17. **Intermittent Episodes of Frequent Seizure Activity (i.e., seizure clusters, acute repetitive seizures).** Approve for 1 year if the patient meets the following criteria (A and B):
    - **A)** Patient is currently receiving maintenance antiepileptic medication(s); AND
    - **B)** Nayzilam is prescribed by or in consultation with a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Nayzilam is not recommended in the following situations:

12. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Antiepileptics – Valtoco Prior Authorization Policy

- Valtoco® (diazepam nasal spray – Neurelis)

REVIEW DATE: 02/03/2021

OVERVIEW

Valtoco, a benzodiazepine, is indicated for the acute treatment of **intermittent, stereotypic episodes of frequent seizure activity** (i.e., seizure clusters, acute repetitive seizures) that are distinct from a patient's usual seizure pattern in patients with epilepsy ≥ 6 years of age.[1]

Valtoco is for acute treatment only. Do not use more than two doses of Valtoco to treat a single episode.[1] It is recommended that Valtoco be used to treat no more than one episode every five days and no more than five episodes per month.

Disease Overview

Patients with epilepsy can experience acute repetitive seizures or seizure clusters.[2] Patients with severe and/or poorly controlled epilepsy are more likely to experience seizure clusters. Seizure clusters can result in increased emergency room visits or hospitalization, and they can disrupt the daily life, studies, and work of patients and caregivers. They are particularly concerning because of their association with status epilepticus, a potentially life-threatening condition. Benzodiazepine rescue medication is the primary acute therapy for management of seizure clusters, helping to abort clusters and reduce emergency department visits.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Valtoco. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Valtoco is recommended in those who meet the following criteria:

FDA-Approved Indications

18. **Intermittent Episodes of Frequent Seizure Activity (i.e., seizure clusters, acute repetitive seizures).** Approve for 1 year if the patient meets the following criteria (A and B):
    A) Patient is currently receiving maintenance antiepileptic medication(s); AND
    B) The medication is prescribed by or in consultation with a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Valtoco is not recommended in the following situations:

13. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Antiepileptics – Vigabatrin (Sabril) Prior Authorization Policy

- Sabril® (vigabatrin tablets and powder for solution – Lundbeck, generics)

REVIEW DATE: 09/16/2020

OVERVIEW

Vigabatrin is indicated for the following:[1]

- **Monotherapy for infantile spasms** in pediatric patients 1 month to 2 years of age for whom the potential benefits outweigh the potential risk of vision loss. Vigabatrin is not indicated as a first line agent for complex partial seizures.
- **Adjunctive therapy for refractory complex partial seizures** in adults and pediatric patients ≥ 2 years of age who have inadequately responded to several alternative treatments and for whom the potential benefits outweigh the risk of vision loss.

According to the vigabatrin prescribing information, use the lowest dosage and shortest exposure to vigabatrin consistent with clinical objectives.[1] For infantile spasms, vigabatrin is titrated to a maximum dose of 150 mg/kg/day given in two divided doses (75 mg/kg twice daily). Vigabatrin should be withdrawn if a substantial clinical benefit is not observed within 2 to 4 weeks. For refractory complex partial seizures, vigabatrin is titrated to 3,000 mg/day (1,500 mg twice daily) for patients ≥ 17 years of age and to 2,000 mg/day (1,000 mg twice daily) for pediatric patients 10 years to 16 years of age. In patients with refractory complex partial seizures, vigabatrin should be withdrawn if a substantial clinical benefit is not observed within 3 months of initiating treatment.

Safety

Vigabatrin has a Boxed Warning with regard to permanent vision loss.[1] In some cases, vigabatrin also can damage the central retina and may decrease visual acuity. The onset of vision loss from vigabatrin is unpredictable, and can occur within weeks of starting treatment or sooner, or at any time after starting treatment, even after months or years. The risk of vision loss increases with increasing dose and cumulative exposure, but there is no dose or exposure known to be free of risk of vision loss. Vision assessment is recommended at baseline (no later than 4 weeks after starting vigabatrin), at least every 3 months during

therapy, and about 3 to 6 months after the discontinuation of therapy. Once detected, vision loss due to vigabatrin is not reversible. Because of the risk of vision loss, vigabatrin should be withdrawn from patients with refractory complex partial seizures who fail to show substantial clinical benefit within 3 months of initiation and within 2 to 4 weeks of initiation for patients with infantile spasms, or sooner if treatment failure becomes obvious. Because of the risk of permanent vision loss, vigabatrin is available only through a restricted program under a Risk Evaluation and Mitigation Strategy (REMS) called the Vigabatrin REMS Program.

Guidelines/Recommendations

In 2012 the American Academy of Neurology (AAN) and the Child Neurology Society updated the evidence-based guideline for the medical treatment of infantile spasms.[2] The guidelines note that low-dose adrenocorticotropic hormone (ACTH) is a first-line agent for the short-term treatment of infantile spasms. ACTH or vigabatrin may be useful for short-term treatment of infantile spasms, with ACTH considered preferentially over vigabatrin. Hormonal therapy (ACTH or prednisolone) may be considered for use in preference to vigabatrin in infants with cryptogenic infantile spasms, to possibly improve developmental outcome. A shorter lag time to treatment of infantile spasms with either hormonal therapy or vigabatrin possibly improves long-term developmental outcomes. The Infantile Spasms Working Group (ISWG) published a US consensus report on infantile spasms in 2010.[3] Data regarding ACTH use and vigabatrin use in infantile spasms were detailed.[3] ACTH is an effective first-line therapy for infantile spasms. Vigabatrin is considered a drug of first choice for infantile spasms comorbid with tuberous sclerosis complex, and it is the drug of second or third choice for children with other symptomatic or cryptogenic infantile spasms.

The American Academy of Neurology (AAN) and the American Epilepsy Society published a guideline update for treatment-resistant epilspsy (2018) that clobazam is probably effective as add-on therapy for LGS and is possibly effective as add-on therapy for treatment-resistant adult focal epilepsy.[4] Vigabatrin is effective as add-on therapy in treatment-resistant adult focal epilepsy based on two Class I studies, but it should not be used as a first-line treatment. The benefits of vigabatrin should be weighed against the risks, particularly the risk of irreversible retinopathy.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of vigabatrin. Because of the specialized skills required for evaluation and diagnosis of patients treated with vigabatrin as well as the monitoring required for adverse events and long-term efficacy, initial approval requires vigabatrin to be prescribed by, or in consultation with, a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of vigabatrin is recommended in those who meet the following criteria:

FDA-Approved Indications

11. Infantile Spasms. Approve for 6 months if the patient meets the following criteria (A, B, and C):
- **B)** Patient is ≤ 2 years of age; AND
- **C)** Vigabatrin is being used as monotherapy; AND
- **D)** The medication is prescribed by, or in consultation with, a neurologist.

12. Treatment-Refractory Complex Partial Seizures. Approve for the duration noted below if the patient meets ONE of the following criteria (A or B):

G) Initial Therapy: Approve for 3 months if the patient meets the following criteria (i, ii, and iii):

i. Patient is ≥ 2 years of age; AND

ii. Patient has tried and/or is concomitantly receiving at least three other antiepileptic drugs; AND

Note: Examples of antiepileptic drugs include valproic acid, gabapentin, phenytoin, carbamazepine, oxcarbazepine, lacosamide, levetiracetam, zonisamide, Fycompa (perampanel tablet or oral suspension), lamotrigine, topiramate, rufinamide, tiagabine, felbamate, Diacomit (stiripentol capsules or oral suspension), and clobazam.

iii. The medication is prescribed by, or in consultation with, a neurologist.

H) Patient is Currently Receiving Vigabatrin: Approve for 1 year if the patient is responding to therapy (e.g., reduced seizure severity, frequency, and/or duration) as determined by the prescriber.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of vigabatrin is not recommended in the following situations:

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Antifungal – Cresemba® (isavuconazonium sulfate capsules – Astellas Pharma)

DATE REVIEWED: 06/10/2020

OVERVIEW

Cresemba, an azole antifungal, is indicated for use in patients ≥ 18 years of age for the treatment of invasive aspergillosis or invasive mucormycosis.[1] Cresemba is also available for use as an intravenous (IV) infusion. Switching between the IV and oral formulations is acceptable as the two formulations are bioequivalent.

In the pivotal study involving patients with invasive aspergillosis, patients were initiated on IV Cresemba before transitioning to oral Cresemba therapy.[1] The mean treatment duration was 47 days, of which patients received IV Cresemba for 8 to 9 days. In an open-label, non-comparative study that included a subset of patients with invasive mucormycosis, patients were treated with either IV or oral Cresemba. The median duration of Cresemba therapy was 102 days.

Guidelines/Recommendations

The Infectious Diseases Society of America (IDSA) [2016] recommends Cresemba as a treatment option for invasive aspergillosis and different invasive syndromes of *Aspergillus* (e.g., invasive pulmonary aspergillosis, invasive sinus aspergillosis, aspergillosis of the central nervous system, etc).[2] Treatment of invasive aspergillosis should be continued for a minimum of 6 to 12 weeks, depending on the degree and duration of immunosuppression, site of disease, and evidence of disease improvement.

The European Conference on Infections in Leukemia (ECIL), a collaboration between the European Organization for Research and Treatment of Cancer (EORTC), the European Society for Bone and Marrow Transplantation (EBMT), the European Leukemia Net (ELN), and the International Immunocompromised Host Society (CSH), provided recommendations for the treatment of several types of fungal infections, including invasive aspergillosis and mucormycosis in hematologic patients (2016).[3] The ECIL-6 recommendations list Cresemba, among other antifungals, as first-line for the treatment of invasive aspergillosis (A1 grade; good evidence from at least one properly randomized, controlled trial). The panel recommends a multidisciplinary approach, including antifungal therapy (amphotericin B), surgery, and control of the underlying conditions (e.g., control of diabetes, use of hematopoietic growth factor if the patient is neutropenic, discontinuation/tapering of steroids, reduction of immunosuppressive therapy).

The European Society for Clinical Microbiology and Infectious Diseases (ESCMID) and the European Confederation of Medical Mycology (ECMM) published joint clinical guidelines for the management of mucormycosis in 2013.[4] The panel notes that there are no published, well-designed, randomized clinical efficacy trials in the field of mucormycosis. Surgery, whenever possible, is strongly recommended to be combined with medical treatment. The drug of choice for the treatment of invasive mucormycosis is liposomal amphotericin B.

The National Comprehensive Cancer Network (NCCN) Prevention and Treatment of Cancer-Related Infections clinical guidelines (version 2.2020 – June 5, 2020) note that Cresemba is currently not recommended for use as prophylaxis against fungal infections in patients with cancer and neutropenia.[5]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Cresemba capsules.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Cresemba is recommended in those who meet the following criteria:

FDA-Approved Indications

1. ***Aspergillus* Infections – Treatment.** Approve for 3 months.

2. **Mucormycosis – Treatment.** Approve for 3 months.

Other Uses with Supportive Evidence

3. **Fungal Infections (Systemic) That Are Susceptible to Cresemba – Treatment.** Approve for 3 months.

4. **Patients Currently Receiving Intravenous Cresemba or Oral Cresemba Capsules.** Approve for 3 months to complete the course of therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Cresemba has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

30. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Antifungal – Noxafil® (posaconazole delayed-release tablets [generics] and oral suspension – Merck)

DATE REVIEWED: 06/10/2020

OVERVIEW

Noxafil, an azole antifungal, is indicated for prophylaxis of invasive *Aspergillus* and *Candida* infections in patients who are at high risk of developing these infections due to being severely immunocompromised, such as hematopoietic stem cell transplant (HSCT) recipients with graft-versus-host disease (GVHD) or those with hematologic malignancies with prolonged neutropenia from chemotherapy.[1] Noxafil oral suspension is also indicated for the treatment of oropharyngeal candidiasis, including oropharyngeal candidiasis refractory to itraconazole and/or fluconazole. Noxafil delayed-release tablets and oral suspension are indicated for use in patients ≥ 13 years of age. The delayed-release tablets and oral suspension should not be used interchangeably.

The duration of Noxafil therapy is varied. In a pivotal study, where Noxafil oral suspension was compared with fluconazole capsules as prophylaxis for the prevention of invasive fungal infections in allogeneic HSCT recipients with GVHD, the mean duration of Noxafil therapy was 80 days.[1]

Guidelines/Recommendations

The Infectious Diseases Society of America (IDSA) guidelines for aspergillosis (2016) recommend Noxafil for prophylaxis of invasive aspergillosis.[2] The IDSA guidelines for candidiasis (2016) notes Noxafil as one of the drugs of choice for the treatment of fluconazole-refractory oropharyngeal candidiasis.[3] The National Comprehensive Cancer Network (NCCN) Guidelines for the Prevention and Treatment of Cancer-Related Infections (version 2.2020 – June 5, 2020) recommends Noxafil (category 1) for antifungal prophylaxis in patients with acute myeloid leukemia (AML) or myelodysplastic syndrome (MDS) and neutropenia who are receiving induction or re-induction chemotherapy; voriconazole is a category 2B recommendation.[4] The IDSA notes Noxafil as having high-quality evidence for prophylaxis of candidiasis, whereas voriconazole is noted as having moderate-quality evidence.

Other Uses

The IDSA guidelines for aspergillosis (2016) list Noxafil as an option for treatment of invasive aspergillosis that is refractory to other antifungal therapies or that has progressed despite treatment.[2] The guidelines for prevention and treatment of opportunistic infections in adults and adolescents with human immunodeficiency virus (HIV) infections (2019) note Noxafil as an option for treatment of patients with coccidiodomycosis.[4] The NCCN Guidelines for Prevention and Treatment of Cancer-Related Infections (version 2.2020 – June5, 2020) include Noxafil as one of the antifungal therapies for the following: treatment of mouth and esophageal infections (e.g., oral thrush) refractory to fluconazole; invasive fusariosis; *Scedosporium* infections; and maintenance treatment of mucormycosis.[5] Additionally, the NCCN notes Noxafil as one of the antifungal therapies that are recommended for use as prophylaxis against fungal infections in patients with cancer (e.g., patients with AML or MDS; patients with graft-versus-host disease [GVHD]; hematopoietic cell transplant [HCT] recipients). Antifungal prophylaxis should be continued until resolution of neutropenia or GVHD. Noxafil is active against *Candida* and *Aspergillus* species, some *Zygomycetes* species; and against dimorphic fungi.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Noxafil delayed-release tablets and oral suspension.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Noxafil is recommended in those who meet the following criteria:

FDA-Approved Indications

5. ***Aspergillus* Infections – Prophylaxis.** Approve for 6 months.

6. ***Candida* Infections (Systemic) – Prophylaxis.** Approve for 6 months.

7. **Oropharyngeal candidiasis – Treatment.** Approve for 3 months.

Other Uses with Supportive Evidence

8. ***Aspergillus* Infections – Treatment.** Approve for 3 months.

9. **Mouth and Esophageal Infections (Refractory to Other Azole Antifungals) – Treatment.** Approve for 3 months.

10. **Mucormycosis – Maintenance.** Approve for 6 months.

11. **Fusariosis, Invasive – Treatment.** Approve for 3 months.

12. ***Scedosporium* infections – Treatment.** Approve for 3 months.

13. **Fungal Infections (Systemic) In Patients with Human Immunodeficiency Virus (HIV) Infections (e.g., Histoplasmosis, Coccidioidomycosis) – Treatment.** Approve for 3 months.

14. **Fungal Infections (Systemic) In Patients At Risk Of Neutropenia – Prophylaxis.** Approve for 6 months.

15. **Fungal Infections (Systemic) That Are Susceptible to Noxafil – Treatment.** Approve for 3 months.

16. **Patients Currently Receiving Intravenous Noxafil or Oral Noxafil (Tablets or Oral Suspension).** Approve for 3 months to complete the course of therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Noxafil has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

31. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION WITH STEP THERAPY POLICY

POLICY: Tolsura™ (itraconazole capsules – Mayne Pharma)

DATE REVIEWED: 06/10/2020

OVERVIEW

Tolsura, a branded itraconazole product, is indicated for the treatment of the following fungal infections in immunocompromised and non-immunocompromised adult patients: blastomycosis (pulmonary and extrapulmonary); histoplasmosis, including chronic cavitary pulmonary disease and disseminated, non-meningeal histoplasmosis; and aspergillosis (pulmonary and extrapulmonary) in patients who are intolerant of or who are refractory to amphotericin B therapy.[1] Limitations of use: Tolsura is not indicated for the treatment of onychomycosis. Tolsura is not interchangeable or substitutable with other itraconazole products due to the differences in the dosing between Tolsura and other itraconazole products. Compared with itraconazole capsules, the bioavailability of Tolsura is greater (relative bioavailability is 173% with 21% less variability).[2] The recommended dose for the treatment of blastomycosis or histoplasmosis is 130 mg (2 x 65 mg capsules) once daily (QD). The dose is 130 mg (2 x 65 mg capsules) QD or twice daily (BID) for the treatment of aspergillosis.[1] A loading dose of 130 mg (2 x 65 mg capsules) three times a day (TID) may be necessary for the treatment of life-threatening infections. Tolsura is available as 65 mg capsules.

Itraconazole capsule (Sporanox, generics) is indicated for the treatment of the following fungal infections in immunocompromised and non-immunocompromised patients: blastomycosis (pulmonary and extrapulmonary); histoplasmosis (including chronic cavitary pulmonary disease and disseminated, non-meningeal histoplasmosis); and aspergillosis (pulmonary and extrapulmonary) in patients who are intolerant of or who are refractory to amphotericin B therapy.[3] Itraconazole capsule is also indicated for the treatment of the following fungal infections in non-immunocompromised patients: onychomycosis of the toenail, with or without fingernail involvement, due to dermatophytes (tinea unguium); and onychomycosis of the fingernail due to dermatophytes (tinea unguium). The dose of itraconazole capsule (100 mg capsules) for the treatment of systemic fungal infections and onychomycosis range from 200 mg/day to 400 mg/day; a 600 mg/day loading dose (for 3 days) is recommended for life-threatening infections.

Itraconazole oral solution (Sporanox, generics) is indicated for the treatment of oropharyngeal and esophageal candidiasis.[4] The prescribing information notes that itraconazole oral solution was not

investigated in severely neutropenic patients with oropharyngeal and/or esophageal candidiasis and it is not recommended for initiation of treatment in patients at immediate risk of systemic candidiasis. The recommended dose of itraconazole oral solution (10 mg/mL) range from 100 mg (10 mL) to 200 mg (20 mL) per day. Itraconazole oral solution should not be used interchangeably with itraconazole capsule. Drug exposure is greater with the oral solution than with the capsules when the same dose of drug is given. Although itraconazole oral solution is not FDA-approved for the treatment of systemic fungal infections, both the capsule and liquid formulation of itraconazole are listed as options for use in the treatment and prophylaxis of systemic fungal infections by the Infectious Diseases Society of America (IDSA), American Thoracic Society (ATS) and the National Comprehensive Cancer Network (NCCN).[5-7] Many guidelines note improved bioavailability of the oral solution compared with the capsule formulation.[5,8,9] Therapeutic drug monitoring of itraconazole is recommended.

Clinical Efficacy/Guidelines

Tolsura has not yet been incorporated into guidelines. Conventional itraconazole (capsule and/or oral solution) is a treatment option for systemic fungal infections, including invasive aspergillosis, blastomycosis, and histoplasmosis.[5,6,10]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Tolsura. This Prior Authorization Policy also contains a Step Therapy component. When clinically appropriate, patients are directed to try one Preferred Step 1 agent (itraconazole capsules or oral solution) prior to Tolsura (Step 2). All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tolsura is recommended in those who meet the following criteria:

FDA-Approved Indications

13. **Blastomycosis – Pulmonary Or Extrapulmonary – Treatment.** Approve for 3 months if the patient meets one of the following criteria (A or B):
    - **a)** The patient has tried one of itraconazole capsules or oral solution; OR
    - **b)** The patient is currently receiving Tolsura for this condition.

14. **Histoplasmosis (Including Chronic Cavitary Pulmonary Disease and Disseminated, Non-Meningeal) – Treatment.** Approve for 3 months if the patient meets one of the following criteria (A or B):
    - **a)** The patient has tried one of itraconazole capsules or oral solution; OR
    - **b)** The patient is currently receiving Tolsura for this condition.

15. **Aspergillosis – Pulmonary Or Extrapulmonary – Treatment.** Approve for 3 months if the patient meets one of the following criteria (A or B):
    - **a)** The patient has tried one of itraconazole capsules or oral solution; OR
    - **b)** The patient is currently receiving Tolsura for this condition.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Tolsura not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for

these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

32. Onychomycosis. Treatment of onychomycosis is noted as a Limitation of Use in the prescribing information.

33. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Antifungals – Voriconazole tablets and oral suspension (Vfend® – Roerig, a division of Pfizer; generics)

DATE REVIEWED: 06/10/2020

OVERVIEW

Voriconazole (Vfend, generics), an azole antifungal, is indicated in adults and pediatric patients (≥ 2 years of age) for the treatment of invasive aspergillosis, esophageal candidiasis, and for the treatment of serious fungal infections caused by *Scedosporium apiospermum* (asexual form of *Pseudallescheria boydii*) and *Fusarium* spp., including *Fusarium solani* in patients intolerant of, or refractory to, other therapy.[1] Voriconazole is also indicated for the treatment of candidemia in non-neutropenic patients and the

following *Candida* infections: disseminated infections in skin and infections in abdomen, kidney, bladder wall, and wounds. The duration of voriconazole therapy is varied, ranging from a median duration of 15 days for esophageal candidiasis to 76 days for invasive aspergillosis.

Guidelines/Recommendations

The Infectious Diseases Society of America (IDSA) recommends Voriconazole as a treatment option for invasive aspergillosis (2016) and different invasive syndromes of *Aspergillus* (e.g., invasive pulmonary aspergillosis, invasive sinus aspergillosis, aspergillosis of the central nervous system) and for candidemia and candidiasis (2016).[2,3] The National Comprehensive Cancer Network (NCCN) Guidelines for Prevention and Treatment of Cancer-Related Infections (version 2.2020 – June 5, 2020) note Voriconazole as an option for the treatment of infections caused by *Fusarium* and *Scedosporium* species.[4]

Other Uses

The IDSA guidelines for aspergillosis (2016) recommend Voriconazole for prophylaxis of invasive aspergillosis. The IDSA guidelines for management of candidiasis (2016) note voriconazole as a treatment option for the following infections: *Candida* intravascular infections, including endocarditis and infections of implantable cardiac devices; fluconazole-refractory oropharyngeal candidiasis; *Candida* endophthalmitis.[3] The IDSA guidelines for the management of blastomycosis (2008) note Voriconazole as an option for the treatment of central nervous system blastomycosis.[5] The NCCN Guidelines for Prevention and Treatment of Cancer-Related Infections (version 2.2020 – June 5, 2020) note Voriconazole as an option for prophylactic use against fungal infections in patients at risk of neutropenia (e.g., patients with cancer; patients with graft-versus-host disease [GVHD]; hematopoietic cell transplant [HCT] recipients).[4] Antifungal prophylaxis should be continued until resolution of neutropenia or GVHD; in one study involving HCT recipients, Voriconazole was used for up to 6 months. The guidelines for prevention and treatment of opportunistic infections in adults and adolescents with human immunodeficiency virus (HIV) infections (2019) recommend voriconazole for prophylaxis or chronic suppressive/maintenance treatment for various fungal infections in patients with HIV (e.g., histoplasmosis, coccidioidomycosis, infections caused by *Talaromyces marneffei* [formerly known as *Penicillium marneffei]*).[6]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Vfend tablets and oral suspension and generic voriconazole tablets and oral suspension.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Voriconazole is recommended in those who meet the following criteria:

FDA-Approved Indications

17. ***Aspergillus* Infections – Treatment.** Approve for 3 months if the patient meets one of the following criteria (A or B):
    a. Generic voriconazole tablets or oral suspension is requested; OR
    b. If brand Vfend tablet or brand Vfend oral suspension is requested, the patient has tried the corresponding generic voriconazole product (tablet or oral suspension) AND cannot take the generic voriconazole product due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the brand and the bioequivalent generic product,

which per the prescribing physician, would result in a significant allergy or serious adverse reaction.

18. Esophageal Candidiasis – Treatment. Approve for 3 months if the patient meets one of the following criteria (A or B):
   a. Generic voriconazole tablets or oral suspension is requested; OR
   b. If brand Vfend tablet or brand Vfend oral suspension is requested, the patient has tried the corresponding generic voriconazole product (tablet or oral suspension) AND cannot take the generic voriconazole product due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the brand and the bioequivalent generic product, which per the prescribing physician, would result in a significant allergy or serious adverse reaction.

19. Infections caused by *Scedosporium apiospermum* – Treatment. Approve for 3 months if the patient meets one of the following criteria (A or B):
   a. Generic voriconazole tablets or oral suspension is requested; OR
   b. If brand Vfend tablet or brand Vfend oral suspension is requested, the patient has tried the corresponding generic voriconazole product (tablet or oral suspension) AND cannot take the generic voriconazole product due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the brand and the bioequivalent generic product, which per the prescribing physician, would result in a significant allergy or serious adverse reaction.

20. Infections caused by *Fusarium* species – Treatment. Approve for 3 months if the patient meets one of the following criteria (A or B):
   a. Generic voriconazole tablets or oral suspension is requested; OR
   b. If brand Vfend tablet or brand Vfend oral suspension is requested, the patient has tried the corresponding generic voriconazole product (tablet or oral suspension) AND cannot take the generic voriconazole product due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the brand and the bioequivalent generic product, which per the prescribing physician, would result in a significant allergy or serious adverse reaction.

21. *Candida* (Systemic) Infections – Treatment. Approve for 3 months if the patient meets one of the following criteria (A or B):
   a. Generic voriconazole tablets or oral suspension is requested; OR
   b. If brand Vfend tablet or brand Vfend oral suspension is requested, the patient has tried the corresponding generic voriconazole product (tablet or oral suspension) AND cannot take the generic voriconazole product due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the brand and the bioequivalent generic product, which per the prescribing physician, would result in a significant allergy or serious adverse reaction.

Other Uses with Supportive Evidence

22. *Aspergillus* Infections – Prophylaxis. Approve for 6 months if the patient meets one of the following criteria (A or B):
   A) Generic voriconazole tablets or oral suspension is requested; OR
   B) If brand Vfend tablet or brand Vfend oral suspension is requested, the patient has tried the corresponding generic voriconazole product (tablet or oral suspension) AND cannot take the generic voriconazole product due to a formulation difference in the inactive ingredient(s) [e.g.,

difference in dyes, fillers, preservatives] between the brand and the bioequivalent generic product, which per the prescribing physician, would result in a significant allergy or serious adverse reaction.

23. **Oropharyngeal Candidiasis (fluconazole-refractory) – Treatment.** Approve for 3 months if the patient meets one of the following criteria (A or B):
    A) Generic voriconazole tablets or oral suspension is requested; OR
    B) If brand Vfend tablet or brand Vfend oral suspension is requested, the patient has tried the corresponding generic voriconazole product (tablet or oral suspension) AND cannot take the generic voriconazole product due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the brand and the bioequivalent generic product, which per the prescribing physician, would result in a significant allergy or serious adverse reaction.

24. ***Candidia* endophthalmitis – Treatment.** Approve for 3 months if the patient meets one of the following criteria (A or B):
    A) Generic voriconazole tablets or oral suspension is requested; OR
    B) If brand Vfend tablet or brand Vfend oral suspension is requested, the patient has tried the corresponding generic voriconazole product (tablet or oral suspension) AND cannot take the generic voriconazole product due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the brand and the bioequivalent generic product, which per the prescribing physician, would result in a significant allergy or serious adverse reaction.

25. **Blastomycosis – Treatment.** Approve for 3 months if the patient meets one of the following criteria (A or B):
    a. Generic voriconazole tablets or oral suspension is requested; OR
    b. If brand Vfend tablet or brand Vfend oral suspension is requested, the patient has tried the corresponding generic voriconazole product (tablet or oral suspension) AND cannot take the generic voriconazole product due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the brand and the bioequivalent generic product, which per the prescribing physician, would result in a significant allergy or serious adverse reaction.

26. **Fungal Infections (Systemic) in Patients At Risk Of Neutropenia – Prophylaxis.** Approve for 6 months if the patient meets one of the following criteria (A or B):
    A) Generic voriconazole tablets or oral suspension is requested; OR
    B) If brand Vfend tablet or brand Vfend oral suspension is requested, the patient has tried the corresponding generic voriconazole product (tablet or oral suspension) AND cannot take the generic voriconazole product due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the brand and the bioequivalent generic product, which per the prescribing physician, would result in a significant allergy or serious adverse reaction.

27. **Fungal Infections (Systemic) In Patients with Human Immunodeficiency Virus (HIV) – Prophylaxis or Treatment.** Approve for 6 months if the patient meets one of the following criteria (A or B):
    A) Generic voriconazole tablets or oral suspension is requested; OR
    B) If brand Vfend tablet or brand Vfend oral suspension is requested, the patient has tried the corresponding generic voriconazole product (tablet or oral suspension) AND cannot take the generic voriconazole product due to a formulation difference in the inactive ingredient(s) [e.g.,

difference in dyes, fillers, preservatives] between the brand and the bioequivalent generic product, which per the prescribing physician, would result in a significant allergy or serious adverse reaction.

12. Fungal Infections (Systemic) That Are Susceptible to Voriconazole – Treatment. Approve for 3 months if the patient meets one of the following criteria (A or B):

A) Generic voriconazole tablets or oral suspension is requested; OR

B) If brand Vfend tablet or brand Vfend oral suspension is requested, the patient has tried the corresponding generic voriconazole product (tablet or oral suspension) AND cannot take the generic voriconazole product due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the brand and the bioequivalent generic product, which per the prescribing physician, would result in a significant allergy or serious adverse reaction.

13. Patients Currently Receiving Intravenous Voriconazole or Oral Voriconazole (Tablets or Oral Suspension). Approve for 3 months to complete the course of therapy if the patient meets ONE of the following criteria (A or B):

A) Generic voriconazole tablets or oral suspension is requested; OR

B) If brand Vfend tablet or brand Vfend oral suspension is requested, the patient has tried the corresponding generic voriconazole product (tablet or oral suspension) AND cannot take the generic voriconazole product due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the brand and the bioequivalent generic product, which per the prescribing physician, would result in a significant allergy or serious adverse reaction.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Voriconazole has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

34. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Date Reviewed
New Policy	--	06/05/2019
Update	08/27/19: Changed policy name from "Antifungals – Voriconazole (Vfend) [Oral] PA Policy" to "Antifungals – Voriconazole Tablets and Oral Suspension PA Policy".	--
Annual revision	No criteria changes.	06/10/2020

PRIOR AUTHORIZATION POLICY

POLICY: Antifungals (Azoles) – Intravenous Products Prior Authorization Policy

- Cresemba® (isavuconazonium sulfate injection for intravenous infusion – Astellas)
- Fluconazole injection for intravenous infusion – generic only
- Noxafil® (posaconazole injection for intravenous infusion injection – Merck)
- Vfend® (voriconazole injection for intravenous infusion use – Pfizer, generic)

REVIEW DATE: 02/10/2021

OVERVIEW

Cresemba injection for intravenous (IV) infusion, fluconazole injection for IV infusion, Noxafil injection for IV infusion, and voriconazole injection for IV infusion are azole antifungals. These products are indicated for prophylaxis and/or treatment of fungal infections, including *Candida* infections, cryptococcal meningitis, esophageal candidiasis, invasive aspergillosis, and invasive mucormycosis.[1-4]

Injectable formulations of some antifungals have been compounded with other topical products (clindamycin, clotrimazole, ketoconazole, and mupirocin) to make foot baths and other products. There are no data to support these uses.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Cresemba injection for intravenous (IV) infusion, fluconazole injection for IV infusion, Noxafil injection for IV infusion, and voriconazole injection for IV infusion, when these products are prescribed in conjunction with select topical products: clindamycin, clotrimazole, ketoconazole, and mupirocin. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: If there are no prescription claims for topical clindamycin, topical clotrimazole, topical ketoconazole, and/or topical mupirocin products in the past 180 days, the Prior Authorization edit will not be applied in adjudication. Prior Authorization will only apply to prescriptions for Cresemba injection for IV infusion, fluconazole injection for IV infusion, Noxafil injection for IV infusion, and voriconazole injection for IV infusion when there is history of topical clindamycin, topical clotrimazole, topical ketoconazole, and/or topical mupirocin products in the past 180 days.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Cresemba injection for intravenous (IV) infusion, fluconazole injection for IV infusion, Noxafil injection for IV infusion, and voriconazole injection for IV infusion is recommended in those who meet the following criteria:

FDA-Approved Indications

16. Systemic Fungal Infections (Prophylaxis or Treatment). Approve for 3 months.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Cresemba injection for intravenous (IV) infusion, fluconazole injection for IV infusion, Noxafil injection for IV infusion, and voriconazole injection for IV infusion is not recommended in the following situations:

35. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Annual Revision	• Slight wording changes: o **Policy statement:** Revised "… when these products are prescribed in conjunction with topical clindamycin products, topical clotrimazole products, topical ketoconazole products, and/or topical mupirocin products" to "… when these products are prescribed in conjunction with select topical products: clindamycin, clotrimazole, ketoconazole, and mupirocin". o **Automation:** Revised "Prior Authorization will only apply to IV Cresemba, fluconazole, Noxafil, and voriconazole with history of topical clindamycin products, topical clotrimazole products, topical ketoconazole products, and/or topical mupirocin products in the past 180 days." to "Prior Authorization will only apply to prescriptions for Cresemba injection for intravenous (IV) infusion, fluconazole injection for IV infusion, Noxafil injection for IV infusion, and voriconazole injection for IV infusion when there is history of topical clindamycin, topical clotrimazole, topical ketoconazole, and/or topical mupirocin products in the past 180 days". • No criteria changes.	02/10/2021

PRIOR AUTHORIZATION POLICY

POLICY: Antiparasitics – Impavido® (miltefosine capsules – Profounda, Inc.)

DATE REVIEWED: 04/22/2020

OVERVIEW

Impavido is indicated in adults and adolescents ≥ 12 years of age weighing ≥ 30 kg for the treatment of visceral leishmaniasis caused by *Leishmania donovani*; cutaneous leishmaniasis caused by *L. braziliensis*, *L. guyanensis*, and *L. panamensis*; and mucosal leishmaniasis caused by *L. braziliensis*.[1] Limitation of use: *Leishmania* species studied in clinical trials evaluating Impavido were based on epidemiologic data; there may be geographic variation in clinical response of the same *Leishmania* species to Impavido; and the efficacy of Impavido in the treatment of other *Leishmania* species has not been evaluated.

Impavido is active *in vitro* against promastigotes and amastigotes of a variety of *Leishmania* species and anti-leishmanial activity has been demonstrated in clinical infections.[1] The exact mechanism of action is unknown. The recommended dose of Impavido is one 50 mg capsule twice daily with food for patients who weigh between 30 kg and 44 kg, and one 50 mg capsule three times a day with food for patients who weigh ≥ 45 kg. The treatment duration is 28 consecutive days.

A systematic review of four studies conducted in the Americas evaluated the efficacy of Impavido in pediatric patients ≤ 12 years of age with cutaneous leishmaniasis (n = 130).[2] The regimen was similar for all studies, with a target dose of 2.5 mg/kg/day (given as three times a day) for 28 days. The reported efficacy ranged from 63.1% to 82.8%.

Disease Overview

Leishmaniasis is a vector-borne disease that is transmitted by sandflies.[3] The number of annual new cases of leishmaniasis is unknown; it is estimated there are 700,000 to 1 million new cases annually. The cases of leishmaniasis in the US reflect travel and immigration patterns; leishmaniasis is not endemic to the US.[4] There are three primary forms of leishmaniasis: cutaneous, mucosal, and visceral.[3-5] Cutaneous leishmaniasis is the most common form, both in general and in US travelers. Mucosal leishmaniasis is the least common form of the three and it can be a sequela of cutaneous leishmaniasis, resulting from dissemination of the parasites from the skin to the naso-oropharyngeal mucosa.[4] Visceral leishmaniasis can affect several internal organs (usually the spleen, liver, and bone marrow) and can be life-threatening. If left untreated, visceral leishmaniasis can become fatal, either directly from the disease or indirectly from complications such as secondary bacterial infection or hemorrhage.[3,4]

Guidelines/Recommendations

In March 2011, Impavido was added to the World Health Organization (WHO) Essential Medicines List as an anti-leishmanial medicine.[6] The current WHO recommendations for the treatment of leishmaniasis include Impavido, liposomal amphotericin B, amphotericin B deoxycholate, paromomycin (not available in the US), pentavalent antimonial compounds (not available in the US) with or without pentoxifylline, systemic azole therapies, and thermotherapy.[6,7]

The Infectious Diseases Society of America (IDSA) and the American Society of Tropical Medicine and Hygiene (ASTMH) released guidelines for the management of persons with leishmaniasis in 2016.[8] Systemic therapies, including Impavido, are recommended for the treatment of patients with cutaneous, mucosal, or visceral leishmaniasis.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Impavido. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Impavido as well as the monitoring required for adverse events and long-term efficacy, approval

requires Impavido to be prescribed by, or in consultation with, a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Impavido is recommended in those who meet the following criteria:

FDA-Approved Indications

28. Leishmaniasis, Visceral, Cutaneous, or Mucosal. Approve Impavido for 1 month if prescribed by, or in consultation with, an infectious diseases specialist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Impavido has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

36. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Attention Deficit Hyperactivity Disorder Non-Stimulant Medications Prior Authorization Policy

- Intuniv® (guanfacine extended-release tablets – Shire Pharmaceuticals, generics)
- Kapvay® (clonidine hydrochloride extended-release tablets – Concordia, generics)
- Strattera® (atomoxetine capsules – Eli Lilly and Company, generics)

REVIEW DATE: 08/05/2020

OVERVIEW

Currently, there are three non-stimulant medications approved for the treatment of attention deficit hyperactivity disorder (ADHD): atomoxetine (Strattera, generics), guanfacine extended-release tablets (Intuniv, generics), and clonidine extended-release tablets (Kapvay, generics).[1-3] Atomoxetine, a selective norepinephrine reuptake inhibitor, is indicated for the treatment of ADHD in children ≥ 6 years of age, adolescents, and adults.[1] Guanfacine extended-release tablets and clonidine extended-release tablets, both of which are alpha agonists, are approved for use in children and adolescents aged 6 to 17 years with ADHD.[2,3] Guanfacine extended-release tablets and clonidine extended-release tablets are indicated for use as monotherapy or as adjunctive therapy to stimulant medications.

Clinical Efficacy

Patients with pervasive developmental disorders who have symptoms of ADHD respond to ADHD medications at a reduced rate compared with typically developing peers and often with undesirable side effects.[4,5] However, there is evidence to support use of these agents (e.g., stimulants, atomoxetine, guanfacine extended-release tablets, clonidine extended-release tablets) in this patient population.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of atomoxetine (Strattera, generics), guanfacine extended-release tablets (Intuniv, generics), and clonidine extended-release tablets (Kapvay, generics). All approvals are provided for the duration noted below.

Automation: An age edit targeting patients < 6 or > 18 years of age is recommended. Therefore, patients between the ages of 6 and 18 years will be approved at the point-of-service. For patients < 6 or > 18 years of age, coverage will be determined by Prior Authorization criteria.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of atomoxetine (Strattera, generics), guanfacine extended-release tablets (Intuniv, generics), or clonidine extended-release tablets (Kapvay, generics) is recommended in those who meet the following criteria:

FDA-Approved Indications

6. Attention Deficit Hyperactivity Disorder. Approve for 3 years if the patient is ≥ 6 years of age.

Other Uses with Supportive Evidence

7. **Pervasive Developmental Disorders (e.g., autism spectrum disorder, Asperger's disorder).** Approve for 3 years in patients with symptoms of attention deficit hyperactivity disorder (e.g., inattention, hyperactivity).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of atomoxetine (Strattera, generics), guanfacine extended-release tablets (Intuniv, generics), or clonidine extended-release tablets (Kapvay, generics) is not recommended in the following situations:

37. **Binge-Eating Disorder.** In one 10-week, placebo-controlled study in outpatients with binge-eating disorder (n = 40), atomoxetine was associated with a significantly greater reduction in binge-eating episode frequency vs. placebo.[6] Additional studies with atomoxetine are needed. There are no data with guanfacine extended-release tablets or clonidine extended-release tablets.

38. **Depression Without Attention Deficit/Hyperactivity Disorder.** Limited information is available on the use of atomoxetine for the treatment of major depressive disorder. In three case reports and one case series in 15 patients with depressive disorders, adding atomoxetine to a selective serotonin reuptake inhibitor (SSRI) resulted in further improvement.[7,8] However, in a published controlled trial, patients with major depressive disorder (without ADHD) [n =276] were treated with sertraline at doses up to 200 mg/day.[9] Patients who continued to experience depressive symptoms (n = 146) were then randomly assigned to either treatment with atomoxetine 40 to 120 mg/day or placebo for an additional 8 weeks. There was no difference between the atomoxetine/sertraline and placebo/sertraline treatment groups in mean change in depressive symptom severity or in the number of patients whose depressive symptoms remitted (40.3% vs. 37.8%, respectively; P = 0.865). Atomoxetine did not improve clinically significant depression in patients with Parkinson disease (n = 55) in one study.[10] There are no data with guanfacine extended-release tablets or clonidine extended-release tablets.

39. **Fibromyalgia.** In case reports, atomoxetine was effective in reducing fatigue and pain in fibromyalgia syndrome.[11] Well-controlled trials with atomoxetine are needed to establish safety and efficacy. There are no data with guanfacine extended-release tablets or clonidine extended-release tablets.

40. **Improve Cognitive Function (or Neuroenhancement).** The use of prescription medication to augment cognitive or affective function in otherwise healthy individuals (also known as neuroenhancement) is increasing in adult and pediatric populations.[19] A 2013 Ethics, Law, and Humanities Committee position paper, endorsed by the American Academy of Neurology (AAN) indicates that based on currently available data and the balance of ethics issues, neuroenhancement in children and adolescents without a diagnosis of a neurologic disorder is not justifiable. The prescription of neuroenhancements is inadvisable due to numerous social, developmental, and professional integrity issues. Several studies have evaluated atomoxetine for cognitive function in various patient populations, including patients with Huntington disease[12], Alzheimer's disease[13], schizophrenia[14,15], and Parkinson's disease.[16] However, atomoxetine has not demonstrated clinical benefit.

41. **Long-Term Combination Therapy (i.e., > 2 months) with atomoxetine (Strattera, generics) and Central Nervous System (CNS) Stimulants used for the Treatment of Attention Deficit/Hyperactivity Disorder (e.g., mixed amphetamine salts extended-release capsules [Adderall XR®, generics], methylphenidate extended-release tablets, methylphenidate immediate-release tablets).** Currently, data do not support using atomoxetine and CNS stimulant medications concomitantly.[17,18] Short-term drug therapy (2 months or less) with both atomoxetine and CNS stimulant medications are allowed for transitioning the patient to only one drug. Guanfacine extended-release tablets and clonidine extended-release tablets are indicated for use as monotherapy or

as adjunctive therapy to CNS stimulant medications; therefore, long-term combination therapy with either agent and CNS stimulants is appropriate.[2-3]

42. Nocturnal Enuresis. In case reports, children with ADHD and other comorbid psychiatric diagnoses who had nocturnal enuresis and were treated with atomoxetine had resolution of their enuresis.[20] In one controlled trial in pediatric patients (n = 87) with nocturnal enuresis, atomoxetine increased the average number of dry nights per week by 1.47 vs. 0.60 for placebo (P = 0.01).[21] Additional controlled trials with atomoxetine are needed. There are no data with guanfacine extended-release tablets or clonidine extended-release tablets.

43. Weight Loss. In one 12-week, placebo-controlled study in obese women (n = 30), atomoxetine resulted in a mean -3.7% loss vs. 0.2% gain with placebo when combined with a hypocaloric diet (500 kcal/day deficit).[22] Atomoxetine did not demonstrate efficacy for weight reduction in patients with schizophrenia (n = 37) treated with antipsychotics (clozapine or olanzapine).[23] Additional studies are needed.

44. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Attention Deficit Hyperactivity Disorder Stimulant Medications Prior Authorization Policy

- Adderall® (dextroamphetamine sulfate, dextroamphetamine saccharate, amphetamine sulfate, amphetamine aspartate immediate-release tablets – Teva, generics)
- Adderall XR® (mixed amphetamine salts [dextroamphetamine sulfate, dextroamphetamine saccharate, amphetamine sulfate, amphetamine aspartate] extended-release capsules – Shire US, generics)
- Adhansia XR™ (methylphenidate extended-release capsules – Adlon/Purdue)
- Adzenys ER™ (amphetamine extended-release oral suspension – Neos Therapeutics)
- Adzenys XR-ODT™ (amphetamine extended-release orally disintegrating tablets – Neos Therapeutics)
- Aptensio XR™ (methylphenidate extended-release capsules – Rhodes)
- Concerta® (methylphenidate extended-release tablets – Janssen, generics)
- Cotempla XR-ODT™ (methylphenidate extended-release orally disintegrating tablets – Neos Therapeutics)
- Daytrana® (methylphenidate transdermal system – Noven Pharmaceuticals)
- Desoxyn® (methamphetamine tablets – Recordati, generics)
- dextroamphetamine sulfate tablets – generics
- Dexedrine® Spansules® (dextroamphetamine sustained-release capsules – Impax, generics)
- Dyanavel™ XR (amphetamine extended-release oral suspension – Tris)
- Evekeo™ (amphetamine sulfate tablets – Arbor Pharmaceuticals)
- Evekeo ODT™ (amphetamine sulfate orally disintegrating tablets – Arbor Pharmaceuticals)
- Focalin® (dexmethylphenidate immediate-release tablets – Novartis, generics)
- Focalin® XR (dexmethylphenidate extended-release capsules – Novartis, generics)
- Jornay PM™ (methylphenidate hydrochloride extended-release capsules – Ironshore)
- Metadate® CD (methylphenidate extended-release capsules – UCB, generics)
- Metadate® ER (methylphenidate sustained-release tablets – UCB, generics)
- Methylin® (methylphenidate tablets, chewable tablets, and oral solution – Shionogi, generics)
- methylphenidate extended-release capsules (generics to discontinued Methylin™ ER)
- methylphenidate 72 mg extended-release tablets (branded product – Trigen)

- Mydayis™ (mixed salts of a single-entity amphetamine product extended-release capsules – Shire)
- Procentra® (dextroamphetamine sulfate liquid – FSC Laboratories, generics)
- QuilliChew ER™ (methylphenidate extended-release chewable tablets – Pfizer)
- Quillivant™ XR (methylphenidate extended-release oral suspension – Pfizer)
- Relexxii® (methylphenidate extended-release tablets – Vertical [branded generic])
- Ritalin® (methylphenidate immediate-release tablets – Novartis, generics)
- Ritalin® LA (methylphenidate extended-release capsules – Novartis, generics)
- Ritalin SR® (methylphenidate sustained-release tablets – Novartis, generics)
- Vyvanse® (lisdexamfetamine dimesylate capsules and chewable tablets – Shire)
- Zenzedi™ (dextroamphetamine tablets – Arbor Pharmaceuticals)

REVIEW DATE: 08/05/2020

OVERVIEW

The central nervous system (CNS) stimulant medications in this policy are indicated for:[1-24,45,46,50-54]

- **Attention deficit hyperactivity disorder (ADHD)**, treatment. All of the stimulant medications in this policy are indicated for the treatment of ADHD.
- **Binge eating disorder (BED)**, treatment. Vyvanse is the only stimulant medication indicated for the treatment of BED.
- **Narcolepsy**, treatment. Several methylphenidate and amphetamine-containing products are also indicated for the treatment of narcolepsy.
- **Exogenous obesity**, treatment. Evekeo is indicated as adjunctive therapy for the short-term (i.e., a few weeks) treatment of exogenous obesity.

Dextroamphetamine sulfate tablets, Zenzedi, and Adderall (generics) are indicated in patients ≥ 3 years of age; the other products are indicated in patients ≥ 6 years of age, except for Mydayis which is indicated in patients ≥ 13 years of age. Adderall XR (generics), Adzenys ER, Adzenys XR-ODT, Mydayis, Vyvanse, Concerta (generics), and several methylphenidate products are indicated for use in adults with ADHD. Jornay PM is the only stimulant taken in the evening.

Disease Overview

Idiopathic hypersomnia, a condition similar to narcolepsy, is characterized by constant or recurrent daytime sleepiness with no other cause of sleepiness, prolonged nocturnal sleep, difficulty awakening with sleep drunkenness, and long unrefreshing naps with no history of cataplexy.[31-34]

Guidelines

Eating disorders: The American Psychiatric Association (APA) guideline on the treatment of patients with eating disorders (2006 with a Guideline Watch in 2012) suggests treatment with antidepressant medications, particularly selective serotonin reuptake inhibitors (SSRIs), is associated with at least a short-term reduction in binge eating behavior but, in most cases, not with substantial weight loss (recommended with substantial clinical confidence); topiramate is effective for binge reduction and weight loss (recommended with moderate clinical confidence); and zonisamide may produce similar effects regarding weight loss (may be recommended on the basis of individual circumstances).[43,44] The 2012 Guideline Watch references a 2011 literature review by a multinational task force on eating disorders which concluded that Grade A evidence supports the use of imipramine (with moderate risk-benefit ratio), sertraline and citalopram/escitalopram (all with good risk-benefit ratios), and topiramate (with moderate risk-benefit ratio), and Grade D evidence for fluvoxamine and fluoxetine (i.e., inconsistent results).

Narcolepsy and other hypersomnias: The practice parameters from the American Academy of Sleep Medicine for the treatment of narcolepsy and other hypersomnias of central origin, updated in 2007, state that amphetamine, methamphetamine, dextroamphetamine, and methylphenidate are effective for treatment of daytime sleepiness due to narcolepsy.[27] The parameters also state that amphetamine, methamphetamine, dextroamphetamine, methylphenidate and modafinil may be effective for the treatment of daytime sleepiness due to idiopathic hypersomnia. As there may be underlying causes/behaviors associated with excessive daytime sleepiness (EDS), a sleep specialist physician has the training to correctly recognize and diagnose this condition.

Major depressive disorder (MDD): The 2010 APA practice guidelines for the treatment of patients with MDD state that many clinicians find augmentation of antidepressants with low doses of stimulants such as methylphenidate or dextroamphetamine may help ameliorate otherwise suboptimally responsive depression, although not all clinical trials have shown benefits from this strategy.[28] There are no clear guidelines regarding the length of time stimulants should be coadministered. A 16-week randomized, double-blind, placebo-controlled trial in patients with geriatric depression in older (mean age of 70 years) outpatients diagnosed with major depression (n = 143) found that combined treatment with citalopram and methylphenidate demonstrated an enhanced clinical response profile in mood and well-being, as well as a higher rate of remission, compared with either drug alone.[47]

Cancer-related fatigue: The National Comprehensive Cancer Network (NCCN) guidelines on cancer-related fatigue (version 2.2020 – May 4, 2020) state to consider use of psychostimulants (i.e., methylphenidate) after other causes of fatigue have been ruled out and/or other management strategies have been attempted.[29] The NCCN guidelines on adult cancer pain (version 1.2020 – April 8, 2020) state that sedation may hinder the achievement of dose titration of opioids to levels that provide adequate analgesia.[30] If opioid-induced sedation develops and persists for greater than 2 to 3 days, it may be managed by administration of a psychostimulant, such as methylphenidate, dextroamphetamine, or modafinil, or by adding caffeine. A meta-analysis of treatments for fatigue associated with palliative care showed a superior effect for methylphenidate in cancer-related fatigue.[48] A review of methylphenidate for cancer-related fatigue found a small but significant improvement in fatigue over placebo (P = 0.005).[49]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of ADHD stimulant medications in adults. Only patients ≥ 18 years of age will be required to meet the Prior Authorization criteria below. All approvals are provided for the duration noted below.

Automation: This policy includes an age edit targeting patients ≥ 18 years of age. Therefore, patients below the age of 18 years will be approved at the point-of-service. For patients ≥ 18 years of age, coverage will be determined by Prior Authorization criteria.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of ADHD stimulant medications is recommended in those who meet the following criteria:

FDA-Approved Indications

8. **Attention Deficit Hyperactivity Disorder.** Approve for 1 year.

2. **Binge Eating Disorder.** Approve only Vyvanse for 1 year if the patient is ≥ 18 years of age.

3. **Narcolepsy.** Approve for 1 year.

Other Uses with Supportive Evidence

4. **Depression, Adjunctive/Augmentation Treatment in Adults.** Approve for 1 year if the patient is concurrently receiving other medication therapy for depression.
   Note: Examples of medications for the treatment of depression include selective serotonin reuptake inhibitors (SSRIs).

5. **Fatigue associated with Cancer and/or its Treatment.** Approve for 1 year.

6. **Idiopathic Hypersomnolence.** Approve for 1 year if the diagnosis is confirmed by a sleep specialist physician or at an institution that specializes in sleep disorders (i.e., sleep center).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of ADHD stimulant medications is not recommended in the following situations:

1. **Fatigue associated with Multiple Sclerosis.** There are no published studies supporting this use. In addition, neither recent review articles nor the 2007 practice parameters for the treatment of narcolepsy and other hypersomnias of central origin mention stimulants (only modafinil). Practice parameters for the treatment of narcolepsy and other hypersomnias of central origin, updated in 2007, state that modafinil may be effective for the treatment of daytime sleepiness due to MS.[27] Agents that have been studied for the treatment of fatigue due to MS include amantadine, modafinil, pemoline, aminopyridines, antidepressants, and aspirin.[41]

45. **Long-term Combination Therapy (i.e., > 2 months) with Strattera® (atomoxetine capsules) and Central Nervous System (CNS) Stimulants for the treatment of Attention Deficit/Hyperactivity Disorder (e.g., mixed amphetamine salts extended-release capsules [Adderall XR®, generics], methylphenidate extended-release tablets, methylphenidate immediate-release tablets).** Currently, data do not support using Strattera and CNS stimulant medications concomitantly.[42] Short-term drug therapy (≤ 2 months) with both Strattera and CNS stimulant medications are allowed for transitioning the patient to only one drug. Intuniv and clonidine extended-release tablets (Kapvay, generics) are indicated for use as monotherapy, or as adjunctive therapy to CNS stimulant medications; therefore, long-term combination therapy with either agent and CNS stimulants is appropriate.[35-36]

46. **Neuroenhancement.** The use of prescription medication to augment cognitive or affective function in otherwise healthy individuals (also known as neuroenhancement) is increasing in adult and pediatric populations.[37] A 2013 Ethics, Law, and Humanities Committee position paper, endorsed by the American Academy of Neurology (AAN) indicates that based on available data and the balance of ethics issues, neuroenhancement in legally and developmentally nonautonomous children and adolescents without a diagnosis of a neurologic disorder is not justifiable. In nearly autonomous adolescents, the fiduciary obligation of the physician may be weaker, but the prescription of neuroenhancements is inadvisable due to numerous social, developmental, and professional integrity issues.

47. **Weight Loss.** Of the CNS stimulants, only amphetamine and methamphetamine are indicated for exogenous obesity, as a short-term (i.e., a few weeks) adjunct in a regimen of weight reduction based on caloric restriction, for patients in whom obesity is refractory to alternative therapy (e.g., repeated diets, group programs, and other drugs).[4,41] However, guidelines on the management of obesity do not address or recommend use of amphetamine or methamphetamine (or any other CNS stimulants).[38-40]

48. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Bone Modifiers – Evenity Prior Authorization Policy

- Evenity® (romosozumab-aqqg injection for subcutaneous use – Amgen)

REVIEW DATE: 04/22/2020

OVERVIEW

Evenity, a sclerostin inhibitor, is indicated for the treatment of osteoporosis in postmenopausal women at high risk for fracture, defined as a history of osteoporotic fracture, or multiple risk factors for fracture; or patients who have failed or are intolerant to other available osteoporosis therapy.[1] According to the Evenity prescribing information, the anabolic effect of Evenity wanes after 12 monthly doses of therapy. Therefore, limit the duration of use to 12 monthly doses. If osteoporosis therapy remains warranted, continued therapy with an anti-resorptive therapy (e.g., alendronate) should be considered.

Guidelines

Many guidelines are available regarding the management of postmenopausal osteoporosis.[2-5] In general, the guidelines recommend bisphosphonate therapy as initially for women in whom pharmacologic therapy is warranted (e.g., women at high risk of fractures) to reduce the risk of fractures. For patients who are extremely high risk of fracture (e.g., previously experienced an osteoporotic or fragility fracture) other osteoporosis therapies are recommended. Other agents are also recommended for women who cannot take bisphosphonate therapy (e.g., patients with severe renal impairment [creatinine clearance < 35 mL/min], chronic kidney disease) or who have an underlying gastrointestinal condition (e.g., esophageal lesions). In general, osteoporosis is defined by the presence of fragility fractures or among women with a T-score of -2.5 or lower in the lumbar spine, femoral neck, total hip, and/or 33% (one-third) radius.[2] Therapy is also recommended among women who have a T-score between -1.0 and -2.5 if a substantial risk for major osteoporotic fracture is present (e.g., Fracture Risk Assessment Tool [FRAX®] score suggests high risk).

In 2020 the Endocrine Society issued a guideline update regarding the pharmacological management of osteoporosis in postmenopausal women which addressed Evenity.[6] In postmenopausal women with osteoporosis at very high risk of fractures such as patients with severe osteoporosis (i.e., low T-score < -2.5 and fractures) or multiple fractures, Evenity therapy is recommended for up to 1 year for the reduction of vertebral, hip, and nonvertebral fractures. The recommended dose is 210 mg monthly by SC injection for 12 months. In postmenopausal women with osteoporosis who have completed a course of Evenity, antiresorptive osteoporosis therapy is recommended to maintain bone density gains and reduce fracture risk.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Evenity. Coverage is limited to 12 monthly doses during the therapy course.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Evenity is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **Osteoporosis Treatment for a Postmenopausal Patient.** Approve for 1 year if the patient meets the following criteria (A, B and C):
   - **A)** The patient meets ONE of the following conditions (i, ii, or iii):
     - **i.** The patient has had a T-score (current or at any time in the past) at or below -2.5 at the lumbar spine, femoral neck, total hip and/or 33% (one-third) radius (wrist); OR
     - **ii.** The patient has had an osteoporotic fracture or a fragility fracture; OR

iii. The patient has low bone mass (T-score [current or at any time in the past] between -1.0 and -2.5 at the lumbar spine, femoral neck, total hip, and/or 33% [one third] radius [wrist]) and the physician determines that the patient it at high risk for fracture; AND

B) The patient meets ONE of the following (i, ii, iii, or iv):

i. The patient has tried at least one oral bisphosphonate or oral bisphosphonate-containing product and meets one of the following (a, b, or c):

a) The patient has had an inadequate response to oral bisphosphonate therapy after a trial duration of 12 months as determined by the prescribing physician (e.g., ongoing and significant loss of bone mineral density (BMD), lack of BMD increase); OR

b) The patient has had an osteoporotic fracture or a fragility fracture while receiving oral bisphosphonate therapy; OR

c) The patient has experienced intolerability to an oral bisphosphonate (e.g., severe gastrointestinal [GI]-related adverse events, severe musculoskeletal-related adverse events, a femoral fracture); OR

ii. The patient cannot take an oral bisphosphonate due to one of the following circumstances (a, b, or c):

a) The patient cannot swallow or has difficulty swallowing; OR

b) The patient cannot remain in an upright position post oral bisphosphonate administration; OR

c) The patient has a pre-existing gastrointestinal (GI) medical condition (e.g., patient with esophageal lesions, esophageal ulcers, or abnormalities of the esophagus that delay esophageal emptying [stricture, achalasia]); OR

iii. The patient has tried ibandronate injection (Boniva IV) or zoledronic acid injection (Reclast); OR

iv. The patient meets one of the following conditions (a, b or c):

a) Severe renal impairment (creatinine clearance < 35 mL/min); OR

b) Chronic kidney disease; OR

c) The patient has had an osteoporotic fracture or a fragility fracture; AND

C) The patient has received no more than 12 monthly doses during this therapy course.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Evenity is not recommended in the following situations:

49. Osteoporosis Prevention. Evenity is not indicated for the prevention of osteoporosis. **Concurrent Use with Other Medications for Osteoporosis.**
Note: Examples include oral bisphosphonates (e.g., alendronate, risedronate, ibandronate), intravenous bisphosphonates (zoledronic acid injection [Reclast], intravenous ibandronate), Prolia® (denosumab injection for subcutaneous use), teriparatide injection for subcutaneous use (Forteo®/Bonsity®), Tymlos® (abaloparatide injection for subcutaneous use), and calcitonin nasal spray (Miacalcin®/Fortical®).

50. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
New Policy	--	04/10/2019
Selected Revision	**Osteoporosis Treatment for a Postmenopausal Patient:** The criterion that requires that the patient has received no more than 12 monthly doses during their lifetime was modified to remove "their lifetime" and replaced with the phrasing "this therapy course."	05/08/2019
Annual Revision	The following changes were made: 1. **Conditions Not Recommended for Approval:** For the criteria regarding Concurrent Use of Other Medications for Osteoporosis, the examples of other medications used for osteoporosis were moved from the criteria to a note. Reference to calcium and vitamin D was deleted.	04/22/2020

PRIOR AUTHORIZATION POLICY

POLICY: Bone Modifiers – Ibandronate Intravenous (Boniva IV) Prior Authorization Policy
- Boniva® (ibandronate injection – Genentech/Roche, generics)

REVIEW DATE: 03/03/2021

OVERVIEW
Ibandronate injection (Boniva IV) is indicated for the treatment of osteoporosis in postmenopausal women.[1]

POLICY STATEMENT
Prior Authorization is recommended for prescription benefit coverage of ibandronate injection (Boniva IV). All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of ibandronate injection (Boniva IV) is recommended in those who meet the following criteria:

FDA-Approved Indication

2. Osteoporosis – Treatment for a Postmenopausal Patient. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** Patient meets ONE of the following conditions (i, ii, or iii):
  - **iv.** Patient has had a T-score (current or at any time in the past) at or below -2.5 at the lumbar spine, femoral neck, total hip and/or 33% (one-third) radius (wrist); OR

v. Patient has had an osteoporotic fracture or a fragility fracture; OR

vi. Patient meets both of the following (a and b):

a) Patient has low bone mass; AND

Note: An example of low bone mass includes a T-score (current or at any time in the past) between -1.0 and -2.5 at the lumbar spine, femoral neck, total hip and/or 33% (one-third) radius (wrist).

b) According to the prescriber, patient is at high risk for fracture; AND

B) Patient meets ONE of the following (i, ii, iii, or iv):

i. Patient has tried ibandronate injection (Boniva) or zoledronic acid injection (Reclast); OR

ii. Patient has tried at least one oral bisphosphonate or oral bisphosphonate-containing product and meets one of the following (a, b, or c):

Note: Examples of oral bisphosphonate products include Fosamax (alendronate tablets and oral solution), Fosamax Plus D (alendronate/cholecalciferol tablets), Actonel (risedronate tablets), Atelvia (risedronate delayed-release tablets), and Boniva (ibandronate tablets).

a) According to the prescriber, patient has experienced inadequate efficacy to oral bisphosphonate therapy after a trial duration of 12 months; OR

Note: Examples of inadequate efficacy are ongoing and significant loss of bone mineral density (BMD) and lack of a BMD increase.

b) Patient has had an osteoporotic fracture or a fragility fracture while receiving oral bisphosphonate therapy; OR

c) Patient has experienced significant intolerance to an oral bisphosphonate; OR

Note: Examples of significant intolerance include severe gastrointestinal related adverse events, severe musculoskeletal related adverse events, or a femoral fracture.

iii. Patient cannot take an oral bisphosphonate due to one of the following circumstances (a, b, or c):

a) Patient cannot swallow or has difficulty swallowing; OR

b) Patient cannot remain in an upright position post oral bisphosphonate administration; OR

c) Patient has a pre-existing gastrointestinal medical condition in which intravenous bisphosphonate therapy may be warranted; OR

Note: Examples of pre-existing gastrointestinal medical conditions include esophageal lesions, esophageal ulcers, or abnormalities of the esophagus that delay esophageal emptying (stricture, achalasia).

iv. Patient has had an osteoporotic fracture or a fragility fracture.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of ibandronate injection (Boniva IV) is not recommended in the following situations:

51. Osteoporosis Prevention. Ibandronate injection (Boniva IV) is not indicated for the prevention of osteoporosis and supporting data are limited.

52. Concurrent Use of Ibandronate Injection (Boniva IV) with Other Medications for Osteoporosis.

Note: Examples of other medications for osteoporosis include oral bisphosphonates (e.g., alendronate, risedronate, ibandronate), other intravenous bisphosphonates (e.g., zoledronic acid injection [Reclast]), Prolia (denosumab injection for subcutaneous use), Evenity (romosozumab-aqqg injection for subcutaneous use), Forteo (teriparatide injection for subcutaneous use, generic), Tymlos (abaloparatide injection for subcutaneous use), and calcitonin nasal spray.

53. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

1. Boniva® injection for intravenous use [prescribing information]. South San Francisco, CA: Genentech USA/Roche; April 2019.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	Previously, the policy was entitled "Bone Modifiers – Bisphosphonates (intravenous)" and included Boniva IV and Reclast. These policies were divided such that this policy only includes Boniva IV and is titled "Bone Modifiers – Ibandronate IV (Boniva IV). Approval durations changed from 3 years to 1 year for osteoporosis treatment for a postmenopausal patient.	02/27/2019
Annual Revision	In the Conditions Not Recommended for Approval section, added medication examples that ibandronate IV should not be used with concomitantly (e.g., Bonsity, Evenity, and provided examples of bisphosphonates).	02/26/2020
Annual Revision	1. **Osteoporosis – Treatment for a Postmenopausal Patient.** The criteria that requires low bone mass had the definition moved from the criteria to a Note and the wording was changed from "prescribing physician" to "prescriber". For the criteria requiring a trial of one oral bisphosphonate, the criteria were changed to state "at least one" and examples of oral bisphosphonates were added to a Note. Wording for the criterion regarding inadequate response to an oral bisphosphonate was changed to "experienced inadequate efficacy" and "prescribing physician" was changed to "prescriber". Examples of inadequate efficacy to an oral bisphosphonate were moved from the criteria to a Note. Wording of the criterion regarding intolerability to an oral bisphosphonate was changed to "experienced significant intolerance". Examples of significant intolerance were moved from the criteria to a Note. For the criterion that addresses if the patient has a pre-existing gastrointestinal medical condition, examples were moved from the criteria to a Note. 2. **Conditions Not Recommended for Approval:** For the notation cited regarding "Concurrent Use of Ibrandronate Injection (Boniva Intravenous) with Other Medications for Osteoporosis" the examples of medications were moved from the criteria to a Note; the medication list was revised. Also, the wording stating "except calcium and vitamin D" was removed.	03/03/2021

PRIOR AUTHORIZATION POLICY

POLICY: Bone Modifiers – Prolia Prior Authorization Policy

- Prolia® (denosumab injection for subcutaneous use – Amgen)

REVIEW DATE: 07/29/2020

OVERVIEW

Prolia, a receptor activator of nuclear factor kappa-B (RANK) ligand inhibitor, is indicated for the following uses:[1]

- **Bone loss (treatment to increase bone mass), in men with nonmetastatic prostate cancer** at high risk for fracture receiving androgen deprivation therapy (ADT).
- **Bone loss (treatment to increase bone mass), in women with breast cancer** at high risk for fracture receiving adjuvant aromatase inhibitor (AI) therapy.
- **Glucocorticoid-induced osteoporosis** (treatment), in men and women at high risk of fracture who are either initiating or continuing systemic glucocorticoids in a daily dosage equivalent to 7.5 mg or greater of prednisone and expected to remain on glucocorticoids for at least 6 months.
- **Osteoporosis,** treatment of **postmenopausal women** at high risk of fracture.
- **Osteoporosis,** treatment to **increase bone mass in men** at high risk for fracture.

In general, high risk of fractures is defined as a history of osteoporotic fracture, multiple risk factors for fracture, or patients who have failed or are intolerant to other available osteoporosis therapy.[1] Of note, denosumab subcutaneous injection is also available under the brand name Xgeva®, and is indicated for the prevention of skeletal-related events in patients with multiple myeloma, as well as in patients with bone metastases from solid tumors, giant cell tumor of bone, and hypercalcemia of malignancy.[2]

Dosing Information

For all indications, the dose is 60 mg once every 6 months as a subcutaneous injection.[1]

Guidelines

Several guidelines address Prolia.

- **Breast Cancer/Prostate Cancer:** The National Comprehensive Cancer Network (NCCN) guidelines for breast cancer (version 5.2020 – July 15, 2020)[6] and prostate cancer (version 2.2020 – May 21, 2020)[7] note that if patients are receiving agents that impact bone mineral density (BMD), bisphosphonates (oral/intravenous), as well as Prolia, should be considered to maintain or improve BMD and/or reduce the risk of fractures.
- **Glucocorticoid-Induced Osteoporosis (GIO):** In 2017, the American College of Rheumatology (ACR) updated guidelines for the prevention and treatment of GIO.[5] In various clinical scenarios, oral bisphosphonates are preferred, followed by intravenous bisphosphonates (e.g., zoledronic acid injection).
- **Postmenopausal Osteoporosis:** Prolia is prominently featured in guidelines for postmenopausal osteoporosis by the Endocrine Society (2019)[3] and the American Association of Clinical Endocrinologists (AACE) and the American College of Endocrinology (ACE) [2020][4]. Prolia is one of among several agents cited as an alternative for patients at high risk for fractures.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Prolia. All approvals are provided for 1 year in duration. In the approval indication, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: men are defined as individuals with the biological traits of a man, regardless of the individual's gender identity or gender expression.

Automation: Smart Coverage Review uses patient claim history to answer Prior Authorization questions regarding medication history of Boniva® (ibandronate injection for intravenous use) or Reclast® (zoledronic acid injection for intravenous use). A 2-year look back period will be used to check claim history and automate for use of either agent (Boniva intravenous or Reclast). If not in claims, medication history can be obtained through Prior Authorization criteria. For all reviews, other Prior Authorization criteria listed below will also be applied.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Prolia is recommended in those who meet the following criteria:

FDA-Approved Indications

17. **Bone Loss (Treatment to Increase Bone Mass) in Patients with Breast Cancer at High Risk for Fracture Receiving Adjuvant Aromatase Inhibitor Therapy.** Approve for 1 year if the patient meets the following criteria (A and B):
    - **A)** Patient has breast cancer that is not metastatic to bone; AND
    - **B)** Patient is receiving aromatase inhibitor therapy (e.g., anastrozole, letrozole, or exemestane).

18. **Bone Loss (Treatment to Increase Bone Mass) in Patients with Nonmetastatic Prostate Cancer at High Risk for Fracture Receiving Androgen Deprivation Therapy.** Approve for 1 year if the patient meets the following criteria (A and B):
    - **A)** Patient has prostate cancer that is not metastatic to bone; AND
    - **B)** Patient meets ONE of the following conditions (i or ii):
        - **i.** Patient is receiving androgen deprivation therapy (e.g., Lupron Depot® [leuprolide for depot suspension], Eligard® [leuprolide acetate for injectable suspension], Trelstar® [triptorelin pamoate for injectable suspension], or Zoladex® [goserelin implant]); OR
        - **ii.** Patient has undergone bilateral orchiectomy.

19. **Glucocorticoid-Induced Osteoporosis – Treatment.** Approve for 1 year if the patient meets the following criteria (A and B):
    - **A)** Patient is either initiating or continuing systemic glucocorticoids (e.g., prednisone); AND
    - **B)** Patient meets ONE of the following (i, ii, iii, or iv):
        - **i.** Patient has tried zoledronic acid injection (Reclast); OR
        - **ii.** Patient has tried at least one oral bisphosphonate or oral bisphosphonate-containing product and meets one of the following (a, b, or c):
          Note: Examples of oral bisphosphonate products include Fosamax® (alendronate tablets and oral solution), Fosamax® Plus D (alendronate/cholecalciferol tablets), Actonel® (risedronate tablets), Atelvia® (risedronate delayed-release tablets), and Boniva® (ibandronate tablets).
            - **a)** Patient has had an inadequate response to oral bisphosphonate therapy after a trial duration of 12 months as determined by the prescriber (e.g., ongoing and significant loss of bone mineral density [BMD], lack of BMD increase); OR
            - **b)** Patient has had an osteoporotic fracture or fragility fracture while receiving oral bisphosphonate therapy; OR

c) Patient has experienced intolerability to an oral bisphosphonate (e.g., severe gastrointestinal [GI]-related adverse effects, severe musculoskeletal-related side effects, a femoral fracture); OR

iii. Patient cannot take an oral bisphosphonate due to one of the following circumstances (a, b, or c):
- **a)** Patient cannot swallow or has difficulty swallowing; OR
- **b)** Patient cannot remain in an upright position post oral bisphosphonate administration; OR
- **c)** Patient has a pre-existing gastrointestinal (GI) medical condition (e.g., patient with esophageal lesions, esophageal ulcers, or abnormalities of the esophagus that delay esophageal emptying [stricture, achalasia]); OR

iv. Patient meets one of the following conditions (a, b, or c):
- **a)** Severe renal impairment (creatinine clearance < 35 mL/min); OR
- **b)** Chronic kidney disease (CKD); OR
- **c)** Patient has had an osteoporotic fracture or a fragility fracture.

~~**20.**~~ **Osteoporosis Treatment for a Postmenopausal Patient.** Approve for 1 year if the patient meets the following criteria (A and B):

A) Patient meets ONE of the following conditions (i, ii, or iii):
- **i.** Patient has had a T-score (current or at any time in the past) at or below -2.5 at the lumbar spine, femoral neck, total hip, and/or 33% (one-third) radius (wrist); OR
- **ii.** Patient has had an osteoporotic fracture or a fragility fracture; OR
- **iii.** Patient meets both of the following (a and b):
  - **a)** Patient has low bone mass (T-score [current or at any time in the past] between -1.0 and -2.5 at the lumbar spine, femoral neck, total hip and/or 33% [one-third] radius [wrist]); AND
  - **b)** Prescriber determines the patient is at high risk for fracture; AND

B) Patient meets ONE of the following (i, ii, iii, or iv):
- **i.** Patient has tried ibandronate injection (Boniva) or zoledronic acid injection (Reclast); OR
- **ii.** Patient has tried at least one oral bisphosphonate or oral bisphosphonate-containing product and meets one of the following (a, b, or c):

  Note: Examples of oral bisphosphonate products include Fosamax® (alendronate tablets and oral solution), Fosamax® Plus D (alendronate/cholecalciferol tablets), Actonel® (risedronate tablets), Atelvia® (risedronate delayed-release tablets), and Boniva® (ibandronate tablets).
  - **a)** Patient has had an inadequate response to oral bisphosphonate therapy after a trial duration of 12 months as determined by the prescriber (e.g., ongoing and significant loss of bone mineral density (BMD), lack of BMD increase); OR
  - **b)** Patient has had an osteoporotic fracture or a fragility fracture while receiving oral bisphosphonate therapy; OR
  - **c)** Patient has experienced intolerability to an oral bisphosphonate (e.g., severe gastrointestinal-related adverse effects, severe musculoskeletal-related side effects, a femoral fracture); OR
- **iii.** Patient cannot take an oral bisphosphonate due to one of the following circumstances (a, b, or c):
  - **a)** Patient cannot swallow or has difficulty swallowing; OR
  - **b)** Patient cannot remain in an upright position post oral bisphosphonate administration; OR
  - **c)** Patient has a pre-existing gastrointestinal medical condition (e.g., patient with esophageal lesions, esophageal ulcers, or abnormalities of the esophagus that delay esophageal emptying [stricture, achalasia]); OR
- **iv.** Patient meets one of the following conditions (a, b, or c):
  - **a)** Severe renal impairment (creatinine clearance < 35 mL/min); OR
  - **b)** Chronic kidney disease (CKD); OR

c) Patient has had an osteoporotic fracture or a fragility fracture.

21. Osteoporosis – Treatment (to Increase Bone Mass) for Men*. Approve for 1 year if the patient meets the following criteria (A and B):

A) Patient meets ONE of the following conditions (i, ii, or iii):

i. Patient has had a T-score (current or at any time in the past) at or below -2.5 at the lumbar spine, femoral neck, total hip and/or 33% (one-third) radius (wrist); OR

ii. Patient has had an osteoporotic fracture or a fragility fracture; OR

iii. Patient meets both of the following (a and b):

a) Patient has low bone mass (T-score [current or at any time in the past] between -1.0 and -2.5 at the lumbar spine, femoral neck, total hip and/or 33% [one-third] radius [wrist]); AND

b) Prescriber determines the patient is at high risk of fracture; AND

B) Patient meets ONE of the following (i, ii, iii or iv):

i. Patient has tried zoledronic acid injection (Reclast); OR

ii. Patient has tried at least one oral bisphosphonate or oral bisphosphonate-containing product and meets one of the following (a, b, or c):

Note: Examples of oral bisphosphonate products include Fosamax® (alendronate tablets and oral solution), Fosamax® Plus D (alendronate/cholecalciferol tablets), Actonel® (risedronate tablets), Atelvia® (risedronate delayed-release tablets), and Boniva® (ibandronate tablets).

a) Patient has had an inadequate response to oral bisphosphonate therapy after a trial duration of 12 months as determined by the prescriber (e.g., ongoing and significant loss of bone marrow density [BMD], lack of BMD increase); OR

b) Patient has had an osteoporotic fracture or a fragility fracture while receiving oral bisphosphonate therapy; OR

c) Patient has experienced intolerability to an oral bisphosphonate (e.g., severe gastrointestinal [GI]-related adverse effects, severe musculoskeletal-related side effects, a femoral fracture); OR

iii. Patient cannot take an oral bisphosphonate due to one of the following circumstances (a, b or c):

a) Patient cannot swallow or has difficulty swallowing; OR

b) Patient cannot remain in an upright position post oral bisphosphonate administration; OR

c) Patient has a pre-existing GI medical condition (e.g., patient with esophageal lesions, esophageal ulcers, or abnormalities of the esophagus that delay esophageal emptying [stricture, achalasia]); OR

iv. Patient meets one of the following conditions (a, b, or c):

a) Severe renal impairment (creatinine clearance < 35 mL/min); OR

b) Chronic kidney disease (CKD); OR

c) Patient has had an osteoporotic fracture or a fragility fracture.

* Refer to the Policy Statement.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Prolia is not recommended in the following situations:

54. Concurrent Use with Other Medications for Osteoporosis.

Note: Examples include teriparatide injection for subcutaneous use (Forteo®/Bonsity®), Tymlos® (abaloparatide injection for subcutaneous use), oral bisphosphonates (e.g., alendronate, risedronate, ibandronate), intravenous bisphosphonates (zoledronic acid injection [Reclast], intravenous

ibandronate), calcitonin nasal spray (Miacalcin®/Fortical®), and Evenity® (romosozumab-aqqg injection for subcutaneous use). Prolia is not indicated for use as combination therapy.[1]

55. **Giant Cell Tumor of Bone.** Studies with denosumab in giant cell tumor of the bone used dosing for Xgeva, which is indicated for the treatment of adults and skeletally mature adolescents with giant cell tumor of bone that is unresectable or where surgical resection is likely to result in severe morbidity.[2]
56. **Osteoporosis Prevention.** Prolia is not indicated for the prevention of osteoporosis.[1]

57. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual revision	Criteria added regarding GIO treatment.	06/20/2018
Annual revision	Approval durations for all FDA-approved uses were changed from 3 years to 1 year. The following criteria changes were made: **Conditions Not Recommended for Approval:** Added Evenity to the list of medications that should not be used concomitantly with Prolia.	07/03/2019
Annual revision	In related criteria the word "prescriber" is replacing the word/phrase "physician" or "prescribing physician". Additionally, the following changes were made: **Automation:** Automation was previously listed as "None". Smart Coverage Review automation was added. **Conditions Not Recommended for Approval:** For the criteria regarding Concurrent Use of Other Medications for Osteoporosis, the examples of other medications used for osteoporosis in the note were revised. Reference to calcium and vitamin D was deleted.	07/29/2020
Update	08/29/2020: No criteria changes: For the conditions that require a trial of at least one oral bisphosphonate or an oral bisphosphonate-containing product (glucocorticoid-induced osteoporosis – treatment; osteoporosis treatment for a postmenopausal patient, and osteoporosis treatment [to increase bone mass] for men), added a note that provided examples of these products (Note: Examples of oral bisphosphonate products include Fosamax® [alendronate tablets and oral solution], Fosamax® Plus D [alendronate/cholecalciferol tablets], Actonel® [risedronate tablets], Atelvia® [risedronate delayed-release tablets], and Boniva® [ibandronate tablets]).	--

PRIOR AUTHORIZATION POLICY

POLICY: Bone Modifiers – Teriparatide Products Prior Authorization Policy

- Forteo® (teriparatide injection for subcutaneous injection – Eli Lilly)
- Teriparatide injection for subcutaneous use – Alvogen

REVIEW DATE: 07/29/2020; selected revision 02/24/2021

OVERVIEW

Teriparatide products, recombinant human parathyroid hormone (PTH) [1-34], are indicated for the following uses:[1-3]

- **Glucocorticoid-induced osteoporosis (treatment)**, in men and women at high risk for fracture associated with sustained systemic glucocorticoid therapy (daily dosage equivalent to 5 mg or greater of prednisone).
- **Osteoporosis, treatment of postmenopausal women** at high risk for fracture.
- **Osteoporosis, to increase bone mass in men with primary or hypogonadal osteoporosis** at high risk for fracture.

In general, for all indications, patients at high risk for fracture are defined as those with a history of osteoporotic fractures, have multiple risk factors for fracture, or have failed or are intolerant to other osteoporosis therapy.[1-3]

Teriparatide has been used for patients with hypoparathyroidism.[4-11] Natpara® (parathyroid hormone injection for subcutaneous use) is indicated as an adjunct to calcium and vitamin D to control hypocalcemia in patients with hypoparathyroidism.[12] However, there is a recall of Natpara and teriparatide is one of two main alternatives recommended in a joint guidance statement from the American Society for Bone and Mineral Research and Endocrine Society for patients with hypoparathyroidism transitioning from

Natpara.[13] It is notable that if teriparatide therapy is used in this clinical scenario, twice daily or even three times daily injections are usually needed.

Guidelines

Teriparatide is addressed in various clinical guidelines.[14-16]

- **Glucocorticoid-Induced Osteoporosis (GIO):** The American College of Rheumatology updated guidelines for the prevention and treatment of GIO (2017).[16] In various clinical scenarios, teriparatide is recommended after trial of other agents (e.g., oral bisphosphonates, intravenous bisphosphonates).
- **Postmenopausal Osteoporosis:** Teriparatide products are mentioned in guidelines for postmenopausal osteoporosis by the Endocrine Society (2019)[14] and the American Association of Clinical Endocrinologists and the American College of Endocrinology (2020)[15]. Teriparatide is one of among several agents cited as an alternative for patients at very high risk for fractures or among those who cannot tolerate oral therapy.

Safety

An increased incidence of osteosarcoma was noted in male and females rates who received teriparatide.[1] Osteosarcoma has been reported in patients treated with teriparatide in the postmarketing setting, however, an increased risk of osteosarcoma has not been observed in observational studies involving humans. There are limited data evaluating the risk of osteosarcoma beyond 2 years of teriparatide use. Avoid use of teriparatide in patients with a baseline risk of osteosarcoma.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of teriparatide products. All approval(s) are provided for 2 years in duration unless otherwise noted below. For the indication of hypoparathyroidism, because of the specialized skills required for evaluation and diagnosis of patients treated with teriparatide as well as monitoring for adverse events and long-term efficacy, approval requires teriparatide to be prescribed by or in consultation with a physician who specialized in the condition being treated. In the approval indication, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: men are defined as individuals with the biological traits of a man, regardless of the individual's gender identity or gender expression.

Automation: Smart Coverage Review uses patient claim history to answer Prior Authorization questions regarding medication history of Boniva® (ibandronate injection for intravenous use) or Reclast® (zoledronic acid injection for intravenous use). A 2-year look back period will be used to check claim history and automate for use of either agent (Boniva intravenous or Reclast). If not in claims, medication history can be obtained through Prior Authorization criteria. For all reviews, other Prior Authorization criteria listed below will also be applied.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of teriparatide products is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Glucocorticoid-Induced Osteoporosis – Treatment.** Approve for 2 years if the patient meets the following criteria (A, B, and C):
   - **C)** Patient is either initiating or continuing systemic glucocorticoids; AND
     Note: An example of a systemic glucocorticoid is prednisone.
   - **D)** Patient meets ONE of the following (i, ii, iii, or iv):

v. Patient has tried zoledronic acid injection (Reclast); OR

vi. Patient has tried at least one oral bisphosphonate or oral bisphosphonate-containing product and meets one of the following (a, b, or c):

Note: Examples of oral bisphosphonate products include Fosamax® (alendronate tablets and oral solution), Fosamax® Plus D (alendronate/cholecalciferol tablets), Actonel® (risedronate tablets), Atelvia® (risedronate delayed-release tablets), and Boniva® (ibandronate tablets).

d) Patient has experienced inadequate efficacy to oral bisphosphonate therapy after a trial duration of 12 months as determined by the prescriber; OR

Note: An example of an inadequate efficacy is ongoing and significant loss of bone mineral density (BMD) or a lack of a BMD increase.

e) Patient has had an osteoporotic fracture or fragility fracture while receiving oral bisphosphonate therapy; OR

f) Patient has experienced significant intolerance to an oral bisphosphonate; OR

Note: Examples of significant intolerance include severe gastrointestinal related adverse events, severe musculoskeletal related adverse events, or a femoral fracture.

vii. Patient cannot take an oral bisphosphonate due to one of the following circumstances (a, b, or c):

d) Patient cannot swallow or has difficulty swallowing; OR

e) Patient cannot remain in an upright position post oral bisphosphonate administration; OR

f) Patient has a pre-existing gastrointestinal (GI) medical condition; OR

Note: Examples of pre-existing gastrointestinal medical conditions include esophageal lesions, esophageal ulcers, or abnormalities of the esophagus that delay esophageal emptying (stricture, achalasia).

viii. Patient meets one of the following conditions (a, b, or c):

d) Severe renal impairment; OR

Note: An example of severe renal impairment is a creatinine clearance < 35 mL/min.

e) Chronic kidney disease (CKD); OR

f) Patient has had an osteoporotic fracture or a fragility fracture; AND

E) Use of teriparatide exceeding 2 years during a patient's lifetime, approve if the patient is at high risk for fracture as determined by the prescriber.

Note: Examples of high risk for fracture include a previous osteoporotic fracture or fragility fracture, receipt of medications that increase the risk of osteoporosis, advanced age, and very low bone mineral density.

2. Osteoporosis – Treatment for a Postmenopausal Patient. Approve for 2 years if the patient meets the following criteria (A, B, and C):

A) Patient meets ONE of the following conditions (i, ii, or iii):

i. Patient has had a T-score (current or at any time in the past) at or below -2.5 at the lumbar spine, femoral neck, total hip, and/or 33% (one-third) radius (wrist); OR

ii. Patient has had an osteoporotic fracture or a fragility fracture; OR

iii. Patient meets both of the following (a and b):

a) Patient has low bone mass; AND

Note: An example of low bone mass includes a T-score (current or at any time in the past) between -1.0 and -2.5 at the lumbar spine, femoral neck, total hip and/or 33% (one-third) radius (wrist).

b) Prescriber determines the patient is at high risk for fracture; AND

B) Patient meets ONE of the following (i, ii, iii, or iv):

ii. Patient has tried ibandronate injection (Boniva) or zoledronic acid injection (Reclast); OR

iii. Patient has tried at least one oral bisphosphonate or oral bisphosphonate-containing product and meets one of the following (a, b, or c):
Note: Examples of oral bisphosphonate products include Fosamax® (alendronate tablets and oral solution), Fosamax® Plus D (alendronate/cholecalciferol tablets), Actonel® (risedronate tablets), Atelvia® (risedronate delayed-release tablets), and Boniva® (ibandronate tablets).
a) Patient has experienced inadequate efficacy to oral bisphosphonate therapy after a trial duration of 12 months as determined by the prescriber; OR
Note: An example of an inadequate efficacy is ongoing and significant loss of bone mineral density (BMD) or a lack of a BMD increase.
b) Patient has had an osteoporotic fracture or fragility fracture while receiving oral bisphosphonate therapy; OR
c) Patient has experienced significant intolerance to an oral bisphosphonate; OR
Note: Examples of significant intolerance include severe gastrointestinal related adverse events, severe musculoskeletal related adverse events, or a femoral fracture.

iv. Patient cannot take an oral bisphosphonate due to one of the following circumstances (a, b, or c):
a) Patient cannot swallow or has difficulty swallowing; OR
b) Patient cannot remain in an upright position post oral bisphosphonate administration; OR
c) Patient has a pre-existing gastrointestinal (GI) medical condition; OR
Note: Examples of pre-existing gastrointestinal medical conditions include esophageal lesions, esophageal ulcers, or abnormalities of the esophagus that delay esophageal emptying (stricture, achalasia).

v. Patient meets one of the following conditions (a, b, or c):
a) Severe renal impairment; OR
Note: An example of severe renal impairment is a creatinine clearance < 35 mL/min.
b) Chronic kidney disease (CKD); OR
c) Patient has had an osteoporotic fracture or a fragility fracture; AND

C) Use of teriparatide exceeding 2 years during a patient's lifetime, approve if the patient is at high risk for fracture as determined by the prescriber.
Note: Examples of high risk for fracture include a previous osteoporotic fracture or fragility fracture, receipt of medications that increase the risk of osteoporosis, advanced age, and very low bone mineral density.

3. Osteoporosis – (to Increase Bone Mass) in Men* with Primary or Hypogonadal Osteoporosis. Approve for 2 years if the patient meets the following criteria (A, B and C):

A) Patient meets ONE of the following conditions (i, ii, or iii):
i. Patient has had a T-score (current or at any time in the past) at or below -2.5 at the lumbar spine, femoral neck, total hip and/or 33% (one-third) radius (wrist); OR
ii. Patient has had an osteoporotic fracture or a fragility fracture; OR
iii. Patient meets both of the following (a and b):
a) Patient has low bone mass; AND
Note: An example of low bone mass includes a T-score (current or at any time in the past) between -1.0 and -2.5 at the lumbar spine, femoral neck, total hip and/or 33% (one-third) radius (wrist).
b) Prescriber determines the patient is at high risk for fracture; AND

B) Patient meets one of the following (i, ii, iii, or iv):
i. Patient has tried zoledronic acid injection (Reclast); OR
ii. Patient has tried at least one oral bisphosphonate or oral bisphosphonate-containing product and meets one of the following (a, b, or c):

Note: Examples of oral bisphosphonate products include Fosamax® (alendronate tablets and oral solution), Fosamax® Plus D (alendronate/cholecalciferol tablets), Actonel® (risedronate tablets), Atelvia® (risedronate delayed-release tablets), and Boniva® (ibandronate tablets).

a) Patient has experienced inadequate efficacy to oral bisphosphonate therapy after a trial duration of 12 months as determined by the prescriber; OR
Note: An example of an inadequate efficacy is ongoing and significant loss of bone mineral density (BMD) or a lack of a BMD increase.

b) Patient has had an osteoporotic fracture or a fragility fracture while receiving oral bisphosphonate therapy; OR

c) Patient has experienced significant intolerance to an oral bisphosphonate; OR
Note: Examples of significant intolerance include severe gastrointestinal related adverse events, severe musculoskeletal related adverse events, or a femoral fracture.

iii. Patient cannot take an oral bisphosphonate due to one of the following circumstances (a, b, or c):

a) Patient cannot swallow or has difficulty swallowing; OR

b) Patient cannot remain in an upright position post oral bisphosphonate administration; OR

c) Patient has a pre-existing gastrointestinal medical condition; OR
Note: Examples of pre-existing gastrointestinal medical conditions include esophageal lesions, esophageal ulcers, or abnormalities of the esophagus that delay esophageal emptying (e.g., stricture, achalasia).

iv. Patient meets one of the following conditions (a, b, or c):

a) Severe renal impairment; OR
Note: An example of severe renal impairment is a creatinine clearance < 35 mL/min.

b) Chronic kidney disease (CKD); OR

c) Patient has had an osteoporotic fracture or a fragility fracture; AND

C) Use of teriparatide exceeding 2 years during a patient's lifetime, approve if the patient is at high risk for fracture as determined by the prescriber.
Note: Examples of high risk for fracture include a previous osteoporotic fracture or fragility fracture, receipt of medications that increase the risk of osteoporosis, advanced age, and very low bone mineral density.

***** Refer to the Policy Statement.

Other Uses with Supportive Evidence

4. Hypoparathyroidism. Approve for 2 years if the patient meets the following criteria (A and B):

1. Patient meets one of the following (i or ii):
   i. Patient has tried Natpara (parathyroid hormone injection); OR
   ii. Natpara is not available; AND
   Note: Approval for this use is a unique circumstance and the other criterion regarding the other indications do not apply.
2. Medication is prescribed by or in consultation with an endocrinologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of teriparatide is not recommended in the following situations:

58. Concurrent Use with Other Medications for Osteoporosis.

Note: Examples include Prolia® (denosumab injection for subcutaneous use), oral bisphosphonates (e.g., alendronate, risedronate, ibandronate), intravenous bisphosphonates (zoledronic acid injection [Reclast], intravenous ibandronate), calcitonin nasal spray (Miacalcin®/Fortical®), Tymlos® (abaloparatide injection for subcutaneous use) and Evenity® (romosozumab-aqqg injection for subcutaneous use).

59. Osteoporosis Prevention. Teriparatide products have not been studied in this patient population. The benefits and risks of building bone with teriparatide products in a condition in which substantial bone loss has not occurred have not been investigated.[1]

60. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated, as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	In related criteria the word "prescriber" is replacing the word/phrase "physician" or "prescribing physician". An authorized generic to Bonsity (teriparatide) was added to the Policy. The same criteria as that in place for Forteo and Bonsity apply. Additionally, the following changes were made: **Automation:** Automation was previously listed as "None". Smart Coverage Review automation was added.	07/29/2020

	Other Uses with Supportive Evidence: For the criteria regarding Concurrent Use of Other Medications for Osteoporosis, the examples of other medications used for osteoporosis in the note were revised. Reference to calcium and vitamin D was deleted.	
Update	08/29/2020: No criteria changes: For the conditions that require a trial of at least one oral bisphosphonate or an oral bisphosphonate-containing product (glucocorticoid-induced osteoporosis – treatment; osteoporosis treatment for a postmenopausal patient, and osteoporosis treatment [to increase bone mass] for men), added a note that provided examples of these products (Note: Examples of oral bisphosphonate products include Fosamax® [alendronate tablets and oral solution], Fosamax® Plus D [alendronate/cholecalciferol tablets], Actonel® [risedronate tablets], Atelvia® [risedronate delayed-release tablets], and Boniva® [ibandronate tablets]).	--

HISTORY (continued)

Type of Revision	Summary of Changes	Review Date
Selected Revision	Bonsity was removed from the listing of products as it was launched in the US as Teriparatide manufactured by Alvogen. The following sentence in the Policy Statement was removed: "Coverage cumulative with teriparatide product and Tymlos is recommended for up to 2 years of a patient's lifetime". The following criteria changes were made: **Glucocorticoid-Induced Osteoporosis – Treatment:** Regarding the approval duration, wording was changed from "Approve for up to 2 years (total)" to "approve for 2 years". The criteria which stated that "Use of teriparatide and/or Tymlos does not exceed 2 years during a patient's lifetime" was changed to "approve use of teriparatide exceeding 2 years during a patient's lifetime if the patient is at high risk for fracture as determined by the prescriber." Examples of high fracture risk are provided in a Note. The example of prednisone as a systemic glucocorticoid was moved from the criteria to a Note. Wording for the criterion regarding inadequate response to an oral bisphosphonate was changed to "experienced inadequate efficacy". Examples of inadequate efficacy to an oral bisphosphonate were moved from the criteria to a Note. Wording of the criterion regarding intolerability to an oral bisphosphonate was changed to "experienced significant intolerance". Examples of significant intolerance were moved from the criteria to a Note. For the criterion that addresses if the patient has a pre-existing gastrointestinal medical condition, examples were moved from the criteria to a Note. For the criterion that addresses severe renal impairment, the example provided of creatinine clearance < 35 mL/min was moved from the criteria to a Note. **Osteoporosis Treatment for a Postmenopausal Patient.** Regarding the approval duration, wording was changed from "Approve for up to 2 years (total)" to "approve for 2 years". The criteria which stated that "Use of teriparatide and/or Tymlos does not exceed 2 years during a patient's lifetime" was changed to "approve use of teriparatide exceeding 2 years during a patient's lifetime if the patient is at high risk for fracture as determined by the prescriber." Examples of high fracture risk are provided in a Note. The criteria that requires low bone mass had the definition moved from the criteria to a Note. Wording for the criterion regarding inadequate response to an oral bisphosphonate was changed to "experienced inadequate efficacy". Examples of inadequate efficacy to an oral bisphosphonate were moved from the criteria to a Note. Wording of the criterion regarding intolerability to an oral bisphosphonate was changed to "experienced significant intolerance". Examples of significant intolerance were moved from the criteria to a Note. For the criterion that addresses if the patient has a pre-existing gastrointestinal medical condition, examples were moved from the criteria to a Note. For the criterion that addresses severe renal impairment, the example provided of creatinine clearance < 35 mL/min was moved from the criteria to a Note. **Osteoporosis (to Increase Bone Mass) in Men with Primary or Hypogonadal Osteoporosis.** Regarding the approval duration, wording was changed from "Approve for up to 2 years (total)" to "approve for 2 years". The criteria which stated that "Use of teriparatide and/or Tymlos does not exceed 2 years during a patient's lifetime" was changed to "approve use of teriparatide exceeding 2 years during a patient's lifetime if the patient is at high risk for fracture as determined by the prescriber." Examples of high fracture risk are provided in a Note. The criteria that requires low bone mass had the definition moved from the criteria to a Note. Wording for the criterion regarding inadequate response to an oral bisphosphonate was changed to "experienced inadequate efficacy". Examples of inadequate efficacy to an oral bisphosphonate were moved from the criteria to a Note. Wording of the criterion regarding intolerability to an oral bisphosphonate was changed to "experienced significant intolerance". Examples of significant intolerance were moved from the criteria	02/24/2021

	to a Note. For the criterion that addresses if the patient has a preexisting gastrointestinal medical condition, examples were moved from the criteria to a Note. For the criterion that addresses severe renal impairment, the example provided of creatinine clearance < 35 mL/min was moved from the criteria to a Note. **Hypoparathyroidism:** Regarding the approval duration, wording was changed from "Approve for up to 2 years (total)" to "approve for 2 years".	

PRIOR AUTHORIZATION POLICY

POLICY: Bone Modifiers – Tymlos Prior Authorization Policy

- Tymlos® (abaloparatide injection for subcutaneous use – Radius Health)

REVIEW DATE: 07/29/2020

OVERVIEW

Tymlos, a human parathyroid hormone related peptide (PTHrP[1-34]) analog, is indicated for the treatment of postmenopausal women with osteoporosis at high risk for fracture.[1] Patients at high risk for fracture are defined as those with a history of osteoporotic fractures, have multiple risk factors for fracture, or have failed or are intolerant to other osteoporosis therapy.

Guidelines

Guidelines for osteoporosis in postmenopausal women from the Endocrine Society (2019)[2] as well as from the American Association of Clinical Endocrinologists (AACE) and the American College of Endocrinology (ACE) [2020][3] discuss Tymlos. In general, Tymlos is one of several alternatives recommended in patients who are at high risk of fracture or in those unable to utilize oral bisphosphonate therapy.

Safety

The prescribing information for Tymlos includes a Boxed Warning regarding an increased incidence of osteosarcoma in rats at doses 4 to 28 times the exposure in humans administered as a 80 mcg dose.[1] Due to these risks, the agent should not be given to those who have an increased baseline risk for osteosarcoma. The prescribing information for Tymlos states that cumulative use of Tymlos and parathyroid hormone analogs (e.g., teriparatide injection for subcutaneous use [Forteo®/Bonsity®]) for > 2 years during a patient's lifetime is not recommended.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Tymlos. Coverage cumulative with Tymlos and teriparatide injection for subcutaneous use (Forteo/Bonsity) is recommended for up to 2 years of a patient's lifetime. All approval(s) are provided for up to 2 years in duration unless otherwise noted below.

Automation: Smart Coverage Review uses patient claim history to answer Prior Authorization questions regarding medication history of Boniva® (ibandronate injection for intravenous use) or Reclast® (zoledronic acid injection for intravenous use). A 2-year look back period will be used to check claim history and automate for use of either agent (Boniva intravenous or Reclast). If not in claims, medication history can be obtained through Prior Authorization criteria. For all reviews, other Prior Authorization criteria listed below will also be applied.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Tymlos is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Osteoporosis Treatment for a Postmenopausal Patient.** Approve for up to 2 years (total) if the patient meets the following criteria (A, B, and C):
   - **D)** Patient meets ONE of the following conditions (i, ii, or iii):
     - **iv.** Patient has had a T-score (current or at any time in the past) at or below -2.5 at the lumbar spine, femoral neck, total hip and/or 33% (one-third) radius (wrist); OR
     - **v.** Patient has had an osteoporotic fracture or a fragility fracture; OR
     - **vi.** The patient meets both of the following (a and b):
       - **a)** Patient has low bone mass (T-score [current or at any time in the past] between -1.0 and -2.5 at the lumbar spine, femoral neck, total hip and/or 33% [one-third] radius [wrist]); AND
       - **b)** Prescriber determines the patient is at high risk for fracture; AND
   - **E)** Patient meets ONE of the following (i, ii, iii, or iv):
     - **vi.** Patient has tried ibandronate injection (Boniva) or zoledronic acid injection (Reclast); OR
     - **vii.** Patient has tried at least one oral bisphosphonate or oral bisphosphonate-containing product and meets one of the following (a, b, or c):

       Note: Examples of oral bisphosphonate products include Fosamax® (alendronate tablets and oral solution), Fosamax® Plus D (alendronate/cholecalciferol tablets), Actonel® (risedronate tablets), Atelvia® (risedronate delayed-release tablets), and Boniva® (ibandronate tablets).
       - **d)** Patient has had an inadequate response to oral bisphosphonate therapy after a trial duration of 12 months as determined by the prescriber (e.g., ongoing and significant loss of bone mineral density [BMD], lack of BMD increase); OR
       - **e)** Patient has had an osteoporotic fracture or fragility fracture while receiving oral bisphosphonate therapy; OR
       - **f)** Patient has experienced intolerability to an oral bisphosphonate (e.g., severe gastrointestinal [GI]-related adverse effects, severe musculoskeletal-related side effects, a femoral fracture); OR
     - **viii.** The patient cannot take an oral bisphosphonate due to one of the following circumstances (a, b, or c):
       - **a)** Patient cannot swallow or has difficulty swallowing; OR
       - **b)** Patient cannot remain in an upright position post oral bisphosphonate administration; OR
       - **c)** Patient has a pre-existing gastrointestinal (GI) medical condition (e.g., patient with esophageal lesions, esophageal ulcers, or abnormalities of the esophagus that delay esophageal emptying [stricture, achalasia]); OR
     - **ix.** Patient meets one of the following conditions (a, b, or c):
       - **d)** Severe renal impairment (creatinine clearance < 35 mL/min); OR
       - **e)** Chronic kidney disease (CKD); OR
       - **f)** Patient has had an osteoporotic fracture or a fragility fracture; AND
   - **F)** Use of Tymlos and/or teriparatide injection for subcutaneous use (Forteo/Bonsity) does not exceed 2 years during a patient's lifetime.

     Note: Approve the duration necessary to complete a maximum of 2 years of therapy during a patient's lifetime (e.g., a patient who has already received 3 months of treatment with Tymlos or teriparatide [Forteo/Bonsity] should be approved for a duration of 21 months. This allows for completion of a maximum of 2 years of therapy).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tymlos is not recommended in the following situations:

61. Concurrent Use with Other Medications for Osteoporosis.
Note: Examples include Prolia® (denosumab injection for subcutaneous use), oral bisphosphonates (alendronate, risedronate, ibandronate), intravenous bisphosphonates (zoledronic acid injection [Reclast], ibandronate intravenous), calcitonin nasal spray (Miacalcin®/Fortical®), teriparatide injection for subcutaneous use (Forteo®/Bonsity), and Evenity® (romosozumab-aqqg injection for subcutaneous use). Tymlos is not indicated for use as combination therapy.

62. Osteoporosis Prevention. Tymlos has not been studied in this patient population. The benefits and risks of building bone with Tymlos in a condition in which substantial bone loss has not occurred have not been investigated.[1]

63. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual revision.	No criteria changes.	06/20/2018
Annual revision	The following criteria changes were made: **Osteoporosis Treatment for a Postmenopausal Patient.** Criteria were added that use of Tymlos and/or Forteo does not exceed 2 years during a patient's lifetime. **Conditions Not Recommended for Approval.** The stipulation that use of Tymlos and/or Forteo does not exceed 2 years during a patient's lifetime was removed as this is now addressed in the approval conditions. Also, added Evenity to the list of medications that should not be used concomitantly with Tymlos.	07/03/2019
Annual revision	In related criteria the word "prescriber" is replacing the word/phrase "physician" or "prescribing physician". Additionally, the following changes were made: **Automation:** Automation was previously listed as "None". Smart Coverage Rule Automation was added. **Conditions Not Recommended for Approval:** For the criteria regarding Concurrent Use of Other Medications for Osteoporosis, the examples of other medications used for osteoporosis in the note were revised. Reference to calcium and vitamin D was deleted.	07/29/2020
Update	08/29/2020: No criteria changes: For the conditions that require a trial of at least one oral bisphosphonate or an oral bisphosphonate-containing product (osteoporosis treatment for a postmenopausal patient), added a note that provided examples of these products (Note: Examples of oral bisphosphonate products include Fosamax® [alendronate tablets and oral solution], Fosamax® Plus D [alendronate/cholecalciferol tablets], Actonel® [risedronate tablets], Atelvia® [risedronate delayed-release tablets], and Boniva® [ibandronate tablets]).	--

PRIOR AUTHORIZATION POLICY

POLICY: Bone Modifiers – Xgeva Prior Authorization Policy
- Xgeva® (denosumab injection for subcutaneous use – Amgen)

REVIEW DATE: 03/03/2021

OVERVIEW

Xgeva, a receptor activator of nuclear factor kappa-B ligand (RANKL) inhibitor, is indicated for the following uses[1]:

- **Giant cell tumor of bone**, treatment of adults and skeletally mature adolescents with disease that is unresectable or where surgical resection is likely to result in severe morbidity.
- **Hypercalcemia of malignancy** that is refractory to bisphosphonate therapy.
- **Skeletal-related events**, prevention of, in patients with multiple myeloma and in those with bone metastases from solid tumors.

Another injectable formulation of denosumab is available, Prolia®, but it is not included in this policy.[2]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Xgeva. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Xgeva as well as the monitoring required for adverse events and long-term efficacy, approval requires Xgeva to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Xgeva is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Bone Metastases from Solid Tumors – Prevention of Skeletal-Related Events.** Approve for 1 year if the patient meets the following criteria (A, B, C and D):
   Note: Some examples of cancer in this clinical scenario include breast cancer, prostate cancer, and non-small cell lung cancer.
   A) Patient is ≥ 18 years of age; AND
   B) Patient has bone metastases; AND
   C) Patient with prostate cancer must have received at least one hormonal therapy; AND
   Note: Examples of hormonal therapies for prostate cancer include Lupron Depot® (leuprolide for depot suspension), Eligard® (leuprolide acetate for injectable suspension), Trelstar® (triptorelin pamoate for injectable suspension), or Zoladex® (goserelin implant).
   D) The medication is prescribed by or in consultation with a hematologist or an oncologist.

2. **Giant Cell Tumor of Bone.** Approve for 1 year.
3. **Hypercalcemia of Malignancy.** Approve for 2 months if the patient meets the following criteria (A, B, and C):
   A) Patient has a current malignancy; AND
   B) Patient meets one of the following (i or ii):
   i. Patient has tried at least one intravenous (IV) bisphosphonate therapy; OR

Note: Examples include zoledronic acid injection (Zometa) and pamidronate injection (Aredia); OR

ii. Patient has an estimated calculated creatinine clearance (CrCl) < 30 mL/min; AND

C) Patient has an albumin-corrected calcium (cCa) ≥ 11.5 mg/dL.

4. Multiple Myeloma – Prevention of Skeletal-Related Events. Approve for 1 year if the patient meets the following criteria (A and B):

A) Patient is ≥ 18 years of age; AND

B) Medication is prescribed by or in consultation with a hematologist or an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Xgeva is not recommended in the following situations:

14. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

76. Prolia® injection for subcutaneous use [prescribing information]. Thousand Oaks, CA: Amgen; March 2020.

HISTORY

Type of Revision	Summary of Changes	Review Date
New Policy	--	02/27/2019
Annual Revision	No criteria changes.	02/26/2020
Annual Revision	The following changes were made: **1. Bone Metastases from Solid Tumors – Prevention of Skeletal-Related Events:** The examples of breast cancer, prostate cancer, and non-small-cell lung cancer were moved as examples of cancers from the cited indication to a Note. Regarding the criterion that patients with prostate cancer must have received at least one hormonal therapy, the examples of hormonal therapies for prostate cancer were moved from the criteria to a Note. **2. Hypercalcemia of Malignancy:** Regarding the criteria that the patient has tried intravenous bisphosphonate therapy, the qualifier of "at least one" bisphosphonate therapy was added and examples were moved from the criteria to a Note.	03/03/2021

PRIOR AUTHORIZATION POLICY

POLICY: Bone Modifiers – Zoledronic Acid (Reclast) Prior Authorization Policy

- Reclast® (zoledronic acid injection – Novartis, generic)

REVIEW DATE: 03/03/2021

OVERVIEW

Zoldedronic acid (Reclast), a bisphosphonate given intravenously, is indicated for the following uses:[1]

- **Glucocorticoid-induced osteoporosis**, for treatment and prevention in men and women who are either initiating or continuing systemic glucocorticoids (e.g., prednisone 7.5 mg or greater) and who are anticipated to remain on glucocorticoids for at least 12 months.
- **Osteoporosis, prevention in postmenopausal women**.
- **Osteoporosis, treatment in men** to increase bone mass.
- **Osteoporosis, treatment in postmenopausal women.**
- **Paget's disease of bone**, treatment in men and women.

Another zoledronic acid injection product, Zometa®, is indicated for hypercalcemia of malignancy; and for multiple myeloma and bone metastases from solid tumors.[2] Although not indicated, zoledronic acid injection (Reclast) has been used in patients, mainly children, with osteogenesis imperfecta and benefits were noted, such as increases in bone mineral density.[1,3-8]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of zoledronic acid injection (Reclast). All approvals are provided for the duration noted below. In the approval indication for zoledronic acid injection (Reclast), as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: men are defined as individuals with the biological traits of a man, regardless of the individual's gender identity or gender expression.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

FDA-Approved Indications

1. **Glucocorticoid-Induced Osteoporosis (GIO) – Prevention and Treatment.** Approve for 1 year if the patient meets the following criteria (A and B):
   - **A)** Patient is either initiating or continuing systemic glucocorticoids; AND
     Note: An example of a systemic glucocorticoid is prednisone.
   - **B)** Patient meets ONE of the following (i, ii, iii, or iv):
     - **i.** Patient has tried zoledronic acid injection (Reclast); OR
     - **ii.** Patient has tried at least one oral bisphosphonate or oral bisphosphonate-containing product and meets one of the following (a, b, or c):
       Note: Examples of oral bisphosphonate products include Fosamax (alendronate tablets and oral solution), Fosamax Plus D (alendronate/cholecalciferol tablets), Actonel (risedronate tablets), Atelvia (risedronate delayed-release tablets), and Boniva (ibandronate tablets).
       - **a)** According to the prescriber, patient has experienced inadequate efficacy to oral bisphosphonate therapy after a trial duration of 12 months ; OR
         Note: Examples of inadequate efficacy are ongoing and significant loss of bone mineral density (BMD) and lack of a BMD increase.
       - **b)** Patient has had an osteoporotic fracture or fragility fracture while receiving oral bisphosphonate therapy; OR
       - **c)** Patient has experienced significant intolerance to an oral bisphosphonate; OR
         Note: Examples of significant intolerance include severe gastrointestinal related adverse events, severe musculoskeletal related adverse events, and femoral fracture.
     - **iii.** Patient cannot take an oral bisphosphonate due to one of the following circumstances (a, b, or c):

a) Patient cannot swallow or has difficulty swallowing; OR
b) Patient cannot remain in an upright position post-oral bisphosphonate administration; OR
c) Patient has a pre-existing gastrointestinal medical condition in which intravenous bisphosphonate therapy may be warranted; OR
Note: Examples of pre-existing gastrointestinal medical conditions include esophageal lesions, esophageal ulcers, and abnormalities of the esophagus that delay esophageal emptying (stricture, achalasia).

iv. Patient has had an osteoporotic fracture or a fragility fracture.

2. Osteoporosis – Prevention for a Postmenopausal Patient. Approve for 1 year if the patient meets the following criteria (A, B, and C):

A) Patient meets ONE of the following conditions (i or ii):
i. Patient has had a T-score (current or at any time in the past) between -1.0 and -2.5 at the lumbar spine, femoral neck, total hip, and/or 33% (one third) radius (wrist); OR
ii. Patient has had an osteoporotic fracture or a fragility fracture; AND

B) Patient meets ONE of the following (i, ii, iii, or iv):
i. Patient has tried zoledronic acid injection (Reclast); OR
ii. Patient has tried at least one oral bisphosphonate or oral bisphosphonate-containing product and meets one of the following (a, b, or c):
Note: Examples of oral bisphosphonate products include Fosamax (alendronate tablets and oral solution), Fosamax Plus D (alendronate/cholecalciferol tablets), Actonel (risedronate tablets), Atelvia (risedronate delayed-release tablets), and Boniva (ibandronate tablets).
a) According to the prescriber, patient has experienced inadequate efficacy to oral bisphosphonate therapy after a trial duration of 12 months ; OR
Note: Examples of inadequate efficacy are ongoing and significant loss of bone mineral density (BMD) and lack of a BMD increase.
b) Patient has had an osteoporotic fracture or fragility fracture while receiving oral bisphosphonate therapy; OR
c) Patient has experienced significant intolerance to an oral bisphosphonate; OR
Note: Examples of significant intolerance include severe gastrointestinal related adverse events, severe musculoskeletal related adverse events, and femoral fracture.
iii. Patient cannot take an oral bisphosphonate due to one of the following circumstances (a, b, or c):
a) Patient cannot swallow or has difficulty swallowing; OR
b) Patient cannot remain in an upright position post oral bisphosphonate administration; OR
c) Patient has a pre-existing gastrointestinal medical condition in which intravenous bisphosphonate therapy may be warranted; OR
Note: Examples of pre-existing gastrointestinal medical conditions include esophageal lesions, esophageal ulcers, and abnormalities of the esophagus that delay esophageal emptying (stricture, achalasia).
iv. Patient has had an osteoporotic fracture or a fragility fracture; AND

C) If the patient has received Reclast previously, at least 24 months has elapsed since the last dose.

3. Osteoporosis – Treatment for Men*. Approve for 1 year if the patient meets the following criteria (A and B):

A) Patient meets ONE of the following conditions (i, ii, or iii):
i. Patient has had a T-score (current or at any time in the past) at or below -2.5 at the lumbar spine, femoral neck, total hip, and/or 33% (one third) radius (wrist); OR
ii. Patient has had an osteoporotic fracture or a fragility fracture; OR
iii. Patient meets both of the following (a and b):
a. Patient has low bone mass; AND

Note: An example of low bone mass includes a T-score (current or at any time in the past) between -1.0 and -2.5 at the lumbar spine, femoral neck, total hip and/or 33% (one-third) radius (wrist).

b. According to the prescriber, patient is at high risk for fracture; AND

B) Patient meets ONE of the following (i, ii, iii, or iv):

i. Patient has tried zoledronic acid injection (Reclast); OR

ii. Patient has tried at least one oral bisphosphonate or oral bisphosphonate-containing product and meets one of the following (a, b, or c):

Note: Examples of oral bisphosphonate products include Fosamax (alendronate tablets and oral solution), Fosamax Plus D (alendronate/cholecalciferol tablets), Actonel (risedronate tablets), Atelvia (risedronate delayed-release tablets), and Boniva (ibandronate tablets).

a) According to the prescriber, patient has experienced inadequate efficacy to oral bisphosphonate therapy after a trial duration of 12 months; OR

Note: Examples of inadequate efficacy are ongoing and significant loss of bone mineral density (BMD) and lack of a BMD increase.

b) Patient has had an osteoporotic fracture or a fragility fracture while receiving oral bisphosphonate therapy; OR

c) Patient has experienced significant intolerance to an oral bisphosphonate; OR

Note: Examples of significant intolerance include severe gastrointestinal related adverse events, severe musculoskeletal related adverse events, and femoral fracture.

iii. Patient cannot take an oral bisphosphonate due to one of the following circumstances (a, b, or c):

a) Patient cannot swallow or has difficulty swallowing; OR

b) Patient cannot remain in an upright position post oral bisphosphonate administration; OR

c) Patient has a pre-existing gastrointestinal medical condition in which intravenous bisphosphonate therapy may be warranted; OR

Note: Examples of pre-existing gastrointestinal medical conditions include esophageal lesions, esophageal ulcers, and abnormalities of the esophagus that delay esophageal emptying (stricture, achalasia).

iv. Patient has had an osteoporotic fracture or a fragility fracture.

***** Refer to the Policy Statement.

4. Osteoporosis – Treatment for a Postmenopausal Patient. Approve for 1 year if the patient meets the following criteria (A and B):

A) Patient meets ONE of the following conditions (i, ii, or iii):

i. Patient has had a T-score (current or at any time in the past) at or below -2.5 at the lumbar spine, femoral neck, total hip, and/or 33% (one-third) radius (wrist); OR

ii. Patient has had an osteoporotic fracture or a fragility fracture; OR

iii. Patient meets both of the following (a and b):

a) Patient has low bone mass; AND

Note: An example of low bone mass includes a T-score (current or at any time in the past) between -1.0 and -2.5 at the lumbar spine, femoral neck, total hip and/or 33% (one-third) radius (wrist).

b) According to the prescriber, patient is at high risk for fracture; AND

B) Patient meets ONE of the following (i, ii, iii, or iv):

i. Patient has tried ibandronate injection (Boniva IV) or zoledronic acid injection (Reclast); OR

ii. Patient has tried at least one oral bisphosphonate or oral bisphosphonate-containing product and meets one of the following (a, b, or c):

Note: Examples of oral bisphosphonate products include Fosamax (alendronate tablets and oral solution), Fosamax Plus D (alendronate/cholecalciferol tablets), Actonel (risedronate tablets), Atelvia (risedronate delayed-release tablets), and Boniva (ibandronate tablets).

a) According to the prescriber, patient has experienced inadequate efficacy to oral bisphosphonate therapy after a trial duration of 12 months ; OR
Note: Examples of inadequate efficacy are ongoing and significant loss of bone mineral density (BMD) and lack of a BMD increase.

b) Patient has had an osteoporotic fracture or a fragility fracture while receiving oral bisphosphonate therapy; OR

c) Patient has experienced significant intolerance to an oral bisphosphonate; OR
Note: Examples of significant intolerance include severe gastrointestinal related adverse events, severe musculoskeletal related adverse events, and femoral fracture.

iii. Patient cannot take an oral bisphosphonate due to one of the following circumstances (a, b, or c):

a) Patient cannot swallow or has difficulty swallowing; OR

b) Patient cannot remain in an upright position post oral bisphosphonate administration; OR

c) Patient has a pre-existing gastrointestinal medical condition in which intravenous bisphosphonate therapy may be warranted; OR
Note: Examples of pre-existing gastrointestinal medical conditions include esophageal lesions, esophageal ulcers, and abnormalities of the esophagus that delay esophageal emptying (stricture, achalasia).

iv. Patient has had an osteoporotic fracture or a fragility fracture.

5. Paget's Disease of Bone. Approve for one dose if the patient meets one of the following criteria (A, B, or C):

A) Patient has elevations in serum alkaline phosphatase of two times higher than the upper limit of the age-specific normal reference range; OR

B) Patient is symptomatic; OR
Note: Examples of symptoms include bone pain, hearing loss, and osteoarthritis.

C) Patient is at risk for complications from their disease.
Note: Examples of disease complications include immobilization, bone deformity, fractures and nerve compression syndrome.

Other Uses with Supportive Evidence

6. Osteogenesis Imperfecta. Approve for 1 year.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of zoledronic acid injection (Reclast) is not recommended in the following situations:

1. Concurrent Use of Zoledronic Acid Injection (Reclast) with Other Medications for Osteoporosis.
Note: Examples of other medications for osteoporosis include oral bisphosphonates (e.g., alendronate, risedronate, ibandronate), other intravenous bisphosphonates (e.g., intravenous ibandronate [Boniva]), Prolia (denosumab injection for subcutaneous use), Evenity [romosozumab-aqqg injection for subcutaneous use], Forteo (teriparatide injection for subcutaneous use, generic), Tymlos (abaloparatide injection for subcutaneous use), and calcitonin nasal spray.

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	In the Conditions Not Recommended for Approval section, added medication examples that Reclast should not be used with concomitantly (e.g., Bonsity, Evenity, and provided examples of bisphosphonates).	02/26/2020
Annual Revision	The following criteria changes were made: i. **Glucocorticoid-Induced Osteoporosis – Treatment:** The example of prednisone as a systemic glucocorticoid was moved from the criteria to a Note. Regarding the criterion that requires a trial of one oral bisphosphonate, the wording was added to state "at least one". Examples of oral bisphosphonates are now provided in a Note. Wording for the criterion regarding inadequate response to an oral bisphosphonate was changed to "experienced inadequate efficacy". For this criterion, "prescribing physician" was changed to "prescriber". Examples of inadequate efficacy to an oral bisphosphonate were moved from the criteria to a Note. Wording of the criterion regarding intolerability to an oral bisphosphonate was changed to "experienced significant intolerance". Examples of significant intolerance were moved from the criteria to a Note. For the criterion that addresses if the patient has a pre-existing gastrointestinal medical condition, examples were moved from the criteria to a Note. i. **Osteoporosis – Prevention for a Postmenopausal Patient:** Regarding the criterion that requires a trial of one oral bisphosphonate, the wording was added to state "at least one". Examples of oral bisphosphonates are now provided in a Note. Wording for the criterion regarding inadequate response to an oral bisphosphonate was changed to "experienced inadequate efficacy". For this criterion, "prescribing physician" was changed to "prescriber". Examples of inadequate efficacy to an oral bisphosphonate were moved from the criteria to a Note. Wording of the criterion regarding intolerability to an oral bisphosphonate was changed to "experienced significant intolerance". Examples of significant intolerance were moved from the criteria to a Note. For the criterion that addresses if the patient has a pre-existing gastrointestinal medical condition, examples were moved from the criteria to a Note. i. **Osteoporosis – Treatment for Men.** The criteria that requires low bone mass had the definition moved from the criteria to a Note. Also, the wording that the "prescribing physician" had to make this determination was changed to state "prescriber". Regarding the criterion that requires a trial of one oral bisphosphonate, the wording was added to state "at least one". Examples of oral bisphosphonates are now provided in a Note. Wording for the criterion regarding inadequate response to an oral bisphosphonate was changed to "experienced inadequate efficacy". For this criterion, "prescribing physician" was changed to "prescriber". Examples of inadequate efficacy to an oral bisphosphonate were moved from the criteria to a Note. Wording of the criterion regarding intolerability to an oral bisphosphonate was changed to "experienced significant intolerance". Examples of significant intolerance were moved from the criteria to a Note. For the criterion that addresses if the patient has a pre-existing gastrointestinal medical condition, examples were moved from the criteria to a Note. v. **Osteoporosis – Treatment for a Postmenopausal Patient:** The criteria changes were the same at those noted above for the indication of "Osteoporosis – Treatment for Men". v. **Paget's Disease:** For the criteria that requires that the patient is symptomatic, examples were moved from the criteria to a Note. For the criteria that requires that the patient is at risk for complications of their disease, the examples were moved from the criteria to a Note. i. **Other Conditions Not Recommended for Approval:** For the notation cited regarding "Concurrent Use of Zoledronic Acid Injection (Reclast) with Other Medications for Osteoporosis" the examples of medications were moved from the criteria to a Note; the medication list was revised. Also, the wording stating "except calcium and vitamin D" was removed.	03/03/2021

PRIOR AUTHORIZATION POLICY

POLICY: Bone Modifiers – Zoledronic Acid (Zometa) Prior Authorization Policy
- Zometa® (zoledronic acid injection – Novartis, generic)

REVIEW DATE: 03/03/2021

OVERVIEW

Zoledronic acid injection (Zometa), a bisphosphonate, is indicated for the treatment of the following:[1]
- **Hypercalcemia of malignancy**.
- **Multiple myeloma and documented bone metastases from solid tumors**, in addition to standard antineoplastic therapy.

Prostate cancer should have progressed after treatment with at least one hormonal therapy.[1] Another formulation of zoledronic acid injection is available, Reclast®, but is not included in this policy.[2]

Other Uses With Supportive Evidence

Data are available with zoledronic acid injection (Zometa) regarding off-label uses. One example is to prevent bone loss in patients with breast cancer receiving aromatase inhibitor therapy. Aromatase inhibitor therapy prevents peripheral production and suppress estrogen levels and can lead to accelerated bone loss beyond what would naturally occur in women.[3,4] This can place the patient at an increased risk for having a fracture. A review on the management of aromatase inhibitor-associated bone loss in postmenopausal women with breast cancer[5] states that zoledronic acid injection (Zometa) [4 mg every 6 months] is the preferred agent for prevention and treatment of aromatase inhibitor bone loss.[4] Zoledronic acid injection (Zometa) has been studied and shown benefits in postmenopausal women receiving adjuvant letrozole for breast cancer.[5,6]

Zoledronic acid injection (Zometa) has also been utilized to prevent bone loss in patients with prostate cancer who are receiving androgen deprivation therapy (ADT). ADT is associated with a variety of adverse events, including osteoporosis. The National Comprehensive Cancer Network (NCCN) clinical practice guidelines regarding prostate cancer (version 2.2021 – February 17, 2021)[7] cite zoledronic acid as an option to increase bone density, a surrogate for fracture risk, during ADT for prostate cancer. Zoledronic acid injection (Zometa) has led to bone mineral density increases in patients with prostate cancer who are receiving androgen deprivation therapy.[8,9] A clinical practice guideline for osteoporosis in men from the Endocrine Society[9] recommends pharmacological treatment for osteoporosis for men with prostate cancer receiving ADT who have a high risk of fracture.

Zoldedronic acid injection (Zometa) has utility in premenopausal patients with breast cancer who have developed ovarian failure. Chemotherapy-induced ovarian failure is an adverse effect associated with some adjuvant chemotherapy and can lead to rapid bone loss.[10,11] Studies have demonstrated zoledronic acid injection (Zometa) to be efficacious in preserving bone mineral density in premenopausal women with breast cancer who developed ovarian failure due to adjuvant chemotherapy.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of zoledronic acid injection (Zometa). All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with zoledronic acid injection (Zometa) as well as the monitoring required for adverse events and long-term efficacy, approval requires zoledronic acid injection (Zometa) to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of zoledronic acid injection (Zometa) is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Bone Metastases From Solid Tumors – Treatment** Approve for 1 year if the patients meets all of the following criteria (A, B, and C):
   Note: Some examples of cancer in this clinical scenario include breast cancer, prostate cancer, non-small cell lung cancer, renal cell cancer, small cell lung cancer, colorectal cancer, bladder cancer, gastrointestinal/genitourinary cancer, and head and neck cancer.
   A) Patient has bone metastases; AND
   B) Patient with prostate cancer must have received at least one hormonal therapy; AND
   Note: Examples of hormonal therapies for prostate cancer include Lupron Depot® (leuprolide for depot suspension), Eligard® (leuprolide acetate for injectable suspension), Trelstar® (triptorelin pamoate for injectable suspension), and Zoladex® (goserelin implant).
   C) The medication is prescribed by or in consultation with a hematologist or an oncologist.

2. **Hypercalcemia of Malignancy.** Approve for 1 month if the patient meets the following criteria (A and B):
   A) Patient has a current malignancy; AND
   B) Patient has an albumin-corrected calcium (cCa) ≥ 11.5 mg/dL.

3. **Multiple Myeloma – Treatment.** Approve for 1 year if the agent is prescribed by or in consultation with a hematologist or an oncologist.

Other Uses with Supportive Evidence

4. **Prevention of Bone Loss (To Increase Bone Mass) in Patients with Breast Cancer Receiving Aromatase Inhibitor Therapy**. Approve for 1 year if the patient meets the following criteria (A and B):
   A) Patient has breast cancer that is not metastatic to bone; AND
   B) Patient is receiving an aromatase inhibitor therapy.
   Note: Examples of aromatase inhibitor agents include anastrozole, letrozole, and exemestane.

5. **Prevention of Bone Loss (To Increase Bone Mass) in Patients with Prostate Cancer Who are Receiving Androgen Deprivation Therapy (ADT).** Approve for 1 year if the patient meets the following criteria (A and B):
   A) Patient has prostate cancer that is not metastatic to bone; AND
   B) Patient must meet one of the following (i or ii):
      i. Patient is currently receiving androgen deprivation therapy; OR
      Note: Examples of androgen deprivation therapies include Lupron Depot® (leuprolide for depot suspension), Eligard® (leuprolide acetate for injectable suspension), Trelstar® (triptorelin pamoate for injectable suspension), or Zoladex® (goserelin implant).
      ii. Patient has undergone bilateral orchiectomy.

6. **Prevention of Bone Loss (to Increase Bone Mass) in Premenopausal Patients with Breast Cancer Who Have Developed Ovarian Failure.** Approve for 1 year if the patient meets the following criteria (A, B and C):
   A) Patient is premenopausal; AND
   B) Breast cancer is not metastatic to bone; AND
   C) Patient received adjuvant chemotherapy that led to ovarian failure.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of zoledronic acid (Zometa) is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
New Policy	--	03/06/2019
Annual Revision	No criteria changes.	02/26/2020
Annual Revision	The following changes were made: **1. Bone Metastases from Solid Tumors – Treatment:** The examples of cancers were moved from the cited indication to a Note. Regarding the criterion that patients with prostate cancer must have received at least one hormonal therapy, the examples of hormonal therapies for prostate cancer were moved from the criteria to a Note. **2. Prevention of Bone Loss (To Increase Bone Mass) in Patients with Breast Cancer Receiving Aromatase Inhibitor Therapy**. The examples of aromatase inhibitor therapies were moved from the criteria to a Note. **3. Prevention of Bone Loss (To Increase Bone Mass) in Patients with Prostate Cancer Who are Receiving Androgen Deprivation Therapy (ADT).** The examples of androgen deprivation therapies were moved from the criteria to a Note.	03/03/2021

PRIOR AUTHORIZATION POLICY

POLICY: Botulinum Toxins – Botox Prior Authorization Policy

- Botox® (onabotulinumtoxinA for injection – Allergan)

REVIEW DATE: 06/03/2020; selected revision 02/24/2021

OVERVIEW

Botox, a botulinum toxin, is indicated for the following:

- **Blepharospasm** associated with dystonia, including benign essential blepharospasm or seventh nerve disorders, and strabismus in patients ≥ 12 years of age.
- **Cervical dystonia,** to reduce the severity of abnormal head position and neck pain associated with cervical dystonia.
- **Hyperhidrosis, primary axillary**, that is inadequately treated with topical agents.
- **Migraine headache prophylaxis,** in adults with chronic migraine (≥ 15 days per month with headache lasting 4 hours per day or longer).
- **Overactive bladder** with symptoms of urge urinary incontinence, urgency, and frequency, in adults who have inadequate response to or are intolerant of an anticholinergic medication.
- **Spasticity** (upper and lower limb) in patients ≥ 2 years of age.
- **Urinary incontinence due to detrusor overactivity** associated with a neurological condition (e.g., spinal cord injury, multiple sclerosis) in adults who have an inadequate response to or are intolerant of an anticholinergic medication.
- **Neurogenic detrusor overactivity** in pediatric patients ≥ 5 years of age who have had an inadequate response to or are intolerant of an anticholinergic medication.[1]

In addition, botulinum toxin type A has been used to treat a multitude of disorders characterized by abnormal muscle contraction.[2] The benefit of this drug has also been demonstrated in the treatment of gastrointestinal, genitourinary, ocular, and autonomic nervous system disorders.[2,3] Of note, with regard to the indication of migraine headache prophylaxis, an updated assessment of the preventive and acute treatment of migraine by the American Headache Society (2018) notes that all patients with migraine should be offered a trial of acute treatment.[4] Regarding migraine prophylaxis, several medications are cited as having established or probable efficacy in migraine prevention, including antiepileptic medications, beta-blockers, antidepressants, and Botox.

Other Uses with Supportive Evidence

Botox has been studied in a variety of indications outside of FDA-approved uses. Literature is available to support use of Botox in the following conditions:

- **Achalasia:** The American College of Gastroenterology (ACG) clinical guideline for the diagnosis and management of achalasia (2013) recommends the use of botulinum toxin therapy in patients who are not good candidates for more definitive therapy with pneumatic dilation or surgery (myotomy).[5]
- **Anal Fissures:** The ACG clinical guideline for the management of benign anorectal disorders (2014) recommends the use of botulinum toxin therapy or surgical internal anal sphincterotomy in patients who do not respond to conservative or topical pharmacologic agents, such as a calcium channel blockers or nitrates.[6]
- **Chronic Facial Pain/Pain Associated with Temporomandibular Dysfunction:** Data from several open-label studies, as well as one randomized, placebo-controlled trial, support the efficacy of Botox in the treatment of chronic facial pain/chronic facial pain associated with hyperactivity of the masticatory muscles.[7-10]
- **Chronic Low Back Pain:** In one 8-week, randomized, double-blind, placebo-controlled trial in 31 patients with chronic low back pain (no causative factor identified in the majority of patients; history of disc disease in 6 patients, discectomy in 3 patients, and trauma in 4 patients), Botox in addition to their current pharmacologic treatment regimen resulted in significantly greater improvement in pain relief and degree of disability compared with placebo.[11] A 14-month, open-label, prospective study evaluated the short- and long-term effects of paraspinal muscle injections

of Botox in 75 patients with refractory chronic low back pain. A total of 53% and 52% of patients reported significant pain relief at 3 weeks and 2 months, respectively.[12]

- **Dystonia, other than cervical (e.g., focal dystonias, tardive dystonia, anismus, laryngeal dystonia/spasmodic dysphonia):** Guidelines from the American Academy of Neurology (AAN) support use of botulinum toxins in focal dystonias of the upper extremity (should be considered; Level B recommendation).[13] Botulinum toxin A is the most widely accepted treatment for spasmodic dysphonia, a focal laryngeal dystonia, viewed as the treatment of choice by the American Academy of Otolaryngology-Head and Neck Surgery.[14] Per the guideline, clinicians should offer, or refer to a clinician who can offer, botulinum toxin injections for treatment of dysphonia caused by spasmodic dysphonia and other types of laryngeal dystonia. AAN guidelines note that botulinum toxin is probably effective and should be considered for adductor type laryngeal dystonia (Level B).[13]
- **Essential Tremor:** According to the clinical practice parameter on essential tremor by the AAN, propranolol and primidone are first-line therapy in the treatment of essential tremor.[15] Second-line medication options include alprazolam, atenolol, (monotherapy), sotalol, gabapentin, and topiramate. Botulinum toxin A may also reduce tremor. The guidelines recommend that botulinum toxin A may be considered in medically refractory cases of limb, head, and voice tremor associated with essential tremor (Level C for limb, head, and voice tremor).
- **Frey's Syndrome (gustatory sweating):** AAN guidelines state that botulinum toxin may be considered for this use (Level C). Botox is recommended as a first-line option for Frey's syndrome by the International Hyperhidrosis Society.[16,17]
- **Hyperhidrosis, Palmar/Plantar and Facial:** The efficacy of Botox is well-established in the treatment of primary focal/palmar hyperhidrosis based on data from both randomized, double-blind, placebo-controlled studies and open-label studies.[3,18,19] Guidelines from the International Hyperhidrosis Society support use of Botox in patients who have failed to respond to topical therapy.[16,20,21] AAN guidelines state that botulinum toxins are probably safe and effective and should be considered for palmar hyperhidrosis (plantar and facial hyperhidrosis are not addressed in the AAN guideline).[17]
- **Myofascial Pain:** Data from several retrospective reviews and open-label trials support the efficacy of Botox in the treatment of myofascial pain syndromes associated with various muscle groups.[7,22] In one randomized, controlled trial in 40 patients with chronic myofascial pain of various forms, Botox resulted in a significantly greater reduction in pain score from baseline compared with intramuscularly administered methylprednisolone at 30 days and 60 days post injection.[23] Another double-blind, randomized, placebo-controlled study involving 30 patients showed no difference in spontaneous and evoked pain reduction between Botox and isotonic saline injection recipients.[24]
- **Ophthalmic Disorders, Other Than Blepharospasm or Strabismus (e.g., esotropia, exotropia, nystagmus, facial nerve paresis):** Botulinum toxin A has been successful in improving or treating many ophthalmic disorders. One retrospective review (n = 54) concluded that Botox may have a role in the treatment of esotropia in patients > 18 months of age.[25] Botox improved visual acuity in one small, open-label study in patients with acquired symptomatic nystagmus from multiple sclerosis or brain-stem hemorrhage as well as in case reports.[26,27] Data from uncontrolled studies have shown Botox to be beneficial in the treatment of sixth nerve palsy.[28,29]
- **Plantar Fasciitis:** In one randomized, double-blind study (n = 36), botulinum toxin A exhibited more rapid and sustained improvement over the duration of the study as compared with the patients who received steroid injections.[30] The clinical consensus statement on the diagnosis and treatment of heel pain (developed by the American College of Foot and Ankle Surgeons) published in 2010, botulinum toxin injection is listed as a Tier 2 option (Grade I); Tier 1 treatment options include: padding and strapping of the foot (Grade B), therapeutic orthotic insoles (Grade B), oral anti-inflammatory agents (Grade I), corticosteroid injections (Grade B), and Achilles and plantar fascia

stretching (Grade B) [Grade B recommendations are supported by fair evidence, Grade I recommendations indicate there is insufficient evidence to make a recommendation].[31]

- **Sialorrhea, Chronic:** Botulinum toxin A has been studied in the treatment of sialorrhea associated with Parkinson's Disease, parkinsonian syndromes, cerebral palsy, head and neck carcinoma, neurodegenerative disease, stroke, and amytrophic lateral sclerosis (ALS).[3] A review of the literature on medical treatment of sialorrhea found that Botox is probably effective for the treatment of this condition (level B evidence).[32] AAN guidelines note that botulinum toxin is probably safe and effective and should be considered (Level B).[17]
- **Spasticity, Other Than Lower and Upper Limb (i.e., spasticity or hypertonia due to cerebral palsy, stroke, brain injury, spinal cord injury, multiple sclerosis, hemifacial spasm):** Per the AAN, botulinum toxin is established effective in upper and lower limb spasticity and in cerebral palsy (Level A), and it may be considered in hemifacial spasm (Level C).[13,33]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Botox. Use should be limited to the treatment of medical conditions. Prescription benefit coverage of this product is not recommended for cosmetic conditions. All approvals are provided for 1 year. Previous therapy is required to be verified by a clinician in the Coverage Review Department when noted in the criteria as **[verification of therapies required]**.

Prior authorization and prescription benefit coverage are not recommended for Botox Cosmetic.

Automation: None

RECOMMENDED AUTHORIZATION CRITERIA

FDA-Approved Indications

1. **Blepharospasm Associated with Dystonia or Strabismus**. Approve for 1 year.

2. **Cervical Dystonia (spasmodic torticollis).** Approve for 1 year.
   Note: Cervical dystonia is also known as spasmodic or cervical torticollis.

3. **Hyperhidrosis, Primary Axillary.** Approve for 1 year if the patient has tried at least one topical agent (e.g., topical aluminum chloride, Qbrexza™ [glycopyrronium cloth 2.4% for topical use]).

4. **Migraine Headache Prophylaxis in Patients with Chronic Migraine.** Approve for 1 year in patients who meet all of the following conditions (A, B, C, and D):
   - **A)** Patient has ≥ 15 migraine headache days per month with headache lasting 4 hours per day or longer (prior to initiation of Botox therapy); AND
   - **B)** Patient has tried at least two other prophylactic pharmacologic therapies, each from a different pharmacologic class (e.g., beta-blocker, anticonvulsant, tricyclic antidepressant) **[verification of therapies required]**; AND
   - **C)** Patient meets ONE of the following (i or ii):
     - **i.** Patient has tried at least one triptan therapy; OR
     - **ii.** Patient has a contraindication to triptan(s) according to the prescriber; AND
   - **D)** Botox is being prescribed by or after consultation with a neurologist or headache specialist.

5. **Overactive Bladder with Symptoms of Urge Urinary Incontinence, Urgency, and Frequency.** Approve for 1 year if the patient has tried at least one other pharmacologic therapy.
   Note: Examples of other pharmacologic therapies include a beta-3 adrenergic agonist or an anticholinergic medication. For treatment of urinary incontinence associated with a neurological condition (e.g., spinal cord injury, multiple sclerosis, spina bifida), see FDA-Approved Indications criterion #8 (below).

6. **Spasticity, Lower Limb**. Approve for 1 year.
   Note: For other forms of spasticity that do not fit this condition of approval, see Other Uses with Supportive Evidence, Spasticity.

7. **Spasticity, Upper Limb.** Approve for 1 year.
   Note: For other forms of spasticity that do not fit this condition of approval, see Other Uses with Supportive Evidence, Spasticity.

8. **Urinary Incontinence Associated with a Neurological Condition (e.g., spinal cord injury, multiple sclerosis, spina bifida).** Approve for 1 year if the patient has tried at least one other pharmacologic therapy.
   Note: Examples of other pharmacologic therapies include a beta-3 adrenergic agonist or an anticholinergic medication. For treatment of overactive bladder with symptoms of urge urinary incontinence, urgency, and frequency, see FDA-Approved Indications criterion #5 (above).

Other Uses with Supportive Evidence

9. **Achalasia**. Approve for 1 year.

10. **Anal Fissure (anal sphincter).** Approve for 1 year.

11. **Chronic Facial Pain/Pain Associated with Temporomandibular Dysfunction.** Approve for 1 year.

12. **Chronic Low Back Pain.** Approve for 1 year in patients who meet the following conditions (A and B):
    A) Patient has tried at least two other pharmacologic therapies (e.g., nonsteroidal anti-inflammatory drugs [NSAIDs], antispasmodics, muscle relaxants, opioids, antidepressants); AND
    B) Botox is being used as part of a multimodal therapeutic pain management program.[3]

13. **Dystonia, Other Than Cervical (e.g., focal dystonias, tardive dystonia, anismus, laryngeal dystonia/spasmodic dysphonia).** Approve for 1 year.
    Note: For cervical dystonia, see FDA-Approved Indications criterion #2 (above).

14. **Essential Tremor.** Approve for 1 year after a trial with at least one other pharmacologic therapy (e.g., primidone, propranolol, benzodiazepines, gabapentin, topiramate).

15. **Frey's Syndrome (gustatory sweating).** Approve for 1 year.

16. **Hyperhidrosis, Palmar/Plantar and Facial.** Approve for 1 year if the patient has tried at least one topical agent (e.g., aluminum chloride).

17. **Myofascial Pain.** Approve for 1 year.

18. **Ophthalmic Disorders, Other Than Blepharospasm or Strabismus (e.g., esotropia, exotropia, nystagmus, facial nerve paresis).** Approve for 1 year.
    Note: For blepharospasm associated with dystonia or strabismus, see FDA-Approved Indications criterion #1 (above).

19. **Plantar Fasciitis.** Approve for 1 year after a trial of two other treatment modalities (e.g., padding and strapping of the foot, therapeutic orthotic insoles, oral anti-inflammatory drugs, corticosteroid injections, stretching).

20. **Sialorrhea, Chronic.** Approve for 1 year.

21. **Spasticity, Other Than Lower and Upper Limb (i.e., spasticity or hypertonia due to cerebral palsy, stroke, brain injury, spinal cord injury, multiple sclerosis, hemifacial spasm).** Approve for 1 year.
    Note: For lower and upper limb spasticity, see FDA-Approved Indications criteria #6 and #7 (above).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Botox is not recommended in the following situations:

1. **Cosmetic Uses** (e.g., facial rhytides, frown lines, glabellar wrinkling, horizontal neck rhytides, mid and lower face and neck rejuvenation, platsymal bands, rejuvenation of the periorbital region). Cosmetic use is not recommended for coverage as this indication is excluded from coverage in a typical medical benefit.

2. **Fibromyalgia.** More data are needed to define the place in therapy of Botox in the treatment of fibromyalgia. A small pilot study involving 16 patients concluded botulinum toxin A injections into fibromyalgia trigger points offered more relief (up to 16 weeks minimum) compared with local saline or anesthetic injections; it was concluded Botox is effective in the treatment of fibromyalgia.[34] Other small studies have shown effectiveness of Botox in pain relief post injection.[2] Botox is not mentioned in guidelines for the treatment of fibromyalgia.

3. **Gastroparesis.** The ACG issued clinical guidelines on the management of gastroparesis (2013).[35] ACG does not recommend the use of botulinum toxin injected into the pylorus as a treatment for gastroparesis. This is based on two double-blind, placebo-controlled studies which did show some improvement in gastric emptying, but no improvement in symptoms compared with placebo.

4. **Vaginismus.** More data are needed to define the place in therapy of Botox in the treatment of vaginismus. The use of Botox for the treatment of vaginismus has been evaluated in a few small studies with successful outcomes.[36]

5. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	**Hyperhidrosis, Primary Axillary:** Qbrexza was added as an example of a medication that satisfies the requirement for trial of a topical product. **Ophthalmic Disorders, Other Than Blepharospasm or Strabismus:** "Other than blepharospasm or strabismus" added for clarification. Clarification noted to refer to FDA-Approved Indication #1 for Blepharospasm Associated with Dystonia or Strabismus. **Spasticity, Other Than Lower and Upper Limb:** "Other than lower or upper limb" added for clarification.	05/08/2019
Annual Revision	**FDA-Approved Uses:** • "Cervical Dystonia" updated to "Cervical Dystonia (spasmodic torticollis)". • Under criteria for "Migraine Headache Prophylaxis in Patients with Chronic Migraine", "prescribing physician" was updated to "prescriber". **Other Uses with Supportive Evidence:** • "Benign Prostatic Hyperplasia" removed from policy. • "Salivary Hypersecretion" updated to "Sialorrhea, Chronic." • "Speech/Voice Disorder (e.g., dysphonias)" renamed to laryngeal dystonia/spasmodic torticollis. This approval condition was rolled up into "Dystonia, other than cervical" and laryngeal dystonia/spasmodic dysphonia was added to the list of examples. • "Tinnitus" removed from policy.	06/03/2020
Selected Revision	**Overactive Bladder with Symptoms of Urge Urinary Incontinence, Urgency, and Frequency:** Examples of pharmacologic therapies were updated to "a beta-3 adrenergic agonist or an anticholinergic medication" and were moved from examples to a note. Specific product names were removed from the examples. **Urinary Incontinence Associated with a Neurological Condition (e.g., spinal cord injury, multiple sclerosis, spina bifida):** Spina bifida was added to the list of examples of neurological conditions. Examples of pharmacologic therapies were updated to "a beta-3 adrenergic agonist or an anticholinergic medication" and were moved from examples to a note. Specific product names were removed from the examples.	02/24/2021

PRIOR AUTHORIZATION POLICY

POLICY: Botulinum Toxins – Dysport® (abobotulinumtoxinA for injection – Ipsen)

DATE REVIEWED: 06/03/2020

OVERVIEW

Dysport® (abobotulinumtoxinA), is indicated for the following:

- Treatment of cervical dystonia in adults;
- Treatment of upper and lower limb spasticity in adults;
- Treatment of upper limb spasticity in pediatric patients ≥ 2 years of age, excluding spasticity caused by cerebral palsy; and
- Treatment of lower limb spasticity in pediatric patients ≥ 2 years of age.[1]

Toxin distribution varies between the commercially available botulinum toxin A products, Botox® (onabotulinumtoxinA), Xeomin® (incobotulinumtoxinA), and Dysport.[1-4] It has been postulated that differences in albumin concentration control diffusion of toxin from the injection site (Botox contains 500 mcg of albumin, while Dysport contains 125 mcg of albumin and Xeomin contains 1 mg of albumin). In addition, the labels for the botulinum toxin type A products (Botox, Dysport, and Xeomin) state that there

is a lack of interchangeability between the products for various reasons, including differences in the units of biological activity.[1,2,4] Studies have attempted to establish a conversion ratio between botulinum toxin products, with variable results. In general, conversion ratios of 1:1 for Botox to Xeomin, 1:3 for Botox to Dysport, and 1:50 to 1:100 for Botox to Myobloc have been suggested.[5,6]

Other Uses with Supportive Evidence

Botulinum toxins, including Dysport, have been studied in a variety of indications outside of FDA-approved uses. Literature is available to support use of Dysport in the following conditions:

- **Anal Fissure (anal sphincter):** There is an extensive amount of data from open-label studies, randomized, placebo-controlled trials, and randomized, comparative trials supporting the efficacy of botulinum toxin A in the treatment of anal fissures.[7-9] Injection of botulinum toxin allows healing in approximately 60% to 80% of anal fissures.[10] There is no consensus on the dose, site of injection, or number of injections. Botulinum toxin A has been shown to be more effective than topical nitroglycerin but less effective than surgery in inducing and maintaining fissure healing.[11] The ACG clinical guideline for the management of benign anorectal disorders (2014) recommends the use of botulinum toxin therapy or surgical internal anal sphincterotomy in patients who do not respond to conservative or topical pharmacologic agents, such as a calcium channel blockers or nitrates.[9]
- **Blepharospasm:** Dysport has demonstrated efficacy in clinical trials in patients with blepharospasm.[12,13] AAN guidelines (2016) support the use of Dysport for blepharospasm with a Level C recommendation ("possibly effective").[14]
- **Frey's Syndrome (gustatory sweating):** Botulinum toxin A has been successfully used to treat gustatory sweating. Dysport demonstrated efficacy in two small trials in a total of 53 patients with gustatory sweating.[15] American Academy of Neurology (AAN) guidelines state that botulinum toxin is possibly effective and may be considered for this use (Level C).[16]
- **Hyperhidrosis, Primary Axillary:** Topical antiperspirants (e.g., topical aluminum chloride) or Qbrexza are the recommended first-line therapy for the treatment of primary axillary hyperhidrosis.[17-20] The efficacy of Dysport for axillary hyperhidrosis was demonstrated in one randomized, double-blind, multicenter study in patients (n = 145) unresponsive to topical therapy with aluminum chloride (10% or 20%).[21] A significant ($P < 0.001$) decrease in sweat production vs. placebo occurred 2 weeks post-injection and was maintained 24 weeks post-injection.
- **Sialorrhea, Chronic:** Botulinum toxin A has been studied in the treatment of sialorrhea associated with Parkinson's Disease, parkinsonian syndromes, cerebral palsy, head and neck carcinoma, neurodegenerative disease, stroke, and amytrophic lateral sclerosis (ALS).[22-24] Data with Dysport come from two small controlled trials.[22,23] AAN guidelines state that botulinum toxin is probably safe and effective and should be considered (Level B).[16]
- **Spasticity, Other Than Lower and Upper Limb (i.e., spasticity or hypertonia due to cerebral palsy, stroke, brain injury, spinal cord injury, multiple sclerosis, hemifacial spasm):** Oral medications have a long history in spasticity treatment (e.g., baclofen, benzodiazepines, tizanidine, dantrolene, phenytoin, or gabapentin) yet they have dose-limiting side effects and limited diffusion across the blood brain barrier.[25] Several randomized, controlled trials have evaluated the efficacy of Dysport in spasticity of various etiologies in both upper and lower limbs.[11,25-27] Other randomized, controlled trials evaluated botulinum toxin A for the management of upper limb spasticity in children with cerebral palsy and showed significant improvement in spasticity/tone, range of motion, and functional gains after botulinum toxin A injections.[28] Treatment with botulinum toxin A in hemifacial spasm appears to remain effective over long-term use of several years (4 to 10 years); most cases do not require a dosage increase.[29] In an observational study, patients (n = 133) with hemifacial spasm and reinnervation synkinesias were exclusively treated with either Dysport or Botox for 6 years; Botox and Dysport were similarly effective and the therapeutic effect was stable throughout the observation period.[30]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Dysport. Use should be limited to the treatment of medical conditions. Prescription benefit coverage of this product is not recommended for cosmetic conditions. All approvals are provided for 1 year.

Automation: None

RECOMMENDED AUTHORIZATION CRITERIA

FDA-Approved Indications

10. **Cervical Dystonia (spasmodic torticollis).** Approve for 1 year.
    (Note: Cervical dystonia is also known as spasmodic or cervical torticollis.)

11. **Spasticity, Lower Limb**. Approve for 1 year.
    (Note: For other forms of spasticity that do not fit this condition of approval, see Other Uses with Supportive Evidence, Spasticity.)

12. **Spasticity, Upper Limb.** Approve for 1 year.
    (Note: For other forms of spasticity that do not fit this condition for coverage, see Other Uses with Supportive Evidence, Spasticity.)

Other Uses with Supportive Evidence

13. **Anal Fissure (anal sphincter).** Approve for 1 year.

14. **Blepharospasm.** Approve for 1 year.

15. **Frey's Syndrome (gustatory sweating).** Approve for 1 year.

16. **Hyperhidrosis, Primary Axillary.** Approve for 1 year if the patient has tried at least one topical agent (e.g., topical aluminum chloride, Qbrexza™ [glycopyrronium cloth 2.4% for topical use]).

17. **Sialorrhea, Chronic.** Approve for 1 year.

18. **Spasticity, Other Than Lower and Upper Limb (i.e., spasticity or hypertonia due to cerebral palsy, stroke, brain injury, spinal cord injury, multiple sclerosis, hemifacial spasm).** Approve for 1 year.
    (Note: For lower limb spasticity and upper limb spasticity, see FDA-Approved Indication criteria #2 and #3 [above].)

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Dysport has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

6. **Cosmetic Uses** (e.g., facial rhytides, frown lines, glabellar wrinkling, horizontal neck rhytides, mid and lower face and neck rejuvenation, platsymal bands, rejuvenation of the periorbital region). Cosmetic use is not recommended for coverage as this indication is excluded from coverage in a typical pharmacy benefit.

7. **Fibromyalgia.** Limited data are available with Botox. No data are available with Dysport at this time.

8. **Ophthalmic Disorders, Other Than Blepharospasm (e.g., esotropia, exotropia, nystagmus, facial nerve paresis).** More data are needed to define the place of therapy of Dysport in the treatment of ophthalmic disorders. Botulinum toxin A has been successful in improving or treating many ophthalmic disorders. Retrospective reviews conclude that botulinum toxin A may have a role in the treatment of exotropia.[31,32] Dysport improved visual acuity in patients with acquired symptomatic nystagmus from multiple sclerosis or brain-stem hemorrhage in one case series (n = 12).[33] Data from an uncontrolled study have shown Dysport to be beneficial in the treatment of fourth nerve palsy.[34]

9. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Date Reviewed
Annual review	No change to criteria.	03/08/2017
Annual revision	Removal of Allergic rhinitis, Bladder/voiding/urethral dysfunction, Crocodile tears syndrome, Essential tremor, Gait freezing in Parkinson's disease, and Vaginismus from Conditions Not Recommended for Approval.	04/11/2018
Annual revision	**Hyperhidrosis, Primary Axillary:** Qbrexza (glycopyrronium cloth) added to list of medications that satisfy requirement for trial of a topical agent. **Spasticity, Other Than Lower and Upper Limb:** "Other than lower and upper limb" added to clarify this covers uses other than the FDA-approved indications. **Ophthalmic Disorders, Other Than Blepharospasm (e.g., esotropia, exotropia, nystagmus, facial nerve paresis):** The phrase "other than blepharospasm" was added for clarification, and "i.e." was changed to "e.g.".	05/08/2019
Annual revision	**FDA-Approved Indications:** • "Cervical Dystonia (torticollis)" updated to "Cervical Dystonia (spasmodic torticollis)". **Other Uses with Supportive Evidence:** • "Salivary Hypersecretion" updated to "Sialorrhea, Chronic."	06/03/2020

PRIOR AUTHORIZATION POLICY

POLICY: Botulinum Toxins – Myobloc® (rimabotulinumtoxinB injection – Solstice Neurosciences)

DATE REVIEWED: 06/03/2020

OVERVIEW

Myobloc® (rimabotulinumtoxinB) is indicated for the treatment of patients with cervical dystonia to reduce the severity of abnormal head position and neck pain associated with cervical dystonia.[1] It is also indicated for the treatment of chronic sialorrhea. There are published studies and case reports supporting the use of botulinum toxin type B for other medical conditions.

Like the botulinum toxin type A products (Botox® and Botox® Cosmetic [onabotulinumtoxinA], Dysport® [abobotulinumtoxinA]), and Xeomin® [incobotulinumtoxinA]), Myobloc has also been used to treat cosmetic conditions such as glabellar rhytides, crow's feet, and platysmal bands, and it has been used in brow lifts.

Albeit rare, repeated injections of botulinum toxin type A products can lead to the formation of neutralizing antibodies which can result in clinical resistance. It is important to note that the presence of botulinum toxin type A antibodies are not equivalent to clinical nonresponse. Myobloc is antigenically distinct from botulinum toxin type A and, therefore, in some cases may be used as an alternative to botulinum toxin type A in type A-resistant patients.[2] Studies have attempted to establish a conversion ratio between botulinum toxin products, with variable results. In general, conversion ratios of 1:1 for Botox to Xeomin, 1:3 for Botox to Dysport, and 1:50 to 1:100 for Botox to Myobloc have been suggested.[3,4]

Other Uses with Supportive Evidence

Botulinum toxins, including Myobloc, have been studied in a variety of indications outside of FDA-approved uses. Literature is available to support use of Myobloc in the following conditions:

- **Bladder Dysfunction:** Botulinum toxin type B was shown to be effective in improving symptoms of overactive bladder in one small randomized, double-blind, placebo-controlled study (formulation not specified) in patients unresponsive to oral antimuscarinic agents.[5] Oral pharmacologic therapy with antimuscarinic agents is the mainstay of drug therapy in the treatment of overactive bladder.[6,7,]
- **Hyperhidrosis, Palmar or Primary Axillary:** Myobloc was shown to be effective in treating palmar hyperhidrosis in one small, randomized, double-blind, placebo-controlled study and a second prospective, open, single-blind, multicenter study.[8,9,] Botulinum toxin type B was shown to be effective in treating axillary hyperhidrosis in one randomized, double-blind, placebo-controlled trial (using Myobloc) and one small, open-label study (using Neurobloc).[10,11,] There was no significant difference between Botox and Myobloc/Neurobloc in duration of effect in one small comparative study in patients with axillary hyperhidrosis.[12] In a small (n = 10), single-blind, comparative study, botulinum toxin type B (Neurobloc) was significantly more effective than Botox in decreasing sweat weight and area.[13] Topical antiperspirants (e.g., topical aluminum chloride) are recommended first-line therapies for the treatment of primary hyperhidrosis.[14-16,] In the setting of primary axillary hyperhidrosis, Qbrexza, a topical anticholinergic, may also be used first-line.[17] The AAN notes that botulinum toxin therapy is established safe and effective in axillary hyperhidrosis (Level A).[18] AAN guidelines state that botulinum toxins are probably safe and effective and should be considered for palmar hyperhidrosis (Level B).
- **Myofascial Pain:** Myobloc was effective in reducing myofascial pain associated with piriformis syndrome in a small open-label study; 95% of patients reported fair to excellent improvement in pain.[19]
- **Spasticity (i.e., spasticity or hypertonia due to cerebral palsy, stroke, brain injury, spinal cord injury, multiple sclerosis, hemifacial spasm):** Botulinum toxin type B was shown to be effective in reducing spasticity in one open-label study (formulation not specified) in children with spastic or dystonic movement disorders[20] and in a randomized, double-blind, placebo-controlled study (n = 24) in hemiparetic patients with disabling elbow flexor overactivity after stroke or traumatic brain injury.[21] In one small, randomized, double-blind, placebo-controlled study in patients with upper-limb post-stroke spasticity (n = 15), Myobloc reduced spasticity at 2 weeks but was not statistically

significant at other follow-up visits.[22] Botulinum toxin type B was shown to be effective in treating hemifacial spasm in one small open-label study (formulation not specified).[23] Per American Academy of Neurology (AAN) guidelines, botulinum toxin is possibly effective and may be considered for hemifacial spasm (Level C).

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Myobloc. Use should be limited to the treatment of medical conditions. Prescription benefit coverage of this product is not recommended for cosmetic conditions. All approvals are provided for 1 year.

Automation: None

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Myobloc is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Cervical Dystonia (spasmodic torticollis).** Approve for 1 year.

2. **Sialorrhea, Chronic.** Approve for 1 year.

Other Uses with Supportive Evidence

3. **Bladder Dysfunction.** Approve for 1 year in patients who meet the following conditions (A and B):
   - **A)** Patient has tried at least one other pharmacologic therapy (e.g., oral antimuscarinic agents [for example: oxybutynin, tolterodine tartrate, trospium chloride, Enablex, Toviaz, Vesicare]), AND
   - **B)** Myobloc is being prescribed by or after consultation with a urologist.

4. **Hyperhidrosis, Palmar or Primary Axillary.** Approve for 1 year in patients who meet the following conditions (A and B):
   - **A)** Patient has tried at least one topical agent (e.g., topical aluminum chloride, Qbrexza™ [glycopyrronium cloth 2.4% for topical use]); AND
   - **B)** Patient has tried Botox.

5. **Myofascial Pain.** Approve for 1 year.

6. **Spasticity (i.e., spasticity or hypertonia due to cerebral palsy, stroke, brain injury, spinal cord injury, multiple sclerosis, hemifacial spasm).** Approve for 1 year.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Myobloc has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

1. **Cosmetic Uses (e.g., facial and/or glabellar rhytides [wrinkles, lines], crow's feet, brow lifts, platysmal bands).** Cosmetic use is not recommended for coverage as this indication is excluded from coverage in a typical pharmacy benefit.

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Date Reviewed

Selected revision	Migraine prophylaxis: Updated criteria to include trial of triptans or contraindication to triptans.	08/01/2018
Selected revision	Migraine prophylaxis: Change to require verification of specific therapies that have been tried for migraine prophylaxis.	09/19/2018
Annual revision	**Hyperhidrosis, Palmar or Primary Axillary:** Qbrexza was added as an example of a medication that satisfies the requirement for trial of a topical product.	05/08/2019
Selected revision	**Sialorrhea (Salivary Hypersecretion), Chronic:** Moved to FDA-approved indications. "Chronic" added for clarification and to align with product labeling.	09/04/2019
Annual revision	**FDA-Approved Indications:** • "Sialorrhea (Salivary Hypersecretion), Chronic" updated to "Sialorrhea, Chronic." **Other Uses with Supportive Evidence:** • "Anal Fissures" removed from policy. • "Blepharospasm" removed from policy. • "Hemifacial spasm" rolled into approval condition of "Spasticity". • "Migraine headache prophylaxis in patients with chronic migraine" removed from policy. • "Speech/Voice Disorder" removed from policy.	06/03/2020

PRIOR AUTHORIZATION POLICY

POLICY: Botulinum Toxins – Xeomin® (incobotulinumtoxinA for injection – Merz)

DATE REVIEWED: 06/03/2020

OVERVIEW

Xeomin® (incobotulinumtoxinA) is indicated in adult patients for the following:

- blepharospasm;
- cervical dystonia;
- chronic sialorrhea; AND
- upper limb spasticity.[1]

Xeomin is also indicated for the temporary improvement in the appearance of moderate to severe glabellar lines associated with corrugators and/or procerus muscle activity in adult patients.

The labels for the botulinum toxin type A products (Botox® [onabotulinumtoxinA], Dysport® [abobotulinumtoxinA], and Xeomin) state that there is a lack of interchangeability between the products for various reasons, including differences in the units of biological activity.[1-3] However, studies have demonstrated that identical units of Xeomin and Botox were equally effective.[4-7] Based on published literature, it has been established that Xeomin and Botox have identical therapeutic effects and adverse event (AE) profiles with a 1:1 conversion ratio.[7]

Other Uses with Supportive Evidence

Botulinum toxins, including Xeomin, have been studied in a variety of indications outside of FDA-approved uses. Literature is available to support use of Xeomin in the following conditions:

- **Hyperhidrosis, Primary Axillary, Palmar/Plantar, and Facial:** Overall, topical antiperspirants (e.g., aluminum chloride) are the recommended first-line therapy for the treatment of primary axillary hyperhidrosis and focal hyperhidrosis.[8-11] In the setting of primary axillary hyperhidrosis, Qbrexza, a topical anticholinergic, may also be used first-line.[12] The efficacy of Xeomin in the treatment of palmar/plantar hyperhidrosis and cranial hyperhidrosis was demonstrated in patients (n = 20) previously treated with Botox.[13] In a double-blind clinical trial, patients (n = 25) with moderate or severe palmar hyperhidrosis received in the same session intradermal injections of Botox on one hand and Xeomin on the other; the two products appeared to be comparable.[14] The

efficacy of Xeomin for axillary hyperhidrosis was demonstrated in a prospective, double-blind, head-to-head intra-individual comparison trial vs. Botox.[15] A total of 46 patients received 50 units of botulinum toxin type A treatment (Xeomin in one axilla, and Botox in the other axilla). Efficacy and tolerability were similar between Botox and Xeomin. In addition, the efficacy of Xeomin in the treatment of axillary hyperhidrosis was demonstrated in patients (n = 41) previously treated with Botox.[13] AAN guidelines state that botulinum toxins are probably safe and effective and should be considered for palmar hyperhidrosis (plantar and facial hyperhidrosis are not addressed in the AAN guideline).[16]

- **Spasticity, Other Than Upper Limb (i.e., spasticity or hypertonia due to cerebral palsy, stroke, brain injury, spinal cord injury, multiple sclerosis, hemifacial spasm):** Oral medications have a long history in spasticity treatment (e.g., baclofen, benzodiazepines, phenytoin, or gabapentin) yet they have dose-limiting side effects and limited diffusion across the blood brain barrier.[17] In a prospective, randomized study in patients (n = 192) with upper limb spasticity due to stroke, brain injury, multiple sclerosis, or cerebral palsy, the majority of Xeomin-treated patients had improvement in functional disability and in muscle tone.[18] In a Phase III randomized study in patients (n = 148) with post-stroke upper limb spasticity, Xeomin was significantly more effective than placebo at Week 4 and at Week 12.[19] In addition, the efficacy of Xeomin in the treatment of hemispasticity, arm spasticity, generalized spasticity, paraspasticity, leg spasticity, and hemifacial spasm was demonstrated in patients (n = 95) previously treated with Botox for at least 1 year under stable conditions and crossed over in a blinded fashion to Xeomin for 3 years.[13] Per the AAN, botulinum toxin is established effective in upper and lower limb spasticity and in cerebral palsy (Level A), and it may be considered in hemifacial spasm (Level C).[20,21]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Xeomin. Use should be limited to the treatment of medical conditions. Prescription benefit coverage of this product is not recommended for cosmetic conditions. All approvals are provided for 1 year.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

FDA-Approved Indications

19. **Blepharospasm**. Approve for 1 year.

20. **Cervical Dystonia (spasmodic torticollis).** Approve for 1 year.
(Note: Cervical dystonia is also known as spasmodic or cervical torticollis.)

21. **Sialorrhea, Chronic.** Approve for 1 year.

22. **Spasticity, Upper Limb.** Approve for 1 year.
(Note: For other forms of spasticity that do not fit this condition of approval, see Other Uses with Supportive Evidence, Spasticity.)

Other Uses with Supportive Evidence

23. **Hyperhidrosis – Primary Axillary, Palmar/Plantar, and Facial.** Approve for 1 year if the patient has tried at least one topical agent (e.g., aluminum chloride, Qbrexza™ [glycopyrronium cloth 2.4% for topical use]).

24. **Spasticity, Other Than Upper Limb (i.e., spasticity or hypertonia due to cerebral palsy, stroke, brain injury, spinal cord injury, multiple sclerosis, hemifacial spasm).** Approve for 1 year. (Note: For upper limb spasticity, see FDA-Approved Indication criterion #4 [above].)

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Xeomin has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

10. **Cosmetic Uses** (e.g., facial rhytides, frown lines, glabellar wrinkling, horizontal neck rhytides, mid and lower face and neck rejuvenation, platsymal bands, rejuvenation of the periorbital region). Cosmetic use is not recommended for coverage as this indication is excluded from coverage in a typical pharmacy benefit.

11. **Fibromyalgia.** Limited data are available with Botox. No data are available with Xeomin at this time.

12. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Date Reviewed
Annual revision	Combined Primary Axillary Hyperhidrosis, Palmar/Plantar Hyperhidrosis and Facial Hyperhidrosis under one Other Use with Supportive Evidence; previously they were listed separately. Removal of Allergic rhinitis, Crocodile tears syndrome, Dysphagia, Gait freezing, Interstitial cystitis, Trigeminal neuralgia, and Vaginismus from Conditions Not Recommended for Approval.	04/11/2018
Selected revision	Moved criterion for Chronic Sialorrhea (Salivary Hypersecretion) to FDA-Approved Indications from Other Uses with Supportive Evidence.	7/18/2018
Annual revision	**Hyperhidrosis – Primary Axillary, Palmar/Plantar, and Facial:** Added Qbrexza to list of medications that satisfy requirement for trial of a topical agent. **Spasticity, Other Than Upper Limb:** "Other than upper limb" added to clarify this covers uses other than the FDA-approved indications.	05/08/2019
Selected revision	**Blepharospasm:** Removed requirement for previous trial of Botox.	05/22/2019
Annual revision	**FDA-Approved Indications:** • "Cervical Dystonia" updated to "Cervical Dystonia (spasmodic torticollis)". • "Sialorrhea (Salivary Hypersecretion), Chronic" updated to "Sialorrhea, Chronic."	06/03/2020

PRIOR AUTHORIZATION POLICY

POLICY: Calcitonin Gene-Related Peptide Inhibitors – Aimovig® (erenumab injection for subcutaneous use – Amgen)

DATE REVIEWED: 04/15/2020

OVERVIEW

Aimovig, a calcitonin gene-related peptide (CGRP) receptor antagonist, is indicated for the preventive treatment of migraine in adults.[1] Aimovig is a human monoclonal antibody that binds to the CGRP receptor and antagonizes CGRP receptor function. The recommended dosage of Aimovig is 70 mg injected subcutaneously (SC) once monthly. Some patients may benefit from a dosage of 140 mg SC once monthly.

Disease Overview

Migraine is a common, chronic condition marked by paroxysmal, unilateral attacks of moderate-to-severe throbbing headache which is aggravated by routine physical activity (e.g., walking or climbing stairs) and associated with nausea, vomiting, and/or photophobia and phonophobia.[2] Migraine headache episodes typically last 4 to 72 hours if untreated. Migraine affects approximately 15% of US adults.[3] Migraines have been defined as chronic or episodic. Chronic migraine is described by the International Headache Society as headache occurring on ≥ 15 days/month for > 3 months and has the features of migraine headache on ≥ 8 days/month.[2] Episodic migraine is characterized by headaches that occur < 15 days/month.[4] Patients with episodic migraine may transform to chronic migraine over time at a rate of about 2.5% of episodic-migraine patients/year. Potential strategies for preventing migraine transformation include preventing and treating headaches, lifestyle modifications, or effective management of comorbidities (e.g., obesity, obstructive sleep apnea, depression, anxiety). Episodic migraine is more common than chronic migraine; however, chronic migraine is associated with a markedly greater personal and societal burden.

Guidelines

An updated assessment of the **preventive and acute treatment of migraine** by the **American Headache Society** (2018) reaffirms previous migraine guidelines.[5] Patients with migraine should be considered for preventive treatment when attacks significantly interfere with patients' daily routines despite acute treatment; frequent attacks (≥ 4 monthly headache days); contraindication to, failure, overuse, or adverse events with acute treatments; or patient preference. Before developing a preventive treatment plan, the appropriate use (e.g., drug type, route and timing of administration, frequency) of acute treatments should be initiated and coupled with education and lifestyle modifications. All patients with migraine should be offered a trial of acute treatment. Based on the level of evidence for efficacy and the American Academy of Neurology (AAN) scheme for classification of evidence, the following oral treatments have established efficacy and should be offered for migraine prevention: antiepileptic drugs (divalproex sodium, valproate sodium, topiramate [not for women of childbearing potential without a reliable method of birth control]); beta-blockers (metoprolol, propranolol, timolol); and frovatriptan (for short-term preventive treatment of menstrual migraine).[6] The following treatments are probably effective and should be considered for migraine prevention: antidepressants (amitriptyline, venlafaxine); beta-blockers (atenolol, nadolol); and angiotensin receptor blockers (candesartan).

Four injectable preventive therapies for migraine are mentioned in the AHS consensus statement: Botox® (onabotulinumtoxinA injection) and three monoclonal antibodies targeting CGRP (Aimovig, Ajovy® [fremanezumab-vfrm injection], and Emgality® [galcanezumab-gnlm injection]).[5] The update notes that a CGRP inhibitor should only be initiated in patients who are diagnosed with migraine, have ≥ 4 migraine headache days per month, and have intolerance or inadequate response to 6-week trials of at least two traditional oral migraine preventive medications. Additional criteria apply depending on the number and severity of monthly headache days. Clinical judgment may result in an emerging treatment being added to one or more established treatments. If initiating treatment with a CGRP inhibitor in a patient already on a preventive treatment, it is appropriate to add the CGRP inhibitor to the existing regimen and make no other changes until the effectiveness of the CGRP inhibitor is determined since the risk of interactions between traditional oral migraine preventive medications and the CGRP inhibitors is minimal or nonexistent. Making a decision regarding continuation of therapy for a CGRP inhibitor requires a trial of the medication for at least 3 months, and treatment should be continued only if benefits can be documented during that time (e.g., reduction in mean monthly headache days of ≥ 50% relative to the pretreatment baseline). Since migraine may improve or remit over time, it is important to reevaluate therapeutic response and, if possible, taper or discontinue treatment if patients no longer meet the criteria for offering preventive treatment. However, once control is established, the decision to discontinue or taper treatment should be a shared decision between patient and clinician.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Aimovig. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Aimovig is recommended in those who meet the following criteria:

FDA-Approved Indications

9. Migraine Headache Prevention. Approve Aimovig for 1 year if the patient meets the following criteria (A, B, C, and D):

- **2.** Patient is ≥ 18 years of age; AND
- **3.** Patient has ≥ 4 migraine headache days per month (prior to initiating a migraine-preventative medication); AND
- **4.** Patient has tried at least two standard prophylactic pharmacologic therapies, each from a different pharmacologic class (e.g., angiotensin receptor blocker, angiotensin converting enzyme inhibitor, anticonvulsant, β-blocker, calcium channel blocker, tricyclic antidepressant, other antidepressant), and meets ONE of the following criteria (i, ii, or iii):
  - **i.** The patient has had inadequate efficacy to both of those standard prophylactic pharmacologic therapies, according to the prescriber; OR
  - **ii.** The patient has experienced adverse event(s) severe enough to warrant discontinuation of both of those standard prophylactic pharmacologic therapies, according to the prescriber; OR
  - **iii.** The patient has had inadequate efficacy to one standard prophylactic pharmacologic therapy and has experienced adverse event(s) severe enough to warrant discontinuation to another standard prophylactic pharmacologic therapy, according to the prescriber; AND
- **5.** Patient meets ONE of the following (i or ii):
  - **i.** Patient has tried at least one triptan therapy; OR
  - **ii.** Patient has a contraindication to triptan(s) according to the prescriber.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Aimovig has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

1. Acute Treatment of Migraine. Aimovig has not been studied for the acute treatment of migraine.

2. Cluster Headache, Treatment or Prevention. Aimovig has not been studied in patients with cluster headache. The pivotal trials of Aimovig excluded patients with this condition.[7,8]

3. Combination Therapy with Ajovy® (fremanezumab-vfrm injection for subcutaneous use), Emgality® (galcanezumab-gnlm injection for subcutaneous use), or Vyepti™ (eptinezumab-jjmr injection for intravenous use). Aimovig, Ajovy, Emgality, and Vyepti are calcitonin gene-related peptide (CGRP) inhibitors for migraine prevention and have not been studied for use in combination with another agent in the same class.[9-11]

4. **Hemiplegic Migraine, Treatment or Prevention.** Aimovig has not been studied in patients with hemiplegic migraine. The pivotal trials of Aimovig excluded patients with this condition.[7,8]

5. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Date Reviewed
New Policy	--	05/18/2018
Selected revision	The criterion requiring inadequate responses at least two standard prophylactic pharmacologic therapies from two different pharmacologic classes was modified to clarify that the patient had inadequate efficacy or serious adverse events to those preventive therapies.	06/13/2018
Selected revision	Changed the document name to Calcitonin Gene-Related Peptide (CGRP) Inhibitors – Aimovig PA to take into account the different mechanism of action of the new CGRP inhibitor Ajovy. Added a new Condition Not Recommended for Approval for combination therapy with Ajovy or Emgality.	10/03/2018
Annual revision	No change to criteria.	05/29/2019
Annual revision	Throughout the criteria, "prescribing physician" was changed to "prescriber". For the Condition Not Recommended for Approval of combination therapy, Vyepti was added to the list of injectable calcitonin gene-related peptide inhibitors. For the Conditions Not Recommended for Approval of cluster headache and hemiplegic migraine, "treatment or prevention" was added to clarify the intent.	04/15/2020

PRIOR AUTHORIZATION POLICY

POLICY: Calcitonin Gene-Related Peptide Inhibitors – Ajovy® (fremanezumab-vfrm injection for subcutaneous use – Teva)

DATE REVIEWED: 04/15/2020

OVERVIEW

Ajovy, a calcitonin gene-related peptide (CGRP) antagonist, is indicated for the preventive treatment of migraine in adults.[1] Ajovy is a human monoclonal antibody that binds to the CGRP ligand and blocks its binding to the receptor. The recommended dosage of Ajovy is 225 mg injected subcutaneously (SC) once monthly or 675 mg every 3 months (quarterly), which is administered as three consecutive SC injections of 225 mg each. A healthcare professional, patient, and/or caregiver may administer Ajovy.

Disease Overview

Migraine is a common, chronic condition marked by paroxysmal, unilateral attacks of moderate-to-severe throbbing headache which is aggravated by routine physical activity (e.g., walking or climbing stairs) and associated with nausea, vomiting, and/or photophobia and phonophobia.[2] Migraine headache episodes typically last 4 to 72 hours if untreated. Migraine affects approximately 15% of US adults.[3] Migraines have been defined as chronic or episodic. Chronic migraine is described by the International Headache Society as headache occurring on ≥ 15 days/month for > 3 months and has the features of migraine headache on ≥ 8 days/month.[2] Episodic migraine is characterized by headaches that occur < 15 days/month.[4] Patients with episodic migraine may transform to chronic migraine over time at a rate of about 2.5% of episodic-migraine patients/year. Potential strategies for preventing migraine transformation include preventing and treating headaches, lifestyle modifications, or effective management of comorbidities (e.g., obesity, obstructive sleep apnea, depression, anxiety). Episodic migraine is more common than chronic migraine; however, chronic migraine is associated with a markedly greater personal and societal burden.

Guidelines

An updated assessment of the **preventive and acute treatment of migraine** by the **American Headache Society** (2018) reaffirms previous migraine guidelines.[5] Patients with migraine should be considered for preventive treatment when attacks significantly interfere with patients' daily routines despite acute treatment; frequent attacks (≥ 4 monthly headache days); contraindication to, failure, overuse, or adverse events with acute treatments; or patient preference. Before developing a preventive treatment plan, the appropriate use (e.g., drug type, route and timing of administration, frequency) of acute treatments should be initiated and coupled with education and lifestyle modifications. All patients with migraine should be offered a trial of acute treatment. Based on the level of evidence for efficacy and the American Academy of Neurology (AAN) scheme for classification of evidence, the following oral treatments have established efficacy and should be offered for migraine prevention: antiepileptic drugs (divalproex sodium, valproate sodium, topiramate [not for women of childbearing potential without a reliable method of birth control]); beta-blockers (metoprolol, propranolol, timolol); and frovatriptan (for short-term preventive treatment of menstrual migraine).[6] The following treatments are probably effective and should be considered for migraine prevention: antidepressants (amitriptyline, venlafaxine); beta-blockers (atenolol, nadolol); and angiotensin receptor blockers (candesartan).

Four injectable preventive therapies for migraine are mentioned in the AHS consensus statement: Botox® (onabotulinumtoxinA injection) and three monoclonal antibodies targeting CGRP (Aimovig, Ajovy® [fremanezumab-vfrm injection], and Emgality® [galcanezumab-gnlm injection]).[5] The update notes that a CGRP inhibitor should only be initiated in patients who are diagnosed with migraine, have ≥ 4 migraine headache days per month, and have intolerance or inadequate response to 6-week trials of at least two traditional oral migraine preventive medications. Additional criteria apply depending on the number and severity of monthly headache days. Clinical judgment may result in an emerging treatment being added to one or more established treatments. If initiating treatment with a CGRP inhibitor in a patient already on a preventive treatment, it is appropriate to add the CGRP inhibitor to the existing regimen and make no other changes until the effectiveness of the CGRP inhibitor is determined since the risk of interactions between

traditional oral migraine preventive medications and the CGRP inhibitors is minimal or nonexistent. Making a decision regarding continuation of therapy for a CGRP inhibitor requires a trial of the medication for at least 3 months, and treatment should be continued only if benefits can be documented during that time (e.g., reduction in mean monthly headache days of ≥ 50% relative to the pretreatment baseline). Since migraine may improve or remit over time, it is important to reevaluate therapeutic response and, if possible, taper or discontinue treatment if patients no longer meet the criteria for offering preventive treatment. However, once control is established, the decision to discontinue or taper treatment should be a shared decision between patient and clinician.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Ajovy. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Ajovy is recommended in those who meet the following criteria:

FDA-Approved Indications

10. Migraine Headache Prevention. Approve Ajovy for 1 year if the patient meets the following criteria (A, B, C, and D):

- **6.** Patient is ≥ 18 years of age; AND
- **7.** Patient has ≥ 4 migraine headache days per month (prior to initiating a migraine-preventative medication); AND
- **8.** Patient has tried at least two standard prophylactic pharmacologic therapies, each from a different pharmacologic class (e.g., angiotensin receptor blocker, angiotensin converting enzyme inhibitor, anticonvulsant, β-blocker, calcium channel blocker, tricyclic antidepressant, other antidepressant), and meets ONE of the following criteria (i, ii, or iii):
  - **i.** The patient has had inadequate efficacy to both of those standard prophylactic pharmacologic therapies, according to the prescriber; OR
  - **ii.** The patient has experienced adverse event(s) severe enough to warrant discontinuation of both of those standard prophylactic pharmacologic therapies, according to the prescriber; OR
  - **iii.** The patient has had inadequate efficacy to one standard prophylactic pharmacologic therapy and has experienced adverse event(s) severe enough to warrant discontinuation to another standard prophylactic pharmacologic therapy, according to the prescriber; AND
- **9.** Patient meets ONE of the following (i or ii):
  - **i.** Patient has tried at least one triptan therapy; OR
  - **ii.** Patient has a contraindication to triptan(s) according to the prescriber.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Ajovy has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

6. Acute Treatment of Migraine. Ajovy has not been studied for the acute treatment of migraine.

7. **Cluster Headache, Treatment or Prevention.** Ajovy has not been found to be effective in in patients with chronic or episodic cluster headache.[7]

8. **Combination Therapy with Aimovig™ (erenumab-aooe injection for subcutaneous use), Emgality™ (galcanezumab-gnlm injection for subcutaneous use), or Vyepti™ (eptinezumab-jjmr injection for intravenous use).** Ajovy, Aimovig, Emgality, and Vyepti are calcitonin gene-related peptide (CGRP) antagonists for migraine prevention and have not been studied for use in combination with another agent in the same class.[8-10]

9. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Calcitonin Gene-Related Peptide Inhibitors – Emgality® (galcanezumab-gnlm injection for subcutaneous use – Lilly)

DATE REVIEWED: 04/15/2020

OVERVIEW

Emgality, a calcitonin gene-related peptide (CGRP) antagonist, is indicated for the preventive treatment of migraine in adults and for the treatment of episodic cluster headache in adults.[1] Emgality is a human monoclonal antibody that binds to the CGRP ligand and blocks its binding to the receptor. The recommended dosage of Emgality for the prevention of migraine is 240 mg (two consecutive subcutaneous [SC] injections of 120 mg each) once as a loading dose, followed by monthly doses of 120 mg injected subcutaneously. For cluster headache, Emgality is dosed as 300 mg SC (administered as three consecutive injections of 100 mg each) at the onset of the cluster period, and then monthly until the end of the cluster period. Emgality is intended for patient self-administration.

Disease Overview

Migraine is a common, chronic condition marked by paroxysmal, unilateral attacks of moderate-to-severe throbbing headache which is aggravated by routine physical activity (e.g., walking or climbing stairs) and associated with nausea, vomiting, and/or photophobia and phonophobia.[2] Migraine headache episodes typically last 4 to 72 hours if untreated. Migraine affects approximately 15% of US adults.[3] Migraines have been defined as chronic or episodic. Chronic migraine is described by the International Headache Society as headache occurring on ≥ 15 days/month for > 3 months and has the features of migraine headache on ≥ 8 days/month.[2] Episodic migraine is characterized by headaches that occur < 15 days/month.[4] Patients with episodic migraine may transform to chronic migraine over time at a rate of about 2.5% of episodic-migraine patients/year. Potential strategies for preventing migraine transformation include preventing and treating headaches, lifestyle modifications, or effective management of comorbidities (e.g., obesity, obstructive sleep apnea, depression, anxiety). Episodic migraine is more common than chronic migraine; however, chronic migraine is associated with a markedly greater personal and societal burden.

Cluster headache is the most common of the group of headache disorders known as the trigeminal autonomic cephalalgias, with a lifetime prevalence exceeding 1 in 1,000.[5] Cluster headaches are associated with attacks of severe, strictly unilateral pain which is orbital, supraorbital, temporal, or in any combination of these sites, lasting 15 to 180 minutes.[2] The headaches occur from once every other day to eight times a day. Cluster headache is considered among the most severe of the primary headache disorders because of extreme pain, associated autonomic symptoms, and high attack frequency.[5] In addition, a large proportion of patients with cluster headache have chronic cluster headache, which features only brief or no remission periods, and may be particularly refractory to medical therapies. Patients with cluster headache are often suboptimally treated, even though treatment of cluster headache in accordance with guidelines is associated with better outcomes.

Guidelines

An updated assessment of the **preventive and acute treatment of migraine** by the **American Headache Society** (2018) reaffirms previous migraine guidelines.[6] Patients with migraine should be considered for preventive treatment when attacks significantly interfere with patients' daily routines despite acute treatment; frequent attacks (≥ 4 monthly headache days); contraindication to, failure, overuse, or adverse events with acute treatments; or patient preference. Before developing a preventive treatment plan, the appropriate use (e.g., drug type, route and timing of administration, frequency) of acute treatments should be initiated and coupled with education and lifestyle modifications. All patients with migraine should be offered a trial of acute treatment. Based on the level of evidence for efficacy and the American Academy of Neurology (AAN) scheme for classification of evidence, the following oral treatments have established efficacy and should be offered for migraine prevention: antiepileptic drugs (divalproex sodium, valproate sodium, topiramate [not for women of childbearing potential without a reliable method of birth control]); beta-blockers (metoprolol, propranolol, timolol); and frovatriptan (for short-term preventive treatment of menstrual migraine).[7] The following treatments are probably effective and should be considered for migraine prevention: antidepressants (amitriptyline, venlafaxine); beta-blockers (atenolol, nadolol); and angiotensin receptor blockers (candesartan).

Four injectable preventive therapies for migraine are mentioned in the AHS consensus statement: Botox® (onabotulinumtoxinA injection) and three monoclonal antibodies targeting CGRP (Aimovig, Ajovy® [fremanezumab-vfrm injection], and Emgality® [galcanezumab-gnlm injection]).[6] The update notes that a CGRP inhibitor should only be initiated in patients who are diagnosed with migraine, have ≥ 4 migraine headache days per month, and have intolerance or inadequate response to 6-week trials of at least two traditional oral migraine preventive medications. Additional criteria apply depending on the number and severity of monthly headache days. Clinical judgment may result in an emerging treatment being added to one or more established treatments. If initiating treatment with a CGRP inhibitor in a patient already on a preventive treatment, it is appropriate to add the CGRP inhibitor to the existing regimen and make no other changes until the effectiveness of the CGRP inhibitor is determined since the risk of interactions between traditional oral migraine preventive medications and the CGRP inhibitors is minimal or nonexistent. Making a decision regarding continuation of therapy for a CGRP inhibitor requires a trial of the medication for at least 3 months, and treatment should be continued only if benefits can be documented during that time (e.g., reduction in mean monthly headache days of ≥ 50% relative to the pretreatment baseline). Since migraine may improve or remit over time, it is important to reevaluate therapeutic response and, if possible, taper or discontinue treatment if patients no longer meet the criteria for offering preventive treatment. However, once control is established, the decision to discontinue or taper treatment should be a shared decision between patient and clinician.

The **American Headache Society** has published evidence-based guidelines on the **treatment of cluster headache** (2016).[5] The guidelines recommend sumatriptan subcutaneous, zolmitriptan nasal spray, and high flow oxygen for acute treatment. For prophylactic therapy, suboccipital steroid injection has been established as effective for the prophylactic therapy of episodic and chronic cluster headache (Level A). Lithium, verapamil, and melatonin are considered possibly effective for the prophylactic therapy of episodic and chronic cluster headache (Level C). Currently, there is insufficient evidence to make a recommendation for frovatriptan and prednisone (Level U).

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Emgality. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Emgality is recommended in those who meet the following criteria:

FDA-Approved Indications

11. Episodic Cluster Headache Treatment. Approve Emgality for 6 months if the patient meets the following criteria (A, B, C, and D):
- **10.** Patient is ≥ 18 years of age; AND
- **11.** Patient has between one headache every other day and eight headaches per day; AND
- **12.** Patient has tried at least one standard prophylactic pharmacologic therapy for cluster headache; AND

  Note: Examples of standard prophylactic pharmacologic therapies for cluster headache include lithium, verapamil, melatonin, frovatriptan, prednisone, suboccipital steroid injection, topiramate, and valproate.
- **13.** Patient has had inadequate efficacy or has experienced adverse event(s) severe enough to warrant discontinuation of the standard prophylactic pharmacologic therapy, according to the prescriber.

12. Migraine Headache Prevention. Approve Emgality for 1 year if the patient meets the following criteria (A, B, C, D, and E):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has ≥ 4 migraine headache days per month (prior to initiating a migraine-preventative medication); AND
- **C)** Patient has tried at least two standard prophylactic pharmacologic therapies, each from a different pharmacologic class; AND

  Note: Examples of standard prophylactic pharmacologic therapies for migraine include angiotensin receptor blocker, angiotensin converting enzyme inhibitor, anticonvulsant, β-blocker, calcium channel blocker, tricyclic antidepressant, other antidepressant.
- **D)** Patient meets ONE of the following criteria (i, ii, or iii):
  - **i.** The patient has had inadequate efficacy to both of those standard prophylactic pharmacologic therapies, according to the prescriber; OR
  - **ii.** The patient has experienced adverse event(s) severe enough to warrant discontinuation of both of those standard prophylactic pharmacologic therapies, according to the prescriber; OR
  - **iii.** The patient has had inadequate efficacy to one standard prophylactic pharmacologic therapy and has experienced adverse event(s) severe enough to warrant discontinuation to another standard prophylactic pharmacologic therapy, according to the prescriber; AND
- **E)** Patient meets ONE of the following (i or ii):
  - **i.** Patient has tried at least one triptan therapy; OR
  - **ii.** Patient has a contraindication to triptan(s) according to the prescriber.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Emgality has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-

coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

10. **Acute Treatment of Migraine.** Emgality has not been studied for the acute treatment of migraine.

11. **Combination Therapy with Aimovig® (erenumab-aooe injection for subcutaneous use), with Ajovy® (fremanezumab-vfrm injection for subcutaneous use), or Vyepti™ (eptinezumab-jjmr injection for intravenous use).** Ajovy, Aimovig, Emgality, and Vyepti are calcitonin gene-related peptide (CGRP) antagonists for migraine prevention and have not been studied for use in combination with another agent in the same class.[8-10]

12. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Selected revision	For the FDA-approved indication of Episodic Cluster Headache Treatment, approval criteria was changed from requiring a trial of at least two standard prophylactic pharmacologic therapies to requiring a trial of at least one standard prophylactic pharmacologic therapy. The prescriber still needs to attest to the patient having had inadequate efficacy or having experienced adverse event(s) severe enough to warrant discontinuation of the standard prophylactic pharmacologic therapy.	10/23/2019
Annual revision	For the Condition Not Recommended for Approval of combination therapy, Vyepti was added to the list of injectable calcitonin gene-related peptide inhibitors.	04/15/2020

PRIOR AUTHORIZATION POLICY

POLICY: Calcitonin Gene-Related Peptide Inhibitors – Vyepti™ (eptinezumab-jjmr injection for intravenous use – Lundbeck)

DATE REVIEWED: 03/25/2020; selected revision 04/15/2020

OVERVIEW

Vyepti, a calcitonin gene-related peptide (CGRP) inhibitor, is indicated for the preventive treatment of migraine in adults.[1] Vyepti is a humanized monoclonal antibody produced in *Pichia pastoris* yeast cells by recombinant DNA technology. Vyepti binds to the CGRP ligand and blocks its binding to the CGRP receptor. The recommended dosage is 100 mg administered by intravenous (IV) infusion over approximately 30 minutes once every 3 months; however, some patients may benefit from a dosage of 300 mg IV once every 3 months. Vyepti must be administered by a healthcare provider.

Disease Overview

Migraine is a common, chronic condition marked by paroxysmal, unilateral attacks of moderate-to-severe throbbing headache which is aggravated by routine physical activity (e.g., walking or climbing stairs) and associated with nausea, vomiting, and/or photophobia and phonophobia.[2] Migraine headache episodes typically last 4 to 72 hours if untreated. Migraine affects approximately 15% of US adults.[3] Migraines have been defined as chronic or episodic. Chronic migraine is described by the International Headache Society as headache occurring on ≥ 15 days/month for > 3 months and has the features of migraine headache on ≥ 8 days/month.[2] Episodic migraine is characterized by headaches that occur < 15 days/month.[4] Patients with episodic migraine may transform to chronic migraine over time at a rate of about 2.5% of episodic-migraine patients/year. Potential strategies for preventing migraine transformation include preventing and treating headaches, lifestyle modifications, or effective management of comorbidities (e.g., obesity, obstructive sleep apnea, depression, anxiety). Episodic migraine is more common than chronic migraine; however, chronic migraine is associated with a markedly greater personal and societal burden.

Guidelines

An updated assessment of the **preventive and acute treatment of migraine** by the **American Headache Society** (2018) reaffirms previous migraine guidelines.[5] Patients with migraine should be considered for preventive treatment when attacks significantly interfere with patients' daily routines despite acute treatment; frequent attacks (≥ 4 monthly headache days); contraindication to, failure, overuse, or adverse events with acute treatments; or patient preference. Before developing a preventive treatment plan, the appropriate use (e.g., drug type, route and timing of administration, frequency) of acute treatments should be initiated and coupled with education and lifestyle modifications. All patients with migraine should be offered a trial of acute treatment. Based on the level of evidence for efficacy and the American Academy of Neurology (AAN) scheme for classification of evidence, the following oral treatments have established efficacy and should be offered for migraine prevention: antiepileptic drugs (divalproex sodium, valproate sodium, topiramate [not for women of childbearing potential without a reliable method of birth control]); beta-blockers (metoprolol, propranolol, timolol); and frovatriptan (for short-term preventive treatment of menstrual migraine).[6] The following treatments are probably effective and should be considered for migraine prevention: antidepressants (amitriptyline, venlafaxine); beta-blockers (atenolol, nadolol); and angiotensin receptor blockers (candesartan).

Four injectable preventive therapies for migraine are mentioned in the AHS consensus statement: Botox® (onabotulinumtoxinA injection) and three monoclonal antibodies targeting CGRP (Aimovig, Ajovy® [fremanezumab-vfrm injection], and Emgality® [galcanezumab-gnlm injection]).[5] The update notes that a CGRP inhibitor should only be initiated in patients who are diagnosed with migraine, have ≥ 4 migraine headache days per month, and have intolerance or inadequate response to 6-week trials of at least two traditional oral migraine preventive medications. Additional criteria apply depending on the number and severity of monthly headache days. Clinical judgment may result in an emerging treatment being added to one or more established treatments. If initiating treatment with a CGRP inhibitor in a patient already on a preventive treatment, it is appropriate to add the CGRP inhibitor to the existing regimen and make no other changes until the effectiveness of the CGRP inhibitor is determined since the risk of interactions between traditional oral migraine preventive medications and the CGRP inhibitors is minimal or nonexistent. Making a decision regarding continuation of therapy for a CGRP inhibitor requires a trial of the medication for at least 3 months, and treatment should be continued only if benefits can be documented during that time (e.g., reduction in mean monthly headache days of ≥ 50% relative to the pretreatment baseline). Since migraine may improve or remit over time, it is important to reevaluate therapeutic response and, if possible, taper or discontinue

treatment if patients no longer meet the criteria for offering preventive treatment. However, once control is established, the decision to discontinue or taper treatment should be a shared decision between patient and clinician.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Vyepti. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Vyepti is recommended in those who meet the following criteria:

FDA-Approved Indications

13. Migraine Headache Prevention. Approve Vyepti for 1 year if the patient meets the following criteria (A, B, C, and D):

14. Patient is ≥ 18 years of age; AND

15. Patient has ≥ 4 migraine headache days per month (prior to initiating a migraine-preventative medication); AND

16. Patient has tried at least two standard prophylactic pharmacologic therapies, each from a different pharmacologic class (e.g., angiotensin receptor blocker, angiotensin converting enzyme inhibitor, anticonvulsant, β-blocker, calcium channel blocker, tricyclic antidepressant, other antidepressant), and meets ONE of the following criteria (i, ii, or iii):

- **i.** The patient has had inadequate efficacy to both of those standard prophylactic pharmacologic therapies, according to the prescriber; OR
- **ii.** The patient has experienced adverse event(s) severe enough to warrant discontinuation of both of those standard prophylactic pharmacologic therapies, according to the prescriber; OR
- **iii.** The patient has had inadequate efficacy to one standard prophylactic pharmacologic therapy and has experienced adverse event(s) severe enough to warrant discontinuation to another standard prophylactic pharmacologic therapy, according to the prescriber; AND

17. Patient meets ONE of the following (i or ii):

- **i.** Patient has tried at least one triptan therapy; OR
- **ii.** Patient has a contraindication to triptan(s) according to the prescriber.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Vyepti has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

2. Acute Treatment of Migraine. Clinical data is currently lacking for the use of Vyepti in the acute treatment of migraine.

3. Cluster Headache, Treatment or Prevention. Vyepti has not been studied in patients with cluster headache. The pivotal trials of Vyepti excluded patients with this condition.[7,8]

4. Combination Therapy with Aimovig® (erenumab-aooe injection for subcutaneous use), Ajovy® (fremanezumab-vfrm injection for subcutaneous use) or Emgality® (galcanezumab-gnlm injection for subcutaneous use). Aimovig, Ajovy, Emgality, and Vyepti are calcitonin gene-related peptide (CGRP) inhibitors for migraine prevention and have not been studied for use in combination with another agent in the same class.[9-11]

5. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REVIEW DATE: 05/20/2020

OVERVIEW

Corlanor, a hyperpolarization-activated cyclic nucleotide-gated channel blocker, is indicated to reduce the risk of hospitalization for worsening heart failure (HF) in adults with stable, symptomatic chronic HF with left ventricular ejection fraction (LVEF) ≤ 35%, who are in sinus rhythm with a resting heart rate ≥ 70 beats per minute (bpm) and either are receiving maximally tolerated doses of beta blockers or have a contraindication to beta blocker use.[1] Corlanor is also indicated for the treatment of stable symptomatic HF due to dilated cardiomyopathy in pediatric patients ≥ 6 months and older, who are in sinus rhythm with an elevated heart rate.

Clinical Efficacy

The efficacy of Corlanor was established in a randomized, event-driven, multinational, double-blind, parallel-group pivotal trial called SHIFT (Systolic Heart failure treatment with the I_f inhibitor ivabradine Trial) that compared Corlanor with placebo, in addition to standard HF therapies, in adults with stable New York Heart Association (NYHA) class II to IV HF, a reduced LVEF, and a resting heart rate of rate 70 bpm (n = 6,558).[1,2] The occurrence of the primary endpoint (a composite of the first occurrence of either hospitalization for HF or worsening HF or cardiovascular [CV] death) was reduced with Corlanor compared with placebo[1,2]

A randomized, multicenter, double-blind, placebo-controlled, Phase II/III, 12-month trial evaluated the effects of Corlanor on heart rate in children who were ≥ 6 months to < 18 years of age, with symptomatic dilated cardiomyopathy (n = 116).[1,17] Patients had a history of class II or IV symptomatic HF (NYHA functional class or Ross classification) and a LVEF ≤ 45% who were receiving stable treatment for chronic HF. Also, patients had to be clinically stable for ≥ 4 weeks and be optimized on medical therapy and have a resting heart rate in the normal range for age. The mean patient age was 5.8 ± 4.9 years.[17] The target heart rate reduction was achieved at the end of the titration period in a higher number of patients who received Corlanor compared with placebo (72% vs. 16%).[1] Of note, dilated cardiomyopathy comprises approximately one-half of all cardiomyopathies in children.[17] The overall incidence of pediatric dilated cardiomyopathy is low; however, it is more common in children < 1 year of age (44 cases per million/year) compared with children ≥ 3 years of age (3.4 cases per million/year).

Guidelines

In 2017 the American College of Cardiology (ACC), American Heart Association (AHA), and the Heart Failure Society of America published a focused update for the management of heart failure.[14] Regarding Corlanor it is stated that the agent can be beneficial to reduce HF hospitalization for patients with symptomatic (NYHA Class II to III) stable chronic HF with reduced ejection fraction (LVEF ≤ 35%) who are receiving guideline-directed evaluation and management, including a beta-blocker at the maximum tolerated dose, and who are in sinus rhythm with a heart rate of 70 beats per minute or greater at rest. Due to the well-proven mortality benefits of beta blocker therapy, it is important to initiate and up-titrate these agents to target doses, as tolerated, prior to evaluating resting heart rate for consideration of Corlanor.

Other Uses with Supportive Evidence

Inappropriate sinus tachycardia is defined as a sinus heart rate > 100 bpm at rest (with a mean 24-hour heart rate > 90 bpm not due to primary causes) and is associated with distressing symptoms such as palpitations, weakness, dizziness and syncope.[11] The condition is believed to be chronic in many cases. The mechanisms causing inappropriate sinus tachycardia are not distinctly known but underlying diseases that can result in this syndrome include increased sinus node automaticity, beta-adrenergic hypersensitivity, and decreased parasympathetic activity. There is a paucity of long-term, prospective, placebo-controlled trials of any agents that show substantial improvement in outcomes, and syndromes may persist despite heart rate control. Very few medications have solid evidence supporting benefits for this condition. Beta-blockers are not usually effective. Other treatments have been suggested (e.g., fludrocortisone, volume expansion, clonidine, and erythropoietin). Some data with Corlanor note improvement in symptoms and increased exercise performance.[11-13,15,19-21] The 2015 Heart Rhythm Society Expert Consensus Statement on the diagnosis and treatment of postural tachycardia syndrome, inappropriate sinus tachycardia, and vasovagal syncope state that Corlanor can be useful for treating patients with inappropriate sinus tachycardia.[11] Additionally, the 2015 American College of Cardiology, American Heart Association Task Force on Clinical Practice Guidelines, and the Heart Rhythm Society also state that Corlanor is reasonable for ongoing management in patients with symptomatic inappropriate sinus tachycardia (class IIa recommendation).[12] Also, the guidelines state that the combination of beta blockers and Corlanor may be considered for the ongoing management of patients with inappropriate sinus tachycardia (class IIb recommendation).

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Corlanor. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Corlanor is recommended in those who meet the following criteria:

FDA-Approved Indications

14. Heart Failure (HF). Approve for 1 year if the patient meets the following criteria (A, B and C):

- **A)** Patient is ≥ 18 years of age; AND
- **B)** The patient has a left ventricular ejection fraction (LVEF) ≤ 35% currently or prior to initiation of Corlanor therapy; AND
- **C)** The patient meets one of the following (i or ii):
  - **iii.** The patient has tried or is currently receiving one beta blocker for heart failure treatment. Note: Examples of beta blockers are metoprolol succinate sustained-release, carvedilol, bisoprolol, and Coreg CR® (carvedilol extended-release capsules); OR
  - **iv.** The patient has a contraindication to use of beta blocker therapy. Note: Examples that are contraindications to use of beta blockers are bronchospastic disease such as chronic obstructive pulmonary disease (COPD) and asthma, severe hypotension or bradycardia.

2. Heart Failure due to Dilated Cardiomyopathy. Approve for 1 year if the patient is < 18 years of age.

Other Uses with Supportive Evidence

3. Inappropriate Sinus Tachycardia. Approve for 1 year.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Corlanor is recommended in those who meet the following criteria:

64. Stable Angina Pectoris, in Patients Without Chronic Heart Failure. Corlanor has been studied as a treatment for stable angina pectoris but further data are needed.[4-8,18] US guidelines addressing stable angina do not include Corlanor.[9-10,15-16]

65. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	No criteria changes.	05/23/2018
Annual Revision	The oral solution was added to with the same approval criteria as those applied to Corlanor tablets. The heading "Cardiology" was put in the name of this policy. **Chronic Heart Failure:** This criteria set was revised to remove the distinctions that differed in criteria for patients who are not receiving Corlanor (initial therapy) and among those who are currently receiving Corlanor. Criteria were revised so that these two clinical scenarios are addressed in one criteria set. The criterion that the patient is in sinus rhythm with a resting heart rate of ≥ 70 beats per minute was removed, which only impacted patients who were to receive therapy initially. To address both clinical	05/08/2019

	scenarios, the phrase "currently or prior to initiation of Corlanor therapy" was added to the criterion that requires patients to have a left ventricular ejection fraction ≤ 35%. Also, due to the new indication in children (addressed below), the descriptor of "adults" was added to the chronic heart failure diagnosis. **Heart failure due to Dilated Cardiomyopathy, Children.** This diagnosis was added to approve for 1 year based on its new FDA-approved indication for use.	
Annual Revision	The following changes were made: **a. Heart Failure (Adults):** The terms of "Chronic" and "Adults" were removed from the listing of the indication. A criterion was added that the patient is ≥ 18 years of age. For the criteria that requires that the patient has tried or is currently receiving one beta blocker for heart failure treatment, the examples of beta blockers removed from the criteria and put in a note. Also, the reasons provided on why use of beta blocker therapy is contraindicated was moved from the criteria to a note. **b. Heart Failure (Children).** The term "Children" was removed from the wording of the indication "Heart Failure due to Dilated Cardiomyopathy, Children." A criterion was added that the patient is < 18 years of age.	05/20/2020

PRIOR AUTHORIZATION POLICY

POLICY: Cardiology – Zontivity Prior Authorization Policy
- Zontivity® (vorapaxar tablets – Aralez Pharmaceuticals)

REVIEW DATE: 10/14/2020

OVERVIEW

Zontivity, a protease-activated receptor-1 antagonist, is indicated for the reduction of thrombotic cardiovascular (CV) events in patients with a history of myocardial infarction (MI) or with peripheral arterial disease (PAD).[1] Zontivity has been shown to reduce the rate of a combined endpoint of CV death, MI, stroke, and urgent coronary revascularization. There is no experience with the use of Zontivity alone as the only administered antiplatelet agent. Studies involving Zontivity involved adding the agent to aspirin and/or clopidogrel. Use Zontivity with aspirin and/or clopidogrel according to indicated uses or the standard of care. The clinical use of Zontivity with other antiplatelet medications is limited. In a subgroup analyses of the pivotal data, patients weighing < 60 kg who received Zontivity did not have a favorable outcome regarding the primary composite endpoint of CV death, MI, stroke, or urgent coronary revascularization.[1,2]

Guidelines

In 2016 and American Heart Association and the American College of Cardiology published a guidelines on the management of patients with lower extremity peripheral artery disease (PAD).[3] The guidelines state that the overall clinical benefit of Zontivity added to existing antiplatelet therapy in patients with symptomatic PAD is uncertain.

Safety

Zontivity has a Boxed Warning regarding the risk of bleeding. Zontivity is contraindicated in patients with a history of stroke, transient ischemic attack (TIA), or intracranial hemorrhage (ICH). Antiplatelet medications, including Zontivity, increased the risk of bleeding, including ICH and fatal bleeding.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Zontivity. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zontivity is recommended in patients who meet the following criteria:

FDA-Approved Indication

15. Patient with a Previous Myocardial Infarction (MI) or Peripheral Arterial Disease (PAD). Approve for 3 years if the patient meets the following criteria (A, B and C):

O) Patient is receiving Zontivity in combination with aspirin and/or clopidogrel; AND

P) Patient has been determined to be at high risk for future thrombotic events as determined by the prescriber; AND

Note: Examples of high risk include that the patient has experienced multiple myocardial infarctions, has undergone many urgent coronary revascularization procedures, has had placement of coronary artery stents, or the patient has other concomitant diseases that increase cardiovascular risk such as diabetes.

Q) The patient weighs ≥ 60 kg.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Zontivity is not recommended in the following situations:

66. Acute Coronary Syndrome (ACS) that Occurred Recently (within < 14 days). In the TRACER (Thrombin Receptor Antagonist for Clinical Event Reduction in acute coronary syndrome) study, adding Zontivity to standard therapy in those who experienced an ACS increased the risk of major bleeding and did not result in clinical benefits.

67. Patient with a Prior History of Stroke, Transient Ischemic Attack (TIA), or Intracranial Hemorrhage (ICH). Zontivity is contraindicated for use in patients with a history of stroke, TIA or ICH due to an increased risk of ICH in this population.

68. Concurrent Use of Effient® (prasugrel tablets) or Brilinta® (ticagrelor tablets). There is limited clinical experience involving use of Zontivity with antiplatelet agents (e.g., Effient, Brilinta) other than aspirin and/or clopidogrel.

69. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Annual Revision	No criteria changes.	10/10/2018
Annual Revision	No criteria changes.	10/09/2019
Annual Revision.	Added the header "Cardiology" to the *Zontivity Prior Authorization Policy*. In the criteria, the phrase "prescribing physician" was changed to "prescriber". Also, examples of clinical scenarios associated with a high risk of thrombotic events was moved from the criteria to a Note.	10/14/2020

PRIOR AUTHORIZATION POLICY

POLICY: Chelating Agents – Chemet® (succimer capsules – Lannett Company, Inc., for Recordati Rare Diseases, Inc.)

DATE REVIEWED: 04/22/2020

OVERVIEW

Chemet, a heavy metal chelator, is indicated for the treatment of lead poisoning in pediatric patients with blood lead levels > 45 mcg/dL.[1] Chemet is not indicated for prophylaxis of lead poisoning in a lead-containing environment; the use of Chemet should be accompanied by identification and removal of the source of the lead exposure. Safety and efficacy of Chemet in children < 12 months of age have not been established. The course of therapy is 19 days; if indicated, a repeat course may be given with a minimum of 2 weeks between courses, unless blood lead levels indicate the need for more prompt treatment. The chemical name for Chemet is *meso* 2,3-dimercaptosucininc acid (DMSA).

Lead, mercury, arsenic, and iron account for most cases of diagnosed heavy metal poisoning in the US.[2] Most cases of lead poisoning are in children who swallow lead-based paint in homes or toys; other causes include water carried through pipes made of lead or containing lead solder. Children are especially susceptible to the toxic effects of lead, which may affect the developing brain and nervous system, potentially causing lower IQs, learning difficulties, hearing loss, and behavior difficulties. In adults, lead poisoning can cause high blood pressure and kidney damage.

Arsenic is a naturally-occurring substance; in some areas of the world, low-level arsenic exposure occurs because of the presence of arsenic in ground water.[2] Accidental poisoning accounts for the majority of acute arsenic toxicity.[3] Patients may develop muscle weakness, numbness and tingling in their arms and legs, skin changes (darkening or discoloration, redness, swelling, and hyperkeratosis), sensory and motor nerve damage, and cancer if they are exposed to lower levels of arsenic over a long period of time.[2,4] Symptoms of acute poisoning include gastrointestinal (GI) symptoms, such as profuse vomiting and diarrhea; shock and coma can follow.[2] The Agency for Toxic Substances and Disease Registry (ATSDR) states that patients with severe arsenic poisoning must be hospitalized.[7] Chelation therapy can curtail the distribution of arsenic in the body and reduce the body burden. Oral chelators, such as Chemet, have been used with success. There are case reports to support the use of DMSA in acute arsenic poisoning.[3,8] The patients' clinical status improved with DMSA therapy and urine arsenic levels decreased with therapy.

Mercury poisoning can result from vapor inhalation, mercury ingestion, mercury injection, and absorption of mercury through the skin.[5] Symptoms of mercury poisoning depends on the type of mercury exposure and severity of exposure: organic mercury (antiseptics, bactericidals, fungicides, insecticides), inorganic mercury (chemical laboratory work, disinfectants, explosives, fur hat processing), and elemental mercury (thermometers, batteries, dental amalgams, fluorescent lamps). The primary sources of inorganic mercury exposure in humans are from contaminated fish and industrial chemicals.[2,5] Chronic and intense acute mercury exposure cause cutaneous (e.g., erythema of the palms and soles, desquamating rash) and

neurologic symptoms (e.g., visual loss, extremity numbness, hearing loss, and ataxia). Other effects of mercury exposure include GI effects, weight loss, fatigue, lung injury, and kidney damage.[2] The ATSDR notes that patients with serious mercury exposure must be hospitalized.[9] Chelation should be considered for any symptomatic patient with a clear history of acute elemental mercury exposure. The decision to chelate is less clear in asymptomatic patients with elevated urine mercury levels.[10] Oral chelators, such as Chemet, have been used successfully for the treatment of acute mercury intoxication/poisoning.[9] The World Health Organization (WHO) recommends that urine mercury concentration should not exceed 50 mcg/g creatinine.[11]

Several case reports have demonstrated the effectiveness of DMSA therapy for treatment of acute mercury poisoning.[12-15] All of the patients exhibited symptoms consistent with mercury poisoning and were treated in a hospital setting. DMSA therapy resulted in reduction of mercury levels and improved symptomatology.

Treatment Recommendations
Treatment of heavy metal poisoning includes removing the patient from the source of the metal and treating the patient's symptoms.[2] Diagnosis includes the patient's history, symptoms, and blood or urine tests.[2,4,5] Treatment of acute metal poisoning involves emergency care and generally requires the use of chelating agents, such as DMSA.[6] The chemical name for Chemet is DMSA. (Note: the chemical name, DMSA, will be used to describe the case reports in this document because it is unclear if the FDA-approved Chemet product was used).

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of Chemet. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Chemet as well as the monitoring required for adverse events, approval requires Chemet to be prescribed by, or in consultation with, a physician who specializes in the condition being treated..

Documentation: Documentation is required where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes, prescription claims records, prescription receipts and/or laboratory data.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Chemet is recommended in those who meet the following criteria:

FDA-Approved Indications

16. **Acute Lead Poisoning.** Approve for 2 months if the patient meets the following criteria (A, B, C, and D):
    - **A)** The patient is between the age of 12 months and 18 years; AND
    - **B)** Prior to starting Chemet therapy, the patient's blood lead level was > 45 micrograms/deciliter (mcg/dL) **[documentation required]**; AND
    - **C)** Chemet is being used for treatment of acute lead poisoning and not as prophylaxis against lead poisoning in a lead-containing environment; AND
    - **D)** Chemet is prescribed by, or in consultation with, a professional experienced in the use of chelation therapy (e.g., a medical toxicologist or a poison control center specialist).

Other Uses with Supportive Evidence

17. **Acute Arsenic Intoxication/Poisoning.** Approve for 1 month if the patient meets the following criteria (A and B):
    - **A)** The patient was recently initiated on Chemet therapy in the hospital and further treatment is needed to finish the course of therapy; AND
    - **B)** Chemet is prescribed by, or in consultation with, a professional experienced in the use of chelation therapy (e.g., a medical toxicologist or a poison control center specialist).

18. **Acute Mercury Intoxication/Poisoning.** Approve for 1 month if the patient meets the following criteria (A and B):
    - **A)** The patient was recently initiated on Chemet therapy in the hospital and further treatment is needed to finish the course of therapy; AND
    - **B)** Chemet is prescribed by, or in consultation with, a professional experienced in the use of chelation therapy (e.g., a medical toxicologist or a poison control center specialist).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Chemet has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below.

70. **Use of Chemet in Conjunction with other Chelators (e.g., calcium disodium versenate injection [$CaNa_2EDTA$], dimercaprol injection [British anti-Lewisite {BAL}]).**
    In patients with acute lead poisoning, data on the concomitant use of Chemet with $CaNa_2EDTA$ with or without BAL are not available and such use is not recommended.[1]

71. **Chelation of Heavy Metals to Treat Chronic Medical and/or Psychiatric Conditions.**
    Chelation of heavy metals has been advertised as a viable treatment for numerous conditions: treatment of intermittent claudication; treatment or management of symptoms of autism; prevention or cure of neurodegenerative conditions such as Alzheimer's disease; use in Parkinson's disease; treatment of macular degeneration.[2] There is no evidence to show that chelators work in these conditions. Furthermore, unapproved uses of chelation therapy have resulted in harm and even death.

    Chelation of heavy metals is also one of several popular interventions in children with autism spectrum disorders.[2] The FDA notes chelation therapies for the treatment of autism to be associated with significant health risks and does not approve such use.[16]

72. **Chronic Arsenic Exposure.**
    Use of chelation therapy following chronic exposure to inorganic arsenic may accelerate metal excretion, but potential therapeutic efficacy in terms of decreased morbidity and mortality is largely unestablished.[17]

    In a prospective, randomized-controlled trial, 21 patients with chronic arsenicosis due to drinking arsenic-contaminated subsoil water were randomized to receive DMSA (1,400 mg/day or 100 mg/m^2 in four divided doses for 1 week and then 1,050 mg/day or 750 mg/m^2 in three divided doses for 2 weeks; repeat the regimen after 3 weeks) or placebo.[18] The patients had history of drinking arsenic-contaminated water (50 mcg/L or $\geq$ 0.05 mg/L) for at least 2 years and clinical signs/symptoms of chronic arsenicosis. Similar improvement in the clinical score was observed in the DMSA and placebo groups. Furthermore, urinary arsenic excretion before treatment and at 48 hours and 72 hours post-

treatment were similar between the two groups. The investigators concluded that DMSA did not result in clinical or biochemical benefit in patients with chronic arsenicosis.

In another case report involving a 39 year old woman with arsenic poisoning (urine arsenic level was 2,000 mcg/L; normal level is < 10 mcg/L), DMSA 600 mg three times a day (TID) for 45 days did not significantly affect the clearance of arsenic or clinical outcome.[19] During the 45-day course, the patient stopped therapy for a total of 13 days (unknown reason).

73. Chronic Mercury Exposure.

The American Academy of Pediatrics notes there is no scientific evidence behind the use of chelation therapy to improve nervous system symptoms of chronic mercury toxicity.[16] Use of chelation therapy following chronic exposure to inorganic mercury may accelerate metal excretion, but potential therapeutic efficacy in terms of decreased morbidity and mortality is largely unestablished.[17]

In a randomized, double-blind, parallel-group, placebo-controlled study in Sweden, 20 patients were randomized to receive DMSA 20 mg/kg/day in three divided doses or placebo for 14 days.[20] These patients experienced symptoms that were allegedly associated with amalgam fillings for at least 6 months. DMSA therapy resulted in increased urinary excretion of mercury and blood mercury levels were decreased. However, there were no statistically significant changes in any of the symptoms. The investigators concluded that although urinary excretion of mercury was increased during DMSA treatment, chelating therapy did not alleviate symptoms allegedly attributable to mercury from amalgam fillings.

Cao and colleagues reported the effects of Chemet in reducing blood mercury levels in children 12 to 33 months of age.[21] The original study was to evaluate the use of Chemet for lead poisoning; the investigators used the blood samples for the lead study and measured the mercury levels. Blood mercury concentrations were measured one week before randomization and treatment, at one week after treatment initiation, and after three courses of treatment. Mercury was not detected/quantified in any of the blood samples. At one week of treatment, organic mercury concentration decreased 8% in the Chemet group, but remained the same in the placebo group (P = 0.04). However, the investigators suggested that the difference was not due to a reduction in the Chemet group but rather, Chemet therapy prevented a rise in the blood mercury concentration as seen in the placebo group. Chemet therapy did not reverse the accumulation of organic mercury over multiple courses over 5 months.

74. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Chelating Agents – Iron Chelators (Oral) Prior Authorization Policy

- Exjade® (deferasirox tablets for suspension – Novartis; generics)
- Jadenu® (deferasirox tablets – Novartis; generics)
- Jadenu® Sprinkle (deferasirox granules for oral use – Novartis)
- Ferriprox® (deferiprone tablets and oral solution – ApoPharma USA)

REVIEW DATE: 06/17/2020

OVERVIEW

Iron chelating therapy should be considered in all patients who require long-term blood transfusions.[5] Patients with sickle cell disease, myelodysplastic syndromes (MDS), thalassemia major, Diamond-Blackfan anemia, aplastic anemia, and other congenital and acquired forms of refractory anemia (e.g., hereditary hemochromatosis) may require regular blood transfusions and as a result may require iron chelation therapy. This is because the body does not have an efficient mechanism to excrete iron.[4] In patients requiring multiple blood transfusions, iron accumulates and is deposited into multiple organ systems. The long term consequences of chronic iron overload include multiple organ dysfunction (e.g., heart, liver) and/or organ failure. Iron chelation therapy is necessary to prevent organ failure and decrease mortality. In the US, it is estimated that approximately 25,000 patients are transfusion dependent due to various causes such as sickle cell disease and refractory anemias.[7]

Serum ferritin level measurements are the laboratory parameter most often used to assess the iron burden and response to chelation therapy.[4] Sustained serum ferritin levels > 2,500 mcg/L are associated with organ toxicity and death. Most chelation regimens strive to achieve the goal of ferritin levels < 2,500 mcg/L. Trends in ferritin level are useful in monitoring the direction of body iron loading, but it may not predict cardiac iron loading.[6] Long-term elevations in ferritin levels predict cardiac mortality, with ferritin levels > 2,500 mcg/L indicating a higher cardiac risk; however, there is no threshold effect, so a ferritin level of 1,000 mcg/L could indicate a risk. Cardiac iron levels have a better predictive value of heart failure.

Exjade, Jadenu (granules and tablets), and Ferriprox are orally administered iron chelators used for the treatment of iron overload.[1-3] Exjade and Jadenu have the same chemical entity (deferasirox) in different formulations.[1-2] Deferoxamine is an intravenously (IV) administered iron chelator that is not covered under this prior authorization policy. Both Exjade and Jadenu products have Limitations of Use that safety and efficacy has not been established when each of these agents are used in combination with other iron chelation therapy.

Ferriprox is indicated for the treatment of patients with transfusional iron overload due to thalassemia syndromes when current chelation therapy is inadequate.[3] Ferriprox approval was based on a reduction in serum ferritin levels. There are no controlled trials demonstrating a direct treatment benefit, such as an improvement in disease-related symptoms, functioning, or increased survival. Safety and effectiveness of Ferriprox for the treatment of transfusional iron overload in patients with other chronic anemias have not been established.

Exjade and Jadenu (granules and tablets) have the following FDA-approved indications[1-2]:

- Treatment of chronic iron overload due to blood transfusions (transfusion iron overload) in patients ≥ 2 years of age. Exjade/Jadenu therapy should be considered when a patient has evidence of chronic transfusional iron overload (e.g., at least 20 units of packed red blood cells for a 40 kg person or more) and a serum ferritin consistently > 1,000 mcg/L.
- Exjade and Jadenu are also indicated for the treatment of chronic iron overload in patients ≥ 10 years of age with non-transfusion-dependent thalassemia (NTDT) syndromes and with a liver iron concentration (LIC) of at least 5 milligrams of iron per gram of liver dry weight (mg Fe/g dw) and a serum ferritin > 300 mcg/L. This indication is based on achievement of an LIC < 5 mg Fe/g dw. An improvement in survival or disease-related symptoms has not been established.
- Limitations of Use: Controlled trials of Exjade and Jadenu with myelodysplastic syndrome (MDS) and chronic iron overload due to blood transfusions have not been performed. The safety and efficacy of Exjade and Jadenu when administered with other iron chelation therapy have not been established.

EFFICACY

A 5-year multicenter, randomized, open-label trial assessed the efficacy of Ferriprox compared with deferoxamine intravenous (IV) treatment in patients with sickle cell disease.[11] Patients (n = 60) were > 13 years of age and had serum ferritin concentration between 800 to 3,000 mcg/L. By Year 5, 36.6% of patients treated with Ferriprox achieved serum ferritin levels < 400 mcg/L compared with 3.3% of patients treated with deferoxamine. Overall survival did not differ significantly between the two groups after 5 years or 10 years. A Phase III study is underway comparing the efficacy of Ferriprox vs. Exjade/Jadenu in pediatric patients with transfusion-related iron overload due to thalassemia, sickle cell disease, and other conditions.[12] Studies with Ferriprox use in pediatric patients for various iron overload conditions have been conducted in other countries.[13]

Iron overload in thalassemia intermedia is mainly due to increased intestinal absorption of iron due to chronic anemia.[9] Transfusions play a minor role in iron overloading in these patients, but iron chelation therapy is indicated for thalassemia intermedia. A 5-year randomized, open-label, long-term trial was

conducted in patients (n = 88) with thalassemia intermedia comparing Ferriprox with deferoxamine IV treatment. After 5 years there were no statistically significant differences between Ferriprox and deferoxamine in the decrease in mean serum ferritin levels and overall survival. There are data available from other studies as well with Ferriprox use in iron-loaded non-transfusion dependent thalassemias.[10]

The three pivotal studies for Exjade/Jadenu included patients with β-thalassemia, chronic anemias, myelodysplastic syndromes, sickle cell disease, Diamond-Blackfan syndrome and other congenital or acquired anemias.[1,2] The prospective EPIC study (Evaluation of Patients' Iron Chelation with Exjade) included patients with thalassemia (~70%), myelodysplastic syndrome (20%), aplastic anemia (7%), sickle cell disease (5%) and other rare anemias such as red cell aplasia and hemolytic anemias (~2.5%).[14] Baseline median serum ferritin levels in all subgroups were > 2,500 mcg/L. Overall there was a significant reduction in serum ferritin level from baseline (-264 ng/mL) in all subgroups, except sickle cell disease (likely due to low number of patients). The NCCN myelodysplastic syndromes guidelines notes that monitoring serum ferritin levels and aiming to decrease ferritin levels to < 1,000 mcg/L may be useful.[8]

GUIDELINES

The American Heart Association published a consensus statement on cardiovascular function and treatment in β-thalassemia major.[6] Exjade/Jadenu, Ferriprox, and deferoxamine intravenous (IV) iron chelator all remove cardiac iron if given in adequate doses and if patient compliance is good. Optimal therapy must be tailored to each patient. In patients with detectable, asymptomatic cardiac iron overload, the following are noted: retrospective studies suggest that Ferriprox monotherapy may offer superior cardiac protection and improve survival compared with deferoxamine IV chelator. The AHA recommends the use of Ferriprox monotherapy in patients with cardiac siderosis and it is also suitable for patients with reduced left ventricular ejection fraction (LVEF) or asymptomatic left ventricular (LV) dysfunction. Exjade/Jadenu monotherapy can be used successfully in patients with detectable cardiac iron and normal cardiac function; however, no change in LVEF was observed in trails. The AHA recommends Exjade/Jadenu for cardiac siderosis, but it is not recommended as first-choice treatment for cardiac iron (T2*) < 6 ms or in patients with reduced LVEF because of the limited data on efficacy. Caution is recommended in the use of Exjade/Jadenu monotherapy to treat cardiac siderosis in patients with high liver iron loading, especially if higher doses are required (> 40 mg/kg/day), as cardiac efficacy may be delayed. The use of combination Ferriprox and deferoxamine therapy is noted as widespread, and this combination is used especially in patients with moderate to severe cardiac iron overload or when LVEF is impaired. Exjade/Jadenu has also been used in combination with deferoxamine. There are limited data available for the combination use of daily Ferriprox with daily Exjade/Jadenu.

The National Comprehensive Cancer Network (NCCN) guidelines for myelodysplastic syndromes (version 2.2020 – February 28, 2020) has the following recommendations under supportive care, for the management of iron overload.[8] For patients with chronic transfusion need, serum ferritin levels and associated organ function should be monitored. It is useful to decrease serum ferritin levels to < 1,000 mcg/L. The NCCN Panel recommends consideration of once-daily deferoxamine subcutaneously or Exjade/Jadenu orally to decrease iron overload (aiming for target ferritin level < 1,000 ng/mL) in lower risk patients with MDS or who are potential transplant candidates and are anticipated to receive > 20 to 30 blood transfusions; and patients with serum ferritin levels > 2,500 ng/mL the aim is to get the levels to < 1,000 ng/mL. The NCCN recommendations notes that a third oral chelating agent, Ferriprox, is available and it was approved based on retrospective analysis of pooled efficacy and safety studies in patients with transfusion-related iron overload refractory to existing chelation therapy. NCCN notes that controversy remains regarding the use of this agent for MDS due to the boxed warning for agranulocytosis.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Exjade, Jadenu (granules and tablets), and Ferriprox. Because of the specialized skills required for evaluation and diagnosis of patients treated with these agents as well as the monitoring required for adverse events and long-term efficacy, approval requires Exjade, Jadenu (granules and tablets), and Ferriprox to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration listed below.

Documentation: Documentation is required where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes, prescription claims records, prescription receipts, and/or laboratory data.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

I. Coverage of **Ferriprox** is recommended in those who meet the following criteria:

FDA-Approved Indications

19. Iron Overload, Chronic – Transfusion-Related Due to Thalassemia Syndromes. Approve Ferriprox for 1 year if the patient meets the following criteria (A or B):

18. Initial Therapy. Approve Ferriprox if the patient meets all of the following criteria (i and ii):

i. Prior to starting Ferriprox therapy, the serum ferritin level was > 2,500 micrograms/liter [mcg/L]) **[documentation required]**; AND

ii. Ferriprox is prescribed by or in consultation with a hematologist.

19. Patients Currently Receiving Ferriprox. Approve for 1 year if the patient is benefiting from Ferriprox therapy (e.g., reduction in the serum ferritin levels by at least 20% from baseline, stable disease, reduced cardiac iron load), as confirmed by the prescriber.

Other Uses with Supportive Evidence

2. Iron Overload, Chronic – Transfusion – Related Due to Sickle Cell Disease. Approve Ferriprox for 1 year if the patient meets the following criteria (A or B).

A) Initial Therapy. Approve Ferriprox if the patient meets all the following criteria (i and ii):

i. Prior to starting Ferriprox therapy, the patient's serum ferritin level was > 1,000 micrograms/liter (mcg/L) **[documentation required]**; AND

ii. Ferriprox is prescribed by or in consultation with a hematologist.

B) Patients Currently Receiving Ferriprox. Approve for 1 year if the patient is benefiting from Ferriprox therapy for sickle cell disease (e.g., reduction in the serum ferritin levels to < 1,000 mcg/L, stable disease, reduced cardiac iron load), as confirmed by the prescriber.

3. Iron Overload, Chronic – Non-Transfusion-Dependent Thalassemia Syndromes. Approve Ferriprox for 1 year if the patient meets the following criteria (A or B).

A) Initial Therapy. Approve Ferriprox if the patient meets all the following criteria (i, ii, and iii):

i. Prior to starting Ferriprox therapy, the patient's serum ferritin level was > 300 micrograms/liter (mcg/L) **[documentation required]**; AND

ii. Ferriprox is prescribed by or in consultation with a hematologist.

B) Patients Currently Receiving Ferriprox. Approve for 1 year if the patient is benefiting from Ferriprox therapy (e.g., reduction in the serum ferritin levels, stable disease, reduced cardiac iron load), as confirmed by the prescriber.

II. Coverage of **Exjade or Jadenu (granules or tablets)** is recommended in those who meet the following criteria:

FDA-Approved Indications

1. Iron Overload, Chronic – Transfusion-Related. Approve Exjade or Jadenu (granules or tablets) for 1 year if the patient meets the following criteria (A or B):

A) Initial Therapy. Approve Exjade or Jadenu (granules or tablets) if the patient meets all the following criteria (i, ii, and iii):

i. Patient is receiving blood transfusions at regular intervals for various conditions (e.g., thalassemia syndromes, myelodysplastic syndrome, chronic anemia, sickle cell disease); AND

ii. Prior to starting Exjade or Jadenu (granules or tablets) therapy, the patient's serum ferritin level was > 1,000 micrograms/liter (mcg/L) **[documentation required]**; AND

iii. Exjade or Jadenu (granules or tablets) is prescribed by or in consultation with a hematologist.

B) Patients Currently Receiving Exjade or Jadenu (granules or tablets). Approve for 1 year if the patient is benefiting from Exjade or Jadenu (granules or tablets) therapy (e.g., reduction in the serum ferritin levels to < 1,000 mcg/L, stable disease, reduced cardiac iron load), as confirmed by the prescriber.

20. Iron Overload, Chronic – Non-Transfusion-Dependent Thalassemia Syndromes. Approve Exjade or Jadenu (granules or tablets) for 1 year if the patient meets the following criteria (A or B).

A) Initial Therapy. Approve Exjade or Jadenu (granules or tablets) if the patient meets all the following criteria (i and ii):

i. Prior to starting Exjade or Jadenu (granules or tablets) therapy, the patient's serum ferritin level was > 300 micrograms/liter (mcg/L) **[documentation required]**; AND

ii. Exjade or Jadenu (granules or tablets) is prescribed by or in consultation with a hematologist.

B) Patients Currently Receiving Exjade or Jadenu (granules or tablets). Approve for 1 year if the patient is benefiting from Exjade or Jadenu (granules or tablets) therapy (e.g., reduction in the serum ferritin levels, stable disease, reduced iron load), as confirmed by the prescriber.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Exjade, Jadenu (granules or tablets), and Ferriprox have not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

75. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Chelating Agents – Penicillamine Products

- Cuprimine® (penicillamine capsules – Valeant, generics)
- Depen® (penicillamine tablets – Meda, generics)

DATE REVIEWED: 04/15/2020

OVERVIEW

Penicillamine products ([Cuprimine® capsules, generics] and [Depen® tablets, generics]) are chelating agents indicated for the treatment of Wilson's disease.[1-2] These agents also have other indications for the treatment of cystinuria and treatment of patients with severe, active rheumatoid arthritis who have failed to respond to an adequate trial of conventional therapy. However, per product labeling, available evidence suggests that Cuprimine and Depen are not of value in ankylosing spondylitis. Product labeling for Cuprimine and Depen is identical, with the exception of the differences in dosage forms; Cuprimine is supplied as 250 mg capsules; Depen is supplied as 250 mg tablets.

Wilson's Disease Overview

Copper is an essential metal and is an important cofactor for many proteins.[4] However, normal dietary consumption and absorption of copper exceeds the amount that the body needs.[5] Copper homeostasis depends primarily on biliary excretion. Wilson's disease is an inherited disorder in which alterations in cellular copper processing and impaired biliary excretion lead to copper accumulation.[3-5] Copper initially builds up in the liver and eventually is released into the bloodstream and deposited into other organs (e.g., brain, kidneys, and cornea). The majority of patients with Wilson's disease are diagnosed between the ages of 5 and 35 years, with the most common presentations being liver disease, neurological disorder (e.g., tremor, ataxia, dystonia), or psychiatric illness.[4-5] The average prevalence of Wilson's disease is 30 cases per million individuals. Lifelong pharmacologic therapy is the mainstay of treatment for Wilson's disease;

without treatment, most patients will die from liver disease or progressive neurologic disease. Liver transplantation is reserved for severe or resistant cases. In patients with Wilson's disease, penicillamine acts as a general metal chelator and promotes urinary copper excretion.

Guidelines

The American Association for the Study of Liver Diseases (AASLD) provides guidelines for the diagnosis and management of Wilson's disease (2008).[4] It is noted that while the most experience in the treatment of this condition is with penicillamine; trientine hydrochloride capsules (Syprine, generics), another chelating agent, is also effective for the treatment of Wilson's disease, especially in patients who are intolerant of penicillamine or have clinical features indicating potential intolerance (history of renal disease of any sort, congestive splenomegaly causing severe thrombocytopenia, autoimmune tendency). The AASLD recommends that initial treatment for symptomatic patients include a chelating agent (penicillamine or trientine). For the treatment of presymptomatic patients or those on maintenance therapy, chelating agents and zinc are both treatment options. In pregnant patients, treatment for Wilson's disease should be continued due to the risk of liver failure with therapy interruption, but dosage reduction is advisable for penicillamine and trientine. Dose reductions with zinc are not necessary. Satisfactory outcomes have been shown with continuation of therapy with chelating agents (both penicillamine and trientine) during pregnancy. Liver transplantation should be considered in patients with acute liver failure due to Wilson's disease and in patients with decompensated cirrhosis unresponsive to chelation therapy.
The European Association for the Study of the Liver (EASL) also published a clinical practice guideline for the treatment of Wilson's disease (2012).[5] Like the AASLD, the EASL acknowledges that numerous studies have demonstrated the effectiveness of penicillamine. The EASL also notes that trientine has been shown to be an effective initial therapy. A chelating agent (penicillamine or trientine) is the recommended initial treatment of symptomatic patients, and again, a chelating agent or zinc may be used for the treatment of presymptomatic patients or patients established on maintenance therapy. In patients with neurological disease established on maintenance therapy either a chelating agent or zinc may be used; zinc may have a role as first-line therapy in these patients. If zinc is used, careful monitoring of transaminases is needed, with changing to chelators if these laboratory parameters are increasing. The EASL guidelines also state that despite teratogenicity concerns with penicillamine, treatment of Wilson's disease should be continued during pregnancy as the risks of withdrawing therapy outweigh those of continuing therapy. However, penicillamine and trientine dosage reductions are recommended in pregnant patients.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of the penicillamine products. All approvals are provided for the duration listed below. Because of the specialized skills required for evaluation and diagnosis of patients treated with penicillamine products as well as the monitoring required for adverse events and long-term efficacy, approval requires penicillamine products to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of the penicillamine products is recommended in those who meet the following criteria:

I. Coverage of Cuprimine and penicillamine capsules are recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Wilson's Disease.** Approve for 3 years if the patient meets the following criteria (A, B, and C):
   - **A)** The medication is prescribed by or in consultation with a gastroenterologist, hepatologist, or liver transplant physician; AND
   - **B)** The patient meets ONE of the following criteria (i, ii, iii, or iv):
     - **i.** The patient has tried Galzin® (zinc acetate capsules); OR
     - **ii.** The patient has tried another zinc product (e.g., zinc sulfate, zinc gluconate, zinc acetate); OR
     - **iii.** According to the prescriber, the patient has symptoms of Wilson's disease and zinc would not be an appropriate therapy; OR
     - **iv.** The patient has been started on therapy with a penicillamine product; AND
   - **C)** The patient meets one of the following (i or ii):
     - **i.** Generic penicillamine capsules are requested; OR
     - **ii.** If brand Cuprimine is prescribed, the patient has tried generic penicillamine capsules AND cannot take generic penicillamine capsules due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the bioequivalent generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.

2. **Cystinuria.** Approve for 3 years if the patient meets one of the following criteria (A or B):
   - **A)** Generic penicillamine capsules are requested; OR
   - **B)** If brand Cuprimine is prescribed, the patient has tried generic penicillamine capsules AND cannot take generic penicillamine capsules due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the bioequivalent generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.

3. **Rheumatoid Arthritis.** Approve for 3 years if the patient meets one of the following criteria (A or B):
   - **A)** Generic penicillamine capsules are requested; OR
   - **B)** If brand Cuprimine is prescribed, the patient has tried generic penicillamine capsules AND cannot take generic penicillamine capsules due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the bioequivalent generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.

II. Coverage of Depen and penicillamine tablets are recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Wilson's Disease.** Approve for 3 years if the patient meets the following criteria (A, B, and C):
   - **A)** The medication is prescribed by or in consultation with a gastroenterologist, hepatologist, or liver transplant physician; AND
   - **B)** The patient meets ONE of the following criteria (i, ii, iii, or iv):
     - **i.** The patient has tried Galzin® (zinc acetate capsules); OR
     - **ii.** The patient has tried another zinc product (e.g., zinc sulfate, zinc gluconate, zinc acetate); OR
     - **iii.** According to the prescriber, the patient has symptoms of Wilson's disease and zinc would not be an appropriate therapy; OR
     - **iv.** The patient has been started on therapy with a penicillamine product.
   - **C)** The patient meets one of the following (i or ii):
     - **i.** Generic penicillamine tablets are requested; OR
     - **ii.** If brand Depen is prescribed, the patient has tried generic penicillamine tablets AND cannot take generic penicillamine tablets due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the bioequivalent generic

product which, per the prescriber, would result in a significant allergy or serious adverse reaction.

2. **Cystinuria.** Approve for 3 years if the patient meets one of the following criteria (A or B):
   A) Generic penicillamine tablets are requested; OR
   B) If brand Depen is prescribed, the patient has tried generic penicillamine tablets AND cannot take generic penicillamine tablets due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the bioequivalent generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.

3. **Rheumatoid Arthritis.** Approve for 3 years if the patient meets one of the following criteria (A or B):
   A) Generic penicillamine tablets are requested; OR
   B) If brand Depen is prescribed, the patient has tried generic penicillamine tablets AND cannot take generic penicillamine tablets due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the bioequivalent generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

The penicillamine products have not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Chelating Agents – Syprine Prior Authorization Policy

- Syprine® (trientine hydrochloride capsules – Valeant, generics)

REVIEW DATE: 09/23/2020

OVERVIEW

Trientine, a metal chelator, is indicated for the treatment of patients with Wilson's disease who are intolerant of penicillamine.[1] Trientine and penicillamine are not interchangeable; trientine should be used when treatment with penicillamine is no longer possible because of intolerable or life-endangering side effects. Trientine is not indicated for use in patients with cystinuria, rheumatoid arthritis, or biliary cirrhosis. In general, patients should remain under regular medical supervision while receiving trientine and patients (especially women) should be closely monitored for evidence of iron deficiency anemia. Controlled studies of trientine in pediatric patients are not available; however, it has been used in patients as young as 6 years with no adverse events. Other chelating agents indicated in the treatment of Wilson's disease include penicillamine capsules (Cuprimine®, generics) and Depen® (penicillamine tablets).[5-6] These agents also have other indications for the treatment of cystinuria and treatment of patients with severe, active rheumatoid arthritis who have failed to respond to an adequate trial of conventional therapy.

Disease Overview

Copper is an essential metal and is an important cofactor for many proteins.[3] However, normal dietary consumption and absorption of copper exceeds the amount that the body needs.[4] Copper homeostasis depends primarily on biliary excretion. Wilson's disease is an inherited disorder in which alterations in cellular copper processing and impaired biliary excretion lead to copper accumulation.[2-4] Copper initially builds up in the liver and eventually is released into

the bloodstream and deposited into other organs (e.g., brain, kidneys, and cornea). The majority of patients with Wilson's disease are diagnosed between the ages of 5 and 35 years, with the most common presentations being liver disease, neurological disorder (e.g., tremor, ataxia, dystonia), or psychiatric illness.[3-4] The average prevalence of Wilson's disease is 30 cases per million individuals. Lifelong pharmacologic therapy is the mainstay of treatment for Wilson's disease; without treatment, most patients will die from liver disease or progressive neurologic disease. Liver transplantation is reserved for severe or resistant cases. In patients with Wilson's disease, trientine acts as a general metal chelator and promotes urinary copper excretion.

Guidelines

The American Association for the Study of Liver Diseases (AASLD) provides guidelines for the diagnosis and management of Wilson's disease (2008).[3] It is noted that while the most experience in the treatment of this condition is with penicillamine, trientine is effective for the treatment of Wilson's disease, especially in patients who are intolerant of penicillamine or have clinical features indicating potential intolerance (history of renal disease of any sort, congestive splenomegaly causing severe thrombocytopenia, autoimmune tendency). Trientine has been found to be effective initial therapy, even in patients with decompensated liver disease at the outset. The AASLD recommends that initial treatment for symptomatic patients include a chelating agent (penicillamine or trientine). Neurological worsening following therapy initiation appears to be much less common with Syprine than with penicillamine. For the treatment of presymptomatic patients or those on maintenance therapy, chelating agents and zinc are both treatment options. Zinc appears preferable for presymptomatic children under the age of 3 years. In pregnant patients, treatment for Wilson's disease should be continued due to the risk of liver failure with therapy interruption, but dosage reduction is advisable for penicillamine and trientine. Satisfactory outcomes have been shown with continuation of therapy with chelating agents (both penicillamine and trientine) during pregnancy. Liver transplantation should be considered in patients with acute liver failure due to Wilson's disease and in patients with decompensated cirrhosis unresponsive to chelation therapy.

The European Association for the Study of the Liver (EASL) also published a clinical practice guideline for the treatment of Wilson's disease (2012).[4] Like the AASLD, the EASL acknowledges that numerous studies have demonstrated the effectiveness of penicillamine. The EASL also notes that trientine has been shown to be an effective initial therapy. A chelating agent (penicillamine or trientine) is the recommended initial treatment of symptomatic patients, and again, a chelating agent or zinc may be used for the treatment of presymptomatic patients or patients established on maintenance therapy. In patients with neurological disease established on maintenance therapy either a chelating agent or zinc may be used; zinc may have a role as first-line therapy in these patients. The EASL guidelines also state that despite teratogenicity concerns with penicillamine, treatment of Wilson's disease should be continued during pregnancy as the risks of withdrawing therapy outweigh those of continuing therapy. However, penicillamine and trientine dosage reductions are recommended in pregnant patients.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of trientine. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with trientine as well as the monitoring required for adverse events and long-term efficacy, approval requires trientine to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of trientine is recommended in those who meet the following criteria:

FDA-Approved Indications

4. Wilson's Disease. Approve for 3 years if the patient meets the following criteria (A and B):
- **D)** Patient meets ONE of the following criteria (i, ii, iii, iv, v or vi):
  - **i.** Patient has tried one penicillamine product and is intolerant to penicillamine therapy, according to the prescriber; OR

Note: Examples of penicillamine products are Cuprimine® (penicillamine capsules, generics), Depen® (penicillamine tablets, generics).

ii. Patient has clinical features indicating the potential for intolerance to penicillamine therapy, according to the prescriber; OR
Note: Specific clinical features include history of any renal disease, congestive splenomegaly causing severe thrombocytopenia, autoimmune tendency.

iii. Patient has a contraindication to penicillamine therapy, according to the prescriber; OR

iv. Patient has neurologic manifestations of Wilson's disease; OR

v. Patient is pregnant; OR

vi. Patient has been started on therapy with trientine (Syprine, generics).

E) The medication is prescribed by or in consultation with a gastroenterologist, hepatologist, or liver transplant physician.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of trientine is not recommended in the following situations:

76. Biliary Cirrhosis. Trientine (Syprine, generics) is not indicated for the treatment of biliary cirrhosis.[1]

77. Cystinuria. Trientine (Syprine, generics) is not recommended for use in patients with cystinuria.[1] Unlike penicillamine, trientine does not contain a sulfhydryl moiety and therefore it is not capable of binding cysteine.

78. Rheumatoid Arthritis (RA). Trientine (Syprine, generics) is not recommended for use in patients with RA.[1] Per the prescribing information, trientine was not found to be effective in improving any clinical or biochemical parameter after 12 weeks of treatment of patients with RA.

6. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Chenodal Prior Authorization Policy

- Chenodal™ (chenodiol tablets – Retrophin)

REVIEW DATE: 08/12/2020

OVERVIEW

Chenodal, a naturally occurring bile acid, is indicated for patients with radiolucent stones in well-opacifying gallbladders, in whom selective surgery would be undertaken except for the presence of increased surgical risk due to systemic disease or age.[1] The most widely used treatment for symptomatic gallstones is cholecystectomy.[2] Two naturally occurring bile acids are used in the treatment of gallstones: ursodeoxycholic acid (UrsoForte®, Urso-250®, [ursodiol tablets, generics], Actigall® [ursodiol capsules, generics]) and chenodeoxycholic acid/chenodiol (Chenodal).[3] These agents reduce biliary cholesterol; however, their exact mechanisms differ. Both Chenodal and ursodiol promote the gradual dissolution of radiolucent gallstones over a period of 6 months to 2 years.[2]

Cerebrotendinous xanthomatosis (CTX) is a lipid storage disorder with various clinical manifestations including juvenile cataracts, tendon xanthomas, premature atherosclerosis, and progressive neurologic disturbance (e.g., ataxia, seizures, psychiatric disorders, and peripheral neuropathy).[4] Other conditions associated with CTX include osteoarthritis, skeletal fractures, pulmonary insufficiency, renal and hepatic calculi, and childhood chronic diarrhea. CTX is the result of a mutated enzyme (cytochrome P450 27-sterol hydroxylase [CYP27]) which is normally responsible for the conversion of cholesterol to cholic acid and chenodeoxycholic acid. In CTX, reduced synthesis of cholic- and chenodeoxycholic acids seem to result in failed feedback inhibition of cholesterol production, in turn leading to hallmark laboratory findings of the disorder: increased serum cholestanol concentrations and elevated urinary bile alcohols.[5] Replacement therapy with chenodiol inhibits abnormal bile acid synthesis and is most effective in reducing elevated plasma cholesterol concentrations and eliminating bile alcohols.[4]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Chenodal. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Chenodal as well as the monitoring required for adverse events and long-term efficacy, approval requires Chenodal to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Chenodal is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Gallstones.** Approve for 3 years if the patient meets one of the following criteria (A or B):
   A) Patient has tried an ursodiol product; OR
   B) Patient is currently receiving an ursodiol product.

Other Uses with Supportive Evidence

2. Cerebrotendinous Xanthomatosis. Approve for 3 years if Chenodal is prescribed by or in consultation with a metabolic specialist who treats patients with cerebrotendinous xanthomatosis or a specialist who focuses in the treatment of cerebrotendinous xanthomatosis.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Chenodal is not recommended in the following situations:

7. **Combination Therapy with Cholbam™** (cholic acid capsules). There are no efficacy data available to support use of combination therapy with Chenodal and Cholbam.

8. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Cholbam® (cholic acid capsules – Retrophin)

DATE REVIEWED: 06/03/2020

OVERVIEW

Cholbam, a bile acid, is indicated for the treatment of bile acid synthesis disorders due to single enzyme defects (SEDs).[1] It is also indicated for adjunctive treatment of peroxisomal disorders (PDs), including Zellweger spectrum disorders, in patients who exhibit manifestations of liver disease, steatorrhea, or complications from decreased fat soluble vitamin absorption. The effects of Cholbam on extrahepatic manifestations (e.g., neurologic symptoms) of bile acid synthesis disorders due to SEDs or PDs have not been established.

The prescribing information states that treatment with Cholbam should be discontinued if liver function does not improve within 3 months of the start of treatment or if complete biliary obstruction develops.[1]

Bile Acid Synthesis Disorders

Bile acids are found in the liver and have several biological roles, including promotion of bile flow and intestinal absorption of fat and fat soluble vitamins.[2,3] The two primary bile acids are cholic acid and chenodeoxycholic acid (available as Chenodal® [chenodiol tablets]). Bile acids are formed from cholesterol; inadequate bile acid production leads to accumulation of cholesterol in the body, as well as other intermediary metabolites. This can result in damage to various organ systems. Severe cases may progress to cirrhosis and liver failure. Progressive neurologic disease may also occur, even in the absence of liver disease. There are at least 17 known enzymes involved in bile acid synthesis.[3] Primary bile acid synthesis disorders may be caused by a defect in the gene encoding any one of these enzymes, and therefore these conditions are also termed SEDs.[2,3] The estimated incidence of bile acid synthesis disorders due to SEDs is 1 to 9 per one million live births.[4] The most common of all of the bile acid SEDs is 3β-hydroxy-C_{27}-steroid oxidoreductase deficiency (3β-HSD gene defect).[5] Other common defects include Δ^4-3-oxosteroid 5β-reductase deficiency (aldo-keto reductase 1D1 [AKR1D1] gene), 27-hydroxylase deficiency (cerebrotendinous xanthomatosis [CTX]), and alpha-methylacyl-CoA racemase deficiency (AMACR gene). Cholbam is indicated for all SEDs, though the majority of patients in the pivotal study for Cholbam had 3β-HSD defect.[1] Chenodal has been used for CTX though it is not labeled for this condition.[6] Bile acid synthesis disorders may be diagnosed with either genetic testing or urine bile acid profile by Fast Atom Bombardment ionization – mass spectrometry (FAB-MS).[10] FAB-MS was used for diagnosis in the pivotal trial; gene sequencing was not available when the trial was conducted.[11] However, gene sequencing is now available for many of the affected enzymes.

Peroxisomal Disorders (PDs)

PDs occur due to genetic mutations which are essential to the proper formation of peroxisomes.[7] Peroxisomes are found throughout the body but are most numerous in the kidneys and liver.[7,8] Among their many roles, peroxisomes are vital to the production of bile acids, as well as plasmalogens, which are important for neurologic function.[8] Peroxisomal disorders are estimated to affect approximately 1 in 50,000 live births.[4] Zellweger spectrum disorder is a type of PD and includes Zellweger syndrome, neonatal adrenoleukodystrophy (NALD), and infantile Refsum disease. Zellweger syndrome is the most severe form in the spectrum, followed by NALD, and infantile Refsum disease is the least severe form. Cholbam is indicated only for adjunctive treatment of liver disease symptoms such as steatorrhea. Patients with Zellweger spectrum disorders present with other primary clinical issues such as feeding problems in infants, weak muscle tone, hearing and vision loss, and seizures. Liver involvement with Zellweger spectrum disorders may be diagnosed by genetic testing or by bile acid profile testing with mass spectrometry.[12] FAB-MS was used for diagnosis in the pivotal trial; gene sequencing was not available when the trial was conducted.[11] However, gene sequencing is now available for many of the affected enzymes.

GUIDELINES

A joint guideline by the North American and European societies for Pediatric Gastroenterology, Hepatology, and Nutrition is available (2017).[9] The guideline, which briefly addresses evaluation of cholestatic jaundice in infants, provides recommendations for diagnosis of bile acid synthesis disorders. It is possible to perform rapid diagnosis of potential inborn errors in bile acid synthesis from urinary bile acid analysis; fast atom bombardment mass spectrometry of urine is recommended. The guideline also notes that molecular techniques identify the specific mutations in genes encoding enzymes responsible for bile acid synthesis.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Cholbam. Because of the specialized skills required for evaluation and diagnosis of patients treated with Cholbam as well as the monitoring required for efficacy, approval requires Cholbam to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for 1 year in duration unless otherwise noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Cholbam is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Bile Acid Synthesis Disorders Due to Single Enzyme Defects (SEDs).** Approve for the duration noted if the patient meets one of the following conditions (A or B):
   - **A)** Initial Therapy: Approve for 3 months if the patients meets both of the following criteria (i and ii):
     - **i.** Patient has a diagnosis of SED based on at least one of the following criteria (a or b):
       - **a)** An abnormal urinary bile acid as confirmed by Fast Atom Bombardment ionization – Mass Spectrometry (FAB-MS) analysis; OR
       - **b)** Molecular genetic testing consistent with the diagnosis; AND
     - **ii.** Cholbam is prescribed by or in consultation with a hepatologist, metabolic specialist, or a gastroenterologist.
   - **B)** Patients Currently Receiving Cholbam: Approve for 1 year if the patient meets the following criteria (i, ii, and iii):
     - **i.** Patient has responded to initial Cholbam therapy with an improvement in liver function tests (e.g., aspartate aminotransferase [AST], alanine aminotransferase [ALT], bilirubin levels); AND
     - **ii.** Patient does not have complete biliary obstruction; AND
     - **iii.** Cholbam is prescribed by or in consultation with a hepatologist, metabolic specialist, or a gastroenterologist.

2. **Bile Acid Synthesis Disorders Due to Peroxisomal Disorders (PDs), Including Zellweger Spectrum Disorders.** Approve for the duration noted if the patient meets one of the following conditions (A or B):
   - **A)** Initial Therapy: Approve for 3 months if the patient meets the following criteria (i, ii, and iii):
     - **i.** Patient has peroxisomal disorders with at least one of the following criteria (a or b):
       - **a)** An abnormal urinary bile acid analysis by Fast Atom Bombardment ionization – Mass Spectrometry (FAB-MS); OR
       - **b)** Molecular genetic testing consistent with the diagnosis; AND
     - **ii.** Patient has liver disease, steatorrhea, or complications from decreased fat soluble vitamin absorption (e.g., rickets); AND
     - **iii.** Cholbam is prescribed by or in consultation with a hepatologist, metabolic specialist, or a gastroenterologist.
   - **B)** Patients Currently Receiving Cholbam: Approve for 1 year if the patient meets the following criteria (i, ii, and iii):
     - **i.** Patient has responded to initial Cholbam therapy as per the prescribing physician (e.g., improvements in liver enzymes, improvement in steatorrhea); AND

ii. Patient does not have complete biliary obstruction; AND
iii. Cholbam is prescribed by or in consultation with a hepatologist, metabolic specialist, or a gastroenterologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Cholbam has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

79. Combination Therapy with Chenodal. There are no efficacy data available to support use of combination therapy with Cholbam and Chenodal.

80. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Cinacalcet (Sensipar) Prior Authorization Policy
- Sensipar® (cinacalcet tablets – Amgen, generic)

REVIEW DATE: 02/10/2021

Overview
Cinacalcet (Sensipar, generic), a calcium-sensing receptor agonist (calcimimetic), is indicated for the following uses:[1]
- **Hypercalcemia** in adult patients with **parathyroid carcinoma**.
- **Hypercalcemia** in adult patients with **primary hyperparathyroidism** for whom parathyroidectomy would be indicated on the basis of serum calcium levels, but who are unable to undergo parathyroidectomy.
- **Secondary hyperparathyroidism** in adult patients with chronic kidney disease (CKD) on dialysis.

Disease Overview
Secondary hyperparathyroidism is a frequent complication of CKD caused by a reduction in circulating calcitriol levels and disturbances in calcium and phosphorous metabolism.[2] This leads to increases in the parathyroid hormone (PTH) levels, which then leads to osteoclastic activity resulting in bone resorption and marrow fibrosis.

Parathyroid carcinoma is a rare malignant cancer and is an uncommon cause of primary hyperparathyroidism.[3] The condition is associated with higher serum calcium and PTH levels than primary hyperparathyroidism due to benign adenoma. The primary cause of morbidity in patients with parathyroid carcinoma is due to complications of hypercalcemia (e.g., cardiac arrhythmias, renal failure). Surgical resection of the malignancy may relieve symptoms and reduce serum calcium levels. Medical therapy with cinacalcet and intravenous bisphosphonates are useful adjunct therapies to control hypercalcemia.

Guidelines
The Kidney Disease: Improving Global Outcomes (KDIGO) clinical practice guidelines (2017) for the treatment of CKD-mineral bone disorder (MBD) recommend the use of cinacalcet, calcitriol, vitamin D analogues, or a combination of these agents in CKD stage 5D (dialysis) patients with elevated or rising PTH levels.[4] The guidelines recognize that there are no randomized controlled trials showing that treatment to achieve a specific PTH level results in improved outcomes. There is no established "cause and effect" relationship between the measured biochemical variables and observed outcomes. Therefore, the guidelines recommend interpreting changes in PTH in conjunction with calcium and phosphorous levels to guide therapeutic decisions. In general, in patients with CKD stage 5D, the KDIGO guidelines suggest maintaining intact PTH (iPTH) levels in the range of approximately two to nine times the upper limit of normal for the assay. Changes in therapy are suggested if there are marked changes in PTH levels in either direction within this range. If iPTH levels fall below two times the upper limit of normal for the assay, the use of calcimimetics, calcitriol, or vitamin D analogues should be reduced or discontinued.

Other Uses with Supportive Evidence
The KDIGO clinical practice guidelines (2017) for the treatment of CKD-MBD note that although cinacalcet is not approved for the treatment of hyperparathyroidism in kidney transplant recipients, it is used in these patients, especially those with significant hypercalcemia.[4]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of cinacalcet. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with cinacalcet as well as the monitoring required for adverse events and long-term efficacy, approval requires cinacalcet to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: When available, the ICD-9/ICD-10 codes for Malignant Neoplasm of Parathyroid Gland (ICD-9: 194.1* and ICD-10: C75.0*) AND "oncologist or endocrinologist" will be used as part of automation to allow approval of the requested medication.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of cinacalcet is recommended in those who meet the following criteria:

FDA-Approved Indications

21. Hypercalcemia due to Parathyroid Carcinoma. Approve for 1 year if cinacalcet is prescribed by or in consultation with an oncologist or endocrinologist.

22. Hypercalcemia in Patients with Primary Hyperparathyroidism. Approve for 1 year if the patient meets both of the following criteria (A and B):
- **A)** Patient has failed or is unable to undergo a parathyroidectomy due to a contraindication; AND
- **B)** The medication is prescribed by or in consultation with a nephrologist or endocrinologist.

23. Secondary Hyperparathyroidism. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Patient has chronic kidney disease and is on dialysis; AND
- **B)** The baseline (prior to starting cinacalcet therapy) intact parathyroid hormone (iPTH) level is at least two times the upper limit of normal as defined by the laboratory reference value measured on two separate occasions; AND
- **C)** The medication is prescribed by or in consultation with a nephrologist or endocrinologist.

Other Uses with Supportive Evidence

24. Hyperparathyroidism in Post-Renal Transplant Patients. Approve for 1 year if the patient meets both of the following conditions (A and B):
- **A)** The baseline (prior to starting cinacalcet therapy) calcium and intact parathyroid hormone (iPTH) levels are above the normal range, as defined by the laboratory reference values; AND
- **B)** The medication is prescribed by or in consultation with a transplant physician, nephrologist, or endocrinologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of cinacalcet is not recommended in the following situations:

81. Patients with Primary Hyperparathyroidism eligible for Parathyroidectomy. Parathyroidectomy is the primary treatment for primary hyperparathyroidism.

82. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Colony Stimulating Factors – Filgrastim Products Prior Authorization Policy

- Neupogen® (filgrastim injection for subcutaneous or intravenous use – Amgen)
- Nivestym™ (filgrastim injection for subcutaneous or intravenous use – Hospira/Pfizer)
- Zarxio® (filgrastim-sndz injection for subcutaneous or intravenous use – Sandoz)

REVIEW DATE: 08/19/2020

OVERVIEW

Filgrastim products leukocyte growth factors, are indicated for the following uses:[1-3]

- **Decrease the incidence of infection as manifested by febrile neutropenia**, in patients with nonmyeloid malignancies receiving myelosuppressive anti-cancer drugs associated with a significant incidence of severe neutropenia with fever.
- **Mobilization of hematopoietic progenitor cells,** into the peripheral blood for collection by leukapheresis.
- **Reduce the time to neutrophil recovery and the duration of fever,** following induction or consolidation chemotherapy treatment of adults with acute myeloid leukemia (AML).
- **Reduce the duration of neutropenia and neutropenia-related clinical sequelae (e.g., febrile neutropenia),** in patients with nonmyeloid malignancies undergoing myeloablative chemotherapy followed by marrow transplantation.
- **Reduce the incidence and duration of sequelae of neutropenia (e.g., fever, infections, oropharyngeal ulcers),** in symptomatic patients with congenital neutropenia, cyclic neutropenia, or idiopathic neutropenia.

Nivestym and Zarxio are two products that are biosimilars to Neupogen.[2,3] Neupogen is the only agent indicated to increase survival in patients acutely exposed to myelosuppressive doses of radiation (Hematopoietic Syndrome of Acute Radiation Syndrome).[1] Granix (tbo-filgrastim injection for subcutaneous use) is another filgrastim product.[4]

Guidelines

The National Comprehensive Cancer Network (NCCN) address the use of filgrastim products in several guidelines.

- **Acute Lymphoblastic Leukemia:** Guidelines (version 2.2020 – January 15, 2020) recommend granulocyte colony-stimulating factors (CSFs) as supportive care for myelosuppressive blocks of therapy or as directed by treatment protocol.[7]
- **Hematopoietic Growth Factors:** Guidelines (version 2.2020 – January 27, 2020) recommend filgrastim, along with other CSFs, for prophylactic use if the patient is receiving anti-cancer medications that are associated with a high (> 20%) incidence of severe neutropenia with fever.[5] Consider CSF therapy for patients with an intermediate (10% to 20%) probability of developing febrile neutropenia based on risk factors. The NCCN guidelines also recommend therapy with a CSFs in other scenarios in those given myelosuppressive chemotherapy. Filgrastim products are also recommended for mobilization and following hematopoietic cell transplant.
- **Management of Immunotherapy-Related Toxicities:** Guidelines (version 1.2020 – December 16, 2019) recommend granulocyte CSFs as supportive care for neutropenic patients with Grade 1 cytokine release syndrome resulting from chimeric antigen receptor (CAR) T-cell therapy.[20]
- **Myelodysplastic Syndromes (MDS):** Guidelines (version 2.2020 – February 28, 2020) recommend filgrastim for use in certain patients with MDS (e.g., neutropenic patients with recurrent or resistant infections, combination use with epoetin alfa or Aranesp® [darbepoetin alfa injection] in patients with anemia]).[6]

The American Society of Clinical Oncology clinical practice guidelines for the use of white blood cell growth factors (2015) recommends CSFs to reduce the risk of febrile neutropenia in patients receiving cancer chemotherapy.[6] CSFs may be considered in patients receiving radiation therapy alone if prolonged delays secondary to neutropenia are expected. The guidelines state CSFs should be avoided in patients receiving concomitant chemotherapy and radiation therapy, particularly involving the mediastinum.

Other Uses With Supportive Evidence

Neutropenia occurs in patients with HIV and may be caused by medications or due to the disease process. Studies have demonstrated positive outcomes with the use of filgrastim for the treatment of neutropenia in this patient population.[9-12]

Filgrastim has been used for agranulocytosis caused by non-cytotoxic medications, primarily described in case series, case reports and literature reviews.[13-19]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of filgrastim products. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with filgrastim products as well as the monitoring required for adverse events and long-term efficacy, approval for some conditions requires filgrastim products to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of filgrastim products is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Cancer in a Patient Receiving Myelosuppressive Chemotherapy.** Approve for 6 months if the patient meets the following (A and B):
   A) Patient meets ONE of the following conditions (i, ii, iii, or iv):
      iii. Patient is receiving myelosuppressive anti-cancer medications that are associated with a high risk of febrile neutropenia (the risk is at least 20% based on the chemotherapy regimen); OR
      iv. Patient is receiving myelosuppressive anti-cancer medications that are associated with a risk of febrile neutropenia, but the risk is less than 20% based on the chemotherapy regimen and the patient has at least one risk factor for febrile neutropenia according to the prescriber.
      Note: Examples of risk factors include age ≥ 65 years; prior chemotherapy or radiation therapy; persistent neutropenia; bone marrow involvement by tumor; recent surgery and/or open wounds; liver and/or renal dysfunction; poor performance status; or human immunodeficiency virus (HIV) infection; OR
      v. Patient has had a neutropenic complication from prior chemotherapy and did not receive prophylaxis with a colony stimulating factor and a reduced dose or frequency of chemotherapy may compromise treatment outcome; OR
      Note: Examples of colony-stimulating factors include filgrastim products, pegfilgrastim products, and sargramostim products (e.g., Leukine®).
      vi. Patient who has received chemotherapy has febrile neutropenia and has at least one risk factor for poor clinical outcomes or for developing infection-associated complications according to the prescriber; AND
      Note: Examples of risk factors include sepsis syndrome; age > 65 years; severe neutropenia (absolute neutrophil count [ANC] < 100 cells/mm^3); neutropenia expected to be > 10 days in duration; invasive fungal infection; or other clinically documented infections.
   B) The agent is prescribed by, or in consultation with, an oncologist or hematologist.

2. **Acute Myeloid Leukemia in a Patient Receiving Chemotherapy.** Approve for 6 months if prescribed by or in consultation with an oncologist or hematologist.

3. **Bone Marrow Transplant in a Patient with Cancer Who Received Chemotherapy.** Approve for 1 month if prescribed by or in consultation with a hematologist, an oncologist, or a physician who specializes in transplantation.

4. **Peripheral Blood Progenitor Cell Collection and Therapy.** Approve for 1 month if prescribed by or in consultation with an oncologist, a hematologist or a physician who specializes in transplantation.

5. **Severe Chronic Neutropenia (e.g., Congenital Neutropenia, Cyclic Neutropenia, Idiopathic Neutropenia).** Approve for 6 months if prescribed by or in consultation with a hematologist.

6. **Radiation Syndrome (Hematopoietic Syndrome of Acute Radiation Syndrome).** Approve for 1 month if prescribed by or in consultation with a physician who has expertise in treating acute radiation syndrome.

Other Uses with Supportive Evidence

7. **Neutropenia Associated with Human Immunodeficiency Virus (HIV) or Acquired Immunodeficiency Syndrome (AIDS).** Approve for 4 months if the agent is prescribed by or in consultation with a physician that specializes in infectious diseases, a hematologist, or a physician who specializes in the management of HIV/AIDS.

8. **Myelodysplastic Syndromes.** Approve for 3 months if prescribed by, or in consultation with, an oncologist or hematologist.

9. **Drug-Induced (Non-Chemotherapy) Agranulocytosis or Neutropenia.** Approve for 1 month.

10. **Acute Lymphoblastic Leukemia.** Approve for 1 month if prescribed by or in consultation with an oncologist or a hematologist.

11. **Radiation-Induced Neutropenia.** Approve for 6 months if the patient meets the following criteria (A and B):

A) Patient is not currently receiving chemotherapy; AND
B) The agent is prescribed by, or in consultation with, an oncologist, radiologist or radiation oncologist.

12. Cytokine Release Syndrome Associated with Chimeric Antigen Receptor (CAR) T-Cell Therapy. Approve for 1 month if prescribed for a patient who has neutropenia.
Note: Examples of CAR T-cell therapy include Kymriah™ (tisagenlecleucel intravenous suspension) and Yescarta™ (axicabtagene ciloleucel intravenous suspension).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of filgrastim products is not recommended in the following situations:

9. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date

Annual Revision	The name of the policy was changed from Colony Stimulating Factors – Neupogen PA to Colony Stimulating Factors – Filgrastim products PA. This includes the filgrastim biosimilars of Zarxio and Nivestym. Nivestym was just added to the policy. Zarxio was added to the policy as well and the individual PA policy for Zarxio was retired. Criteria that stated Neupogen or Zarxio was changed to state filgrastim to address all products. For the criteria regarding patients with cancer receiving myelosuppressive therapy in the criteria that reference a colony stimulating factor, the terminology of filgrastim and pegfilgrastim products were added, along with the listing of the individual products, which included adding Nivestym and Fulphila.	08/01/2018
Selected Revision	For the indication regarding Patients with Cancer (Adults and Children) Receiving Myelosuppressive Chemotherapy, removed "(adults and children)".	08/08/2018
Annual Revision	The following changes per the specific indications are cited below: **1. Cancer in Patients Receiving Myelosuppressive Chemotherapy:** CSFs are provided as examples in a Note rather than as part of the criterion. Also, risk factors are now listed as Notes rather than as part of the criterion. The wording in reference to according to the "according to the prescribing physician" was changed to "according to the prescriber". **2. Acute Myeloid Leukemia in Patients Receiving Chemotherapy:** The qualifier of "adults" was removed from the indication. **3. Peripheral Blood Progenitor Cell Collection and Therapy:** The qualifier of "adults and children" was removed from the indication. **4. Severe Chronic Neutropenia:** The qualifier of "adults and children" was removed from the indication. **5. Neutropenia Associated with HIV or AIDS:** The qualifier of "adults" was removed from the indication. **6. MDS:** The qualifier of "adults" was removed from the indication. **7. Aplastic Anemia:** The criteria for approval were eliminated for this condition.	08/21/2019
Annual Revision	Cytokine release syndrome associated with chimeric antigen receptor (CAR) T-cell therapy and criteria were added as an approval condition.	08/19/2020

PRIOR AUTHORIZATION POLICY

POLICY: Colony Stimulating Factors – Granix Prior Authorization Policy

- Granix® (tbo-filgrastim injection for subcutaneous use – Teva)

REVIEW DATE: 08/19/2020

OVERVIEW

Granix, a leukocyte growth factor, is indicated to reduce the duration of severe neutropenia in adults and pediatric patients 1 month of age and older with non-myeloid malignancies receiving myelosuppressive anti-cancer medications associated with a clinically significant incidence of febrile neutropenia.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) address the use of Granix in guidelines.

- **Hematopoietic Growth Factors:** Guidelines (version 2.2020 – January 27, 2020) recommend Granix, along with other granulocyte colony stimulating factors (CSFs), for prophylactic use if the patient is receiving anti-cancer medications that are associated with a high (> 20%) incidence of severe neutropenia with fever.[2] Consider CSF therapy for patients with an intermediate (10% to 20%) probability of developing febrile neutropenia based on risk factors. The NCCN guidelines also recommend therapy with a CSFs in other scenarios in those given myelosuppressive chemotherapy. Granix is also recommended for mobilization and following hematopoietic cell transplant.
- **Myelodysplastic Syndromes (MDS):** Guidelines (version 2.2020 – February 28, 2020) recommend Granix for use in certain patients with MDS (e.g., neutropenic patients with recurrent

or resistant infections, combination use with epoetin alfa or Aranesp® [darbepoetin alfa injection] in patients with anemia]).[3]

The American Society of Clinical Oncology clinical practice guidelines for the use of white blood cell growth factors (2015) recommends CSFs to reduce the risk of febrile neutropenia in patients receiving cancer chemotherapy.[4] CSFs may be considered in patients receiving radiation therapy alone if prolonged delays secondary to neutropenia are expected. The guidelines state CSFs should be avoided in patients receiving concomitant chemotherapy and radiation therapy, particularly involving the mediastinum.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Granix. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Granix as well as the monitoring required for adverse events and long-term efficacy, approval requires Granix to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Granix is recommended in those who meet the following criteria:

FDA-Approved Indications

12. Cancer in a Patient Receiving Myelosuppressive Chemotherapy. Approve for 6 months if the patient meets the following (A and B):

B) Patient meets ONE of the following conditions (i, ii, iii, or iv):

vii. Patient is receiving myelosuppressive anti-cancer medications that are associated with a high risk of febrile neutropenia (the risk is at least 20% based on the chemotherapy regimen); OR

viii. Patient is receiving myelosuppressive anti-cancer medications that are associated with a risk of febrile neutropenia, but the risk is less than 20% based on the chemotherapy regimen and the patient has at least one risk factor for febrile neutropenia according to the prescriber; OR

Note: Examples of risk factors include age ≥ 65 years; prior chemotherapy or radiation therapy; persistent neutropenia; bone marrow involvement by tumor; recent surgery and/or open wounds; liver and/or renal dysfunction; poor performance status; or human immunodeficiency virus (HIV) infection.

ix. Patient has had a neutropenic complication from prior chemotherapy and did not receive prophylaxis with a colony stimulating factor and a reduced dose or frequency of chemotherapy may compromise treatment outcome; OR

Note: Examples of colony-stimulating factors include filgrastim products, pegfilgrastim products, and sargramostim products (e.g., Leukine®).

x. Patient who has received chemotherapy has febrile neutropenia and has at least one risk factor for poor clinical outcomes or for developing infection-associated complications according to the prescriber; AND

Note: Examples of risk factors include sepsis syndrome; age > 65 years; severe neutropenia (absolute neutrophil count [ANC] < 100 cells/mm^3); neutropenia expected to be > 10 days in duration; invasive fungal infection; other clinically documented infections; or prior episode of febrile neutropenia.

B) The medication is prescribed by, or in consultation with, an oncologist or hematologist.

Other Uses with Supportive Evidence

13. Peripheral Blood Progenitor Cell Collection and Therapy. Approve for 1 month if prescribed by or in consultation with an oncologist, a hematologist or a physician who specializes in transplantation.

14. Myelodysplastic Syndromes. Approve for 3 months if prescribed by, or in consultation with, an oncologist or hematologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Granix is not recommended in the following situations:

10. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	For the criteria regarding patients with cancer receiving myelosuppressive therapy who are adults, in the criteria that reference a colony stimulating factor, the terminology of filgrastim and pegfilgrastim products were added, along with the listing of the individual products, which included adding Nivestym and Fulphila.	08/01/2018
Selected Revision	For the indication of cancer patients receiving myelosuppressive chemotherapy, removed the notation "who are adults" to reflect FDA-approval of Granix in children.	08/08/2018
Annual Revision	The following changes per the specific indications are cited below: **8. Cancer in Patients Receiving Myelosuppressive Chemotherapy:** CSFs are now provided as examples in a Note rather than as part of the criterion. Also, risk factors are now listed as Notes rather than as part of the criterion. The wording in reference to "according to the prescribing physician" was changed to "according to the prescriber". **9. Peripheral Blood Progenitor Cell Collection and Therapy:** The qualifier of "adults and children" was removed from the indication.	08/21/2019
Annual Revision	Myelodysplastic Syndromes and criteria were added as an approval condition.	08/19/2020

PRIOR AUTHORIZATION POLICY

POLICY: Colony Stimulating Factors – Leukine Prior Authorization Policy

- Leukine® (sargramostim injection – Partner Therapeutics)

REVIEW DATE: 08/19/2020

OVERVIEW

Leukine, a recombinant human granulocyte macrophage colony stimulating factor (GM-CSF), is indicated for the following uses:[1]

- **Acute exposure to myelosuppressive doses of radiation,** to increase survival in adult and pediatric patients from birth to 17 years of age acutely exposed to myelosuppressive doses of radiation (hematopoietic syndrome of acute radiation syndrome).
- **Acute myeloid leukemia following induction chemotherapy**, to shorten the time to neutrophil recovery and to reduce the incidence of severe, life-threatening, or fatal infections in patients ≥ 55 years of age.
- **Allogeneic bone marrow transplantation,** for acceleration of myeloid reconstitution in adult and pediatric patients ≥ 2 years of age undergoing allogeneic bone marrow transplantation from human leukocyte antigen-matched related donors.
- **Allogeneic or autologous bone marrow transplantation: treatment of delayed neutrophil recovery or graft failure,** treatment of patients ≥ 2 years of age who have undergone allogeneic or autologous bone marrow transplantation in whom neutrophil recovery is delayed or failed.
- **Autologous peripheral blood progenitor cell (PBPC) and bone marrow transplantation,** acceleration of myeloid reconstitution after autologous PBPC or bone marrow transplantation in

adult and pediatric patients 2 years of age and older with non-Hodgkin's lymphoma, acute lymphoblastic leukemia, and Hodgkin's lymphoma.

- **Autologous peripheral blood progenitor cell mobilization and collection,** in adult patients with cancer undergoing autologous hematopoietic stem cell transplantation for the mobilization of hematopoietic progenitor cells into peripheral blood for collection by leukapheresis.

Other Uses With Supportive Evidence

Unituxin® (dinutuximab injection for intravenous use) is indicated for use in combination with GM-CSF, interleukin-2, and 13-cis-retinoic acid for the treatment of pediatric patients with high-risk neuroblastoma who achieve at least a partial response to first-line, multiagent, multimodality therapy.[2]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Leukine. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Leukine as well as the monitoring required for adverse events and long-term efficacy, approval requires Leukine to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Leukine is recommended in those who meet the following criteria:

FDA-Approved Indications

7. **Acute Myeloid Leukemia.** Approve for 6 months if the patient is prescribed by or in consultation with an oncologist or a hematologist.

8. **Peripheral Blood Progenitor Cell Collection and Therapy.** Approve for up to 14 days if the agent is prescribed by or in consultation with an oncologist, a hematologist, or a physician that specializes in transplantation.

9. **Bone Marrow Transplant.** Approve for 1 month if prescribed by or in consultation with a hematologist, an oncologist, or a physician who specializes in transplantation.

10. **Radiation Syndrome (Hematopoietic Syndrome of Acute Radiation Syndrome).** Approve for 1 month if the agent is prescribed by or in consultation with a physician with expertise in treating acute radiation syndrome.

Other Uses with Supportive Evidence

11. **Neuroblastoma.** Approve for 6 months if the patient meets the following criteria (A, B and C):
    - **A)** The patient is < 18 years of age; AND
    - **B)** The patient is receiving Leukine in a regimen with Unituxin® (dinutuximab injection for intravenous use); AND
    - **C)** The agent is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Leukine is not recommended in the following situations:

11. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
New Policy	--	03/13/2019
Early annual revision	Changes per the specific indications were as follows: 1. **Bone Marrow Transplant.** Criteria were added that approves Leukine for 1 month if prescribed by or in consultation with a hematologist, an oncologist, or a physician who specializes in transplantation. Previously, criterion directed to a Medical Director and this criterion was removed. 2. **Cancer in Patients Receiving Myelosuppressive Chemotherapy:** This indication for use, and related criteria, were removed. **3. Myelodysplastic syndrome:** This indication for use was deleted. **4. Neuroblastoma:** Criteria were added that the patient is < 18 years of age and the phrase "Pediatric Patients with High Risk" was removed from the cited condition of approval..	08/21/2019
Annual Revision	No criteria changes.	08/19/2020

PRIOR AUTHORIZATION POLICY

POLICY: Colony Stimulating Factors – Pegfilgrastim Products Prior Authorization Policy

- Fulphila™ (pegfilgrastim-jmdb injection for subcutaneous use – Mylan)
- Neulasta® (pegfilgrastim injection for subcutaneous use [includes single-dose prefilled syringes for manual use and single-dose prefilled syringe co-packaged with the On-body Injector] – Amgen)
- Nyvepria™ (pegfilgrastim-apgf injection for subcutaneous use – Pfizer)
- Udenyca™ (pegfilgrastim-cbqv injection for subcutaneous use – Coherus)
- Ziextenzo™ (pegfilgrastim-bmez injection for subcutaneous use – Sandoz)

REVIEW DATE: 08/19/2020

OVERVIEW

Pegfilgrastim, a leukocyte growth factor, is indicated to decrease the incidence of infection, as manifested by febrile neutropenia, in patients with non-myeloid malignancies receiving myelosuppressive anti-cancer drugs associated with a clinically significant incidence of febrile neutropenia.[1-5] Fulphila, Nyvepria, Udenyca, and Ziextenzo are biosimilars to Neulasta. Neulasta is additionally indicated to increase survival in patients acutely exposed to myelosuppressive doses of radiation (Hematopoietic Subsyndrome of Acute Radiation Syndrome).[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) address the use of filgrastim products in guidelines for hematopoietic growth factors (version 2.2020 – January 27, 2020).[6] Guidelines recommend pegfilgrastim, along with other granulocyte colony stimulating factors (CSFs), for prophylactic use if the patient is receiving anti-cancer medications that are associated with a high (> 20%) incidence of severe neutropenia with fever.[5] Consider CSF therapy for patients with an intermediate (10% to 20%) probability of developing febrile neutropenia based on risk factors. The NCCN guidelines also endorse pegfilgrastim for the treatment of hematopoietic acute radiation syndrome and as supportive care post autologous hematopoietic cell transplant. NCCN recognize biosimilars as substitutes for Neulasta.

The American Society of Clinical Oncology clinical practice guidelines for the use of white blood cell growth factors (2015) recommends CSFs to reduce the risk of febrile neutropenia in patients receiving cancer chemotherapy.[7] CSFs may be considered in patients receiving radiation therapy alone if prolonged delays secondary to neutropenia are expected. The guidelines state CSFs should be avoided in patients receiving concomitant chemotherapy and radiation therapy, particularly involving the mediastinum.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of pegfilgrastim. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with pegfilgrastim as well as the monitoring required for adverse events and long-term efficacy, approval requires pegfilgrastim to be prescribed by or in consultation with a physician who specializes in the condition being treated.
Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of pegfilgrastim products is recommended in those who meet the following criteria:

FDA-Approved Indications

15. **Cancer in a Patient Receiving Myelosuppressive Chemotherapy**. Approve for 6 months if the patient meets the following criteria (A and B):
    - **A)** Patient meets ONE of the following conditions (i, ii, or iii):
        - **i.** Patient is receiving myelosuppressive anti-cancer medications that are associated with a high risk of febrile neutropenia (the risk is at least 20% based on the chemotherapy regimen); OR
        - **ii.** Patient is receiving myelosuppressive anti-cancer medications that are associated with a risk of febrile neutropenia but the risk is less than 20% based on the chemotherapy regimen and the patient has at least one risk factor for febrile neutropenia according to the prescriber; OR
          Note: Examples of risk factors include age ≥ 65 years; prior chemotherapy or radiation therapy; persistent neutropenia; bone marrow involvement by tumor; recent surgery and/or open wounds; liver and/or renal dysfunction; poor performance status; or human immunodeficiency virus (HIV) infection.
        - **iii.** The patient has had a neutropenic complication from prior chemotherapy and did not receive prophylaxis with a colony stimulating factor and a reduced dose or frequency of chemotherapy may compromise treatment outcome; AND
          Note: Examples of colony-stimulating factors include filgrastim products, pegfilgrastim products, and sargramostim products (e.g., Leukine®).
    - **B)** The medication is prescribed by or in consultation with an oncologist or hematologist.

12. **Radiation Syndrome (Hematopoietic Syndrome of Acute Radiation Syndrome).** Approve for 1 month if the agent is prescribed by or in consultation with a physician with expertise in treating acute radiation syndrome.

Other Uses with Supportive Evidence

13. **Peripheral Blood Progenitor Cell Transplantation in Patients with Cancer.** Approve one dose if prescribed by or in consultation with, an oncologist, a hematologist, or a physician who specializes in transplantation.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of pegfilgrastim products is not recommended in the following situations:

12. **Myelodysplastic Syndrome (MDS).** Only limited data report use of pegfilgrastim for patients with MDS.[8] Guidelines from the NCCN for MDS (version 2.2020 – February 28, 2020) do not mention use of pegfilgrastim in this patient population.[9]

13. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Annual Revision	No criteria changes.	08/19/2020

PRIOR AUTHORIZATION POLICY

POLICY: Complement Inhibitors – Soliris Prior Authorization Policy

- Soliris® (eculizumab injection for intravenous use – Alexion)

REVIEW DATE: 05/27/2020; selected revision 09/16/2020

OVERVIEW

Soliris, a complement inhibitor, is indicated for the following uses:[1]

- **Atypical hemolytic uremic syndrome** (aHUS), to inhibit complement-mediated thrombotic microangiopathy.
- **Generalized myasthenia gravis** (gMG), in adult patients who are anti-acetylcholine receptor (AChR) antibody positive.
- **Neuromyelitis optica spectrum disorder** (NMOSD), in adult patients who are anti-aquaporin-4 (AQP4) antibody positive.

- **Paroxysmal nocturnal hemoglobinuria** (PNH), to reduce hemolysis.

Soliris is not indicated for the treatment of patients with Shiga toxin E. coli related hemolytic uremic syndrome. The safety and effectiveness of Soliris for the treatment of PNH, gMG, and NMOSD in pediatric patients have not been established. The safety and effectiveness of Soliris in pediatric patients for aHUS is supported by evidence from four adequate and well-controlled clinical studies assessing the safety and effectiveness of Soliris for the treatment of aHUS.

Disease Overview

Myasthenia gravis (MG) is a chronic autoimmune neuromuscular disease that causes weakness in the skeletal muscles, which are responsible for breathing and moving parts of the body, including the arms and legs.[4] The hallmark of myasthenia gravis is muscle weakness that worsens after periods of activity and improves after periods of rest. Certain muscles such as those that control eye and eyelid movement, facial expression, chewing, talking, and swallowing are often involved in the disorder; however, the muscles that control breathing and neck and limb movements may also be affected. Acquired MG results from the binding of autoantibodies to components of the neuromuscular junction, most commonly the AChR.[5]

PNH is a rare disorder involving bone marrow failure that manifests with hemolytic anemia, thrombosis, and peripheral blood cytopenias.[6] Due to the absence of two glycosylphosphatidylinositol (GPI)-anchored proteins, CD55 and CD59, uncontrolled complement activation leads to hemolysis and other PNH manifestations. GPI anchor protein deficiency is often due to mutations in phosphatidylinositol glycan class A (PIGA), a gene involved in the first step of GPI anchor biosynthesis. PNH is a clinical diagnosis that should be confirmed with peripheral blood flow cytometry to detect the absence or severe deficiency of GPI-anchored proteins on at least two lineages. Prior to the availability of Soliris, there was no specific therapy for PNH with only supportive management in terms of the cytopenias and control of thrombotic risk. Supportive measures used include platelet transfusion, immune suppressive therapy for patients with bone marrow failure, use of erythropoietin for anemias, and aggressive anticoagulation. Soliris is the treatment of choice for patients with severe manifestations of PNH. Bone marrow transplantation is the only cure for PNH but should be reserved for patients with a suboptimal response to Soliris.

NMOSD is a rare, relapsing, autoimmune disorder of the brain and spinal cord with optic neuritis and/or myelitis as predominate characteristic symptoms.[2] NMOSD often causes significant, permanent damage to vision and/or spinal cord function causing blindness or impaired mobility.[3] Patients may experience pain, paralysis, loss of bowel and bladder control, loss of visual acuity, uncontrolled motor functions, and complications can cause death. Uplizna™ (inebilizumab-cdon injection for intravenous infusion) and Enspryng™ (satralizumab-mwge for subcutaneous injection) are two other FDA-approved medications for treatment of NMOSD in adults who are anti-AQP4 antibody-positive.[4,5] For acute attacks, typical treatment is high-dose intravenous corticosteroids.[6,7] Plasma exchange may be effective in patients who suffer acute severe attacks that do not response to intravenous corticosteroids. For long-term control of the disease a variety of immunosuppressive drugs are utilized as first-line therapy. While all are considered off-label use, corticosteroids, azathioprine, mycophenolate mofetil, and rituximab are treatments prescribed as preventative therapy.

Guidelines

An international consensus guidance for the management of MG was published in 2016 and do not address Soliris.[5] The guidelines recommend pyridostigmine for the initial treatment in most patients with MG. The ability to discontinue pyridostigmine can indicate that the patient has met treatment goals and may guide the tapering of other therapies. Corticosteroids or immunosuppressant therapy should be used in all patients with MG who have not met treatment goals after an adequate trial of pyridostigmine. Nonsteroidal immunosuppressant agents include azathioprine, cyclosporine, mycophenolate mofetil, methotrexate, and tacrolimus. It is usually necessary to maintain some immunosuppression for many years, sometimes for life. Plasma exchange and intravenous immunoglobulin can be used as short-term treatments in certain patients. The guidelines note that few physicians treat enough patients with MG to be comfortable with all available treatments.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Soliris. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of

the specialized skills required for evaluation and diagnosis of patients treated with Soliris as well as the monitoring required for adverse events and long-term efficacy, approval requires Soliris to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Soliris is recommended in those who meet the following criteria:

FDA-Approved Indications

25. Atypical Hemolytic Uremic Syndrome. Approve for 1 year if the patient meets the following criteria (A and B):
- **20.** Patient does not have Shiga toxin *E. coli* related hemolytic uremic syndrome; AND
- **21.** The medication is being prescribed by or in consultation with a nephrologist.

26. Generalized Myasthenia Gravis. Approve if the patient meets ONE of the following criteria (A or B):

B) Initial therapy: Approve for 6 months if the patient meets the following criteria (i, ii, iii, iv, v, and vi):
- **i.** Patient is ≥ 18 years of age; AND
- **ii.** Patient has confirmed anti-acetylcholine receptor antibody positive generalized Myasthenia Gravis; AND
- **iii.** Patient is currently receiving or has tried and has contraindications, intolerance, or failed pyridostigmine; AND
- **iv.** Patient is currently receiving or has tried and has contraindications, intolerance, or failed two different immunosuppressant therapies over ≥ 1 year; AND
  Note: Examples of immunosuppressant therapies tried include azathioprine, cyclosporine, mycophenolate mofetil, methotrexate, tacrolimus, cyclophosphamide.
- **v.** Patient has evidence of unresolved symptoms of generalized Myasthenia Gravis, such as difficulty swallowing, difficulty breathing, or a functional disability resulting in the discontinuation of physical activity (e.g., double vision, talking, impairment of mobility); AND
- **vi.** The medication is being prescribed by or in consultation with a neurologist.

C) Patient currently receiving Soliris. Approve for 1 year if the patient is continuing to derive benefit from Soliris, according to the prescriber.
Note: Examples of derived benefit include reductions in exacerbations of myasthenia gravis; improvements in speech, swallowing, mobility, and respiratory function.

27. Neuromyelitis Optica Spectrum Disorder. Approve if the patient meets ONE of the following criteria (A or B):

A) Initial Therapy. Approve for 1 year if the patient meets the following criteria (i, ii, iii, iv, and v):
- **i.** Patient is ≥ 18 years of age; AND
- **ii.** Neuromyelitis optica spectrum disorder diagnosis was confirmed by blood serum test for anti-aquaporin-4 antibody positive; AND
- **iii.** Patient is currently receiving or has previously tried two of the following systemic therapies (a, b, c, or d):
  - **a.** Azathioprine; OR
  - **b.** Corticosteroid; OR
  - **c.** Mycophenolate mofetil; OR
  - **d.** Rituximab; AND
    Note: An exception to the requirement for a trial of a systemic therapy can be made if the patient has already tried Enspryng™ (satralizumab-mwge for subcutaneous injection) or Uplizna™ (inebilizumab-cdon injection) for neuromyelitis optica spectrum disorder. Patients who have already tried Enspryng or Uplizna for neuromyelitis optica spectrum disorder are not required to try another systemic agent.
- **iv.** Patient has a history of at least 1 relapse in the last 12 months or two relapses in the last 2 years; AND
- **v.** The medication is being prescribed by or in consultation with a neurologist.

B) Patients Currently Receiving Soliris. Approve for 1 year if the patient meets the following (i, ii, iii, and iv):
- **i.** Patient is ≥ 18 years of age; AND
- **ii.** Neuromyelitis optica spectrum disorder diagnosis was confirmed by blood serum test for anti-aquaporin-4 antibody positive; AND
- **iii.** According to the prescriber, patient has had clinical benefit from the use of Soliris; AND
  Note: Examples of clinical benefit include reduction in relapse rate, reduction in symptoms (e.g., pain, fatigue, motor function), and a slowing progression in symptoms.
- **iv.** The medication is being prescribed by or in consultation with a neurologist.

28. Paroxysmal Nocturnal Hemoglobinuria. Approve if the patient meets ONE of the following (A or B):

A) Initial therapy: Approve for 6 months if the patient meets the following criteria (i, ii, and iii):
- **i.** Patient is ≥ 18 years of age; AND
- **ii.** Paroxysmal nocturnal hemoglobinuria diagnosis was confirmed by peripheral blood flow cytometry results showing the absence or deficiency of glycosylphosphatidylinositol (GPI)-anchored proteins on at least two cell lineages; AND
- **iii.** The medication is being prescribed by or in consultation with a hematologist; OR

B) Patient currently receiving Soliris: Approve for 1 year if the patient is continuing to derive benefit from Soliris, according to the prescriber.
Note: Examples of derived benefit include stabilization of hemoglobin levels, decreased transfusion requirements or transfusion independence, reductions in hemolysis.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Soliris is not recommended in the following situations:

14. Concomitant use with a rituximab product, Enspryng™ (satralizumab-mwge), or Uplizna™ (inebilizumab-cdon injection). There is no evidence to support additive efficacy of combining Soliris with rituximab, Enspryng or Uplizna.

15. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Annual Revision	No change to criteria.	05/29/2019
Selected Revision	**Neuromyelitis Optica Spectrum Disorder** approval **Criteria** were added to the FDA-approved indications section of the policy.	08/07/2019
Annual Revision	No changes to criteria.	05/27/2020
Selected Revision	**Generalized Myasthenia Gravis (gMG).** Examples of immunosuppressant therapies were changed to a Note. For patients currently receiving Soliris, examples of the patient continuing to derive benefit was changed to a Note and prescribing physician was changed to prescriber. **Paroxysmal Nocturnal Hemoglobinuria.** For patients currently receiving Soliris, examples of the patient continuing to derive benefit was changed to a Note and prescribing physician was changed to prescriber. **Neuromyelitis Optica Spectrum Disorder.** Criteria was separated into Initial Therapy and Patients Currently Receiving Soliris. For both sections, criteria for approval duration, age restriction, diagnosis confirmation, and specialist requirement remained the same as before. For Initial Therapy, a Note was created to allow an exception to previously tried systemic therapies for patients who have tried Enspryng or Uplizna. Criteria for a history of previous relapses were added. For Patients Currently Receiving Soliris, criteria were added to show the patient is receiving a clinical benefit from Soliris. **Concomitant use with a rituximab product, Soliris® (eculizumab injection), or Enspryng™ (satralizumab-mwge injection)** was added as a condition not recommended for approval.	09/09/2020

PRIOR AUTHORIZATION POLICY

POLICY: Complement Inhibitors – Ultomiris Prior Authorization Policy

- Ultomiris™ (ravulizumab-cwvz injection for intravenous use – Alexion)

REVIEW DATE: 11/04/2020

OVERVIEW

Ultomiris, a complement inhibitor, is indicated for the following uses:[1]

- **Atypical hemolytic uremic syndrome** (aHUS), in adults and pediatric patients one month of age and older.
- **Paroxysmal nocturnal hemoglobinuria** (PNH), in adults.

The safety and effectiveness of Ultomiris for the treatment of PNH in pediatric patients have not been established.[1] PNH is a clinical diagnosis that should be confirmed with peripheral blood flow cytometry to detect the absence or severe deficiency of glycosylphosphatidylinositol (GPI)-anchored proteins on at least two lineages.[2] The recommended dosing regimen for adults with PNH consists of a weight-based loading dose (dosage range: 2,400 mg to 3,000 mg) followed by maintenance dosing (dosage range: 3,000 mg to 3,600 mg), administered by intravenous (IV) infusion.[1] Starting 2 weeks after the loading dose administration, begin maintenance doses at a once every 8-week interval. The recommended dosing regimen for patients with aHUS consists of a weight-based loading dose (dosage range: 600 mg to 3,000 mg) followed by maintenance dosing (dosage range: 300 mg to 3,600 mg), administered by IV infusion. Starting 2 weeks after the loading dose administration, begin maintenance doses at a once every 4-week interval for patients ≥ 5 kg to < 20 kg or at a once every 8-week interval for patients ≥ 20 kg. For both PNH and aHUS the dosing schedule is allowed to occasionally vary within 7 days of the scheduled infusion day (with the exception of the first maintenance dose) but the subsequent dose should be administered according to the original schedule.

Disease Overview

Hemolytic uremic syndrome (HUS) is defined as the triad of non-immune hemolytic anemia, thrombocytopenia, and acute renal failure, in which the underlying lesions are mediated by systemic thrombotic microangiopathy (TMA).[4]

The TMA process that characterizes HUS can be caused by a variety of things. Atypical HUS (aHUS) is a sub-type of HUS in which TMA are the consequence of endothelial damage in the microvasculature of the kidneys and other organs due to a dysregulation of the activity of the complement system. Various aHUS-related mutations have been identified in genes of the complement system, which can explain approximately 60% of the aHUS cases, and a number of mutations and polymorphisms have been functionally characterized. aHUS should be distinguished from a more common condition referred to as typical HUS.[5] The two disorders have different causes and different signs and symptoms. Unlike aHUS, the typical form is caused by infection with certain strains of *Escherichia coli* (*E. coli*) bacteria that produce toxic substances called Shiga-like toxins. The typical form is characterized by severe diarrhea and most often affects children < 10 years of age, and it is less likely than aHUS to involve recurrent attacks of kidney damage that lead to end stage renal disease (ESRD). The incidence of aHUS is estimated to be 1:500,000 people/year in the US; aHUS is approximately 10 times less common than typical HUS.

PNH is a rare disorder involving bone marrow failure that manifests with hemolytic anemia, thrombosis, and peripheral blood cytopenias.[2] Due to the absence of two GPI-anchored proteins, CD55 and CD59, uncontrolled complement activation leads to hemolysis and other PNH manifestations. GPI anchor protein deficiency is often due to mutations in phosphatidylinositol glycan class A (PIGA), a gene involved in the first step of GPI anchor biosynthesis. Prior to the availability of Soliris® (eculizumab injection for IV) [a complement inhibitor][3], there was no specific therapy for PNH with only supportive management in terms of the cytopenias and control of thrombotic risk. Supportive measures used include platelet transfusion, immune suppressive therapy for patients with bone marrow failure, use of erythropoietin for anemias, and aggressive anticoagulation. Soliris is the treatment of choice for patients with severe manifestations of PNH. Bone marrow transplantation is the only cure for PNH but should be reserved for patients with a suboptimal response to medication.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Ultomiris. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Ultomiris as well as the monitoring required for adverse events and long-term efficacy, approval requires Ultomiris to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Ultomiris is recommended in those who meet the following criteria:

FDA-Approved Indications

29. Paroxysmal Nocturnal Hemoglobinuria. Approve for the duration noted if the patient meets ONE of the following (A or B):

B) Initial therapy: Approve Ultomiris for 6 months if the patient meets the following criteria (i, ii, and iii):
- **i.** Patient is ≥ 18 years of age; AND
- **ii.** Paroxysmal nocturnal hemoglobinuria diagnosis was confirmed by peripheral blood flow cytometry results showing the absence or deficiency of glycosylphosphatidylinositol (GPI)-anchored proteins on at least two cell lineages; AND
- **iii.** Ultomiris is being prescribed by or in consultation with a hematologist; OR

C) Patient currently receiving Ultomiris: Approve Ultomiris for 1 year if the patient is continuing to derive benefit from Ultomiris, according to the prescriber.
Note: Examples of benefit from Ultomiris include stabilization of hemoglobin levels, decreased transfusion requirements or transfusion independence, reductions in hemolysis.

30. Atypical Hemolytic Uremic Syndrome. Approve for 1 year if the patient meets the following criteria (A and B):
- **22.** Patient does not have Shiga toxin *E. coli* related hemolytic uremic syndrome; AND
- **23.** Ultomiris is being prescribed by or in consultation with a nephrologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Ultomiris is not recommended in the following situations:

16. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
New Policy	--	12/24/2018
Early Annual Revision	The condition of Atypical Hemolytic Uremic Syndrome and criteria were added to the policy within the FDA-approved indications.	11/06/2019
Annual Revision	**Paroxysmal Nocturnal Hemoglobinuria.** For patients currently receiving Ultomiris, the wording of "prescribing physician" was changed to "prescriber". Also, examples of benefit from Ultomiris were changed to a Note.	11/04/2020

PRIOR AUTHORIZATION POLICY

POLICY: Compounded Select Topical Medications (topical ketamine, topical gabapentin, topical diclofenac, topical ketoprofen, topical flurbiprofen, topical nabumetone, topical meloxicam, topical hyaluronic acid, topical mometasone furoate, topical fluticasone propionate)

DATE REVIEWED: 05/13/2020

OVERVIEW

Compounded products are used for a variety of indications from treating pain to hormone therapy. The compounded formulations can contain just one active drug in a base vehicle or they may contain a combination of active drugs. Compounded medications are not Food and Drug Administration (FDA) approved, thus the FDA has limited regulatory authority over compounding pharmacies since they are licensed by their respective state board of pharmacy. Compounded medications also do not undergo the rigorous drug review process to demonstrate safe and effective use in patients that all commercially available prescription drugs must establish prior to widespread availability. Also, compounded medications generally do not have standardized dosages and duration for use; likewise, there are no standardized protocols to prepare each compound. For these reasons, compounded preparations are at a greater propensity to have batch-to-batch variability and the product sterility/purity cannot be guaranteed relative to the commercially available products.

EFFICACY

There are very limited published controlled studies with established safety and efficacy data supporting use of compounded medications for any condition. The available efficacy data for the targeted topical compounds in this policy are described below.

Topical Ketamine

There are four randomized, placebo-controlled studies published assessing the use of compounded topical ketamine for neuropathic pain. *Study 1* enrolled patients (n = 208) with chemotherapy-induced peripheral neuropathy (CIPN) and randomized them to either a placebo gel or a compounded mixture containing baclofen 10 mg, amitriptyline 40 mg, and ketamine 20 mg in a pluronic lecithin organogel (BAK-PLO) vehicle base.[1] Patients applied the gel twice daily (BID) for 4 weeks. There was a trend towards improvement in the sensory neuropathy scale (primary endpoint) compared with placebo, though it was not statistically significant (P = 0.053). Statistically significant improvement was noted with the motor subscale (P = 0.021). *Study 2* enrolled patients (n = 92) with mixed neuropathic pain (i.e., diabetic neuropathy [n = 20/92], postherpetic neuralgia [n = 14/92], post-surgical/post-traumatic neuropathic pain [n = 58/92] with allodynia, hyperalgesia, or pinprick hyperthesia) and evaluated the application of one of four topical creams: topical amitriptyline 2%, topical ketamine 1%, a combination of topical amitriptyline 2% and topical ketamine 1%, or placebo (vehicle base).[2] Patients applied 4 mL cream to the site of maximum pain three times daily (TID) for 3 weeks. Pain levels at the end of the study compared with baseline were not statistically significant between treatment groups. *Study 3* evaluated the efficacy of topical ketamine 5% cream applied TID for 4 weeks in patients (n = 17) with diabetic neuropathy.[3] Seven different pain characteristics (i.e., intensity, sharpness, cold, hot, dull, sensitive, and itchy) were measured using a pain scale both before and after treatment. Diabetic pain measures were reduced in both treatment groups and the placebo effect was equally as strong as ketamine 5% cream. *Study 4* was a cross-over trial that assessed the efficacy of (S)-ketamine 1% ointment or placebo applied four times daily (QID) for 15 days in patients (n = 12) with postherpetic neuralgia.[4] There was a wash-out period of 7 days in-between crossover. A numerical verbal scale was used to assess pain scores and efficacy of therapy during three different clinic visits. There was no statistical significance in pain scores during treatments with (S)-ketamine 1% ointment or placebo.

One small randomized, double-blind, placebo-controlled study assessed the use of compounded topical ketamine in patients (n = 20) with complex regional pain syndrome (CRPS).[5] CRPS has been described as a challenging pain syndrome usually starting after a trauma or surgery.[6] CRPS can be classified into two types: patients with CRPS type 1 do not have demonstrable nerve lesions and type 2 is based on objective nerve damage, most commonly caused by severe trauma. CRPS type 1 has also been recognized as a chronic neuropathic pain syndrome that typically develops in an extremity after tissue trauma. The above mentioned study[5] concluded that topical ketamine did not lead to pain reduction in patients with CRPS, but it did reduce allodynia to brushing.

Topical Gabapentin

There are no published data available with the use of compounded topical gabapentin for neuropathic pain.

The only published trial available is a retrospective study assessing the use of topical gabapentin 2% to 6% cream in women (n = 51) with vulvodynia (chronic, unexplained vulvar pain or discomfort, characterized by burning, stinging, irritation or rawness).[7] After a minimum of 8 weeks of therapy with application of gabapentin cream TID, about 80% of the patients demonstrated at least a 50% improvement in their pain scores. The British Society for the Study of Vulval Diseases guidelines (2010) for the management of vulvodynia do not list topical gabapentin as a therapeutic choice (oral gabapentin is considered an option).[8]

Topical Hyaluronic Acid Sodium Salt

Hyaluronic acid is a naturally occurring polysaccharide that is widely distributed in various body tissues.[9] Sodium hyaluronate and other derivatives are used for a variety of conditions, such as osteoarthritis (OA), and as surgical aid in ophthalmic procedures. It is available commercially as FDA-approved products in various dosage forms: as intra-articular injections (e.g., Synvisc®) for the treatment of knee OA; as ophthalmic solution for irrigation (e.g., Vitrax®); and as topical spray, cream, and gel products for use in wound care (e.g., Hylase® wound gel, Bionect® topical gel, cream, spray). There are also multiple

hyaluronic acid products available as intradermal injectable gel for use as wrinkle fillers in cosmetic procedures (e.g., Juvederm® XC). Most of the hyaluronic acid products were approved as devices by the FDA.

There are limited published data available with the use of compounded topical hyaluronic acid as vaginal suppositories for the treatment of vaginal atrophy in postmenopausal women.[10-14] If over-the-counter (OTC) vaginal moisturizers were ineffective as initial treatment, prescription vaginal estrogen therapy is the recommended first-line agent for the treatment of symptomatic vaginal atrophy.[15]

Topical Corticosteroids – Fluticasone Propionate, Mometasone Furoate
Fluticasone propionate and mometasone furoate are corticosteroids which are used intranasally for the treatment of allergic and non-allergic rhinitis, by oral inhalation for the treatment of asthma and/or chronic obstructive pulmonary disease (COPD), and as topical preparations for the treatment of inflammatory and pruritic types of dermatoses and psoriasis.[9] These two corticosteroids are available as FDA-approved, commercial products in the following strengths and dosage form: fluticasone propionate 0.05% cream, lotion, and as 0.005% ointment; mometasone furoate 0.1% cream, lotion, and ointment.
There are no published clinical trial data available for the use of compounded topical formulations of fluticasone propionate or mometasone furoate either alone or in combination with other products for the treatment of skin conditions. One small open-label study (n = 23) evaluated the use of intranasal irrigation of fluticasone propionate in post-endoscopic sinus surgery patients with chronic rhinosinusitis.[16] The main intent of this study was to assess the effects of fluticasone on adrenal function (whether or not it was suppressed) and its effect on intraocular pressure (IOP). The irrigation solution was prepared by emptying a 3-mg capsule of fluticasone propionate (provided by a compounding pharmacy) into 240 mL isotonic saline solution (available OTC as Sinus Rinse™ saline rinse kit) and used twice daily for 6 weeks. There were no significant changes with fluticasone irrigation use in measured salivary cortisol levels or IOP after 6 weeks. No other efficacy data are noted in this study.

Topical Non-Steroidal Anti-inflammatory Drugs (NSAIDs)
The other compounded topical drugs targeted in this policy – topical diclofenac, ketoprofen, flurbiprofen, meloxicam, and nabumetone – all belong to the NSAID drug class. These agents are generally used for the treatment of pain (e.g., OA, musculoskeletal pain). There are several topical NSAID formulations that are FDA-approved and commercially available. Topical diclofenac is commercially available as Solaraze® 3% gel, Voltaren® 1% gel, Pennsaid® 1.5% topical solution, Voltaren® 0.1% ophthalmic solution, and as Flector® 1.3% topical patch.[17-21] Voltaren gel is indicated for the treatment of OA in knees and hands, and Pennsaid is indicated for the treatment of OA of the knees.[18-19] Topical flurbiprofen is commercially available as Ocufen® 0.03% ophthalmic solution and it is indicated for the treatment of intraoperative miosis.[22] The American College of Rheumatology (ACR) guidelines (2012) for hand, hip, and knee OA recommend topical NSAIDs for the treatment of hand and knee OA.[23] It is important to note that these guidelines are only referring to FDA-approved topical NSAIDs, as literature searches were limited to only commercially available NSAID formulations in the US and Canada.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of the following compounded topical medications: ketamine, gabapentin, diclofenac, ketoprofen, flurbiprofen, meloxicam, nabumetone, hyaluronic acid derivatives, mometasone furoate, and fluticasone propionate. Due to the lack of robust clinical efficacy and safety data, in addition to the lack of standardized dosages and formulations, **approval is not recommended for any condition** for these non-FDA-approved topical compounded formulations of ketamine, gabapentin, diclofenac, ketoprofen, flurbiprofen, meloxicam, nabumetone, hyaluronic acid derivatives, mometasone furoate, and fluticasone propionate (either alone or in combination with other medications).

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

None.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Compounded topical formulations of ketamine, gabapentin, diclofenac, ketoprofen, flurbiprofen, meloxicam, nabumetone, hyaluronic acid derivatives, mometasone furoate, and fluticasone propionate (either alone or in combination with other medications) have not been shown to be effective or there are limited or preliminary data that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

Topical Ketamine

83. Neuropathic Pain. There are published data available from four randomized, placebo-controlled studies assessing the efficacy of compounded topical ketamine, either alone or in combination with other agents (e.g., amitriptyline, baclofen) for the treatment of various types of neuropathic pain (e.g., peripheral neuropathy, diabetic neuropathy).[1-4] In summary, three of the four studies did not show any statistically significant efficacy differences compared with placebo. One study showed a trend towards improvement compared with placebo in patients with CIPN.[1] All of the other published data with topical ketamine use for neuropathic pain are based on case reports, open-label studies, or pilot studies.

84. Complex regional pain syndrome (CRPS). There are very limited published efficacy data available with topical ketamine for the treatment of CRPS. One small double-blind, placebo-controlled study assessed the efficacy of ketamine 10% cream in patients (n = 20) with CRPS type 1 (n = 18/20) and type 2 (n = 2/20) on two separate occassions.[5] The primary aim was to determine whether topical ketamine inhibited sensory disturbances in the symptomatic limb of patients. Topical ketamine did not lead to pain reduction, but allodynia to brushing the skin was reduced. Most of the other published evidence for topical ketamine use for CRPS is based on case reports.

Topical Gabapentin

1. Neuropathic Pain. There are no published efficacy or safety data available with compounded topical formulations of gabapentin either alone or in combination with other drugs for use in neuropathic pain.

2. Complex regional pain syndrome (CRPS). There are no published efficacy or safety data available with topical gabapentin use for the treatment of CRPS.

3. Vulvodynia. There is one retrospective study that assessed the efficacy of topical gabapentin 2% to 6% in women (n = 51) with vulvodynia.[7] Though topical gabapentin was effective in reducing pain in about 80% of women, these data are limited by small sample size and study design. Large randomized trials are needed to establish the efficacy of topical gabapentin for vulvodynia.

Topical NSAIDs (diclofenac, ketoprofen, flurbiprofen, nabumetone, and meloxicam)

1. Arthritis (e.g., osteoarthritis [OA], rheumatoid arthritis [RA]). There are no published data available with the use of compounded, non-FDA approved topical formulations of NSAIDs such as topical diclofenac, topical ketoprofen, topical meloxicam, topical nabumetone, or topical flurbiprofen, either alone or in combination with other agents for the treatment of arthritis, such as OA. FDA-approved, commercially available topical NSAIDs such as Voltaren 1% gel, and Pennsaid 1.5% topical solution are indicated for the treatment of OA and have substantial efficacy and safety data supporting their use.[10-11] With the availability of effective and safe FDA-approved topical NSAIDs, the use of other compounded topical NSAIDs with no established efficacy and safety data is not recommended.

Topical Fluticasone Propionate and Mometasone Furoate

1. **Use in various types of skin conditions (e.g., dermatitis, wound care).** There are very limited to no published efficacy or safety data available with non-FDA approved, compounded formulations of fluticasone and mometasone for the treatment of skin conditions.

2. **Cosmetic Use (e.g., scar therapy, for minimizing stretch marks).** Cosmetic use is excluded from coverage in a typical pharmacy benefit.

3. **Use as Intranasal Irrigation Solution for Chronic Rhinosinusitis.** One small study (n = 23) assessed the use of fluticasone propionate 3 mg in 240 mL saline, as irrigation solution twice daily in patients with chronic rhinosinusitis who had undergone sinus surgery.[16] The study mainly assessed for the effects of fluticasone on salivary cortisol levels and ocular changes. There are no other published efficacy or safety data with the use of corticosteroids in irrigation solutions.

Topical Hyaluronic Acid Derivatives

1. **Vaginal Atrophy.** Limited data are available with the use of hyaluronic acid derivatives in combination with other agents (e.g., vitamin E) for the treatment of vaginal atrophy;[10-14] however, vaginal estrogen therapies are the recommended first-line agents for the treatment of symptomatic vaginal atrophy.[15]

2. **Osteoarthritis (OA).** There are no published efficacy data available to support the use of non-FDA -approved, compounded formulations of hyaluronic acid and its derivatives for use in any OA or other pain-related conditions. Hyaluronic acid intra-articular injections (e.g., Synvisc) are available as FDA-approved products for the treatment of OA of the knee.[9]

3. **Use in Any Other Medical Condition, Including, But Not Limited to Ophthalmic Procedures and Wound Care.** There are no published efficacy data available to support the use of non-FDA- approved, compounded formulations of hyaluronic acid and its derivatives for use in any medical condition.

4. **Cosmetic Use (e.g., treatment of frown lines).** Cosmetic use is excluded from coverage in a typical pharmacy benefit.

PRIOR AUTHORIZATION POLICY

POLICY: Contraceptives – Phexxi Prior Authorization Policy

- Phexxi™ (lactic acid, citric acid, and potassium bitartrate vaginal gel – EvoFem Biosciences, Inc.)

REVIEW DATE: 11/04/2020

OVERVIEW

Phexxi is indicated for the **prevention of pregnancy** in females of reproductive potential for use as an on-demand method of contraception.[1] Limitation of Use: Phexxi is not effective for the prevention of pregnancy when administered after intercourse.

Phexxi contains lactic acid, citric acid, and potassium bitartrate; *in vitro* studies show that a pH lowering effect and sperm motility reduction contribute to the activity of the product in the vagina.[1] Phexxi has been previously known under multiple names, such as Amphora, Acidform, and was historically available as an over-the-counter (OTC) personal lubricant.[2] The recommended dose of Phexxi is one pre-filled applicator

(5 grams) vaginally administered immediately before or up to one hour before each act of vaginal intercourse.[1] If more than one act of vaginal intercourse occurs within one hour, an additional dose must be used.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Phexxi. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Phexxi is recommended in those who meet the following criteria:

FDA-Approved Indications

14. Prevention of Pregnancy. Approve for 6 months if the patient has tried THREE other barrier methods of contraception (i.e., diaphragms, condoms, spermicides, or sponges).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Phexxi is not recommended in the following situations:

17. As a Personal Lubricant. The ingredients in Phexxi were previously available and marketed as an OTC personal lubricant.[2] Phexxi is currently only indicated for prevention of pregnancy.[1]

18. Acute Episodes of Bacterial Vaginosis. Low vaginal pH may provide a measure of protection against specific organisms.[2] In a pilot clinical study comparing Acidform gel with metronidazole gel for the treatment of symptomatic bacterial vaginosis, Acidform gel was significantly less effective.[3]

19. For Protection Against Human Immunodeficiency Virus (HIV) or any other Sexually Transmitted Infections. Per Phexxi labeling, it does not protect against HIV infection and other sexually transmitted infections.[1]

20. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

New Policy	--	11/04/2020

PRIOR AUTHORIZATION POLICY

POLICY: Coronavirus Disease – Veklury Prior Authorization Policy

- Veklury® (remdesivir injection – Gilead Sciences, Inc.)

REVIEW DATE: 11/04/2020

OVERVIEW

Veklury, a severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) nucleotide analog RNA polymerase inhibitor, is indicated for the treatment of **coronavirus disease 19 (COVID-19)** in patients ≥ 12 years of age and weighing ≥ 40 kg, who require hospitalization.[1]

Guidelines

The Infectious Disease Society of America (IDSA) and the National Institutes of Health (NIH) have developed treatment guidelines for the management of COVID-19 and each address the use of Veklury.[2,3] Both the IDSA and NIH guidelines recommend Veklury for hospitalized patients with COVID-19 who require supplemental oxygen. For patients receiving supplemental oxygen, Veklury is recommended for 5 days of treatment, and patients receiving invasive mechanical ventilation or extracorporeal membrane oxygenation should be treated with Veklury for 10 days.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Veklury. All approvals are provided for the duration noted below. All reviews will be forwarded to the Medical Director for evaluation.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Veklury is recommended in those who meet the following criteria:

FDA-Approved Indications

15. Coronavirus Disease 2019 (COVID-19), Treatment. Approve for 10 days if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 12 years of age; AND
- **B)** Patient has tested positive for the severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2); AND
- **C)** Patient is being treated in a hospital.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Veklury is not recommended in the following situations:

21. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
New Policy	--	11/04/2020

PRIOR AUTHORIZATION POLICY

POLICY: Crysvita Prior Authorization Policy

- Crysvita® (burosumab-twza injection, subcutaneous use – Ultragenyx)

REVIEW DATE: 05/27/2020; selected revision 07/22/2020

OVERVIEW

Crysvita, a fibroblast growth factor 23 (FGF23) blocking antibody, is indicated for[1]:

- **X-linked hypophosphatemia** in patients ≥ 6 months of age.
- **Tumor-induced osteomalacia**, for treatment of FGF-related hypophosphatemia associated with phosphaturic mesenchymal tumors that cannot be curatively resected or localized in patients ≥ 2 years of age.

Disease Overview

X-Linked Hypophosphatemia

X-linked hypophosphatemia is a condition that is believed to result from an inactivating genetic mutation in phosphate regulating endopeptidase on the X chromosome (PHEX).[2-4] This mutation leads to increased levels of FGF23, which increases phosphate excretion and abnormal vitamin D metabolism, ultimately leading to hypophosphatemic rickets.[2-5] Pediatric patients (usually < 2 years of age) usually present with bowing deformities of the lower extremities and short stature. In adults, symptoms include calcification of tendons, ligaments, and joint capsules, joint pain, impaired mobility, spontaneous dental abscesses, stress fractures, and sensorineural hearing loss. The X-linked hypophosphatemia diagnosis can be established in patients with a low serum phosphate concentration, a reduced tubular resorption of phosphate corrected for glomerular filtration rate (TmP/GFR), an inappropriate calcitriol level for the severity of hypophosphatemia, and/or by identification on molecular genetic testing of a hemizygous PHEX pathogenic variant in a male patient or a heterozygous PHEX pathogenic variant in a female patient. Genetic testing is estimated to identify mutations in the PHEX gene in approximately 70% of patients with hypophosphatemic rickets and 85% to 90% of patients who have familial hypophosphatemic rickets.[6]

Tumor-Induced Osteomalacia

Tumor-induced osteomalacia is an extremely rare condition caused by tumors that produce the phosphaturic hormone FGF23.[7] Elevated FGF23 causes renal phosphate wasting, which ultimately leads to hypophosphatemia, rickets, and osteomalacia. Tumor-induced osteomalacia is generally caused by small, slow-growing, benign phosphaturic mesenchymal tumors; complete resection of the tumor results in cure. However, in some cases, locating the tumor is not possible or the tumor may be inoperable. Patients usually present in adulthood with symptoms of fatigue, muscle weakness, and pain.[8] They may also experience decreased bone mineral density and frequent fractures. Current treatment of patients with inoperable or unidentifiable tumors has been phosphate supplementation and active vitamin D.

Clinical Efficacy

X-Linked Hypophosphatemia

The efficacy of Crysvita for the treatment of X-linked hypophosphatemia was evaluated in several clinical in pediatric and adult patients with X-linked hypophosphatemia.[1] Eligible patients had baseline serum phosphorus levels less than the lower limit of normal for age.[1,9-11] Across the studies, Crysvita was found

to increase mean serum phosphorus levels significantly from baseline. Radiographic improvements and healing of fractures/pseudofractures were also observed. In a single-arm extension of the adult study, normalization of serum phosphorous was maintained during an additional 24 weeks of Crysvita therapy.[12] Improvements in healing of fractures/pseudofractures were also observed. One additional study compared Crysvita with conventional therapy in patients 1 to 12 years of age with X-linked hypophosphatemia.[13] Following 64 weeks of therapy, patients receiving Crysvita had demonstrated a significantly greater improvement in the Radiographic Global Impression of Change global score compared with the conventional therapy group.

Tumor-Induced Osteomalacia

Two studies evaluated the efficacy of Crysvita in patients with tumor-induced osteomalacia.[1,14] Eligible patients were adults with a confirmed diagnosis of FGF-23-related hypophosphatemia produced by an underlying tumor that was not amenable to surgical excision or could not be located. In addition to low baseline serum phosphorus, patients were also required to have a low tubular reabsorption of phosphate corrected for glomerular filtration rate (TmP/GFR) and a high FGF23 level. The vast majority of patients had previously received phosphate and active vitamin D therapy. Crysvita was found to increase the mean serum phosphorus level from baseline through Week 24 (Month 6) when levels stabilized. These increases were sustained near or above the lower limit of normal through Week 144.

Guidelines

X-Linked Hypophosphatemia

In 2019, an expert panel published Clinical Practice Recommendations for the Diagnosis and Management of X-linked hypophosphatemia.[13] This document recommends treatment with oral phosphate and active vitamin D (e.g., calcitriol) for symptomatic adults with X-linked hypophosphatemia. Crysvita therapy should be considered for the treatment of adults with X-linked hypophosphatemia with the following features: persistent bone/joint pain due to X-linked hypophosphatemia and/or osteomalacia that limits daily activities; pseudofractures or osteomalacia-related fractures; and insufficient response or refractory to oral phosphate and active vitamin D. If patients experience complications related to oral phosphate and active vitamin D, Crysvita is recommended as well.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Crysvita. Because of the specialized skills required for evaluation and diagnosis of patients treated with Crysvita as well as the monitoring required for adverse events and long-term efficacy, approval requires Crysvita to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Crysvita is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **X-Linked Hypophosphatemia.** Approve Crysvita for the duration noted if the patient meets ONE of the following criteria (A or B):
   - **A)** Initial Therapy. Approve for 1 year if the patient meets ALL of the following criteria (i, ii, iii, and iv):

i. Patient has had a baseline (prior to any X-linked hypophosphatemia treatment) serum phosphorus level that was below the normal range for age; AND
Note: Examples of X-linked hypophosphatemia treatment include Crysvita, oral phosphate/vitamin D therapy.

ii. Patient meets ONE of the following (a or b):
- **a)** Patient has had a baseline (prior to any X-linked hypophosphatemia treatment) tubular reabsorption of phosphate corrected for glomerular filtration rate (TmP/GFR) that was below the normal range for age and gender; OR
  Note: Examples of X-linked hypophosphatemia treatment include Crysvita, oral phosphate/vitamin D therapy.
- **b)** Patient has had a genetic test confirming the diagnosis of X-linked hypophosphatemia via identification of a PHEX mutation; AND

iii. If the patient is ≥ 18 years of age, the patient meets BOTH of the following (a and b):
- **a)** Per the prescriber, the patient is currently exhibiting one or more signs or symptoms of X-linked hypophosphatemia; AND
  Note: Examples of signs and symptoms of X-linked hypophosphatemia in patients ≥ 18 years of age include fractures/pseudofractures, bone and joint pain, muscle weakness, and impaired mobility.
- **b)** Patient meets ONE of the following (1 or 2):
  - **a)** Patient has tried oral phosphate and calcitriol therapy; OR
  - **b)** Per the prescriber the patient has a contraindication to oral phosphate therapy, calcitriol therapy, or both; AND

iv. The medication is prescribed by or in consultation with an endocrinologist or nephrologist.

B) Patient is Currently Receiving Crysvita. Approve for 1 year if the patient is continuing to derive benefit from Crysvita as determined by the prescriber.
Note: Examples of a response to Crysvita therapy are increased phosphorus levels, radiographic improvement in deformities, healing of fractures/pseudofractures, reduction in the incidence of new fractures/pseudofractures.

2. Tumor-Induced Osteomalacia. Approve Crysvita for the duration noted if the patient meets ONE of the following criteria (A or B):

A) Initial Therapy. Approve for 6 months if the patient meets ALL of the following criteria (i, ii, iii, iv, v, vi and vii):

i. Patient is ≥ 2 years of age; AND

ii. Patient has a mesenchymal tumor that cannot be curatively resected or identified/localized; AND

iii. Per the prescriber, the patient is currently exhibiting one or more signs or symptoms of tumor-induced osteomalacia; AND
Note: Examples of signs and symptoms of tumor-induced osteomalacia include bone pain, impaired mobility, muscle weakness, and fatigue.

iv. Patient has had a baseline (prior to any tumor-induced osteomalacia treatment) serum phosphorus level that was below the normal range for age; AND
Note: Examples of tumor-induced osteomalacia treatment include Crysvita, oral phosphate/vitamin D therapy.

v. Patient has had a baseline (prior to any tumor induced osteomalacia treatment) tubular reabsorption of phosphate corrected for glomerular filtration rate (TmP/GFR) that was below the normal range for age and gender; AND
Note: Examples of tumor-induced osteomalacia treatment include Crysvita, oral phosphate/vitamin D therapy.

vi. Patient meets ONE of the following (a or b):
- **a)** Patient has tried oral phosphate and calcitriol therapy; OR

b) Per the prescriber the patient has a contraindication to oral phosphate therapy, calcitriol therapy, or both; AND

vii. The medication is prescribed by or in consultation with an endocrinologist or nephrologist.

B) Patient is Currently Receiving Crysvita. Approve for 1 year if the patient is continuing to derive benefit from Crysvita as determined by the prescriber.

Note: Examples of a response to Crysvita therapy are increased phosphorus levels, decreased symptoms of bone pain and/or muscle weakness, and increased mobility.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Crysvita is not recommended in the following situations:

1. **Chronic Kidney Disease, Severe Renal Impairment or End Stage Renal Disease**. Crysvita is contraindicated in patients with severe renal impairment or end stage renal disease.[1] These patients often have abnormal mineral metabolism which may be associated with FGF23. However, Crysvita has not been studied for the treatment of patients with chronic kidney disease who have elevations of FGF23 impacting phosphate regulation.[1,9]

2. **Epidermal Nevus Syndrome**. More data are necessary to establish the efficacy and safety of Crysvita in patients with epidermal nevus syndrome. A Phase II single-arm, open-label, dose-finding study (unpublished) included 16 adults with tumor induced osteomalacia (n = 15) or epidermal nevus syndrome (n = 1) with hypophosphatemia and an elevated FGF23.[10] Crysvita administered every 4 weeks improved mean serum phosphorus levels and increased markers of bone turnover (as measured by biopsy) at Weeks 16 and 24.

3. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
New Policy	---	04/25/2018
Annual Revision	**X-Linked Hypophosphatemia:** Added criteria for patients currently receiving Crysvita to approve if the patient is continuing to derive benefit from Crysvita as determined by the prescribing physician. Changed approval duration from 3 years to 1 year.	05/15/2019
Selected Revision	**X-Linked Hypophosphatemia:** Added criteria to allow for genetic confirmation of X-linked hypophosphatemia.	08/14/2019
Update	Date: 10/02/2019 No criteria changes. Updated overview to reflect expanded age indication.	NA
Annual Revision	**X-Linked Hypophosphatemia:** Added criteria to require patients ≥ 18 years of age to have one or more signs or symptoms of X-linked hypophosphatemia per the prescriber and to have tried oral phosphate and calcitriol therapy (or per the prescriber have a contraindication to one or both of these therapies). Wording in reference to "according to the prescribing physician" was changed to "according to the prescriber".	05/27/2020
Selected Revision	**Tumor-Induced Osteomalacia:** Added new approval criteria for this indication which include an age requirement, involvement of a specialist, the presence of signs/symptoms of tumor-induced osteomalacia, low serum phosphorus, low tubular resorption of phosphate corrected for glomerular filtration rate, and previous phosphate and calcitriol therapy. **Conditions Not Recommended for Approval:** Removed "Tumor-Induced Osteomalacia".	07/22/2020

PRIOR AUTHORIZATION POLICY

POLICY: Cushing's – Isturisa® (osilodrostat tablets – Recordati Rare Diseases)

DATE REVIEWED: 05/27/2020

OVERVIEW

Isturisa, a cortisol synthesis inhibitor, is indicated for the treatment of patients ≥ 18 years of age with Cushing's disease for whom pituitary surgery is not an option or has not been curative.[1] Isturisa inhibits cytochrome 11beta-hydroxylase, the enzyme responsible for the final step of cortisol biosynthesis in the adrenal gland. The recommended initial dose is 2 mg administered orally twice daily, with or without food. The maintenance dosage of Isturisa is individualized and determined by titration based on cortisol levels and patient's signs and symptoms. Titrate the dosage by 1 to 2 mg twice daily, no more frequently than every 2 weeks based on the rate of cortisol changes (elevated 24-hour urine free cortisol levels above upper normal limit). The maximum recommended maintenance dosage of Isturisa is 30 mg twice daily.

Disease Overview

Cushing's syndrome refers to the general state of excessive levels of cortisol (hypercortisolism) in the blood.[2,3] Hypercortisolism can occur for reasons that are either endogenous or exogenous in nature (e.g., Cushing's disease, cortisol-containing medications, adrenal gland tumor, certain cancers). The incidence of endogenous Cushing's syndrome is dependent on the population studied, ranging from 0.7 to 2.4 cases per million population per year and is more common in women than men. Endogenous Cushing's syndrome can be divided into adrenocorticotropic hormone (ACTH) -dependent and ACTH-independent with the majority of cases as ACTH-dependent (80%). Cushing's disease (hypercortisolism caused by pituitary adenomas) is the most common type of ACTH-dependent Cushing's syndrome (70%). Other ACTH-dependent causes include ectopic ACTH secretion by a benign or malignant tumor (10%) or rarely ectopic corticotropin-releasing hormone secretion by a tumor. ACTH-independent causes of

Cushing's syndrome include adrenal adenoma (10%), adrenal carcinoma (5%), adrenal hyperplasia (1% to 2%), McCune Albright syndrome (1% to 2%) and primary pigmented medullar adrenal disease, including Carney complex (1% to 2%). Patients with Cushing's syndrome exhibit a variety of signs and symptoms such as high blood pressure, diabetes, loss of libido, menstrual disorders, weight gain, hirsutism, acne, easy bruising, purplish skin striae, osteoporosis, muscle weakness, depression, and cognitive impairment as a result of prolonged and inappropriately high exposure of tissue to glucocorticoids. In patients with persistent hypercortisolism, Cushing's syndrome is accompanied by a higher mortality compared to the general population (3.8 to 5 times greater) due to vascular and metabolic comorbidities; therefore, early disease detection is important.

The role of drug therapy in patients with Cushing's syndrome is generally adjunctive and may help to improve the medical status of patients in preparation for surgery, and to control severe hypercortisolism in patients who are acutely ill, or in patients awaiting the effects of radiotherapy.[3-5] Drug therapies act at the hypothalamic-pituitary level and decrease ACTH secretion (e.g., Signifor® [pasireotide injection for subcutaneous use], Signifor® LAR [pasireotide injection for intramuscular use], bromocriptine), at the adrenal level and inhibit cortisol synthesis (steroidgenesis inhibitors [e.g., ketoconazole, Metopirone® {metyrapone capsules}, Lysodren® {mitotane tablets}, etomidate]), or at the peripheral level by competing with cortisol (Korlym® [mifepristone tablets]).[3,6] Pituitary-directed medical treatments are suggested in patients with Cushing's disease who are not surgical candidates or have persistent disease after surgery.[7] Korlym is indicated to control hyperglycemia secondary to hypercortisolism in adult patients with endogenous Cushing's syndrome who have type 2 diabetes mellitus or glucose intolerance and have failed surgery or are not candidates for surgery.[8]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Isturisa. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Isturisa as well as the monitoring required for adverse events and long-term efficacy, approval requires Isturisa to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Isturisa is recommended in those who meet the following criteria:

FDA-Approved Indications

31. Cushing's Disease. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Isturisa is prescribed by or in consultation with an endocrinologist or a physician who specializes in the treatment of Cushing's disease; AND
- **C)** According to the prescriber, the patient is not a candidate for surgery or surgery has not been curative.
  Note: For patients with endogenous Cushing's syndrome awaiting surgery or therapeutic response after radiotherapy, see *Other Uses with Supportive Evidence.*

Other Uses with Supportive Evidence

32. Endogenous Cushing's Syndrome. Approve for 1 year if the patient meets the following criteria (A, B, C, and D):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Isturisa is prescribed by or in consultation with an endocrinologist or a physician who specializes in the treatment of endogenous Cushing's syndrome; AND
- **C)** According to the prescriber, the patient is not a candidate for surgery or surgery has not been curative.
  Note: For patients with endogenous Cushing's syndrome awaiting surgery or therapeutic response after radiotherapy, see *Other Uses with Supportive Evidence.*

D) The patient meets one of the following (i or ii):

i. The patient has tried one of ketoconazole tablets, Korlym® (mifepristone tablets), Metopirone® (metyrapone capsules), Lysodren® (mitotane tablets), Signifor® (pasireotide injection for subcutaneous use), or Signifor® LAR (pasireotide injection for intramuscular use) for the treatment of endogenous Cushing's syndrome; OR

ii. The patient is currently receiving Isturisa.

3. **Endogenous Cushing's Syndrome – Patients Awaiting Surgery.** Approve for 4 months if the patient meets the following criteria (A and B):
   A) Patient is ≥ 18 years of age; AND
   B) Isturisa is prescribed by or in consultation with an endocrinologist or a physician who specializes in the treatment of Cushing's syndrome.

4. **Endogenous Cushing's Syndrome – Patients Awaiting Therapeutic Response After Radiotherapy.** Approve for 4 months if the patient meets the following criteria (A and B):
   A) Patient is ≥ 18 years of age; AND
   B) Isturisa is prescribed by or in consultation with an endocrinologist or a physician who specializes in the treatment of Cushing's syndrome.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Isturisa not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

22. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Date Reviewed
New Policy	--	05/27/2020

PRIOR AUTHORIZATION POLICY

POLICY: Cushing's – Korlym® (mifepristone 300 mg tablets – Corcept)

DATE REVIEWED: 05/27/2020

OVERVIEW

Korlym is a cortisol receptor blocker indicated to control hyperglycemia secondary to hypercortisolism in adult patients with endogenous Cushing's syndrome who have type 2 diabetes mellitus or glucose intolerance and have failed surgery or are not candidates for surgery.[1] Korlym should not be used for the treatment of type 2 diabetes mellitus unrelated to endogenous Cushing's syndrome. Mifepristone, the active

ingredient in Korlym is also available as Mifeprex® (mifepristone 200 mg tablets) indicated for the medical termination of intrauterine pregnancy through 70 days' pregnancy.[2] Mifeprex is not included in this *Prior Authorization* policy.

Mifepristone, the active ingredient in Korlym is a selective antagonist of the progesterone receptor (PR) at low doses and blocks the glucocorticoid type 2 receptor (GR-II) at higher doses.[1] Mifepristone has high affinity for the GR-II receptor but little affinity for the GR-I (mineralocorticoid) receptor (MR). In addition, mifepristone appears to have little or no affinity for estrogen, muscarinic, histaminic, or monoamine receptors. Mifepristone acts at the receptor level to block the effects of cortisol, and its antagonistic actions affect the hypothalamic-pituitary-adrenal (HPA) axis in such a way as to further increase circulating cortisol levels while at the same time blocking their effects. Mifepristone and its three active metabolites have greater affinity for the glucocorticoid receptor (100%, 61%, 48%, and 45%, respectively) than either dexamethasone (23%) or cortisol (9%).

Cushing's Disease

Endogenous Cushing's syndrome is a rare heterogeneous disorder with diverse causes that leads to cortisol excess (hypercortisolism).[3] Patients with Cushing's syndrome exhibit a variety of signs and symptoms such as high blood pressure, diabetes, loss of libido, menstrual disorders, weight gain, hirsutism, acne, easy bruising, purplish skin striae, osteoporosis, muscle weakness, depression and cognitive impairment as a result of prolonged and inappropriately high exposure of tissue to glucocorticoids.[3-4]

The treatment of Cushing's syndrome requires a multi-modal approach. The goals of treatment are normalization of cortisol excess, long-term disease control, avoidance of recurrence and reversal of clinical features.[5] Drug therapy plays an adjunctive role in patients with Cushing's syndrome and may help to improve the medical status of patients in preparation for surgery, and to control severe hypercortisolism in patients who are acutely ill, or in patients awaiting the effects of radiotherapy.[6-9]

Medications inhibiting adrenocortical steroidgenesis (ketoconazole tablets, Metopirone® [metyrapone capsules], Lysodren® [mitotane tablets] and etomidate injection) have been widely used in patients with Cushing's syndrome of varying causes.[6] Ketoconazole tablets have a Food and Drug Administration (FDA) Orphan Drug Designation for the treatment of endogenous Cushing's syndrome.[16] Ketoconazole and metyrapone (not commercially available in the US, may be obtained from the manufacturer on a compassionate use basis) are dose-dependent and reversible inhibitors of adrenal cortisol synthesis.[6,8] Mitotane inhibits the synthesis of cortisol; however, at doses greater than 4 grams daily it causes cellular necrosis due to its irreversible effects on mitochondrial function, and therefore is primarily used in adrenal cancer.[8] Signifor is a somatostatin analog indicated for the treatment of adults with Cushing's *disease* for whom pituitary surgery is not an option or has not been curative and works by decreasing adrenocorticotropic hormone (ACTH) secretion.[13] The use of these drugs is limited by variable efficacy and adverse events (AEs).

The impairment of glucose metabolism generally resolves with normalization of cortisol levels because hypercortisolism is the causative factor for hyperglycemia.[17]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Korlym. All approvals are provided for 1 year unless otherwise noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Korlym as well as the monitoring required for AEs, approval requires Korlym to be prescribed by or in consultation with an endocrinologist or a physician who specializes in the treatment of Cushing's syndrome.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Korlym is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Endogenous Cushing's Syndrome.** Approve in patients who meet the following criteria (A, B, C, D and E):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Korlym is prescribed by or in consultation with an endocrinologist or a physician who specializes in the treatment of Cushing's syndrome; AND
   - **C)** Korlym is being used to control hyperglycemia secondary to hypercortisolism in patients who have type 2 diabetes mellitus or glucose intolerance; AND
   - **D)** According to the prescriber, the patient is not a candidate for surgery or surgery has not been curative; AND
     Note: For patients with endogenous Cushing's syndrome awaiting surgery or therapeutic response after radiotherapy, see *Other Uses with Supportive Evidence.*
   - **E)** The patient meets one of the following (i or ii):
     - **i.** The patient has tried one of ketoconazole tablets, Metopirone (metyrapone capsules), Lysodren (mitotane tablets), or Signifor/Signifor LAR for the treatment of Cushing's syndrome; OR
     - **ii.** The patient is currently receiving Korlym.

Other Uses with Supportive Evidence

2. **Endogenous Cushing's Syndrome – Patients Awaiting Surgery.** Approve for 4 months if the patient meets the following criteria (A and B):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Korylm is prescribed by, or in consultation with, an endocrinologist or a physician who specializes in the treatment of Cushing's syndrome.

3. **Endogenous Cushing's Syndrome – Patients Awaiting Response After Radiotherapy.** Approve for 4 months if the patient meets the following criteria (A and B):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Korlym is prescribed by, or in consultation with, an endocrinologist or a physician who specializes in the treatment of Cushing's syndrome.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Korlym has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

85. **Exogenous (Iatrogenic) Cushing's Syndrome.** Korlym is not indicated in exogenous Cushing's syndrome. Exogenous Cushing's syndrome is caused by excessive glucocorticoid administration.[12] Therefore, the process to reverse the excessive cortisol exposure is to taper or discontinue the offending drug when possible.

86. Type 2 Diabetes Not Associated with Endogenous Cushing's Syndrome. Korlym should not be used for the treatment of type 2 diabetes unrelated to endogenous Cushing's syndrome.[1]

87. Psychotic Features of Psychotic Depression. Mifepristone has been used to treat the psychotic features of psychotic depression. Individual trials have demonstrated variable efficacy results.[3,10-11,15,18] In some of the studies comparing mifepristone with placebo, various statistically significant improvements in psychiatric symptoms have been noted with mifepristone relative to placebo; however, the methodology and statistical analyses of some studies have been questioned.[14] Data are inconclusive.

88. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Date Reviewed
Annual Revision	Updated policy title to include Cushing's. The requirement that Korlym be prescribed by an endocrinologist was modified to add "a physician who specializes in the treatment of Cushing's syndrome". A requirement was added to align with the FDA-approved indication to add that Korlym is being used to control hyperglycemia secondary to hypercortisolism in patients who have type 2 diabetes mellitus or glucose intolerance.	05/23/2018
Selected revision	Added Signifor LAR as option of previous therapies.	09/12/2018

Annual revision	Endogenous Cushing's Syndrome: the length of approval was updated from 3 years to 1 year. Cushing's Syndrome – Patients Awaiting Surgery: the length of approval was updated from 2 months to 4 months to align with other Cushing's policies. Created separate approval condition for Cushing's Syndrome – Patients Awaiting Therapeutic Response for Radiotherapy with a 4 month approval duration.	05/08/2019
Selected revision	**1. Endogenous Cushing's Syndrome:** The option was added as an alternative to a trial of another therapy that "The patient is currently receiving Korlym."; such patients are not subject to try another therapy prior to approval	12/18/2019
Annual revision	**Endogenous Cushing's Syndrome.** For the exception applying to patient who are not a candidate for surgery or surgery has not been curative, wording was updated to more generally allow this determination by the prescriber (criteria previously specified this was according to the prescribing physician). A note was added for patients with endogenous Cushing's syndrome awaiting surgery or therapeutic response after radiotherapy, see *Other Uses with Supportive Evidence.*	05/27/2020

PRIOR AUTHORIZATION POLICY

POLICY: Cushing's – Signifor™ (pasireotide injection – Novartis)

DATE REVIEWED: 05/27/2020

OVERVIEW

Signifor is an injectable cyclohexapeptide somatostatin analogue indicated for the treatment of adults with Cushing's disease for whom pituitary surgery is not an option or has not been curative.[1] Signifor exerts its pharmacological activity via binding to somatostatin receptors (ssts). Five human somatostatin receptor (hsst) subtypes are known: hsst 1, 2, 3, 4, and 5; these receptor subtypes are expressed in different tissues under normal physiological conditions. Corticotroph tumor cells from patients with Cushing's disease frequently over-express hsst 5 whereas the other receptor subtypes are often not expressed or are expressed at lower levels. Signifor binds and activates the hsst receptors resulting in inhibition of adrenocorticotropic hormone (ACTH) secretion, which leads to decreased cortisol secretion.

Signifor is administered by subcutaneous (SC) injection twice a day (BID) and the dose is titrated based on response and tolerability.[1] Patients should be evaluated for a treatment response (clinically meaningful reduction in 24-hour urinary free cortisol [UFC] levels and/or improvement in signs or symptoms of the disease) and should continue receiving therapy with Signifor as long as benefit is derived. Maximum UFC

reduction is typically seen by 2 months of treatment. Management of suspected adverse events (AEs) may require temporary dose reduction of Signifor.

Prior to the start of Signifor, patients should have baseline levels of the following: fasting plasma glucose (FPG), glycosylated hemoglobin (HbA_{1C}), liver tests and serum potassium and magnesium levels.[1] Patients should also have a baseline electrocardiogram (ECG) and gallbladder ultrasound. Treatment of patients with poorly controlled diabetes mellitus should be intensively optimized with anti-diabetic therapy prior to starting Signifor.

Cushing's Disease

Causes of endogenous Cushing's syndrome can be divided into ACTH-dependent and ACTH-independent.[2] The majority of cases of endogenous Cushing's syndrome are ACTH-dependent (80%); most of these cases are caused by pituitary adenoma (also referred to as Cushing's *disease* [70%]). Other ACTH-dependent causes include ectopic ACTH secretion by a benign or malignant tumor (10%) or rarely ectopic corticotropin-releasing hormone (CRH) secretion by a tumor. ACTH-independent causes of Cushing's syndrome include adrenal adenoma (10%), adrenal carcinoma (5%), adrenal hyperplasia (1% to 2%), McCune Albright syndrome (1% to 2%) and primary pigmented medullar adrenal disease, including Carney complex (1% to 2%).

The treatment of Cushing's syndrome requires a multi-modal approach. The goals of treatment are normalization of cortisol excess, long-term disease control, avoidance of recurrence, and reversal of clinical features.[3] In general, the initial treatment of choice for Cushing's *disease* (that is Cushing's syndrome caused by a pituitary adenoma) is selective pituitary adenomectomy by a surgeon with extensive demonstrated experience in pituitary surgery. However, the rate of cure at long-term follow-up is suboptimal and recurrences are high.[4] Immediate remission rates range from 65% to 90%, with recurrence rates reaching about 25% after 10 years.

The role of drug therapy in patients with Cushing's syndrome is generally adjunctive and may help to improve the medical status of patients in preparation for surgery, and to control severe hypercortisolism in patients who are acutely ill, or in patients awaiting the effects of radiotherapy.[2,5,6] Drug therapies act at the hypothalamic-pituitary level and decrease ACTH secretion (e.g., Signifor, bromocriptine), at the adrenal level and inhibit cortisol synthesis (steroidgenesis inhibitors [e.g., ketoconazole, Metopirone® {metyrapone capsules}, Lysodren® {mitotane tablets}, etomidate]), or at the peripheral level by competing with cortisol (Korlym® [mifepristone tablets]).[2,4] Pituitary-directed medical treatments are suggested in patients with Cushing's disease who are not surgical candidates or have persistent disease after surgery.[7]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Signifor. Because of the specialized skills required for evaluation and diagnosis of patients treated with Signifor as well as the monitoring required for AEs and long-term efficacy, approval requires Signifor to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration specified below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Signifor is recommended in those who meet the following criteria:

Food and Drug Administration (FDA)-Approved Indications

33. Cushing's Disease.

A) Initial Therapy. Approve for 4 months of initial therapy if the patient meets the following criteria (i, ii, and iii):
   i. Patient is ≥ 18 years of age; AND
   ii. Signifor is prescribed by or in consultation with an endocrinologist or a physician who specializes in the treatment of Cushing's syndrome; AND
   iii. According to the prescriber, the patient is not a candidate for surgery or surgery has not been curative.
   Note: For patients with endogenous Cushing's syndrome awaiting surgery or therapeutic response after radiotherapy, see *Other Uses with Supportive Evidence.*

B) Patients Currently Receiving Signifor/Signifor LAR. Approve for 1 year of continuation therapy if the patient has already been started on Signifor/Signifor LAR; patient has had a response, as determined by the prescriber; and patient is continuing therapy to maintain response.

Other Uses with Supportive Evidence

2. Endogenous Cushing's Syndrome – Patients Awaiting Surgery. Approve for 4 months if the patient meets the following criteria (A and B):
   A) Patient is ≥ 18 years of age; AND
   B) Signifor is prescribed by or in consultation with an endocrinologist or a physician who specializes in the treatment of Cushing's syndrome.

3. **Endogenous Cushing's Syndrome – Patients Awaiting Therapeutic Response After Radiotherapy.** Approve for 4 months if the patient meets the following criteria (A and B):
   A) Patient is ≥ 18 years of age; AND
   B) Signifor is prescribed by or in consultation with an endocrinologist or a physician who specializes in the treatment of Cushing's syndrome.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Signifor has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions are provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

89. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Date Reviewed
Annual revision	Updated policy title to include Cushing's. The requirement that Signifor be prescribed by an endocrinologist was modified to add "a physician who specializes in the treatment of Cushing' syndrome".	05/23/2018
Selected revision	Added Signifor LAR to the policy under patient currently receiving therapy. Specified Cushing's Disease/"Syndrome" to approval condition and added "Patients" awaiting surgery. Approval duration increased from 2 months to 4 months to align. Created separate approval condition for Cushing's Disease/Syndrome – Patients Awaiting Therapeutic Response from Radiotherapy with 4 month approval duration. Initial therapy approval criteria for Cushing's Disease changed to 4 months.	09/12/2018
Annual revision	Removal of the following Conditions Not Recommended for Approval: Acromegaly and Neuroendocrine Tumors	05/08/2019
Annual revision	**Cushing's Disease.** For the exception applying to patient who are not a candidate for surgery or surgery has not been curative, wording was updated to more generally allow this determination by the prescriber (criteria previously specified this was according to the prescribing physician). The Note pertaining to patients with Cushing's disease awaiting surgery was changed to endogenous Cushing's syndrome awaiting surgery with addition of patients waiting for a therapeutic response after radiotherapy. For the exception applying to patients that have already been started on Signifor/Signifor LAR and has had a response, wording was updated to more generally allow this determination by the prescriber (criteria previously specified this was according to the prescribing physician). **Cushing's Disease/Syndrome – Patients Awaiting Surgery.** The condition name was changed to **Endogenous Cushing's Syndrome – Patients Awaiting Surgery**. **Cushing's Disease/Syndrome – Patients Awaiting Therapeutic Response After Radiotherapy.** The condition name was changed to **Endogenous Cushing's Syndrome – Patients Awaiting Therapeutic Response After Radiotherapy.**	05/27/2020

PRIOR AUTHORIZATION POLICY

POLICY: Cystic Fibrosis – Bronchitol Prior Authorization Policy

- Bronchitol® (mannitol inhalation powder, for oral inhalation – Pharmaxis Ltd/Chiesi USA)

REVIEW DATE: 02/03/2021

OVERVIEW

Bronchitol, a sugar alcohol, is indicated as **add-on maintenance therapy to improve pulmonary function in patients ≥ 18 years of age with cystic fibrosis** (CF).[1]

Safety

Bronchitol can cause bronchospasm, which can be severe in susceptible patients.[1] Therefore, Bronchitol is contraindicated in individuals who fail to pass the Bronchitol Tolerance Test. Prior to prescribing Bronchitol, the Bronchitol Tolerance Test must be administered and performed under the supervision of a healthcare practitioner who is able to manage acute bronchospasm, to identify patients who are suitable candidates for Bronchitol maintenance therapy. For patients who have passed the Bronchitol Tolerance Test, the recommended dosage of Bronchitol is 400 mg twice a day (BID) by oral inhalation (the contents of 10 capsules administered individually) via the inhaler. A short-acting bronchodilator should be administered by oral inhalation, 5 to 15 minutes before every dose of Bronchitol. Bronchitol should be

taken once in the morning and once in the evening, with the later dose taken at least 2 to 3 hours before bedtime.

Guidelines

Bronchitol is not addressed in US guidelines. Guidelines from the CF Foundation (2013) in the US strongly recommend chronic use of Pulmozyme (dornase alfa inhalation solution) in patients ≥ 6 years of age with moderate to severe disease to improve lung function, quality of life, and reduce exacerbations. Pulmozyme is also recommended for chronic use in patients ≥ 6 years of age with asymptomatic or mild disease to improve lung function and reduce exacerbations. Chronic use of hypertonic saline is also recommended in individuals with CF who are ≥ 6 years of age to improve lung function and quality of life and reduce exacerbations.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Bronchitol. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Bronchitol as well as the monitoring required for adverse events and long-term efficacy, approval requires Bronchitol to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Bronchitol is recommended in those who meet the following criteria:

FDA-Approved Indications

16. Cystic Fibrosis (CF). Approve for 1 year if the patient meets the following criteria (A, B, C, D, and E):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has tried hypertonic saline; AND
- **C)** Patient has passed the Bronchitol Tolerance Test; AND
- **D)** Patient will pre-medicate with a short-acting bronchodilator; AND
- **E)** The medication is prescribed by or in consultation with a pulmonologist or a physician who specializes in the treatment of cystic fibrosis.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Bronchitol is not recommended in the following situations:

23. Concomitant Use with Hypertonic Saline. Bronchitol has not been studied in combination with hypertonic saline.[3-5]

24. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
New Policy	--	02/03/2021

PRIOR AUTHORIZATION POLICY

POLICY: Cystic Fibrosis – Kalydeco Prior Authorization Policy
- Kalydeco® (ivacaftor tablets and oral granules – Vertex)

REVIEW DATE: 02/03/2021

OVERVIEW

Kalydeco, a cystic fibrosis transmembrane conductance regulator (CFTR) potentiator, is indicated for the **treatment of cystic fibrosis (CF)** in patients ≥ 4 months of age who have who have one mutation in the CFTR gene that is responsive to Kalydeco potentiation based on clinical and/or in vitro assay data.[1]

Mutations with an increase in chloride transport of 10% or greater are considered responsive. In patients with unknown genotype, a FDA-cleared CF mutation test should be used to detect the presence of the CFTR mutation followed by verification with bidirectional sequencing when recommended by the mutation test instructions for use. Kalydeco is not effective in patients with CF who are homozygous for the F508del mutation in the CFTR. A patient must have at least one CFTR mutation responsive to ivacaftor to be indicated. Table 1 lists mutations that are responsive to Kalydeco based on 1) a positive clinical response and/or 2) in vitro data in FRT cells indicating that Kalydeco increases chloride transport to ≥ 10% over baseline (% of normal).

CFTR – Cystic fibrosis transmembrane regulator.

Guidelines

Guidelines from the CF Foundation (2018) provide guidance on the use of CFTR therapy in patients with CF, Symdeko and Trikafta are not addressed and neither is the lower pediatric age indication for Kalydeco.[2] For adults ≥ 6 years of age with CF due to a gating mutation other than G551D or R117H (e.g., G178R, S549N, S549R, G551S, G1244E, S1251N, S1255P, or G1249D), the Guidelines make a conditional recommendation for treatment with Kalydeco. For those with the R117H mutation, the Guideline panel made a conditional recommendation for treatment with Kalydeco for adults ≥ 18 years of age and for children 6 to 17 years of age with a ppFEV1 < 90%. For individuals with R117H mutation, the Guidelines recommend against treatment with Kalydeco for children 12 to 17 years of age with a percent predicted forced expiratory volume in 1 second (ppFEV1) > 90% and in children < 6 years of age.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Kalydeco. All approvals are provided for 3 years. Because of the specialized skills required for evaluation and diagnosis of patients treated with Kalydeco as well as the monitoring required for adverse events and efficacy, approval requires Kalydeco to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Kalydeco is recommended in those who meet the following criteria:

FDA-Approved Indications

17. Cystic Fibrosis (CF). Approve Kalydeco for 3 years in patients who meet the following criteria (A, B, and C):

A) Patient is ≥ 4 months of age; AND

B) Patient has at least ONE of the following mutations in the cystic fibrosis transmembrane conductance regulator (CFTR) gene: E56K, P67L, R74W, D110E, D110H, R117C, E193K, L206W, R347H, R352Q, A455E, D579G, S945L, S977F, F1052V, K1060T, A1067T, G1069R, R1070Q, R1070W, F1074L, D1152H, D1270N, G551D, G178R, S549N, S549R, G551S, G1244E, S1251N, S1255P, G1349D, 2789+5G—>A, 3272-26A—>G, 3849+10kbC—>T, 711+3A—>G, E831X, R117H, A120T, A234D, A349V, D192G, D924N, E882K, F311L, F311delF508C, F508C;S1251N, G178E, G194R, G314E, G576A, G970D, G1249R, H939R, H1375P, I148T, I175V, I807M, I1027T, I1139V, L320V, L967S, L997F, L1480P, M152V, M9521, M952T, Q237E, Q237H, Q359R, Q1291R, R75Q, R117G, R117L, R117P, R170H, R347L, R553Q, R668C, R792G, R933G, R1162L, R1283M, S589N, S737F, S1159F, S1159P, T338I, T1053I, V232D, V562I, V754M, V1293G, W1282R, Y1014C, or Y1032C; AND

C) The medication is prescribed by or in consultation with a pulmonologist or a physician who specializes in the treatment of CF.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Kalydeco is not recommended in the following situations:

1. Cystic Fibrosis (CF), Patients who are Homozygous for the phe508del (F508del) Mutation in the Cystic Fibrosis Transmembrane Regulator (CFTR) Gene. Efficacy results from a double-blind, placebo controlled trial in patients with CF who were homozygous for the phe508del mutation in the CFTR gene showed no statistically significant difference in FEV_1 over 16 weeks of Kalydeco treatment compared with placebo.[1] In a Phase II trial in patients homozygous for the F508del (n = 112) Kalydeco did not result in an improvement in FEV_1 relative to placebo.[3]

90. Cystic Fibrosis (CF), Patients with Unknown Cystic Fibrosis Transmembrane Regulator (CFTR) Gene Mutation. An FDA-cleared CF mutation test should be used to detect the presence of the CFTR mutation prior to use of Kalydeco.[1]

91. Combination Therapy with Orkambi, Symdeko, or Trikafta. Orkambi, Symdeko, and Trikafta contain ivacaftor, the active agent in Kalydeco and therefore are not indicated in combination with Kalydeco.

4. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Annual Revision	Cystic Fibrosis (CF): F311L and G178E were added to the list of approvable mutations. T3381, T10531, and V5621 were amended to: T338I, T1035I, and V562I.	02/03/2021

PRIOR AUTHORIZATION POLICY

POLICY: Cystic Fibrosis – Orkambi Prior Authorization Policy

- Orkambi™ (lumacaftor/ivacaftor tablets and oral granules – Vertex)

REVIEW DATE: 07/08/2020

OVERVIEW

Orkambi, a combination of lumacaftor and ivacaftor, is indicated for the treatment of cystic fibrosis (CF) in patients ≥ 2 years of age who are homozygous for the F508del mutation in the cystic fibrosis transmembrane regulator (CFTR) gene.[1]

If the patient's genotype is unknown, an FDA-cleared CF mutation test should be used to detect the presence of the F508del mutation on both alleles of the CFTR gene. The efficacy and safety of Orkambi have not been established in patients with CF other than those homozygous for the F508del mutation. Orkambi contains a new chemical entity, lumacaftor, which is a CFTR corrector that increases trafficking of F508del CFTR to the cell surface, and ivacaftor (the same active ingredient contained in Kalydeco® [ivacaftor tablets and granules]), a CFTR potentiator that enhances chloride transport of CFTR on the cell surface. The F508del mutation in CFTR causes CF by limiting the amount of CFTR protein that reaches the epithelial cell surface.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Orkambi. Because of the specialized skills required for evaluation and diagnosis of patients treated with Orkambi as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Orkambi to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Orkambi is recommended in those who meet the following criteria:

FDA-Approved Indications

18. **Cystic Fibrosis (CF), Homozygous for the F508del (Phe508del) Mutation in the Cystic Fibrosis Transmembrane Regulator (CFTR) Gene.** Approve for 3 years in a patient who meets the following criteria (A, B, and C):
    A) Patient is homozygous for the F508del (Phe508del) mutation in the CFTR gene (meaning the patient has two copies of the F508del [Phe508del] mutation); AND
    B) Patient is ≥ 2 years of age; AND
    C) Orkambi is prescribed by or in consultation with a pulmonologist or a physician who specializes in the treatment of CF.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Orkambi is not recommended in the following situations:

25. **Cystic Fibrosis, Heterozygous for the F508del (Phe508del) Mutation in the CFTR Gene.** Orkambi is not indicated for patients with only one copy of the F508del mutation in the CFTR gene.[1] Patients who are heterozygous for the F508del mutation and have one of the following mutations are potential candidates for Kalydeco therapy: G551D, G178R, S549N, S549R, G551S, G1244E, S1251N, S1255P, G1349D, or R117H.

26. **Combination Therapy with Kalydeco, Symdeko, or Trikafta.** Orkambi contains ivacaftor, the active agent in Kalydeco and therefore is not indicated in combination with Kalydeco. Symdeko and Trikafta contain ivacaftor and are therefore not indicated in combination with Orkambi.

27. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

DATE REVIEWED: 05/20/2020

OVERVIEW

Pulmozyme, a recombinant human deoxyribonuclease I (rhDNase), is indicated in conjunction with standard therapies for the management of cystic fibrosis (CF) patients to improve pulmonary function.[1] According to Patient Registry data compiled by the Cystic Fibrosis Foundation (2018), Pulmozyme is used by the vast majority of patients with CF and its use continues to rise.[2]

Disease Overview

CF is an autosomal recessive disease of epithelial chloride transport estimated to affect approximately 30,000 individuals in the US.[2] Dysfunction in the cystic fibrosis transmembrane conductance regulator (CFTR) protein decreases chloride and water transport across mucus-producing cells, leading to viscous sputum.[3,4] The retained secretions allow development of chronic bronchial infection.[4] Subsequent massive neutrophil infiltration causes tissue destruction, as well as release of nucleic acids and cytosol matrix, which further contribute to mucus hyper-viscosity.[5] Pulmozyme cleaves to the extracellular DNA present in the mucus, thereby decreasing sputum viscosity.[1,4]

Guidelines

Guidelines from the CF Foundation (2007, updated in 2013) address the chronic use of medications for management of lung health in CF patients aged 6 years and older.[5,6] These guidelines recommend Pulmozyme use for CF patients regardless of disease severity to improve lung function and reduce exacerbations. Separate guidelines have addressed Pulmozyme use in younger patients.[7,8] Although efficacy data are lacking in patients under 5 years of age, safety and tolerability have been established in patients as young as 3 months.[1,8] CF Foundation guidelines for infants under 2 years of age (2009) and children between 2 and 5 years of age (2016) support Pulmozyme use in these populations based on individual circumstances.[7,8]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Pulmozyme. Because of the specialized skills required for evaluation and diagnosis of patients treated with Pulmozyme, approval requires Pulmozyme to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for 3 years unless otherwise noted below.

Automation: None

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Pulmozyme is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Cystic Fibrosis.** Approve Pulmozyme for 3 years if Pulmozyme is prescribed by or in consultation with a pulmonologist or a physician who specializes in the treatment of cystic fibrosis.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Pulmozyme has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

1. **Asthma.** Mucus hypersecretion may be mediated by a variety of causes, including inflammation, irritation, stimulation, or mucus-producing tumors.[9] However, efficacy of Pulmozyme is not established for conditions other than CF. In a pilot study of patients with severe acute asthma (n = 50), there was no significant difference in forced expiratory volume in 1 second (FEV_1) with Pulmozyme use vs. placebo.[10]

2. **Bronchiectasis, Idiopathic.** A multicenter, double-blind, randomized, placebo-controlled 24-week trial (n = 349) examined the effect of Pulmozyme vs. placebo on patients with idiopathic bronchiectasis (i.e., bronchiectasis not related to cystic fibrosis).[11] Patients in the Pulmozyme arm experienced worsened lung function and more frequent pulmonary exacerbations vs. placebo. The authors concluded that Pulmozyme should not be used in this population.

3. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Cystic Fibrosis – Symdeko Prior Authorization Policy

- Symdeko® (tezacaftor/ivacaftor and ivacaftor tablets – Vertex)

REVIEW DATE: 02/03/2021

OVERVIEW

Symdeko is indicated for the **treatment of patients ≥ 6 years of age with cystic fibrosis (CF)** who are homozygous for the F508del mutation or who have at least one mutation in the cystic fibrosis transmembrane conductance regulator (CFTR) gene that is responsive to tezacaftor/ivacaftor based on *in vitro* data and/or clinical evidence.[1] If the patient's genotype is unknown, an FDA-cleared CF mutation test should be used to detect the presence of a CFTR mutation followed by verification with bi-directional sequencing when recommended by the mutation test instructions for use. Table 1 lists responsive CFTR mutations based on: 1) a clinical forced expiratory volume in 1 second (FEV_1) response and/or 2) *in vitro* data in FRT cells, indicating that tezacaftor/ivacaftor increases chloride transport to ≥ 10% of untreated normal over baseline. CFTR gene mutations that are not responsive to ivacaftor alone (Kalydeco®) are not expected to respond to Symdeko except for F508del homozygotes.

CFTR – Cystic fibrosis transmembrane regulator; * A patient must have two copies of the F508del mutation or at least one copy of a responsive mutation presented in Table 1 to be indicated.

Guidelines

Guidelines from the CF Foundation (2018) provide guidance on the use of CFTR therapy in patients with CF; Symdeko is not addressed.[4]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Symdeko. Because of the specialized skills required for evaluation and diagnosis of patients treated with Symdeko as well as the monitoring required for adverse events and efficacy, approval requires Symdeko to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for 3 years unless otherwise noted below.

Automation: None

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Symdeko is recommended in those who meet the following criteria:

FDA-Approved Indications

22. Cystic Fibrosis (CF). Approve Symdeko for 3 years in patients who meet the following criteria (A, B, and C):

A) Patient meets ONE of the following conditions (i or ii):

i. Patient has at least one of the following mutations in the cystic fibrosis transmembrane conductance regulator (CFTR) gene: E56K, P67L, R74W, D110E, D110H, R117C, E193K, L206W, R347H, R352Q, A455E, D579G, 711+3A → G, S945L, S977F, F1052V, E831X, K1060T, A1067T, R1070W, F1074L, D1152H, D1270N, 2789+5G → A, 3272-26A → G, 3849 + 10kbC → T, 546insCTA, A120T, A234D, A349V, A554E, A1006E, D192G, D443Y, D443Y;G57A;R668C, D614G, D836Y, D924N, D979V, I618T, I807M, I980K, I1027T, I1139V, I1269N, I1366N, L15P, L320V, R170H, R258G, R334L, R334Q, R347L, R347P, R352W, R553Q, R668C, R751L, V1293G, E60K, E92K, E116K, E403D, E558V, E822K, F191V, F311del, F311L, F508C, F508C;S1251N, F575Y, L346P, L967S, L997F, L1324P, L1335P, L1480P, M152V, M265R, M9521, R1066H, R1070Q, R1162L, R1283M, R1283S, S549N, S549R, S589N, S737F, S912L, F1016S, F1099L, G126D, G178E, G178R, G194R, G194V, G314E, G551D, G551S, G576A, G576A;R668C, M952T, P5L, P205S, Q98R, Q237E, Q237H, Q359R, Q1291R, R31L, S1251N, S1255P, T338I, T1036N, T1053I, V201M, V232D, V562I, V754M, V1153E, G622D, G970D, G1069R, G1244E, G1249R, G1349D, H939R, H1054D, H1375P, I148T, I175V, I336K, I601F, R74Q, R74W;D1270N, R74W;V201M, R74W;V201M;D1270N, R75Q, R117G, R117H, R117L, R117P, W1282R, Y109N, Y161S, Y1014C, Y1032C, R792G, R933G, S1159F, S1159P, or V1240G; OR

ii. The patient has two copies of the F508del mutation; AND

B) Patient is ≥ 6 years of age; AND
C) The medication is prescribed by or in consultation with a pulmonologist or a physician who specializes in the treatment of CF.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Symdeko is not recommended in the following situations:

1. **Cystic Fibrosis (CF), Patients with Unknown Cystic Fibrosis Transmembrane Regulator (CFTR) Gene Mutation.** An FDA-cleared CF mutation test should be used to detect the presence of the CFTR mutation prior to use of Symdeko[1]

92. **Combination Therapy with Orkambi, Kalydeco, or Trikafta.** Symdeko contains ivacaftor, the active agent in Kalydeco and part of Orkambi and Trikafta. Symdeko also contains tezacaftor, part of Trikafta. Symdeko is not indicated in combination with Kalydeco, Orkambi, or Trikafta.

3. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Cystic Fibrosis – Trikafta Prior Authorization Policy
- Trikafta® (elexacaftor/tezacaftor/ivacaftor tablets; ivacaftor tablets, co-packaged – Vertex)

REVIEW DATE: 10/21/2020; selected revision 01/06/2021

OVERVIEW

Trikafta is a combination of ivacaftor, a cystic fibrosis transmembrane regulator (CFTR) potentiator, tezacaftor, and elexacaftor indicated for the **treatment of cystic fibrosis (CF)** in patients ≥ 12 years of age who have at least one F508del mutation in the CFTR gene or a mutation in the CFTR gene that is responsive based on *in vitro* data.[1] If the patient's genotype is unknown, an FDA-cleared CF mutation test should be used to confirm the presence of at least one F508del mutation. Table 1 lists responsive CFTR mutations based on *in vitro* data in Fischer Rat Thyroid cells indicating that Trikafta increases chloride transport to ≥ 10% of normal over baseline.

CFTR – Cystic Fibrosis Transmembrane Regulator.

Elexacaftor is a new chemical entity. Ivacaftor is also available as Kalydeco® (tablets and oral granules) and as part of the co-formulated Orkambi® (lumacaftor/ivacaftor tablets and oral granules).[2,3] Tezacaftor and ivacaftor are part of the co-formulated product, Symdeko® (tezacaftor/ivacaftor tablets; ivacaftor tablets).[4]

Both elexacaftor and tezacaftor bind to different sites of the CFTR protein and have an additive effect in facilitating the cellular processing and trafficking of F508del-CFTR to increase the amount of CFTR protein delivered to the cell surface compared with either molecule alone.[1] Ivacaftor potentiates the channel open probability (or gating) of the CFTR protein at the cell surface. The combined effect of the three drugs is increased quantity and function of F508del-CFTR at the cell surface, resulting in increased CFTR activity as measured by CFTR mediated chloride transport.

Guidelines

Guidelines from the CF Foundation (2018) provide guidance on the use of CFTR therapy in patients with CF; Trikafta is not addressed.[5]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Trikafta. All approvals are provided for 3 years unless otherwise noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Trikafta as well as the monitoring required for adverse events and long-term efficacy, approval requires Trikafta to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Trikafta is recommended in those who meet the following criteria:

FDA-Approved Indications

19. Cystic Fibrosis (CF). Approve for 3 years if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 12 years of age; AND
- **B)** Patient has at least one copy of one of the following mutations in the cystic fibrosis conductance regulator gene: F508del, 3141del9, E822K, G1069R, L967S, R117L, S912L, 546insCTA, F191V, G1244E, L997F, R117P, S945L, A46D, F311del, G1249R, L1077P, R170H, S977F, A120T, F311L, G1349D, L1324P, R258G, S1159F, A234D, F508C, H139R, L1335P, R334L, S1159P, A349V, F508C;S1251N, H199Y, L1480P, R334Q, S1251N, A455E, H939R, M152V, R347H, S1255P, A554E, F575Y, H1054D, M265R, R347L, T338I, A1006E, F1016S, H1085P, M952I, R347P, T1036N, A1067T, F1052V, H1085R, M952T, R352Q, T1053I, D110E, F1074L, H1375P, M1101K, R352W, V201M, D110H, F1099L, I148T, P5L, R553Q, V232D, D192G, G27R, I175V, P67L, R668C, V456A, D443Y, G85E, I336K, P205S, R751L, V456F, D443Y;G576A;R668C,

G126D, I502T, P574H, R792G, V562I, D579G, G178E, I601F, Q98R, R933G, V754M, D614G, G178R, I618T, Q237E, R1066H, V1153E, D836Y, G194R, I807M, Q237H, R1070Q, V1240G, D924N, G194V, I980K, Q359R, R1070W, V1293G, D979V, G314E, I1027T, Q1291R, R1162L, W361R, D1152H, G463V, I1139V, R31L, R1283M, W1098C, D1270N, G480C, I1269N, R74Q, R1283S, W1282R, E56K, G551D, I1366N, R74W, S13F, Y109N, E60K, G551S, K1060T, R74W;D1270N, S341P, Y161D, E92K, G576A, L15P, R74W;V201M, S364P, Y161S, E116K, G576A;R668C, L165S, R74W;V201M;D1270N, S492F, Y563N, E193K, G622D, L206W, R75Q, S549N, Y1014C, E403D, G628R, L320V, R117C, S549R, Y1032C, E474K, G970D, L346P, R117G, S589N, E588V, G1061R, L453S, R117H, or S737F; AND

C) The medication is prescribed by or in consultation with a pulmonologist or a physician who specializes in the treatment of CF.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Trikafta is not recommended in the following situations:

28. Cystic Fibrosis (CF), Patients with Unknown Cystic Fibrosis Transmembrane Regulator (CFTR) Gene Mutation. An FDA-cleared CF mutation test should be used to detect the presence of the CFTR mutation prior to use of Trikafta.[1]

29. Combination Therapy with Orkambi, Kalydeco, or Symdeko. Trikafta contains ivacaftor which is a component of Orkambi, Kalydeco, and Symdeko. Tezacaftor, another component of Trikafta is also contained in Symdeko.

30. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Desmopressin Products – Nocdurna Prior Authorization Policy

- Nocdurna® (desmopressin acetate sublingual tablets [27.7 mcg and 55.3 mcg] – Ferring)

REVIEW DATE: 10/07/2020

OVERVIEW

Nocdurna, a vasopressin analog, is indicated for the treatment of nocturia due to nocturnal polyuria in adults who awaken at least two times per night to void.[1] Before initiating therapy it is recommended that the diagnosis of nocturnal polyuria has been confirmed with a 24-hour urine collection.

Disease Overview

Nocturnal polyuria is defined as nocturnal urine volume exceeding 33% of the total 24-hour urine volume in patients ≥ 65 years of age or exceeding 20% of 24-hour urine volume in younger patients.[2] Nocturnal polyuria may improve via lifestyle and behavior modifications, which should be implemented prior to pharmacotherapy.[3] Such modifications include minimizing fluid intake before bed (particularly caffeine and alcohol), restriction of total fluid consumption, emptying the bladder before bed, increasing exercise and fitness levels, earlier dosing of medications such as diuretics, and elevating the legs above heart level for a few hours before going to bed (for patients with peripheral edema).

Safety

Nocdurna has a Boxed Warning regarding hyponatremia.[1] Use of Nocdurna is contraindicated in patients at increased risk of severe hyponatremia such as patients with excessive fluid intake, illness that may cause fluid or electrolyte imbalances, and in patients using loop diuretics or systemic or inhaled glucocorticoids. It is recommended to check serum sodium concentrations prior to initiating or resuming Nocdurna and throughout treatment. If hyponatremia occurs, Nocdurna may need to be temporarily or permanently discontinued.

Nocdurna is contraindicated in patients with hyponatremia or among those with a history of hyponatremia.[1] Also, patients with polydipsia should not use Nocdurna. Do not administer Nocdurna concomitantly with loop diuretics or with systemic or inhaled glucocorticoids. Patients with renal impairment with an estimated glomerular filtration rate below 50 mL/min/1.73 m^2 should not use Nocdurna. Those with known or suspected syndrome of inappropriate antidiuretic hormone secretion should not use Nocdurna. Do not utilize Nocdurna during illnesses that may cause fluid or electrolyte imbalance, such as gastroenteritis, salt-wasting nephropathies, or systemic infection. Nocdurna is contraindicated in patients with heart failure or among those with uncontrolled hypertension because the fluid retention in these conditions increases the risk of worsening the underlying condition. Also, Nocdurna is not recommended in patients at risk for increased intracranial pressure or those with a history of urinary retention. Trials involving Nocdurna have not included pediatric patients.

Guidelines

A consensus statement on the diagnosis and treatment of nocturia was published by the International Continence Society in 2019.[2] There was consensus that fluid restriction should be advised for all desmopressin-treated patients. Newer desmopressin formulations, including Nocdurna and Noctiva® (desmopressin acetate nasal spray), are generally regarded as low-dose desmopressin. Low-dose formulations are appropriate in the absence of contraindications to desmopressin therapy.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Nocdurna. All approvals are provided for the duration noted below. Due to the specialized skills required for evaluation and diagnosis of patients treated with Nocdurna, as well as the monitoring required for adverse events and long-term efficacy, approval requires Nocdurna to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Nocdurna is recommended in those who meet the following criteria:

FDA-Approved Indications

34. Nocturia due to Nocturnal Polyuria. Approve for 1 year if the patient meets all of the following criteria (A, B, C, D, E, F, and G):

- **G)** Patient is ≥ 18 years of age; AND
- **H)** The diagnosis of nocturnal polyuria has been confirmed with a 24-hour urine collection before treatment initiation and the patient meets one of the following (i or ii):
  - **i.** The nocturnal urine volume exceeds 20% of the total 24-hour urine volume in patients < 65 years of age; OR
  - **ii.** The nocturnal urine volume exceeds 33% of the total 24-hour urine volume in patients ≥ 65 years of age; AND
- **I)** Prior to desmopressin therapy, patient awakens at least two times per night to void; AND
- **J)** Patient has serum sodium concentrations within the normal range (135 to 145 mmol/L); AND
- **K)** Prescriber has verified that the patient does not have the following conditions/circumstances in which use of Nocdurna is not recommended (i, ii, iii, iv, v, or vi):
  - **i.** Currently receiving loop diuretics (e.g., furosemide, torsemide, bumetanide); OR
  - **ii.** Currently receiving systemic or inhaled glucocorticoids; OR
  - **iii.** Renal impairment with an estimated glomerular filtration rate < 50 mL/min/1.73 m^2; OR
  - **iv.** Heart failure; OR
  - **v.** Polydipsia; OR
  - **vi.** Known or suspected syndrome of inappropriate antidiuretic hormone secretion; AND
- **L)** Patient has tried non-pharmacologic techniques or lifestyle interventions to manage the nocturia; AND

  Note: Examples of non-pharmacologic techniques include nighttime fluid restriction, avoidance of caffeine and alcohol, earlier timing of medications, leg elevation, or use of compression stockings.

- **M)** Nocdurna is prescribed by or in consultation with a urologist, geriatrician, or endocrinologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Nocdurna is not recommended in the following situations:

93. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION WITH STEP THERAPY POLICY

POLICY: Desmopressin Products – Noctiva Prior Authorization with Step Therapy Policy

- Noctiva™ (desmopressin acetate nasal spray for intranasal use [0.83 mcg/0.1 mL and 1.66 mcg/0.1 mL] – Avadel)

REVIEW DATE: 10/07/2020

OVERVIEW

Noctiva, a vasopressin analog, is indicated for the treatment of nocturia due to nocturnal polyuria in adults who awaken at least two times per night to void.[1] A limitation of use is that the agent has not been studied in patients < 50 years of age.

Disease Overview

Nocturnal polyuria is defined as nocturnal urine volume exceeding 33% of the total 24-hour urine volume in patients ≥ 65 years of age or exceeding 20% of 24-hour urine volume in younger patients.[2] Nocturnal polyuria may improve via lifestyle and behavior modifications, which should be implemented prior to pharmacotherapy.[3] Such modifications include minimizing fluid intake before bed (particularly caffeine and alcohol), restriction of total fluid consumption, emptying the bladder before bed, increasing exercise and fitness levels, earlier dosing of medications such as diuretics, and elevating the legs above heart level for a few hours before going to bed (for patients with peripheral edema).

Safety

Noctiva has a Boxed Warning regarding hyponatremia.[1] Noctiva is contraindicated in patients with hyponatremia or among those with a history of hyponatremia. Also, patients with polydipsia or primary nocturnal enuresis should not use Noctiva. Do not administer Noctiva concomitantly with loop diuretics or with systemic or inhaled glucocorticoids. Patients with renal impairment with an estimated glomerular

filtration rate below 50 mL/min/1.73 m^2 should not use Noctiva. Those with known or suspected syndrome of inappropriate antidiuretic hormone secretion should not use Noctiva. Do not utilize Noctiva during illnesses that may cause fluid or electrolyte imbalance, such as gastroenteritis, salt-wasting nephropathies, or systemic infection. Noctiva is contraindicated in patients with congestive heart failure (CHF) [New York Heart Association {NYHA} class II to IV] or among those with uncontrolled hypertension because the fluid retention in these conditions increases the risk of worsening the underlying condition. Also, Noctiva is not recommended in patients at risk for increased intracranial pressure or those with a history of urinary retention, and should be used with caution (e.g., monitoring of volume status) in patients with NYHA class I CHF. Noctiva is contraindicated for the treatment of primary nocturnal enuresis because of reports of hyponatremic-related seizures in pediatric patients treated with other intranasal formulations of desmopressin. Trials involving Noctiva have not been performed in pediatric patients.

Guidelines

A consensus statement on the diagnosis and treatment of nocturia was published by the International Continence Society in 2019.[2] There was consensus that fluid restriction should be advised for all desmopressin-treated patients. Newer desmopressin formulations, including Nocdurna® (desmopressin acetate sublingual tablets [27.7 mcg and 55.3 mcg]) and Noctiva, are generally regarded as low-dose desmopressin. Low-dose formulations are appropriate in the absence of contraindications to desmopressin therapy. Oral desmopressin tablets are cited as another formulation in the consensus statement (available as 100 mcg and 200 mcg tablets in the US). This is noted to be an option for certain patients, although lower-dose formulations should be used when concomitant hyponatremia risk factors are present. Of note, it is uncertain how the pharmacokinetic profile of Noctiva aligns with the other FDA-approved nasal desmopressin products because there are no comparative bioavailability studies and Noctiva contains a novel excipient, cyclopentadecanolide, which enhances absorption.[1] The consensus statement suggests that pharmacodynamic and pharmacokinetic studies in nocturia patients during an overnight evaluation would be ideal to characterize plasma desmopressin levels and rationale for dose differentiation.[2]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Noctiva. All approvals are provided for the duration noted below. Due to the specialized skills required for evaluation and diagnosis of patients treated with Noctiva well as the monitoring required for adverse events and long-term efficacy, approval requires Noctiva to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Noctiva is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Nocturia due to Nocturnal Polyuria.** Approve for 1 year if the patient meets all of the following criteria (A, B, C, D, E, F, G and H):
   - **A)** Patient is ≥ 50 years of age; AND
   - **B)** The diagnosis of nocturnal polyuria has been confirmed with a 24-hour urine collection before treatment initiation and the patient meets one of the following (i or ii):
     - **i.** The nocturnal urine volume exceeds 20% of the total 24-hour urine volume in patients < 65 years of age; OR

ii. The nocturnal urine volume exceeds 33% of the total 24-hour urine volume in patients ≥ 65 years of age; AND

C) Prior to desmopressin therapy, patient awakens at least two times per night to void; AND

D) Patient has serum sodium concentrations within the normal range (135 to 145 mmol/L); AND

E) Prescriber has verified that the patient does not have the following conditions/circumstances in which use of Noctiva is not recommended (i, ii, iii, iv, v, or vi):

i. Currently receiving loop diuretics (e.g., furosemide, torsemide, bumetanide); OR

ii. Currently receiving systemic or inhaled glucocorticoids; OR

iii. Renal impairment with an estimated glomerular filtration rate < 50 mL/min/1.73 m^2; OR

iv. New York Heart Association class II to IV congestive heart failure; OR

v. Polydipsia; OR

vi. Known or suspected syndrome of inappropriate antidiuretic hormone secretion; AND

F) Patient has tried non-pharmacologic techniques or lifestyle interventions to manage the nocturia; AND

Note: Examples of non-pharmacologic techniques include nighttime fluid restriction, avoidance of caffeine and alcohol, earlier timing of medications, leg elevation, or use of compression stockings.

G) Patient tried one of Nocdurna (desmopressin acetate sublingual tablets) or oral desmopressin acetate tablets (DDAVP tablets, generics); AND

H) Noctiva is prescribed by or in consultation with a urologist, geriatrician, or endocrinologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Noctiva is not recommended in the following situations:

94. Primary Nocturnal Enuresis. Use of Noctiva is contraindicated for the treatment of patients with primary nocturnal enuresis.[1] Reports of hyponatremia-related seizures have occurred in pediatric patients treated with other intranasal formulations of desmopressin.

95. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

DEU Update	**01/26/2021:** No changes to criteria. The policy was renamed to "Desmopressin Products – Noctiva Prior Authorization with Step Therapy Policy."	NA

PRIOR AUTHORIZATION POLICY

POLICY: Diabetes – Glucagon-Like Peptide-1 Agonists Prior Authorization Policy

- Adlyxin® (lixisenatide injection – sanofi-aventis)
- Bydureon® (exenatide extended-release injectable suspension – AstraZeneca)
- Bydureon BCise® (exenatide extended-release injectable suspension – AstraZeneca)
- Byetta® (exenatide injection – AstraZeneca)
- Ozempic® (semaglutide injection – Novo Nordisk)
- Rybelsus® (semaglutide tablets – Novo Nordisk)
- Tanzeum™ (albiglutide injection – GlaxoSmithKline [obsolete 07/31/2018])
- Trulicity® (dulaglutide injection – Eli Lilly)
- Victoza® (liraglutide injection – Novo Nordisk)

REVIEW DATE: 10/21/2020

OVERVIEW

The glucagon-like peptide-1 (GLP-1) receptor agonists addressed in this policy are indicated as adjuncts to diet and exercise to improve glycemic control in adults with type 2 diabetes.[1-9] Victoza is additionally indicated for type 2 diabetes in patients ≥ 10 years of age.[9] Victoza, Ozempic, and Trulicity also have labeled indications related to cardiovascular (CV) risk reduction in adults with type 2 diabetes.

Guidelines

According to the ADA Standards of Care (2020), among patients with type 2 diabetes with established atherosclerotic CV disease, sodium-glucose co-transporter 2 inhibitors or GLP-1 agonists with demonstrated CV disease benefit are recommended as part of the antihyperglycemic regimen.[10] GLP-1 agonists are also useful as add-on therapy for patients who are inadequately controlled on metformin. Other guidelines have similar recommendations.[11]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of the GLP-1 agonists targeted in this policy. Of note, Saxenda® (liraglutide injection) is indicated for weight loss, not diabetes, and is not targeted in this policy. All approvals are provided for the duration noted below.

Automation: If criteria for previous use of an oral medication for diabetes (this includes all oral medications for diabetes) in the past 130 days are not met at the point of service, coverage will be determined by prior authorization criteria.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Type 2 Diabetes Mellitus.** Approve for 3 years.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage is not recommended in the following situations:

31. **Type 1 Diabetes Mellitus.** None of the GLP-1 agonists are indicated for patients with type 1 diabetes.[1-9] Addition of GLP-1 receptor agonists to insulin therapy resulted in small (0.2%) reductions in HbA_{1C} among patients with type 1 diabetes compared with insulin alone.[10]

32. **Weight Loss Treatment**. Saxenda contains the same chemical entity as Victoza at a higher dosage and is indicated for chronic weight management. Endocrine Society guidelines for pharmacological management of obesity (2015) advise against off-label prescribing of medications such as GLP-1 receptor agonists for the sole purpose of producing weight loss.[12]

33. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Diabetes – Symlin Prior Authorization Policy

- Symlin™ (pramlintide injection – AstraZeneca)

REVIEW DATE: 08/12/2020

OVERVIEW

Symlin, an antihyperglycemic agent for subcutaneous injection, is indicated as an adjunctive treatment in patients with type 1 or type 2 diabetes who use mealtime insulin therapy and who have failed to achieve

desired glucose control despite optimal insulin therapy.[1] Symlin is contraindicated in patients with a confirmed diagnosis of gastroparesis and in patients with hypoglycemia unawareness. At the initiation of Symlin, mealtime insulin should be decreased by 50%.

Pramlintide is a synthetic analog of the naturally occurring neuroendocrine hormone amylin which is synthesized by pancreatic β-cells and contributes to glucose control during the postprandial period.[1] Pramlintide slows gastric emptying and reduces the postprandial rise in plasma glucagon. Pramlintide has also been shown to reduce food intake via a proposed satiety mechanism.

Guidelines/Consensus Statements

The American Diabetes Association (ADA) Standards of Medical Care in Diabetes (2020) note that Symlin is the only approved treatment for adjunct therapy to insulin in type 1 diabetes; however, a specific recommendation for its use it not provided.[2] Symlin is not included on the ADA treatment algorithm for type 2 diabetes. Similarly, American Association of Clinical Endocrinologists (AACE) and American College of Endocrinology (ACE) guidelines for management of type 2 diabetes (2020) note that Symlin is approved in combination with basal-bolus insulin regimens but do not make a recommendation regarding its place in therapy.[3]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Symlin. All approvals are provided for the duration noted below.

Automation: If criteria for previous use of insulin (automated) within the past 130 days are not met at the point of service, coverage will be determined by prior authorization criteria.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Symlin is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Diabetes Mellitus, Type 1 or Type 2.** Approve for 3 years if Symlin is prescribed in adjunct to insulin therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Symlin is not recommended in the following situations:

1. **Weight Loss Treatment**. AACE/ACE obesity clinical practice guidelines (2016) comment that Symlin may lead to modest weight loss in diabetic patients but do not comment on a role for Symlin in management of obesity in non-diabetic patients.[4] Limited data are available with Symlin for weight loss treatment.[5] Other pharmacotherapies are available and indicated for weight loss.

96. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Dronabinol Prior Authorization Policy

- Marinol® (dronabinol capsules – AbbVie, generics)
- Syndros® (dronabinol oral solution – Insys)

REVIEW DATE: 10/21/2020

OVERVIEW

Dronabinol capsules (Marinol®, generics) and Syndros® (dronabinol oral solution) are both indicated for anorexia associated with weight loss in patients with Acquired Immune Deficiency Syndrome (AIDS) and for nausea and vomiting associated with cancer chemotherapy in patients who have failed to respond adequately to conventional antiemetic treatments.[1,2]

Dronabinol is an orally active cannabinoid which has complex effects on the central nervous system (CNS).[1,2] The active ingredient is synthetic delta-9-tetrahydrocannabinol (delta-9-THC), which is a naturally occurring component of *Cannabis sativa L.* (e.g., marijuana). Dronabinol demonstrates reversible effects on appetite, mood, cognition, memory, and perception. These effects appear to be dose-related, increasing in frequency with higher dosages, and subject to great interpatient variability. Dronabinol capsules have not been studied in and are not recommended for pediatric patients with AIDS-related anorexia; caution is recommended in prescribing dronabinol capsules for children because of the psychoactive effects. The safety and effectiveness of Syndros have not been established in pediatric patients. Dronabinol is a controlled substance; the capsules are CIII and the oral solution is CII.

In addition to the FDA-approved uses for dronabinol, several Phase III studies have been completed or are underway according to clinicaltrials.gov; the disease states being studied include anorexia nervosa, chronic pain, multiple sclerosis, and opioid dependence.[3] Published studies supporting these off-label uses are lacking.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines regarding the treatment of emesis (version 2.2020 – April 23, 2020) include various regimens depending upon the emetogenic potential of the chemotherapy agent(s) being administered.[4] Dronabinol is included in the list of medications for breakthrough nausea or emesis. Other recommended agents for breakthrough nausea or emesis include

serotonin 5-HT_3 receptor antagonists, olanzapine, lorazepam, haloperidol, metoclopramide, scopolamine, prochlorperazine, promethazine, and dexamethasone. The agent should be from a different drug class to the current regimen, but no preference is given.

Safety

Dronabinol capsules contain sesame oil and are contraindicated in patients who are allergic to this substance.[1] Syndros is contraindicated in patients with a history of hypersensitivity to alcohol and patients who are receiving, or have recently received, disulfiram- or metronidazole-containing products within 14 days.[2] Syndros contains 50% (w/w) dehydrated alcohol and 5.5% (w/w) propylene glycol.

POLICY STATEMENT
Prior Authorization is recommended for prescription benefit coverage of dronabinol. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

A. Coverage of dronabinol capsules is recommended in those who meet the following criteria:

FDA-Approved Indications

23. Anorexia Associated with Weight Loss in Patients with Acquired Immune Deficiency Syndrome (AIDS): Approve for 6 months if ONE of the following criteria is met (A or B):
- **A)** Generic dronabinol capsules are requested; OR
- **B)** If brand Marinol is prescribed, the patient has tried generic dronabinol capsules AND the Brand product is being requested due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the bioequivalent generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.

2. Nausea and Vomiting Associated with Cancer Chemotherapy in Patients who have Failed to Respond Adequately to Conventional Antiemetic Treatments: Approve for 1 year if the patient meets BOTH of the following criteria (A and B):
- **A)** Patient has failed to respond adequately to at least two conventional antiemetic treatments; AND
  Note: Examples of conventional antiemetic treatments include selective serotonin [5-HT_3] receptor antagonists [such as ondansetron, granisetron, Anzemet® {dolasetron}, Aloxi® {palonosetron injection}], Akynzeo® [netupitant/palonosetron capsules], Emend® (aprepitant capsules), Varubi™ (rolapitant tablets), metoclopramide, prochlorperazine, dexamethasone.
- **B)** Patient meets ONE of the following criteria (i or ii):
  - **i.** Generic dronabinol capsules are requested; OR
  - **ii.** If brand Marinol is prescribed, the patient has tried generic dronabinol capsules AND the Brand product is being requested due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the bioequivalent generic product which, per the prescriber, would result in a significant allergy or serious adverse reaction.

B. Coverage of Syndros is recommended in those who meet the following criteria:

FDA-Approved Indications

1. Anorexia Associated with Weight Loss in Patients with Acquired Immune Deficiency Syndrome (AIDS): Approve Syndros for 6 months if the patient meets ONE of the following criteria (A or B):
- **A)** Patient has tried generic dronabinol capsules; OR
- **B)** Patient cannot swallow or has difficulty swallowing capsules.

2. Nausea and Vomiting Associated with Cancer Chemotherapy in Patients who have Failed to Respond Adequately to Conventional Antiemetic Treatments: Approve Syndros for 1 year if the patient meets BOTH of the following criteria (A and B):
- **A)** Patient has failed to respond adequately to at least two conventional antiemetic treatments; AND

Note: Examples of conventional antiemetic treatments include selective serotonin [5-HT_3] receptor antagonists [such as ondansetron, granisetron, Anzemet® {dolasetron}, Aloxi® {palonosetron injection}], Akynzeo® [netupitant/palonosetron capsules], Emend® (aprepitant capsules), Varubi™ (rolapitant tablets), metoclopramide, prochlorperazine, dexamethasone.

B) Patient meets ONE of the following (i or ii):
- **i.** Patient has tried generic dronabinol capsules; OR
- **ii.** Patient cannot swallow or has difficulty swallowing capsules.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of dronabinol is not recommended in the following situations:

97. Chronic Non-Cancer Pain. Based on a review of published studies, there is insufficient evidence for the use of dronabinol in non-cancer pain due to the small study sizes and moderate to high risk of bias to allow for a definitive conclusion.[5] In the two studies reviewed, the authors reported mixed effects for pain measures for dronabinol. More data are needed to define the place in therapy of dronabinol in the treatment of chronic non-cancer pain.

98. Multiple Sclerosis. Results from one published, randomized, double-blind, placebo-controlled study (n = 498) demonstrated that dronabinol has no overall effect on the progression of multiple sclerosis in patients with primary and secondary progressive multiple sclerosis.[6] There is limited published evidence for the use of dronabinol in spasticity and pain in multiple sclerosis.[7-8] An analysis of three studies in patients with spasticity due to multiple sclerosis found some improvement with dronabinol vs. placebo, but it did not reach statistical significance.[7] A small study (n = 24) in patients with pain due to multiple sclerosis found that dronabinol had a modest analgesic effect, but adverse effects were also more frequent with dronabinol over placebo.[8] A study in patients with multiple sclerosis and central neuropathic pain (n = 240) found no difference between dronabinol and placebo in pain intensity.[9] More data are needed to define the place in therapy of dronabinol in the treatment of multiple sclersosis.

99. Tourette's syndrome. Published studies of dronabinol in patients with Tourette's syndrome are lacking.[10] More data are needed to define the place in therapy of dronabinol in the treatment of Tourette's syndrome.

100. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Enspryng Prior Authorization Policy

- Enspryng™ (satralizumab-mwge for subcutaneous injection – Viela Bio)

REVIEW DATE: 08/26/2020; selected revision 09/09/2020

OVERVIEW

Enspryng, an interleukin-6 receptor antagonist, is indicated for the treatment of neuromyelitis optica spectrum disorder (NMOSD) in patients ≥ 18 years of age who are anti-aquaporin-4 antibody positive.[1]

Disease Overview

NMOSD is a rare, relapsing, autoimmune disorder of the brain and spinal cord with optic neuritis and/or myelitis as predominate characteristic symptoms.[2] NMOSD often causes significant, permanent damage to vision and/or spinal cord function resulting in blindness or impaired mobility.[3] Patients may experience pain, paralysis, loss of bowel and bladder control, loss of visual acuity, uncontrolled motor functions, and complications can lead to death.

Other Therapies

Soliris® (eculizumab injection for intravenous infusion) and Uplizna™ (inebilizumab-cdon injection for intravenous infusion) are two other FDA-approved medications for treatment of NMOSD in adults who are anti-AQP4 antibody-positive.[4,5] For acute attacks, typical treatment is high-dose intravenous corticosteroids.[6,7] Plasma exchange may be effective in patients who suffer acute severe attacks that do not respond to intravenous corticosteroids. For long-term control of the disease, a variety of immunosuppressive drugs are utilized as first-line therapy. Preventative maintenance therapies include corticosteroids, azathioprine, mycophenolate mofetil, and rituximab (off-label).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Enspryng. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Enspryng as well as the monitoring required for adverse events and long-term efficacy, approval requires Enspryng to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Enspryng is recommended in those who meet the following criteria:

FDA-Approved Indications

35. Neuromyelitis Optica Spectrum Disorder. Approve if the patient meets ONE of the following criteria (A or B):

C) Initial Therapy. Approve for 1 year if the patient meets the following criteria (i, ii, iii, iv, and v):

vi. Patient is ≥ 18 years of age; AND

vii. Neuromyelitis optica spectrum disorder diagnosis was confirmed by blood serum test for anti-aquaporin-4 antibody positive; AND

viii. Patient is currently receiving or has previously tried two of the following systemic therapies (a, b, c, or d):

a. Azathioprine; OR

b. Corticosteroid; OR

c. Mycophenolate mofetil; OR

d. Rituximab; AND

Note: An exception to the requirement for a trial of a systemic therapy can be made if the patient has already tried Soliris® (eculizumab injection) or Uplizna™ (inebilizumab-cdon injection) for neuromyelitis optica spectrum disorder. Patients who have already tried Soliris or Uplizna for neuromyelitis optica spectrum disorder are not required to try another systemic agent.

ix. Patient has a history of at least one relapse in the last 12 months or two relapses in the last 2 years; AND

x. The medication is being prescribed by or in consultation with a neurologist.

D) Patient is Currently Receiving Enspryng. Approve for 1 year if the patient meets the following (i, ii, iii, and iv):

v. Patient is ≥ 18 years of age; AND

vi. Neuromyelitis optica spectrum disorder diagnosis was confirmed by blood serum test for anti-aquaporin-4 antibody positive; AND

vii. According to the prescriber, patient has had clinical benefit from the use of Enspryng; AND

Note: Examples of clinical benefit include reduction in relapse rate, reduction in symptoms (e.g., pain, fatigue, motor function), and a slowing progression in symptoms.

viii. The medication is being prescribed by or in consultation with a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Enspryng is not recommended in the following situations:

34. Concomitant use with a rituximab product, Soliris® (eculizumab injection), or Uplizna™ (inebilizumab-cdon injection). There is no evidence to support additive efficacy of combining Enspryng with rituximab, Soliris or Uplizna.

35. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
New Policy	--	08/26/2020
Selected Revision	**Neuromyelitis Optica Spectrum Disorder.** Initial therapy approval duration was changed from 6 months to 1 year. The requirement for tried systemic therapies verbiage of "used in the maintenance setting" was removed. The addition of two relapses in the last 2 years was added as an option and (acute attack from neuromyelitis optica spectrum disorder) was removed from the history of relapses criteria. **Concomitant use with Soliris® (eculizumab injection) or Uplizna™ (inebilizumab-cdon injection).** Rituximab was added as a product not to be used concomitantly with Enspryng.	09/09/2020

PRIOR AUTHORIZATION POLICY

POLICY: Enzyme Replacement Therapy – Strensiq® (asfotase alfa for subcutaneous use – Alexion Pharmaceuticals, Inc.)

TAC APPROVAL DATE: 08/08/2018

OVERVIEW

Strensiq is indicated for the treatment of patients with perinatal/infantile- and juvenile-onset hypophosphatasia (HPP).[1] Strensiq is an enzyme replacement therapy which replaces human tissue non-specific alkaline phosphatase (TNSALP). Strensiq is produced via recombinant DNA technology in Chinese hamster ovary cells. It is a soluble glycoprotein composed of two identical polypeptide chains, each containing TNSALP, bound to the Fc domain of human immunoglobulin G_1 and a deca-aspartate peptide for targeting the bone.

Disease Overview

Hypophosphatasia (HPP) is an inherited metabolic disease caused by a loss-of-function mutation in the gene which codes for TNSALP.[2] TNSALP is tissue bound and expressed in high concentrations in the liver, kidney, neurons, neutrophils, bone and teeth.[2,3] In HPP, inorganic pyrophosphate and pyridoxal 5'-phosphate, substrates for TNSALP, are increased and lead to disease manifestations. Inorganic pyrophosphate is an inhibitor of bone mineralization, and its accumulation leads to rickets and osteomalacia. Pyridoxal 5'-phosphate, a derivative of vitamin B_6, is necessary for the synthesis of gamma aminobutyric acid (GABA). However, for pyridoxal 5'-phosphate to enter the neuron, it must be dephosphorylated to allow pyridoxal to enter the neuron where it is rephosphorylated. The decreased synthesis of GABA in HPP leads to seizures.

HPP is a rare disease, with an estimated live-birth incidence, for the severe forms of HPP, of 1:100,000 in Canada and approximately 1:300,000 in Europe.[2,4] Prevalence in certain populations, such as Canadian

Mennonites may be as high as 1:2,500 births. Disease severity can range from neonatal death with almost no skeletal mineralization to dental problems in adults without any bone symptoms.[2-4] In patients most severely affected by HPP, mortality ranges from 50% to nearly 100% during infancy.[2]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Strensiq. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Strensiq as well as the monitoring required for adverse events and long-term efficacy, approval requires Strensiq to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Strensiq is recommended in those who meet the following criteria:

FDA-Approved Indications

36. Hypophosphatasia – Perinatal/Infantile- and Juvenile-Onset. Approve for 3 years if the patient meets ALL of the following criteria (A, B, C AND D):

24. Diagnosis is supported by one of the following (i, ii or iii):

- **i.** Molecular genetic testing documenting tissue non-specific alkaline phosphatase (*ALPL*) gene mutation; OR
- **ii.** Low baseline serum alkaline phosphatase activity; OR
- **iii.** An elevated level of a tissue non-specific alkaline phosphatase substrate (i.e., serum pyridoxal 5'-phosphate, serum or urinary inorganic pyrophosphate, urinary phosphoethanolamine); AND

25. Patient meets one of the following (i or ii):

- **i.** Patient currently has, or has a history of clinical manifestations consistent with hypophosphatasia (e.g., skeletal abnormalities, premature tooth loss, muscle weakness, poor feeding, failure to thrive, respiratory problems, Vitamin B_6-dependent seizures); OR
- **ii.** Patient has a family history (parent or sibling) of hypophosphatasia without current clinical manifestations of hypophosphatasia; AND

26. Disease onset ≤ 18 years of age; AND

27. Strensiq is prescribed by or in consultation with a geneticist, endocrinologist, a metabolic disorder sub-specialist, or a physician who specializes in the treatment of hypophosphatasia or related disorders.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Strensiq has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

101. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Enzyme Replacement Therapy – Adagen Prior Authorization Policy

- Adagen® (pegademase bovine injection for intramuscular use – Leadiant [obsolete 6/30/2019])

REVIEW DATE: 11/11/2020

OVERVIEW

Adagen is a modified enzyme used for enzyme replacement therapy for the **treatment of severe combined immunodeficiency disease associated with a deficiency of adenosine deaminase (ADA-SCID).**[1] It is recommended for use in infants from birth or in children at any age at the time of diagnosis.

Disease Overview

ADA-SCID is an ultra-rare, autosomal recessive genetic disorder of purine metabolism affecting lymphocyte development, viability, and function.[1,2] It is estimated to occur in 1:200,000 to 1:1,000,000 live births. ADA is a purine salvage enzyme which metabolizes deoxyadenosine (dAdo) and adenosine (Ado) into deoxyinosine and inosine, respectively.[3] When ADA is deficient, dAdo accumulates in intracellular and extracellular compartments, along with its metabolite, deoxyadenosinetriphosphate (dATP). The buildup of both dAdo and dATP negatively impacts lymphocyte development and function by impeding DNA replication and repair, inducing apoptosis, and inhibiting lymphocyte activation.

There are a variety of phenotypes of ADA deficiency; ADA-SCID is the most severe and typically diagnosed before 1 year of age.[2] Infants with typical ADA-SCID have failure to thrive and opportunistic infections associated with marked depletion of B, T, and NK lymphocytes. Manifestations include persistent diarrhea, extensive dermatitis, recurrent pneumonia, and other life-threatening illnesses caused by opportunistic infections. Growth failure and other physical manifestations, including hepatic and neurologic abnormalities, may also be present. Without treatment, patients with ADA-SCID rarely survive beyond 1 to 2 years of age.

Guidelines

According to a consensus statement for management of ADA-SCID (2018), diagnosis is usually established by demonstrating absent or very low (< 1 % of normal) ADA catalytic activity, accompanied by elevated Ado or dAdo in plasma, urine, or dried blood spots.[4] This should be followed by genetic testing to confirm bi-allelic mutations in the *ADA* gene. Enzyme replacement therapy (ERT) is recommended by the consensus panel for all patients newly diagnosed with ADA-SCID as an immediate stabilizing measure. The ideal duration of ERT has not been established. The consensus recommends that most patients use ERT as a "bridge" for a few months to approximately 2 years prior to undergoing curative therapy with a hematopoietic stem cell transplant (HSCT) or hematopoietic stem cell gene therapy. Long-term use of ERT has declined in the past 30 years and has not been systematically studied. Lymphocyte counts and function may deteriorate over time, contributing to increased risk of infections and malignancy. Therefore, ERT longer than 5 to 8 years should be avoided and employed on a continuous basis only when neither HSCT nor gene therapy have been available or effective. The consensus also suggests ERT use for patients with later-onset phenotypes who may not be ideal candidates for curative processes.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Adagen. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Adagen, approval requires it to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Adagen is recommended in those who meet the following criteria:

FDA-Approved Indications

3. Adenosine Deaminase Severe Combined Immunodeficiency (ADA-SCID). Approve for 1 year if the patient meets the following criteria (A and B):

- **A)** Patient has a diagnosis of ADA-SCID confirmed by one of the following criteria (i or ii):
  - **i.** At baseline (i.e., prior to initiating enzyme replacement therapy), the patient has had absent or very low (< 1% of normal) adenosine deaminase (ADA) catalytic activity; OR
  - **ii.** Patient has had molecular genetic testing confirming bi-allelic mutations in the *ADA* gene; AND
- **B)** The medication is prescribed by, or in consultation with, an immunologist, hematologist/oncologist, or physician that specializes in ADA-SCID or related disorders.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Adagen is not recommended in the following situations:

6. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Enzyme Replacement Therapy – Aldurazyme® (laronidase solution for intravenous infusion – Genzyme Corporation)

DATE REVIEWED: 04/15/2020

OVERVIEW

Aldurazyme is human α-L-iduronidase produced in Chinese hamster ovary cells via recombinant DNA technology.[1] Alpha-L-iduronidase catalyzes the hydrolysis of terminal α-L-iduronic acid from dermatan sulfate and heparin sulfate.

Aldurazyme is indicated for patients with Hurler and Hurler-Scheie forms of Mucopolysaccharidosis type I and in patients with the Scheie form who have moderate to severe symptoms.[1] The risks and benefits of treating mildly affected patients with the Scheie form have not been established.

Disease Overview

Mucopolysaccharidosis type I (MPS I) is a rare autosomal recessive, lysosomal storage disease characterized by the deficiency of α-L-iduronidase.[2] Patients with MPS I are unable to degrade dermatan and heparin sulfate, resulting in the accumulation of glycosoaminoglycans within lysosomes. Over time, the accumulation of glycosoaminoglycans leads to progressive tissue damage,[3] ultimately resulting in multiorgan dysfunction.[2,3] Patients with MPS I commonly have a characteristic face, corneal clouding, cardiomyopathy, enlarged tongue, respiratory insufficiency, hepatosplenomegaly, hernias, dysostosis multiplex, joint stiffness, and cognitive impairment.[4,5] MPS I is commonly classified as three separate entities, Hurler syndrome (severe form), Hurler-Scheie syndrome (intermediate form) and Scheie syndrome (mild form).[2-4] However, this classification system is based on disease severity and age of onset, not on any biochemical differences between the three syndromes.[5] All three forms of the disease are the result of the same enzymatic deficiency and represent varying degrees of severity along the disease continuum. The definitive diagnosis of MPS I is based on demonstrating deficient α-L-iduronidase activity in fibroblasts, leukocytes, plasma, or serum.[2,3,5]

Specific treatments for MPS I include hematopoietic stem cell transplantation (HSCT) and enzyme replacement therapy.[2,4,5] HSCT is indicated for the severe forms of MPS I, in children < 2 years of age who are cognitively intact.[2,4] HSCT has been shown to preserve intellectual development, reverse some aspects of somatic disease and increase survival.[2,4,5] Enzyme replacement therapy (Aldurazyme) does not cross the blood-brain barrier and is unlikely to improve cognitive or neurologic function.[2] Therefore, Aldurazyme is appropriate in children < 2 years of age who have already experienced cognitive decline, or who are cognitively intact with severe physical disease prior to HSCT to improve their health. Aldurazyme is also recommended in older patients with or without cognitive or neurologic decline.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Aldurazyme. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated

with Aldurazyme as well as the monitoring required for adverse events and long-term efficacy, approval requires Aldurazyme to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Aldurazyme is recommended in those who meet the following criteria:

FDA-Approved Indications

20. Mucopolysaccharidosis Type I (Hurler Syndrome, Hurler-Scheie Syndrome, and Scheie Syndrome). Approve for 1 year if the patient meets the following criteria (A and B):

A) The diagnosis is established by one of the following (i or ii):

i. Patient has a laboratory test demonstrating deficient α-L-iduronidase activity in leukocytes, fibroblasts, plasma, or serum; OR

ii. Patient has a molecular genetic test demonstrating α-L-iduronidase gene mutation; AND

B) Aldurazyme is prescribed by or in consultation with a geneticist, endocrinologist, a metabolic disorder sub-specialist, or a physician who specializes in the treatment of lysosomal storage disorders.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Aldurazyme has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

36. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Enzyme Replacement Therapy – Elaprase® (idursulfase injection for intravenous use – Shire Human Genetic Therapies)

DATE REVIEWED: 04/15/2020

OVERVIEW

Elaprase is human iduronate-2-sulfatase (idursulfase), produced in a human cell line using recombinant DNA technology.[1] Idursulfase hydrolyzes the 2-sulfate esters of terminal iduronate sulfate residues from dermatan and heparin sulfate in lysosomes of various cell types.

Elaprase is indicated for patients with Hunter syndrome (Mucopolysaccharidosis type II [MPS II]).[1] Elaprase has been shown to improve walking capacity in patients ≥ 5 years of age. In patients 16 months to 5 years of age, no data are available to demonstrate improvement in disease-related symptoms or long-term clinical outcome; however, treatment has reduced spleen volume similar to that of patients ≥ 5 years of age.

Disease Overview

MPS II or Hunter syndrome, is a rare, X-linked lysosomal storage disorder characterized by a deficiency of iduronate-2-sulfatase leading to the accumulation of the glycosaminoglycans dermatan sulfate and heparin sulfate.[2,3] Males are almost exclusively affected, although there have been a few case reports of females with Hunter syndrome.[3,4] The onset, progression, and severity of MPS II is variable.[2-4] Most of the patients with MPS II have a severe form with neurologic involvement leading to cognitive impairment and neurologic regression.[3,4] Other manifestations of Hunter syndrome include course facial features, hepatosplenomegaly, cardiac and respiratory disease, short stature, and stiff joints and contractures.[2,3] The definitive diagnosis of MPS II is established by demonstrating deficient iduronate-2-sulfatase activity in leukocytes, fibroblasts, serum, or plasma, or mutations in the iduronate-2-sulfatase gene.[2,5] Definitive treatment of MPS II consists of enzyme replacement therapy with Elaprase.[2-4] Hematopoietic stem cell transplantation has not demonstrated clear neurological benefit to date and is not recommended for MPS II due to the high rate of morbidity and mortality associated with this therapy.[2,4]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Elaprase. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Elaprase as well as the monitoring required for adverse events and long-term efficacy, approval requires Elaprase to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Elaprase is recommended in those who meet the following criteria:

FDA-Approved Indications

21. Mucopolysaccharidosis Type II (Hunter Syndrome). Approve for 1 year if the patient meets the following criteria (A and B):

- **A)** The diagnosis is established by one of the following (i or ii):
  - **i.** Patient has a laboratory test demonstrating deficient iduronate-2-sulfatase activity in leukocytes, fibroblasts, serum, or plasma; OR
  - **ii.** Patient has a molecular genetic test demonstrating iduronate-2-sulfatase gene mutation; AND
- **B)** Elaprase is prescribed by or in consultation with a geneticist, endocrinologist, a metabolic disorder sub-specialist, or a physician who specializes in the treatment of lysosomal storage disorders.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Elaprase has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

37. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Enzyme Replacement Therapy – Fabrazyme® (agalsidase injection for intravenous use – Genzyme)

DATE REVIEWED: 04/15/2020

OVERVIEW

Fabrazyme is human α-galactosidase A (α-Gal), with the same amino acid sequence as the native enzyme.[1] It is produced in Chinese hamster ovary cells via recombinant DNA technology. Fabrazyme catalyzes the breakdown of globotriaosylceramide (GL-3) and other α-galactyl-terminated neutral glycosphingolipids to ceramide and galactose.

Fabrazyme is indicated for use in patients with Fabry disease.[1] It reduces the deposition of GL-3 in the capillary endothelium of the kidney and certain other cell types.

Disease Overview

Fabry disease is a rare inherited X-linked lysosomal storage disorder due to absent or significantly reduced α-Gal activity leading to the accumulation of GL-3 in a wide variety of cells throughout the body.[2-4] The accumulation of GL-3 leads to progressive multisystem disease, primarily impacting the kidney, heart and nervous system.[3,4] The incidence of Fabry disease is estimated to be about 1:117,000 live male births.[2] Fabry disease can be divided into two phenotypes. A severe, classical phenotype typically occurs in men without α-Gal activity, whereas a generally milder non-classical phenotype is found in men and women with some residual α-Gal activity.[2,3] The diagnosis of Fabry disease can be confirmed in males by demonstrating a deficiency in α-Gal activity, and in all patients by identifying a Fabry disease causing gene mutation.[4] Long-term consequences of Fabry disease include hypertrophic cardiomyopathy, arrhythmias, renal failure, and stroke.[3] The kidney disease that occurs in Fabry disease is associated with progressive proteinuria and a decline in glomerular filtration rate, which over time, leads to end-stage renal disease requiring dialysis and ultimately, kidney transplantation.[2] Treatment with Fabrazyme reduces the accumulation of GL-3 in the kidney (and in other organs), with the goal of stopping or slowing the decline in kidney function.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Fabrazyme. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Fabrazyme as well as the monitoring required for adverse events and long-term efficacy, approval requires Fabrazyme to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Fabrazyme is recommended in those who meet the following criteria:

FDA-Approved Indications

22. Fabry Disease. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** The diagnosis is established by one of the following (i or ii):
  - **i.** Patient has a laboratory test demonstrating deficient α-galactosidase A activity in leukocytes or fibroblasts; OR
  - **ii.** Patient has a molecular genetic test demonstrating mutations in the galactosidase alpha gene; AND
- **B)** Fabrazyme is prescribed by or in consultation with a geneticist, endocrinologist, a metabolic disorder sub-specialist, or a physician who specializes in the treatment of lysosomal storage disorders.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Fabrazyme has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

38. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Enzyme Replacement Therapy – Kanuma™ (sebelipase alfa injection for intravenous use – Alexion Pharmaceuticals)

DATE REVIEWED: 04/15/2020

OVERVIEW

Kanuma is human lysosomal acid lipase (LAL) produced in the egg white of genetically engineered chicken via recombinant DNA technology.[1] LAL catalyzes the breakdown of cholesteryl esters to free cholesterol and fatty acids, and the breakdown of triglycerides to glycerol and free fatty acids.

Kanuma is indicted for the treatment of patients with a diagnosis of LAL deficiency.[1]

Disease Overview

LAL deficiency is a rare lysosomal storage disorder characterized by absent or deficient LAL activity leading to the accumulation of cholesterol and triglycerides in the liver and other organs.[2,3] Patients with LAL deficiency often have dyslipidemias, cardiovascular disease and progressive liver disease.[2] The disorder has a heterogeneous presentation ranging from a rapidly progressive form occurring in infants which leads to death in the first year of life, to a childhood/adult-onset form with milder signs and symptoms. Almost all patients with childhood/adult-onset LAL deficiency have hepatomegaly with elevated liver transaminases and have an increased risk of developing fibrosis and cirrhosis.[3] The diagnosis of LAL deficiency is established by demonstrating deficient LAL activity in leukocytes, fibroblasts, or liver tissue, or by genetic testing.[2,3]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Kanuma. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Kanuma as well as the monitoring required for adverse events and long-term efficacy, approval requires Kanuma to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Kanuma is recommended in those who meet the following criteria:

FDA-Approved Indications

23. Lysosomal Acid Lipase Deficiency. Approve for 1 year if the patient meets the following criteria (A and B):

- **A)** The diagnosis is established by one of the following (i or ii);
  - **i.** Patient has a laboratory test demonstrating deficient lysosomal acid lipase activity in leukocytes, fibroblasts, or liver tissue; OR
  - **ii.** Patient has a molecular genetic test demonstrating lysosomal acid lipase gene mutation; AND
- **B)** Kanuma is prescribed by or in consultation with a geneticist, endocrinologist, a metabolic disorder sub-specialist, or a physician who specializes in the treatment of lysosomal storage disorders.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Kanuma has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

39. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Enzyme Replacement Therapy – Lumizyme® (alglucosidase injection for intravenous use – Genzyme)

DATE REVIEWED: 04/15/2020

OVERVIEW

Lumizyme (alglucosidase) is a human hydrolytic lysosomal glycogen-specific enzyme (acid α-glucosidase) produced in Chinese hamster ovary cell line via recombinant DNA technology.[1] After administration of Lumizyme, it is internalized into cells and transported to lysosomes where it catalyzes the breakdown of glycogen to glucose.

Lumizyme is indicated for patients with Pompe disease (acid α-glucosidase deficiency).[1]

Disease Overview

Pompe disease (glycogen storage disease type II, or acid maltase deficiency), is a rare lysosomal storage disorder characterized by a deficiency in acid α-glucosidase activity leading to the accumulation of glycogen, particularly in muscle.[2,3] The onset, progression and severity of Pompe disease is variable. Infantile-onset Pompe disease usually manifests in the first few months of life and death often occurs in the first year of life and if left untreated.[2] Clinical manifestations of infantile-onset Pompe disease includes hypotonia, difficulty feeding, and cardiopulmonary failure.[4] Late-onset Pompe disease has more variable clinical course, can manifest any time after 12 months of age, and patients typically present with progressive muscle weakness which can progress to respiratory insufficiency.[3,4] The diagnosis of Pompe disease is established by demonstrating decreased acid α-glucosidase activity in blood, fibroblasts, or muscle tissue, or by genetic testing.[3,4] Definitive treatment of Pompe disease consists of enzyme replacement therapy with Lumizyme.[2-4]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Lumizyme. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Lumizyme as well as the monitoring required for adverse events and long-term efficacy, approval requires Lumizyme to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Lumizyme is recommended in those who meet the following criteria:

FDA-Approved Indications

24. Acid Alpha-Glucosidase Deficiency (Pompe Disease). Approve for 1 year if the patient meets the following criteria (A and B):

A) The diagnosis is established by one of the following (i or ii):

i. Patient has a laboratory test demonstrating deficient acid alpha-glucosidase activity in blood, fibroblasts, or muscle tissue; OR

ii. Patient has a molecular genetic test demonstrating acid alpha-glucosidase gene mutation; AND

B) Lumizyme is prescribed by or in consultation with a geneticist, neurologist, a metabolic disorder sub-specialist, or a physician who specializes in the treatment of lysosomal storage disorders.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Lumizyme has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

40. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Enzyme Replacement Therapy – Mepsevii™ (vestronidase alfa-vjbk injection, for intravenous use – Ultragenyx Pharmaceutical)

DATE REVIEWED: 04/15/2020

OVERVIEW

Mepsevii is lysosomal beta glucuronidase (GUS) produced in a Chinese hamster ovary cell line via recombinant DNA technology.[1] It has the same amino acid sequence as human GUS and catabolizes accumulated glycosaminoglycans in lysosomes in affected tissues.

Mepsevii is indicated in pediatric and adult patients for the treatment of Mucopolysaccharidosis type VII ([MPS VII], Sly syndrome).[1]

Disease Overview

MPS VII or Sly syndrome is an extremely rare lysosomal storage disorder characterized by deficient GUS activity.[2] In MPS VII, the partially catabolized glycosaminoglycans, chondroitin sulfate, dermatan sulfate, and heparin sulfate accumulate in the lysosomes, ultimately leading to the signs and symptoms of the disease.[2,3] The onset, severity and rate of progression of MPS VII is heterogeneous. Patients may present at birth with hydrops fetalis and only survive a few months while others may have milder disease and survive into their 40s.[2] However, most patients have mental retardation, hepatosplenomegaly, and musculoskeletal issues including short stature, course facial features, loss of range of motion, restricted mobility, scoliosis, and kyphosis. The diagnosis of MPS VII is established by

demonstrating deficient GUS activity in leukocytes, fibroblasts or serum, or by genetic testing.[3] Treatment for MPS VII includes enzyme replacement therapy with Mepsevii and hematopoietic stem cell transplantation.[2]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Mepsevii. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Mepsevii as well as the monitoring required for adverse events and long-term efficacy, approval requires Mepsevii to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Mepsevii is recommended in those who meet the following criteria:

FDA-Approved Indications

25. Mucopolysaccharidosis Type VII (Sly Syndrome). Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** The diagnosis is established by one of the following (i or ii):
  - **i.** Patient has a laboratory test demonstrating deficient beta-glucuronidase activity in leukocytes, fibroblasts, or serum; OR
  - **ii.** Patient has a molecular genetic test demonstrating glucuronidase gene mutation; AND
- **B)** Mepsevii is prescribed by or in consultation with a geneticist, endocrinologist, a metabolic disorder sub-specialist, or a physician who specializes in the treatment of lysosomal storage disorders.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Mepsevii has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

41. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Enzyme Replacement Therapy – Naglazyme® (galsulfase injection for intravenous use – BioMarin Pharmaceuticals)

DATE REVIEWED: 04/15/2020

OVERVIEW

Naglazyme (galsulfase) is human *N*-acetylgalactosamine 4-sulfatase, produced in a Chinese hamster ovary cell line via recombinant DNA technology.[1] The enzyme catalyzes the hydrolysis of the sulfate ester from the glycosaminoglycans, chondroitin 4-sulfate and dermatan sulfate.

Naglazyme is indicated for patients with Mucopolysaccharidosis type VI (Maroteaux – Lamy syndrome [MPS VI]).[1] Naglazyme has been shown to improve walking and stair climbing capacity.

Disease Overview

MPS VI, or Maroteaux – Lamy syndrome, is a rare lysosomal storage disorder characterized by a deficiency of *N*-acetylgalactosamine 4-sulfatase (arylsulfatase B).[2,3] The enzyme deficiency results in the accumulation of partially hydrolyzed dermatan sulfate and chondroitin 4-sulfate in lysosomes leading to the signs and symptoms of the

disease.[2,3] The onset, severity and rate of progression of MPS VI is heterogeneous; however, most patients are severely affected with a rapidly progressive form.[3] Clinical manifestations include course facial features, short stature, kyphoscoliosis, joint stiffness, pulmonary insufficiency, cardiac disease, hepatosplenomegaly, corneal clouding, and hernias.[2,3] The definitive diagnosis of MPS VI is established by demonstrating deficient arylsulfatase B enzyme activity in leukocytes or fibroblasts, or by genetic testing.[2,3] Definitive treatment of MPS VI consists of either enzyme replacement therapy (ERT) with Naglazyme or hematopoietic stem cell transplantation (HSCT). Due to the morbidity and mortality associated with HSCT, this therapy is typically reserved for patients who are intolerant of or do not respond to ERT.[2]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Naglazyme. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Naglazyme as well as the monitoring required for adverse events and long-term efficacy, approval requires Naglazyme to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Naglazyme is recommended in those who meet the following criteria:

FDA-Approved Indications

26. Mucopolysaccharidosis Type VI (Maroteaux – Lamy Syndrome). Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** The diagnosis is established by one of the following (i or ii):
  - **i.** Patient has a laboratory test demonstrating deficient *N*-acetylgalactosamine 4-sulfatase (arylsulfatase B) activity in leukocytes or fibroblasts; OR
  - **ii.** Patient has a molecular genetic test demonstrating arylsulfatase B gene mutation; AND
- **B)** Naglazyme is prescribed by or in consultation with a geneticist, endocrinologist, a metabolic disorder sub-specialist, or a physician who specializes in the treatment of lysosomal storage disorders.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Naglazyme has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

42. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Enzyme Replacement Therapy – Revcovi Prior Authorization Policy
- Revcovi® (elapegademase-lvlr injection for intramuscular use – Leadiant)

REVIEW DATE: 11/11/2020

OVERVIEW

Revcovi is a recombinant adenosine deaminase indicated for the treatment of **adenosine deaminase severe combined immune deficiency (ADA-SCID) in pediatric and adult patients**.[1]

Disease Overview

ADA-SCID is an ultra-rare, autosomal recessive genetic disorder of purine metabolism affecting lymphocyte development, viability, and function.[1,2] It is estimated to occur in 1:200,000 to 1:1,000,000 live births. ADA is a purine salvage enzyme which metabolizes deoxyadenosine (dAdo) and adenosine (Ado) into deoxyinosine and inosine, respectively.[3] When ADA is deficient, dAdo accumulates in intracellular and extracellular compartments, along with its metabolite, deoxyadenosinetriphosphate

(dATP). The buildup of both dAdo and dATP negatively impacts lymphocyte development and function by impeding DNA replication and repair, inducing apoptosis, and inhibiting lymphocyte activation.

There are a variety of phenotypes of ADA deficiency; ADA-SCID is the most severe and typically diagnosed before 1 year of age.[2] Infants with typical ADA-SCID have failure to thrive and opportunistic infections associated with marked depletion of B, T, and NK lymphocytes. Manifestations include persistent diarrhea, extensive dermatitis, recurrent pneumonia, and other life-threatening illnesses caused by opportunistic infections. Growth failure and other physical manifestations, including hepatic and neurologic abnormalities, may also be present. Without treatment, patients with ADA-SCID rarely survive beyond 1 to 2 years of age.

Guidelines

According to a consensus statement for management of ADA-SCID (2018), diagnosis is usually established by demonstrating absent or very low (< 1 % of normal) ADA catalytic activity, accompanied by elevated Ado or dAdo in plasma, urine, or dried blood spots.[4] This should be followed by genetic testing to confirm bi-allelic mutations in the *ADA* gene. Enzyme replacement therapy (ERT) is recommended by the consensus panel for all patients newly diagnosed with ADA-SCID as an immediate stabilizing measure. The ideal duration of ERT has not been established. The consensus recommends that most patients use ERT as a "bridge" for a few months to approximately 2 years prior to undergoing curative therapy with a hematopoietic stem cell transplant (HSCT) or hematopoietic stem cell gene therapy. Long-term use of ERT has declined in the past 30 years and has not been systematically studied. Lymphocyte counts and function may deteriorate over time, contributing to increased risk of infections and malignancy. Therefore, ERT longer than 5 to 8 years should be avoided and employed on a continuous basis only when neither HSCT nor gene therapy have been available or effective. The consensus also suggests ERT use for patients with later-onset phenotypes who may not be ideal candidates for curative processes.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Revcovi. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Revcovi, approval requires it to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Revcovi is recommended in those who meet the following criteria:

FDA-Approved Indications

4. **Adenosine Deaminase Severe Combined Immunodeficiency (ADA-SCID).** Approve for 1 year if the patient meets the following criteria (A and B):
   - **A)** Patient has a diagnosis of ADA-SCID confirmed by one of the following (i or ii):
     - **i.** At baseline (i.e., prior to initiating enzyme replacement therapy), the patient has had absent or very low (< 1% of normal) adenosine deaminase (ADA) catalytic activity; OR
     - **ii.** Patient has had molecular genetic testing confirming bi-allelic mutations in the *ADA* gene; AND
   - **B)** The medication is prescribed by, or in consultation with, an immunologist, hematologist/oncologist, or physician that specializes in ADA-SCID or related disorders.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Revcovi is not recommended in the following situations:

7. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Enzyme Replacement Therapy – Strensiq Prior Authorization Policy

- Strensiq® (asfotase alfa for subcutaneous use – Alexion Pharmaceuticals, Inc.)

REVIEW DATE: 07/15/2020

OVERVIEW

Strensiq, a tissue non-specific alkaline phosphatase, is indicated for the treatment of patients with perinatal/infantile- and juvenile-onset hypophosphatasia (HPP).[1] Strensiq is an enzyme replacement therapy which replaces human tissue non-specific alkaline phosphatase (TNSALP).

Disease Overview

Hypophosphatasia (HPP) is an inherited metabolic disease caused by a loss-of-function mutation in the gene which codes for TNSALP.[2] TNSALP is tissue bound and expressed in high concentrations in the liver, kidney, neurons, neutrophils, bone and teeth.[2,3] In HPP, inorganic pyrophosphate and pyridoxal 5'-phosphate, substrates for TNSALP, are increased and lead to disease manifestations. Inorganic pyrophosphate is an inhibitor of bone mineralization, and its accumulation leads to rickets and osteomalacia. Pyridoxal 5'-phosphate, a derivative of vitamin B_6, is necessary for the synthesis of gamma aminobutyric acid (GABA). However, for pyridoxal 5'-phosphate to enter the neuron, it must be dephosphorylated to allow pyridoxal to enter the neuron where it is rephosphorylated. The decreased synthesis of GABA in HPP leads to seizures.

HPP is a rare disease, with an estimated live-birth incidence, for the severe forms of HPP, of 1:100,000 in Canada and approximately 1:300,000 in Europe.[2,4] Prevalence in certain populations, such as Canadian Mennonites may be as high as 1:2,500 births. Disease severity can range from neonatal death with almost no skeletal mineralization to dental problems in adults without any bone symptoms.[2-4] In patients most severely affected by HPP, mortality ranges from 50% to nearly 100% during infancy.[2]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Strensiq. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Strensiq as well as the monitoring required for adverse events and long-term efficacy, approval requires Strensiq to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Strensiq is recommended in those who meet the following criteria:

FDA-Approved Indications

37. Hypophosphatasia – Perinatal/Infantile- and Juvenile-Onset. Approve for 3 years if the patient meets all of the following criteria (A, B, C, and D):

28. Diagnosis is supported by one of the following (i, ii, or iii):

- **i.** Molecular genetic testing documenting tissue non-specific alkaline phosphatase (*ALPL*) gene mutation; OR
- **ii.** Low baseline serum alkaline phosphatase activity; OR
- **iii.** An elevated level of a tissue non-specific alkaline phosphatase substrate (i.e., serum pyridoxal 5'-phosphate, serum or urinary inorganic pyrophosphate, urinary phosphoethanolamine); AND

29. Patient meets one of the following (i or ii):

i. Patient currently has, or has a history of clinical manifestations consistent with hypophosphatasia; OR

Note: Examples of clinical manifestations include skeletal abnormalities, premature tooth loss, muscle weakness, poor feeding, failure to thrive, respiratory problems, vitamin B_6-dependent seizures.

ii. Patient has a family history (parent or sibling) of hypophosphatasia without current clinical manifestations of hypophosphatasia; AND

30. Disease onset ≤ 18 years of age; AND

31. Strensiq is prescribed by or in consultation with a geneticist, endocrinologist, a metabolic disorder sub-specialist, or a physician who specializes in the treatment of hypophosphatasia or related disorders.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Strensiq is not recommended in the following situations:

102. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Annual review	No criteria changes.	07/15/2020

PRIOR AUTHORIZATION POLICY

POLICY: Enzyme Replacement Therapy – Sucraid® (sacrosidase oral solution – QOL Medical)

DATE REVIEWED: 04/15/2020

OVERVIEW

Sucraid is indicated as oral replacement therapy of the genetically determined sucrase deficiency, which is part of congenital sucrase-isomaltase deficiency (CSID).[1]

Disease Overview

CSID is an autosomal recessive intestinal disorder characterized by reduced or absent activity of the sucrase-isomaltase complex.[2,3] These enzymes are responsible for the hydrolysis of complex sugars and starches into simple sugars which are absorbed from the gastrointestinal tract. With absent or diminished enzyme activity, complex sugars and starches accumulate in the small intestine and lead to disease manifestations.[2] Symptoms include osmotic diarrhea, vomiting, bloating, abdominal pain, and steatorrhea.[2,3] Patients can occasionally experience dehydration, failure to thrive, developmental retardation, and muscular hypotonia.[2] The diagnosis of CSID can be established by testing small intestine biopsy specimens for reduced or absent enzyme activity, a sucrose hydrogen breath test, or by genetic testing to identify a mutation in the sucrase-isomaltase gene.[3,4]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Sucraid. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Sucraid as well as the monitoring required for adverse events and long-term efficacy, approval requires Sucraid to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Sucraid is recommended in those who meet the following criteria:

FDA-Approved Indications

27. Congenital Sucrase-Isomaltase Deficiency. Approve for 1 year if the patient meets the following criteria (A and B):

- **A)** The diagnosis is established by one of the following (i, ii, or iii):
  - **i.** Patient has a laboratory test demonstrating deficient sucrase or isomaltase activity in duodenal or jejunal biopsy specimens; OR
  - **ii.** Patient has a sucrose hydrogen breath test; OR
  - **iii.** Patient has a molecular genetic test demonstrating sucrase-isomaltase mutation in saliva or blood; AND
- **B)** Sucraid is prescribed by or in consultation with a geneticist, gastroenterologist, a metabolic disorder sub-specialist, or a physician who specializes in the treatment of congenital diarrheal disorders.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Sucraid has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

43. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Enzyme Replacement Therapy – Vimizim® (elosulfase alfa injection for intravenous use – BioMarin Pharmaceuticals)

DATE REVIEWED: 04/15/2020

OVERVIEW

Vimizim (elosulfase) is human *N*-acetylgalactosamine-6-sulfatase produced in Chinese hamster ovary cells via recombinant DNA technology.[1] Vimizim is a hydrolytic lysosomal enzyme which is taken up by lysosomes and hydrolyzes sulfate from the non-reduced ends of the glycosaminoglycans keratan sulfate and chondroitin-6-sulfate.

Vimizim is indicated for patients with Mucopolysaccharidosis type IVA (Morquio A syndrome [MPS IVA]).[1]

Disease Overview

MPS IVA (Morquio A syndrome) is a rare lysosomal storage disorder characterized by deficient *N*-acetylgalactosamine-6-sulfatase activity leading to the accumulation of chondroitin-6-sulfate and keratan sulfate in lysosomes in bone, cartilage, and ligaments.[2,3] The clinical course, onset, and severity of MPS IVA is heterogeneous.[2] Manifestations of MPS IVA include short trunk dwarfism with short neck, kyphoscoliosis, odontoid dysplasia, knock-knee, cervical spinal cord compression, hypermobile joints, cardiac disease, respiratory insufficiency, obstructive sleep apnea, corneal clouding, and dental abnormalities.[2-4] MPS IVA has not been associated with cognitive decline.[2] The definitive diagnosis of MPS IVA is established by demonstrating deficient *N*-acetylgalactosamine-6-sulfatase activity in leukocytes or fibroblasts, or by genetic testing.[2] Definitive treatment for MPS IVA consists of enzyme replacement therapy with Vimizim. Hematopoietic stem cell transplantation is not recommended for MPS IVA.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Vimizim. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Vimizim as well as the monitoring required for adverse events and long-term efficacy, approval requires Vimizim to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Vimizim is recommended in those who meet the following criteria:

FDA-Approved Indications

28. Mucopolysaccharidosis Type IVA (Morquio A Syndrome). Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** The diagnosis is established by one of the following (i or ii):
  - **i.** Patient has a laboratory test demonstrating deficient *N*-acetylgalactosamine-6-sulfatase activity in leukocytes or fibroblasts; OR
  - **ii.** Patient has a molecular genetic test demonstrating *N*-acetylgalactosamine-6-sulfatase gene mutation; AND
- **B)** Vimizim is prescribed by or in consultation with a geneticist, endocrinologist, a metabolic disorder sub-specialist, or a physician who specializes in the treatment of lysosomal storage disorders.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Vimizim has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

44. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Erectile Dysfunction – Alprostadil for injection Prior Authorization Policy
- Caverject® (alprostadil for injection – Pfizer)
- Caverject Impulse® (alprostadil for injection – Pfizer)
- Edex® (alprostadil for injection – Endo Pharmaceuticals, Inc.)
- MUSE® (alprostadil urethral suppository – MEDA Pharmaceuticals)

REVIEW DATE: 9/23/2020

OVERVIEW

Injectable alprostadil products include Caverject, Caverject Impulse (disposable, single-dose, dual chamber syringe system), and Edex.[1-3] MUSE is available as a single-use, medicated transurethral system for the delivery of alprostadil directly in the urethra.[4] MUSE is administered by inserting the applicator stem into the urethra after urination. All of the alprostadil products are indicated for the treatment of ED due to

neurogenic, vasculogenic, psychogenic, or mixed etiology.[1-4] Additionally, intracavernosal Caverject may be used adjunct to other diagnostic tests in the diagnosis of ED.[1]

These products have also been studied for penile rehabilitation.[5] Alprostadil may help the recovery of erectile function by promotion of cavernosal oxygenation levels. Several studies have demonstrated the efficacy of alprostadil injections and MUSE for early penile rehabilitation post radical prostatectomy.[6-12]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of alprostadil products. Intravenous (IV) or other routes of administration of alprostadil is not covered by this policy. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with alprostadil products as well as the monitoring required for adverse events and long-term efficacy, approval requires alprostadil products to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of alprostadil products are recommended in those who meet the following criteria:

FDA-Approved Indications

38. Erectile Dysfunction. Approve for 1 year.

Other Uses with Supportive Evidence

39. Prophylaxis after Radical Prostatectomy (Early Penile Rehabilitation). Approve for 1 year in treatment-naïve patients if they meet both of the following criteria (A and B).
A) Therapy will be started within 6 months of surgery; AND
B) The medication is prescribed by or in consultation with an urologist

40. Patient with a History of Radical Prostatectomy who is Continuing Alprostadil Therapy (e.g., Edex, Caverject, MUSE). Approve for 1 year if patient was started on therapy post-operatively and is currently continuing therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of alprostadil products are not recommended in the following situations:

103. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Erectile Dysfunction – Sildenafil (Viagra) Prior Authorization Policy

- Viagra® (sildenafil tablets – Pfizer, generics)

REVIEW DATE: 09/23/2020

OVERVIEW

Sildenafil (Viagra, generics) are indicated for the treatment of **erectile dysfunction**.[1]

Sildenafil has been studied for other indications.

- **Pulmonary Arterial Hypertension**. Sildenafil tablets (Revatio®) are approved for pulmonary arterial hypertension.[2] Sildenafil (Viagra, generics) are available in 25 mg, 50 mg, and 100 mg tablets, and Revatio is available as 20 mg tablets. Viagra has been used for this diagnosis.[3-7] Doses of Viagra that were used in these reports ranged from 25 mg twice daily to 100 mg five times daily. Patients will have usually been started on Revatio 20 mg three times daily.
- **Raynaud Phenomenon**. Studies show Viagra has been effective in patients with Raynaud phenomenon (usually with scleroderma) who have digital ischemia, gangrene, or ulcers.[9-11] Capillary blood flow velocity increased in patients after therapy with Viagra.
- **Benign Prostatic Hyperplasia.** The European Association of Urology guidelines (2020) note that phosphodiesterase type 5 inhibitors can be used in men with moderate-to-severe lower urinary tract symptoms with or without erectile dysfunction.[13] The guidelines add that based on the results from a meta-analysis[12], younger men with lower body mass index and more severe lower urinary tract symptoms benefit the most from phosphodiesterase type 5 inhibitors.
- **Prophylaxis after Radical Prostatectomy.** Viagra given on a daily basis has been used to improve the return of normal spontaneous erectile function, improve tissue oxygenation, and prevent penile fibrosis after nerve-sparing radical prostatectomy.[14-17] It is better to initiate a penile rehabilitation program as soon as possible after surgery in order to limit and prevent postoperative local hypoxygenation and fibrosis.
- **High-Altitude Pulmonary Edema.** Published guidelines for the prevention of high-altitude pulmonary edema recommend nifedipine as the preferred pharmacologic treatment option .[18] Other pharmacologic therapies include salmeterol, tadalafil, sildenafil, dexamethasone, or acetazolamide.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of sildenafil (Viagra, generics). All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with sildenafil (Viagra, generics) as well as the monitoring required for adverse events and long-term efficacy, approval requires sildenafil (Viagra, generics) to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: When available, the ICD-10 codes for male erectile dysfunction (ICD-10: N52.*) will be used for automation to allow approval of the requested medication. This automation is gender-selective and is not applicable for women; approval for use in women is always determined by prior authorization criteria.

Note: Phosphodiesterase type 5 inhibitors should not be administered, either regularly or intermittently, with concomitant nitrate therapy. Patients will be informed of the consequences should they initiate nitrate therapy while taking a phosphodiesterase type 5 inhibitor.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of sildenafil (Viagra, generics) are recommended in those who meet one of the following criteria:

FDA-Approved Indications

24. Erectile Dysfunction. Approve for 1 year.

Other Uses with Supportive Evidence

25. Pulmonary Arterial Hypertension. Approve for 1 year.

26. Raynaud's Phenomenon. Approve for 1 year if the patient meets one of the following criteria (A or B):

27. Patient has tried at least two of the following therapies for Raynaud disease: calcium channel blockers, α-adrenergic blockers, nitroglycerin, losartan, fluoxetine, or angiotensin converting enzyme (ACE) inhibitors; OR

Note: Examples of calcium channel blockers include amlodipine, felodipine, nifedipine. Examples of α-adrenergic blockers include prazosin, doxazosin. Examples of ACE inhibitors include lisinopril, benazepril, captopril, enalapril.

B) Patient has tried one vasodilator.
Note: Examples of vasodilators include: Flolan® (epoprostenol for injection), Edex® (alprostadil for injection), Tracleer® (bosentan tablets).

28. Benign Prostatic Hyperplasia. Approve for 1 year if the patient meets one of the following criteria (A or B):

29. Patient has tried an α_1-blocker; OR
Note: Examples of α_1-blockers include doxazosin, terazosin, tamsulosin, alfuzosin.

30. Patient has tried a 5α-reductase inhibitor.
Note: Examples of a 5α-reductase inhibitor includes finasteride, dutasteride.

Note: For men with erectile dysfunction and benign prostatic hyperplasia, use criterion 1 above.

5. Prophylaxis After Radical Prostatectomy (Early Penile Rehabilitation). Approve for 1 year in patients who meet the following criteria (A and B):
A) Patient had radical prostatectomy within the previous 12 months; AND
B) The medication is prescribed by or in consultation with an urologist.

6. High-Altitude Pulmonary Edema (HAPE), Treatment or Prevention. Approve for 1 year in patients who meet the following criteria (A and B):
A) Patient has HAPE or a history of HAPE; AND
B) Patient has tried one other pharmacologic therapy for the treatment or prevention of HAPE.
Note: Examples of other pharmacologic therapy for the treatment of HAPE are nifedipine, Serevent (salmeterol inhalation powder), dexamethasone, acetazolamide, Cialis (tadalafil tablets).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of sildenafil (Viagra, generics) is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Erectile Dysfunction – Stendra Prior Authorization Policy

- Stendra™ (avanafil tablets – Mist Pharmaceuticals, LLC)

REVIEW DATE: 09/23/2020

OVERVIEW

Stendra is a phosphodiesterase type 5 (PDE5) inhibitor indicated for the treatment of **erectile dysfunction** (ED).[1]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Stendra. All approvals are provided for the duration noted below.

Automation: When available, the ICD-10 codes for male erectile dysfunction (ICD-10: N52.*) will be used for automation to allow approval of the requested medication. This automation is gender-selective and is not applicable for women; approval for use in women is always determined by prior authorization criteria.

Note: Phosphodiesterase type 5 inhibitors should not be administered, either regularly or intermittently, with concomitant nitrate therapy. Patients will be informed of the consequences should they initiate nitrate therapy while taking a phosphodiesterase type 5 inhibitor.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Stendra is recommended in those who meet the following criteria:

FDA-Approved Indications

7. **Erectile Dysfunction (ED)**. Approve for 1 year.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Stendra is not recommended in the following situations:

104. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Annual Revision	No criteria changes	8/28/2019
Annual Revision	Removal of the following Conditions Not Recommended for Approval: Benign prostatic hyperplasia and Prophylaxis of erectile dysfunction after radical prostatectomy. Removal of ICD-9 codes from automation. ICD-10 codes still applicable.	09/23/2020

PRIOR AUTHORIZATION POLICY

POLICY: Erectile Dysfunction – Tadalafil (Cialis) Prior Authorization Policy

- Cialis® (tadalafil tablets – Eli Lilly, generics)

REVIEW DATE: 09/23/2020

OVERVIEW

Tadalafil (Cialis, generics) is indicated for the following uses:

- **Erectile dysfunction**.
- **The signs and symptoms of benign prostatic hyperplasia**.
- **Erectile dysfunction and the signs and symptoms of benign prostatic hyperplasia**.

Tadalafil has been studies for other indications:

- **Raynaud phenomenon.** Multiple studies have evaluated the efficacy of tadalafil for Raynaud disease.[2-4]
- **Prophylaxis after radical prostatectomy.** Multiple studies have evaluated the efficacy of tadalafil for prophylaxis after radical prostatectomy.[5-7]
- **Pulmonary arterial hypertension.** Adcirca (and generics) contain the same active ingredient as tadalafil (Cialis, generics) and are indicated for the treatment of pulmonary arterial hypertension. Tadalafil (Cialis, generics) are available in 2.5 mg, 5 mg, 10 mg, and 20 mg tablets. Adcirca is available as a 20 mg tablet. Tadalafil (Cialis, generics) have been used in multiple studies for pulmonary arterial hypertension.[8-10]
- **High-Altitude pulmonary edema.** Published guidelines for the prevention of high-altitude pulmonary edema recommend nifedipine as the preferred pharmacologic treatment option.[11] Other pharmacologic therapies include salmeterol, sildenafil, dexamethasone, or acetazolamide.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of tadalafil (Cialis, generics). All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with tadalafil (Cialis, generics) as well as the monitoring required for adverse events and long-term efficacy, approval requires tadalafil (Cialis, generics) to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: When available, the ICD-10 codes for male erectile dysfunction (ICD-10: N52.*) will be used for automation to allow approval of the requested medication. This automation is gender-selective and is not applicable for women; approval for use in women is always determined by prior authorization criteria.

Note: Phosphodiesterase type 5 inhibitors should not be administered, either regularly or intermittently, with concomitant nitrate therapy. Patients will be informed of the consequences should they initiate nitrate therapy while taking a phosphodiesterase type 5 inhibitor.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of tadalafil (Cialis, generics) are recommended in those who meet one of the following criteria:

FDA-Approved Indications

8. **Erectile Dysfunction**. Approve for 1 year.

9. **Benign Prostatic Hyperplasia.** Approve for 1 year if the patient meets one of the following criteria (A or B):
   - **A)** Patient has tried an α_1-blocker; OR
     Note: Examples of α_1-blockers include doxazosin, terazosin, tamsulosin, alfuzosin.
   - **B)** Patient has tried a 5α-reductase inhibitor.
     Note: Examples of 5α-reductase inhibitor includes finasteride, dutasteride.

   Note: For men with erectile dysfunction/benign prostatic hyperplasia, use criterion 1 above.

Other Uses with Supportive Evidence

10. **Raynaud's Phenomenon.** Approve for 1 year if the patient meets one of the following criteria (A or B):
    - **A)** Patient has tried at least two of the following therapies for Raynaud disease: calcium channel blockers, α-adrenergic blockers, nitroglycerin, losartan, fluoxetine, or angiotensin converting enzyme (ACE) inhibitors; OR
      Note: Examples of calcium channel blockers include amlodipine, felodipine, nifedipine. Examples of α-adrenergic blockers include prazosin, doxazosin. Examples of ACE inhibitors include lisiniopril, benazepril, captopril, enalapril.
    - **B)** Patient has tried one vasodilator.
      Note: Examples of vasodilators include Flolan® (epoprostenol for injection), Edex® (alprostadil for injection), Tracleer® (bosentan tablets).

4. **Prophylaxis After Radical Prostatectomy (Early Penile Rehabilitation).** Approve for 1 year in patients who meet the following criteria (A and B):
   A) Patient had radical prostatectomy within the previous 12 months; AND
   B) The medication is prescribed by or in consultation with an urologist.

5. **Pulmonary Arterial Hypertension (PAH).** Approve for 1 year in patients who cannot use Adcirca (or generics of Adcirca) because the dose is not available using Adcirca (or generics of Adcirca), that is, patients who are using 10 mg doses of tadalafil (Cialis, generics).
   Note: Patients using 20 mg or 40 mg of tadalafil (Cialis, generics) for PAH should use Adcirca (or generics of Adcirca).

6. **High-Altitude Pulmonary Edema (HAPE), Treatment or Prevention**. Approve for 1 year in patients who meet the following criteria (A and B):
   A) Patient has HAPE or a history of HAPE; AND
   B) Patient has tried one other pharmacologic therapy for treatment or prevention of HAPE.
   Note: Examples of other pharmacologic therapy for the treatment of HAPE are nifedipine, Serevent (salmeterol inhalation powder), dexamethasone, acetazolamide, Viagra (sildenafil).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of tadalafil (Cialis, generics) is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	No criteria changes	08/22/2018
Annual Revision	Generic Cialis was added to policy. Criteria specific to Pulmonary Arterial Hypertension (PAH) was updated to include generic Adcirca.	08/28/2019
Annual Revision	Benign Prostatic Hyperplasia: Moved examples of α_1-blockers and 5α-reductase inhibitors to a note. Raynaud's Phenomenon: Moved examples of calcium channel blockers, α-adrenergic blockers, angiotensin converting enzyme inhibitors, and vasodilators to a note. High-Altitude Pulmonary Edema (HAPE), Treatment or Prevention: Moved other pharmacologic therapies for treatment or prevention of HAPE to a note. Removal of ICD-9 codes from automation. ICD-10 codes still applicable.	09/23/2020

PRIOR AUTHORIZATION POLICY

POLICY: Erectile Dysfunction – Vardenafil (Levitra, Staxyn) Prior Authorization Policy

- Levitra® (vardenafil tablets – GlaxoSmithKline, generics)
- Staxyn™ (vardenafil orally disintegrating tablet – GlaxoSmithKline, generics)

REVIEW DATE: 09/23/2020

OVERVIEW

Vardenafil (Levitra, generics) and vardenafil orally disintegrating tablets (Staxyn, generics) are indicated for the treatment of **erectile dysfunction**.[1,2]

Vardenafil has been studied for other indications:

- **Raynaud Phenomenon**. Vardenafil has been studied in patients with Raynaud phenomenon.[3,4] Levitra improved digital blood flow and decreased the number of Raynaud's attacks.
- **Benign Prostatic Hyperplasia**. Vardenafil has been studied in benign prostatic hyperplasia.[5,6] The European Association of Urology guidelines (2020) note that phosphodiesterase type 5 inhibitors can be used in men with moderate-to-severe lower urinary tract symptoms with or without erectile dysfunction.[7] The guidelines add that based on the results from a meta-analysis[8], younger men with lower body mass index and more severe lower urinary tract symptoms benefits the most from phosphodiesterase type 5 inhibitors.
- **Prophylaxis after Radical Prostatectomy**. Vardenafil was studied in men following bilateral nerve-sparing radical prostatectomy.[9]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of vardenafil tablets (Levitra, generics) and vardenafil orally disintegrating tablets (Staxyn, generics). All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with vardenafil tablets (Levitra, generics) and vardenafil orally disintegrating tablets (Staxyn, generics) as well as the monitoring required for adverse events and long-term efficacy, approval requires vardenafil tablets (Levitra, generics) and vardenafil orally disintegrating tablets (Staxyn, generics) to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: When available, the ICD-10 codes for male erectile dysfunction (ICD-10: N52.*) will be used for automation to allow approval of the requested medication. This automation is gender-selective and is not applicable for women; approval for use in women is always determined by prior authorization criteria.

Note: Phosphodiesterase type 5 inhibitors should not be administered, either regularly or intermittently, with concomitant nitrate therapy. Patients will be informed of the consequences should they initiate nitrate therapy while taking a phosphodiesterase type 5 inhibitor.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of vardenafil tablets (Levitra, generics) or vardenafil orally disintegrating tablet (Staxyn, generics) is recommended in those who meet one of the following criteria:

FDA-Approved Indications

11. Erectile Dysfunction. Approve for 1 year.

Other Uses with Supportive Evidence

2. Raynaud's Phenomenon. Approve for 1 year if the patient meets one of the following criteria (A or B):

A) Patient has tried at least two of the following therapies: calcium channel blockers, α-adrenergic blockers, nitroglycerin, losartan fluoxetine, or angiotensin converting enzyme (ACE) inhibitors; OR

Note: Examples of calcium channel blockers include amlodipine, felodipine, nifedipine. Examples of α-adrenergic blockers include prazosin, doxazosin. Examples of ACE inhibitors include lisinopril, benazepril, captopril, enalapril.

B) Patient has tried one vasodilator.

Note: Examples of vasodilators include Flolan® (epoprostenol for injection), Edex® (alprostadil for injection), Tracleer® (bosentan tablets).

3. Benign Prostatic Hyperplasia. Approve for 1 year if the patient meets one of the following criteria (A or B):

A) Patient has tried an α_1-blocker; OR

Note: Examples of α_1-blockers include doxazosin, terazosin, tamsulosin, alfuzosin.

B) Patient has tried a 5α-reductase inhibitor.

Note: Examples of 5α-reductase inhibitor includes finasteride, dutasteride.

Note: For men with erectile dysfunction and benign prostatic hyperplasia, use criterion 1 above.

4. Prophylaxis After Radical Prostatectomy (Early Penile Rehabilitation). Approve for 1 year in patients who meet the following criteria (A and B):

A) Patient had radical prostatectomy within the previous 12 months; AND

B) The medication is prescribed by or in consultation with an urologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of vardenafil (Levitra, generics) or vardenafil orally disintegrating tablets (Staxyn, generics) is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Erythropoiesis-Stimulating Agents – Aranesp Prior Authorization Policy

- Aranesp® (darbepoetin alfa for intravenous or subcutaneous use – Amgen)

REVIEW DATE: 07/22/2020

OVERVIEW

Aranesp, an erythropoiesis-stimulating agent (ESA), is indicated for the following uses:[1]

- **Anemia due to chronic kidney disease** (CKD), including patients on dialysis and patients not on dialysis.
- **Anemia due to chemotherapy in patients with cancer,** in patients with non-myeloid malignancies where anemia is due to the effect of concomitant myelosuppressive chemotherapy, and upon initiation, there is a minimum of two additional months of planned chemotherapy.

Aranesp has not been shown to improve quality of life, fatigue, or patient well-being.[1] Aranesp is not indicated for use:

- In patients with cancer receiving hormonal agents, biologic products, or radiotherapy unless also receiving concomitant myelosuppressive chemotherapy.
- In patients with cancer receiving myelosuppressive chemotherapy when the anticipated outcome is cure.
- In patients with cancer receiving myelosuppressive chemotherapy in whom anemia can be managed by transfusion.
- As a substitute for red blood cell (RBC) transfusions in those who require immediate correction of anemia.

Therapy should be initiated for adult patients with CKD on dialysis when the hemoglobin (Hb) level is < 10.0 g/dL and if the Hb level approaches or exceeds 11.0 g/dL, reduce or interrupt the Aranesp dose.[1] For adult patients with CKD not on dialysis, Aranesp should be initiated when Hb is < 10.0 g/dL and other considerations apply (e.g., patient is likely to need transfusions). If the Hb level exceeds 10.0 g/dL, reduce or interrupt the Aranesp dose and use the lowest dose sufficient to reduce the need for RBC transfusions. Initiate Aranesp for patients on cancer chemotherapy only if the Hb is < 10.0 g/dL. Use the lowest dose of Aranesp to avoid RBC transfusions. For pediatric patients with CKD, initiate Aranesp when the Hb < 10.0 g/dL and if the Hb level approaches 12.0 g/dL, reduce or interrupt the dose of Aranesp.

Guidelines

The Kidney Disease Improving Global Outcomes (KDIGO) clinical practice guidelines for anemia in CKD (2012) state that for adults with CKD on dialysis, ESA therapy should be used to avoid having the Hb concentration fall below 9.0 g/dL by initiating ESA therapy when the Hb is between 9.0 and 10.0 g/dL.[2] The guidelines recommend against ESA therapy for adult patients with CKD who are not on dialysis when Hb levels are ≥ 10.0 g/dL. For adult patients with CKD who are not on dialysis with Hb levels < 10.0 g/dL, the decision whether to initiate ESA therapy should be individualized based on many factors (e.g., prior response to iron therapy, the risk of needing a transfusion, presence of symptoms). In general, ESAs should not be used to maintain Hb concentrations above 11.5 g/dL in adult patients with CKD. For pediatric patients with CKD, the Hb concentration in which ESAs should be initiated in the individual patient should be considered while being aware of the potential benefits and potential harms. In all pediatric patients with CKD receiving ESA therapy the selected Hb concentration should be in the range of 11.0 to 12.0 g/dL. Iron supplementation can improve response to ESA therapy. Baseline and periodic monitoring (e.g., iron, total iron-binding capacity, transferrin saturation, or ferritin levels) and instituting iron replacement when needed may be useful in limiting the need for ESAs, maximizing symptomatic improvement in patients, and determining the reason for failure to adequately respond to ESAs. Iron deficiency can occur following continued ESA use and, therefore, iron supplementation is required in most patients to maintain an optimal response.

Clinical practice guidelines from the National Comprehensive Cancer Network (NCCN) for myelodysplastic syndrome (MDS) [version 2.2020 – February 28, 2020] list Aranesp as having utility in anemic, symptomatic patients with MDS if serum erythropoietin levels are ≤ 500 mU/mL.[3] Iron stores should be adequate. Due to safety issues, the guidelines suggest that ESAs be used in the management of symptomatic anemia in patients with MDS and to aim for a target Hb ≤ 12.0 g/dL. The NCCN guidelines for myeloproliferative neoplasms (version 1.2020 – May 21, 2020) address Aranesp and epoetin alfa products as options for treatment of patients with anemia related to myelofibrosis having a serum erythropoietin level ≤ 500 mU/mL.[4] Iron stores should be adequate. The guidelines also advise that ESAs are not effective for the management of transfusion-dependent anemia.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Aranesp in patients with conditions other than CKD who are on dialysis. The intent of this policy is to provide recommendations for uses other than anemia in patients with CKD who are on dialysis. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Aranesp as well as the monitoring required for adverse events and long-term efficacy, approval requires Aranesp to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Aranesp is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Anemia in Patients with Chronic Kidney Disease who are on Dialysis.** Approve for 3 years.

2. **Anemia in Patients with Chronic Kidney Disease who are not on Dialysis.** Approve for 1 year if the patient meets the following criteria (A or B):
   - **A)** Initial Therapy. Approve if the patient meets the following criteria (i and ii):
     - **i.** Patient meets one of the following (a or b):
       - **a)** Patient is ≥ 18 years of age with a hemoglobin < 10.0 g/dL; OR
       - **b)** Patient is < 18 years of age with a hemoglobin ≤ 11.0 g/dL; AND
     - **ii.** Patient meets one of the following (a or b):
       - **a)** Patient is currently receiving iron therapy; OR
       - **b)** Patient has adequate iron stores according to the prescriber; OR
   - **B)** Patient is currently receiving an erythropoiesis-stimulating agent (ESA). Approve if the patient meets the following criteria (i and ii):

     Note: Examples of erythropoiesis-stimulating agents include an epoetin alfa product (e.g., Epogen, Procrit, or Retacrit), a darbepoetin alfa product (e.g., Aranesp), or a methoxy polyethylene glycol-epoetin beta product (e.g., Mircera).
     - **i.** Patient meets one of the following (a or b):
       - **a)** Patient is ≥ 18 years of age with a hemoglobin < 11.5 g/dL; OR
       - **b)** Patient is < 18 years of age with a hemoglobin ≤ 12.0 g/dL; AND
     - **ii.** Patient meets one of the following (a or b):
       - **a)** Patient is currently receiving iron therapy; OR
       - **b)** Patient has adequate iron stores according to the prescriber.

3. **Anemia in Patients with Cancer due to Cancer Chemotherapy.** Approve for 6 months if the patient meets the following criteria (A or B):
   - **A)** Initial Therapy. Approve if the patient meets the following criteria (i, ii, and iii):
     - **i.** Patient has a hemoglobin < 10.0 g/dL; AND
     - **ii.** Patient is currently receiving myelosuppressive chemotherapy; AND
     - **iii.** Patient meets one of the following (a or b):
       - **a)** Patient is currently receiving iron therapy; OR
       - **b)** Patient has adequate iron stores according to the prescriber; OR
   - **B)** Patient is currently receiving an erythropoiesis-stimulating agent (ESA). Approve if the patient meets the following criteria (i, ii, and iii):

     Note: Examples of erythropoiesis-stimulating agents include an epoetin alfa product (e.g., Epogen, Procrit, or Retacrit), or a darbepoetin alfa product (e.g., Aranesp).
     - **i.** Patient has a hemoglobin ≤ 12.0 g/dL; AND
     - **ii.** Patient is currently receiving myelosuppressive chemotherapy; AND
     - **iii.** Patient meets one of the following (a or b):
       - **a)** Patient is currently receiving iron therapy; OR
       - **b)** Patient has adequate iron stores according to the prescriber.

Other Uses with Supportive Evidence

4. **Anemia Associated with Myelodysplastic Syndrome (MDS).** Approve for 1 year if the patient meets the following criteria (A or B):
   - **A)** Initial Therapy. Approve if the patient meets the following criteria (i, ii, iii, and iv):
     - **i.** Patient meets one of the following (a or b):
       - **a)** Patient has a hemoglobin < 10.0 g/dL; OR

b) Patient has a serum erythropoietin level ≤ 500 mU/mL; AND

ii. Patient is ≥ 18 years of age; AND

iii. Aranesp is prescribed by or in consultation with a hematologist or oncologist; AND

iv. Patient meets one of the following (a or b):

a) Patient is currently receiving iron therapy; OR

b) Patient has adequate iron stores according to the prescriber; OR

B) Patient is currently receiving an erythropoiesis-stimulating agent (ESA). Approve if the patient meets the following criteria (i, ii, iii, and iv):

Note: Examples of erythropoiesis-stimulating agents include an epoetin alfa product (e.g., Epogen, Procrit, or Retacrit), or a darbepoetin alfa product (e.g., Aranesp).

i. Patient has a hemoglobin ≤ 12.0 g/dL; AND

ii. Patient is ≥ 18 years of age; AND

iii. Aranesp is prescribed by or in consultation with a hematologist or oncologist; AND

iv. Patient meets one of the following (a or b):

a) Patient is currently receiving iron therapy; OR

b) Patient has adequate iron stores according to the prescriber.

5. Anemia Associated with Myelofibrosis. Approve for the duration noted below if the patient meets the following criteria (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets the following criteria (i, ii, and iii):

i. Patient meets one of the following (a or b):

a) Patient has a hemoglobin < 10.0 g/dL; OR

b) Patient has a serum erythropoietin level ≤ 500 mU/mL; AND

ii. The agent is prescribed by or in consultation with a hematologist or oncologist; AND

iii. Patient meets one of the following (a or b):

a) Patient is currently receiving iron therapy; OR

b) Patient has adequate iron stores according to the prescriber; OR

B) Patient is currently receiving an erythropoiesis-stimulating agent (ESA) therapy. Approve for 1 year if the patient meets the following criteria (i, ii, iii, and iv):

Note: Examples of erythropoiesis-stimulating agents include an epoetin alfa product (e.g., Epogen, Procrit, or Retacrit), or a darbepoetin alfa product (e.g., Aranesp).

i. Patient has a hemoglobin ≤ 12.0 g/dL; AND

ii. The ESA therapy is prescribed by or in consultation with a hematologist or oncologist; AND

iii. Patient meets one of the following (a or b):

a) Patient is currently receiving iron therapy; OR

b) Patient has adequate iron stores according to the prescriber; AND

iv. According to the prescriber, patient has responded to therapy defined as hemoglobin ≥ 10 g/dL or a hemoglobin increase of ≥ 2 g/dL.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Aranesp is not recommended in the following situations:

1. Anemia Associated with Cancer in Patients not Receiving Myelosuppressive Cancer Chemotherapy. Aranesp is not indicated in patients with cancer who are not receiving cancer chemotherapy.[1]

2. Anemia Associated with Acute Myelogenous Leukemias (AML), Chronic Myelogenous Leukemias (CML) or other Myeloid Cancers. Aranesp is indicated for use in non-myeloid cancers. AML and CML are examples of myeloid cancers.[1]

3. Anemia Associated with Radiotherapy in Cancer. Aranesp is not indicated for use in patients with cancer who are given only radiation therapy.[1]

4. To Enhance Athletic Performance. Aranesp is not recommended for approval because this indication is excluded from coverage in a typical pharmacy benefit.

5. **Anemia due to Acute Blood Loss.** Use of Aranesp is not appropriate in these types of situations.

6. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual revision	Criteria that previously stated Epogen/Procrit were changed to cite epoetin alfa to address the approval of Retacrit. For patients with anemia due to CKD who are on dialysis, the criteria were changed to reflect approval of Mircera in pediatric patients who are on hemodialysis. For patients requesting to use Aranesp who are currently receiving Mircera, the target Hb of ≤ 12.0 g/dL was added for children, similar to other ESA. Previously, the criteria only addressed the Hb threshold in adults (≤ 11.5 g/dL) who were receiving Mircera and requesting to transition to Aranesp.	06/20/2018
Annual revision	The following changes were made: 1. **Anemia in CKD for Patients Who are on Dialysis:** The approval duration was changed from 6 months to 1 year. For the criteria that requires the patient have a specified Hb value, changed the wording of "adults" to "patients ≥ 18 years of age". For the criteria that requires children to have a specified Hb value, changed the wording of "children" to "patients < 18 years of age". For the criteria that addresses patients who are currently receiving an ESA, changed from citing examples of the ESA products in criteria to providing a list of ESAs in a note. The example cited that the "Aranesp prescribing information recommends supplemental iron therapy when serum ferritin is < 100 mcg/L or when serum transferrin saturation is < 20%" was deleted. 2. **Anemia in CKD for Patients Who are Not on Dialysis:** The approval duration was changed from 6 months to 1 year. For the criteria that requires the patient have a specified Hb value, changed the wording of "adults" to "patients ≥ 18 years of age". For the criteria that requires children to have a specified Hb value, changed the wording of "children" to "patients < 18 years of age". For the criteria that addresses patients who are currently receiving an ESAs, changed from citing examples of the ESA products in criteria to providing a list of ESAs in a note. The example cited that the "Aranesp prescribing information recommends supplemental iron therapy when serum ferritin is < 100 mcg/L or when serum transferrin saturation is < 20%" was deleted. 3. **Anemia in Patients with Cancer Due to Cancer Chemotherapy:** The approval duration was changed from 4 months to 6 months. For the criteria that addresses patients who are currently receiving an ESA, changed from citing examples of the ESA products in criteria to providing a list of ESAs in a note. The example cited that the "Aranesp prescribing information recommends supplemental iron therapy when serum ferritin is < 100 mcg/L or when serum transferrin saturation is < 20%" was deleted. 4. **Anemia Associated with MDS:** The approval duration was changed from 6 months to 1 year. For the criteria that addresses patients who are currently receiving an ESAs, changed from citing examples of the ESA products in criteria to providing a list of ESAs in a note. Initial approval and extended approval as a separate section was removed, including the criteria that defined response. The example cited that the "Aranesp prescribing information recommends supplemental iron therapy when serum ferritin is < 100 mcg/L or when serum transferrin saturation is < 20%" was deleted. 5. **Anemia Associated with Myelofibrosis:** New criteria were approved.	07/24/2019

Selected revision	**Anemia in CKD for Patients Who are on Dialysis.** Existing criteria were removed. This indication is no longer a targeted indication for this policy. All requests for anemia in CKD for patients who are on dialysis changed to approve for 1 year.	9/11/2019
Selected revision	For **Anemia in Patients with Chronic Kidney Disease who are on Dialysis,** the approval duration was changed from 1 year to 3 years.	11/06/2019
Annual Revision	No criteria changes.	07/22/2020

PRIOR AUTHORIZATION POLICY

POLICY: Erythropoiesis-Stimulating Agents – Epoetin Alfa Products Prior Authorization Policy

- Epogen® (epoetin alfa injection for intravenous or subcutaneous use – Amgen)
- Procrit® (epoetin alfa injection for intravenous or subcutaneous use – Janssen)
- Retacrit™ (epoetin alfa-epbx injection for intravenous and subcutaneous use Pfizer/Hospira)

REVIEW DATE: 07/22/2020

OVERVIEW

Epoetin alfa (Epogen, Procrit, Retacrit), an erythropoiesis-stimulating agent (ESA), is indicated for the following uses:[1-3]

- **Anemia due to chronic kidney disease** (CKD), including patients on dialysis and patients not on dialysis to decrease the need for red blood cell (RBC) transfusions.
- **Anemia due to chemotherapy in patients with cancer**, in patients with non-myeloid malignancies where anemia is due to the effect of concomitant myelosuppressive chemotherapy, and upon initiation, there is a minimum of two additional months of planned chemotherapy.
- **Anemia due to zidovudine**, in patients with human immunodeficiency virus (HIV) infection.
- **Reduction of allogeneic RBC transfusions**, in patients with perioperative hemoglobin (Hb) > 10.0 to ≤ 13.0 g/dL who are at high risk for perioperative blood loss from elective, noncardiac, nonvascular surgery.

Epoetin alfa has not been shown to improve quality of life, fatigue, or patient well-being.[1-3] Epoetin alfa is not indicated for use:

- In patients with cancer receiving hormonal agents, biologic products, or radiotherapy unless also receiving concomitant myelosuppressive chemotherapy.
- In patients with cancer receiving myelosuppressive chemotherapy when the anticipated outcome is cure.
- In patients with cancer receiving myelosuppressive chemotherapy in whom anemia can be managed by transfusion.
- In patients scheduled for surgery who are willing to donate autologous blood.
- In patients undergoing cardiac or vascular surgery.
- As a substitute for RBC transfusions in those who require immediate correction of anemia.

Therapy should be initiated for patients with CKD on dialysis when the Hb level is < 10.0 g/dL and if the Hb level approaches or exceeds 11.0 g/dL, reduce or interrupt the dose of epoetin alfa.[1-3] For adults with CKD who are not on dialysis, epoetin alfa should be initiated when the Hb is < 10.0 g/dL and other considerations apply (e.g., patient is likely to need transfusions). If the Hb exceeds 10.0 g/dL, reduce or interrupt the epoetin alfa dose and use the lowest dose sufficient to reduce the need for RBC transfusions. Epoetin alfa is indicated for the treatment of anemia due to zidovudine given at ≤ 4,200 mg per week in HIV-infected patients with endogenous serum erythropoietin levels of ≤ 500 mU/mL. It is recommended to withhold epoetin alfa if Hb exceeds 12.0 g/dL. Data show that epoetin alfa elevated or maintained Hb and/or hematocrit and decreased transfusions in anemic patients (Hb < 10.0 g/dL) who were receiving zidovudine. Patients with baseline endogenous serum erythropoietin levels ≤ 500 mU/mL derived greater benefit with epoetin alfa (e.g., achievement of higher hematocrit, reduction in transfusion requirements) compared

with those having levels greater than this threshold. Initiate epoetin alfa for patients on cancer chemotherapy only if the Hb is < 10.0 g/dL. Use the lowest dose of epoetin alfa necessary to avoid RBC transfusions. Hb can be increased to (or near) a concentration of 12.0 g/dL at which time the dose of epoetin alfa should be titrated to maintain that level.

Guidelines

The Kidney Disease Improving Global Outcomes (KDIGO) clinical practice guidelines for anemia in CKD (2012) state that for adults with CKD on dialysis ESA therapy should be used to avoid having the Hb concentration fall below 9.0 g/dL by initiating ESA therapy when the Hb is between 9.0 and 10.0 g/dL.[4] The guidelines recommend against ESA therapy for adult patients with CKD who are not on dialysis when Hb levels are ≥ 10.0 g/dL. For adult patients with CKD who are not on dialysis with Hb levels < 10.0 g/dL, the decision whether to initiate ESA therapy should be individualized based on many factors (e.g., prior response to iron therapy, the risk of needing a transfusion, presence of symptoms). In general, ESAs should not be used to maintain Hb concentrations above 11.5 g/dL in adult patients with CKD. For pediatric patients with CKD, the Hb concentration in which ESAs should be initiated in the individual patient should be considered while being aware of the potential benefits and potential harms. In all pediatric patients with CKD receiving ESA therapy, the selected Hb concentration should be in the range of 11.0 to 12.0 g/dL. Iron supplementation can improve response to ESA therapy. Baseline and periodic monitoring (e.g., iron, total iron-binding capacity, transferrin saturation, or ferritin levels) and instituting iron replacement when needed may be useful in limiting the need for ESAs, maximizing symptomatic improvement in patients, and determining the reason for failure to adequately respond to ESAs. Iron deficiency can occur following continued ESA use and, therefore, iron supplementation is required in most patients to maintain an optimal response.

Clinical practice guidelines from the National Comprehensive Cancer Network (NCCN) for myelodysplastic syndrome (MDS) [version 2.2020 – February 28, 2020] list Epoetin alfa as having utility in anemic, symptomatic patients with MDS if serum erythropoietin levels are ≤ 500 mU/mL.[5] Iron stores should be adequate. Due to safety issues, the guidelines suggest that ESAs be used in the management of symptomatic anemia in patients with MDS and to aim for a target Hb ≤ 12.0 g/dL. The NCCN guidelines for myeloproliferative neoplasms (version 1.2020 – May 21, 2020) address Aranesp and epoetin alfa products as options for treatment of patients with anemia related to myelofibrosis having a serum erythropoietin level ≤ 500 mU/mL.[6] Iron stores should be adequate. The guidelines also advise that ESAs are not effective for the management of transfusion-dependent anemia.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of epoetin alfa products in patients with conditions other than CKD who are on dialysis. The intent of this policy is to provide recommendations for uses other than anemia in patients with CKD who are on dialysis. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with epoetin alfa as well as the monitoring required for adverse events and long-term efficacy, approval requires epoetin alfa to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of epoetin alfa is recommended in those who meet the following criteria:

FDA-Approved Indications

4. **Anemia in Patients with Chronic Kidney Disease who are on Dialysis.** Approve for 3 years.

5. **Anemia in Patients with Chronic Kidney Disease who are not on Dialysis.** Approve for 1 year if the patient meets the following criteria (A or B):
   - **C)** Initial Therapy. Approve if the patient meets the following criteria (i and ii):
     - **iii.** Patient meets one of the following (a or b):
       - **c)** Patient is ≥ 18 years of age with a hemoglobin < 10.0 g/dL; OR

d) Patient is < 18 years of age with a hemoglobin ≤ 11.0 g/dL; AND

iv. Patient meets one of the following (a or b):

c) Patient is currently receiving iron therapy; OR

d) Patient has adequate iron stores according to the prescriber; OR

D) Patient is currently receiving an erythropoiesis-stimulating agent (ESA). Approve if the patient meets the following criteria (i and ii):

Note: Examples of erythropoiesis-stimulating agents include an epoetin alfa product (e.g., Epogen, Procrit, or Retacrit), a darbepoetin alfa product (e.g., Aranesp), or a methoxy polyethylene glycol-epoetin beta product (e.g., Mircera).

iii. Patient meets one of the following (a or b):

c) Patient is ≥ 18 years of age with a hemoglobin < 11.5 g/dL; OR

d) Patient is < 18 years of age with a hemoglobin ≤ 12.0 g/dL; AND

iv. Patient meets one of the following (a or b):

c) Patient is currently receiving iron therapy; OR

d) Patient has adequate iron stores according to the prescriber.

6. Anemia in Patients with Cancer due to Cancer Chemotherapy. Approve for 6 months if the patient meets the following criteria (A or B):

C) Initial Therapy. Approve if the patient meets the following criteria (i, ii, and iii):

iv. Patient has a hemoglobin < 10.0 g/dL; AND

v. Patient is currently receiving myelosuppressive chemotherapy; AND

vi. Patient meets one of the following (a or b):

c) Patient is currently receiving iron therapy; OR

d) Patient has adequate iron stores according to the prescriber; OR

D) Patient is currently receiving an erythropoiesis-stimulating agent (ESA). Approve if the patient meets the following criteria (i, ii, and iii):

Note: Examples of erythropoiesis-stimulating agents include an epoetin alfa product (e.g., Epogen, Procrit, or Retacrit), or a darbepoetin alfa product (e.g., Aranesp).

iv. Patient has a hemoglobin ≤ 12.0 g/dL; AND

v. Patient is currently receiving myelosuppressive chemotherapy; AND

vi. Patient meets one of the following (a or b):

c) Patient is currently receiving iron therapy; OR

d) Patient has adequate iron stores according to the prescriber.

4. Patients with Anemia and Human Immunodeficiency Virus who are Receiving Zidovudine. Approve for 1 year if the patient meets the following criteria (A or B):

A) Initial Therapy. Approve if the patient meets the following criteria (i, ii, and iii):

i. Patient meets one of the following (a or b):

a) Patient has a hemoglobin < 10.0 g/dL; OR

b) Patient has a serum erythropoietin level is ≤ 500 mU/mL; AND

ii. Patient is currently receiving zidovudine therapy; AND

iii. Patient meets one of the following (a or b):

a) Patient is currently receiving iron therapy; OR

b) Patient has adequate iron stores according to the prescriber; OR

B) Patient is currently receiving an erythropoiesis-stimulating agent (ESA). Approve if the patient meets the following criteria (i, ii, and iii):

Note: Examples of erythropoiesis-stimulating agents include an epoetin alfa product (e.g., Epogen, Procrit, or Retacrit), or darbepoetin alfa product (e.g., Aranesp).

v. Patient has a hemoglobin ≤ 12.0 g/dL; AND

vi. Patient is currently receiving zidovudine therapy; AND

vii. Patient meets one of the following (a or b):

a) Patient is currently receiving iron therapy; OR

b) Patient has adequate iron stores according to the prescriber.

5. **Reduction of Allogeneic Red Blood Cell Transfusions in Patients Undergoing Surgery.** Approve for 1 month if the patient meets the following criteria (A, B, C and D):
   - **A)** Hemoglobin is ≤ 13.0 g/dL; AND
   - **B)** The surgery is elective, nonvascular and noncardiac; AND
   - **C)** Patient is not willing or able to donate autologous blood prior to surgery; AND
   - **D)** Patient meets one of the following (i or ii):
     - **i.** Patient is currently receiving iron therapy; OR
     - **ii.** Patient has adequate iron stores according to the prescriber.

Other Uses with Supportive Evidence

6. **Anemia Associated with Myelodysplastic Syndrome (MDS).** Approve for 1 year if the patient meets the following criteria (A or B):
   - **C)** Initial Therapy. Approve if the patient meets the following criteria (i, ii, iii, and iv):
     - **v.** Patient meets one of the following (a or b):
       - **a)** Patient has a hemoglobin < 10.0 g/dL; OR
       - **b)** Patient has a serum erythropoietin level ≤ 500 mU/mL; AND
     - **vi.** Patient is ≥ 18 years of age; AND
     - **vii.** The agent is prescribed by or in consultation with a hematologist or oncologist; AND
     - **viii.** Patient meets one of the following (a or b):
       - **c)** Patient is currently receiving iron therapy; OR
       - **d)** Patient has adequate iron stores according to the prescriber; OR
   - **B)** Patient is currently receiving an erythropoiesis-stimulating agent (ESA). Approve if the patient meets the following criteria (i, ii, iii, and iv):
     Note: Examples of erythropoiesis-stimulating agents include an epoetin alfa product (e.g., Epogen, Procrit, or Retacrit), or a darbepoetin alfa product (e.g., Aranesp).
     - **viii.** Patient has a hemoglobin ≤ 12.0 g/dL; AND
     - **ix.** Patient is ≥ 18 years of age; AND
     - **x.** The agent is prescribed by or in consultation with a hematologist or oncologist; AND
     - **xi.** Patient meets one of the following (a or b):
       - **c)** Patient is currently receiving iron therapy; OR
       - **d)** Patient has adequate iron stores according to the prescriber.

7. **Anemia Associated with Myelofibrosis.** Approve for the duration noted below if the patient meets the following criteria (A or B):
   - **A)** Initial Therapy. Approve for 3 months if the patient meets the following criteria (i, ii, and iii):
     - **i.** Patient meets one of the following (a or b):
       - **a)** Patient has a hemoglobin < 10.0 g/dL; OR
       - **b)** Patient has a serum erythropoietin level ≤ 500 mU/mL; AND
     - **ii.** The agent is prescribed by or in consultation with a hematologist or oncologist; AND
     - **iii.** Patient meets one of the following (a or b):
       - **a)** Patient is currently receiving iron therapy; OR
       - **b)** Patient has adequate iron stores according to the prescriber; OR
   - **B)** Patient is currently receiving an erythropoiesis-stimulating agent (ESA) therapy. Approve for 1 year if the patient meets the following criteria (i, ii, iii, and iv):
     Note: Examples of erythropoiesis-stimulating agents include an epoetin alfa product (e.g., Epogen, Procrit, or Retacrit), or a darbepoetin alfa product (e.g., Aranesp).
     - **i.** Patient has a hemoglobin ≤ 12.0 g/dL; AND
     - **ii.** The ESA therapy is prescribed by or in consultation with a hematologist or oncologist; AND
     - **iii.** Patient meets one of the following (a or b):
       - **a)** Patient is currently receiving iron therapy; OR
       - **b)** Patient has adequate iron stores according to the prescriber; AND
     - **iv.** According to the prescriber, patient has responded to therapy defined as hemoglobin ≥ 10 g/dL or a hemoglobin increase of ≥ 2 g/dL.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Epoetin alfa is not recommended in the following situations:

7. **Anemia Associated with Cancer in Patients not Receiving Myelosuppressive Cancer Chemotherapy.** Epoetin alfa is not indicated in patients with cancer who are not receiving cancer chemotherapy.[1-3]

8. **Anemia Associated with Acute Myelogenous Leukemias (AML), Chronic Myelogenous Leukemias (CML) or other Myeloid Cancers.** Epoetin alfa is indicated for use in non-myeloid cancers. AML and CML are examples of myeloid cancers.[1-3]

9. **Anemia Associated with Radiotherapy in Cancer.** Epoetin alfa is not indicated for use in patients with cancer who are given only radiation therapy.[1-3]

10. **To Enhance Athletic Performance.** Epoetin alfa is not recommended for approval because this indication is excluded from coverage in a typical pharmacy benefit.

11. **Anemia due to Acute Blood Loss.** Use of Epoetin alfa is not appropriate in these types of situations.

12. **Non-Anemic Patients (Hemoglobin [Hb] > 13.0 g/dL) Prior to Surgery.** Although studies have been done that involved non-anemic patients undergoing various surgeries receiving epoetin alfa preoperatively and sometimes postoperatively to prevent transfusions or subsequent anemia, the overall benefit of this therapy in those with relatively normal preoperative Hb level is questionable.

13. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual revision	Added Retacrit to the policies with the same approval criteria to that of Epogen and Procrit. The name of the policy was changed from Epogen/Procrit to Epoetin Alfa Products. Criteria that previously stated Epogen/Procrit were changed to state epoetin alfa. Criteria were revised to reflect FDA-approval of Mircera for use in the treatment of anemia associated with chronic kidney disease in pediatric patients who are on hemodialysis. For patients requesting to use epoetin alfa who are currently receiving Mircera, the target Hb of ≤ 12.0 g/dL was added for children, similar to the other ESAs. Previous, the criteria only addressed the hemoglobin threshold in adults (≤ 11.5 g/dL) who were receiving Mircera and requesting to transition to epoetin alfa.	06/20/2018
Annual revision	The following changes were made: 1. **Anemia in CKD for Patients Who are on Dialysis:** The approval duration was changed from 6 months to 1 year. For the criteria that requires the patient have a specified Hb value, changed the wording of "adults" to "patients ≥ 18 years of age". For the criteria that requires children to have a specified Hb value, changed the wording of "children" to "patients < 18 years of age". For the criteria that addresses patients who are currently receiving an ESA, changed from citing examples of the ESA products in criteria to providing a list of ESAs in a note. The example cited that the "Epoetin alfa prescribing information recommends supplemental iron therapy when serum ferritin is < 100 mcg/L or when serum transferrin saturation is < 20%" was deleted. 2. **Anemia in CKD for Patients Who are Not on Dialysis:** The approval duration was changed from 6 months to 1 year. For the criteria that requires the patient have a specified Hb value, changed the wording of "adults" to "patients ≥ 18 years of age". For the criteria that requires children to have a specified Hb value, changed the wording of "children" to "patients < 18 years of age". For the criteria that addresses patients who are currently receiving an ESA, changed from citing examples of the ESA products in criteria to providing a list of ESAs in a note. The example cited that the "Epoetin alfa prescribing information recommends supplemental iron therapy when serum ferritin is < 100 mcg/L or when serum transferrin saturation is < 20%" was deleted. 3. **Patients with Anemia and HIV who are Receiving Zidovudine:** The duration of therapy was changed from 4 months to 1 year. For the criteria that addresses patients who are currently receiving an ESA, changed from citing examples of the ESA products in criteria to providing a list of ESAs in a note. The example cited that the "Epoetin alfa prescribing information recommends supplemental iron therapy when serum ferritin is < 100 mcg/L or when serum transferrin saturation is < 20%" was deleted. 4. **Anemia in Patients with Cancer Due to Cancer Chemotherapy:** The approval duration was changed from 4 months to 6 months. For the criteria that addresses patients who are currently receiving an ESA, changed from citing examples of the ESA products in criteria to providing a list of ESAs in a note. The example cited that the "Epoetin alfa prescribing information recommends supplemental iron therapy when serum ferritin is < 100 mcg/L or when serum transferrin saturation is < 20%" was deleted. 5. **Reduction of Allogeneic Red Blood Cell Transfusions in Patients Undergoing Surgery:** The example cited that the "Epoetin alfa prescribing information recommends supplemental iron therapy when serum ferritin is < 100 mcg/L or when serum transferrin saturation is < 20%" was deleted. 6. **Anemia Associated with MDS:** The approval duration was changed from 6 months to 1 year. For the criteria that addresses patients who are currently receiving an ESA, changed from citing examples of the ESA products in criteria to providing a list of ESAs in a note. 7. **Anemia Associated with Myelofibrosis:** New criteria were approved. See policy.	07/24/2019
Selected revision	**Anemia in CKD for Patients Who are on Dialysis.** Existing criteria were removed. This indication is no longer a targeted indication for this policy. All requests for anemia in CKD for patients who are on dialysis changed to approve for 1 year.	9/11/2019
Selected revision	For **Anemia in Patients with Chronic Kidney Disease who are on Dialysis,** the approval duration was changed from 1 year to 3 years.	11/06/2019
Annual Revision	No criteria changes.	07/22/2020

PRIOR AUTHORIZATION POLICY

POLICY: Erythropoiesis-Stimulating Agents – Mircera Prior Authorization Policy

- Mircera® (methoxy polyethylene glycol-epoetin beta injection for intravenous or subcutaneous use – Vifor Pharma)

REVIEW DATE: 07/22/2020

OVERVIEW

Mircera, an erythropoiesis-stimulating agent (ESA), is indicated for the following uses:[1]

- **Anemia due to chronic kidney disease** (CKD), including adult patients on dialysis, adult patients not on dialysis, and pediatric patients 5 to 17 years of age on hemodialysis who are converting from another ESA after their hemoglobin level was stabilized with an ESA.

Mircera has not been shown to improve symptoms, physical functioning, or health-related quality of life.[1] Mircera is not indicated for use:

- In the treatment of anemia due to cancer chemotherapy.
- As a substitute for red blood cell (RBC) transfusions in those who require immediate correction of anemia.

Therapy should be initiated for patients with CKD on dialysis when the Hb level is < 10.0 g/dL and if the Hb level approaches or exceeds 11.0 g/dL, reduce or interrupt the dose of Mircera.[1] Patients with CKD not on dialysis, Mircera should be initiated when the Hb is < 10.0 g/dL and other considerations apply (e.g., patient is likely to need transfusions). If the Hb exceeds 10.0 g/dL, reduce or interrupt the Mircera dose and use the lowest dose sufficient to reduce the need for RBC transfusions.

Guidelines

The Kidney Disease Improving Global Outcomes (KDIGO) clinical practice guidelines for anemia in CKD (2012) state that for adults with CKD on dialysis ESA therapy should be used to avoid having the Hb concentration fall below 9.0 g/dL by initiating ESA therapy when the Hb is between 9.0 and 10.0 g/dL.[2] The guidelines recommend against ESA therapy for adult patients with CKD who are not on dialysis when Hb levels are ≥ 10.0 g/dL. For adult patients with CKD who are not on dialysis with Hb levels < 10.0 g/dL, the decision whether to initiate ESA therapy should be individualized based on many factors (e.g., prior response to iron therapy, the risk of needing a transfusion, presence of symptoms). In general, ESAs should not be used to maintain Hb concentrations above 11.5 g/dL in adult patients with CKD. For pediatric patients with CKD, the Hb concentration in which ESAs should be initiated in the individual patient should be considered while being aware of the potential benefits and potential harms. In all pediatric patients with CKD receiving ESA therapy, the selected Hb concentration should be in the range of 11.0 to 12.0 g/dL. Iron supplementation can improve response to ESA therapy. Baseline and periodic monitoring (e.g., iron, total iron-binding capacity, transferrin saturation, or ferritin levels) and instituting iron replacement when needed may be useful in limiting the need for ESAs, maximizing symptomatic improvement in patients, and determining the reason for failure to adequately respond to ESAs. Iron deficiency can occur following continued ESA use and, therefore, iron supplementation is required in most patients to maintain an optimal response.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Mircera in patients with conditions other than CKD who are on dialysis. The intent of this policy is to provide recommendations for uses other than anemia in patients with CKD who are on dialysis. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Mircera as well as the monitoring required for adverse events and long-term efficacy, approval requires Mircera to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Mircera is recommended in those who meet the following criteria:

FDA-Approved Indications

7. **Anemia in Patients with Chronic Kidney Disease who are on Dialysis.** Approve for 3 years.

8. **Anemia in Patients with Chronic Kidney Disease who are not on Dialysis.** Approve for 1 year if the patient meets the following criteria (A or B):
   - **A)** Initial Therapy. Approve if the patient meets the following criteria (i, ii, and iii):
     - **i.** Patient is ≥ 18 years of age; AND
     - **ii.** Patient has a hemoglobin < 10.0 g/dL; AND
     - **iii.** Patient meets one of the following (a or b):
       - **a)** Patient is currently receiving iron therapy; OR
       - **b)** Patient has adequate iron stores according to the prescriber; OR
   - **B)** Patient is currently receiving an erythropoiesis-stimulating agent (ESA). Approve if the patient meets the following criteria (i, ii, and iii):

     Note: Examples of erythropoiesis-stimulating agents include an epoetin alfa product (e.g., Epogen, Procrit, or Retacrit), a darbepoetin alfa product (e.g., Aranesp), or a methoxy polyethylene glycol-epoetin beta product (e.g., Mircera).
     - **i.** Patient is ≥ 18 years of age; AND
     - **ii.** Patient has a hemoglobin < 11.5 g/dL; AND
     - **iii.** Patient meets one of the following (a or b):
       - **a)** Patient is currently receiving iron therapy; OR
       - **b)** Patient has adequate iron stores according to the prescriber.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Mircera is not recommended in the following situations:

14. **Anemia Associated with Cancer in Patients Receiving Myelosuppressive Cancer Chemotherapy.** Mircera is not indicated and not recommended for the treatment of anemia due to cancer chemotherapy.[1]

15. **To Enhance Athletic Performance.** Aranesp is not recommended for approval because this indication is excluded from coverage in a typical pharmacy benefit.

16. **Anemia due to Acute Blood Loss.** Use of Aranesp is not appropriate in these types of situations.

17. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual revision	No criteria changes.	02/14/2018
Early annual revision	Criteria that mentioned Epogen/Procrit were changed to epoetin alfa to reflect approval of Retacrit, the first biosimilar epoetin alfa product. For the criteria regarding patients with anemia in CKD who are on dialysis, the criteria that the patient be ≥ 18 years of age was changed to ≥ 5 years of age. For this indication, in patients receiving Mircera for initial therapy for anemia in CKD for patients who are on dialysis, it was noted that the Hb value was required to be ≤ 11.0 g/dL for children initiating therapy; for patients currently receiving Mircera, the Hb value is required to be ≤ 12.0 g/dL in children.	06/20/2018

Annual revision	The following changes were made: 1. **Anemia in CKD for Patients Who are on Dialysis:** The approval duration was changed from 6 months to 1 year. For the criteria that requires the patient have a specified Hb value, changed the wording of "adults" to "patients ≥ 18 years of age". For the criteria that requires children to have a specified Hb value, changed the wording of "children" to "patients < 18 years of age". For the criteria that addresses patients who are currently receiving an ESA, changed from citing examples of the ESA products in criteria to providing a list of ESAs in a note. The example cited that the "Mircera prescribing information recommends supplemental iron therapy when serum ferritin is < 100 mcg/L or when serum transferrin saturation is < 20%" was deleted. 2. **Anemia in CKD for Patients Who are Not on Dialysis:** The approval duration was changed from 6 months to 1 year. For the criteria that requires the patient have a specified Hb value, changed the wording of "adults" to "patients ≥ 18 years of age". For the criteria that requires children to have a specified Hb value, changed the wording of "children" to "patients < 18 years of age". For the criteria that addresses patients who are currently receiving an ESA, changed from citing examples of the ESA products in criteria to providing a list of ESAs in a note. The example cited that the "Mircera prescribing information recommends supplemental iron therapy when serum ferritin is < 100 mcg/L or when serum transferrin saturation is < 20%" was deleted.	07/24/2019
Selected revision	**Anemia in CKD for Patients Who are on Dialysis.** Existing criteria were removed. This indication is no longer a targeted indication for this policy. All requests for anemia in CKD for patients who are on dialysis changed to approve for 1 year.	9/11/2019
Selected revision	For **Anemia in Patients with Chronic Kidney Disease who are on Dialysis,** the approval duration was changed from 1 year to 3 years.	11/06/2019
Annual revision	No criteria changes.	7/22/2020

PRIOR AUTHORIZATION POLICY

POLICY: Fabry Disease – Galafold Prior Authorization Policy

- Galaford® (migalastat capsules – Amicus Therapeutics, Inc.)

REVIEW DATE: 09/30/2020

OVERVIEW

Galafold is indicated for the treatment of adults with a confirmed diagnosis of Fabry disease and an amenable galactosidase alpha gene (GLA) variant based on in vitro assay data.[1] Certain GLA variants produce abnormally folded and less stable forms of the α-galactosidase A (α-GAL) enzyme, however the enzyme still retains activity. Galafold is a pharmacologic chaperone which binds to the active site of α-GAL, which stabilizes the enzyme and allows it to be trafficked from the endoplasmic reticulum to lysosomes. In the lysosome, Galafold dissociates from the enzyme allowing it to exert its pharmacologic activity.

Disease Overview

Fabry disease is a rare inherited X-linked lysosomal storage disorder due to absent or significantly reduced α-Gal activity leading to the accumulation of globotriaosylceramide (GL-3) in a wide variety of cells throughout the body.[2-4] The accumulation of GL-3 leads to progressive multisystem disease, primarily impacting the kidney, heart, and nervous system.[3,4] Life expectancy in patients with Fabry disease is reduced, median survival is typically 50 to 55 years in men and 70 years in women.[2]

The disease can be divided into two phenotypes, a severe, classical phenotype typically found in men without α-Gal activity, and a generally milder non-classical phenotype in men and women with some residual α-Gal activity.[2,3] Classical Fabry disease symptoms often seen at presentation include neuropathic pain, cornea verticillata, and angiokeratoma,[3] and can occur in males as young as 6 to 8 years of age and at 9 years of age in females.[4] Long–term consequences of Fabry disease include hypertrophic

cardiomyopathy, arrhythmias, renal failure, and stroke.[3] Individuals with some residual α-Gal activity typically develop non-classical Fabry disease, which has a later onset, variable disease course, is typically less severe and may affect a single organ, most commonly the heart.[2,3] Despite Fabry disease being an X–linked disorder, women often have Fabry disease signs and symptoms, however they typically have less severe disease than men.

Currently, there have been more than 800 mutations to the gene encoding α-Gal identified and about 60% are missense mutations resulting in single amino acid substitutions.[5] Some of these mutated enzymes have activity levels similar to normal α-Gal however they have been found to be unstable and are retained in the endoplasmic reticulum.

Guidelines

Current Fabry disease treatment guidelines either do not mention Galafold as a treatment option or discuss it as an investigational agent.[6,7]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Galafold. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Galafold as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Galafold to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Galafold is recommended in those who meet the following criteria:

FDA-Approved Indications

41. Fabry Disease. Approve for 3 years if the patient meets the following criteria (A, B, and C):
- ~~**32.**~~ Patient is ≥ 18 years of age; AND
- ~~**33.**~~ Patient has an amenable galactosidase alpha gene (GLA) variant based on *in vitro* assay data; AND
- **34.** The medication is prescribed by or in consultation with a geneticist, nephrologist, or a physician who specializes in the treatment of Fabry disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Galafold is not recommended in the following situations:

105. Concurrent Use with Fabrazyme. One small study (n = 23) assessed a single dose of Galafold (150 mg or 450 mg) used concurrently with Fabrazyme or agalsidase alpha. While a single dose of Galafold significantly increased α-GAL activity, the long-term safety and efficacy of concurrent use of Galafold and Fabrazyme has not been established.[8] Galafold is not FDA approved for concurrent use with Fabrazyme.

106. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Gamifant Prior Authorization Policy

- Gamifant® (emapalumab-lzsg for intravenous injection – Sobi)

REVIEW DATE: 12/02/2020

OVERVIEW

Gamifant, an anti-interferon gamma (IFN-γ) antibody, is indicated for the treatment of adult and pediatric patients with **primary hemophagocytic lymphohistiocytosis** (HLH) with refractory, recurrent, or progressive disease or intolerance with conventional HLH therapy.[1]

Disease Overview

HLH is a syndrome characterized by signs and symptoms of extreme inflammation, caused by defects in cytotoxic function (cytotoxic T cells and natural killer cells).[2] The incidence is estimated at 1.2 cases per million individuals per year, but this is likely an underestimate.[3] In healthy individuals, cytotoxic function is important to terminate immune responses when appropriate by targeting and destroying activated immune cells. Deficiencies in cytotoxic function lead to an unchecked immune response and hyper-inflammation. Primary HLH has a clear genetic cause, whereas secondary HLH is triggered by a concomitant infection or medical condition, such as Epstein-Barr virus infection, malignancy, or rheumatologic disorders. IFN-γ normally has both pro-inflammatory functions (e.g., macrophage activation) and anti-inflammatory functions (e.g., activation of cytotoxic cells).[4,5] However, in HLH, the anti-inflammatory action of IFN-γ is ineffective due to impaired cytotoxic cell activity; thus, pro-inflammatory effects predominate.

Guidelines

The HLH-2004 treatment protocol, developed by the Histiocyte Society, is the current standard of care for diagnostic and therapeutic guidelines.[6] Gamifant is not addressed in the 2004 protocol. To establish a diagnosis of HLH, patients must either have a molecular diagnosis consistent with HLH or meet five out of eight diagnostic criteria. A backbone of etoposide and systemic dexamethasone is the conventional standard of care to induce symptomatic resolution; cyclosporine A and anti-thymocyte globulin have also demonstrated efficacy. Although chemotherapy prolongs survival in primary HLH, a hematopoietic stem cell transplant (HSCT) is needed for cure. Patients with primary HLH should continue chemotherapy (usually with etoposide, cyclosporine A, and dexamethasone) until HSCT can be performed. Myelotoxicity due to chemotherapy is a concern, especially since patients with HLH can have severe cytopenias and immunodeficiency at baseline.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Gamifant. Because of the specialized skills required for evaluation and diagnosis of patients treated with Gamifant, approval requires it to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Gamifant is recommended for those who meet the following criteria:

FDA-Approved Indications

5. Hemophagocytic Lymphohistiocytosis, Primary. Approve Gamifant for 6 months in patients meeting all of the following criteria (A, B, C, and D):

- **A)** Patient has a diagnosis of hemophagocytic lymphohistiocytosis determined by at least one of the following (i or ii):
  - **i.** Patient has a molecular genetic diagnosis consistent with hemophagocytic lymphohistiocytosis; OR
  - **ii.** Prior to treatment, the patient meets at least FIVE of the following diagnostic criteria at baseline (FIVE of a, b, c, d, e, f, g, or h):
    - **a)** Fever ≥ 38.5 °C;
    - **b)** Splenomegaly;
    - **c)** Cytopenias defined as at least TWO of the following (1, 2, or 3):
      - **1)** Hemoglobin < 9 g/dL (or < 10 g/dL in infants less than 4 weeks of age);
      - **2)** Platelets < 100 x 10^9/L;
      - **3)** Neutrophils < 1.0 x 10^9/L;
    - **d)** Patient meets one of the following (1 or 2):
      - **1)** Fasting triglycerides ≥ 265 mg/dL; OR
      - **2)** Fibrinogen ≤ 1.5 g/L;
    - **e)** Hemophagocytosis in bone marrow, spleen, or lymph nodes;
    - **f)** Low or absent natural killer cell activity (according to local laboratory reference);
    - **g)** Ferritin ≥ 500 mcg/L;
    - **h)** Soluble CD25 (i.e., soluble interleukin-2 receptor) ≥ 2,400 U/mL; AND
- **B)** Patient has tried at least one conventional therapy (e.g., etoposide, cyclosporine A, or anti-thymocyte globulin); AND
- **C)** According to the prescriber, the patient has experienced at least ONE of the following (i or ii):
  - **i.** Refractory, recurrent, or progressive disease during conventional therapy (e.g., etoposide, cyclosporine A, or anti-thymocyte globulin); OR
  - **ii.** Intolerance to conventional therapy (e.g., etoposide, cyclosporine A, or anti-thymocyte globulin); AND
- **D)** The medication is prescribed by, or in consultation with, a hematologist, oncologist, immunologist, transplant specialist, or physician who specializes in hemophagocytic lymphohistiocytosis or related disorders.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Gamifant is not recommended in the following situations:

8. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Gastroenterology – Gattex Prior Authorization Policy

- Gattex (teduglutide injection for subcutaneous use – NPS Pharmaceuticals)

REVIEW DATE: 06/24/2020

OVERVIEW

Gattex is a glucagon-like peptide-2 (GLP-2) analog indicated for the treatment of short bowel syndrome in patients ≥ 1 year of age who are dependent on parenteral support.[1] In clinical studies, Gattex decreased the volume of parenteral support needed for some patients with short bowel syndrome and intestinal failure. It is administered via a daily subcutaneous injection.

Clinical Efficacy

In a study involving adults (n = 86) with short bowel syndrome requiring parenteral support at least 3 days per week, more patients treated with Gattex through Month 6 achieved ≥ 20% reduction in weekly intravenous volume (63% vs. 30% with placebo).[1] The mean reduction in intravenous volume was 4.4 liters with Gattex vs. 2.3 liters with placebo. When treated over an additional 2 years, the mean reduction from baseline was 7.55 liters. Ten patients were weaned off of nutritional support and remained on Gattex therapy. At Week 24 of a pediatric study, 69% of patients (n = 18/26) reduced parenteral support volume by at least 20% with Gattex. The mean reduction in intravenous volume was -23 mL/kg/day, a 42% reduction in parenteral support. Three patients were weaned off of parenteral nutritional support.

Safety

Gattex has Warnings and Precautions regarding acceleration of neoplastic growth, intestinal obstruction, biliary and pancreatic disease, fluid overload (including congestive heart failure), and increased absorption of concomitant oral medications.[1] It was approved with a Risk Evaluation and Mitigation Strategy (REMS) program intended to inform healthcare providers and patients about serious risks, including the risks of possible acceleration of neoplastic growth and enhancement of colon polyp growth, gastrointestinal (GI) obstruction, and biliary and pancreatic disorders.[2]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Gattex. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Gattex as well as the monitoring required for adverse events and long-term efficacy, approval requires Gattex to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Gattex is recommended in those who meet the following criteria:

FDA-Approved Indications

29. Short Bowel Syndrome. Approve for the duration noted if the patient meets the following criteria (A or B):

A) Initial Therapy. Approve for 6 months if the patient meets ALL of the following (i, ii, and iii):

- **i.** Patient is ≥ 1 year of age; AND
- **ii.** Patient meets ONE of the following (a or b):
  - **a)** Patient is currently receiving parenteral nutrition on 3 or more days per week; OR
  - **b)** According to the prescriber, the patient is unable to receive adequate total parenteral nutrition (TPN) required for caloric needs; AND
- **iii.** The medication is prescribed by or in consultation with a gastroenterologist.

B) Patient is Currently Receiving Gattex. Approve for 1 year if the patient meets all of the following (i, ii, and iii):

- **i.** Patient has already received at least 6 months of therapy with Gattex; AND
  Note: A patients who has received < 6 months of continuous therapy should be considered under criterion 1A (Initial Therapy).
- **ii.** According to the prescriber, the patient has experienced at least a 20% decrease from baseline in the weekly volume of parenteral nutrition; AND
- **iii.** The agent is prescribed by or in consultation with a gastroenterologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Gattex is not recommended in the following situations:

45. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Gaucher Disease – Enzyme Replacement Therapy – Cerezyme Prior Authorization Policy

- Cerezyme® (imiglucerase for injection – Genzyme)

REVIEW DATE: 03/17/2021

OVERVIEW

Cerezyme, an analogue of β-glucocerebrosidase, is indicated for the long-term enzyme replacement therapy for pediatric and adult patients with a confirmed diagnosis of **Type 1 Gaucher disease** that results in at least one of the following: anemia, thrombocytopenia, bone disease, hepatomegaly, or splenomegaly.[1]

Cerezyme is produced via recombinant DNA technology in Chinese hamster ovary cells and differs from human placental glucocerebrosidase by one amino acid at position 495.[1] Cerezyme catalyzes the breakdown of glucocerebroside to glucose and ceramide.

Disease Overview

Gaucher disease is a rare autosomal recessive, inherited, lysosomal storage disorder caused by a deficiency of the lysosomal enzyme β-glucocerebrosidase.[2-4] Glucocerebrosidase is responsible for the breakdown of glucosylcerebroside (GluCer) into glucose and ceramide. A deficiency of this enzyme is characterized by an excessive accumulation of GluCer in the visceral organs such as the liver, spleen, and bone marrow. GluCer remains stored within lysosomes causing enlarged lipid-laden macrophages called "Gaucher cells".

Gaucher disease is classified into three phenotypes (Types 1 through 3).[2-5] Type 1 is a non-neuropathic variant with asymptomatic or symptomatic clinical manifestations of splenomegaly, hepatomegaly, anemia, thrombocytopenia, skeletal complications, and occasional lung involvement. Type 2 is an acute neuropathic form characterized by an early onset (3 to 6 months of age) of rapidly progressive neurological disease with visceral manifestations; death generally occurs by the time patients reach 1 to 2 years of age. Type 3 is characterized by neurological symptoms and visceral symptoms with a later onset and includes abnormal eye movements, ataxia, seizures, and dementia. Type 1 is most prevalent in the Western world, accounting for an estimated 94% of patients with Gaucher disease.[2,6] Types 2 and 3 represent < 1% and 5%, respectively, in Europe, North America, and Israel.[2,5] The diagnosis of Gaucher disease is established by demonstrating deficient β-glucocerebrosidase activity in leukocytes or fibroblasts, or mutations in the glucocerebrosidase gene.[7,8]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Cerezyme. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Cerezyme as well as the monitoring required for adverse events and long-term efficacy, approval requires Cerezyme to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Cerezyme is recommended in those who meet the following criteria:

FDA-Approved Indications

30. Gaucher Disease. Approve for 1 year if the patient meets the following criteria (A, B, and C):

- **A)** Patient has Type 1 Gaucher disease; AND
- **B)** The diagnosis is established by one of the following (i or ii):
  - **i.** Demonstration of deficient β-glucocerebrosidase activity in leukocytes or fibroblasts; OR
  - **ii.** Molecular genetic testing documenting glucocerebrosidase gene mutation; AND

C) Cerezyme is prescribed by or in consultation with a geneticist, endocrinologist, a metabolic disorder sub-specialist, or a physician who specializes in the treatment of lysosomal storage disorders.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Cerezyme is not recommended in the following situations:

46. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Gaucher Disease – Enzyme Replacement Therapy – Elelyso Prior Authorization Policy

- Elelyso® (taliglucerase for injection – Pfizer)

REVIEW DATE: 03/17/2021

OVERVIEW

Elelyso, an analogue of β-glucocerebrosidase, is indicated for the treatment of patients with a confirmed diagnosis of Type 1 Gaucher disease.[1]

Elelyso is produced via recombinant DNA technology in genetically modified carrot plant root cells.[1] Elelyso differs from human glucocerebrosidase by two amino acids at the N terminal and seven amino acids at the C terminal end of the protein. Elelyso catalyzes the breakdown of glucocerebroside to glucose and ceramide.

Disease Overview

Gaucher disease is a rare autosomal recessive, inherited, lysosomal storage disorder caused by a deficiency of the lysosomal enzyme β-glucocerebrosidase.[2-4] Glucocerebrosidase is responsible for the breakdown of glucosylcerebroside (GluCer) into glucose and ceramide. A deficiency of this enzyme is characterized by an excessive

accumulation of GluCer in the visceral organs such as the liver, spleen, and bone marrow. GluCer remains stored within lysosomes causing enlarged lipid-laden macrophages called "Gaucher cells".

Gaucher disease is classified into three phenotypes (Types 1 through 3).[2-5] Type 1 is a non-neuropathic variant with asymptomatic or symptomatic clinical manifestations of splenomegaly, hepatomegaly, anemia, thrombocytopenia, skeletal complications, and occasional lung involvement. Type 2 is an acute neuropathic form characterized by an early onset (3 to 6 months of age) of rapidly progressive neurological disease with visceral manifestations; death generally occurs by the time patients reach 1 to 2 years of age. Type 3 is characterized by neurological symptoms and visceral symptoms with a later onset and includes abnormal eye movements, ataxia, seizures, and dementia. Type 1 is most prevalent in the Western world, accounting for an estimated 94% of patients with Gaucher disease.[2,6] Types 2 and 3 represent < 1% and 5%, respectively, in Europe, North America, and Israel.[2,5] The diagnosis of Gaucher disease is established by demonstrating deficient β-glucocerebrosidase activity in leukocytes or fibroblasts, or mutations in the glucocerebrosidase gene.[7,8]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Elelyso. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Elelyso as well as the monitoring required for adverse events and long-term efficacy, approval requires Elelyso to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Elelyso is recommended in those who meet the following criteria:

FDA-Approved Indications

31. Gaucher Disease. Approve for 1 year if the patient meets the following criteria (A, B, C, and D):
- **A)** Patient has Type 1 Gaucher disease; AND
- **B)** Patients is ≥ 4 years of age; AND
- **C)** The diagnosis is established by one of the following (i or ii):
  - **i.** Demonstration of deficient β-glucocerebrosidase activity in leukocytes or fibroblasts; OR
  - **ii.** Molecular genetic testing documenting glucocerebrosidase gene mutation; AND
- **D)** Elelyso is prescribed by or in consultation with a geneticist, endocrinologist, a metabolic disorder sub-specialist, or a physician who specializes in the treatment of lysosomal storage disorders.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage for Elelyso is not recommended in the following situations:

47. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Gaucher Disease – Enzyme Replacement Therapy – Vpriv Prior Authorization Policy

- Vpriv® (velaglucerase for injection – Shire Human Genetic Therapies)

REVIEW DATE: 03/17/2021

OVERVIEW

Vpriv, an analogue of β-glucocerebrosidase, is indicated for long-term enzyme replacement therapy for patients with Type 1 Gaucher disease.[1]

Vpriv is produced via gene activation technology in a human fibroblast cell line.[1] Vpriv has the same amino acid sequence as the naturally occurring human glucocerebrosidase. Vpriv catalyzes the breakdown of glucocerebroside to glucose and ceramide.

Disease Overview

Gaucher disease is a rare autosomal recessive, inherited, lysosomal storage disorder caused by a deficiency of the lysosomal enzyme β-glucocerebrosidase.[2-4] Glucocerebrosidase is responsible for the breakdown of glucosylcerebroside (GluCer) into glucose and ceramide. A deficiency of this enzyme is characterized by an excessive accumulation of GluCer in the visceral organs such as the liver, spleen, and bone marrow. GluCer remains stored within lysosomes causing enlarged lipid-laden macrophages called "Gaucher cells".

Gaucher disease is classified into three phenotypes (Types 1 through 3).[2-5] Type 1 is a non-neuropathic variant with asymptomatic or symptomatic clinical manifestations of splenomegaly, hepatomegaly, anemia, thrombocytopenia, skeletal complications, and occasional lung involvement. Type 2 is an acute neuropathic form characterized by an early onset (3 to 6 months of age) of rapidly progressive neurological disease with visceral manifestations; death generally occurs by the time patients reach 1 to 2 years of age. Type 3 is characterized by neurological symptoms and visceral symptoms with a later onset and includes abnormal eye movements, ataxia, seizures, and dementia. Type 1 is most prevalent in the Western world, accounting for an estimated 94% of patients with Gaucher disease.[2,6] Types 2 and 3 represent < 1% and 5%, respectively, in Europe, North America, and Israel.[2,5] The diagnosis of Gaucher disease is established by demonstrating deficient β-glucocerebrosidase activity in leukocytes or fibroblasts, or mutations in the glucocerebrosidase gene.[7,8]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Vpriv. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Vpriv as well as the monitoring required for adverse events and long-term efficacy, approval requires Vpriv to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Vpriv is recommended in those who meet the following criteria:

FDA-Approved Indications

32. Gaucher Disease. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Patient has Type 1 Gaucher disease; AND
- **B)** The diagnosis is established by one of the following (i or ii):
  - **i.** Demonstration of deficient β-glucocerebrosidase activity in leukocytes or fibroblasts; OR
  - **ii.** Molecular genetic testing documenting glucocerebrosidase gene mutation; AND
- **C)** Vpriv is prescribed by or in consultation with a geneticist, endocrinologist, a metabolic disorder sub-specialist, or a physician who specializes in the treatment of lysosomal storage disorders.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Vpriv is not recommended in the following situations:

48. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Gaucher Disease Substrate Reduction Therapy – Cerdelga® (eliglustat capsules – Genzyme)

DATE REVIEWED: 05/06/2020

OVERVIEW

Cerdelga, a glucosylceramide synthase inhibitor, is indicated for the long-term treatment of adult patients with Gaucher Disease type 1 who are cytochrome P450(CYP)2D6 extensive metabolizers (EMs),

intermediate metabolizers (IMs), or poor metabolizers (PMs) as detected by an FDA-cleared test.[1] The Cerdelga prescribing information notes the following limitations of use: patients who are CYP2DE ultra-rapid metabolizers (URMs) may not achieve adequate concentrations of Cerdelga to achieve a therapeutic effect; and a specific dosage cannot be recommended for patients for whom the CYP2D6 genotype cannot be determined (indeterminate metabolizers).

DISEASE OVERVIEW

Gaucher disease is caused by a deficiency in the lysosomal enzyme β-glucocerebrosidase.[1] This enzyme is responsible for the breakdown of glucosylceramide into glucose and ceramide. In Gaucher disease, deficiency of the enzyme β-glucocerebrosidase results in the accumulation of glucosylceramide substrate in lysosomal compartment of macrophages, giving rise to foam cells or "Gaucher cells." Cerdelga is a specific inhibitor of the enzyme glycosylceramide synthase, which is responsible for producing the substrate glucosylceramide; hence Cerdelga functions as a substrate reduction therapy.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Cerdelga. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Cerdelga as well as the monitoring required for adverse events and long-term efficacy, approval requires Cerdelga to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Cerdelga is recommended in those who meet the following criteria:

FDA-Approved Indications

42. Gaucher Disease Type I. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** The patient is a cytochrome P450(CYP) 2D6 extensive metabolizer (EM), intermediate metabolizer (IM), or poor metabolizer (PM) as detected by an approved test; AND
- **B)** Cerdelga is prescribed by or in consultation with a geneticist, endocrinologist, a metabolic disorder sub-specialist, or a physician who specializes in the treatment of Gaucher Disease or related disorders.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Cerdelga has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

107. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Gaucher Disease Substrate Reduction Therapy – Miglustat capsules (Zavesca® – Actelion Pharmaceuticals; generic)

DATE REVIEWED: 05/06/2020

OVERVIEW

Miglustat capsules (Zavesca), a glucosylceramide synthase inhibitor, is indicated as monotherapy for the treatment of adult patients with mild to moderate Gaucher disease type 1 for whom enzyme replacement therapy is not a therapeutic option (e.g., due to allergy, hypersensitivity, or poor venous access).[1] Generic miglustat is an AB-rated therapeutically equivalent generic of Zavesca.

DISEASE OVERVIEW

Gaucher disease is caused by a deficiency in the lysosomal enzyme β-glucocerebrosidase.[2] This enzyme is responsible for the breakdown of glucosylceramide into glucose and ceramide. In Gaucher disease, deficiency of the enzyme β-glucocerebrosidase results in the accumulation of glucosylceramide substrate in lysosomal compartment of macrophages, giving rise to foam cells or "Gaucher cells." Zavesca is a specific inhibitor of the enzyme glycosylceramide synthase, which is responsible for producing the substrate glucosylceramide.[1] By functioning as a substrate reduction therapy, Zavesca allows the residual activity of the deficient glucocerebrosidase enzyme to be more effective.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Zavesca/generic miglustat. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Zavesca/generic miglustat as well as the monitoring required for adverse events and long-term efficacy, approval requires Zavesca/generic miglustat to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zavesca/generic miglustat is recommended in those who meet the following criteria:

FDA-Approved Indications

43. Gaucher Disease Type I. Approve for 1 year if Zavesca or generic miglustat is prescribed by or in consultation with a geneticist, endocrinologist, metabolic disorder sub-specialist, or a physician who specializes in the treatment of Gaucher Disease or related disorders.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Zavesca/generic miglustat has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

108. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Gonadotropin-Releasing Hormone Agonist – Synarel Prior Authorization Policy

- Synarel® (nafarelin acetate nasal solution – G.D. Searle LLC)

REVIEW DATE: 11/18/2020

OVERVIEW

Synarel, a gonadotropin-releasing hormone agonist (GnRH), is indicated for the following[1]:

- **Central precocious puberty**, treatment in children of both sexes.
- **Endometriosis management**, including pain relief and reduction of endometriotic lesions. Experience with Synarel for this indication is limited to women ≥ 18 years of age treated for 6 months.

Guidelines

GnRH agonists are the standard of care for the treatment of central precocious puberty is GnRH agonists.[2-4] The European Society for Paediatric Endocrinology and the Lawson Wilkins Pediatric Endocrine Society convened a consensus conference to review the use of GnRH agonists in pediatric patients with central precocious puberty (2009).[2] The panel noted that the available GnRH agonists (including nafarelin) are effective despite different routes of administration, dosing, and duration of action. In addition, the various GnRH agonists are well-tolerated in children and adolescents. An update by an International Consortium (2019) notes the lack of prospective comparative studies to establish differences in efficacy (if any) among the various GnRH agonists.[3] Discontinuation of GnRH agonist therapy should be individualized, based on the patient's readiness for resumption of puberty, recent growth rates, and shifts in height prediction.

The American College of Obstetrician and Gynecologist (ACOG) practice bulletin on the management of endometriosis (2010, reaffirmed 2018) notes that empiric treatment with a GnRH agonist is appropriate after an appropriate pretreatment evaluation (to exclude other causes of chronic pelvic pain) and failure of initial treatment with oral contraceptives and non-steroidal anti-inflammatory drugs (NSAIDS).[5]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Synarel. All approvals are provided for 1 year in duration unless otherwise noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Synarel is recommended in those who meet one of the following criteria:

FDA-Approved Indications

17. Central Precocious Puberty. Approve for 1 year.

18. Endometriosis. Approve for 6 months if the patient meets the following criteria (A and B):

a) Patient is ≥ 18 years of age; AND

b) Patient has tried one of the following, unless contraindicated (i, ii, or iii):

i. A contraceptive; OR
   Note: Examples of contraceptives includes combination oral contraceptives, levonorgestrel-releasing intrauterine systems [e.g., Mirena®, Liletta®]).

ii. An oral progesterone (e.g., norethindrone tablets): OR

iii. A depo-medroxyprogesterone injection
   Note: An exception to the requirement for a trial of the above therapies can be made if the patient has previously used a gonadotropin-releasing hormone (GnRH) agonist (e.g., Lupron Depot) or antagonist (e.g., Orilissa) for endometriosis.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Synarel is not recommended in the following situations:

3. Peripheral Precocious Puberty (Also Known as Gonadotropin-Releasing Hormone-Independent Precocious Puberty). Children with peripheral precocious puberty do not respond to gonadotropin-releasing hormone agonist therapy.[2] Treatment is directed at removing or blocking the production and/or response to the excess sex steroids, depending on the cause (e.g., surgically removing human chorionic gonadotropin-secreting tumors or using glucocorticoids to treat defects in adrenal steroidogenesis [such as classic congenital adrenal hyperplasia]).

4. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
New Policy	--	11/18/2020

PRIOR AUTHORIZATION POLICY

POLICY: Gonadotropin-Releasing Hormone Agonists – Central Precocious Puberty Prior Authorization Policy

- Fensolvi® (leuprolide acetate for injectable suspension – Tolmar)
- Lupron Depot-Ped® (leuprolide acetate for depot suspension – AbbVie)
- Triptodur™ (triptorelin extended-release injectable suspension – Arbor Pharmaceuticals, LLC)

REVIEW DATE: 09/16/2020

OVERVIEW

Fensolvi, Lupron Depot-Ped, and Triptodur are gonadotropin-releasing hormone (GnRH) agonists indicated for the treatment of children with central precocious puberty.[1-3] Fensolvi is administered by a subcutaneous injection and both Lupron Depot-Ped and Triptodur are administered by intramuscular injection. Fensolvi is administered once every 6 months, Lupron Depot-Ped is administered once a month or once every 3 months, and Triptodur is administered once every 24 weeks.

Guidelines

The standard of care for central precocious puberty is GnRH agonists.[4-6] The European Society for Paediatric Endocrinology and the Lawson Wilkins Pediatric Endocrine Society convened a consensus conference to review the use of GnRH agonists in pediatric patients with central precocious puberty (2009).[4] The panel noted that the available GnRH agonists (including leuprolide and triptorelin) are effective despite different routes of administration, dosing, and duration of action. In addition, the various GnRH agonists are well-tolerated in children and adolescents. An update by an International Consortium (2019) notes the lack of prospective comparative studies to establish differences in efficacy (if any) among the various GnRH agonists.[5] The Consortium does not prefer one GnRH agonist over another. Discontinuation of GnRH agonist therapy should be individualized, based on the patient's readiness for resumption of puberty, recent growth rates, and shifts in height prediction.

Other Uses With Supportive Evidence

The Endocrine Society Guideline (2017) for the treatment of gender-dysphoric/gender-incongruent persons note that persons who fulfill criteria for treatment and who request treatment should initially undergo treatment to suppress physical changes of puberty.[7] Pubertal hormonal suppression should typically be initiated after the adolescent first exhibits physical changes of puberty (Tanner stages G2/B2). However, there may be compelling reasons to initiate hormone treatment before the age of 16 years in some adolescents. The guidelines note suppression of pubertal development and gonadal function can be effectively achieved via gonadotropin suppression using GnRH analogs. Long-acting GnRH analogs are the currently preferred treatment option. An advantage to using a GnRH analog is that the effects can be

reversed; pubertal suppression can be discontinued if the individual no longer wishes to transition. Upon discontinuation of therapy, spontaneous pubertal development has been shown to resume. The World Professional Association for Transgender Health (WPATH) Standards of Care (version 7) document also recommends the use of GnRH analogs in both male and female adolescents as a fully reversible intervention for pubertal suppression.[8] GnRH can also be used in patients during late puberty to suppress the hypothalamic-pituitary-gonadal axis to allow for lower doses of cross-sex hormones.[9] In addition to use in adolescents, GnRH analog therapy is also used in adults, particularly male-to-female patients.[10]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of gonadotropin-releasing hormone agonists (Fensolvi, Lupron Depot-Ped, and Triptodur). All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of gender-dysphoric/gender-incongruent persons treated with Fensolvi, Lupron Depot-Ped, or Triptodur as well as the monitoring required for adverse events and long-term efficacy, approval requires that the product be prescribed by or in consultation with, a physician who specializes in this condition.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of a gonadotropin-releasing hormone agonist (Fensolvi, Lupron Depot-Ped, and Triptodur) is recommended in those who meet the following criteria:

FDA-Approved Indications

12. Central Precocious Puberty. Approve the requested gonadotropin-releasing hormone agonist for 1 year.

Other Uses with Supportive Evidence

13. Gender-Dysphoric/Gender-Incongruent Persons; Persons Undergoing Gender Reassignment (Female-To-Male or Male-To-Female). Approve the requested gonadotropin-releasing hormone agonist for 1 year if prescribed by or in consultation with an endocrinologist or a physician who specializes in the treatment of transgender patients.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of a gonadotropin-releasing hormone agonist (Fensolvi, Lupron Depot-Ped, and Triptodur) is not recommended in the following situations:

109. Peripheral Precocious Puberty (Also Known as Gonadotropin-Releasing Hormone-Independent Precocious Puberty). Children with peripheral precocious puberty do not respond to gonadotropin-releasing hormone agonist therapy.[4] Treatment is directed at removing or blocking the production and/or response to the excess sex steroids, depending on the cause (e.g., surgically removing human chorionic gonadotropin-secreting tumors or using glucocorticoids to treat defects in adrenal steroidogenesis [such as classic congenital adrenal hyperplasia]).

110. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Gonadotropin-Releasing Hormone Agonists Implants Prior Authorization Policy

- Supprelin® LA (histrelin acetate subcutaneous implant – Endo Pharmaceuticals)
- Vantas® (histrelin acetate subcutaneous implant – Endo Pharmaceuticals)

- Zoladex® (goserelin acetate subcutaneous implant – TerSera Therapeutics)

REVIEW DATE: 01/20/2021

Overview

Supprelin LA, Vantas, and Zoladex are gonadotropin-releasing hormone (GnRH) agonists implants.[1-4]

Supprelin LA is indicated for the treatment of children with **central precocious puberty**.[1]

Vantas is indicated for the palliative treatment of **advanced prostate cancer**.[2] Although Vantas is not indicated for use in children with central precocious puberty, it contains the same chemical entity as that of Supprelin LA, and can be used for this condition.

Zoladex is indicated for the following conditions:[3,4]

- **Breast cancer**, palliative treatment of advanced breast cancer in pre- and perimenopausal women (Zoladex 3.6 mg implant only).
- **Endometrial-thinning**, use as an endometrial-thinning agent prior to endometrial ablation for dysfunctional uterine bleeding (Zoladex 3.6 mg implant only).
- **Endometriosis**, including pain relief and reduction of endometriotic lesions for the duration of therapy (Zoladex 3.6 mg implant only).
- **Prostate cancer**, in combination with flutamide for the management of locally confined Stage T2b-T4 (Stage B2-C).
- **Prostate cancer**, palliative treatment.

Guidelines

The NCCN Breast Cancer guidelines (version 6.2020 – September 8, 2020) does not note the use of Zoladex implants for advanced breast cancer.[5] However, the guidelines note that GnRH agonists (e.g., Zoladex) administered prior to initiating chemotherapy protect against ovarian failure and reduce the risk of early menopause.

Central precocious puberty, also known as gonadotropin-dependent precocious puberty, is caused by early maturation of the hypothalamic-pituitary-gonadal axis.[6] The standard of care for central precocious puberty is GnRH agonists. The European Society for Paediatric Endocrinology and the Lawson Wilkins Pediatric Endocrine Society convened a consensus conference (2009) to review the use of GnRH agonists in pediatric patients with central precocious puberty.[7] The panel noted that the available GnRH agonists (including leuprolide, triptorelin, and histrelin implant) are effective despite different routes of administration, dosing, and duration of action. An update by the International Consortium (2019) reiterates the use of GnRH agonists (e.g., leuprolide, triptorelin, and histrelin implant) for the treatment of central precocious puberty.[8] GnRH agonists are generally well-tolerated in children and adolescents.

The National Comprehensive Cancer Network (NCCN) Prostate Cancer guidelines (version 3.2020 – November 17, 2020) list both Vantas and Zoladex as androgen deprivation therapy (ADT) options for use in various settings (all category 2A): clinically localized disease, regional disease, prostate specific antigen (PSA) persistence/recurrence after radical prostatectomy (RP) or external beam radiation therapy (EBRT) [castration-naïve disease], and metastatic castration-naïve disease.[9]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Supprelin LA, Vantas, and Zoladex. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Vantas, and Zoladex as well as the monitoring required for adverse events and long-term efficacy, approval requires these agents to be prescribed by or in consultation with a physician who specializes in the condition being treated. Note that as with Supprelin LA, when Vantas is prescribed for use in children with central precocious puberty, it does not need to be prescribed by or in consultation with a specialist.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

I. Coverage of Vantas is recommended in patients who meet the following criteria:

FDA-Approved Indications

1. **Prostate Cancer.** Approve for 1 year if the medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

2. **Central Precocious Puberty.** Approve for 1 year.

II. Coverage of Supprelin LA is recommended in patients who meet the following criteria:

FDA-Approved Indications

1. **Central Precocious Puberty.** Approve for 1 year.

III. Coverage of Zoladex is recommended in patients who meet one of the following criteria:

FDA-Approved Indications

1. **Abnormal Uterine Bleeding.** Approve for up to 2 months (total) if the patient meets the following conditions (A and B):
   A) Zoladex is used as an endometrial-thinning agent prior to endometrial ablation; AND
   B) The medication is prescribed by or in consultation with an obstetrician-gynecologist or a healthcare practitioner who specializes in the treatment of women's health.

2. **Breast Cancer**. Approve for 1 year if the patient meets the following conditions (A and B):
   A) Zoladex is used in premenopausal or perimenopausal women; AND
   B) The medication is prescribed by or in consultation with an oncologist.

3. **Endometriosis.** Approve for up to 6 months (total) if the patient meets the following conditions (A and B):
   A) Patient is ≥ 18 years of age; AND
   B) The medication is prescribed by or in consultation with an obstetrician-gynecologist or a healthcare practitioner who specializes in the treatment of women's health.

4. **Prostate Cancer**. Approve for 1 year if the medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Supprelin LA, Vantas, and Zoladex is not recommended in the following situations:

111. Peripheral Precocious Puberty (also known as GnRH-independent precocious puberty).
Children with peripheral precocious puberty do not respond to GnRH agonist therapy.[8] Treatment is directed at removing or blocking the production and/or response to the excess sex steroids, depending on the cause (e.g.,

surgically removing human chorionic gonadotropin-secreting tumors or using glucocorticoids to treat defects in adrenal steroidogenesis [such as classic congenital adrenal hyperplasia]).

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
New Policy	--	04/03/2019
Selected Revision	Revised Precocious Puberty (also known as Gonadotropin-releasing hormone independent precocious puberty or peripheral precocious puberty) to Peripheral Precocious Puberty (also known as GnRH-independent precocious puberty).	09/18/2019
Update	11/21/2019: Changed policy name from Gonadotropin-Releasing Hormone Agonists – Supprelin LA, Vantas, Zoladex Implants Prior Authorization Policy to Gonadotropin-Releasing Hormone Agonists – Implants (Supprelin LA, Vantas, and Zoladex) Prior Authorization Policy	NA
Early Annual Revision	No criteria changes. Policy Statement: Removed Supprelin LA from this sentence: Because of the specialized skills required for evaluation and diagnosis of patients treated with Vantas, and Zoladex as well as the monitoring required for adverse events and long-term efficacy, approval requires these agents to be prescribed by or in consultation with a physician who specializes in the condition being treated (Supprelin LA was erroneously included). Approval of Central Precocious Puberty does not require that it be prescribed by or in consultation with a specialist).	01/15/2020
Selected Revision	Vantas: Added approval for central precocious puberty – approve for 1 year. Policy Statement: Added this sentence: Note that as with Supprelin LA, when Vantas is prescribed for use in children with central precocious puberty, it does not need to be prescribed by or in consultation with a specialist.	03/11/2020
Update	09/22/2020: Revised policy name from "Gonadotropin-Releasing Hormone Agonists – Implants (Supprelin LA, Vantas, and Zoladex) PA Policy" to "Gonadotropin-Releasing Hormone Agonists – Implants PA Policy".	NA
Annual Revision	No criteria changes.	01/20/2021

NA – Not applicable.

PRIOR AUTHORIZATION POLICY

POLICY: Gonadotropin-Releasing Hormone Agonists – Injectable Long-Acting Products Prior Authorization Policy

- Lupaneta Pack® (leuprolide acetate for depot suspension; norethindrone acetate tablets co-packaged for intramuscular use and oral use, respectively – AbbVie)
- Lupron Depot® (leuprolide acetate suspension for intramuscular injection – Abbott Laboratories)

REVIEW DATE: 01/20/2021; Selected revision 03/03/2021

Overview

Lupaneta Pack is indicated for initial management of the painful symptoms of **endometriosis** and for management of recurrence of symptoms.[1,2]

Lupron Depot (3.75 mg intramuscular (IM) injection every month, 11.25 mg IM injection every 3 months) is indicated for the following conditions:[3,4]

- Preoperative hematologic improvement of women with **anemia caused by uterine leiomyomata** (fibroids) for whom 3 months of hormonal suppression is deemed necessary. (Lupron Depot in combination with iron therapy).
- **Endometriosis**, including pain relief and reduction of endometriotic lesions (Lupron Depot monotherapy).
- **Endometriosis**, initial management of the painful symptoms of endometriosis and management of recurrence of symptoms (Lupron Depot in combination with norethindrone acetate 5 mg daily).

Lupron Depot (7.5 mg IM injection every month, 22.5 mg IM injection every 3 months, 30 mg IM injection every 4 months, and 45 mg IM injection every 6 months) is indicated for the **palliative treatment of advanced prostate cancer**.[5]

Duration of Treatment:

- Lupaneta Pack: Initial treatment course is limited to 6 months; a single retreatment course of up to 6 months is allowed. Total duration of treatment is limited to 12 months.[1,2]
- Lupron Depot 3.75 mg and 11.25 mg:[3,4]
  - Endometriosis: For the first 6 months of treatment, Lupron Depot may be used as monotherapy or in combination with norethindrone acetate. If retreatment is needed, Lupron Depot must be used in combination with norethindrone acetate (for 6 months). Total duration of treatment is limited to 12 months.
  - Uterine leiomyomata (fibroids): Recommended duration of treatment is up to 3 months.
- Lupron Depot 7.5 mg, 22.5 mg, 30 mg, and 45 mg: Labeling does not specify a treatment duration.

Guidelines

Abnormal Uterine Bleeding/Uterine Leiomyomata (Fibroids)

The American College of Obstetricians and Gynecologists (ACOG) practice bulletin regarding the diagnosis of abnormal uterine bleeding in reproductive-aged women discusses the nomenclature of abnormal uterine bleeding. It can be classified by the acronym PALM-COEIN (polyp, adenomyosis, leiomyoma, malignancy and hyperplasia, coagulopathy, ovulatory dysfunction, endometrial, iatrogenic, and not yet classified) and can be further classified by etiology.[6] The term abnormal uterine bleeding can also be paired with descriptive terms that describe the associated bleeding pattern such as heavy menstrual bleeding or intermenstrual bleeding.

The ACOG frequently asked questions (FAQ) #074 (2018) addresses medication use for the treatment of fibroids.[7] Gonadotropin-releasing hormone (GnRH) agonists are noted as medications that can stop the menstrual cycle and shrink fibroids. GnRH analogs are used as short-term preoperative therapy to reduce uterine and leiomyoma volume; long-term therapy should be limited to patients who have contraindications to other medical or surgical treatments.[8] They can also be used for acute abnormal uterine bleeding with an aromatase inhibitor or antagonist to prevent initial estrogen flare and for the treatment of heavy menstrual bleeding caused by leiomyoma-associated hormonal imbalance.[9]

A clinical practice guideline from the Society of Obstetricians and Gynaecologists of Canada notes that leuprolide acetate or combined hormonal contraception should be considered highly effective in preventing abnormal uterine bleeding when initiated prior to cancer treatment in premenopausal women at risk of thrombocytopenia.[10] The ACOG committee opinion on prevention and management of heavy menstrual bleeding in adolescent patients undergoing cancer treatment lists leuprolide as an option for patients.[11]

Endometriosis

According to the ACOG practice bulletin on the management of endometriosis (2010, reaffirmed 2018), empiric therapy with a 3-month course of a gonadotropin-releasing hormone (GnRH) agonist is appropriate after an appropriate pretreatment evaluation (to exclude other causes of chronic pelvic pain) and failure of initial treatment with oral contraceptives and nonsteroidal anti-inflammatory drugs (NSAIDs).[12]

Other Uses With Supportive Evidence

The Endocrine Society Guideline (2017) for the Treatment of Gender-Dysphoric/Gender-Incongruent Persons note that persons who fulfill criteria for treatment and who request treatment should initially undergo treatment to suppress physical changes of puberty.[13] Pubertal hormonal suppression should typically be initiated after the adolescent first exhibits physical changes of puberty (Tanner stages G2/B2).

However, there may be compelling reasons to initiate hormone treatment before the age of 16 years in some adolescents. The guidelines note suppression of pubertal development and gonadal function can be effectively achieved via gonadotropin suppression using GnRH analogs. Long-acting GnRH analogs are the currently preferred treatment option. An advantage to using a GnRH analog is that the effects can be reversed; pubertal suppression can be discontinued if the individual no longer wishes to transition. Upon discontinuation of therapy, spontaneous pubertal development has been shown to resume. The World Professional Association for Transgender Health (WPATH) Standards of Care (version 7) document also recommends the use of GnRH analogs in both male and female adolescents as a fully reversible intervention for pubertal suppression.[14] GnRH can also be used in patients during late puberty to suppress the hypothalamic-pituitary-gonadal axis to allow for lower doses of cross-sex hormones.[15] In addition to use in adolescents, GnRH analog therapy is also used in adults, particularly male-to-female patients.[16]

In addition to the approved indications, GnRH agonists such as long-acting leuprolide, have been used for other conditions. The National Comprehensive Cancer Network (NCCN) guidelines for Adolescent and Young Adult Oncology (version 1.2021 – September 10, 2020) note there are some data to suggest menstrual suppression with GnRH agonists (before the initiation of chemotherapy) may protect ovaries in young women with breast cancer.[17] There are conflicting data regarding the beneficial effects of GnRH agonists on fertility preservation. The NCCN guidelines for Breast Cancer (version 6.2020 – September 8, 2020) note that luteinizing hormone-releasing hormone agonists, such as leuprolide, can be used for ovarian suppression.[18] The guidelines further note that randomized trials have shown that ovarian suppression with GnRH agonist therapy administered during adjuvant chemotherapy in premenopausal women with breast tumors (regardless of hormone receptor status) may preserve ovarian function and diminish the likelihood of chemotherapy-induced amenorrhea. The NCCN guidelines for Head and Neck Cancer (version 1.2021 – November 9, 2020) recommend the use of androgen receptor therapy (i.e., leuprolide, bicalutamide) for androgen receptor-positive, advanced salivary gland tumors with distant metastases.[19] The NCCN guidelines for Ovarian Cancer including Fallopian Tube Cancer and Primary Peritoneal Cancer (version 2.2020 – January 12, 2021) recommend leuprolide as a hormonal therapy option in various settings (e.g., adjuvant therapy, recurrence).[20]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Lupaneta Pack and Lupron-Depot. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Lupaneta Pack and Lupron-Depot as well as the monitoring required for adverse events and long-term efficacy, approval for some of the conditions requires Lupaneta Pack and Lupron-Depot to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

Recommended Authorization Criteria

Coverage of Lupaneta Pack and Lupron Depot is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Endometriosis.** Approve Lupron Depot or Lupaneta Pack for 1 year if the patient has tried one of the following (A, B, or C):
   - **A)** A contraceptive (e.g., combination oral contraceptives, levonorgestrel-releasing intrauterine systems [e.g., Mirena®, Liletta®]), OR
   - **B)** An oral progesterone (e.g., norethindrone tablets), OR

C) A depo-medroxyprogesterone injection, unless contraindicated.
NOTE: An exception to the requirement for a trial of the above therapies can be made if the patient has previously used a gonadotropin-releasing hormone [GnRH] agonist (e.g., Lupron-Depot) or antagonist (e.g., Orilissa).

2. **Prostate Cancer.** Approve Lupron Depot for 1 year if prescribed by or in consultation with an oncologist.

3. **Uterine Leiomyomata (fibroids).** Approve Lupron Depot for 3 months.

Other Uses with Supportive Evidence

4. **Abnormal Uterine Bleeding.** Approve Lupron Depot for 6 months.

5. **Breast Cancer.** Approve Lupron Depot for 1 year if prescribed by or in consultation with an oncologist.

6. **Gender Dysphoric/Gender-Incongruent Persons; Persons Undergoing Gender Reassignment (Female-To-Male [FTM] or Male-To-Female [MTF]).** Approve Lupron Depot for 1 year if prescribed by or in consultation with an endocrinologist or a physician who specializes in the treatment of transgender patients.

7. **Head and Neck Cancer – Salivary Gland Tumors.** Approve Lupron Depot for 1 year if the patient meets the following criteria (A, B, and C):
   A) Patient has advanced salivary gland tumors with distant metastases; AND
   B) Patient has androgen receptor (AR)-positive disease; AND
   C) The medication is prescribed by or in consultation with an oncologist.

8. **Ovarian Cancer.** Approve Lupron Depot for 1 year if prescribed by or in consultation with an oncologist.

9. **Preservation of Ovarian Function/Fertility in Patients Undergoing Chemotherapy.** Approve Lupron Depot for 1 year if prescribed by or in consultation with an oncologist.

10. **Prophylaxis or Treatment of Uterine Bleeding in Patients with Hematologic Malignancy, or Undergoing Cancer Treatment, or Prior to Bone Marrow/Stem Cell Transplantation (BMT/SCT).** Approve Lupron Depot for 1 year if prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Lupron Depot and Lupaneta Pack is not recommended in the following situations:

1. **Hirsutism.** The Endocrine Society guidelines (2018) on the treatment of hirsutism in premenopausal women suggest against using GnRH agonists except in women with severe forms of hyperandrogenemia, such as ovarian hyperthecosis, who have had a suboptimal response to oral contraceptives and antiandrogens.[21]

2. **Menstrual Migraine.** A review article notes that GnRH analogs are effective in eliminating menstrual migraines, but their use is limited due to the significant adverse effects of estrogen deficiency, including severe vasomotor symptoms, sleep disruption, and a marked reduction in bone density.[22,23]

3. **Premenstrual Syndrome (PMS).** On occasion, GnRH analogs are recommended as an aid in the diagnosis of PMS.[24] Use of GnRH analogs results in profound cycle suppression and elimination of PMS symptoms, but these agents should not be used routinely. GnRH analogs are recommended only as a third-line treatment or for the most refractory patients.

4. **Polycystic Ovarian Syndrome (PCOS).** PCOS guidelines from the Endocrine Society (2013)[25] and review articles[26,27] do not recommend this as a treatment modality.

5. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Early Annual Revision	• Removal of Lupron Depot-Ped and Triptodur and the indication of central precocious puberty. These medications are addressed in the policy: Gonadotropin-Releasing Hormone Agonists for Central Precocious Puberty PA Policy with Preferred Step Therapy. • Updated the following indication, Prophylaxis or Treatment of Uterine Bleeding in Patients with Hematologic Malignancy or Prior to Bone Marrow/Stem Cell Transplantation to include patients undergoing cancer treatment. • Added "if prescribed by or in consultation with an oncologist" to the following diagnoses: Prostate Cancer, Ovarian Cancer, Breast Cancer, Preserve Ovarian Function/Fertility in Patients undergoing Chemotherapy, and Prophylaxis or Treatment of Uterine Bleeding in Patients with Hematologic Malignancy or Undergoing Cancer Treatment, or Prior to Bone Marrow/Stem Cell Transplantation to align with the Lupron Depot Medical Benefit Management policy.	1/30/2019
Selected Revision	• Updated endometriosis criterion: removal of continued pain criteria and removal of prescriber's specialty or consultation specialty. • Added the wording Gender Dysphoric/Gender Incongruent Persons to the diagnosis for Gender Reassignment.	4/10/2019
Annual Revision	No criteria changes.	01/15/2020
Update	09/22/2020: Revised policy name from "Gonadotropin-Releasing Hormone Agonists – Injectable Long-Acting Products (Lupron Depot and Lupaneta Pack) Prior Authorization Policy" to "Gonadotropin-Releasing Hormone Agonists – Injectable Long-Acting Products Prior Authorization Policy".	--
Annual Revision	Head and Neck Cancer – Salivary Gland Tumors: revised "Patient has recurrent disease with distant metastases" to "Patient has advanced salivary gland tumors with distant metastases".	01/20/2021
Selected Revision	Lupron Depot 3.75 mg and 11.25 mg – Uterine leiomyomata (fibroids): Approval duration is changed from 6 months to 3 months, due to revised labeling.	03/03/2021

PRIOR AUTHORIZATION POLICY

POLICY: Gonadotropin-Releasing Hormone Antagonists – Oriahnn™ (elagolix, estradiol, and norethindrone acetate capsules; elagolix capsules – AbbVie Inc.)

DATE REVIEWED: 06/03/2020

OVERVIEW

Oriahnn, an oral gonadotropin-releasing hormone (GnRH) receptor antagonist with added estrogen and progestin therapy, is indicated for the management of heavy menstrual bleeding associated with uterine leiomyomas (fibroids) in premenopausal women.[1] Oriahnn consists of two capsules: one capsule to be taken in the morning and one capsule to be taken in the evening. The morning capsule contains elagolix 300 mg, estradiol 1 mg, and norethindrone acetate 0.5 mg and the evening capsule contains elagolix 300 mg. Elagolix inhibits endogenous GnRH signaling by binding competitively to GnRH receptors in the pituitary gland. Therapy results in suppression of luteinizing hormone (LH) and follicle stimulating hormone (FSH), decreasing blood concentrations of estradiol and progesterone, and resulting in a hypogonadal state. Estradiol and norethindrone are considered as "add-back" therapy to attenuate side effects of GnRH therapy (i.e., decreased bone mineral density).

Disease Overview

Uterine fibroids (leiomyomas) are benign tumors. They are the most frequent gynecologic benign disease.[2] Fibroids can be asymptomatic or cause symptoms; symptoms generally present as abnormal (heavy) uterine bleeding or pelvic

pain/pressure. Heavy menstrual bleeding can cause associated problems, such as iron deficiency anemia. The actual prevalence of uterine fibroids is difficult to ascertain since many are asymptomatic, but it is estimated that fibroids can be detected in up to 80% of women by 50 years of age.[3]

Guidelines

Oriahnn is not addressed in guidelines for uterine fibroids. There are multiple American College of Obstetricians and Gynecologists (ACOG) guidelines related to leiomyomas (fibroids), but none specific to the management of heavy menstrual bleeding. According to the ACOG guideline, Alternatives to Hysterectomy in the Management of Leiomyomas (2008) [reaffirmed 2019], GnRH agonists have been widely used for preoperative treatment, both for myomectomy and hysterectomy.[4] Guidelines on the Management of Uterine Leiomyomas from the Society of Obstetricians and Gynecologists of Canada (SOGC) [2015] state that effective medical treatments for women with abnormal uterine bleeding associated with uterine fibroids include the levonorgestrel intrauterine system, GnRH analogues, selective progesterone receptor modulators, oral contraceptives, progestins, and danazol.[5]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Oriahnn. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Oriahnn as well as the monitoring required for adverse events and long-term efficacy, approval requires Oriahnn to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Oriahnn is recommended in those who meet the following criteria:

FDA-Approved Indications

33. Heavy Menstrual Bleeding Associated with Uterine Fibroids. Approve for 24 months if the patient meets the following criteria (A, B, C, D, E, and F):

- **A)** The patient is ≥ 18 years of age; AND
- **B)** The patient is premenopausal; AND
- **C)** Uterine fibroids have been confirmed by a pelvic ultrasound, hysteroscopy, or magnetic resonance imaging; AND
- **D)** The patient has tried at least one other therapy for the medical management of heavy menstrual bleeding; AND
  Note: Examples include: combination oral contraceptives, levonorgestrel-releasing intrauterine systems [e.g. Mirena®, Liletta®], an oral progesterone (e.g., medroxyprogesterone acetate), depo-medroxyprogesterone injection, tranexamic acid tablets.
- **E)** The patient has not previously received 24 months or longer of therapy of Oriahnn; AND
- **F)** The medication is prescribed by or in consultation with an obstetrician-gynecologist or a health care practitioner who specializes in the treatment of women's health.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Oriahnn has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

49. Heavy Menstrual Bleeding not associated with Uterine Fibroids.
Oriahnn has been shown effective in reducing heavy menstrual bleeding only in women with uterine fibroids.[1]

50. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Date Reviewed
New Policy	-	6/10/2020

PRIOR AUTHORIZATION POLICY

POLICY: Gonadotropin-Releasing Hormone Antagonists – Orilissa™ (elagolix tablets – AbbVie Inc.)

APPROVAL DATE: 4/01/2020

OVERVIEW

Orilissa is an oral gonadotropin-releasing hormone (GnRH) receptor antagonist indicated for the management of moderate to severe pain associated with endometriosis.[1] In patients with normal liver function or mild hepatic impairment, the recommended dosage is 150 mg once daily for up to 24 months or 200 mg twice daily for up to 6 months. In patients with moderate hepatic impairment (Child-Pugh Class B), the recommended dosage is 150 mg once daily for up to 6 months. The use of 200 mg twice daily dosing is not recommended in patients with moderate hepatic impairment. Orilissa is contraindicated in patients with severe hepatic impairment. Duration of therapy is limited due to the anti-estrogenic effects of the medication which include a decrease in bone mineral density (BMD).

Disease Overview

Endometriosis is a condition where the tissues similar to the lining of the uterus (or endometrium) migrate outside of the womb and are found elsewhere in the body.[2,3] The migrated tissues are generally found in the pelvic cavity (e.g., peritoneum, uterosacral ligaments, rectal-vaginal septum, or any spaces between the bladder, uterus, vagina, and rectum) and can attach to any of the female reproductive organs (e.g., ovaries, fallopian tubes). The migrated tissue is less commonly found outside the pelvic cavity or on the intestines, colon, appendix or rectum. Endometriosis affects an estimated 176 million women of reproductive age worldwide.[3] Many women are not diagnosed and therefore not treated. The most common symptom of endometriosis is pelvic pain. The pain often correlates to the menstrual cycle, but not always. Symptoms can range from minimal to severely debilitating. Many women with endometriosis also experience dyspareunia and infertility.

Guidelines

According to the American College of Obstetrician and Gynecologist (ACOG) practice bulletin on the management of endometriosis (2010, reaffirmed 2018), after an appropriate pretreatment evaluation (to exclude other causes of chronic pelvic pain) and failure of initial treatment with OCs and NSAIDs, empiric therapy with a 3-month course of a GnRH agonist is appropriate.[4]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Orilissa. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: When available, the ICD-9/ICD-10 codes for endometriosis (ICD-9: 617 through 617.9 and ICD-10: N80 through N80.9) **AND** a prior therapy in the last 180 days which includes any one of the following: contraceptives (STCs 0248, 9654, and 9495), intrauterine devices (STC 4730), oral progestins (STC 0246 RT 01), depo-medroxyprogesterone injections (STC 4139), GnRH agonists (STC 8253, STC E851, STC 8254 STR 0190 RT 27), or Orilissa will be used to allow approval of the requested medication.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Orilissa is recommended in those who meet the following criteria:

FDA-Approved Indications

44. Endometriosis. Approve for the duration noted if the patient meets one of the following (A or B):

35. Initial Therapy. Approve for 6 months if the patient has tried one of the following: a contraceptive (e.g., combination oral contraceptives, levonorgestrel-releasing intrauterine systems [e.g., Mirena®, Liletta®]), an oral progesterone (e.g., norethindrone tablets), or a depo-medroxyprogesterone injection, unless contraindicated; OR

NOTE: An exception to the requirement for a trial of the above therapies can be made if the patient had previously used a gonadotropin-releasing hormone agonist (e.g., Lupron Depot®) for endometriosis.

36. Patients Continuing Therapy. Approve for 6 months.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Orilissa has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

6. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Gout – Krystexxa® (pegloticase injection for intravenous [IV] infusion – Savient Pharmaceuticals)

DATE REVIEWED: 04/29/2020

OVERVIEW

Krystexxa is a PEGylated uric acid specific enzyme indicated for treatment of chronic gout in adult patients refractory to conventional therapy.[1-2] It is made up of a recombinant modified mammalian uricase produced by a genetically modified strain of *Escherichia coli* which is covalently bonded to monomethoxypoly (ethylene glycol) [mPEG].[1] The recommended dose of Krystexxa is 8 mg administered every 2 weeks over no less than 120 minutes as an intravenous (IV) infusion. Before beginning therapy with Krystexxa, it is recommended that all oral urate-lowering therapies (ULTs) are discontinued and not restarted while on Krystexxa because concomitant use may blunt any increase in serum uric acid (SUA) levels.

Disease Overview

Gout results from a metabolic disorder called hyperuricemia caused by an overproduction or underexcretion of uric acid. Hyperuricemia is typically defined as a serum uric acid level greater than 6.8 mg/dL; however, asymptomatic patients with elevated uric acid levels do not have gout and do not require treatment.[10-11] Excessive amounts of uric acid in the blood lead to deposits of crystals in the joints and connective tissues and may cause excruciating pain. Lumps of urate crystals (tophi) may develop in soft tissues such as the elbow, ear, or distal finger joints. Treatment-failure gout (TFG) exists in a small population of patients with severe gout.[5] These patients have failed to normalize SUAand have inadequate control of the signs and symptoms of gout with maximum medically appropriate doses of ULT (e.g., allopurinol, Uloric) or have a contraindication to ULT. TFG should be differentiated from gout in patients who are under-treated for gout or are non-compliant with gout therapy. Those with TFG generally have a high prevalence of tophi, frequent and disabling gout flares, deforming arthropathy, diminished quality of life, and disability.[2] TFG commonly co-exists with other conditions, including hypertension, cardiovascular disease (CVD), diabetes mellitus, chronic kidney disease, obesity, and hyperlipidemia. Although many patients with gout have concomitant cardiovascular (CV) co-morbidities, it is unknown if elevated SUA is a predictor or causative factor associated with CVD.[6] Of the estimated 5 million patients in the US with gout, it is believed that TFG affects approximately 50,000 patients,[2] although some reports indicate that as many as 300,000

patients may be afflicted.[5] Krystexxa achieves a therapeutic effect by catalyzing the oxidation of uric acid to allantoin.[1] Allantoin is then eliminated, mainly by renal excretion, thus lowering serum uric acid (SUA).

Guidelines

The American College of Rheumatology (ACR) guidelines (2012) for the management of gout have not been updated since the FDA required the labeling of Uloric to have a new Boxed Warning and updated indication due to increased risk of death compared with allopurinol.[7-8] Although Uloric was previously approved for use in the first-line setting of gout, it is now labeled for use only following maximal titration of allopurinol, or an intolerance or inability to use allopurinol.[8-9] ACR guidelines (developed when Uloric was indicated for hyperuricemia in patients with gout) recommend xanthine oxidase inhibitors, either allopurinol or Uloric® (febuxostat tablets), as first-line pharmacologic ULT.[3] Serum urate level should be lowered sufficiently to improve the signs and symptoms of gout and may require therapeutic serum urate level lowering to below 5 mg/dL. Probenacid is recommended as an alternative first-line pharmacologic therapy if the patient had intolerance or contraindications to at least one first-line agent but is not recommended as first-line monotherapy in patients with estimated creatinine clearance (CrCl) < 50 mL/min. In patients with refractory disease, effective therapeutic options include combination therapy with a xanthine oxidase inhibitor and a uricosuric agent (e.g., probenacid, fenofibrate, or losartan). While Krystexxa is never recommended as first-line therapy, it is appropriate in patients with severe gout disease burden and refractoriness to, or intolerance of, appropriately dosed oral ULTs.

The European League Against Rheumatism (EULAR) has recommendations for gout (2016).[4] In patients with normal renal function, allopurinol is recommended as first-line ULT. The allopurinol dose should be adapted to the patient's renal function and slowly titrated to the maximum allowed dosage. If the target SUA is not achieved, the guidelines recommend switching to a uricosuric ±-allopurinol or Uloric. In patients who do not achieve target SUA, combined therapy with a uricosuric + XOI is recommended. Krystexxa is recommended only in patients with crystal-proven severe, debilitating gout, in patients with poor quality of life, when the target SUA cannot be reached with any other available drug (including combinations) at the maximal dose.

Other Uses with Supportive Evidence

Nephrolithiasis and/or Gouty Nephropathy

Approximately 10% to 20% of patients with primary gout will develop kidney stones, with factors such as diet and genetic aspects playing a role in their development.[11] However, the most common reason for the development of uric acid nephrolithiasis has no identifiable secondary cause for the development of uric acid stones. Even though clinical gout is not present, the condition resembles primary gout in many aspects, including a persistently low urine pH, a reduced fractional excretion of uric acid, and varying degrees of hyperuricemia.

Safety

Krystexxa has Boxed Warnings due to concerns of anaphylaxis and infusion reactions.[1] Krystexxa should be administered in a healthcare setting by a healthcare professional. Patients should be pre-medicated with corticosteroids and antihistamines. Anaphylaxis may occur with any infusion, including the first infusion. Systems of anaphylaxis generally manifest within 2 hours of the infusion; delayed-type hypersensitivity reactions have also been reported. The risk of anaphylaxis and infusion reactions are higher in patients whose uric acid level increases to above 6 mg/dL, particularly when two consecutive levels above 6 mg/dL are observed. There is also a Boxed Warning concerning hemolysis and methemoglobinemia in patients with glucose-6-phosphate dehydrogenase (G6PD) deficiency.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Krystexxa. Because of the specialized skills required for evaluation and diagnosis of patients treated with Krystexxa as well as the monitoring required for adverse events (AEs) and efficacy, approval requires Krystexxa to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Krystexxa is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Gout, Chronic.** Approve for the duration noted below if the patient meets ONE of the following conditions (A or B):
   - **A)** Initial Therapy. Approve for 6 months if the patient meets ALL of the following (i, ii, and iii):
     - **i.** Krystexxa is prescribed by or in consultation with a rheumatologist or a nephrologist; AND
     - **ii.** The patient meets one of the following conditions (a or b):
       - **a)** The patient has had an inadequate response, defined as a serum uric acid level that remained > 6 mg/dL following a 3-month trial of at least ONE of the following agents: allopurinol, Uloric, or a uricosuric agent.
         Note: Examples of uricosuric agents include probenecid, fenofibrate, and losartan;OR
       - **b)** The patient has a contraindication or has had an intolerance to a trial of allopurinol, as determined by the prescribing physician; AND
     - **iii.** Patient has current symptoms of gout.
       Note: Examples of gout symptoms include gout flares, gout tophus, and gouty arthritis.
   - **B)** Patients currently receiving Krystexxa. Approve for 1 year if the patient meets ALL of the following (i, ii, and iii):
     - **i.** Krystexxa is prescribed by or in consultation with a rheumatologist or a nephrologist; AND
     - **ii.** The patient is continuing therapy with Krystexxa to maintain response/remission; AND
     - **iii.** Patient has responded to therapy with evidence of serum uric acid level < 6 mg/dL with continued Krystexxa treatments.

Other Uses with Supportive Evidence

2. **Nephrolithiasis and/or Gouty Nephropathy.** Approve for the duration noted below if the patient meets ONE of the following conditions (A or B):
   - **A)** Initial Therapy. Approve for 6 months if the patient meets BOTH of the following conditions (i and ii):
     - **i.** Krystexxa is prescribed by or in consultation with a rheumatologist or a nephrologist; AND
     - **ii.** Patient meets one of the following conditions (i or ii):
       - **a)** Patient has had an inadequate response, defined as a serum uric acid level that remained > 6 mg/dL following a 3-month trial of allopurinol or Uloric; OR
       - **b)** Patient has a contraindication or has had an intolerance to a trial of allopurinol, as determined by the prescribing physician.
   - **B)** Patients Currently Receiving Krystexxa. Approve for 1 year if the patient meets ALL of the following (i, ii, and iii):
     - **i.** Krystexxa is prescribed by or in consultation with a rheumatologist or a nephrologist; AND
     - **ii.** The patient is continuing therapy with Krystexxa to maintain response/remission; AND
     - **iii.** Patient has responded to therapy with evidence of serum uric acid level < 6 mg/dL with continued Krystexxa treatments.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Krystexxa has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

7. **Known Glucose-6-Phosphate Dehydrogenase (G6PD) Deficiency.** Because of risks of hemolysis and methemoglobinemia, Krystexxa is contraindicated in G6PD deficiency.[1] Patients at increased risk of this deficiency (e.g., those of African or Mediterranean ancestry) should be screened prior to initiation of therapy.

8. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Date Reviewed
Annual revision	No criteria changes.	10/11/2018
Early annual revision	Early revision to align with review date for new MBM Policy. **Gout, Chronic:** Due to the updated indication and Boxed Warning for Uloric, criteria were changed to require one of the listed therapies (previously required two therapies). The exception for patients who have a contraindication or intolerance to both allopurinol and Uloric was changed to only apply to allopurinol. Additionally, reference to Zurampic and Duzallo were removed from the policy (no longer available). **Nephrolithiasis and/or Gouty Nephropathy:** The exception for patients who have a contraindication or intolerance to both allopurinol and Uloric was changed to only apply to allopurinol.	04/24/2019
Annual revision	**Gout, Chronic:** Clarify in criteria that an inadequate response to previous therapy is defined by serum uric acid (SUA) level that remains > 6 mg/dL (previously SUA level was listed as an i.e. in the criteria). Examples uricosuric agents were moved to a Note in the criteria section (previously listed within the criteria). Examples of gout symptoms were moved to a note (previously included within the criteria). For patients continuing therapy, remove criterion that generally require that the patient has previously responded to Krystexxa (not needed because criteria also require a specific response, defined as evidence of serum uric acid level < 6 mg/dL with Krystexxa). **Nephrolithiasis and/or Gouty Nephropathy:** Clarify in criteria that an inadequate response to previous therapy is defined by serum uric acid (SUA) level that remains > 6 mg/dL (previously SUA level was listed as an i.e. in the criteria). For patients continuing therapy, remove criterion that generally require that the patient has previously responded to Krystexxa (not needed because criteria also require a specific response, defined as evidence of serum uric acid level < 6 mg/dL with Krystexxa).	04/29/2020

PRIOR AUTHORIZATION POLICY

POLICY: Growth Disorders – Growth Hormone [somatropin] Prior Authorization Policy

- Genotropin®(somatropin injection – Pfizer)
- Humatrope® (somatropin injection – Eli Lilly)
- Norditropin® (somatropin injection – Novo Nordisk)
- Nutropin AQ® (somatropin injection – Genentech)
- Omnitrope® (somatropin injection – Sandoz)
- Saizen® (somatropin injection – EMD Serono)
- Serostim® (somatropin injection – EMD Serono)
- Zomacton™ (somatropin injection – Ferring Pharmaceuticals)
- Zorbtive® (somatropin injection – EMD Serono)

REVIEW DATE: 02/10/2021

OVERVIEW

Indications for somatropin vary among these products. Somatropin is indicated for the following conditions:

- **Growth failure, treatment of pediatric patients**, due to an inadequate secretion of endogenous growth hormone.[1-7]
- **Non-growth hormone deficient short stature (idiopathic short stature)**, treatment, defined by height standard deviation score (SDS) ≤ -2.25 (1.2 percentile), and associated with growth rates unlikely to permit attainment of adult height in the normal range.[1-4,6,7]
- **Adults with growth hormone deficiency (GHD)** for replacement of endogenous growth hormone.[1-7]

- **Children with chronic kidney disease (CKD)**, treatment of growth failure, up to the time of kidney transplantation.[4]
- **Noonan syndrome**, treatment of patients with short stature.[3]
- **Prader Willi syndrome**, treatment of patients with growth failure or short stature.[1,3,7]
- **Short stature homeobox-containing gene (SHOX) deficiency**, treatment of short stature or growth failure in children.[2,6]
- **Small for gestational age (SGA)**, treatment of growth failure or short stature in patients with no catch-up growth by age 2[1,7] to 4 years[2,3,6].
- **Turner syndrome**, treatment of short stature.[1-4,6,7]
- **Short bowel syndrome (SBS)**, treatment, in adult patients receiving specialized nutritional support.[8]
- **Human immunodefiency virus (HIV) infected patients with wasting or cachexia**, treatment, to increase lean body mass (LBM) and body weight, and improve physical endurance.[9]

Growth Hormone Deficiency in Children and Adolescents

Somatropin is indicated for the treatment of growth failure in children due to an inadequate secretion of endogenous growth hormone.[1-7] In these children with GHD, somatropin is effective for increasing final adult height.[31] Somatropin therapy is recommended to normalize adult height and avoid extreme shortness in children and adolescents with GHD.[31] Cranial radiation often causes hypopituitarism, and GHD is a frequent pituitary abnormality seen in children and adults who have undergone cranial radiation.[17] Children who have undergone total body irradiation in preparation for hematopoietic stem cell transplant commonly have GHD and an impaired growth rate; these patients can be treated successfully with growth hormone.[-] Somatropin therapy improves the final height of young children after total body irradiation.[11]

Congenital Hypopituitarism

Somatropin is used in infants and young children with congenital hypopituitarism, that manifests in infancy with hypoglycemia, microgenitalia, hyperbilirubinemia, and multiple anterior pituitary hormone deficiencies.[31] The Pediatric Endocrine Society guidelines suggest that GHD due to congenital hypopituitarism be diagnosed without formal growth hormone provocative testing in a newborn with hypoglycemia who does not attain a serum growth hormone concentration > 5 mcg/L (> 5 ng/mL) and has deficiency of at least one additional pituitary hormone and/or the classical imaging triad (ectopic posterior pituitary and pituitary hypoplasia with abnormal stalk).[31]

Non-Growth Hormone Deficient Short Stature (Idiopathic Short Stature) in Children or Adolescents

Somatropin is indicated for the long-term treatment of idiopathic short stature (non-growth hormone deficient short stature) which is defined by a height SDS > 2.25 (1.2 percentile) and associated with growth rates that are unlikely to permit attainment of adult height in the normal range.[1-4,6,7] The predicted adult heights of these children was < 160 cm (63 inches) for men and < 150 cm (59 inches) in women.[31] The Pediatric Endocrine Society guidelines[31] recommend that the decision to treat idiopathic short stature with somatropin be made on a case-by-case basis after assessing physical and psychological burdens, and discussion of risks and benefits. They recommend against the routine use of somatropin in every child with height SDS ≤ -2.25. In one consensus statement on children with idiopathic short stature from the Growth Hormone Research Society, the Lawson Wilkins Pediatric Endocrine Society, and the European Society for Paediatric Endocrinology Workshop, it was felt that the optimal age for initiating treatment is 5 years to early puberty.[12]

The initial 6-month trial of somatropin is to establish that the child's condition responds to somatropin therapy. Authorization for continued therapy should be based on an adequate clinical response[14] defined as an annualized growth rate that doubles in comparison to the previous year. Children who show a striking

increase in growth velocity during the first 6 to 12 months of somatropin therapy are most likely to benefit from long-term therapy, and therapy should be discontinued if there is no significant increase in growth rate during the first year. Children who have a significant increase in growth rate after the first 6-month trial and the next 12 months should then be reviewed annually for growth rate, closure of the epiphyses, and/or attainment of mid-parental height.

Growth Hormone Deficiency in Adults or Transition Adolescents

Somatropin is indicated for the replacement of endogenous growth hormone in adults with GHD, which may present in adults or children as GHD (isolated GHD) or in addition to other pituitary hormone deficiencies (gonadotropin, adrenocorticotropic hormone [ACTH], and/or thyroid-stimulating hormone [TSH] deficiencies).[15] Patients with other anterior pituitary hormone deficiencies are likely to have GHD. In adults, the diagnosis of GHD usually is made in patients with signs and symptoms of hypothalamic-pituitary disease (endocrine, structural, and/or genetic causes); those who have received cranial irradiation or tumor treatment; or those with traumatic brain injury or subarachnoid hemorrhage.[15,16] Onset may be in adulthood or childhood. In childhood, the goal of somatropin therapy is primarily for statural growth. When final adult height is attained, somatropin therapy is no longer required for statural growth. Transition is used to describe the period in adolescence after growth is completed and the need for continued replacement into adulthood is assessed. Ongoing GHD is most likely in patients with multiple pituitary hormone deficits, with or without structural pituitary or peripituitary disease, and/or a history of cranial radiation therapy. Confirmatory growth hormone stimulation testing may not be required in patients, such as with congenital/genetic GHD or multiple pituitary hormone deficiencies. When persistent GHD is documented after completion of adult height, somatropin therapy should be continued to attain full skeletal and muscle maturation during the transition period from childhood to adulthood.[15] In adults with GHD, somatropin replacement therapy improves abnormalities in substrate metabolism, body composition, and physical and psychosocial function.[15,16]

Growth hormone is not approved by the FDA for the treatment of other conditions in adults who may have a low growth hormone response to growth hormone provocative testing (such as obesity, aging, or depression) or to improve athletic performance.[17,18]

Growth Hormone Stimulation Tests (Adults or Transition Adolescents)

The insulin tolerance test is the gold standard growth hormone stimulation test,[53] but is contraindicated in patients with ischemic heart disease or seizure disorders or in elderly or pregnant patients.[15,16,27] The glucagon stimulation test and the macimorelin test could be considered as alternatives test.[53] The response to all growth hormone stimulation tests show intra-individual variability, and the growth hormone cutoff points vary with the test used. Otherwise healthy obese persons have blunted growth hormone responses to various tests.[30] There is no information on the effects of increased body mass index (BMI) or central adiposity on the insulin tolerance test. When Geref was available [discontinued in the US in 2008], Geref (GHRH) plus arginine was considered the best alternative to the insulin tolerance test in adults.

Macrilen (macimorelin) is the most recently approved test for the diagnosis of adult GHD. Patients in the pivotal trial were 18 to 66 years of age and the BMI ranged from 16 to 40 kg/m^2.[29] Safety and diagnostic performance has not been established in patients with BMI > 40 kg/m^2. Clinical studies established that a maximally stimulated serum growth hormone level of < 2.8 ng/mL (i.e., at the 30, 45, 60, and 90 minute timespoints) after Macrilen administration confirms the presence of adult GHD. Warnings and precautions for Macrilen include QT prolongation, potential for false positive test results with use of strong cytochrome P450 (CYP)3A4 inducers (discontinue and washout strong CYP3A4 inducers before testing), and potential for false negative test results in recent onset hypothalamic disease.

Arginine and levodopa testing have not been systematically evaluated and validated, and because they have a low sensitivity and specificity in adults and transition patients, it is not recommended to utilize these tests

in this population.[53] Additionally, the clonidine, levodopa, and arginine alone tests are generally not recommended because very low growth hormone cutoff points are required to achieve adequate specificity.[27]

Adults with childhood onset GHD may have alterations in body composition, bone mineral density, and lipid metabolism that are alleviated by treatment with somatropin.[15,31] However, some children with a diagnosis of GHD have a normal somatotropic axis when retested in late adolescence.[31,52] Re-evaluation of the somatotropic axis in children diagnosed with GHD is required during the transition period. The transition period is the time from late puberty to establishment of adult muscle and bone composition, and encompasses attainment of adult height.[31] Re-evaluation of the somatotropic axis is most conveniently done when growth has slowed to the point where pediatric somatropin dosing will be discontinued (i.e., the growth velocity is < 2 to 2.5 cm/year. Recommendations for transitional care after childhood somatropin treatment from the Pediatric Endocrine Society guidelines[31] are as follows. Patients with multiple (≥ 3) pituitary hormone deficiencies regardless of etiology, or GHD with a documented causal genetic mutation or specific pituitary/hypothalamic structural defect (except ectopic posterior pituitary) be diagnosed with persistent GHD. These guidelines recommend re-evaluation of the somatotropic axis for persistent GHD in persons with 1) GHD and deficiency of only one additional pituitary hormone, 2) idiopathic isolated GHD, 3) idiopathic isolated GHD with or without a small pituitary/ectopic posterior pituitary, and 4) in patients after irradiation. Testing can be done after a trial of at least 1 month off somatropin treatment. The guidelines also recommend growth hormone provocative testing to evaluate the function of the somatotropic axis in the transition period if indicated by a low IGF-1 level. Persons with idiopathic isolated GHD will very likely test sufficient with GH provocative testing. To continue growth hormone therapy in adulthood, retesting for GHD with GH-stimulation test/s is recommended in most transition patients and at least 1 month after discontinuation of pediatric growth hormone therapy.[53] Retesting is not required in transition patients with evidence of panhypopituitarism (≥ 3 pituitary hormone deficiencies) and low serum IGF-1 levels, patients with genetic defects, and patients with hypothalamic-pituitary structural brain defects.

Adult GHD can be predicted with > 90% accuracy by the presence of three or four pituitary hormone deficiencies in addition to serum IGF-1 concentration that is less than the 2.5th percentile or < -2 SDS.[15,16] This is in the absence of conditions that lower IGF-1. Patients with ≥ 3 pituitary hormone deficiencies and an IGF-1 level below the reference range do not need a growth hormone stimulation test.[16] Because of the nature of the cause of GHD in children with structural lesions with multiple hormone deficiencies and those with proven genetic causes, provocative testing in these adults is not necessary.

Chronic Kidney Disease in Children or Adolescents

Somatropin is indicated for the treatment of growth failure in children with CKD up to the time of kidney transplantation and is effective for increasing the rate of growth.[4] Somatropin therapy has increased final adult height in these patients.[19] An adequate growth response can be assumed if height velocity during the first year of growth hormone treatment is greater than 2 cm per year over basline.[20] This increase is supported by outcomes of controlled-trials specific to patients with chronic kidney disease. In a clinical practice guidelines, for children with CKD, patients who have had a kidney transplant and have persistent growth failure, growth hormone therapy is recommended to be initiated 1 year after transplantation if spontaneous catch-up growth does not occur and steroid-free immunosuppression is not a feasible option.[20]

Noonan Syndrome and Short Stature in Children or Adolescents

Somatropin is indicated for the treatment of children with short stature associated with Noonan syndrome.[3,21] Not all patients with Noonan syndrome have short stature; some will achieve a normal adult height without treatment. The younger the age at start of therapy, the larger the change in height SDS.

Prader-Willi Syndrome

Somatropin is indicated for the treatment of *pediatric* patients who have growth failure due to Prader-Willi syndrome.[1,3,7] Somatropin therapy in children increases linear growth velocity, improves body composition (i.e., decreases the percentage body fat, increases or stabilizes LBM), increases bone mineral density, improves physical strength and agility, and improves final adult height.[22] After final height is attained, there may be potential benefits of somatropin on body composition, peak bone mass, cognition, and quality of life in adults.[22] Somatropin is contraindicated in patients with Prader-Willi syndrome who are severely obese or have severe respiratory impairment.[1,3,7]

Short Stature Homeobox-Containing Gene (SHOX) Deficiency in Children or Adolescents
Somatropin is indicated for the treatment of short stature or growth failure in children with SHOX deficiency.[2,6] SHOX deficiency may result from either deletion of one copy of the SHOX gene or from mutation within or outside one copy of the SHOX gene that impairs the production or function of the SHOX protein. Women with Turner syndrome have only a single copy of the SHOX gene because they lack all or part of their second X chromosome.[23] SHOX deficiency is also the primary cause of short stature in most patients with Léri-Weill dyschondrosteosis (syndrome), and SHOX mutations and deletions are found in patients with idiopathic short stature. In one study consisting of a 2-year control period and a subsequent extension period to final height, short prepubertal patients with SHOX deficiency received somatropin.[24]

Children Born Small for Gestational Age

Somatropin is indicated for the treatment of growth failure in children born SGA who fail to exhibit catch-up growth by age 2[1,7] to 4 years.[2,3,6] SGA is defined as a birth weight and/or birth length that is greater than 2 SD (about the 3rd percentile) below mean normal values after adjusting for gestational age and sex. The terms SGA and intrauterine growth restriction (retardation) [IUGR] are used interchangeably in this document. In clinical trials, patients born SGA (including children with Silver-Russell syndrome) without catch-up growth who were 2 to 11 years of age had significant increases in growth when treated with somatropin before puberty.[1,3] Optimal duration of therapy once catch-up growth has been attained is not known.

Almost all patients with Silver-Russell syndrome are born SGA, and postnatal catch-up growth does not occur in the majority of children.[44] An expert consensus statement recommends that patients with Silver-Russell syndrome receive treatment with somatropin as soon as possible.[44] Starting therapy at age 2 to 4 years is adequate for the majority of patients. In some cases, somatropin therapy is started in patients less than 2 years of age who have severe fasting hypoglycemia, severe malnutrition, or severe muscular hypotonia. These experts recommend that somatropin therapy be stopped when height velocity is < 2 cm per year over a 6-month period and when bone age is > 14 years in females or > 17 years in males.

Turner Syndrome
Somatropin is indicated for the treatment of short stature associated with Turner syndrome.[1-4,6,7,25,63]

Short Bowel Syndrome
Somatropin is indicated for the treatment of SBS in adults receiving specialized nutritional support.[11]

Human Immunodeficiency Virus-Associated Wasting or Cachexia
Somatropin is indicated for the treatment of HIV-infected adults with wasting (loss of lean body mass [LBM]) or cachexia to increase LBM and body weight, and improve physical endurance.[9] Somatropin therapy increases LBM, decreases fat mass, and increases physical function in patients with HIV-associated wasting. Studies directly comparing somatropin with other therapies (megestrol, oxandrolone, testosterone, and progressive resistance training) for wasting or cachexia in HIV-infection are lacking.[26]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of somatropin. All reviews will be directed to a clinician (i.e., pharmacist) for verification of criteria. All approvals are provided for 1 year in duration unless otherwise noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with somatropin as well as the monitoring required for adverse events and long-term efficacy, initial approval requires somatropin to be prescribed by or in consultation with a physician who specializes in the condition being treated. Human growth hormone is FDA-approved for treatment of a limited number of conditions. The FDA has not approved the use of human growth hormone as therapy for anti-aging, longevity, cosmetic or performance enhancement. Federal law prohibits the dispensing of human growth hormone for non-approved purposes. A pharmacy's failure to comply with that law could result in significant criminal penalties to the pharmacy and its employees. Accordingly, a pharmacy may decline to dispense prescriptions for human growth hormone when written by physicians or other authorized prescribers who they believe may be involved in or affiliated with the fields of anti-aging, longevity, rejuvenation, cosmetic, performance enhancement or sports medicine.

Documentation: Documentation is required for use of somatropinas noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes, prescription claims records, prescription receipts, and/or other information. For patient cases in which documentation is required, if this documentation has been previously received upon a prior coverage review, the documentation requirement is considered to be met.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

I. Coverage of Genotropin, Humatrope, Norditropin, Nutropin AQ, Omnitrope, Saizen, and Zomacton (all listed products except Serostim and Zorbtive) is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Growth Hormone Deficiency (GHD) in Children or Adolescents.** Approve for *initial* for 1 year therapy in patients who meet the following criteria (A, B, C, D, or E):
   - **A)** Patient meets the following (i or ii and iii):
     - **i.** Patient has had two growth hormone (GH) stimulation tests performed with any of the following agents: levodopa, insulin-induced hypoglycemia, arginine, clonidine, or glucagon AND both tests show an inadequate response as defined by a peak GH response which is below the normal reference range as determined by the testing laboratory; OR
     - **ii.** Patient meets both of the following criteria (a and b):
       - **a)** Patient has had at least one growth hormone stimulation test performed with any of the following agents: levodopa, insulin-induced hypoglycemia, arginine, clonidine, or glucagon AND the test shows an inadequate response as defined by a peak GH response which is below the normal reference range as determined by the testing laboratory; AND
       - **b)** Patient has at least one risk factor for growth hormone deficiency (for example, the height for age curve has deviated downward across two major height percentiles [e.g., from above the 25th percentile to below the 10th percentile]; the child's growth rate is less than the expected normal growth rate based on age and gender; low IGF-1 and/or IGFBP-3 levels; the child has a very low peak growth hormone level on provocative testing as defined by the prescribing physician; the child's growth velocity is less than the 10th percentile for age and gender [height velocity percentile is NOT the same as height-for-age percentile]; the

patient is status post craniopharyngioma resection; the patient has optic nerve hypoplasia; the patient has a growth hormone gene deletion); AND

Note: Some children will achieve stimulated growth hormone concentrations in the normal range as determined by the testing laboratory and could be reviewed for authorization under non-GHD short stature (idiopathic short stature).

iii. Patient has been evaluated by an endocrinologist.

B) Patient has *undergone brain radiation or tumor resection* AND meets the following criteria (i and ii):
- **i.** Patient meets at least ONE of the following criteria (a or b):
  - **a)** Patient has had one growth hormone stimulation test with any of the following agents: levodopa, insulin-induced hypoglycemia, arginine, clonidine, or glucagon AND the test shows an inadequate response as defined by a peak GH response which is below the normal reference range as determined by the testing laboratory; OR
  - **b)** Patient has a deficiency in at least one other pituitary hormone (that is, adrenocorticotropic hormone [ACTH], thyroid-stimulating hormone [TSH], gonadotropin deficiency [luteinizing hormone {LH} and/or follicle stimulating hormone {FSH} deficiency are counted as one deficiency], or prolactin); AND
- **ii.** Patient has been evaluated by an endocrinologist.

C) Patient has *congenital hypopituitarism* AND meets the following criteria (i and ii):
- **i.** Patient meets at least ONE of the following criteria (a or b):
  - **a)** Patient has had one growth hormone stimulation test with any of the following agents: levodopa, insulin-induced hypoglycemia, arginine, clonidine, or glucagon AND the test shows an inadequate response as defined by a peak GH response which is below the normal reference range as determined by the testing laboratory; OR
  - **b)** Patient has a deficiency in at least one other pituitary hormone (that is, adrenocorticotropic hormone [ACTH], thyroid-stimulating hormone [TSH], gonadotropin deficiency [luteinizing hormone {LH} and/or follicle stimulating hormone {FSH} deficiency are counted as one deficiency], or prolactin) and/or the patient has the imaging triad of ectopic posterior pituitary and pituitary hypoplasia with abnormal pituitary stalk; AND
- **ii.** Patient has been evaluated by an endocrinologist.

D) Patient has *panhypopituitarism* and meets the following criteria (i and ii):
Note: GHD may occur in combination with other pituitary hormone deficiencies and is referred to as hypopituitarism, panhypopituitarism, or multiple pituitary hormone deficiency.

- **i.** Patient meets at least ONE of the following criteria (a, b, or c):
  - **a)** Patient has pituitary stalk agenesis, empty sella, sellar or supra-sellar mass lesion, or ectopic posterior pituitary "bright spot" on magnetic resonance image or computed tomography; OR
  - **b)** Patient has three or more of the following pituitary hormone deficiencies: somatropin (growth hormone), adrenocorticotropic hormone (ACTH), thyroid-stimulating hormone (TSH), gonadotropin deficiency (luteinizing hormone [LH] and/or follicle stimulating hormone [FSH] deficiency are counted as one deficiency), and prolactin; OR
  - **c)** Patient has had one growth hormone stimulation test with any of the following agents: levodopa, insulin-induced hypoglycemia, arginine, clonidine, or glucagon AND the test

shows an inadequate response as defined by a peak GH response which is below the normal reference range as determined by the testing laboratory; AND

ii. Patient has been evaluated by an endocrinologist.

E) Patient has had a hypophysectomy (surgical removal of pituitary gland).

Children or Adolescents with Growth Hormone Deficiency (GDH) Continuing Somatropin Therapy (i.e., established on somatropin for ≥ 10 months). Approve for 1 year in patients who meet ONE of the following (A, B, or C):

A) *Patients < 12 years of age.* The height has increased by ≥ 2 cm/year in the most recent year.

B) *Adolescents between ≥ 12 years and ≤ 18 years of age.* Patient meets the following criteria (i and ii):

i. Height has increased by ≥ 2 cm/year in the most recent year; AND

ii. The epiphyses are open.

C) *Adolescents or young adults > 18 years of age.* Patient meets the following criteria (i, ii, and iii):

i. Height has increased by ≥ 2 cm/year in the most recent year; AND

ii. The epiphyses are open; AND

iii. Mid-parental height has *not* been attained.

Note: Mid-parental height is the father's height plus the mother's height divided by 2, plus 2.5 inches if male or minus 2.5 inches if female.

Note: Adolescents and young adults with childhood onset GHD who have previously responded to somatropin with increases in height velocity and who have completed linear growth may continue receiving somatropin therapy as a transition adolescent or as an adult. See criteria I.3. (GHD in adults or transition adolescents).

2. Non-Growth Hormone Deficient Short Stature (Idiopathic Short Stature) in Children or Adolescents. Approve 6 months of *initial* therapy if the patient meets the following criteria (A, B, C, D, E, and F).

A) The child is ≥ 5 years of age; AND

B) Patient's baseline height is less than 1.2 percentile or a standard deviation score (SDS) < -2.25 for age and gender; AND

C) Patient's growth (height) velocity is ONE of the following (i or ii):

i. The child is ≥ 5 years of age AND has a growth rate < 4 cm/year; OR

ii. The growth (height) velocity is less than the 10th percentile for age and gender based on at least 6 months of growth data; AND

Note: Height velocity percentile is NOT the same as height for age percentile.

D) Without growth hormone therapy, the patient's predicted adult height is < 160 cm (63 inches) in males or < 150 cm (59 inches) in females; AND

E) The epiphyses are open; AND

F) Patient does not have constitutional delay of growth and puberty (CDGP).

Children or Adolescents with Non-Growth Hormone Deficient Short Stature (Idiopathic Short Stature) Continuing Somatropin Therapy. Approve 1 year of continuation therapy if the patient meets ONE of the following criteria (A, B, C, or D):

A) *Patients ≥ 5 years of age who received somatropin on an initial 6-month trial basis.* The annualized growth rate has doubled in comparison to the previous year. Note: For example, if the growth velocity was 3 cm/year for the year prior to treatment, then the growth velocity must be at least 3 cm in 6 months (baseline velocity was 1.5 cm/6 months) or for example, the growth velocity was

2 cm/year for the year prior to treatment, then after 6 months of somatropin therapy, the growth velocity must be at least 2 cm in 6 months (1 cm/6 months baseline); OR

B) *Patients ≥ 5 years and < 12 years of age* (i.e., established on somatropin for ≥ 10 months). The height has increased by ≥ 2 cm/year in the most recent year; OR

C) *Patients ≥ 12 years of age and ≤ 18 years of age* (i.e., established on somatropin for ≥ 10 months). Patient meets the following criteria (i and ii):

- **i.** Height has increased by ≥ 2 cm/year in the most recent year; AND
- **ii.** The epiphyses are open.

D) *Adolescents and young adults > 18 years of age* (i.e., established on somatropin for ≥ 10 months). Patient meets the following criteria (i, ii, and iii):

- **i.** Height has increased by ≥ 2 cm/year in the most recent year; AND
- **ii.** The epiphyses are open; AND
- **iii.** Mid-parental height has *not* been attained.

  Note: Mid-parental height is the father's height plus the mother's height divided by 2, plus 2.5 inches if male or minus 2.5 inches if female.

3. Growth Hormone Deficiency in Adults or Transition Adolescents. Approve for 1 year in patients who meet the following criteria (A, B, C, and D):

A) The endocrinologist must certify that somatropin is not being prescribed for anti-aging therapy or to enhance athletic ability or for body building; AND

B) Patient must have a diagnosis of GHD that is one of the following (i or ii): [documentation required for all elements]

- **i.** Childhood onset; OR
- **ii.** Adult onset that results from one of the following: growth hormone deficiency (GHD) alone or multiple hormone deficiencies (hypopituitarism) resulting from pituitary disease, hypothalamic disease, pituitary surgery, cranial radiation therapy, tumor treatment, traumatic brain injury, or subarachnoid hemorrhage; AND

C) Patient meets one of the following criteria (i, ii, or iii):

- **i.** Patient (adult or transition adolescent) has known mutations, embryopathic lesions, congenital or genetic defects, or structural hypothalamic-pituitary defects; [documentation required] OR
- **ii.** Patient meets the following criteria (a, b, and c):
  - **a)** Patient (adult onset or transition adolescent) has three or more of the following pituitary hormone deficiencies: Adrenocorticotropic hormone (ACTH), thyroid-stimulation hormone (TSH), gonadotropin deficiency (luteinizing hormone [LH] and/or follicle stimulating hormone (FSH) deficiency are counted as one deficiency), and prolactin [documentation required]; AND
  - **b)** The age and gender adjusted serum insulin-like growth factor-1 (IGF-1) must be below the lower limits of the normal reference range for the reporting laboratory [documentation required]; AND
  - **c)** Other causes of low serum insulin-like growth factor-1 (IGF-1) have been excluded (e.g., malnutrition, prolonged fasting, poorly controlled diabetes mellitus, hypothyroidism, hepatic insufficiency, oral estrogen therapy).

  OR
- **iii.** Patient has had a negative response to one of the following standard growth hormone stimulation tests with the response given for each test and depending on whether an adult or transition adolescent [documentation required];

  Adults: Patient meets ONE of the following criteria (a, b, c, d, e, or f): [documentation required for all elements]

Note: If the patient has had a previous trial of an arginine alone test with a peak response of ≤ 0.4 mcg/L, this would meet the criteria for a negative response to a growth hormone stimulation test.

a) Insulin tolerance test (obtaining at least 3 growth hormone levels in at least a 60 minute timeframe [not including a level at timeframe zero], with adequate hypoglycemia being achieved) with peak response ≤ 5.0 mcg/L; OR

b) Glucagon stimulation test (obtaining at least 3 growth hormone levels in at least 180 minute timeframe [not including a level at timeframe zero]) with peak response ≤ 3.0 mcg/L AND the patient's body mass index (BMI) is < 25 kg/m^2; OR

c) Glucagon stimulation test (obtaining at least 3 growth hormone levels in at least 180 minute timeframe [not including a level at timeframe zero]) with a peak response ≤ 3.0 mcg/L AND the patient's body mass index (BMI) is ≥ 25 kg/m^2 and ≤ 30 kg/m^2 with, according to the prescriber, a high pretest probability of GH deficiency; OR

d) Glucagon stimulation test (obtaining at least 3 growth hormone levels in at least 180 minute timeframe [not including a level at timeframe zero]) with a peak response ≤ 1.0 mcg/L AND the patient's body mass index (BMI) is ≥ 25 kg/m^2 and ≤ 30 kg/m^2 with, according to the prescriber, a low pretest probability of GH deficiency; OR

e) Glucagon stimulation test (obtaining at least 3 growth hormone levels in at least 180 minute timeframe [not including a level at timeframe zero]) with peak response ≤ 1.0 mcg/L AND the patient's body mass index (BMI) is > 30 kg/m^2; OR

f) Macrilen™ (macimorelin for oral solution) test (obtaining at least 4 growth hormone levels in at least a 90 minute timeframe [not including a level at timeframe zero]) with peak responses < 2.8 ng/mL (2.8 mcg/L) AND the patient's body mass index (BMI) is ≤ 40 kg/m^2.

Note: The following formula can be used to calculate BMI: BMI equals body weight in kg divided by height meters squared (m^2) [i.e., BMI = kg/m^2].

OR

***Transition Adolescents*:** (The transition period is the time from late puberty to establishment of adult muscle and bone composition, and encompasses attainment of adult height.) The patient meets the following criteria (a and b): [documentation required for all elements]

Note: If the patient has had a trial of a Macrilen test with a peak response of < 2.8 ng/mL (mcg/L), this would meet the criteria for a negative response to a growth hormone stimulation test.

a) Patient has been off somatropin therapy for at least 1 month before retesting with a growth hormone stimulation test; AND

b) Patient meets ONE of the following responses to growth hormone stimulation testing (1, 2, 3, 4, 5 or 6):

(1) Insulin tolerance test (obtaining at least 3 growth hormone levels in at least a 60 minute timeframe [not including a level at timeframe zero], with adequate hypoglycemia being achieved) with peak response ≤ 5.0 mcg/L; OR

(2) Glucagon stimulation test (obtaining at least 3 growth hormone levels in at least 180 minute timeframe [not including a level at timeframe zero]) with peak response ≤ 3.0 mcg/L AND the patient's body mass index (BMI) is < 25 kg/m^2; OR

(3) Glucagon stimulation test (obtaining at least 3 growth hormone levels in at least 180 minute timeframe [not including a level at timeframe zero]) with a peak response of ≤ 3.0 mcg/L AND the patient's body mass index (BMI) is ≥ 25 kg/m^2 and ≤ 30 kg/m^2 with, according to the prescriber, a high pretest probability of GH deficiency; OR

(4) Glucagon stimulation test (obtaining at least 3 growth hormone levels in at least 180 minute timeframe [not including a level at timeframe zero]) with a peak

response ≤ 1.0 mcg/L AND the patient's body mass index (BMI) is ≥ 25 kg/m^2 and ≤ 30 kg/m^2 with, according to the prescriber, a low pretest probability of GH deficiency; OR

(5) Glucagon stimulation test (obtaining at least 3 growth hormone levels in at least 180 minute timeframe [not including a level at timeframe zero]) with peak response ≤ 1.0 mcg/L AND the patient's body mass index (BMI) is > 30 kg/m^2; OR

(6) If both the insulin tolerance test AND glucagon stimulation test are contraindicated, the arginine alone test can be used (obtaining at least 3 growth hormone levels in at least 120 minute timeframe [not including a level at timeframe zero]) with a peak response ≤ 0.4 mcg/L;AND

D) Patient has been evaluated by an endocrinologist.

4. Chronic Kidney Disease in Children or Adolescents. Approve for *initial* therapy for 1 year for growth failure in children with CKD who meet the following criteria (A and B):

A) Patient has or had chronic kidney disease (CKD) as defined by an abnormal creatinine clearance; AND

B) Patient has been evaluated by an endocrinologist or a nephrologist.

Chronic Kidney Disease in Children or Adolescents Continuing Somatropin Therapy (i.e., established on somatropin for ≥ 10 months)**.** Approve for 1 year in patients who meet the following criteria (A and B):

A) Height has increased by ≥ 2 cm/year in the most recent year; AND

B) The epiphyses are open.

5. Noonan Syndrome in Children or Adolescents. Approve for *initial* therapy for 1 year in patients who meet the following criteria (A and B):

A) Patient's baseline height is less than the 5th percentile using a growth chart for children without Noonan syndrome; AND

B) Patient has been evaluated by an endocrinologist.

Noonan Syndrome in Children or Adolescents Continuing Somatropin Therapy (i.e., established on somatropin for ≥ 10 months). Approve for 1 year in patients who meet the following criteria (A and B):

A) Height has increased by ≥ 2 cm/year in the most recent year; AND

B) The epiphyses are open.

6. Prader-Willi Syndrome. Approve for *initial* therapy for 1 year in patients (children or adults) who have been evaluated by an endocrinologist.

Prader-Willi Syndrome in Patients Continuing Somatropin Therapy (i.e., established on somatropin for ≥ 10 months). Approve for 1 year in patients who meet ONE of the following criteria (A or B):

A) *Children and adolescents.* The patient meets the following criteria (i and ii):

i. Height has increased by ≥ 2 cm/year in the most recent year; AND

ii. The epiphyses are open.

Note: When the epiphyses are closed and/or the height velocity is < 2 cm/year, the patient can be reviewed for continuation of therapy as an adult with Prader-Willi syndrome.

B) *Adults or adolescents whose epiphyses are closed and/or whose height velocity is < 2 cm/year* The patient meets the following criteria (i and ii):

i. This physician must certify that somatropin is not being used for anti-aging therapy or to enhance athletic performance/body building; AND

ii. Patient must be evaluated by an endocrinologist or in consultation with an endocrinologist.

7. **Short Stature Homeobox-Containing Gene Deficiency in Children or Adolescents.** Approve for *initial* therapy for 1 year in patients who meet the following criteria (A, B, C, and D):
   A) Patient has short stature homeobox-containing gene (SHOX) deficiency demonstrated by chromosome analysis; AND
   B) Epiphyses are open; AND
   C) Patient's baseline height is less than the 3rd percentile for age and gender; AND
   D) Patient has been evaluated by an endocrinologist.

   Short Stature Homeobox-Containing Gene Deficiency in Children or Adolescents Continuing Somatropin Therapy (i.e., established on somatropin for ≥ 10 months). Approve for 1 year in patients who meet the following criteria (A and B):
   A) Height has increased by ≥ 2 cm/year in the most recent year; AND
   B) The epiphyses are open.

8. **Children Born Small for Gestational Age or with Intrauterine Growth Restriction (Retardation) Including Those with Silver-Russell Syndrome.** Approve for *initial* therapy for 1 year in patients who meet the following criteria (A, B, C, and D):
   A) Patient is ≥ 2 years of age; AND
   B) Patient was born small for gestational age (SGA), which is defined as birth weight and/or birth length that is > 2 standard deviations (SD) below the mean (< -2 SD) for gestational age and gender, and the patient did not have sufficient catch-up growth before age 2 to 4 years; AND
   C) Patient's baseline height is less than the 5th percentile for age and gender; AND
   D) Patient has been evaluated by an endocrinologist.

   Children Born Small for Gestational Age or with Intrauterine Growth Restriction (Retardation) Including Those with Silver-Russell Syndrome Continuing Somatropin Therapy (i.e., established on somatropin for ≥ 10 months). Approve for 1 year in patients who meet ONE of the following (A, B, or C):
   A) *Patients < 12 years of age.* Height has increased by ≥ 2 cm/year in the most recent year.
   B) *Patients ≥ 12 years and ≤ 18 years of age.* The patient meets the following criteria (i and ii):
      i. Height has increased by ≥ 2 cm/year in the most recent year; AND
      ii. The epiphyses are open.
   C) *Adolescents and young adults > 18 years of age.* The patient meets the following criteria (i, ii, and iii):
      i. Height has increased by ≥ 2 cm/year in the most recent year; AND
      ii. Epiphyses are open; AND
      iii. Mid-parental height has *not* been attained.
      Note: Mid-parental height is the father's height plus the mother's height divided by 2, plus 2.5 inches if male or minus 2.5 inches if female.

9. **Turner Syndrome**. Approve for *initial* therapy for 1 year in patients with short stature associated with Turner syndrome.

Patients with Turner Syndrome Continuing Somatropin Therapy (i.e., established on somatropin for ≥ 10 months). Approve for 1 year in patients who meet the following criteria (A and B):
A) Height has increased by ≥ 2 cm/year in the most recent year; AND
B) The epiphyses are open.

II. Coverage of Genotropin, Humatrope, Norditropin, Nutropin AQ, Omnitrope, Saizen, Zomacton, and Zorbtive (all listed products except Serostim) is recommended in patients who meet the following criteria:

1. Short Bowel Syndrome in Adults. Approve of *initial* therapy for 1 month if the patient meets the following criteria (A and B):
A) Patient is ≥ 18 years of age; AND
B) Patient is receiving specialized nutritional support (defined as a high carbohydrate, low-fat diet that is adjusted for individual patient requirements and preferences).

Short Bowel Syndrome in Adults Continuing Somatropin Therapy. Approve a second 1-month course of somatropin if the adult patient responded to somatropin therapy with a decrease in the requirement for specialized nutritional support according to the prescriber.

III. Coverage of Serostim is recommended in those who meet the following criteria:

1. Human Immunodeficiency Virus (HIV) Infection with Wasting or Cachexia in Adults. Approve for 6 months in patients who meet ALL of the following criteria (A, B, C, D, and E):
A) Patient is ≥ 18 years of age; AND
B) Patient has ONE of the following (i, ii, or iii):
i. Documented unintentional weight loss of ≥ 10% from baseline; OR
ii. Weight < 90% of the lower limit of ideal body weight; OR
iii. Body mass index (BMI) ≤ 20 kg/m^2; AND
Note: The following formula can be used to calculate BMI: BMI equals body weight in kg divided by height in meters squared (m^2) [i.e., BMI = kg/m^2];
C) Patient has wasting or cachexia that is due to malabsorption, poor diet, opportunistic infection, or depression, and other causes have been addressed prior to starting somatropin; AND
D) Patient has been on antiretroviral therapy or highly active antiretroviral treatment (HAART) for ≥ 30 days prior to beginning Serostim therapy and will continue antiretroviral therapy throughout the course of Serostim treatment; AND
E) Serostim is not being used solely for treatment of alterations in body fat distribution such as increased abdominal girth, lipodystrophy and excess abdominal fat, or buffalo hump.

HIV Infection with Wasting or Cachexia in Adults Continuing Serostim Therapy. Approve up to a 6-month course of Serostim if the patient meets the following criteria (A and B):
A) Patient has been off Serostim for at least 1 month; AND
B) Patient meets criteria III.1.A, B, C, D, and E above.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Coverage of Genotropin, Humatrope, Norditropin, Nutropin AQ, Omnitrope, Saizen, Serostim, and Zorbtive is not recommended in the following situations:
Note: For some of the following indications, authorization for coverage is not recommended because this indication is excluded from coverage in a typical pharmacy benefit.

1. **Acute Critical Illness Due to Complications Following Surgery, Multiple Accidental Trauma, or with Acute Respiratory Failure.**[1-9] In two placebo-controlled trials, in non-growth hormone deficient adults (n = 522) with these conditions, there was a significant increase in mortality (42% vs. 19%) in patients treated with somatropin compared to those on placebo.

2. **Aging (i.e., Antiaging); To Improve Functional Status in Elderly Patients; and Somatopause.**[17,18,32,33] Somatropin is not FDA-approved for anti-aging therapy, to improve functional status in elderly patients, or to treat somatopause. Federal law prohibits the distribution or dispensing of somatropin for non-FDA approved uses. There are no long-term studies assessing somatropin efficacy and safety for anti-aging therapy. Short-term therapy with somatropin may improve some measures of body composition, including increased muscle mass, reduced total body fat, improved skin elasticity, and reduced rate of bone demineralization, but does not have positive effects on strength, functional capacity, or metabolism. Somatropin is associated with considerable adverse effects in non-growth hormone deficient adults (e.g., carpal tunnel syndrome, soft tissue edema, arthralgias, glucose intolerance, increased serum lipids). Another concern is the possible increased risk of cancer with long-term use of somatropin and the potentiating effects of IGFs on cancer. Somatropin is not indicated for the age-related decrease in growth hormone/IGF-1 status.[16]

3. **Athletic Ability Enhancement.**[18,34] Somatropin is not FDA-approved for athletic performance enhancement or for body building in nonathletes. Federal law prohibits the distribution or dispensing of somatropin for non-FDA approved uses. Short-term administration of somatropin to increase strength and endurance in athletes is no more effective than training alone and somatropin should not be administered to athletes or other persons for the purpose of enhancing athletic ability or improving personal appearance (i.e., to appear leaner and more muscular). Somatropin has been used in supraphysiologic doses alone or in combination with other performance enhancing drugs (PEDs) in users who are not athletes.[34] Use of PEDs has been linked to an increased risk of death and many adverse effects including cardiovascular, psychiatric, metabolic, endocrine, neurologic, infectious, hepatic, renal, and musculoskeletal disorders.

4. **Central Precocious Puberty.** Children with precocious puberty are often treated with gonadotropin releasing hormone (GnRH) agonists (Lupron® [leuprolide acetate injection]) to suppress pituitary gonadal activity, to slow the advancement of bone age (prevent premature fusion of the epiphyseal growth plates), and to improve adult height. In some patients GnRH agonist therapy may result in marked deceleration of bone growth and may result in adult height that is less than the midparental height. Somatropin has been used in girls when growth velocity decreases or if it appears that the targeted adult height will not be attained.[35] There are no large well-controlled trials on the efficacy and safety of adding somatropin to GnRH agonist therapy in these children or the effect on final height.[35,36]

5. **Chronic Fatigue Syndrome.** There is no evidence of GHD in chronic fatigue syndrome.[37]

6. **Congenital Adrenal Hyperplasia (CAH).**[38,39] The Endocrine Society clinical practice guidelines on CAH due to steroid 21-hydroxylase deficiency recommends against the use of experimental treatment approaches outside of formally approved clinical trials.[39] Children with predicted adult height SD $\leq$ -2.25 may be considered for growth-promoting treatments in appropriately controlled trials.

7. **Constitutional Delay of Growth and Puberty (CDGP).** These children have delayed skeletal maturation and pubertal development. Administering somatropin does not increase adult height (which is usually normal).[40] Short-term androgen therapy accelerates growth and the rate of pubertal advancement in boys.

8. **Corticosteroid-Induced Short Stature.**[13] This includes a variety of chronic glucocorticoid-dependent conditions, such as asthma, Crohn's disease,[13] juvenile rheumatoid arthritis,[28,41,42] as well as after renal, heart, liver, or bone marrow transplantation.[43] Short-term improvement in growth velocity in children with glucocorticoid-induced suppression has been reported with somatropin therapy. Long-term data are not available.[13] Children being considered for treatment with somatropin should be enrolled in studies that allow careful monitoring and data analysis.

9. **Fibromyalgia.** In one placebo-controlled study, 120 non-GHD adult women with severe fibromyalgia and low levels of IGF-1 were randomized to somatropin 0.006 mg/kg/day for 12 months (dose was adjusted) or placebo for 6 months.[45] Patients receiving placebo initially were switched to somatropin from Months 6 to 12 (open label). Standard therapy for fibromyalgia was continued. After 6 months, there were no differences between somatropin and placebo in the percentage of patients with fewer than 11 positive tender points, mean number of tender points, intensity of pain in every point evaluated, and other measures. After 12 months of somatropin therapy, 53% of patients had less than 11 positive tender points compared with 33% of patients who received placebo and then somatropin for 6 months ($P < 0.05$). At 18 months follow-up evaluation when somatropin was discontinued, impairment in pain perception worsened in both groups but to a lesser extent in the patients on somatropin for 12 months. Further controlled trials are needed with a longer duration,[46] with different doses, and using the 2010 American College of Rheumatology criteria for fibromyalgia. Some patients with fibromyalgia may have adult GHD.

10. **Human Immunodeficiency Virus (HIV)-Infected Patients with Alterations in Body Fat Distribution** (e.g., increased abdominal girth, lipodystrophy and excess abdominal fat, buffalo hump).[26] Somatropin is not indicated for the treatment of HIV-associated adipose redistribution syndrome (HARS). HARS is a subset of HIV lipodystrophy and is defined as maldistribution of body fat characterized by central fat accumulation (lipohypertrophy) with or without lipoatrophy. In HARS, fat may also accumulate in the upper body subcutaneous area such as the dorsocervical area (buffalo hump). These changes may be associated with metabolic disturbances (insulin resistance, glucose intolerance, dyslipidemia) and belly image distress. Safety and efficacy are not established.

11. **Infertility.**[47,10] Clinical trials indicate that somatropin is not useful as an adjunct during in vitro fertilization, for induction of ovulation in polycystic ovary syndrome, or for assisted reproductive technology. The authors of a recent meta-analysis concluded there is no evidence of an increased chance of a live birth with use of somatropin.

12. **Obesity.**[48,49] Somatropin is not indicated for the treatment of obesity. Low growth hormone levels are a consequence of central obesity and not a cause. Obesity is associated with decreased basal and pusatile release of growth hormone and decreased stimulated growth hormone release. Somatropin therapy does not have significant beneficial effects on obesity in persons without GHD and does not produce significant overall weight loss. Supraphysiologic doses of somatropin have been used to treat obesity. Effects of long-term therapy with somatropin are unknown.

13. **Osteoporosis.**[50,51] Guidelines for treatment or prevention of osteoporosis do not include recommendations for use of somatropin. In one double-blind trial, 80 postmenopausal women with osteoporosis (56% of patients [n = 45/80] had a history of fractures) were randomized to somatropin 0.33 mg/day or 0.83 mg/day or to placebo for three years.[50] The double-blind phase was 18 months and patients on somatropin continued drug for another 18 months and patients on placebo stopped at 18 months. Patients were compared with an age-matched random population sample of women (n = 120). All patients received calcium 750 mg, vitamin D 400 units, and hormone replacement therapy. All women were followed for 10 years total. Bone mineral density increased in the patients receiving somatropin at years 4 and 5, and after 10 years, had decreased to similar levels as before treatment. At

10 years, 28% of women (n = 22/80) had had fractures. In the control group, fractures increased from 8% of patients at baseline to 32% of patients after 10 years. At 10 years, 41% of patients (n = 33/80) had stopped hormone replacement therapy; 23% had started bisphosphonates due to fractures, and 3% had received Forteo® (teriparatide injection). Larger studies are needed to determine the effects of somatropin therapy on bone mineral density and fractures in non-growth hormone deficient persons.

14. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	• Removal of Nutropin (obsolete since 2013)	01/16/2019
Selected Revision	• Growth Hormone Deficiency in Children or Adolescents: Criterion related to growth rate and growth velocity percentile were removed. A confirmation of two growth hormone stimulation tests OR one growth hormone stimulation test and a risk factor for growth hormone deficiency was added. Criteria was removed which specified the result of a growth hormone stimulation test was < 10 ng/mL. Criteria was added that the stimulation test show an inadequate response as defined by a peak response below the normal reference range as determined by the testing laboratory. Tumor resection was added to the brain radiation criteria. • Growth Hormone Deficiency in Adults or Transition Adolescents: Growth hormone stimulation tests were updated to include a minimum number of accepted growth hormone values in a specified timeframe required for each test. Criteria was updated for the insulin tolerance test to include information about achieving adequate hypoglycemia. Criterion related to continuation of therapy for Adults and Transition Adolescents were removed. The documentation section of the policy statement was updated to reflect that if documentation had been received upon a prior coverage review, the documentation requirement would be considered met.	05/08/2019
Annual Revision	• Non-Growth Hormone Deficient Short Stature (Idiopathic Short Stature) – clarified criterion ii. as growth (height) velocity. A note was added that height velocity percentile is not the same as height for age percentile. • Growth Hormone Deficiency in Adults or Transition Adolescents – o Criterion "The patient (adult or transition adolescent) had childhood onset growth hormone deficiency (GHD) and has known mutations, embryopathic lesions, congenital defects, or irreversible structural hypothalamic-pituitary lesions/damage" was updated to "The patient (adult or transition adolescent) has known mutations, embryopathic lesions, congenital or genetic defects, or structural hypothalamic-pituitary defects," o Glucagon stimulation test peak response levels were updated for adults and transition adolescents. Peak response levels reflect the patient's body mass index (BMI) and/or pretest probability of growth hormone deficiency. A second test is no longer required for transition adolescents with a BMI of ≥ 25 mg/m2. o Arginine alone stimulation test was removed as a choice for a required stimulation test for adults. A note was added that a previous trial of an arginine alone test with a peak response of ≤ 0.4 mcg/L would meet the criteria for a negative response to a growth hormone stimulation test. o A note was added for transition adolescents that if the patient has had a trial of a Macrilen test with a peak response of < 2.8 ng/mL (mcg/L), this would meet the criteria for a negative response to a growth hormone stimulation test. • Chronic Kidney Disease in Children or Adolescents – Criterion "Patient has chronic kidney disease (CKD) as defined by an abnormal creatinine clearance" was updated to "Patient has or had chronic kidney disease (CKD) as defined by an abnormal creatinine clearance." Continuation criteria were updated to a height increase of ≥ 2 cm/year in the most recent year. • Short Bowel Syndrome in Adults – prescribing physician was replaced by prescriber. • Removal of the following Conditions Not Recommended for Approval: Bony dysplasias (Achondroplasia, Hypochondroplasia), Burn Injury (Extensive) in Children or Adults, Cardiac Transplantation, Crohn's Disease,	2/5/2020

	Cystic Fibrosis, Dilated Cardiomyopathy and Heart Failure, Down's Syndrome, End-Stage Renal Disease in Adults Undergoing Hemodialysis, Familial Dysautonomia (Riley Day Syndrome, Hereditary Sensory Autonomic Neuropathy), Hematopoietic Stem Cell Transplant Without Total Body Irradiation or Cranial Radiation, Kidney Transplant Patients (Children) with a Functional Renal Allograft, Liver Transplantation, Multiple System Atrophy (MSA), Myelomeningocele, Osteogenesis Imperfecta, Thalassemia, X-linked Hypophosphatemic Rickets (Familial Hypophosphatemia, Hypophosphatemic Rickets).	
Selected Revision	• Updated policy statement to direct reviews to a clinician (i.e., pharmacist) for verification of criteria.	4/08/2020
Annual Revision	• Children or Adolescents with Growth Hormone Deficiency (GDH) Continuing Somatropin Therapy; Children or Adolescents with Non-Growth Hormone Deficient Short Stature (Idiopathic Short Stature) Continuing Somatropin Therapy; Children Born Small for Gestational Age or with Intrauterine Growth Restriction (Retardation) Including Those with Silver-Russell Syndrome Continuing Somatropin Therapy: In places the height increase required was 4 cm/year was updated to 2 cm/year. • Noonan Syndrome in Children or Adolescents Continuing Somatropin Therapy; Prader-Willi Syndrome in Patients Continuing Somatropin Therapy; Short Stature Homeobox-Containing Gene Deficiency in Children or Adolescents Continuing Somatropin Therapy; Patients with Turner Syndrome Continuing Somatropin Therapy: In places the height increase was 2.5 cm/year was updated to 2 cm/year.	2/10/2021

PRIOR AUTHORIZATION POLICY

POLICY: Growth Disorders – Increlex Prior Authorization Policy

- Increlex® (mecasermin [rDNA origin] for subcutaneous injection – Ipsen Biopharmaceuticals/Hospira)

REVIEW DATE: 10/14/2020

OVERVIEW

Increlex, an insulin-like growth factor (IGF-1), is indicated for the treatment of growth failure in pediatric patients ≥ 2 years of age with the following conditions:[1]

- **Primary IGF-1 deficiency**, for patients with severe disease, defined as:
  - Height standard deviation score ≤ -3.0; AND
  - Basal IGF-1 standard deviation score ≤ -3.0; AND
  - Normal or elevated growth hormone level.
- **Growth hormone gene deletion**, in patients who have developed neutralizing antibodies to growth hormone.

Increlex is given by subcutaneous injection twice daily, shortly before or after a meal or snack. Treatment with Increlex should continue until the epiphyses fuse indicating full growth potential has been achieved.[3] It is a limitation of use that Increlex is not a substitute to growth hormone for approved growth hormone indications. Increlex is <u>not</u> indicated in secondary forms of IGF-1 deficiency, such as growth hormone deficiency, malnutrition, hypothyroidism, or chronic treatment with pharmacologic doses of anti-inflammatory corticosteroids.[1]

Disease Overview

IGF-1 is the principal hormonal mediator of growth hormone action.[3] Under normal circumstances, growth hormone binds to its receptor in the liver and other tissues and stimulates the synthesis/secretion of IGF-1. In target tissues, the Type 1 IGF-1 receptor is activated by IGF-1, leading to intracellular signaling which stimulates multiple processes leading to stature growth. The metabolic actions of IGF-1 are in part directed at stimulating the uptake of glucose, fatty acids, and amino acids so that metabolism supports growing tissues. Primary IGF-1 deficiency is a group of disorders characterized by decreased IGF-1 production with normal or increased growth hormone secretion.[2] Three distinct molecular abnormalities have been identified as causes of primary IGF-1 deficiency: 1) mutations or gene deletions of the GH receptor gene; 2) mutations affecting the post-growth hormone receptor signaling cascade, as observed in a patient homozygous for a point mutation of the gene for signal transducer and activator of transcription (STAT)-5b; and 3) mutations or deletions of the gene for IGF-1. These patients are not growth hormone deficient and do not respond adequately to exogenous growth hormone treatment.[1-2] Once a diagnosis of severe primary IGF-1 deficiency is made, treatment is recommended as soon as possible.[3] Growth rates are highest during the first year of treatment and both first year catch-up growth and long-term outcomes are improved when initiated in younger children.

Clinical Efficacy

The efficacy of Increlex was evaluated in five clinical studies in patients (n = 71) with primary IGF-1 deficiency.[1] In these studies, 11% of the patients (n = 7) had growth hormone gene deletion. Refer to Table 1 for pooled height results from these studies in patients treated for up to 8 years.

Table 1: Annual Height Results by Number of Years Treated with Increlex.[1]

	Pre-Tx	Year 1	Year 2	Year 3	Year 4	Year 5	Year 6	Year 7	Year 8
Height Velocity (cm/yr)									
n	58	58	48	38	23	21	20	16	13
Mean (SD)	2.8 (1.8)	8.0 (2.2)	5.8 (1.5)	5.5 (1.8)	4.7 (1.6)	4.7 (1.6)	4.8 (1.5)	4.6 (1.5)	4.3 (1.1)
P-value*		<0.0001	<0.0001	<0.0001	0.0045	0.0015	0.0009	0.0897	0.3059
Height SDS									
n	61	61	51	40	24	21	20	16	13
Mean (SD)	-6.7 (1.8)	-5.9 (1.8)	-5.6 (1.8)	-5.4 (1.8)	-5.5 (1.9)	-5.6 (1.8)	-5.4 (1.8)	-5.2 (2.0)	-5.2 (2.0)

Pre-Tx – Pre-treatment; SD – Standard deviation; * P-values for comparison vs. pre-Tx values are computed using paired t-tests; SDS – Standard deviation score.

Most clinical assays used by laboratories in the US report IGF-1 values ± two standard deviations (SD) thereby representing the age-related reference range for the reporting laboratory.[4] Reference ranges for IGF-1 vary among laboratories and are dependent upon patient age, gender, and puberty status. However, some laboratories do not routinely report the SDS for IGF-1.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Increlex. Because of the specialized skills required for evaluation and diagnosis of patients treated with Increlex as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Increlex to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Increlex is recommended in those who meet the following criteria:

FDA-Approved Indications

11. Severe Primary Insulin-Like Growth Factor-1 (IGF-1) Deficiency in a Child. Approve for 1 year if the patient meets ONE of the following conditions (A or B):

A) Initial Therapy or Patient has been on Increlex < 1 Year. Approve for 1 year if the patient meets ALL of the following conditions (i, ii, iii, iv, and v):

- **i.** Patient is ≥ 2 years of age; AND
- **ii.** Height standard deviation score is ≤ -3.0 at baseline; AND
- **iii.** Patient has a basal IGF-1 level below the lower limits of the normal reference range for the reporting laboratory; AND
  Note: Reference ranges for IGF-1 vary among laboratories and are dependent upon age, gender, and puberty status.
- **iv.** Growth hormone concentration is normal or increased at baseline; AND
- **v.** Increlex is prescribed by or in consultation with a pediatric endocrinologist.

B) Patient has been receiving Increlex for ≥ 1 Year. Approve for continuation of therapy if the patient meets the following conditions (i and ii):

- **i.** The patient's height has increased by ≥ 4 cm/year in the most recent year; AND
  Note: Patients are reviewed annually for growth rate.
- **ii.** The epiphyses are open.

12. **Growth Hormone Gene Deletion in a Child who has Developed Neutralizing Antibodies to Growth Hormone.** Approve for 1 year if the patient meets ONE of the following conditions (A or B):
    - **A)** Initial Therapy or Patient has been on Increlex < 1 Year. Patient meets both of the following (i and ii):
        - **i.** Patient is ≥ 2 years of age; AND
        - **ii.** Increlex is prescribed by or in consultation with a pediatric endocrinologist.
    - **B)** Patient has been receiving Increlex for ≥ 1 Year. Approve for continuation of therapy if the patient meets BOTH of the following conditions (i and ii):
        - **i.** The patient's height has increased by ≥ 4 cm/year in the most recent year; AND
          Note: Patients are reviewed annually for growth rate.
        - **ii.** The epiphyses are open.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Increlex is not recommended in the following situations:

1. **Idiopathic Short Stature, Growth Hormone Deficiency.** A Phase II open-label study evaluated somatropin in combination with Increlex in children with short stature associated with IGF-1 deficiency.[6] This study includes prepubertal children with IGF-1 SDS of ≤ -1 for age and gender, height SDS ≤ -2 for age and gender, and GH sufficiency demonstrated by a maximal stimulated GH response of ≥ 10 ng/mL; however, results are not yet available. Somatropin monotherapy is indicated for idiopathic short stature.

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REVIEW DATE: 02/03/2021

Overview

Cablivi, a von Willebrand factor (vWF)-directed antibody fragment, is indicated for the treatment of adult patients with **acquired thrombotic thrombocytopenic purpura** (aTTP), in combination with plasma exchange and immunosuppressive therapy.[1] Cablivi is given once a day during plasma exchange and continued for 30 days after the last plasma exchange session. If, after the initial treatment course, there are signs of persistent underlying disease such as suppressed ADAMTS13 (A Disintegrin And Metalloproteinase with ThromboSpondin-1 motif, member 13) levels, Cablivi therapy may be extended for a maximum of 28 days. Cablivi should be discontinued if the patient experiences more than two recurrences of aTTP while on Cablivi.

Disease Overview

Thrombotic thrombocytopenic purpura (TTP) is a rare but potentially fatal blood disorder.[2-5] TTP may be caused by an inherited severe deficiency of plasma ADAMTS13 activity resulting from mutations; this is referred to as hereditary or congenital TTP. More commonly, TTP is acquired and due to autoantibodies that inhibit plasma ADAMTS13 activity, referred to as immune-mediated TTP (iTTP). Reduced ADAMTS13 activity leads to accumulation of ultra-large vWF multimers in the blood, which bind to platelets and lead to excessive platelet clumping in the microvasculature, resulting in multi-organ failure and death. Cablivi is a nanobody that targets the ultra-large vWF and inhibits the interaction between vWF and platelets, thereby preventing platelet adhesion.[1-3,6]

Guidelines/Recommendations

The standard of care for treatment aTTP is plasma exchange and glucocorticoids.[7] Plasma exchange removes the ultra-large vWF and autoantibodies and replenishes ADAMTS13, and immunosuppressants inhibit autoantibody formation.[2,6,7] Rituximab can also be added to the aTTP treatment regimen.[3] Rituximab has been shown to reduce the incidence of aTTP relapse by diminishing the production of anti-ADAMTS13 antibodies and restoring ADAMTS13 activity.[3,4]

The International Society on Thrombosis and Haemostasis (ISTH) formed a multidisciplinary panel including hematologists and pathologists with clinical expertise in the diagnosis and management of TTP, clinicians from other relevant disciplines, and patient representatives to issue recommendations about treatment of TTP (2020).[8] For patients with aTTP or iTTP experiencing an acute event (first event or relapse), the panel suggests using Cablivi over not using Cablivi. The panel stressed that Cablivi should only be given under the guidance of an experienced clinician; ideally, a TTP expert (e.g., a hematologist or pathologist specialized in transfusion medicine with previous experience in treating the disease).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Cablivi. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Cablivi as well as the monitoring required for adverse events and efficacy, approval requires Cablivi to be prescribed by or in consultation with a physician who specializes in the condition being treated. Note that one course of treatment consists of Cablivi to be administered in conjunction with plasma exchange and Cablivi to be administered for up to 60 days (one dose per day) following the last plasma exchange session.

Automation: None.

Recommended Authorization Criteria

Coverage of Cablivi is recommended in those who meet the following criteria:

FDA-Approved Indications

19. Acquired Thrombotic Thrombocytopenic Purpura (aTTP). Approve for one course of treatment (up to 60 days following the last plasma exchange session) if the patient meets ALL of the following criteria (A, B, C, D, and E):

- **I)** Patient is ≥ 18 years of age; AND
- **J)** Cablivi was initiated in the inpatient setting, in combination with plasma exchange therapy; AND
- **K)** Patient is currently receiving at least one immunosuppressive therapy; AND
  Note: Examples include systemic corticosteroids, rituximab (or a rituximab product), cyclosporine, cyclophosphamide, mycophenolate mofetil, hydroxychloroquine, Velcade® [bortezomib for injection]).
- **L)** If the patient has previously received Cablivi, he/she has not had more than two recurrences of aTTP while on Cablivi; AND
- **M)** The medication is prescribed by or in consultation with a hematologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Cablivi is not recommended in the following situations:

9. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
New Policy	--	02/20/2019
Selected Revision	Revised criterion "The patient is currently receiving daily plasma exchange and at least one immunosuppressant therapy (e.g., corticosteroids with or without a rituximab product" to "The patient is currently receiving at least one immunosuppressive therapy (e.g., systemic corticosteroids, rituximab [or a rituximab product], cyclosporine [Neoral®, Sandimmune®, generics], cyclophosphamide, mycophenolate mofetil, [CellCept®, Myfortic®, generics], hydroxychloroquine, Velcade® [bortezomib for injection]).	02/27/2019

Annual Revision	The following changes were made:
	• **Policy Statement:** This section was revised from "All approvals are provided for the duration noted below" to "All approvals are provided for one course of therapy. Note that one course of therapy consists of Cablivi to be administered in conjunction with plasma exchange and Cablivi to be administered for a maximum of 60 days (one dose per day) following the last plasma exchange".
	• **Acquired Thrombotic Thrombocytopenic Purpura (aTTP):**
	  • The approval duration was changed from 3 months to "one course of treatment (up to 60 days following the last plasma exchange session).
	  • Two criteria were added: Cablivi was initiated in the inpatient setting in combination with plasma exchange therapy; and If the patient has previously received Cablivi therapy, he/she has not had more than two recurrences of aTTP while on Cablivi therapy.
	  • Examples of immunosuppressant therapies (of which at least one is required to be used in conjunction with Cablivi) were removed from the criteria and changed to a note.

Annual Revision	No criteria changes.	02/03/2021

PRIOR AUTHORIZATION POLICY

POLICY: Hematology – Ceprotin Prior Authorization Policy

- Ceprotin® (protein C concentrate [human] injection for intravenous use – Baxalta/Shire)

REVIEW DATE: 10/28/2020

OVERVIEW

Ceprotin is indicated for pediatric and adult patients with **severe congenital protein C deficiency for the prevention and treatment of venous thrombosis and purpura fulminans**.[1]

Disease Overview

Mutations in the *PROC* gene lead to deficiency of protein C, which is a natural anticoagulant.[2] Individuals with heterozygous *PROC* mutation present with milder disease but are at risk for development of venous thromboembolism. The milder form is present in about 1:200 to 1:500 people in the general population. Most individuals with mild protein C deficiency do not require treatment; anticoagulant therapy may be used for individuals with strong family history of venous thromboembolism. Those who have mutations in both *PROC* genes develop severe symptoms within a few hours to days after birth. The prevalence of severe protein C deficiency is approximately 1:500,000 to 1:750,000 in the general population. In severe protein C deficiency, a complication called purpura fulminans may arise in which blood clots form throughout the body. Blood clots affect the extremities most often but can become widespread (disseminated intravascular coagulation), leading to tissue necrosis.

Diagnosis is based on characteristic symptoms and detailed family history, in addition to measurement of protein C activity or antigen levels.[3,4] It is critical to exclude any acquired reason for protein C deficiency, which is more common than congenital protein C deficiency.[3] Potential causes of acquired deficiency include vitamin K antagonists (e.g., warfarin), vitamin K deficiency, chronic liver disease, recent thrombosis, recent surgery, or disseminated

intravascular coagulation. Diagnostic recommendations from the International Society of Thrombosis and Hemostasis recommend waiting until 30 days after vitamin K antagonist treatment ends to perform protein C assay testing.[4] Molecular genetic testing is only available in a few research laboratories and is not routinely used in clinical diagnosis.[3]

Xigris® (drotrecogin alfa [activated]), a recombinant form of human protein C, was previously marketed for the reduction of mortality in adults with severe sepsis; this was voluntarily withdrawn on October 25, 2011 after failure to show survival benefit vs. placebo.[5] Ceprotin is not labeled for use in this setting.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Ceprotin. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Ceprotin as well as the monitoring required for adverse events and long-term efficacy, approval requires Ceprotin to be prescribed by or in consultation with a physician who specializes in the condition being treated.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Ceprotin is recommended in those who meet one of the following criteria:

FDA-Approved Indications

45. Protein C Deficiency, Severe. Approve for 1 year if the patient meets the following criteria (A, B, C, and D)

- **A)** The diagnosis of protein C deficiency is confirmed by at least one of the following (i, ii, or iii):
  - **i.** Plasma protein C activity below the lower limit of normal based on the age-specific reference range for the reporting laboratory; OR
  - **ii.** Plasma protein C antigen below the lower limit of normal based on the age-specific reference range for the reporting laboratory; OR
  - **iii.** Genetic testing demonstrating biallelic mutations in the *PROC* gene; AND
- **B)** Acquired causes of protein C deficiency have been excluded; AND
  Note: Examples of acquired causes of protein C deficiency include recent use vitamin K antagonists (e.g., warfarin) within 30 days, vitamin K deficiency, chronic liver disease, recent thrombosis, recent surgery, or disseminated intravascular coagulation.
- **C)** According to the prescriber, patient has a current or prior history of symptoms associated with severe protein C deficiency (e.g., purpura fulminans, thromboembolism); AND
- **D)** Ceprotin is being prescribed by or in consultation with a hematologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Ceprotin is not recommended in the following situations:

51. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

New Policy	--	10/02/2019
Annual Revision	**Protein C Deficiency, Severe:** Criteria were added requiring confirmation of the diagnosis based on protein C activity or antigen levels or based on molecular genetic testing, current or prior history of symptoms associated with severe protein C deficiency (e.g., purpura fulminans, thromboembolism), and exclusion of acquired causes of protein C deficiency.	10/28/2020

PRIOR AUTHORIZATION POLICY

POLICY: Hematology – Coagadex Prior Authorization Policy

- Coagadex® (coagulation Factor X [human] injection for intravenous use – BPL)

REVIEW DATE: 09/09/2020

OVERVIEW

Coagadex, a plasma-derived coagulation Factor X product, is indicated for use in adults and children with hereditary Factor X deficiency for:[1]

- **On-demand treatment and control** of bleeding episodes.
- **Perioperative management** of bleeding in patients with mild and moderate hereditary Factor X deficiency.
- **Routine prophylaxis** to reduce the frequency of bleeding episodes.

Disease Overview

Factor X deficiency, a rare autosomal recessive inherited bleeding disorder the affects approximately 1 in 500,000 to 1,000,000 patients worldwide.[2] The Factor X protein has a key role to assist in activating the enzymes that are key in clot formation. In this condition, blood does not clot properly. Patients experience easy bruising, nose or mouth bleeds and bleeding after trauma or surgery. Among patients with severe Factor X deficiency, umbilical cord bleeding can be one of the first signs; however, bleeding may present at any time. Serious bleeds include spontaneous head bleeds, spinal cord bleeds, and gastrointestinal bleeds. Women who have the condition may experience heavy menstrual bleeding or have menorrhagia. During pregnancy, women may miscarry during the first trimester or have other complications during labor and delivery. However, Factor X deficiency has an equal prevalence in men and women. It is recommended to maintain trough levels of around 20% to 30%. Other treatments include fresh frozen plasma, prothrombin complex concentrates, and Coagadex.

Guidelines

The National Hemophilia Foundation Medical and Scientific Advisory Council has guidelines for the treatment of hemophilia and other bleeding disorders (revised February 2020).[3] Coagadex is recommended in patients who have Factor X deficiency.[3]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Coagadex. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Coagadex as well as the monitoring required for adverse events and long-term efficacy, approval requires Coagadex to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Coagadex is recommended in those who meet the following criteria:

FDA-Approved Indication

34. Hereditary Factor X Deficiency. Approve for 1 year if the agent is prescribed by or in consultation with a hematologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Coagadex is recommended in those who meet the following criteria:

52. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Hematology – Corifact Prior Authorization Policy

- Corifact® (Factor XIII Concentrate [human] injection for intravenous use – CSL Behring

REVIEW DATE: 09/09/2020

OVERVIEW

Corifact, a Factor XIII concentrate, is indicated for adult and pediatric patients with congenital Factor XIII deficiency for:[1]

- **Peri-operative management** of surgical bleeding.
- **Routine prophylactic** treatment.

Disease Overview

Congenital Factor XIII deficiency is caused by defects in both Factor XIIIA and Factor XIIIB genes.[2] However, most cases are due to genetic alterations on the Factor XIIIA gene. The estimated prevalence of Factor XIIIA deficiency is one case in 2 million patients. Clinical symptoms include delayed wound healing, bleeding of soft and subcutaneous tissue, recurrent spontaneous miscarriage, and central nervous system (CNS) bleeding, which may be life-threatening. If patients have severe Factor XIII deficiency, early manifestations include bleeding from the umbilical cord or CNS. Prospective data showed that a level of 30% Factor XIII clotting activity is an adequate therapeutic target for most patients. Treatment of Factor XIII deficiency involves use of fresh frozen plasma, cryoprecipitate, Corifact, or Tretten® (coagulation Factor XIIIA-Subunit [recombinant] injection for intravenous use).

Guidelines

The National Hemophilia Foundation Medical and Scientific Advisory Council has guidelines for the treatment of hemophilia and other bleeding disorders (revised February 2020).[3] Corifact is recommended in patients who have Factor XIII deficiency.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Corifact. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Corifact as well as the monitoring required for adverse events and long-term efficacy, approval requires Corifact to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Corifact is recommended in those who meet the following criteria:

FDA-Approved Indication

35. Congenital Factor XIII Deficiency. Approve for 1 year if the agent is prescribed by or in consultation with a hematologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Corifact recommended in those who meet the following criteria:

53. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Hematology – Fibrinogen Products Prior Authorization Policy

- Fibryga® (fibrinogen [human] for intravenous use – Octapharma USA)
- RiaSTAP® (fibrinogen concentrate [human] for intravenous use – CSL Behring)

REVIEW DATE: 10/28/2020; selected revision 01/27/2021

OVERVIEW

Fibryga and RiaSTAP, human fibrinogen concentrates, are indicated for treatment of acute bleeding episodes in patients with **congenital fibrinogen deficiency**, including afibrinogenemia and hypofibrinogenemia.[1,2] Fibryga prescribing information notes that it is not indicated for dysfibrinogenemia.

Both Fibryga and RiaSTAP are indicated for use in adult and pediatric patients.[1,2] Fibryga and RiaSTAP have been compared in a randomized pharmacokinetic study and are not bioequivalent.[3]

Disease Overview

Congenital deficiencies in fibrinogen (also known as Factor I) can be quantitative or qualitative.[4,5] Quantitative disorders include afibrinogenemia (absence of circulating fibrinogen) and hypofibrinogenemia (low levels of circulating fibrinogen). By contrast, dysfibrinogenemia is a qualitative deficiency in which fibrinogen levels are adequate but function is impaired. In all cases, clinical presentation is variable but bleeding and thromboembolism are possible.

Diagnosis is made by routine coagulation tests in addition to fibrinogen assays.[6] An accurate diagnosis is crucial to distinguish between quantitative and qualitative disorders and guide appropriate treatment. Treatment of fibrinogen deficiency is generally on-demand for acute bleeding episodes, although effective prophylaxis has been used in high-

risk patients (e.g., secondary prevention after cerebral hemorrhage, primary prevention during pregnancy to prevent miscarriage).[7,8]

Guidelines

Guidelines are available from the British Committee for Standards in Haemotology (2014); the guideline was written prior to approval of Fibryga.[9] Regarding diagnosis, it is noted that afibrinogenemia and hypofibrinogenemia manifest as prolonged prothrombin time and activated partial thromboplastin time, as well as reduced fibrinogen activity and fibrinogen antigen. Fibrinogen concentrate (e.g., RiaSTAP) may be required to treat or prevent bleeding. Cryoprecipitate is noted to be similarly effective to fibrinogen concentrate but may be associated with transfusion reactions or volume overload.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of fibrinogen products (Fibryga, RiaSTAP). All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with fibrinogen products as well as the monitoring required for adverse events and long-term efficacy, approval requires these agents to be prescribed by or in consultation with a physician who specializes in the condition being treated.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Fibryga and RiaSTAP is recommended in those who meet the following criteria:

FDA-Approved Indications

36. Congenital Fibrinogen Deficiency (Factor I Deficiency), Including Afibrinogenemia and Hypofibrinogenemia. Approve for 1 year if the patient meets the following criteria (A and B):

- **A)** The diagnosis is confirmed by the following laboratory testing (i and ii):
  - **i.** Prolonged activated partial thromboplastin time and prothrombin time at baseline, as defined by the laboratory reference values; AND
  - **ii.** Lower than normal plasma functional and antigenic fibrinogen levels at baseline, as defined by the laboratory reference values; AND
- **B)** The requested agent is prescribed by or in consultation with a hematologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Fibryga and RiaSTAP is not recommended in the following situations:

54. Concomitant Use of Fibryga and RiaSTAP. There are no data to support concomitant use of these products.

55. Dysfibrinogenemia. In dysfibrinogenemia, patients have adequate levels of fibrinogen but dysfunctional clotting.[3,4] Prescribing information for Fibryga notes that it is not indicated in dysfibrinogenemia.[2] RiaSTAP should also not be used in these patients due to risk for thromboembolism.[4]

56. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Hematology – Reblozyl Prior Authorization Policy

- Reblozyl® (luspatercept-aamt for subcutaneous injection)

REVIEW DATE: 12/02/2020

OVERVIEW

Reblozyl is an erythroid maturation agent indicated for the following conditions:[1]

- **Beta-thalassemia**, for treatment of adults with anemia who require regular red blood cell (RBC) transfusions.
- **Myelodysplastic syndromes** with ring sideroblasts (MDS-RS) or **myelodysplastic/myeloproliferative neoplasm** with ring sideroblasts and thrombocytosis (MDS/MPN-RS-T) associated anemia, for those failing an erythropoiesis stimulating agent and requiring two or more RBC units over 8 weeks in adult patients with very low- to intermediate-risk disease.

Safety and efficacy have not been established in patients < 18 years of age.

Disease Overview

Beta-thalassemia, an inherited blood disorder, is characterized by reduced levels of functional hemoglobin.[2] Patients with a severe form (beta-thalassemia major) become symptomatic due to low hemoglobin level (e.g., increased cardiac effort, tachycardia, poor growth) or ineffective erythropoiesis (e.g., bone changes, massive splenomegaly). Even with treatment, severe complications may arise due to iron overload secondary to increased intestinal absorption and frequent blood transfusions. The frequency of symptomatic patients with beta-thalassemia is estimated at approximately 1 in 100,000 individuals in the general population but is less common in the US.

Myelodysplastic syndromes are cancers in which cells in the bone marrow do not mature and become healthy blood cells.[5] Patients with MDS with refractory anemia and ring sideroblasts have too few RBCs in the blood with too much iron inside the cell. However, the number of white blood cells and platelets are normal. Supportive therapy may include transfusions and use of erythropoiesis-stimulating agents (ESAs). ESAs may be given to increase the number of mature RBCs made by the body and to lessen the effects of anemia. Myelodysplastic/myeloproliferative neoplasms are diseases of the blood and bone marrow with features of myelodysplastic syndromes as well as myeloproliferative neoplasms (e.g., a greater than normal number of blood stem cells become one or more types of blood cells and the total number of blood cells slowly increases). In the pivotal study evaluating Reblozyl for MDS/MPN, patients with deletion 5q were excluded from enrollment. All patients were required to have disease refractory to ESAs (unless endogenous erythropoietin level was elevated), and the median pretransfusion hemoglobin level was 7.6 g/dL (range, 5 to 10 g/dL).

Dosing Information

For all indications, the starting dose is 1 mg/kg given subcutaneously once every 3 weeks.[1] Assess and review hemoglobin levels and transfusion record prior to each dose. Discontinue if a patient does not experience a decrease in transfusion burden after 9 weeks of treatment (administration of three doses) at the maximum dose level. For beta

thalassemia, the maximum recommended dose is 1.25 mg/kg given once every 3 weeks. For MDS and MDS/MPN, the maximum dose is 1.75 mg/kg given once every 3 weeks.

Guidelines

Guidelines do not address Reblozyl for treatment of beta-thalassemia. Standards of Care Guidelines for Thalassemia (2012) are published by the Children's Hospital and Research Center of Oakland.[3] Life-long blood transfusions and iron chelation are the main treatments for beta-thalassemia. Transfusions are usually needed every 3 to 4 weeks and are recommended to maintain the pre-transfusion Hb level above 9 to 10 g/dL and post-transfusion Hb level should not exceed 14 g/dL. Blood transfusions are given to improve anemia as well as suppress ineffective erythropoiesis. Most serious growth, bone, and neurologic complications are prevented with regular transfusions. Once transfusions are started, transfusion-related complications become a major source of morbidity. Hydroxyurea is described as an experimental agent for beta-thalassemia. The Thalassaemia International Federation (2014) also recommends transfusions and iron chelation for treatment of beta-thalassemia.[4] These guidelines state that transfusions are usually administered every 2 to 5 weeks and are recommended to maintain the pre-transfusion Hb level above 9 to 10.5 g/dL and post-transfusion Hb level below 14 to 15 g/dL. The primary goal of chelation therapy is to maintain safe levels of body iron by balancing iron from blood transfusion with iron excretion by chelation. Despite literature suggesting hydroxyurea may be beneficial in certain patients with beta-thalassemia, use is not recommended outside of a clinical trial.

The National Comprehensive Cancer Network (NCCN) guidelines for MDS (version 1.2021 – September 11, 2020) recommend Reblozyl in patients symptomatic anemia due to MDS, in patients without del(5q), who have no response to ESAs (defined by rise in hemoglobin level or decrease in transfusion burden) following 3 to 4 months of treatment.[6] Reblozyl is also a treatment option for patients who have serum erythropoietin levels > 500 mU/mL. Reblozyl is also a treatment option for MDS/MPN with ring sidroblasts and thrombocytosis.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Reblozyl. All approvals are provided for the duration noted below. In cases where the authorization is provided in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Reblozyl as well as the monitoring required for adverse events and long-term efficacy, approval requires Reblozyl to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Reblozyl is recommended in those who meet the following criteria:

FDA-Approved Indications

37. Beta-Thalassemia. Approve for the duration noted if the patient meets one of the following criteria (A or B):
- **A)** Initial Therapy. Approve for 4 months if the patient meets all of the following (i, ii, and iii):
  - **i.** Patient is ≥ 18 years of age; AND
  - **ii.** According to the prescriber, the patient requires regular red blood cell transfusions. Note: This includes patients who are transfusion-dependent; AND
  - **iii.** The medication is being prescribed by or in consultation with a hematologist.
- **B)** Patient is Currently Receiving Reblozyl. Approve for 1 year if, according to the prescriber, the patient has experienced a clinically meaningful decrease in transfusion burden.

38. Myelodysplastic Syndrome. Approve for the duration noted if the patient meets one of the following (A or B):

A) Initial Therapy. Approve for 6 months if the patient meets ALL of the following (i, ii, iii, iv, v, vi, vii, viii, and ix):
- **i.** Patient is ≥ 18 years of age; AND
- **ii.** According to the prescriber, the patient has myelodysplastic syndromes with ring sideroblasts; AND
- **iii.** Patient has very low- to intermediate-risk myelodysplastic syndromes, as determined by the prescriber; AND
  Note: This is determined using the International Prognostic Scoring System (IPSS).
- **iv.** Patient does not have a confirmed mutation with deletion 5q (del 5q); AND
- **v.** Patient currently requires blood transfusions, defined as at least two red blood cell units over the previous 8 weeks; AND
- **vi.** Patient meets ONE of the following (a or b):
  - **a)** Patient tried an erythropoiesis stimulating agent for at least 3 months, unless intolerant; OR
  - **b)** Serum erythropoietin level is greater than 500 mU/L; AND
- **vii.** Pretreatment hemoglobin level is < 10.0 g/dL; AND
- **viii.** Reblozyl will not be used in combination with an erythropoiesis stimulating agent; AND
- **ix.** The medication is being prescribed by or in consultation with an oncologist or hematologist.

B) Patient is Currently Receiving Reblozyl. Approve for 1 year if, according to the prescriber, the patient has experienced a clinically meaningful decrease in transfusion burden.

39. Myelodysplastic/Myeloproliferative Neoplasm. Approve for the duration noted if the patient meets one of the following criteria (A or B):

A) Initial Therapy. Approve for 6 months if the patient meets all of the following criteria (i, ii, iii, iv, v, vi, vii, viii, and ix):
- **i.** Patient is ≥ 18 years of age; AND
- **ii.** According to the prescriber, the patient has myelodysplastic/myeloproliferative neoplasm with ring sideroblasts and thrombocytosis-associated anemia; AND
- **iii.** Patient has very low- to intermediate-risk disease, as determined by the prescriber; AND
  Note: This is determined using the International Prognostic Scoring System (IPSS).
- **iv.** Patient does not have a confirmed mutation with deletion 5q (del 5q); AND
- **v.** Patient currently requires blood transfusions, defined as at least two red blood cell units over the previous 8 weeks; AND
- **vi.** Patient meets ONE of the following (a or b):
  - **a)** Patient tried an erythropoiesis stimulating agent for at least 3 months, unless intolerant; OR
  - **b)** Serum erythropoietin level is greater than 500 mU/L; AND
- **vii.** Pretreatment hemoglobin level is < 10.0 g/dL; AND
- **viii.** Reblozyl will not be used in combination with an erythropoiesis stimulating agent; AND
- **ix.** The medication is being prescribed by or in consultation with an oncologist or hematologist.

B) Patient is Currently Receiving Reblozyl. Approve for 1 year if, according to the prescriber, the patient has experienced a clinically meaningful decrease in transfusion burden.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Reblozyl is not recommended in the following situations:

57. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Hematology – Tretten Prior Authorization Policy

- Tretten® (coagulation Factor XIII A-Subunit [recombinant] injection for intravenous use – NovoNordisk)

REVIEW DATE: 09/09/2020

OVERVIEW

Tretten, a coagulation Factor XIII A-Subunit, is indicated for routine prophylaxis of bleeding in patients with congenital factor XIII A-subunit deficiency.[1] The agent is not for use in patients with congenital Factor XIII B-subunit deficiency.

Disease Overview

Congenital Factor XIII deficiency is caused by defects in both Factor XIIIA and Factor XIIIB genes.[2] However, most cases are due to genetic alterations on the Factor XIIIA gene. The estimated prevalence of Factor XIIIA deficiency is one case in 1 to 2 million people. Clinical symptoms include delayed wound healing, bleeding of soft and subcutaneous tissue, recurrent spontaneous miscarriage, and central nervous system (CNS) bleeding, which may be life-threatening. If patients have severe Factor XIII deficiency, early manifestations include bleeding from the umbilical cord or CNS. Prospective data showed that a level of 30% Factor XIII clotting activity is an adequate therapeutic target for most patients. Treatment of Factor XIII deficiency involves use of fresh frozen plasma, cryoprecipitate, Corifact® (Factor XIII concentration injection for intravenous use), or Tretten.

Guidelines

The National Hemophilia Foundation Medical and Scientific Advisory Council has guidelines for the treatment of hemophilia and other bleeding disorders (revised February 2020).[3] Tretten is recommended in patients who have

factor XIII deficiency who lack the factor XIII-A subunit. It will not work in patients who only lack factor XIII-B subunit.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Tretten. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Tretten as well as the monitoring required for adverse events and long-term efficacy, Tretten approval requires Tretten to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tretten is recommended in those who meet the following criteria:

FDA-Approved Indication

40. Congenital Factor XIII A-Subunit Deficiency. Approve for 1 year if the agent is prescribed by or in consultation with a hematologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tretten is not recommended in the following situations:

58. Congenital Factor XIII B-Subunit Deficiency. Tretten will not work in patients who only lack Factor XIII-B subunit.[1,2]

59. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Hematology – Vonvendi Prior Authorization Policy

- Vonvendi® (von Willebrand factor [recombinant] injection for intravenous use – Baxalta)

REVIEW DATE: 09/09/2020

OVERVIEW

Vonvendi, a recombinant von Willebrand factor (VWF), is indicated for use in adults ≥ 18 years of age diagnosed with von Willebrand disease (VWD) for:[1]

- **On-demand treatment and control** of bleeding episodes.
- **Perioperative management** of bleeding.

Disease Overview

VWD is an inherited bleeding disorder caused by a deficiency or impairment of a protein found in blood called VWF. VWF is a plasma protein with a dual role in hemostasis by mediating platelet adhesion at sites of vascular injury and by binding and stabilizing factor VIII. The disease is rather common as it affects 1 in 100 people; both genders are impacted equally. Symptoms of VWD include mucocutaneous bleeding and excessive hemorrhage following invasive procedures; occasionally, soft tissue hematomas and joint bleeding may also occur. Women who have VWD may experience heavy menorrhagia or experience excessive bleeding at childbirth. Bleeding episodes may be life-threatening in patients with severe forms of VWD. VWD is classified into six types (1, 2A, 2B, 2M, 2N, and 3) according to distinct genotypic, clinical, and laboratory phenotypic characteristics. Type 1 VWD is the most common type (60% to 80% of patients)[4] and represents a partial quantitative deficiency of VWF. Bleeding symptoms are generally mild to moderate.[5] Type 2 VWD affects 15% to 30% of patients and consists of four disease subtypes (2A,

2B, 2M, and 2N) dependent on the specific gene mutation (e.g., decreased VWF-dependent platelet adhesion, decreased binding affinity for factor VIII). This type is due to a qualitative VWF defect and the bleeding is generally moderate, but can vary among patients. Type 3 VWD is uncommon (5% to 10% of patients)[4] but is usually severe because it is due to a virtually complete deficiency of VWF.[5] Many patients with VWD also have reduced factor VIII levels. Treatment options for VWD include desmopressin either parenterally or by a highly concentrated nasal spray (Stimate), Vonvendi, or plasma-derived Factor VIII product that contain VWF.

Guidelines

The National Hemophilia Foundation Medical and Scientific Advisory Council has guidelines for the treatment of hemophilia and other bleeding disorders (revised February 2020).[3] Most patients with type 1 VWD may be treated with a desmopressin product (DDAVP injection or Stimate nasal spray). Some patients with type 2A VWD may respond to DDAVP; a clinical trial with DDAVP should be performed to determine if DDAVP can be used for these particular patients. The guidelines recommend that both DDAVP injection and Stimate not be used in children aged < 2 years and in patients with VWD in whom desmopressin does not provide adequate VWF levels. Also, they should be used cautiously in pregnant women during labor and deliver. Use of plasma-derived VWF-containing Factor VIII concentrates that have VWF is recommended in certain types of VWD that do not respond to therapy with desmopressin (i.e., type 2B VWD and type 3 VWD). Also, plasma-derived Factor VIII concentrates that contain VWF are recommended in types 1, 2A, 2M, and 2N VWD who have become transiently unresponsive to DDAVP, as well as in surgical situations, especially in young children < 2 years of age. Alphanate, Humate-P, and Wilate are indicated for use in VWD; in certain patients Koāte®– DVI (antihemophilic Factor [plasma-derived] injection) may also be effective. Use of cryoprecipitate is not recommended as it has not undergone any viral attenuation steps. Cryoprecipitate should not be utilized to treat patients with VWD except in life- and limb-threatening emergencies when VWD-containing factor VIII concentrate is not immediately available. Vonvendi is available to treat patients with Type 2B and Type 3 VWD; it can also be used in patients with Types 1, 2A, 2M, and 2N VWD who are not responsive to DDAVP and in children < 2 years of age, regardless of VWD type. It contains ultra-large VWF multimers, in addition to the high, medium, and low molecular weight VWF multimers normally found in plasma. Trace amounts of recombinant Factor VIII is in the product as well.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Vonvendi. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Vonvendi as well as the monitoring required for adverse events and long-term efficacy, approval requires Vonvendi to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Vonvendi is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **Von Willebrand Disease.** Approve for 1 year if the agent is prescribed by or in consultation with a hematologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Vonvendi is not recommended in the following situations:

60. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Hemophilia – Eptacog Products – NovoSeven RT Prior Authorization Policy

- NovoSeven® RT (Coagulation Factor VIIa [recombinant] for intravenous use – Novo Nordisk)

REVIEW DATE: 10/28/2020

OVERVIEW

NovoSeven RT is indicated for the treatment of bleeding episodes and perioperative management in the following conditions:

- **Congenital Factor VII deficiency** in adults and children;
- **Glanzmann's thrombasthenia** with refractoriness to platelet transfusions in adults and children, with or without antibodies to platelets;
- **Hemophilia, acquired** in adults; and
- **Hemophilia A or B with inhibitors** in adults and children.[1]

Of note, off-label use of NovoSeven RT in the general population has been suggested in a variety of acute bleeding scenarios (e.g., trauma, intracranial hemorrhage). A 2012 Cochrane Review concluded that the effectiveness of recombinant activated Factor VIIa as a general hemostatic drug in non-hemophiliac patients remains unproven and that use outside its licensed indications should be limited to clinical trials.[2] Various reviews and clinical practice guidelines concur that the evidence is insufficient to support use of NovoSeven RT as a hemostatic agent outside of its labeled uses.[3-5]

Guidelines

The National Hemophilia Foundation Medical and Scientific Advisory Council (MASAC) guidelines (updated February 2020) support NovoSeven RT as a treatment option for inherited **hemophilia A or B with inhibitors**, **acquired hemophilia A** (other forms of acquired hemophilia not addressed), and **Factor VII deficiency**.[6] Glanzmann's thrombasthenia is not addressed in the guideline. MASAC recommendations (2013) also state that NovoSeven RT has demonstrated efficacy and safety for prophylactic use for patients with inhibitors in hemophilia A and hemophilia B.[7]

Regarding **hemophilia A and B with inhibitors**, World Federation of Hemophilia guidelines (2020) support recombinant Factor VIIa for patients with high-titer inhibitors who require acute treatment or around surgery/invasive procedures.[8] For low-titer inhibitors, Factor VIII or IX replacement may be used. These products may also be used for patients with a history of a high-titer inhibitor whose titer has fallen to low or undetectable levels. However, once an anamnestic response occurs, further treatment with Factor replacement is typically no longer effective, and bypass agent therapy (e.g., recombinant Factor VIIa) is needed. National Hemophilia Foundation MASAC guidelines (updated February 2020) have similar recommendations: treatment for patients with inhibitors depends on multiple factors, including type of inhibitor (high- or low-responding), current titer, location of bleed, and previous response.[6]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of NovoSeven RT. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with NovoSeven RT as well as the monitoring required for adverse events and long-term efficacy, approval requires these agents to be prescribed by or in consultation with a physician who specializes in the condition being treated.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of NovoSeven RT is recommended in those who meet the following criteria:

FDA-Approved Indications

41. Congenital Factor VII Deficiency. Approve for 1 year if NovoSeven RT is prescribed by or in consultation with a hemophilia specialist.

42. Glanzmann's Thrombasthenia. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** Patient is refractory to platelet transfusions; AND
- **B)** NovoSeven RT is prescribed by or in consultation with a hematologist.

43. Hemophilia, Acquired. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** NovoSeven RT is prescribed by or in consultation with a hemophilia specialist.

44. Hemophilia A with Inhibitors. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** Patient meets one of the following (i, ii, or iii):
  - **i.** Patient has a positive inhibitor titer ≥ 5 Bethesda Units; OR
  - **ii.** Patient has a history of an inhibitor with anamnestic response to Factor VIII replacement therapy, which, according to the prescriber, precludes the use of Factor VIII replacement to treat bleeding episodes; OR
  - **iii.** Patient has a history of an inhibitor with refractory hemostatic response to increased Factor VIII dosing, which, according to the prescriber, precludes the use of Factor VIII replacement to treat bleeding episodes; AND
- **B)** NovoSeven RT is prescribed by or in consultation with a hemophilia specialist.

45. Hemophilia B with Inhibitors. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** Patient meets one of the following (i, ii, or iii):
  - **i.** Patient has a positive inhibitor titer ≥ 5 Bethesda Units; OR
  - **ii.** Patient has a history of an inhibitor with anamnestic response to Factor IX replacement therapy, which, according to the prescriber, precludes the use of Factor IX replacement to treat bleeding episodes; OR
  - **iii.** Patient has a history of an inhibitor with refractory hemostatic response to increased Factor IX dosing, which, according to the prescriber, precludes the use of Factor IX replacement to treat bleeding episodes; AND
- **B)** NovoSeven RT is prescribed by or in consultation with a hemophilia specialist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of NovoSeven RT is not recommended in the following situations:

61. Bleeding Associated with Liver Disease. Randomized trials have failed to show benefit of NovoSeven RT in controlling upper gastrointestinal bleeding and variceal bleeding in patients with advanced liver disease.[9,10] American Association for the Study of Liver Disease guidelines for portal hypertensive bleeding in cirrhosis (2016) state that recombinant Factor VIIa should not be used to correct coagulopathy in this scenario.[11]

62. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
New Policy	--	10/02/2019
Annual Revision	Policy renamed to "Hemophilia – Eptacog Products – NovoSeven RT". In addition, the following changes were made: **Glanzmann's Thrombasthenia:** Added criterion that the patient be refractory to platelet transfusions, based on product labeling. **Hemophilia, Acquired:** Approval condition renamed to "Hemophilia, Acquired" to align with product labeling. An age criterion of ≥ 18 years of age was added in alignment with product labeling. **Hemophilia A with Inhibitors** and **Hemophilia B with Inhibitors:** Criteria were added requiring an inhibitor titer of ≥ 5 Bethesda Units, anamnestic response to Factor replacement, or refractoriness to increased Factor dosing.	10/28/2020

PRIOR AUTHORIZATION POLICY

POLICY: Hemophilia – Eptacog Products – Sevenfact Prior Authorization Policy

- Sevenfact® (Factor VIIa [recombinant]-jncw for intravenous infusion – LFB S.A./Hema Biologics)

REVIEW DATE: 10/07/2020

OVERVIEW

Sevenfact, a recombinant Factor VIIa product, is indicated for the treatment and control of bleeding episodes occurring in adults and adolescents (≥ 12 years of age) with hemophilia A or B with inhibitors.[1] As a limitation of use, Sevenfact is not indicated for the treatment of patients with congenital Factor VII deficiency.

Disease Overview

Hemophilia is the most common severe hereditary hemorrhagic disorder.[3] It is inherited in an X-linked recessive fashion; thus, males are much more commonly affected. Of note, approximately 30% of hemophilia cases result from spontaneous mutation with no family history. Hemophilia A (Factor VIII deficiency) is the most common form (80% to 85% of total hemophilia cases) and occurs in 1:5,000 live male births. Hemophilia B (Factor IX deficiency) occurs in 1:30,000 live male births.

Antibodies to exogenous clotting factor, known as "inhibitors", may develop. Approximately 30% of patients with severe hemophilia A and up to 5% of patients with severe hemophilia B develop inhibitors to Factor VIII or Factor IX during their lifetime.[4] A high-responding inhibitor (≥ 5 Bethesda Units [BU]) tends to be persistent, whereas low-responding inhibitors of < 5 BU may wane without changes to the treatment regimen. Presence of inhibitors is associated with higher disease burden, increased risk of musculoskeletal complications, pain, physical limitations, and treatment challenges.[4,5]

Guidelines

Sevenfact is not specifically addressed in hemophilia guidelines; recombinant Factor VIIa is referenced more generally. World Federation of Hemophilia (WFH) guidelines (2020) support recombinant Factor VIIa for patients with high-titer inhibitors who require acute treatment or around surgery/invasive procedures.[5] For low-titer inhibitors, Factor VIII or IX replacement may be used. These products may also be used for patients with a history of a high-titer inhibitor whose titer has fallen to low or undetectable levels. However, once an anamnestic response occurs, further treatment with Factor replacement is typically no longer effective, and bypass agent therapy (e.g., recombinant Factor VIIa) is needed. National Hemophilia Foundation MASAC guidelines (updated February 2020) have similar recommendations: treatment for patients with inhibitors depends on multiple factors, including type of inhibitor (high- or low-responding), current titer, location of bleed, and previous response.[7]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Sevenfact. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Sevenfact as well as the monitoring required for adverse events and long-term efficacy, approval requires Sevenfact to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Sevenfact is recommended in those who meet the following criteria:

FDA-Approved Indications

46. Hemophilia A with Inhibitors. Approve for 1 year if the patient meets all of the following (A, B, and C):
- **A)** Patient is ≥ 12 years of age; AND
- **B)** Patient meets one of the following (i, ii, or iii):
  - **i.** Patient has a positive inhibitor titer ≥ 5 Bethesda Units; OR
  - **ii.** Patient has a history of anamnestic response to Factor VIII replacement therapy, which, according to the prescriber, precludes the use of Factor VIII replacement to treat bleeding episodes; OR
  - **iii.** Patient has a history of refractory response to increased Factor VIII dosing, which, according to the prescriber, precludes the use of Factor VIII replacement to treat bleeding episodes; AND
- **C)** Sevenfact is prescribed by or in consultation with a hemophilia specialist.

47. Hemophilia B with Inhibitors. Approve for 1 year if the patient meets all of the following (A, B, and C):
- **A)** Patient is ≥ 12 years of age; AND
- **B)** Patient meets one of the following (i, ii, or iii):
  - **i.** Patient has a positive inhibitor titer ≥ 5 Bethesda Units; OR
  - **ii.** Patient has a history of anamnestic response to Factor IX replacement therapy, which, according to the prescriber, precludes the use of Factor IX replacement to treat bleeding episodes; OR
  - **iii.** Patient has a history of refractory response to increased Factor IX dosing, which, according to the prescriber, precludes the use of Factor IX replacement to treat bleeding episodes; AND
- **C)** Sevenfact is prescribed by or in consultation with a hemophilia specialist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Sevenfact is not recommended in the following situations:

63. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

- Mononine® (Coagulation Factor IX [plasma-derived] injection – CSL Behring)
- Profilnine® (Factor IX Complex [plasma-derived] injection – Grifols)

REVIEW DATE: 02/19/2020

OVERVIEW

Alprolix, Idelvion, and Rebinyn are extended half-life recombinant Factor IX products indicated in adults and children with hemophilia B for on-demand treatment and control of bleeding episodes and perioperative management of bleeding.[1-3] Alprolix and Idelvion are also indicated for routine prophylaxis to reduce the frequency of bleeding episodes. BeneFIX and Ixinity are standard half-life recombinant Factor IX products that are indicated for the control and prevention of bleeding episodes in adult and pediatric patients (≥ 12 years of age for Ixinity) with hemophilia B, as well as for perioperative management.[4,5] Rixubis is indicated for use in adults and children with hemophilia B for on-demand treatment and control of bleeding episodes; perioperative management of bleeding; and routine prophylaxis to reduce the frequency of bleeding episodes.[6] AlphaNine SD, Mononine, and Profilnine plasma-derived Factor IX products that are indicated for the prevention and control of bleeding in patients with Factor IX deficiency due to hemophilia B.[7-9]

Disease Overview

Hemophilia B is a recessive X-linked bleeding disorder caused by mutations in the factor IX gene that leads to the deficiency or absence of the coagulation factor IX.[10,11] It occurs in 1 out of 30,000 male births and affects about 5,000 people in the US. Hemophilia B predominantly occurs in males; however, approximately 10% of females are carriers and are at risk of usually mild bleeding. The severity of bleeding depends on the degree of the factor IX defect and the phenotypic expression. Factor levels of <1%, 1% to 5%, and > 5% to < 40% are categorized as severe, moderate, and mild hemophilia B, respectively. Patients with mild hemophilia B may only experience abnormal bleeding during surgery, during tooth extractions, or when injured. Patients with moderate hemophilia B generally have prolonged

bleeding responses to minor trauma. Severe hemophilia B is marked by spontaneous bleeding such as spontaneous hemarthrosis, soft-tissue hematomas, retroperitoneal bleeding, intracerebral hemorrhage, and delayed bleeding post-surgery. Complications from recurrent bleeding and soft-tissue hematomas include severe arthropathy, and joint contractures, which may lead to pain and disability. The main treatment of hemophilia B is replacement of missing blood coagulation with Factor IX products. Factor IX replacement therapy may be used on-demand when bleeding occurs or given as routine prophylaxis with scheduled infusions. Both plasma-derived and recombinant Factor IX products are available. In general, prophylactic therapy has been associated with a reduction in bleeds and improved outcomes for selected patients (e.g., patients with moderate or severe factor IX deficiency). The goal of therapy is to prevent uncontrolled internal hemorrhage and severe joint damage and to properly manage bleeding episodes. The development of inhibitors occurs at a lower frequency in patients with severe hemophilia B compared with severe hemophilia A but can occur in up to 5% of patients. Higher doses than that typically used for these uses of standard half-life products can be given if the patient develops an inhibitor.

Guidelines

In April 2018, the Medical and Scientific Council (MASAC) from the National Hemophilia Foundation (NHF) updated recommendations concerning products licensed for the treatment of hemophilia and other bleeding disorders.[12] The guidelines discuss Factor IX products. Due to safety issues, recombinant Factor IX is the treatment of choice for patients in the management of hemophilia B. Regarding plasma-derived Factor IX concentrates, improved viral-depleting processes and donor screening practices have led to plasma-derived Factor IX products that have a greatly reduced risk for transmission of human immunodeficiency virus (HIV), hepatitis B virus (HBV), and hepatitis C virus (HCV). Due to higher purity and only limited amounts of other factors contained in the products, AlphaNine SD and Mononine are the human plasma-derived products that are considered to be of high purity and are recognized options by MASAC in the management of hemophilia B. Profilnine is used in patients with Factor II and/or X deficiency.[12] Some data are available, albeit limited.[13]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of the following Factor IX products: Alprolix, Idelvion, Rebinyn, BeneFIX, Ixinity, Rixubis, AlphaNine, Mononine, and Profilnine. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with recombinant Factor IX products, as well as the monitoring required for adverse events and long-term efficacy, the agent is required to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

I. Coverage of Alprolix, Idelvion, Rebinyn, BeneFIX, Ixinity, and Rixubis is recommended for patients who meet the following criteria:

FDA-Approved Indications

48. Hemophilia B. Approve for 1 year if the agent is prescribed by or in consultation with a hemophilia specialist.

II. Coverage of AlphaNine SD, Mononine, and Profilnine is recommended for patients who meet the following criteria:

FDA-Approved Indications

1. Hemophilia B. Approve for 1 year if the agent is prescribed by or in consultation with a hemophilia specialist.

III. Coverage of Profilnine is recommended for patients who meet the following criteria:

Other Uses with Supportive Evidence

2. **Factor II Deficiency.** Approve Profilnine for 1 year if the agent is prescribed by or in consultation with a hemophilia specialist.

3. **Factor X Deficiency.** Approve Profilnine for 1 year if the agent is prescribed by or in consultation with a hemophilia specialist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of the cited Factor IX products is not recommended in the following situations:

64. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

- Koāte® (Antihemophilic Factor injection – Grifols/Kedrion Biopharma)
- Wilate® (von Willebrand Factor/Coagulation Factor VIII Complex for intravenous use – Octapharma)

REVIEW DATE: 02/19/2020

OVERVIEW

For the management of hemophilia A, many recombinant Factor VIII products are available, including extended half-life products[1-4] (Adynovate, Eloctate, Esperoct, and Jivi) as well as standard half-life products (Advate, Afstyla, Helixate, Kogenate FS, Kovaltry, Novoeight, Nuwiq, Recombinate, and Xyntha).[5-16] In general, such products are used for the on-demand treatment and control of bleeding episodes, perioperative management of bleeding, and for routine prophylaxis to reduce the frequency of bleeding episodes. Several standard half-life Factor VIII plasma-derived products are available. Hemofil M and Monoclate P are plasma-derived standard half-life products that do not contain substantial amounts of von Willebrand Factor which are indicated in hemophilia A (classical hemophilia) for the prevention and control of hemorrhagic episodes.[17,18] Plasma-derived Factor VIII products that contain von Willebrand Factor include Alphanate, Humate P, Koate, and Wilate.[19-22] Alphanate is indicated for the control and prevention of bleeding in adult and pediatric patients with hemophilia A.[1] Alphanate is also indicated for surgical and/or invasive procedures in adult and pediatric patients with von Willebrand Disease in whom desmopressin is either ineffective or contraindicated. The agent is not indicated for patients with severe von Willebrand Disease (type 3) undergoing major surgery.[19] Humate-P is indicated for the treatment and prevention of bleeding in adults with hemophilia A (classical hemophilia).[20] Humate P is also indicated in adult and pediatric patients with von Willebrand disease for the treatment of spontaneous and trauma-induced bleeding episodes and for the prevention of excessive bleeding during and after surgery. The indication in von Willebrand Disease applies to patients with severe von Willebrand disease, as well as in patients with mild to moderate von Willebrand disease where use of desmopressin is known or suspected to be inadequate. Koate is indicated for the control and prevention of bleeding episodes or in order to perform emergency elective surgery in patients with hemophilia A.[21] Wilate is indicated in children and adults with von Willebrand disease for on-demand treatment and control of bleeding episodes and for perioperative management of bleeding.[22] Wilate is also indicated in adolescents and adults with hemophilia A for routine prophylaxis to reduce the frequency of bleeding episodes and on-demand treatment and control of bleeding episodes.

Disease Overview

Hemophilia A is an X-linked bleeding disorder caused by a deficiency in Factor VIII.[23-25] In the US, the incidence of hemophilia A in males is 1:5,000 with an estimated 20,000 people in the US living with hemophilia A. Sometimes the disorder is caused by a spontaneous genetic mutation. Males primarily have the disorder and most times females are asymptomatic carriers. The condition is characterized by bleeding in joints, either spontaneously or in a provoked joint. Bleeding can occur in many different body areas (e.g., muscles, central nervous system, gastrointestinal). Hemarthrosis is the main sign of hemophilia in older children and adults. In newborns and toddlers, bleeding in the

head (intracranial hemorrhage and extracranial hemorrhage), bleeding from circumcision, and in the oral cavity are more common. The bleeding manifestations can lead to substantial morbidity, as well as mortality, if not properly treated. Disease severity is usually defined by the plasma levels of Factor VIII and have been classified as follows: severe (levels less than 1% of normal [normal plasma levels are 50 to 100 U/dL]), moderate (levels 1% to 5% of normal), and mild (levels > 5%); phenotypic expression may also vary. Approximately 25% to 30% of patients with hemophilia A have severe deficiency whereas 3% to 13% of patients have moderate to mild deficiency. Diagnoses can be substantially delayed, especially in patients with mild disease, as bleeding may not clinically occur. Higher doses than that typically used for these uses of standard half-life products can be given if the patient develops an inhibitor, which develop in approximately 25% of patients.[26]

Von Willebrand Disease is a group of inherited bleeding disorders related to defects of von Willebrand Factor (vWF), which is needed to achieve hemostasis.[27-29] It occurs equally in males and females. The disease leads to bleeding from impaired platelet adhesion and aggregation, which may be accompanied by reduced levels of factor VIII. Mucous membrane and skin bleeding symptoms, as well as bleeding with surgical or other hematostatic challenges, may occur. The prevalence of the disease is approximately 1.3%. Pregnancy can increase vWF levels and confound diagnosis. The three major subsubtypes of von Willebrand Disease include: partial quantitative vWF deficiency (type 1, 75% of patients); qualitative vWF deficiency (type 2, 25% of patients); and complete vWF deficiency (type 3, rare). Type 2 disease is further divided into four variants (2A, 2B, 2M, 2N) on the basis of the phenotype. In type 3 von Willebrand Disease, Factor VIII levels are usually very low. Acquired von Willebrand syndrome may result but is rare, occurring in fewer than one in 100,000 adults. The bleeding risk varies between modest increases in bleeding which occur only with procedures to a major risk of spontaneous hemorrhage. Approaches to the management of von Willebrand Disease involve increasing plasma concentrations of vWF through stimulation with desmopressin; replacing vWF by using human plasma-derived viral inactivated concentrates; and promoting hemostasis by use of hemostatic agents with mechanisms other than increasing vWF; and Vonvendi® (von Willebrand factor [recombinant] injection for intravenous use). Regular prophylaxis is not frequently required.

Guidelines

The National Hemophilia Foundation (NHF) Medical and Scientific Advisory Council (MASAC) has recommendations concerning products used for the treatment of hemophilia and other bleeding disorders.[23] It is noted that recombinant Factor VIII products are the recommended treatment of choice for patients with hemophilia A. The MASAC recommendations regarding plasma-derived Factor VIII products state that improved viral-depleting processes and donor screening practices have greatly reduced the risk of transmission and human immunodeficiency virus (HIV), hepatitis B (HBV), and hepatitis C virus (HCV).

MASAC recommendations also discuss von Willebrand Disease and vWF-containing Factor VIII products.[23] Most patients with von Willebrand Disease type 1 may be treated with either desmopressin (either parenterally [DDAVP injection] or by a highly concentrated nasal spray [Stimate nasal spray]). For surgery, trauma, or other serious bleeding episodes, if hemostasis is not achieved using DDAVP, a Factor VIII concentrate that contains high molecular weight multimers of vWF should be used. Patients with type 2B and type 3 von Willebrand Disease, and those with type 1, 2A, 2M, and 2N who have not responded adequately to DDAVP should be treated with a Factor VIII concentrate that contains higher molecular weight multimers of vWF. Products FDA-approved for this use include Alphanate, Humate P, and Wilate. Koate may be effective but it not FDA-approved for this use.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of the following Factor VIII products: Adynovate, Eloctate, Esperoct, Jivi, Advate, Afstyla, Helixate FS, Kogenate FS, Kovaltry, Novoeight, Nuwiq, Recombinate, Xyntha, Hemofil M, Monoclate P, Alphanate, Humate-P, Koate, and Wilate. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with recombinant Factor VIII products, as well as the monitoring required for adverse events and long-term efficacy, the agent is required to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

I. Coverage of Adynovate, Eloctate, Esperoct, Jivi, Advate, Afstyla, Helixate FS, Kogenate FS, Kovaltry, Novoeight, Nuwiq, Recombinate, and Xyntha is recommended in those who meet one of the following criteria.

FDA-Approved Indications

49. Hemophilia A. Approve the requested agent for 1 year if the agent is prescribed by or in consultation with a hemophilia specialist.

II. Coverage of Hemofil M, Monoclate-P, Alphanate, Humate-P, Koate, and Wilate is recommended in those who meet one of the following criteria:

1. Hemophilia A. Approve the requested agent for 1 year if the agent is prescribed by or in consultation with a hemophilia specialist.

2. Von Willebrand Disease. Approve for 1 year if the agent is prescribed by or in consultation with a hemophilia specialist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Factor VIII products is not recommended in the following situations:

65. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Hemophilia – FEIBA Prior Authorization Policy

- Hemophilia – FEIBA® (anti-inhibitor coagulant complex for intravenous use – Takeda)

REVIEW DATE: 10/28/2020

OVERVIEW

FEIBA, a human plasma fraction with Factor VIII bypassing activity, is indicated for use in **hemophilia A and B patients with inhibitors for control and prevention of bleeding episodes, perioperative management, and routine prophylaxis** to prevent or reduce the frequency of bleeding episodes.[1] It contains both activated and inactivated forms of Factors II, VII, IX, and X and is thus referred to as activated prothrombin complex concentrate (aPCC).[1,2] FEIBA is produced from pooled human plasma.[1]

Guidelines

Regarding **hemophilia A with inhibitors** and **hemophilia B with inhibitors** (without history of anaphylaxis/allergy to Factor IX), World Federation of Hemophilia guidelines (2020) support aPCC for patients with high-titer inhibitors who require acute treatment or around surgery/invasive procedures.[3] For low-titer inhibitors, Factor VIII or IX replacement may be used. These products may also be used for patients with a history of a high-titer inhibitor whose titer has fallen to low or undetectable levels. However, once an anamnestic response occurs, further treatment with

Factor replacement is typically no longer effective, and bypass agent therapy (e.g., aPCC) is needed. National Hemophilia Foundation Medical and Scientific Advisory Council (MASAC) guidelines (updated February 2020) have similar recommendations: treatment for patients with inhibitors depends on multiple factors, including type of inhibitor (high- or low-responding), current titer, location of bleed, and previous response.[2]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of FEIBA. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with FEIBA as well as the monitoring required for adverse events and long-term efficacy, approval requires these agents to be prescribed by or in consultation with a physician who specializes in the condition being treated.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of FEIBA is recommended in those who meet the following criteria:

FDA-Approved Indications

50. Hemophilia A with Inhibitors. Approve for 1 year if the patient meets the following criteria (A and B):

- **A)** Patient meets one of the following (i, ii, or iii):
  - **i.** Patient has a positive inhibitor titer ≥ 5 Bethesda Units; OR
  - **ii.** Patient has a history of an inhibitor with anamnestic response to Factor VIII replacement therapy, which, according to the prescriber, precludes the use of Factor VIII replacement to treat bleeding episodes; OR
  - **iii.** Patient has a history of an inhibitor with refractory hemostatic response to increased Factor VIII dosing, which, according to the prescriber, precludes the use of Factor VIII replacement to treat bleeding episodes; AND
- **B)** FEIBA is prescribed by or in consultation with a hemophilia specialist.

51. Hemophilia B with Inhibitors. Approve for 1 year if the patient meets the following criteria (A and B):

- **A)** Patient meets one of the following (i, ii, or iii):
  - **i.** Patient has a positive inhibitor titer ≥ 5 Bethesda Units; OR
  - **ii.** Patient has a history of an inhibitor with anamnestic response to Factor IX replacement therapy, which, according to the prescriber, precludes the use of Factor IX replacement to treat bleeding episodes; OR
  - **iii.** Patient has a history of an inhibitor with refractory hemostatic response to increased Factor IX dosing, which, according to the prescriber, precludes the use of Factor IX replacement to treat bleeding episodes; AND
- **B)** FEIBA is prescribed by or in consultation with a hemophilia specialist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of FEIBA is not recommended in the following situations:

66. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Hemophilia – Hemlibra Prior Authorization Policy
- Hemlibra® (emicizumab-kxwh injection for subcutaneous use – Genentech/Roche/Chugai)

REVIEW DATE: 12/02/2020

OVERVIEW

Hemlibra, a bispecific Factor IXa- and Factor X-directed antibody, is indicated for routine prophylaxis to prevent or reduce the frequency of bleeding episodes in patients aged newborn and older with **hemophilia A** (congenital factor VIII deficiency) with or without factor VIII inhibitors.[1]

Disease Overview

Hemophilia A is an X-linked bleeding disorder caused by a deficiency in Factor VIII.[2-4] In the US, the incidence of hemophilia A in males is 1:5,000 with an estimated 20,000 people in the US living with hemophilia A. Sometimes the disorder is caused by a spontaneous genetic mutation. Males primarily have the disorder and most times females are asymptomatic carriers. The condition is characterized by bleeding in joints, either spontaneously or in a provoked joint. Bleeding can occur in many different body areas (e.g., muscles, central nervous system, gastrointestinal). Hemarthrosis is the main sign of hemophilia in older children and adults. In newborns and toddlers, bleeding in the head (intracranial hemorrhage and extracranial hemorrhage), bleeding from circumcision, and in the oral cavity are more common. The bleeding manifestations can lead to substantial morbidity, as well as mortality, if not properly treated. Disease severity is usually defined by the plasma levels of Factor VIII and have been classified as follows: severe (levels less than 1% of normal [normal plasma levels are 50 to 100 U/dL]), moderate (levels 1% to 5% of normal), and mild (levels > 5%); phenotypic expression may also vary. Approximately 25% to 30% of patients with hemophilia A have severe deficiency whereas 3% to 13% of patients have moderate to mild deficiency. Diagnoses can be substantially delayed, especially in patients with mild disease, as bleeding may not clinically occur. Higher doses than that typically used for these uses of standard half-life products can be given if the patient develops an inhibitor, which develop in approximately 25% of patients.[5] Products that contains Factor VIII, which are given intravenously, are utilized as well as agents such as Hemlibra.[2-4]

Guidelines

Two documents from the National Hemophilia Foundation Medical and Scientific Advisory Council provide recommendations regarding Hemlibra.[2,6] In general, Hemlibra has been shown to prevent or reduce the occurrence of bleeding in patients with hemophilia A in adults, adolescent, children and infants, both

with and without inhibitors. Subcutaneous administration at more prolonged dosing intervals is viewed as having advantages for some patients compared with intravenous administration of Factor VIII products.

Safety

Hemlibra has a Boxed Warning regarding thrombotic microangiopathy and thromboembolism.[1] Cases of thrombotic microangiopathy are thrombotic events were reported when on average a cumulative amount of > 100 U/kg/24 hours of activated prothrombin complex concentrate (aPCC) was given for 24 hours or more to patients receiving Hemlibra prophylaxis. Monitor for the development of thrombotic microangiopathy and thrombotic events when aPCC is given.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Hemlibra. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Hemlibra is recommended in those who meet the following criteria:

FDA-Approved Indication

46. Hemophilia A. Approve for 1 year if the patient meets the following criteria (A and B):
- **N)** Patient is using Hemlibra for routine prophylaxis; AND
- **O)** Medication is prescribed by or in consultation with a hemophilia specialist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Hemlibra is not recommended in the following situations:

10. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Hepatitis C – Epclusa Prior Authorization Policy

- Epclusa® (velpatasvir/sofosbuvir tablets – Gilead)
- velpatasvir/sofosbuvir tablets (authorized generic to Epclusa – Gilead)

REVIEW DATE: 06/17/2020

OVERVIEW

Epclusa is a fixed-dose combination of velpatasvir, a hepatitis C virus (HCV) NS5A inhibitor, and sofosbuvir, an HCV nucleotide analog NS5B polymerase inhibitor, indicated for the treatment of chronic HCV genotype 1 through 6 infection in adult and pediatric patients ≥ 6 years of age or weighing ≥ 17 kg.[1] In patients without cirrhosis or with compensated cirrhosis, Epclusa is indicated alone. In patients with decompensated cirrhosis (Child-Pugh B or C), Epclusa is indicated in combination with ribavirin.

Dosing

The recommended dosage of Epclusa in adults is one tablet (400 mg velpatasvir/100 mg sofosbuvir) taken orally once daily (QD) with or without food.[1] In pediatric patients ≥ 6 years of age or weighing ≥ 17 kg to < 30 kg the recommended dosage of Epclusa is one tablet (200 mg velpatasvir/50 mg sofosbuvir) QD with or without food. In pediatric patients ≥ 6 years of age or weighing ≥ 30 kg the recommended dosage of Epclusa is one tablet (400 mg velpatasvir/100 mg sofosbuvir) or two tablets (200 mg velpatasvir/50 mg sofosbuvir) QD with or without food. In patients with decompensated cirrhosis (Child-Pugh B or C), Epclusa is administered with weight-based ribavirin (WBR). The FDA-approved duration of therapy is 12 weeks for all patients.

Clinical Efficacy

The efficacy of Epclusa for the treatment of genotypes 1 through 6 chronic HCV was established in four published, Phase III clinical trials (ASTRAL-1, -2, -3, and -4).[3-5] In ASTRAL-1, -2, and -3, a total of 1,035 patients received 12 weeks of Epclusa; 21% of patients had compensated cirrhosis and 28% had failed prior therapies for HCV. In the ASTRAL-4 study, 267 patients with decompensated cirrhosis (Child-Pugh B) were randomized to receive 12 or 24 weeks of Epclusa ± WBR. The primary endpoint for all four studies was sustained viral response 12 weeks after treatment completion (SVR12).

In ASTRAL-1 (n = 706), SVR12 was attained in 99% of patients overall with genotypes 1, 2, 4, 5, or 6 chronic HCV treated with Epclusa for 12 weeks. In ASTRAL-2 (n = 269), Epclusa was superior to Sovaldi + WBR in patients with genotype 2 chronic HCV. SVR12 was attained in 99% of patients treated for 12 weeks with Epclusa and in 94% of patients treated with Sovaldi + WBR for 12 weeks. In ASTRAL-3 (n = 558), Epclusa was superior to Sovaldi + WBR in patients with genotype 3 chronic HCV. SVR12 was attained in 95% of patients treated for 12 weeks with Epclusa and in 80% of patients treated with Sovaldi + WBR for 24 weeks.

In ASTRAL-4 (n = 268), Epclusa was administered in one of three regimens in patients with genotypes 1 through 6 chronic HCV with decompensated cirrhosis (Child-Pugh B). SVR12 was attained in 83%, 94%, and 86% of patients treated with Epclusa for 12 weeks, Epclusa + WBR for 12 weeks, and Epclusa for 24 weeks, respectively. The study was not designed to assess differences among treatment groups or by genotype. However, numerically higher rates of SVR12 were generally observed for Epclusa + WBR vs. non-ribavirin containing arms.

For more detailed efficacy information with Epclusa see the *Hepatitis C Virus Direct-Acting Antivirals Therapy Class Summary*.

Guidelines

American Association for the Study of Liver Diseases (AASLD) recommendations provide a simplified treatment algorithm for treatment-naïve adults without cirrhosis as well as for treatment-naïve patients with compensated cirrhosis. In treatment-naïve adults without cirrhosis the recommended regimens are Mavyret for 8 weeks or Epclusa for 12 weeks. In treatment-naïve adults with compensated cirrhosis, the recommended regimens are Mavyret for 8 weeks (genotypes 1 through 6) or Epclusa for 12 weeks (genotypes 1, 2, 4, 5, or 6; patients with genotype 3 require baseline NS5A resistance-associated substitution [RAS] testing and those without Y93H can be treated with 12 weeks of Epclusa). Additional genotype-specific and/or special circumstance-specific recommendations are also provided.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Epclusa (brand or generic). Criteria are based on the guidance issued by American Association for the Study of Liver Diseases (AASLD)/Infectious Diseases Society of America (IDSA, prescribing information, clinical data, and expert review. Because of the specialized skills required for evaluation and diagnosis of patients treated with Epclusa (brand or generic) as well as the monitoring required for adverse events (AEs) and efficacy, approval requires Epclusa (brand or generic) to be prescribed by or in consultation with a gastroenterologist, hepatologist, infectious diseases physician, or liver transplant physician. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Epclusa (brand or generic) is recommended in those who meet the following criteria:

FDA-Approved Indications

37. Chronic Hepatitis C Virus (HCV) Genotype 1, 2, 3, 4, 5, or 6, No Cirrhosis or Compensated Cirrhosis (Child-Pugh A). Approve Epclusa (brand or generic) for 12 weeks if the patient meets all of the following criteria (A, B, C, and D):

- **i.** The patient is ≥ 6 years of age or ≥ 17 kg; AND
- **ii.** Epclusa (brand or generic) is prescribed by or in consultation with a gastroenterologist, hepatologist, infectious diseases physician, or a liver transplant physician; AND
- **iii.** The patient has not been previously treated with Epclusa (brand or generic); AND
- **iv.** The patient does not have cirrhosis OR the patient has compensated cirrhosis (Child-Pugh A)

2. **Chronic Hepatitis C Virus (HCV) Genotype 1, 2, 3, 4, 5, or 6, Decompensated Cirrhosis (Child-Pugh B or C), Adults.** Approve Epclusa (brand or generic) for the specified duration if the patient meets all of the following criteria (A, B, C, D, and E):
   A) The patient is ≥ 18 years of age; AND
   B) Epclusa (brand or generic) is prescribed by or in consultation with a gastroenterologist, hepatologist, infectious diseases physician, or a liver transplant physician; AND
   C) The patient has not been previously treated with Epclusa (brand or generic) or Vosevi (*see Criterion 4*); AND
   D) The patient has decompensated cirrhosis (Child-Pugh B or C); AND
   E) The patient meets one of the following criteria:
      i. The patient is ribavirin-eligible, according to the prescribing physician: Approve Epclusa (brand or generic) for **12 weeks**, if Epclusa (brand or generic) is prescribed **in combination with ribavirin**; OR
      ii. The patient is ribavirin-ineligible, according to the prescribing physician: Approve Epclusa (brand or generic) for **24 weeks**.

3. **Chronic Hepatitis C Virus (HCV) Genotype 1, 2, 3, 5, 6, or 6, Decompensated Cirrhosis (Child-Pugh B or C), Pediatric Patients.** Approve Epclusa (brand or generic) for 12 weeks if the patient meets all of the following criteria (A, B, C, and D):
   A) The patient is ≥ 6 years of age or ≥ 17 kg; AND
   B) Epclusa (brand or generic) is prescribed by or in consultation with a gastroenterologist, hepatologist, infectious diseases physician, or a liver transplant physician; AND
   C) The patient has not been previously treated with Epclusa (brand or generic); AND
   D) The patient has decompensated cirrhosis (Child-Pugh B or C); AND
   E) Epclusa will be prescribed **in combination with ribavirin.**

Other Uses with Supportive Evidence

4. **Chronic Hepatitis C Virus, Genotype 1, 2, 3, 4, 5, or 6, Decompensated Cirrhosis (Child-Pugh B or C), Prior Null Responders, Prior Partial Responders, and Prior Relapsers to Epclusa (brand or generic) or Vosevi.** Approve Epclusa (brand or generic) for 24 weeks in patients who meet all of the following criteria (A, B, C, D, and E).
   A) The patient is ≥ 18 years of age; AND
   B) Epclusa (brand or generic) is prescribed by or in consultation with a gastroenterologist, hepatologist, infectious diseases physician, or a liver transplant physician; AND
   C) The patient has been previously treated with Epclusa (brand or generic) or Vosevi; AND
   D) The patient has decompensated cirrhosis (Child-Pugh B or C); AND
   E) Epclusa (brand or generic) will be prescribed in combination with ribavirin.

   AASLD guidelines recommend Epclusa for 24 weeks in combination with ribavirin for patients with genotypes 1, 2, 3, 4, 5, or 6 chronic HCV who have not responded to treatment with an NS5A inhibitor or sofosbuvir (Level II, C).[2] Data are limited to one Phase II study where Epclusa was studied in patients with genotype 1, 2, and 3 who did not respond to velpatasvir-containing regimens including Epclusa and Vosevi.[2,6] Retreatment with Epclusa + ribavirin for 24 weeks yielded high overall response rates (SVR12 91% [n = 63/69]). Among patients with genotype 1 chronic HCV, 97% of patients (n = 36/37) achieved SVR12. In patients with genotype 2 chronic HCV, SVR12 was attained in 95% of patients (n = 13/14) and in patients with genotype 3 chronic HCV, SVR12 was attained in 78% of patients (n = 14/18). Baseline NS5A resistance associated substitutions (RASs) did not appear to effect SVR rates. No breakdown of the proportion of patients with decompensated cirrhosis was provided in the study.

5. **Patient Has Been Started on Epclusa (brand or generic).** Approve for an indication or condition addressed as an approval in the Recommended Authorization Criteria section (FDA-Approved Indications or Other Uses with Supportive Evidence). Approve the duration described above to complete a course therapy (e.g., a patient who should receive 12 weeks, and has received 3 weeks should be approved for 9 weeks to complete their 12-week course).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Epclusa (brand or generic) has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

1. **Hepatitis C Virus (HCV) [any genotype], Combination with Any Other Direct-Acting Antivirals (DAAs) [Not Including Ribavirin].** Epclusa (brand or generic) provides a complete antiviral regimen for patients with genotype 1 HCV. Epclusa (brand or generic) is not recommended to be used with other products containing sofosbuvir. In the opinion of a specialist physician reviewing the data we have adopted this criterion.

2. **Life Expectancy Less Than 12 Months Due to Non-Liver Related Comorbidities.** Patients with a limited life expectancy that cannot be remediated by HCV treatment, liver transplantation, or another directed therapy do not require antiviral treatment. Patients with a short life expectancy owing to liver disease should be managed in consultation with an expert. Little evidence exists to support initiation of HCV treatment in patients with a limited life expectancy (< 12 months) owing to non-liver-related comorbid conditions. For these patients, the benefits of HCV treatment are unlikely to be realized and palliative care strategies should take precedence.

3. **Pediatric Patients (Age < 6 Years or < 17 kg).** The safety and efficacy of Epclusa (brand or generic) have not been established in pediatric patients < 6 years of age or < 17 kg.[1]

4. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
New policy	New policy	06/29/2016

Selected revision	Removed requirement of a trial of another DAA for genotype 1 chronic HCV.	08/17/2016
Annual revision	Criteria for patients with genotype 1, 2, or 3 chronic HCV with prior null response, prior partial response, or relapse to Epclusa with cirrhosis or advanced cirrhosis added as an approvable condition. The condition not recommended for approval of retreatment with Epclusa in patients who were prior null or partial responders or relapsers was removed. This in now addressed in separate criteria.	06/14/2017
Annual revision	Criteria for retreatment with Epclusa in patients with genotype 1, 2, or 3 chronic HCV was removed from the policy. Criteria for patients with decompensated cirrhosis updated to address ribavirin ineligible patients. Criteria for patients with decompensated cirrhosis previously treated with Vosevi or Epclusa added to other uses with supportive evidence.	06/13/2018
DEU revision	Authorized generics to Epclusa added to targeting and applicable criteria	12/14/2018
Annual Revision	No criteria changes	06/12/2019
Selected Revision	Chronic Hepatitis C Virus (HCV) Genotype 1, 2, 3, 4, 5, or 6, No Cirrhosis or Compensated Cirrhosis (Child-Pugh A): Criteria were changed to approve for patients ≥ 6 years of age or ≥ 17 kg. Chronic Hepatitis C Virus (HCV) Genotype 1, 2, 3, 4, 5, or 6, Decompensated Cirrhosis (Child-Pugh B or C), Adults: The indication was updated to add "Adults". Chronic Hepatitis C Virus (HCV) Genotype 1, 2, 3, 4, 5, or 6, Decompensated Cirrhosis (Child-Pugh B or C), Pediatric Patients: New criteria were created to approve for 12 weeks in pediatric patients ≥ 6 years of age or ≥ 17 kg not previously treated with Epclusa when the product is prescribed by a specialist and in combination with ribavirin. Pediatric Patients (< 18 years): Criteria for this Condition Not Recommended for Approval were changed to Pediatric Patients < 6 Years or < 17 kg).	03/25/2020
Annual Revision	No criteria changes	06/17/2020

PRIOR AUTHORIZATION POLICY

POLICY: Hepatitis C – Harvoni Prior Authorization Policy

- Harvoni® (ledipasvir/sofosbuvir tablets and oral pellets – Gilead)
- ledipasvir/sofosbuvir tablets (authorized generics to Harvoni 90 mg/400 mg tablets only – Gilead)

REVIEW DATE: 09/02/2020

OVERVIEW

Harvoni is a fixed-dose combination of ledipasvir, a hepatitis C virus (HCV) NS5A inhibitor, and sofosbuvir, an HCV nucleotide analog NS5B polymerase inhibitor, indicated for[1]:

- The treatment of chronic HCV genotype 1, 4, 5, and 6 infection in adults and pediatric patients ≥ 3 years of age with or without compensated cirrhosis; and
- Adult and pediatric patients ≥ 3 years of age with genotype 1 chronic HCV with decompensated cirrhosis in combination with ribavirin; and

- Adult and pediatric patients ≥ 3 years of age with genotype 1 or 4 chronic HCV who are liver transplant recipients with or without compensated cirrhosis, in combination with ribavirin.

Dosing

In adults, the recommended dosage of Harvoni is one tablet taken orally once daily with or without food.[1] The recommended dose of Harvoni tablets or pellets in pediatric patients ≥ 3 years of age is based on weight. The Harvoni pellets can be taken in pediatric patients who cannot swallow the tablet formulation. Table 1 below provides the recommended duration of therapy with Harvoni. The Harvoni authorized generic is only available as the 90 mg/400 mg strength tablet; Harvoni is additionally available as a lower strength tablet (45 mg/200 mg) as well as oral pellets (45 mg/200 mg and 33.75 mg/150 mg).

Table 1. Recommended Treatment Duration for Harvoni in Patients ≥ 3 Years of Age with Chronic HCV Genotype 1, 4, 5, or 6.[1]

Patient Population	Duration of Treatment
Genotype 1 – Treatment-naïve with or without compensated (Child Pugh A) cirrhosis	Harvoni 12 weeks*
Genotype 1 – Treatment-experienced** without cirrhosis	Harvoni 12 weeks
Genotype 1 – Treatment-experienced** with compensated (Child Pugh A) cirrhosis	Harvoni 24 weeks†
Genotype 1 – Treatment-naïve and treatment-experienced** with decompensated (Child-Pugh B or C) cirrhosis.	Harvoni + ribavirin‡ 12 weeks
Genotype 1 or 4 – Transplant recipients without cirrhosis, or with compensated (Child-Pugh A) cirrhosis	Harvoni + ribavirin§ 12 weeks
Genotype 4, 5, or 6 – Treatment-naïve and treatment-experienced**, with or without compensated (Child-Pugh A) cirrhosis	Harvoni 12 weeks

Hepatitis C virus – Hepatitis C virus; * Harvoni for 8 weeks can be considered in treatment-naïve patients without cirrhosis who have pretreatment HCV RNA < 6 million IU/mL; ** Treatment-experienced patients who have failed treatment with either peginterferon alfa + ribavirin or a hepatitis C virus protease inhibitor + peginterferon + ribavirin; † Harvoni for 12 weeks can be considered in treatment-experienced patients with cirrhosis who are eligible for ribavirin. The daily dose of ribavirin is weight-based (1,000 mg for patients < 75 kg and 1,200 mg for those ≥ 75 kg) administered in two divided doses. ‡ In patients with decompensated cirrhosis, the starting dosage of ribavirin is 600 mg and can be titrated up to 1,000 mg for patients <75 kg and 1,200 mg for those ≥75 kg in two divided doses with food. If the starting dosage of ribavirin is not well tolerated, the dosage should be reduced as clinically indicated based on hemoglobin levels. § The daily dosage of ribavirin is weight-based (1,000 mg for patients < 75 kg and 1,200 mg for those ≥ 75 kg) administered orally in two divided doses with food.

Guidelines

For the most up-to-date guideline information always refer to the American Association for the Study of Liver Diseases (AASLD) guidelines. Harvoni is recommended in the circumstances outlined in Table 2.

Table 2. AASLD Recommendations for Harvoni.[2]

DAA	Duration	FDA Approved (Y/N)	AASLD Level of Evidence
Genotype 1, 4, 5, and 6 Chronic HCV Treatment-Naïve Adults – Recommended			
Harvoni	12 weeks (± compensated cirrhosis)	Y	Class I, Level A Class IIa, Level B (Genotype 4 compensated cirrhosis, Genotype 5/6 ± compensated cirrhosis)
Harvoni	8 weeks (HIV-uninfected, HCV RNA < 6 million IU/mL, no cirrhosis)	Y	Class I, Level B
Genotype 1, 4, 5, and 6 Chronic HCV Pegylated Interferon/Ribavirin Treatment-Experienced Adults – Recommended			
Harvoni	12 weeks (no cirrhosis)	Y	Class I, Level A (Genotype 1) Class IIa, Level B (Genotype 4, 5, 6)
Harvoni	12 weeks (compensated cirrhosis)	Y	Class IIa, Level B (Genotype 5/6)
Genotype 1 and 4 Chronic HCV Pegylated Interferon/Ribavirin Treatment-Experienced Adults – Alternative			
Harvoni + WBR	12 weeks (compensated cirrhosis)	Y (Genotype 1) N (Genotype 4)	Class I, Level A (Genotype 1) Class IIa, Level B (Genotype 4)
Genotype 1 Chronic HCV NS3/4A + Pegylated Interferon/Ribavirin Treatment-Experienced Adults – Recommended			
Harvoni	12 weeks (no cirrhosis)	Y	Class I, Level A
Genotype 1 Chronic HCV NS3/4A + Pegylated Interferon/Ribavirin Treatment-Experienced Adults – Alternative			
Harvoni + WBR	12 weeks (compensated cirrhosis)	Y	Class I, Level A
Genotype 1 Chronic HCV Non-NS5A Sovaldi-Containing Treatment-Experienced Adults – Alternative			
Harvoni + WBR	12 weeks (no cirrhosis)	N	Class IIa, Level B
Genotype 1, 4, 5, or 6 Chronic HCV, Decompensated Cirrhosis Adults Ribavirin Eligible – Recommended			
Harvoni + ribavirin	12 weeks	Y	Class I, Level A
Genotype 1, 4, 5, or 6 Chronic HCV, Decompensated Cirrhosis Adults Ribavirin Ineligible – Recommended			
Harvoni	24 weeks	N	Class I, Level A
Genotype 1, 4, 5, or 6 Chronic HCV, Decompensated Cirrhosis Adults Prior Sovaldi-Based Failure Only – Recommended			
Harvoni + ribavirin	24 weeks	N	Class II, Level C
Genotype 1, 4, 5, or 6 Recurrent HCV Post-Liver Transplant, No Cirrhosis, Treatment-Naïve or Treatment-Experienced – Recommended			
Harvoni + WBR	12 weeks	Y	Class I, Level B
Genotype 1, 4, 5, or 6 Recurrent HCV Post-Liver Transplant, Compensated Cirrhosis, Treatment-Naïve or Treatment-Experienced – Recommended			
Harvoni + WBR	12 weeks	Y	Class I, Level A
Genotype 1, 4, 5, or 6 Recurrent HCV Post-Liver Transplant, Decompensated Cirrhosis, Treatment-Naïve or Treatment-Experienced – Recommended			
Harvoni + ribavirin	12 to 24 weeks	Y	Class I, Level B
Genotype 1, 4, 5, or 6 Organ Recipients from HCV RNA-Positive Donors, Adults – Recommended			
Harvoni	12 weeks	N	Class I, Level C

Table 2 (continued). AASLD Recommendations for Harvoni.[2]

DAA	Duration	FDA Approved (Y/N)	AASLD Level of Evidence
Genotype 1, 4, 5, or 6 Kidney Transplant Treatment-Naïve or DAA-Experienced ± Compensated Cirrhosis, Adults – Recommended			
Harvoni	12 weeks	N	Class I, Level A
Genotype 1, 4, 5, or 6 Treatment-Naïve Adolescents ≥ 12 years or ≥ 45 kg, ± Compensated Cirrhosis – Recommended			
Harvoni	12 weeks	Y	Class I, Level B
Genotype 1, 4, 5, or 6 Treatment-Experienced Adolescents ≥ 12 years or ≥ 45 kg, ± Compensated Cirrhosis – Recommended			
Harvoni	24 weeks (GT1 compensated cirrhosis)	Y	Class I, Level B
Harvoni	12 weeks (GT 4, 5, or 6 ± compensated cirrhosis)	Y	Class I, Level B

AASLD – American Association for the Study of Liver Diseases; DAA – Direct-acting antiviral; Y – Yes; N – No; HCV – Hepatitis C virus; HIV – Human immunodeficiency virus.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Harvoni (brand or generic). All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Harvoni (brand or generic) as well as the monitoring required for adverse events and long-term efficacy, approval requires Harvoni (brand or generic) to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Harvoni (brand or generic) is recommended in those who meet the following criteria:

FDA-Approved Indications

52. Chronic Hepatitis C Virus (HCV) Genotype 1. Approve for the duration noted if the patient meets all of the following criteria (A, B, and C):

A) Patient is ≥ 3 years of age; AND

B) Patient meets ONE of the following criteria (i, ii or iii):

i. Approve for 8 weeks if the patient meets all of the following criteria (a, b, c, d, and e):

a) Patient is treatment-naïve; AND

b) Patient does not have cirrhosis; AND

c) Patient does not have human immunodeficiency virus (HIV)[2] (patients with HIV should be reviewed the same as patients without HIV using *Criteria ii or iii below*); AND

d) Patient is not awaiting liver transplantation (patients awaiting liver transplantation should be reviewed using *Criteria ii or iii below*); AND

e) Baseline hepatitis C virus (HCV) RNA is < 6 million IU/mL; OR

ii. Approve for 12 weeks if the patient meets ONE the following criteria (a, b, or c):

a) Patient is treatment-naïve AND does not meet criterion *Bi* above; OR

Note: Treatment-naïve includes patients with or without HIV who are treatment-naïve with compensated [Child-Pugh A] cirrhosis regardless of baseline HCV RNA, or treatment-naïve patients with or without HIV without cirrhosis and baseline HCV RNA ≥ 6 million IU/mL. This would also include treatment-naïve patients awaiting transplant with compensated [Child-Pugh A] cirrhosis regardless of baseline HCV RNA or treatment-naïve patients awaiting transplant without cirrhosis and baseline HCV RNA ≥ 6 million IU/mL).

b) Patient has previously been treated for hepatitis C virus (HCV) and does not have cirrhosis; OR

Note: For patients with compensated cirrhosis [Child-Pugh A] see criterion *Biii* below, for patients with decompensated cirrhosis [Child-Pugh B or C] see criterion *Biic* below.

c) Patient is treatment-naïve or has previously been treated for hepatitis C virus (HCV) and meets all of the following criteria ([1], [2], and [3]):

(1) Patient has decompensated (Child-Pugh B or C) cirrhosis; AND

(2) Patient is ribavirin eligible; AND

Note: For ribavirin ineligible patients with decompensated cirrhosis, see criterion *Biiib* below

(3) Harvoni (brand or generic) will be prescribed in combination with ribavirin; OR

iii. Approve for 24 weeks in patients who meet ONE of the following (a or b):

(1) Patient has previously been treated for hepatitis C virus (HCV) and has compensated (Child-Pugh A) cirrhosis; OR

(2) Patient is treatment-naïve or has previously been treated for hepatitis C virus (HCV) and the patient meets both of the following criteria ([1] and [2]):

a. Patient has decompensated (Child-Pugh B or C) cirrhosis; AND

b. Patient is ribavirin ineligible, according to the prescriber; AND

C) Harvoni (brand or generic) is prescribed by or in consultation with a gastroenterologist, hepatologist, infectious diseases physician, or a liver transplant physician.

2. **Chronic Hepatitis C Virus (HCV) – Genotype 4, 5, OR 6.** Approve for 12 weeks if the patient meets the following criteria (A and B):
   - **A)** Patient is ≥ 3 years of age; AND
   - **B)** Harvoni (brand or generic) is prescribed by or in consultation with a gastroenterologist, hepatologist, infectious diseases physician, or a liver transplant physician.

3. **Recurrent Hepatitis C Virus (HCV) Post-Liver Transplantation, Genotypes 1 OR 4.** Approve for 12 weeks if the patient meets the following criteria (A, B, C and D):
   - **A)** Patient is ≥ 3 years of age; AND
   - **B)** Patient has recurrent hepatitis C virus (HCV) after a liver transplantation; AND
   - **C)** Harvoni (brand or generic) will be prescribed in combination with ribavirin; AND
   - **D)** Harvoni (brand or generic) is prescribed by or in consultation with one of the following prescribers who is affiliated with a transplant center[2]: a gastroenterologist, hepatologist, infectious diseases physician, or a liver transplant physician.

Other Uses with Supportive Evidence

4. **Recurrent Hepatitis C Virus (HCV) Post-Liver Transplantation, Genotypes 5 OR 6**. Approve for 12 weeks if the patient meets the following criteria (A, B, C and D):
   - **C)** Patient is ≥ 18 years of age; AND
   - **D)** Patient has recurrent hepatitis C virus (HCV) after a liver transplantation; AND
   - **E)** Harvoni (brand or generic) will be prescribed in combination with ribavirin; AND
   - **F)** Harvoni (brand or generic) is prescribed by or in consultation with one of the following prescribers who is affiliated with a transplant center[2]: a gastroenterologist, hepatologist, infectious diseases physician, or a liver transplant physician.

5. **Hepatitis C Virus (HCV) Kidney Transplant Recipients, Genotype 1 or 4.** Approve for 12 weeks if the patient meets the following criteria (A, B, and C):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient is a kidney transplant recipient with hepatitis C virus (HCV); AND
   - **C)** Harvoni (brand or generic) is prescribed by or in consultation with one of the following prescribers who is affiliated with a transplant center[2]: a gastroenterologist, hepatologist, infectious diseases physician, nephrologist, liver transplant physician, or a renal transplant physician.

6. **Patient Has Been Started on Harvoni (brand or generic).** Approve Harvoni (brand or generic) for an indication or condition addressed as an approval in the Recommended Authorization Criteria section

(FDA-Approved Indications or Other Uses with Supportive Evidence). Approve the duration described above to complete a course of therapy (e.g., a patient who should receive 12 weeks, and has received 3 weeks should be approved for 9 weeks to complete their 12-week course).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Harvoni is not recommended in the following situations:

67. **Hepatitis C Virus (HCV) [any genotype], Combination with Any Other Direct-Acting Antivirals (DAAs) Not Including Ribavirin.** Harvoni (brand or generic) provides a complete antiviral regimen for patients with genotype 1 HCV. Harvoni (brand or generic) is not recommended to be used with other products containing sofosbuvir.

68. **Life Expectancy Less Than 12 Months Due to Non-Liver Related Comorbidities.** Patients with limited life expectancy for whom HCV therapy would not improve symptoms or prognosis do not require treatment.[2] According to AASLD guidance, the panel recommends treatment for all patients with chronic HCV infection, except those with short life expectancies that cannot be remediated by treating HCV, by transplantation, or by other directed therapy. For these patients, the benefits of HCV treatment are unlikely to be realized, and palliative care strategies should take precedence.

69. **Pediatric Patients (Age < 3 years).** The safety and efficacy of Harvoni (brand or generic) have not been established in pediatric patients < 3 years of age.[1]

70. **Retreatment with Harvoni (brand or generic) in Patients Who Have Previously Received Harvoni (brand or generic) (e.g., retreatment in prior null responders, prior partial responders, prior relapse patients, patients who have not completed a course of therapy due to an adverse reaction or for other reasons)**. There are other direct-acting antivirals indicated for patients who have previously been treated with Harvoni (brand or generic).

71. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Hepatitis C – Mavyret Prior Authorization Policy

- Mavyret™ (glecaprevir/pibrentasvir tablets – AbbVie)

REVIEW DATE: 08/19/2020

OVERVIEW

Mavyret, a direct-acting antiviral, is indicated for the treatment of adult and pediatric patients ≥ 12 years of age or ≥ 45 kg with chronic hepatitis C virus (HCV) genotype 1, 2, 3, 4, 5, or 6 infection without cirrhosis or with compensated cirrhosis (Child-Pugh A).[1] Mavyret is also indicated for the treatment of adult and pediatric patients ≥ 12 years of age or ≥ 45 kg with HCV genotype 1 infection who previously have been treated with a regimen containing an HCV NS5A inhibitor or an NS3/4A protease inhibitor, but not both.[1] Mavyret contains glecaprevir, a new pangenotypic NS3/4A protease inhibitor and pibrentasvir, a new pangenotypic NS5A inhibitor.

Dosing

The recommended dose of Mavyret is three tablets (total daily dose: glecaprevir 300 mg and pibrentasvir 120 mg) taken once daily with food. No dosage adjustments are required for patients with human immunodeficiency virus (HIV) co-infection and/or chronic kidney disease, including dialysis. The duration of therapy is based on prior treatment experience, genotype, and the presence or absence of cirrhosis (see Table 1). Mavyret is recommended for 12 weeks in adults and pediatric patients ≥ 12 years of age or ≥ 45 kg liver or kidney transplant recipients. Similar to non-transplant recipients, a 16-week treatment duration is recommended in genotype 1-infected patients who are NS5A inhibitor-experienced without prior treatment with an NS3/4A protease inhibitor or in genotype 3-infected patients who are treatment experienced with regimens containing interferon, pegylated interferon, ribavirin, and/or Sovaldi® (sofosbuvir tablets).

Table 1. Recommended Duration for Treatment-Naïve Patients.[1]

HCV Genotype	Treatment Duration	
	No Cirrhosis	Compensated Cirrhosis (Child-Pugh A)
1, 2, 3, 4, 5, or 6	8 weeks	8 weeks

HCV – Hepatitis C virus.

Table 2. Recommended Duration for Treatment-Experienced Patients.[1]

HCV Genotype	Prior Treatment Experience	Duration

		Without Cirrhosis	With Compensated Cirrhosis
1, 2, 4, 5, 6	PRS	8 weeks	12 weeks
3	PRS	16 weeks	16 weeks
1	NS3/4 PI[1] (NS5A-naïve)	12 weeks	12 weeks
	NS5A inhibitor[2] (NS3/4 PI-naïve)[†]	16 weeks	16 weeks

HCV – Hepatitis C virus; PRS – Prior treatment experience with regimens containing interferon, pegylated interferon, ribavirin, and/or Sovaldi® (sofosbuvir tablets), but no prior treatment experience with an HCV NS3/4A protease inhibitor (PI) or NS5A inhibitor; PI – Protease inhibitor; [1] Regimens containing Olysio® (simeprevir capsules) and Sovaldi, or Olysio, Victrelis® (boceprevir capsules), or Incivek® (telaprevir tablets) with interferon or pegylated interferon and ribavirin were studied; [2] Regimens containing Harvoni® (ledipasvir/sofosbuvir tablets) or Daklinza® (daclatasvir tablets) + pegylated interferon + ribavirin [unapproved regimen] were studied.

Guidelines

The American Association for the Study of Liver Diseases (AASLD)/ Infectious Diseases Society of America (IDSA) recommendations related to Mavyret are summarized below in Table 3. For the most up-to-date information always refer to the guidelines. In treatment-naïve adults without cirrhosis the recommended regimens are Mavyret for 8 weeks or Epclusa for 12 weeks. In treatment-naïve adults with compensated cirrhosis, the recommended regimens are Mavyret for 8 weeks (genotypes 1 through 6) or Epclusa for 12 weeks (genotypes 1, 2, 4, 5, or 6; patients with genotype 3 require baseline NS5A resistance-associated substitution testing and those without Y93H can be treated with 12 weeks of Epclusa). Additional genotype-specific and/or special circumstance-specific recommendations are also provided (Table 3).

Table 3. AASLD Recommendations for Mavyret.[7]

DAA	Duration	FDA Approved (Y/N)	AASLD Level of Evidence
Chronic HCV – Treatment-Naïve – Recommended			
Genotype 1, 2, 3, 4, 5, 6 – No Cirrhosis			
Mavyret	8 weeks	Y	Class I, Level A
Genotype 1, 3 Compensated Cirrhosis			
Mavyret	8 weeks	Y	Class I, Level B
Genotype 2, 4, 5, 6 Compensated Cirrhosis			
Mavyret	12 weeks	Y	Class I, Level B
Chronic HCV – Treatment-Experienced			
Peglyated Interferon/Ribavirin			
Genotype 1, 2, 4, 5, 6 – Recommended			
Mavyret	8 weeks (no cirrhosis) 12 weeks (compensated cirrhosis)	Y Y	Class I, Level A (Class IIa, Level B for genotype 5) Class I, Level B (Class IIa, Level B for genotype 4)
Genotype 3 – Alternative			
Mavyret	16 weeks (± compensated cirrhosis)	Y	Class IIa, Level B
NS3/4A (Incivek, Victrelis, Olysio + Pegylated Interferon/Ribavirin			
Genotype 1 – Recommended			
Mavyret	12 weeks (± compensated cirrhosis)	Y	Class IIa, Level B
Non-NS5A Sovaldi-Containing Regimen			
Genotype 1 – Alternative			
Mavyret	16 weeks (± compensated cirrhosis NOT NS3/4A experienced)	Y	Class IIa, Level B
Sovaldi + WBR			
Genotype 2 – Recommended			
Mavyret	12 weeks (± compensated cirrhosis)	Y	Class IIb, Level B
Genotype 3 – Recommended			
Mavyret	16 weeks (± compensated cirrhosis)	N	Class IIb, Level B
Recurrent HCV Post-Liver Transplant –Treatment-Naïve or Treatment-Experienced			
Genotype 1, 2, 3, 4, 5, 6 – Recommended			
Mavyret	12 weeks (± compensated cirrhosis)	N	Class I, Level B (no cirrhosis) Class 1, Level C (compensated cirrhosis)
Organ Recipients from HCV RNA-Positive Donors			
Genotype 1, 2, 3, 4, 5, 6 – Recommended			
Mavyret	12 weeks	N	Class I, Level C

Stage 4 or 5 CKD (eGFR < 30 mL/min) or ESRD and Chronic HCV			
Genotype 1, 2, 3, 4, 5, 6 – Recommended			
Mavyret	8 to 16 weeks	Y	Class I, Level A

Table 3 (continued). AASLD Recommendations for Mavyret.[7]

DAA	Duration	FDA Approved (Y/N)	AASLD Level of Evidence
Kidney Transplant with HCV Treatment-Naïve or –Experienced ± Compensated Cirrhosis			
Genotype 1, 2, 3, 4, 5, 6 – Recommended			
Mavyret	12 weeks	Y	Class I, Level A (no cirrhosis) Class IIa, Level C (compensated cirrhosis)
Pediatric Patients			
Genotype 1, 2, 3, 4, 5, 6 – Treatment-Naïve Adolescents ≥ 12 years or ≥ 45 kg, ± Compensated Cirrhosis – Recommended			
Mavyret	8 weeks	Y	Class I, Level B
Genotype 1, 2, 3, 4, 5, 6 – Treatment-Experienced Adolescents ≥ 12 years or ≥ 45 kg, ± Compensated Cirrhosis – Recommended			
Mavyret	8 weeks (GT 1, 2, 4, 5, or 6 without cirrhosis)	Y	Class I, Level B
	12 weeks (GT 1, 2, 4, 5, or 6 compensated cirrhosis)	Y	Class I Level B
	16 weeks (GT 3 ± compensated cirrhosis)	Y	Class I, Level B
	16 weeks (GT1 ± compensated cirrhosis)	Y	Class I, Level B
	12 weeks (GT1 without cirrhosis)	Y	Class I, Level B

AASLD – American Association for the Study of Liver Diseases; DAA – Direct-acting antiviral; Y – Yes; N – No; HCV – Hepatitis C virus; WBR – Weight-based ribavirin; CKD – Chronic kidney disease; ESKD – End-stage kidney disease.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Mavyret. See criteria for approval durations. Because of the specialized skills required for evaluation and diagnosis of patients treated with Mavyret as well as the monitoring required for adverse events and efficacy, approval requires Mavyret to be prescribed by or in consultation with a physician who specialized in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Mavyret is recommended in those who meet the following criteria:

FDA-Approved Indications

53. Chronic Hepatitis C Virus (HCV) Genotype 1, 2, 3, 4, 5, or 6, Treatment-Naïve. Approve for 8 weeks if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 12 years of age OR ≥ 45 kg; AND
- **B)** Patient is HCV treatment-naïve (the patient has not previously received treatment for their chronic HCV infection); AND
- **C)** Mavyret is prescribed by or in consultation with a gastroenterologist, hepatologist, infectious diseases physician, or a liver transplant physician.

54. Chronic Hepatitis C Virus (HCV), Genotype 1, Treatment-Experienced. Approve for the duration noted if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 12 years of age OR ≥ 45 kg; AND
- **B)** Patient meets ONE of the following conditions (i, ii, iii, or iv):

  NS5A-Experienced, NS3/4-Naïve
  - **i.** Approve for 16 weeks if the patient meets both of the following criteria (a, b, and c):
    - **a)** The patient does not have cirrhosis or has compensated cirrhosis (Child-Pugh A); AND

b) Patient had a prior null response, prior partial response, or had relapse after prior treatment with one of the following NS5A-inhibitor containing products: Daklinza (daclatasvir tablets), Epclusa (sofosbuvir/velpatasvir brand or generic), Harvoni (ledipasvir/sofosbuvir tablets/oral pellets; brand or generic); AND

c) Patient has not previously been treated with one of the following NS3/4A inhibitor or NS3/4A inhibitor-containing products: Olysio (simeprevir capsules), Victrelis (boceprevir capsules), or Incivek (telaprevir tablets), Technivie (ombitasvir/paritaprevir/ritonavir tablets), Viekira Pak (ombitasvir/paritaprevir/ritonavir tablets; dasabuvir tablets, co-packaged), Viekira XR (dasabuvir/ombitasvir/paritaprevir/ritonavir extended-release tablets), Vosevi (sofosbuvir/velpatasvir/voxilaprevir); or Zepatier (elbasvir/grazoprevir tablets); OR

NS3/4-Experienced, NS5A-Naïve

ii. Approve for 12 weeks if the patient meets both of the following criteria (a, b, and c):

a) Patient does not have cirrhosis or has compensated cirrhosis (Child-Pugh A).

b) Patient has not previously been treated with one of the following NS5A-inhibitor-containing products: Daklinza (daclatasvir tablets), Epclusa (sofosbuvir/velpatasvir brand or generic), Harvoni (ledipasvir/sofosbuvir tablets/oral pellets; brand or generic), Technivie (ombitasvir/paritaprevir/ritonavir tablets), Viekira Pak (ombitasvir/paritaprevir/ritonavir tablets; dasabuvir tablets, co-packaged), Viekira XR (dasabuvir/ombitasvir/paritaprevir/ritonavir extended-release tablets), Vosevi (sofosbuvir/velpatasvir/voxilaprevir), or Zepatier (elbasvir/grazoprevir tablets); AND

c) Patient had a prior null response, prior partial response, or had relapse after prior treatment with one of the following NS3/4A inhibitor or NS3/4A inhibitor-containing products: Olysio (simeprevir capsules), Victrelis (boceprevir capsules), or Incivek (telaprevir tablets); OR

Pegylated Interferon/Interferon, Ribavirin, Sovaldi-Experienced

iii. Approve for 8 weeks if the patient meets both of the following criteria (a and b):

a) Patient does not have cirrhosis; AND

b) Patient had a prior null response, prior partial response, or had relapse after prior treatment with one of the following regimens: interferon ± ribavirin, pegylated interferon ± ribavirin, Sovaldi (sofosbuvir tablets/oral pellets) + ribavirin, Sovaldi + pegylated interferon + ribavirin; AND

iv. Approve for 12 weeks if the patient meets both of the following criteria (a and b):

a) Patient has compensated cirrhosis (Child-Pugh A); AND

b) Patient had a prior null response, prior partial response, or had relapse after prior treatment with one of the following regimens: interferon ± ribavirin, pegylated interferon ± ribavirin, Sovaldi (sofosbuvir tablets/oral pellets) + ribavirin, Sovaldi + pegylated interferon + ribavirin; AND

C) Mavyret is prescribed by or in consultation with a gastroenterologist, hepatologist, infectious diseases physician, or a liver transplant physician.

55. Chronic Hepatitis C Virus (HCV), Genotype 2, 4, 5, or 6, Treatment-Experienced. Approve for the duration noted if the patient meets the following criteria (A, B, C, and D):

A) Patient is ≥ 12 years of age OR ≥ 45 kg; AND

B) Patient meets ONE of the following (i or ii):

i. Approve for 8 weeks if the patient meets both of the following criteria (a and b):

a) Patient does not have cirrhosis; AND

b) Patient had a prior null response, prior partial response, or had relapse after prior treatment with one of the following regimens: interferon ± ribavirin, pegylated interferon ± ribavirin, Sovaldi (sofosbuvir tablets/oral pellets)+ ribavirin, Sovaldi + pegylated interferon + ribavirin; OR

ii. Approve for 12 weeks if the patient meets both of the following criteria a and b):

a) Patient has compensated cirrhosis (Child-Pugh A); AND

b) Patient had a prior null response, prior partial response, or had relapse after prior treatment with one of the following regimens: interferon ± ribavirin, pegylated interferon ± ribavirin, Sovaldi (sofosbuvir tablets/oral pellets) + ribavirin, Sovaldi + pegylated interferon + ribavirin; AND

C) Mavyret is prescribed by or in consultation with a gastroenterologist, hepatologist, infectious diseases physician, or a liver transplant physician.

56. Chronic Hepatitis C Virus (HCV), Genotype 3, Treatment-Experienced. Approve for 16 weeks if the patient meets the following criteria (A, B, C, and D):
- **A)** Patient is 12 years of age OR ≥ 45 kg; AND
- **B)** Patient does not have cirrhosis or has compensated cirrhosis (Child-Pugh A); AND
- **C)** Patient had a prior null response, prior partial response, or had relapse after prior treatment with one of the following regimens: interferon ± ribavirin, pegylated interferon ± ribavirin, Sovaldi (sofosbuvir tablets/oral pellets) + ribavirin, Sovaldi + pegylated interferon + ribavirin; AND
- **D)** Mavyret is prescribed by or in consultation with a gastroenterologist, hepatologist, infectious diseases physician, or a liver transplant physician.

57. Hepatitis C Virus (HCV) Kidney or Liver Transplant Recipients, Genotype 1, 2, 3, 4, 5, OR 6. Approve for the duration noted if the patient meets all of the following criteria (A, B, C and D):
- **A)** Patient is 12 years of age OR ≥ 45 kg; AND
- **B)** Patient is a kidney or liver transplant recipient with hepatitis C virus (HCV); AND
- **C)** Patient meets one of the following conditions (i, ii, or iii):
  - **i.** Patient has genotype 2, 4, 5, or 6 HCV: Approve for **12 weeks**;
  - **ii.** Patient has genotype 1 HCV: Approve for the duration below (a or b):

    NS5A-Experienced, NS3/4-Naïve
    - **a)** Approve for 16 weeks if the patient meets both of the following criteria (1 and 2):
      - **(1)** Patient had a prior null response, prior partial response, or had relapse after prior treatment with one of the following NS5A-inhibitor containing products: Daklinza (daclatasvir tablets), Epclusa (sofosbuvir/velpatasvir brand or generic) Harvoni (ledipasvir/sofosbuvir tablets/oral pellets; brand or generic); AND
      - **(2)** Patient has not previously been treated with one of the following NS3/4A inhibitor or NS3/4A inhibitor-containing products: Olysio (simeprevir capsules), Victrelis (boceprevir capsules), or Incivek (telaprevir tablets), Technivie (ombitasvir/paritaprevir/ritonavir tablets), Viekira Pak (ombitasvir/paritaprevir/ritonavir tablets; dasabuvir tablets, co-packaged), Viekira XR (dasabuvir/ombitasvir/paritaprevir/ritonavir extended-release tablets), Vosevi (sofosbuvir/velpatasvir/voxilaprevir); or Zepatier (elbasvir/grazoprevir tablets). OR
    - **b)** Approve for 12 weeks for all other patients with genotype 1 HCV; OR
  - **iii.** Patient has genotype 3 HCV: Approve for the duration below (a or b):
    - **a)** Approve for 16 weeks if the patient meets the following criteria (1):
      - **(1)** Patient had a prior null response, prior partial response, or had relapse after prior treatment with one of the following regimens: interferon ± ribavirin, pegylated interferon ± ribavirin, Sovaldi (sofosbuvir tablets/oral pellets) + ribavirin, Sovaldi + pegylated interferon + ribavirin**;** OR
    - **b)** Approve for 12 weeks for all other patients with genotype chronic HCV; AND
- **D)** Mavyret is prescribed by or in consultation with a gastroenterologist, hepatologist, infectious diseases physician, or a liver transplant physician.

Other Uses with Supportive Evidence

58. Recurrent Hepatitis C Virus (HCV) Post-Liver Transplantation, Genotype 1, 2, 3, 4, 5, OR 6. Approve for 12 weeks in patients who meet the following criteria (A, B, and C):
- **A)** Patient is ≥ 12 years of age OR ≥ 45 kg; AND
- **B)** Patient has recurrent hepatitis C virus (HCV) after a liver transplantation; AND

C) Mavyret is prescribed by or in consultation with one of the following prescribers who is affiliated with a transplant center: a gastroenterologist, hepatologist, infectious diseases physician, or liver transplant physician.

59. Patient Has Been Started on Mavyret. Approve for an indication or condition addressed as an approval in the Recommended Authorization Criteria section (FDA-Approved Indications or Other Uses with Supportive Evidence). Approve the duration described above to complete a course therapy (e.g., a patient who should receive 12 weeks, and has received 3 weeks should be approved for 9 weeks to complete their 12-week course).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Mavyret is not recommended in the following situations:

72. Hepatitis C Virus (HCV) Child-Pugh Class B or C Liver Disease (Moderate or Severe Hepatic Impairment). Mavyret is contraindicated in patients with moderate or severe hepatic impairment (Child-Pugh Class B or C).

73. Hepatitis C Virus (HCV) [any genotype], Combination with Any Other Direct-Acting Antivirals. Mavyret provides a complete antiviral regimen.

74. Life Expectancy Less Than 12 Months Due to Non-Liver Related Comorbidities. Patients with a limited life expectancy that cannot be remediated by HCV treatment, liver transplantation, or another directed therapy do not require antiviral treatment.[2] Patients with a short life expectancy owing to liver disease should be managed in consultation with an expert. Little evidence exists to support initiation of HCV treatment in patients with a limited life expectancy (< 12 months) owing to non-liver-related comorbid conditions. For these patients, the benefits of HCV treatment are unlikely to be realized and palliative care strategies should take precedence.

75. Pediatric Patients (Age < 12 Years or < 45 kg). The safety and efficacy of Mavyret have not been established in pediatric patients < 12 years of age or < 45 kg.[1]

76. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual revision	Chronic Hepatitis C Virus, Genotype 1, Treatment-Experienced: Epclusa was added to the list of NS5A inhibitors in NS5A-experienced, NS3/4-naïve adults. HCV Post Kidney Transplant Genotype 1, 2, 3, 4, 5, or 6: -Criteria were added to include post-liver transplant HCV patients. -For patients with genotype 1 who are NS5A-experienced NS3/4A naïve, criteria were added to approve for 16 weeks. -For patients with genotype 3 who are pegylated interferon/ribavirin/Sovaldi-experienced, criteria were added to approve for 16 weeks. All other patients are approved for 12 weeks. -This indication was moved from other uses with supportive evidence to FDA-Approved uses.	08/15/2018
Update	Addition of generics to Epclusa and Harvoni	12/14/2018
Selected revision	1. Chronic Hepatitis C Virus (HCV) Genotype 1, 2, 3, 4, 5, or 6, Treatment-Naïve: Added criteria for pediatric patients ≥ 12 years of age or ≥ 45 kg, previously approved for patients ≥ 18 years of age. 2. Chronic Hepatitis C Virus (HCV), Genotype 1, Treatment-Experienced: Added criteria for pediatric patients ≥ 12 years of age or ≥ 45 kg, previously approved for patients ≥ 18 years of age. 3. Chronic Hepatitis C Virus (HCV), Genotype 2, 4, 5, or 6, Treatment-Experienced: Added criteria for pediatric patients ≥ 12 years of age or ≥ 45 kg, previously approved for patients ≥ 18 years of age. 4. Chronic Hepatitis C Virus (HCV), Genotype 3, Treatment-Experienced: Added criteria for pediatric patients ≥ 12 years of age or ≥ 45 kg, previously approved for patients ≥ 18 years of age. 5. Hepatitis C Virus (HCV) Kidney or Liver Transplant Recipients, Genotype 1, 2, 3, 4, 5, OR 6: Added criteria for pediatric patients ≥ 12 years of age or ≥ 45 kg, previously approved for patients ≥ 18 years of age. 6. Recurrent Hepatitis C Virus (HCV) Post-Liver Transplantation, Genotype 1, 2, 3, 4, 5, OR 6: Added criteria for pediatric patients ≥ 12 years of age or ≥ 45 kg, previously approved for patients ≥ 18 years of age. 7. Recurrent Hepatitis C Virus (HCV) Post-Liver Transplantation, Genotype 1, 2, 3, 4, 5, OR 6: Added criteria for pediatric patients ≥ 12 years of age or ≥ 45 kg, previously approved for patients ≥ 18 years of age. 8. Pediatric Patients (Age < 18 Years of Age): This exclusion criterion was updated to < 12 years of age or < 45 kg.	05/08/2019
Annual revision	No criteria changes	08/28/2019
Selected revision	Chronic Hepatitis C Virus (HCV) Genotype 1, 2, 3, 4, 5, or 6, Treatment-Naïve: Approval duration was changed to 8 weeks for all patients. Hepatitis C Virus (HCV) Child-Pugh Class C Liver Disease (Severe Hepatic Impairment): This Condition Not Recommended for Approval was expanded to include patients with Child-Pugh B Liver Disease (Moderate Hepatic Impairment).	10/02/2019

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual revision	Chronic Hepatitis C Virus (HCV), Genotype 1, Treatment-Experienced: Harvoni oral pellets were added to criteria for NS5A-Experienced, NS3/4-Naïve and NS3/4-Experienced/NS5A-Naïve. For pegylated interferon/interferon, ribavirin, Sovaldi-experienced patients, Sovaldi was clarified to include tablets and oral pellets. Chronic Hepatitis C Virus (HCV), Genotype 2, 4, 5, or 6, Treatment-Experienced. Sovaldi was clarified to include tablets and oral pellets. Chronic Hepatitis C Virus (HCV), Genotype 3, Treatment-Experienced. Sovaldi was clarified to include tablets and oral pellets. Hepatitis C Virus (HCV) Kidney or Liver Transplant Recipients, Genotype 1, 2, 3, 4, 5, OR 6: Harvoni oral pellets were added to criteria for NS5A-Experienced, NS3/4-Naïve. For patients with genotype 3 HCV, Sovaldi was clarified to include tablets and oral pellets.	08/19/2020

PRIOR AUTHORIZATION POLICY

POLICY: Hepatitis C – Ribavirin Prior Authorization Policy

- ribavirin tablets (generics)
- Moderiba™ (ribavirin tablets and dose packs – AbbVie, generics; obsolete 05/16/2018)
- ribavirin capsules (generics)
- Rebetol® (ribavirin oral solution – Schering Plough; obsolete 07/31/2019)
- Ribasphere® (ribavirin tablets and capsules – Kadmon, generics; obsolete 01/31/2020 [capsules], 01/01/2019 [tablets])

REVIEW DATE: 09/02/2020

OVERVIEW

Ribavirin is an antiviral agent with direct antiviral activity in tissue culture against many RNA viruses.[1-3] Ribavirin increases the mutation frequency in the genomes of several viruses and ribavirin triphosphate inhibits hepatitis C virus (HCV) polymerase in a biochemical reaction. The products contained in this Prior Authorization policy are indicated for use in combination with pegylated interferons or interferon for the treatment of chronic HCV in adults and children with compensated disease. Ribavirin remains a component of some regimens for the management of HCV.[5] The specific indications vary slightly among the oral ribavirin products:

- Rebetol oral solution and capsules are indicated in combination with PegIntron® (peginterferon alfa-2b injection) or Intron A® (interferon alfa-2b injection) for the treatment of chronic HCV in patients ≥ 3 years of age with compensated liver disease.[1]
- Ribavirin tablets in combination with Pegasys® (peginterferon alfa-2a) are indicated for the treatment of patients ≥ 5 years of age with chronic HCV with compensated liver disease who have not previously been treated with interferon alfa.[2]
- Ribasphere is indicated in adults in combination with Pegasys for the treatment of compensated chronic HCV in patients previously untreated with interferon alfa.[3]

Other Systemic Viral Infections

Ribavirin has been used off-label to treat other systemic viral infections including herpes simplex virus, respiratory syncytial virus[2,6,7], human metapneumovirus infection[8-9], adenovirus[8], influenza, severe acute respiratory syndrome, coronavirus, La Crosse encephalitis, Nipah encephalitis, Lassa fever[10,13], hemorrhagic fever with renal syndrome[10], Crimean-Congo hemorrhagic fever[10,11], Bolivian hemorrhagic fever[10], and hantavirus pulmonary infection[10,12] plus a variety of other systemic viral infections.[5]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of ribavirin. The intent of this Prior Authorization program is to ensure ribavirin is not used in the absence of an alfa interferon or a direct-acting antiviral for the treatment of hepatitis C virus (HCV). All approvals are provided for 1 year unless otherwise noted below. Because of the specialized skills required for evaluation and diagnosis of patients being treated with ribavirin, as well as the monitoring required for adverse events and efficacy, approval requires ribavirin (for hepatitis C indications) to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: The use of a pegylated interferon or non-pegylated interferon or a direct-acting antiviral for hepatitis C virus (HCV) in the past 130 days. This is used as a surrogate marker for HCV. If the criteria for prior use of a pegylated interferon or non-pegylated interferon or direct-acting antiviral for HCV are not met at the point-of-service, coverage will be determined by Prior Authorization criteria.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of ribavirin is recommended in those who meet the following criteria:

FDA-Approved Indications

60. Hepatitis C Virus (HCV). Approve for 1 year if the patient meets the following criteria (A and B):

- **A)** Patient meets ONE of the following criteria (i or ii):
  - **i.** The medication is prescribed in combination with interferon alfa or peginterferon alfa; OR
    Note: Examples of interferon alfa or peginterferon alfa are Intron A (interferon alfa 2-b injection), Pegasys (pegylated interferon alfa-2a injection), PegIntron (pegylated interferon alfa-2b injection).
  - **ii.** Ribavirin is prescribed in combination with a direct-acting antiviral for hepatitis C virus (HCV); AND
    Note: Examples of direct-acting antivirals for HCV are Epclusa (velpatasvir/sofosbuvir tablets), Sovaldi (sofosbuvir tablets/oral pellets), Harvoni (ledipasvir/sofosbuvir tablets/oral pellets), Viekira Pak (paritaprevir/ombitasvir/ritonavir tablets + dasabuvir, co-packaged), Zepatier (elbasvir/grazoprevir tablets).
- **B)** Ribavirin is prescribed by or in consultation with a gastroenterologist, hepatologist, liver transplant physician, or infectious diseases physician.

Other Uses with Supportive Evidence

61. Other Systemic Viral Infections. Approve for 1 year.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of ribavirin is not recommended in the following situations:

77. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Hepatitis C – Sovaldi Prior Authorization Policy
- Sovaldi® (sofosbuvir tablets and oral pellets – Gilead)

REVIEW DATE: 01/13/2021

OVERVIEW

Sovaldi, a hepatitis C virus (HCV) nucleotide analog non-serine (NS)5B polymerase inhibitor, is indicated for the following uses:[1]

- Treatment of **genotype 1, 2, 3 or 4 chronic HCV infection as a component of a combination antiviral treatment**.
- Treatment of **pediatric patients ≥ 3 years of age with genotype 2 or 3 chronic HCV infection without cirrhosis or with compensated cirrhosis in combination with ribavirin**.

The place in therapy for Sovaldi has greatly lessened or is non-existent in some cases due to the availability of other direct-acting antivirals (DAAs) with greater efficacy for many genotypes. However, Sovaldi is the only DAA indicated in pediatric patients ≥ 3 years and < 6 years with genotype 2 or 3 chronic HCV (other DAAs are indicated in patients ≥ 6 years of age).

The recommended dose of Sovaldi tablets is one 400 mg tablet taken orally once daily with or without food.[1] The recommended dosage of Sovaldi tablets or oral pellets in pediatric patients ≥ 3 years of age with genotype 2 or 3 HCV is based on weight, and is to be taken orally once daily in combination with ribavirin. Sovaldi should be used in combination with weight-based ribavirin or peginterferon + ribavirin for the treatment of chronic HCV in adults. Regimens with Sovaldi + peginterferon + ribavirin or Sovaldi + weight-based ribavirin are no longer recommended in treatment guidelines with the exception of pediatric patients due to inferior efficacy compared with other all-oral regimens for all genotypes. Sovaldi + weight-

based ribavirin is indicated in pediatric patients with genotype 2 or 3 chronic HCV and has a unique role in such patients. Table 1 provides pediatric dosing.

Table 1. Sovaldi Treatment Regimen in Pediatric Patients (≥ 3 years of age).[1]

	Patient Population	Treatment and Duration
Genotype 2	Treatment-naïve and treatment experienced without cirrhosis or with compensated cirrhosis (Child-Pugh A)	Sovaldi + ribavirin x 12 weeks
Genotype 3	Treatment-naïve and treatment experienced without cirrhosis or with compensated cirrhosis (Child-Pugh A)	Sovaldi + ribavirin x 24 weeks

Guidelines

The American Association for the Study of Liver Diseases (AASLD) guidelines only recommend Sovaldi in the following instances:[2] Currently, Sovaldi + ribavirin remains the only FDA-approved DAA for children ≥ 3 to < 6 years of age with genotype 2 or 3 infection. However, FDA approval of Epclusa and Mavyret for children beginning at ≥ 3 years of age are anticipated in the future. The HCV guidance panel recommends delaying treatment pending approval of a pangenotypic regimen unless there is a compelling need for immediate antiviral treatment of children ≥ 3 to < 6 years of age with genotype 2 or 3 infection.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Sovaldi. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Sovaldi as well as the monitoring required for adverse events and efficacy, approval requires Sovaldi to be prescribed by or in consultation with a physician who specialized in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Sovaldi is recommended in those who meet the following criteria:

FDA-Approved Indications

47. Chronic Hepatitis C Virus (HCV) Genotype 2, Pediatric Patients. Approve for 12 weeks if the patient meets the following criteria (A, B, C, and D):
- **A)** Patient is ≥ 3 years of age and < 18 years of age; AND
- **B)** Patient does not have decompensated cirrhosis (Child-Pugh B or C). [Coverage is provided for patients without cirrhosis or with compensated {Child-Pugh A} cirrhosis]; AND
- **C)** The medication will be prescribed in combination with ribavirin; AND
- **D)** The medication is prescribed by or in consultation with a gastroenterologist, hepatologist, infectious diseases physician, or a liver transplant physician.

48. Chronic Hepatitis C Virus (HCV) Genotype 3, Pediatric Patients. Approve for 24 weeks if the patient meets the following criteria (A, B, C, and D):
- **A)** Patient is ≥ 3 years of age and < 18 years of age; AND
- **B)** Patient does not have decompensated cirrhosis (Child-Pugh B or C). [Coverage is provided for patients without cirrhosis or for patients with compensated {Child-Pugh A} cirrhosis]; AND
- **C)** The medication will be prescribed in combination with ribavirin; AND
- **D)** The medication is prescribed by or in consultation with a gastroenterologist, hepatologist, infectious diseases physician, or a liver transplant physician.

Other Uses with Supportive Evidence

3. **Patient Has Been Started on Sovaldi.** Approve for an indication or condition addressed as an approval in the Recommended Authorization Criteria section (FDA-Approved Indications or Other Uses with Supportive Evidence). Approve the duration described above to complete a course therapy (e.g., a patient who should receive 12 weeks, and has received 3 weeks should be approved for 9 weeks to complete their 12-week course).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Sovaldi is not recommended in the following situations:

1. **HCV (any genotype), Combination use with Direct-Acting Antivirals (DAAs) Other than or ribavirin.** In adults with genotype 3 chronic HCV with compensated cirrhosis who are peginterferon/ribavirin-experienced, Zepatier (elbasvir/grazoprevir tablets) + Sovaldi ± ribavirin is an alternative recommendation.[2] The C-ISLE study evaluated Zepatier + Sovaldi ± ribavirin, for 8 weeks to 16 weeks in treatment-naive or -experienced, genotype 3 patients with compensated cirrhosis (n = 100). The study included 53 patients with a history peginterferon/ribavirin failure. Treatment-experienced patients were randomized to 12 weeks of Zepatier + Sovaldi, 12 weeks of Zepatier + Sovaldi + weight-based ribavirin, or 16 weeks of Zepatier + Sovaldi. All three treatment arms had 100% SVR on the per protocol analysis, with 17 patients in each arm. Mavyret (glecaprevir/pibrentasvir tablets) and Vosevi (sofosbuvir/velpatasvir/voxilaprevir tablets) are recommended regimens in this setting; Mavyret is FDA-approved. In adults with any genotype chronic HCV with or without compensated cirrhosis who have failed treatment with Mavyret, retreatment with Mavyret + Sovaldi + ribavirin is a recommended regimen based on data from an ongoing Phase IIIb study evaluating the safety and efficacy of Mavyret + Sovaldi + weight-based ribavirin as a 12- or 16-week retreatment regimen for patients who experienced virologic failure to Mavyret within the context of a previous clinical trial. Non-cirrhotic Mavyret non-responders with genotype 1, 2, 4, 5, or 6 who were naive to protease and NS5A inhibitors received 12 weeks Mavyret + Sovaldi and weight-based ribavirin. Patients with genotype 3, and/or compensated cirrhosis, and/or protease/NS5A experience (prior to their initial glecaprevir/pibrentasvir treatment) received 16 weeks of therapy with the same regimen. In a preliminary analysis, 96% (n = 22/23) of these patients achieved SVR12 with a single relapse in a cirrhotic patient with genotype 1a. Vosevi is also a recommended regimen in this instance and it is FDA-approved.

2. **Life Expectancy < 12 Months Due to Non-Liver Related Comorbidities.** According to AASLD guidance, little evidence exists to support initiation of HCV treatment in patients with limited life expectancy (< 12 months) due to non-liver-related comorbid conditions.[2] For these patients, the benefits of HCV treatment are unlikely to be realized, and palliative care strategies should take precedence.

3. **Monotherapy with Sovaldi.** Sovaldi is indicated as a component of a combination antiviral treatment regimen for HCV.[1]

4. **Pediatric Patients (Age < 3 years).** The safety and efficacy of Sovaldi have not been established in pediatric patients < 3 years of age.[1]

5. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Hepatitis C – Viekira Pak Prior Authorization Policy

- Viekira Pak™ (ombitasvir/paritaprevir/ritonavir tablets; dasabuvir tablets [co-packaged] – AbbVie)

REVIEW DATE: 09/02/2020

OVERVIEW

Viekira Pak is indicated for the treatment of patients with genotype 1 chronic hepatitis C virus (HCV).[1] Viekira Pak is indicated in patients with genotype 1b without cirrhosis or with compensated cirrhosis or with genotype 1a without cirrhosis or with compensated cirrhosis for use in combination with ribavirin. Viekira Pak contains ombitasvir, an HCV NS5A inhibitor, paritaprevir, an HCV NS3/4A protease inhibitor, ritonavir, a cytochrome P450 (CYP)3A inhibitor and dasabuvir, an HCV non-nucleoside NS5B palm polymerase inhibitor.

The recommended dose of Viekira Pak is two co-formulated ombitasvir/paritaprevir/ritonavir tablets once daily (in the morning) and one dasabuvir tablet twice daily (morning and evening). When administered with Viekira Pak, the recommended dose of ribavirin is weight-based. For patients with HCV/human immunodeficiency virus (HIV)-1 co-infection the recommendations are the same as for those without co-infection. Of note, product labeling notes that some patients with genotype 1a with cirrhosis may be treated

for 12 weeks with Viekira Pak + weight-based ribavirin based on data from the TURQUOISE-II trial. In liver transplant recipients with normal hepatic function and mild fibrosis (Metavir fibrosis score ≤ 2) the recommended duration of therapy with Viekira Pak is 24 weeks, irrespective of HCV genotype 1 subtype.

Table 1. FDA-Approved Regimens and Treatment Duration for Viekira Pak.[1,5]

Patient Population	Treatment*	Duration
Genotype 1a, without cirrhosis	Viekira Pak + WBR	12 weeks
Genotype 1a, with cirrhosis	Viekira Pak + WBR	24 weeks**
Genotype 1b, with or without cirrhosis	Viekira Pak	12 weeks

* Note: Follow the genotype 1a dosing recommendations in patients with an unknown genotype 1 subtype or with mixed genotype 1 infection; WBR – Weight-based ribavirin; ** A 12 week treatment duration may be considered for some patients based on prior treatment history.

Guidelines

Viekira Pak is not addressed in the American Association for the Study of Liver Diseases (AASLD) Guidelines recommended (or alternative) regimens are detailed in the Hepatitis C Virus Direct-Acting Antivirals Therapy Class Summary.[2] Viekira Pak is only recognized in the guidelines as not recommended for use in patients with decompensated cirrhosis (Child-Pugh B or C).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Viekira Pak. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Viekira Pak as well as the monitoring required for adverse events and efficacy, approval requires Viekira Pak to be prescribed by or in consultation with a physician who specialized in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Viekira Pak is recommended in those who meet the following criteria:

FDA-Approved Indications

62. Chronic Hepatitis C Virus (HCV) Genotype 1a. Approve for the duration noted if the patient meets the following criteria (A, B, C and D):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** The medication is prescribed in combination with ribavirin; AND
- **C)** Patient meets ONE of the following criteria (i or ii):
  - **i.** Patient does not have cirrhosis: Approve for 12 weeks; OR
  - **ii.** Patient has cirrhosis: Approve for 24 weeks; AND
- **D)** The medication is prescribed by or in consultation with a gastroenterologist, hepatologist, infectious diseases physician, or a liver transplant physician.

63. Chronic Hepatitis C Virus (HCV) Genotype 1b. Approve for 12 weeks if the patient meets the following criteria (A and B):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** The medication is prescribed by or in consultation with a gastroenterologist, hepatologist, infectious diseases physician, or a liver transplant physician.

64. Recurrent Hepatitis C Virus (HCV) Post-Liver Transplantation, Genotype 1. Approve for 24 weeks if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Viekira Pak is prescribed in combination with ribavirin; AND
- **C)** Viekira Pak is prescribed by or in consultation with one of the following prescribers who is affiliated with a transplant center[2]: a gastroenterologist, hepatologist, infectious diseases physician, or a liver transplant physician.

65. Patient Has Been Started on Viekira Pak. Approve Viekira Pak for an indication or condition addressed as an approval in the Recommended Authorization Criteria section (FDA-Approved Indications or Other Uses with Supportive Evidence). Approve the duration described above to complete a course of therapy (e.g., a patient who should receive 12 weeks, and has received 3 weeks should be approved for 9 weeks to complete their 12-week course).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Viekira Pak is not recommended in the following situations:

1. **Hepatitis C Virus (HCV), Child-Pugh Class B or Child-Pugh Class C Liver Disease (Moderate or Severe Hepatic Impairment).** Viekira Pak is contraindicated in patients with moderate or severe hepatic impairment (Child-Pugh Class B or C).[1] The AASLD recommend *against* the use of Viekira Pak in patients with chronic hepatitis C virus (HCV) with decompensated cirrhosis (Child-Pugh Class B or C). On October 22, 2015 the FDA issued a safety communication about the risk of serious liver injury when Viekira Pak or Technivie® (paritaprevir/ritonavir/ombitasvir tablets) are used in patients with moderate or severe hepatic impairment.[3] Hepatic decompensation and liver failure in patients with underlying liver cirrhosis have been reported with the use of Viekira Pak and Technivie. Some of these events have resulted in liver transplant or death. These serious outcomes were reported mostly in patients taking Viekira Pak who had evidence of advanced cirrhosis even before starting treatment. Since the approvals of Viekira Pak in December 2014 and Technivie in July 2015, at least 26 worldwide cases submitted to the FDA Adverse Event Reporting System (FAERS) were considered to be possibly or probably related to Viekira Pak or Technivie. In most of the cases, liver injury occurred within 1 to 4 weeks of starting treatment. Some of the cases occurred in patients for whom these medicines were contraindicated or not recommended. Among these 26 cases 5 were reported in the US.[4]

2. **Hepatitis C Virus (HCV) [Any Genotype], Combination with Any Other Direct-Acting Antivirals (DAAs) Not Including Ribavirin.** Viekira Pak provide a complete antiviral regimen for patients with genotype 1 HCV. Viekira Pak is indicated with ribavirin for some patients. In the opinion of a specialist physician reviewing the data we have adopted this criterion.

3. **Life Expectancy Less Than 12 Months Due to Non-Liver Related Comorbidities.** Patients with limited life expectancy for whom HCV therapy would not improve symptoms or prognosis do not require treatment.[2] According to AASLD guidance, the panel continues to recommend treatment for all patients with chronic HCV infection, *except* those with short life expectancies that cannot be remediated by treating HCV, by transplantation, or by other directed therapy. For these patients, the benefits of HCV treatment are unlikely to be realized, and palliative care strategies should take precedence.

5. **Pediatric Patients (Age < 18 Years).** The safety and efficacy of Viekira Pak have not been established in pediatric patients < 18 years of age.[1]

6. **Retreatment with Viekira Pak in Patients Who Have Previously Received Viekira Pak, Viekira XR, or Technivie** (e.g., retreatment in prior null responders, prior partial responders, prior relapse patients, patients who have not completed a course of therapy due to an adverse reaction or for other reasons). Technivie, Viekira Pak, and Viekira XR contain the same active ingredients; Viekira Pak and Viekira XR additionally contain dasabuvir.

7. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REVIEW DATE: 08/19/2020

OVERVIEW

Vosevi is a direct-acting-antiviral (DAA) indicated for the treatment of adult patients with chronic hepatitis C virus (HCV) without cirrhosis or with compensated cirrhosis (Child-Pugh A) who have genotype 1, 2, 3, 4, 5, or 6 infection and have previously been treated with an HCV regimen containing an NS5A inhibitor and for patients with genotype 1a or 3 infection and who have previously been treated with an HCV regimen containing sofosbuvir without an NS5A inhibitor. Additional benefit of Vosevi over Epclusa® (sofosbuvir/velpatasvir tablets) was not shown in adults with genotype 1b, 2, 4, 5, or 6 infection previously treated with sofosbuvir without an NS5A inhibitor. The recommended dosage of Vosevi is one tablet, taken orally, once daily (QD) with food for 12 weeks.

Vosevi contains sofosbuvir, a nucleotide analog NS5B polymerase inhibitor, velpatasvir, an HCV NS5A inhibitor, and voxilaprevir, a new HCV NS3/4A protease inhibitor. Sofosbuvir has previously been available as Sovaldi® (sofosbuvir tablets) and as part of Harvoni® (sofosbuvir/ledipasvir tablets) and Epclusa. Velpatasvir has previously been available as part of Epclusa.

Guidelines

For the most up-to-date guideline information always refer to the American Association for the Study of Liver Diseases (AASLD) guidelines.[3] Vosevi is recommended in the circumstances outlined below (Table 1).

Table 1. AASLD Recommended and Alternative Regimens that Include Vosevi.[3]

DAA	Duration	FDA Approved (Y/N)	AASLD Level of Evidence
Genotype 1 Chronic HCV Previously Treated with Non-NS5A Sovaldi, Adults – Recommended			
Vosevi	12 weeks (GT1a ± compensated cirrhosis)	Y	Class I, Level A

Genotype 1 Chronic HCV Previously Treated with NS5A, Adults – Recommended			
Vosevi	12 weeks (± compensated cirrhosis)	Y	Class I, Level A
Genotype 2 Chronic HCV Previously Treated with Sovaldi + NS5A, Adults – Recommended			
Vosevi	12 weeks (± compensated cirrhosis)	N	Class I, Level B
Genotype 3 Chronic HCV Treatment-Naïve Adults – Alternative			
Vosevi	12 weeks (compensated cirrhosis, if Y93H is present)	N	Class IIa, Level B
Genotype 3 Chronic HCV Previously Treated with Pegylated Interferon/Ribavirin, Adults – Recommended			
Vosevi	12 weeks (compensated cirrhosis)	N	Class IIb, Level B
Genotype 3 Chronic HCV Previously Treated with Pegylated Interferon/Ribavirin, Adults – Alternative			
Vosevi	12 weeks (no cirrhosis)	N	Class IIb, Level B
Genotype 3 Chronic HCV Previously Treated with Sovaldi + WBR, Adults – Recommended			
Vosevi	12 weeks (± compensated cirrhosis)	Y	Class I, Level B
Genotype 3 Chronic HCV DAA-Experienced, Including NS5A, Adults – Recommended			
Vosevi	12 weeks (± compensated cirrhosis)	Y	Class I, Level A
Vosevi + WBR	12 weeks (prior NS5A failures with cirrhosis)	N	Class IIa, Level C
Genotype 4 Chronic HCV DAA-Experienced, Including NS5A, Adults – Recommended			
Vosevi	12 weeks (± compensated cirrhosis)	Y	Class I, Level A

Table 1 (continued). AASLD Recommended and Alternative Regimens that Include Vosevi.[3]

DAA	Duration	FDA Approved (Y/N)	AASLD Level of Evidence
Genotype 5/6 Chronic HCV DAA-Experienced, Including NS5A, Adults – Recommended			
Vosevi	12 weeks (± compensated cirrhosis)	N	Class IIA, Level B
Genotype 1, 2, 3, 4, 5, 6 Recurrent HCV Post-Liver Transplant, DAA-Experienced ± Compensated Cirrhosis, Adults – Recommended			
Vosevi	12 weeks	N	Class I, Level C
Genotype 1, 2, 3, 4, 5, 6 HCV Kidney Transplant Recipients, DAA-Experienced, Adults – Recommended			
Vosevi	12 weeks (± compensated cirrhosis)	N	Class IIa, Level C

AASLD – American Association for the Study of Liver Diseases; FDA – Food and Drug Administration; Y – Yes; N – No; HCV – Hepatitis C virus; DAA – Direct-acting antiviral; WBR – Weight-based ribavirin.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Vosevi. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Vosevi as well as the monitoring required for adverse events and efficacy, approval requires Vosevi to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Vosevi is recommended in those who meet the following criteria:

FDA-Approved Indications

66. Chronic Hepatitis C Virus (HCV) Genotype 1b, 2, 4, 5, or 6. Approve for 12 weeks if the patient meets the following criteria (A, B, C, and D):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient does not have cirrhosis OR the patient has compensated cirrhosis (Child-Pugh A);
- **C)** Patient had a prior null response, prior partial response, or had relapse after prior treatment with an HCV direct-acting antiviral regimen containing an NS5A inhibitor; AND
  Note: Examples of direct-acting antivirals that are, or contain, an NS5A inhibitor include: Daklinza (daclatasvir tablets), Epclusa (sofosbuvir/velpatasvir tablets), Harvoni (ledipasvir/sofosbuvir tablets/oral pellets), Mavyret (glecaprevir/pibrentasvir tablets), Viekira Pak (ombitasvir/paritaprevir/ritonavir tablets; dasabuvir tablets, co-packaged), Zepatier (elbasvir/grazoprevir tablets).
- **D)** Vosevi is prescribed by or in consultation with a gastroenterologist, hepatologist, infectious diseases physician, or a liver transplant physician.

67. Chronic Hepatitis C Virus, Genotype 1a or 3. Approve for 12 weeks if the patient meets the following criteria (A, B, C, and D):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient does not have cirrhosis OR the patient has compensated cirrhosis (Child-Pugh A); AND
- **C)** Patient meets ONE of the following conditions (i or ii):
  - **i.** Patient had a prior null response, prior partial response, or had relapse after prior treatment with an HCV direct-acting antiviral regimen containing an NS5A inhibitor; OR
    Note: Examples of direct-acting antivirals that are, or contain, an NS5A inhibitor include: Daklinza (daclatasvir tablets), Epclusa (sofosbuvir/velpatasvir tablets), Harvoni (ledipasvir/sofosbuvir tablets/oral pellets), Mavyret (glecaprevir/pibrentasvir tablets), Viekira Pak (ombitasvir/paritaprevir/ritonavir tablets; dasabuvir tablets, co-packaged), Zepatier (elbasvir/grazoprevir tablets).

ii. Patient had a prior null response, prior partial response, or had relapse after prior treatment with an HCV DAA regimen containing Sovaldi (sofosbuvir tablets/oral pellets) + a non-NS5A inhibitor; AND
Note: Examples of regimens that contain Sovaldi (sofosbuvir tablets/oral pellets) + a non-NS5A inhibitor include: Sovaldi + NS3 inhibitors (Olysio [simeprevir capsules], Victrelis [boceprevir capsules], or Incivek [telaprevir tablets]) or Sovaldi + ribavirin ± pegylated interferon;

D) Vosevi is prescribed by or in consultation with a gastroenterologist, hepatologist, infectious diseases physician, or a liver transplant physician.

Other Uses with Supportive Evidence

68. Chronic Hepatitis C Virus (HCV) Genotype 1b, 2, 4, 5, or 6. Approve for 12 weeks in patients who meet the following criteria (A, B, C, and D):

A) Patient is ≥ 18 years of age; AND

B) Patient does not have cirrhosis OR the patient has compensated cirrhosis (Child-Pugh A); AND

C) Patient had a prior null response, prior partial response, or had relapse after prior treatment with an HCV DAA regimen containing Sovaldi (sofosbuvir tablets/oral pellets) + a non-NS5A inhibitor; AND
Note: Examples of regimens that contain Sovaldi (sofosbuvir tablets/oral pellets) + a non-NS5A inhibitor include: Sovaldi + NS3 inhibitors (Olysio [simeprevir capsules], Victrelis [boceprevir capsules], or Incivek [telaprevir tablets]) or Sovaldi + ribavirin ± pegylated interferon;

D) Vosevi is prescribed by or in consultation with a gastroenterologist, hepatologist, infectious diseases physician, or a liver transplant physician.

4. Patient Has Been Started on Vosevi. Approve for an indication or condition addressed as an approval in the Recommended Authorization Criteria section (FDA-Approved Indications or Other Uses with Supportive Evidence). Approve the duration described above to complete a course therapy (e.g., a patient who should receive 12 weeks, and has received 3 weeks should be approved for 9 weeks to complete their 12-week course).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Vosevi is not recommended in the following situations:

1. Hepatitis C Virus (HCV) [any genotype], Combination with Any Other Direct-Acting Antivirals (DAAs). Vosevi provides a complete antiviral regimen.

38. Life Expectancy Less Than 12 Months Due to Non-Liver Related Comorbidities. According to the AASLD guidelines, patients with a limited life expectancy that cannot be remediated by HCV treatment, liver transplantation, or another directed therapy do not require antiviral treatment.[3] Patients with a short life expectancy owing to liver disease should be managed in consultation with an expert. Chronic HCV is associated with a wide range of comorbid conditions. Little evidence exists to support initiation of HCV treatment in patients with a limited life expectancy (< 12 months) owing to non-liver-related comorbid conditions. For these patients, the benefits of HCV treatment are unlikely to be realized and palliative care strategies should take precedence.

3. Pediatric Patients (Age < 18 Years). The safety and efficacy of Vosevi have not been established in pediatric patients < 18 years of age.[1]

4. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Hepatitis C – Zepatier® (grazoprevir/elbasvir tablets – Merck)

TAC APPROVAL DATE: 03/25/2020

OVERVIEW

Zepatier is an oral fixed-dose combination tablet containing grazoprevir, a second generation protease inhibitor and elbasvir, an NS5A inhibitor, indicated with or without ribavirin for the treatment of genotypes 1 and 4 chronic hepatitis C virus (HCV) in adults.[1] Zepatier is contraindicated in patients with Child-Pugh B or C liver disease (decompensated cirrhosis). Zepatier is also contraindicated with inhibitors of organic anion transporting polypeptides 1B1/3 (OATP1B1/3) that are known or expected to significantly increase grazoprevir plasma concentrations, strong inducers of cytochrome P450 (CYP)3A, and efavirenz.

Dosing

The recommended dosage of Zepatier is one co-formulated tablet containing 50 mg of grazoprevir and 100 mg of elbasvir once daily (QD) with or without food.[1] The duration of treatment is outlined below (Table 1) and is dependent on the patient population. Prior to initiating Zepatier in patients with genotype 1a infection, testing for the NS5A resistance associated polymorphism is recommended to guide treatment duration. In patients with genotype 1a and this polymorphism present at baseline, 12 weeks of treatment with Zepatier resulted in lower rates of sustained viral response 12 weeks after treatment completion (SVR12) relative to patients with genotype 1a without the presence of this baseline polymorphism.

Table 1. Recommended Zepatier Dosage Regimens for the Treatment of Genotype 1 or 4 Chronic HCV.[1]

Genotype	Treatment History	Baseline NS5A Polymorphism	Treatment Regimen	Treatment Duration
1a	TN/PR-experienced* without NS5A polymorphisms†	No†	Zepatier	12 weeks
1a	TN/PR-experienced* with baseline NS5A polymorphisms†	Yes†	Zepatier + ribavirin‡	16 weeks
1a§ or 1b	PR + HCV PI-experienced$^{\beta}$	NA	Zepatier + ribavirin‡	12 weeks
1b	TN/TE*	NA	Zepatier	12 weeks
4	TN	NA	Zepatier	12 weeks
4	PR-experienced*	NA	Zepatier + ribavirin‡	16 weeks

HCV – Hepatitis C virus; TN – Treatment naïve; PR- Pegylated interferon/ribavirin; * Patients who have failed treatment with PR; † NS5A resistance-associated polymorphisms at amino acid positions 28, 30, 31, or 93; ‡ For patients with creatinine clearance (CrCl) > 50 mL/min, the recommended dose of ribavirin is weight-based. For patients with CrCl ≤ 50 mL/min, including patients receiving hemodialysis, refer to the ribavirin prescribing information for the correct ribavirin dosage; § The optimal Zepatier-based treatment regimen and duration of therapy for PR + HCV protease inhibitor (PI)-experienced genotype 1a-infected patients with one or more baseline NS5A resistance-associated polymorphisms at positions 28, 30, 31, and 93 has not been established; PI – PI – Protease inhibitor; $^{\beta}$ Patients who have failed treatment with PR + and NS3/4A PI (i.e., Victrelis® [boceprevir capsules], Incivek® [telaprevir tablets], or Olysio® [simeprevir capsules]); NA – Not applicable.

Guidelines

The American Association for the Study of Liver Diseases (AASLD) recommended regimens are detailed in the *Hepatitis C Virus Direct-Acting Antivirals Therapy Class Summary*.[5] For the most up-to-date recommendations always consult the guidelines. NS5A RAS testing is recommended for genotype 1a-infected, treatment-naive or -experienced patients being considered for Zepatier. If present, a different regimen should be considered. Zepatier is recognized as a recommended treatment option in patients with genotype 1 or 4 chronic HCV in guidelines.[5]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Zepatier. Criteria are based on the guidance issued by American Association for the Study of Liver Diseases (AASLD)/Infectious Diseases Society of America (IDSA), prescribing information, clinical data, and expert review. Approval durations differ by baseline characteristics. Because of the specialized skills required for evaluation and diagnosis of patients treated with Zepatier as well as the monitoring required for adverse events (AEs) and efficacy, approval requires Zepatier to be prescribed by or in consultation with a gastroenterologist, hepatologist, infectious diseases physician, or liver transplant physician.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zepatier is recommended in those who meet the following criteria:

FDA-Approved Indications

39. Chronic Hepatitis C Virus (HCV) Genotype 1a. Approve for the specified duration below if patients meet the following criteria (A, B, and C):

- **i.** The patient is ≥ 18 years of age; AND
- **ii.** Zepatier is prescribed by or in consultation with a gastroenterologist, hepatologist, infectious diseases physician, or a liver transplant physician; AND
- **iii.** The patient meets ONE of the following criteria (i or ii):
  - **a)** Approve for 12 weeks if the patient meets ONE of the following conditions (a or b):

(1) Condition 1 (patients must meet [1] or [2], PLUS [3]):
   a. The patient is treatment-naïve; OR
   b. The patient has previously been treated with pegylated interferon + ribavirin *only*; AND
   c. The patient does NOT have a baseline NS5A polymorphism at ONE (or more) of the following the amino acid positions: 28, 30, 31, or 93; OR

(2) Condition 2 (patients must meet [1] and [2]):
   a. The patient has previously been treated with pegylated interferon + ribavirin and an HCV protease inhibitor; AND
   b. Zepatier will be prescribed in combination with ribavirin.

b) Approve for 16 weeks if the patient meets the following criteria (a or b, PLUS c and d):
(1) The patient is treatment-naïve; OR
(2) The patient has previously been treated with pegylated interferon + ribavirin *only*; AND
(3) The patient has a baseline NS5A polymorphism at ONE (or more) of the following amino acid positions: 28, 30, 31, or 93; AND
(4) Zepatier will be prescribed in combination with ribavirin.

40. Chronic Hepatitis C Virus (HCV) Genotype 1b. Approve for 12 weeks if patients meet the following criteria (A, B, and C):
i. The patient is ≥ 18 years of age; AND
ii. Zepatier is prescribed by or in consultation with a gastroenterologist, hepatologist, infectious diseases physician, or a liver transplant physician; AND
iii. The patient meets ONE of the following conditions (i or ii):
a) Condition 1 (patients must meet a or b):
(1) The patient is treatment-naïve; OR
(2) The patient has previously been treated with pegylated interferon + ribavirin *only*; OR
b) Condition 2 (patients must meet a and b):
(1) The patient has previously been treated with pegylated interferon + ribavirin + an HCV protease inhibitor; AND
(2) Zepatier will be prescribed in combination with ribavirin.

3. Chronic Hepatitis C Virus (HCV) Genotype 4. Approve for the duration specified below if patients meet the following criteria (A, B, and C):
A) The patient is ≥ 18 years of age; AND
B) Zepatier is prescribed by or in consultation with a gastroenterologist, hepatologist, infectious diseases physician, or a liver transplant physician;
C) The patient meets ONE of the following conditions (i or ii):
i. Approve for 12 weeks if the patient is treatment-naïve; OR
ii. Approve for 16 weeks if the patient has previously been treated with pegylated interferon and ribavirin for HCV and Zepatier will be prescribed in combination with ribavirin.

Other Uses with Supportive Evidence

4. **Patient Has Been Started on Zepatier.** Approve for an indication or condition addressed as an approval in the Recommended Authorization Criteria section (FDA-Approved Indications or Other Uses with Supportive Evidence). Approve the duration described above to complete a course therapy (e.g., a patient who should receive 12 weeks, and has received 3 weeks should be approved for 9 weeks to complete their 12-week course).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Zepatier has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

1. **Hepatitis C Virus (HCV), Child-Pugh Class B or Child-Pugh Class C Liver Disease (Moderate or Severe Hepatic Impairment).** Zepatier is contraindicated in patients with moderate or severe hepatic impairment (Child-Pugh Class B or C).[1]

2. **Hepatitis C Virus (HCV) [any genotype], Combination with Any Other Direct-Acting Antivirals (DAAs) [Not Including Ribavirin].** Zepatier provides a complete antiviral regimen for patients with genotype 1 and 4 chronic HCV.

4. **Life Expectancy Less Than 12 Months Due to Non-Liver Related Comorbidities.** According to AASLD guidance, little evidence exists to support initiation of HCV treatment in patients with limited life expectancy (less than 12 months) due to non–liver-related comorbid conditions.[5] For these patients, the benefits of HCV treatment are unlikely to be realized, and palliative care strategies should take precedence.

4. **Pediatric Patients (Age < 18 Years).** The safety and efficacy of Zepatier have not been established in pediatric patients < 18 years of age.[1] Guidelines recommend Harvoni (ledipasvir/sofosbuvir tablets) in pediatric patients with genotypes 1 or 4 chronic HCV.[5]

5. **Retreatment with Zepatier in Patients Who Have Previously Received Zepatier** (e.g., retreatment in prior null responders, prior partial responders, prior relapse patients, patients who have not completed a course of therapy due to an adverse reaction or for other reasons).

6. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Hepatology – Givlaari Prior Authorization Policy

- Givlaari™ (givosiran injection solution, for subcutaneous use – Alnylam Pharmaceuticals)

REVIEW DATE: 12/16/2020

OVERVIEW

Givlaari, an aminolevulinate synthase 1-directed small interfering RNA, is indicated for the treatment of patients ≥ 18 years of age with **acute hepatic porphyria** (AHP).[1]

Givlaari is a double-stranded small interfering RNA that causes degradation of aminolevulinate synthase 1 (ALAS1) mRNA in hepatocytes through RNA interference, reducing the elevated levels of liver ALAS1 mRNA.[1] This leads to reduced circulating levels of neurotoxic intermediates aminolevulinic acid and porphobilinogen, factors associated with attacks and other disease manifestations of AHP. In the pivotal trial, inclusion criteria specified a minimum of 2 porphyria attacks requiring hospitalization, urgent healthcare visit, or intravenous hemin administration at home in the 6 months prior to study entry. Hemin use during the study was permitted for the treatment of acute porphyria attacks.

Disease Overview

Porphyria is a group of metabolic disorders caused by abnormalities in the chemical steps that lead to the production of heme.[2] Heme is necessary for the transport of oxygen to cells in the body. If synthesis of heme is hindered, an accumulation of porphyrins or porphyrin precursors (intermediate chemicals) accumulates in the cells, resulting in oxygen depletion. AHPs are a subgroup of porphyrias in which the enzyme deficiency occurs within the liver.[3] AHPs include acute intermittent porphyria (AIP), variegate porphyria (VP), 5-aminolevulinic acid dehydratase deficiency porphyria (ALAD), and hereditary coproporphyria (HCP) and are characterized by acute neurovisceral symptoms with or without cutaneous manifestations.[3,4] Symptoms and treatments for AIP, VP, ALAD, and HCP are similar, however, VP and HCP patients often develop photosensitivity. Signs and symptoms of AHP usually occur intermittently and include abdominal pain, constipation, muscle weakness, pain in the arms and legs, insomnia, emotional complications, rapid pulse, and high blood pressure. Hospitalization is often required for acute attacks. Although most symptomatic patients with AHP have complete resolution of their symptoms between attacks, those with numerous recurrent occurrences may develop chronic pain. Due to the high prevalence of chronic kidney disease, serum creatinine and estimated glomerular filtration rate should be monitored annually for all symptomatic patients.

Guidelines

The Porphyrias Consortium of the National Institutes of Health's Rare Diseases Clinical Research Network has developed recommendations for evaluation and long-term management of AHPs (2017).[5] Initial assessments should include diagnostic confirmation by biochemical testing, subsequent genetic testing to determine the specific AHP, and a complete medical history and physical examination. Preventative measures should be taken to prevent attacks. Hemin therapy (e.g., Panhematin® [hemin injection for intravenous infusion]) is recommended for preventative management in AHP and treatment during acute attacks. Patients with ≥ four attacks per year are candidates for either prophylactic or "on demand" infusions. The need for ongoing prophylaxis should be assessed every 6 to 12 months. Repeated long term treatment with hemin therapy can lead to iron overload and contribute to hepatic damage and fibrosis. Carbohydrate loading (glucose tablets or dextrose solutions) has been used in early stages of an acute attack, but there are no clear data showing a benefit. Women with AHP can develop cyclic attacks correlated to the menstrual

cycle. Options to prevent these attacks include recognizing and removing exacerbating factors, a gonadotropin releasing-hormone analog, switching to a low dose hormonal contraceptive, or prophylactic hemin therapy infusions.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Givlaari. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Givlaari as well as the monitoring required for adverse events and long-term efficacy, approval requires Givlaari to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Givlaari is recommended in those who meet the following criteria:

FDA-Approved Indications

69. Acute Hepatic Porphyria. Approve for 1 year if the patient meets the following criteria (A, B, C, and D):

- **A)** Patient is ≥ 18 years of age; AND
- **B)** Diagnosis of acute hepatic porphyria was confirmed by both of the following (i and ii):
  - **i.** Patient demonstrated clinical features associated with acute hepatic porphyria; AND
    Note: Examples of clinical features associated with acute intermittent porphyria include neurovisceral symptoms, blistering lesions, hepatic involvement, peripheral neuropathy, abdominal pain, constipation, muscle weakness, pain in the arms and legs.
  - **ii.** Patient meets one of the following (a or b):
    - **a)** Elevated urinary aminolevulinic acid (ALA) greater than the upper limit of normal; OR
    - **b)** Elevated urinary porphobilinogen (PBG) greater than the upper limit of normal; AND
- **C)** Prior to starting treatment with Givlaari, the patient has a history of one porphyria attack in the last 6 months that required a hospitalization, urgent healthcare visit, or intravenous hemin administration at home; AND
- **D)** Givlaari is prescribed by, or in consultation with a gastroenterologist, hepatologist, or a physician who specializes in acute hepatic porphyria.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Givlaari is not recommended in the following situations:

78. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Type of Revision	Summary of Changes	Review Date

New Policy	--	12/18/2019
Selected Revision	**Acute Hepatic Porphyria:** The requirement for a history of one porphyria attack in the last 6 months that required hospitalization, urgent healthcare visit, or intravenous hemin administration at home was added to the criteria.	05/20/2020
Annual Revision	**Acute Hepatic Porphyria:** Criteria requiring diagnosis of acute hepatic porphyria was added to the policy.	12/16/2020

PRIOR AUTHORIZATION POLICY

POLICY: Hepatology – Ocalvia Prior Authorization Policy

- Ocaliva® (obeticholic acid tablets – Intercept Pharmaceuticals)

REVIEW DATE: 07/22/2020

OVERVIEW

Ocaliva is indicated for the treatment of primary biliary cholangitis in combination with ursodeoxycholic acid (UDCA) in adults with an inadequate response to UDCA or as monotherapy in adults unable to tolerate UDCA.[1] Ocaliva was approved for this indication under accelerated approval based on reduction in alkaline phosphatase. An improvement in survival or primary biliary cholangitis-related symptoms has not been established. The prescribing information notes that continued approval for this indication may be contingent upon verification and description of clinical benefit in confirmatory trials.

Disease Overview

Primary biliary cholangitis is a chronic, progressive, cholestatic liver disease in which autoimmune destruction of small and medium intrahepatic bile ducts leads to cholestasis.[3,4] Cholestasis eventually progresses to advanced fibrosis, cirrhosis, and liver failure.[3-5] The serologic hallmark of primary biliary cholangitis is the finding of anti-mitochondrial antibodies in the serum.[3,4] In the 5% to 10% of patients in which anti-mitochondrial antibodies is absent or present only in low titer, nearly all will have primary biliary cholangitis-specific antinuclear antibodies, including sp100 and gp210, which are present in over 30% of patients who are negative for anti-mitochondrial antibodies by indirect immunofluorescence. The biochemical hallmark of primary biliary cholangitis is the finding of an elevated alkaline phosphatase level.[5]

Clinical Efficacy

The pivotal study evaluated Ocaliva in adult patients with primary biliary cholangitis who either had an inadequate response to UDCA (93% of patients) or were unable to tolerate UDCA (7% of patients).[2] The primary efficacy endpoint (composite of alkaline phosphatase level < 1.67 times the upper limit of normal, ≥ 15% reduction in alkaline phosphatase, and a total bilirubin ≤ upper limit of normal at Month 12) was met by 46% and 47% of patients treated with Ocaliva 5 mg and Ocaliva 10 mg, respectively. There were significant reductions in alkaline phosphatase with both Ocaliva groups early in treatment and sustained throughout the 12-month study. Through Year 3, Ocaliva therapy has resulted in a sustained reduction in alkaline phosphatase.[2,6]

Guidelines

The American Association for the Study of Liver Disease guidelines for primary biliary cholangitis (2018) state that the diagnosis can be confirmed when patients meet two of the following criteria: 1) there is cholestasis as evidenced by alkaline phosphatase elevation; 2) anti-mitochondrial antibodies are present, or if negative for anti-mitochondrial antibodies, other primary biliary cholangitis-specific autoantibodies, including sp100 or gp210, are present; 3) there is histologic evidence of nonsuppurative destructive cholangitis and destruction of interlobular bile ducts. It is specifically noted that diagnosis in a patient who is negative for anti-mitochondrial antibodies does not require a liver biopsy if other diagnostic criteria are

met. Treatment with UDCA (available in the US as ursodiol) at a dose of 13 to 15 mg/kg/day orally is the recommended treatment for patients with primary biliary cholangitis who have abnormal liver enzyme values regardless of histologic stage.[3] Following 12 months of UDCA therapy, the patient should be evaluated to determine if second-line therapy is appropriate. It is estimated that up to 40% of patients have an inadequate response to UDCA; Ocaliva should be considered for these pateints. The European Association for the Study of the Liver guidelines for diagnosis and management of patients with primary biliary cholangitis (2017) make similar recommendations.[7]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Ocaliva. Because of the specialized skills required for evaluation and diagnosis of patients treated with Ocaliva as well as the monitoring required for adverse events and long-term efficacy, approval requires Ocaliva to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Ocaliva is recommended in those who meet the following criteria:

FDA-Approved Indications

49. Primary Biliary Cholangitis (also known as Primary Biliary Cirrhosis). Approve Ocaliva for the duration noted if the patient meets one of the following conditions (A or B):

41. Initial Therapy. Approve for 6 months if the patient meets the following criteria (i, ii, iii, and iv):

i. Patient is ≥ 18 years of age; AND

ii. According to the prescriber, the patient has a diagnosis of primary biliary cholangitis as defined by TWO of the following (a, b, c):

a) Alkaline phosphatase is elevated above the upper limit of normal as defined by normal laboratory reference values;

b) Positive anti-mitochondrial antibodies or other primary biliary cholangitis-specific auto-antibodies, including sp100 or gp210, if anti-mitochondrial antibodies are negative;

c) Histologic evidence of primary biliary cholangitis from a liver biopsy; AND

iii. Patient meets ONE of the following criteria (a or b):

a) Patient has been receiving ursodiol therapy for ≥ 1 year and has had an inadequate response according to the prescriber; OR

b) According to the prescriber the patient is unable to tolerate ursodiol therapy; AND
Note: Examples of ursodiol therapy include ursodiol generic tablets and capsules, Urso 250®, Urso Forte® and Actigall®.

iv. The agent is prescribed by or in consultation with a gastroenterologist, hepatologist, or liver transplant physician.

42. Patient is Currently Receiving Therapy. Approve for 1 year if the patient has responded to Ocaliva therapy as determined by the prescriber.
Note: Examples of a response to Ocaliva therapy are improved biochemical markers of primary biliary cholangitis (e.g., alkaline phosphatase, bilirubin, gamma-glutamyl transpeptidase [GGT], aspartate aminotransferase [AST], alanine aminotransferase [ALT]).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Ocaliva is not recommended in the following situations:

11. **Alcoholic Liver Disease**. There are no data available to support the use of Ocaliva in patients with alcoholic hepatitis. Ocaliva is not FDA-approved for this indication and current alcoholic liver disease guidelines from AASLD (2010) do not make recommendations regarding therapy with Ocaliva.[1,8] Additional well-controlled studies are needed.

12. **Nonalcoholic Fatty Liver Disease (NAFLD), including Nonalcoholic Fatty Liver (NAFL) or Nonalcoholic Steatohepatitis (NASH).** Ocaliva is not FDA-approved for this indication and current NAFLD guidelines from AASLD (2018) recommend against the off-label use of obeticholic acid to treat NASH until additional safety and efficacy data become available.[1,9]

13. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual revision	No changes.	07/11/2018
Annual revision	• Primary Biliary Cholangitis: Wording in reference to "according to the prescribing physician" was changed to "according to the prescriber". For initial therapy approval, to confirm the diagnosis of primary biliary cholangitis, added that patients could be positive for anti-mitochondrial antibodies (AMAs) or other PBC-specific auto-antibodies including sp100 or gp210, if AMA is negative. Changed the approval duration for "Patients Currently Receiving Therapy" from 3 years to 1 year. Removed age requirement and specialist requirement from the criteria for "Patients Currently Receiving Therapy".	07/24/2019
Annual revision	No criteria changes.	07/22/2020

PRIOR AUTHORIZATION POLICY

POLICY: Hereditary Angioedema – C1 Esterase Inhibitors (Intravenous) Prior Authorization Policy

- Berinert® (C1 esterase inhibitor [human] for IV use – CSL Behring)
- Cinryze® (C1 esterase inhibitor [human] for intravenous [IV] use – Shire/Takeda)

- Ruconest® (recombinant C1 esterase inhibitor for IV use – Pharming Healthcare, Inc.)

REVIEW DATE: 08/26/2020

OVERVIEW

Berinert, Cinryze, and Ruconest are C1 esterase inhibitor (C1-INH) replacement therapies for hereditary angioedema (HAE).[1-3] Cinryze and Berinert are human plasma-derived C1-INH; Ruconest is a recombinant C1-INH purified from milk of transgenic rabbits. Berinert is indicated for the treatment of acute abdominal, laryngeal, or facial attacks of HAE in adult and pediatric patients.[2] Cinryze is indicated for routine prophylaxis against angioedema attacks in pediatric, adolescent, and adult patients with HAE.[1] Ruconest is indicated for the treatment of acute HAE attacks in adult and adolescent patients.[3]

Of note, although Cinryze is labeled for use in the prophylactic setting and Berinert is labeled for use in the acute treatment setting, guidelines do not differentiate between these products. Plasma-derived C1-INH therapy is supported for both acute treatment and prophylactic therapy.[4,5,8,9] Additionally, use of Cinryze for acute treatment of acute HAE attacks has been reported in literature.[10]

Disease Overview

HAE due to C1-INH deficiency has two subtypes: HAE type I and HAE type II. HAE diagnosis can be confirmed by measuring functional C1-INH protein levels (usually < 50% of normal in patients with HAE), C4 levels, and C1-INH antigenic levels.[4,5] Patients with HAE type I have low C4 and C1-INH antigenic protein levels, along with low levels of functional C1-INH protein. Patients with HAE type II have low C4 and functional C1-INH protein level, with a normal or elevated C1-INH antigenic protein level. C1-INH replacement therapies are appropriate for both HAE type I and type II.

Patients with the third type of HAE called HAE with normal C1-INH (HAE nC1-INH), previously referred to as HAE type III, have normal C4 and C1-INH antigenic protein levels.[4] HAE nC1-INH is much less prevalent than HAE types I/II, and the exact cause of HAE nC1-INH has not been determined.[4,6] Pathogenic variants in the genes encoding for Factor XII (regulates bradykinin generation), angiopoietin-1 (involved in vascular permeability), and plasminogen have been associated with HAE nC1-INH; however, the majority of cases have unknown etiology. There are no randomized or controlled clinical trial data available with any therapy for use in HAE nC1-INH.[6-8]

Guidelines

Per the World Allergy Organization/European Academy of Allergy and Clinical Immunology guidelines (2017), all HAE type I/II attacks should be considered for acute treatment; treatment is mandatory for any attack potentially affecting the upper airway (HAE nC1-INH is not addressed within the scope of the guideline).[5] Attacks should be treated as early as possible. Self-administration at home facilitates earlier response. The guidelines recommend C1-INH products (Berinert, Cinryze, or Ruconest), Kalbitor® (ecallantide injection), or icatibant injection (Firazyr®, generics) as first-line treatment options. Androgens and anti-fibrinolytics are not effective as acute treatment. Patients should carry acute treatment with them at all times and should have enough supply on hand for treatment of two attacks. Other guidelines from the US Hereditary Angioedema Association Medical Advisory Board (2013), a practice parameter update from a Joint Task Force (2013), and an international and Canadian guideline (2019) have similar recommendations for acute treatment of HAE type I/II attacks.[6,9,11]

The decision to initiate long-term prophylaxis is individualized based on multiple factors and should be made by the patient and an HAE specialist.[6] C1-INH concentrate and Takhzyro™ (lanadelumab-flyo injection) are recognized as treatment options for long-term prophylaxis of HAE type I/II attacks.[5,6]

Androgens are not considered first-line and are contraindicated in certain groups (e.g., pregnancy, prepubescent children, androgen-dependent malignancy).[6] In other populations, the use of androgens for long-term prophylaxis may be considered as second-line but should be considered critically due to potential for adverse events. Therefore, guidelines note that androgens should not be used in patients who have a preference for alternative therapy and that patients should not be required to fail anabolic androgen therapy as a prerequisite to receiving prophylactic C1-INH or Takhzyro therapy.[6,9]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Berinert, Cinryze, and Ruconest. Because of the specialized skills required for evaluation and diagnosis of patients treated with these products, approval requires Berinert, Cinryze, or Ruconest to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Documentation: Documentation will be required where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes, laboratory records, and prescription claims records.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

I. Coverage of Berinert or Cinryze is recommended in those who meet the following criteria:

FDA-Approved Indications

13. Hereditary Angioedema (HAE) Due to C1 Inhibitor (C1-INH) Deficiency [Type I or Type II] – Prophylaxis. Approve Berinert or Cinryze for the duration noted if the patient meets one of the following criteria (A or B):

A) Initial therapy. Approve for 1 year if the patient meets both of the following criteria (i and ii):

- **i.** Patient has HAE type I or type II as confirmed by the following diagnostic criteria (a and b):
  - **a)** Patient has low levels of functional C1-INH protein (< 50% of normal) at baseline, as defined by the laboratory reference values **[documentation required]**; AND
  - **b)** Patient has lower than normal serum C4 levels at baseline, as defined by the laboratory reference values **[documentation required]**; AND
- **ii.** The medication is prescribed by or in consultation with an allergist/immunologist or a physician who specializes in the treatment of HAE or related disorders.

B) Patients currently receiving Berinert or Cinryze prophylaxis. Approve for 1 year if the patient meets all of the following criteria (i, ii, and iii):

- **i.** Patient has a diagnosis of HAE type I or II **[documentation required]**; AND
- **ii.** According to the prescriber, the patient has had a favorable clinical response since initiating Berinert or Cinryze prophylactic therapy compared with baseline (i.e., prior to initiating prophylactic therapy); AND

  Note: Examples of favorable clinical response include decrease in HAE acute attack frequency, decrease in HAE attack severity, or decrease in duration of HAE attacks.
- **iii.** The medication is prescribed by or in consultation with an allergist/immunologist or a physician who specializes in the treatment of HAE or related disorders.

14. **Hereditary Angioedema (HAE) Due to C1 Inhibitor (C1-INH) Deficiency [Type I or Type II] – Treatment of Acute Attacks.** Approve Berinert or Cinryze for the duration noted if the patient meets one of the following criteria (A or B):
    - **A)** Initial therapy. Approve for 1 year if the patient meets both of the following criteria (i and ii):
        - **i.** Patient has HAE type I or type II as confirmed by following criteria (a and b):
            - **a)** Patient has low levels of functional C1-INH protein (< 50% of normal) at baseline, as defined by the laboratory reference values **[documentation required]**; AND
            - **b)** Patient has lower than normal serum C4 levels at baseline, as defined by the laboratory reference values **[documentation required]**; AND
        - **ii.** The medication is prescribed by or in consultation with an allergist/immunologist or a physician who specializes in the treatment of HAE or related disorders.
    - **B)** Patients who have treated previous acute HAE attacks with Berinert or Cinryze. Approve for 1 year if the patient meets all of the following criteria (i, ii, and iii):
        - **i.** Patient has a diagnosis of HAE type I or II **[documentation required]**; AND
        - **ii.** According to the prescriber, the patient has had a favorable clinical response with Berinert or Cinryze treatment; AND

          Note: Examples of favorable clinical response include decrease in the duration of HAE attacks, quick onset of symptom relief, complete resolution of symptoms, or decrease in HAE acute attack frequency or severity.
        - **iii.** The medication is prescribed by or in consultation with an allergist/immunologist or a physician who specializes in the treatment of HAE or related disorders.

II. Coverage of Ruconest is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Hereditary Angioedema (HAE) Due to C1 Inhibitor (C1-INH) Deficiency [Type I or Type II] – Treatment of Acute Attacks.** Approve Ruconest for the duration noted if the patient meets one of the following criteria (A or B):
    - **A)** Initial therapy. Approve for 1 year if the patient meets both of the following criteria (i and ii):
        - **i.** Patient has HAE type I or type II as confirmed by following criteria (a and b):
            - **a)** Patient has low levels of functional C1-INH protein (< 50% of normal) at baseline, as defined by the laboratory reference values **[documentation required]**; AND
            - **b)** Patient has lower than normal serum C4 levels at baseline, as defined by the laboratory reference values **[documentation required]**; AND
        - **ii.** The medication is prescribed by or in consultation with an allergist/immunologist or a physician who specializes in the treatment of HAE or related disorders.
    - **B)** Patients who have treated previous acute HAE attacks with Ruconest. Approve for 1 year if the patient meets all of the following criteria (i, ii, and iii):
        - **i.** Patient has a diagnosis of HAE type I or type II **[documentation required]**; AND
        - **ii.** According to the prescriber, the patient has had a favorable clinical response with Ruconest treatment; AND

          Note: Examples of favorable clinical response include decrease in the duration of HAE attacks, quick onset of symptom relief, complete resolution of symptoms, or decrease in HAE acute attack frequency or severity.
        - **iii.** The medication is prescribed by or in consultation with an allergist/immunologist or a physician who specializes in the treatment of HAE or related disorders.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Berinert, Cinryze, or Ruconest is not recommended in the following situations:

14. **Hereditary Angioedema (HAE) Prophylaxis (Ruconest ONLY).** Ruconest is not FDA-approved for prophylaxis of HAE attacks. A small (n = 32) Phase II, randomized, double-blind, placebo-controlled trial in adults and adolescents ≥ 13 years of age showed efficacy of Ruconest over placebo for reducing mean monthly rate of HAE attacks ($P < 0.0001$).[12] At this time, evidence is not sufficient to support Ruconest use for HAE prophylaxis. Note: This Condition Not Recommended for Approval does not apply to Berinert or Cinryze.

15. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Hereditary Angioedema – C1 Esterase Inhibitors (Subcutaneous) Prior Authorization Policy

- Haegarda® (C1 esterase inhibitor [human] for subcutaneous [SC] use – CSL Behring)

REVIEW DATE: 08/26/2020

OVERVIEW

Haegarda is a C1 esterase inhibitor (C1-INH) replacement therapy for hereditary angioedema (HAE).[1] It is a human plasma-derived C1-INH and is indicated for routine prophylaxis to prevent HAE attacks in adults and pediatric patients ≥ 6 years of age.[1]

Disease Overview

HAE due to C1-INH deficiency has two subtypes: HAE type I and HAE type II. HAE diagnosis can be confirmed by measuring functional C1-INH protein levels (usually < 50% of normal in patients with HAE), C4 levels, and C1-INH antigenic levels.[2,3] Patients with HAE type I have low C4 and C1-INH antigenic protein levels, along with low levels of functional C1-INH protein. Patients with HAE type II have low C4 and functional C1-INH protein level, with a normal or elevated C1-INH antigenic protein level. C1-INH replacement therapies are appropriate for both HAE type I and type II.

Patients with the third type of HAE called HAE with normal C1-INH (HAE nC1-INH), previously referred to as HAE type III, have normal C4 and C1-INH antigenic protein levels.[2] HAE nC1-INH is much less prevalent than HAE types I/II, and the exact cause of HAE nC1-INH has not been determined.[2,4] Pathogenic variants in the genes encoding for Factor XII (regulates bradykinin generation), angiopoietin-1 (involved in vascular permeability), and plasminogen have been associated with HAE nC1-INH; however, the majority of cases have unknown etiology. There are no randomized or controlled clinical trial data available with any therapy for use in HAE nC1-INH.[4-6]

Guidelines

According to international/Canadian guidelines (updated 2019), the decision to initiate long-term prophylaxis is individualized based on multiple factors and should be made by the patient and an HAE specialist.[4] C1-INH concentrate and Takhzyro™ (lanadelumab-flyo injection) are recognized as treatment options for long-term prophylaxis of HAE type I/II attacks.[3,4] Androgens are not considered first-line and are contraindicated in certain groups (e.g., pregnancy, prepubescent children, androgen-dependent malignancy).[4] In other populations, the use of androgens for long-term prophylaxis may be considered as second-line but should be considered critically due to potential for adverse events. Therefore, guidelines note that androgens should not be used in patients who have a preference for alternative therapy and that patients should not be required to fail anabolic androgen therapy as a prerequisite to receiving prophylactic C1-INH or Takhzyro therapy.[4,7]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Haegarda. Because of the specialized skills required for evaluation and diagnosis of patients treated with Haegarda, approval requires Haegarda to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Documentation: Documentation will be required where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes, laboratory records, and prescription claims records.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Haegarda is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Hereditary Angioedema (HAE) Due to C1 Inhibitor (C1-INH) Deficiency [Type I or Type II] – Prophylaxis.** Approve Haegarda for the duration noted if the patient meets one of the following criteria (A or B):
   - **C)** Initial therapy. Approve for 1 year if the patient meets both of the following criteria (i and ii):
     - **i.** Patient has HAE type I or type II as confirmed by the following diagnostic criteria (a and b):
       - **a)** Patient has low levels of functional C1-INH protein (< 50% of normal) at baseline, as defined by the laboratory reference values **[documentation required]**; AND
       - **b)** Patient has lower than normal serum C4 levels at baseline, as defined by the laboratory reference values **[documentation required]**; AND
     - **ii.** The medication is prescribed by or in consultation with an allergist/immunologist or a physician who specializes in the treatment of HAE or related disorders.
   - **D)** Patients currently receiving Haegarda prophylaxis. Approve for 1 year if the patient meets all of the following criteria (i, ii, and iii):
     - **i.** Patient has a diagnosis of HAE type I or II **[documentation required]**; AND
     - **ii.** According to the prescriber, the patient has had a favorable clinical response since initiating Haegarda prophylactic therapy compared with baseline (i.e., prior to initiating prophylactic therapy); AND

       Note: Examples of favorable clinical response include decrease in HAE acute attack frequency, decrease in HAE attack severity, or decrease in duration of HAE attacks.
     - **iii.** The medication is prescribed by or in consultation with an allergist/immunologist or a physician who specializes in the treatment of HAE or related disorders.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Haegarda is not recommended in the following situations:

16. **Concomitant Use with Other HAE Prophylactic Therapies (e.g., Cinryze®, Takhzyro™).** Haegarda has not been studied in combination with other prophylactic therapies for HAE, and combination therapy for long-term prophylactic use is not recommended. Patients may use other medications, including Cinryze, for treatment of acute HAE attacks, and for short-term (procedural) prophylaxis.

17. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Hereditary Angioedema – Icatibant (Firazyr) Prior Authorization Policy
- Firazyr® (icatibant injection for subcutaneous use – Shire/Takeda)
- Icatibant injection for subcutaneous use – various

REVIEW DATE: 08/19/2020

OVERVIEW

Icatibant (Firazyr, generics) is a synthetic decapeptide that is indicated for the treatment of acute hereditary angioedema (HAE) attacks in adults ≥ 18 years of age.[1] Icatibant is a competitive bradykinin B2 receptor antagonist with an affinity similar to bradykinin. Bradykinin is a vasodilator which is likely responsible for the characteristic HAE symptoms of localized swelling, inflammation and pain. By preventing the binding of bradykinin to its receptor, icatibant treats the clinical symptoms of an acute HAE attack.

Disease Overview

HAE due to C1 esterase inhibitor (C1-INH) deficiency has two subtypes: HAE type I and HAE type II. HAE diagnosis can be confirmed by measuring functional C1-INH protein levels (usually < 50% of normal in patients with HAE), C4 levels, and C1-INH antigenic levels.[2,3] Patients with HAE type I have low C4 and C1-INH antigenic protein levels, along with low levels of functional C1-INH protein. Patients with HAE type II have low C4 and functional C1-INH protein level, with a normal or elevated C1-INH antigenic protein level. C1-INH replacement therapies are appropriate for both HAE type I and type II.

Patients with the third type of HAE called HAE with normal C1-INH (HAE nC1-INH), previously referred to as HAE type III, have normal C4 and C1-INH antigenic protein levels.[2] HAE is much less prevalent

than HAE types I/II, and the exact cause of HAE nC1-INH has not been determined.[2,4] Pathogenic variants in the genes encoding for Factor XII (regulates bradykinin generation), angiopoietin-1 (involved in vascular permeability), and plasminogen have been associated with HAE nC1-INH; however, the majority of cases have unknown etiology. There are no randomized or controlled clinical trial data available with any therapy for use in HAE nC1-INH.[4-6]

Guidelines

Per the World Allergy Organization/European Academy of Allergy and Clinical Immunology guidelines (2017), all HAE type I/II attacks should be considered for acute treatment; treatment is mandatory for any attack potentially affecting the upper airway (HAE nC1-INH is not addressed within the scope of the guideline).[3] Attacks should be treated as early as possible. Self-administration at home facilitates earlier response. The guidelines recommend C1-INH products, Kalbitor® (ecallantide for subcutaneous injection), or icatibant as first-line treatment options. Androgens and antifibrinolytics are not effective as acute treatment. Patients should carry acute treatment with them at all times and should have enough supply on hand for treatment of two attacks. Other guidelines from the US Hereditary Angioedema Association Medical Advisory Board (2013), a practice parameter update from a Joint Task Force (2013), and an international and Canadian guideline (2019) have similar recommendations regarding acute treatment of HAE type I/II attacks.[4,7,8]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of icatibant. Because of the specialized skills required for evaluation and diagnosis of patients treated with icatibant, approval requires it to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Documentation: Documentation will be required where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes, laboratory records, and prescription claims records.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of icatibant is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Hereditary Angioedema (HAE) Due to C1 Inhibitor (C1-INH) Deficiency (Type I or Type II) – Treatment of Acute Attacks.** Approve for the duration noted if the patient meets one of the following criteria (A or B):
   - **A)** Initial therapy. Approve for 1 year if the patient meets both of the following criteria (i and ii):
     - **i.** Patient has HAE type I or type II as confirmed by the following diagnostic criteria (a and b):
       - **a)** Patient has low levels of functional C1-INH protein (< 50% of normal) at baseline, as defined by the laboratory reference values **[documentation required]**; AND
       - **b)** Patient has lower than normal serum C4 levels at baseline, as defined by the laboratory reference values **[documentation required]**; AND
     - **ii.** The medication is prescribed by, or in consultation with, an allergist/immunologist or a physician who specializes in the treatment of HAE or related disorders.

B) Patient who has treated previous acute HAE attacks with icatibant (Firazyr). Approve for 1 year if the patient meets all of the following criteria (i, ii, and iii):

- **i.** Patient has a diagnosis of HAE type I or type II **[documentation required]**; AND
- **ii.** According to the prescriber, the patient has had a favorable clinical response (e.g., decrease in the duration of HAE attacks, quick onset of symptom relief, complete resolution of symptoms, decrease in HAE acute attack frequency or severity) with icatibant treatment; AND
- **iii.** The medication is prescribed by or in consultation with an allergist/immunologist or a physician who specializes in the treatment of HAE or related disorders.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of icatibant is not recommended in the following circumstances:

18. Hereditary Angioedema (HAE) Prophylaxis. Data are not available and icatibant is not indicated for prophylaxis of HAE attacks.

19. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Hereditary Angioedema – Kalbitor Prior Authorization Policy

- Kalbitor® (ecallantide injection for subcutaneous use – Dyax)

REVIEW DATE: 08/26/2020

OVERVIEW

Kalbitor, a plasma kallikrein inhibitor, is indicated for the treatment of acute attacks of hereditary angioedema (HAE) in patients ≥ 12 years of age.[1] Potentially serious hypersensitivity reactions, including anaphylaxis, have occurred in patients treated with Kalbitor. Kalbitor should only be administered by a healthcare professional with appropriate medical support to manage anaphylaxis and HAE.

Disease Overview

HAE due to C1 esterase inhibitor (C1-INH) deficiency has two subtypes: HAE type I and HAE type II. HAE diagnosis can be confirmed by measuring functional C1-INH protein levels (usually < 50% of normal in patients with HAE), C4 levels, and C1-INH antigenic levels.[2,3] Patients with HAE type I have low C4 and C1-INH antigenic protein levels, along with low levels of functional C1-INH protein. Patients with HAE type II have low C4 and functional C1-INH protein level, with a normal or elevated C1-INH antigenic protein level. C1-INH replacement therapies are appropriate for both HAE type I and type II.

Patients with the third type of HAE called HAE with normal C1-INH (HAE nC1-INH), previously referred to as HAE type III, have normal C4 and C1-INH antigenic protein levels.[2] HAE nC1-INH is much less

prevalent than HAE types I/II, and the exact cause of HAE nC1-INH has not been determined.[2,4] Pathogenic variants in the genes encoding for Factor XII (regulates bradykinin generation), angiopoietin-1 (involved in vascular permeability), and plasminogen have been associated with HAE nC1-INH; however, the majority of cases have unknown etiology. There are no randomized or controlled clinical trial data available with any therapy for use in HAE nC1-INH.[4-6]

Guidelines

Per the World Allergy Organization/European Academy of Allergy and Clinical Immunology guidelines (2017), all HAE type I/II attacks should be considered for acute treatment; treatment is mandatory for any attack potentially affecting the upper airway (HAE nC1-INH is not addressed within the scope of the guideline).[3] Attacks should be treated as early as possible. Self-administration at home facilitates earlier response. The guidelines recommend C1-INH products, Kalbitor, or icatibant injection (Firazyr®, generics) as first-line treatment options. Androgens and anti-fibrinolytics are not effective as acute treatment. Patients should carry acute treatment with them at all times and should have enough supply on hand for treatment of two attacks. Other guidelines from the US Hereditary Angioedema Association Medical Advisory Board (2013), a practice parameter update from a Joint Task Force (2013), and an international and Canadian guideline (2019) have similar recommendations for acute treatment of HAE type I/II attacks.[4,7,8]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Kalbitor. Because of the specialized skills required for the evaluation and diagnosis of patients treated with Kalbitor, approval requires Kalbitor to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Documentation: Documentation will be required where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes, laboratory records, and prescription claims records.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Kalbitor is recommended in those who meet the following criteria:

FDA-Approved Indications

2. **Hereditary Angioedema (HAE) Due to C1 Inhibitor (C1-INH) Deficiency [Type I or Type II] – Treatment of Acute Attacks.** Approve Kalbitor for the duration noted if the patient meets one of the following criteria (A or B):
   - **C)** Initial therapy. Approve for 1 year if the patient meets both of the following criteria (i and ii):
     - **i.** Patient has HAE type I or type II as confirmed by the following diagnostic criteria (a and b):
       - **a)** Patient has low levels of functional C1-INH protein (< 50% of normal) at baseline, as defined by the laboratory reference values **[documentation required]**; AND
       - **b)** Patient has lower than normal serum C4 levels at baseline, as defined by the laboratory reference values **[documentation required]**; AND
     - **ii.** The medication is prescribed by, or in consultation with, an allergist/immunologist or a physician that specializes in the treatment of HAE or related disorders.

D) Patient who has treated previous acute HAE attacks with Kalbitor. Approve for 1 year if the patient meets all of the following criteria (i, ii, and iii):

i. Patient has a diagnosis of HAE type I or II **[documentation required]**; AND

ii. According to the prescriber, the patient has had a favorable clinical response with Kalbitor treatment; AND

Note: Examples of favorable clinical response include decrease in the duration of HAE attacks, quick onset of symptom relief, complete resolution of symptoms, or decrease in HAE acute attack frequency or severity.

iii. The medication is prescribed by or in consultation with an allergist/immunologist or a physician that specializes in the treatment of HAE or related disorders.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Kalbitor is not recommended in the following situations:

5. **Hereditary Angioedema (HAE) Prophylaxis.** Data are not available and Kalbitor is not indicated for the prophylaxis of HAE attacks.

6. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Hereditary Angioedema – Orladeyo Prior Authorization Policy
- Orladeyo™ (berotralstat capsules – Biocryst)

REVIEW DATE: 12/09/2020

OVERVIEW

Orladeyo, an inhibitor of plasma kallikrein, is indicated for prophylaxis to prevent attacks of hereditary angioedema (HAE) in patients ≥ 12 years of age.[1]

Disease Overview

HAE due to C1 esterase inhibitor (C1-INH) deficiency has two subtypes: HAE type I and HAE type II. HAE diagnosis can be confirmed by measuring functional C1-INH protein levels (usually < 50% of normal in patients with HAE), C4 levels, and C1-INH antigenic levels.[2,3] Patients with HAE type I have low C4 and C1-INH antigenic protein levels, along with low levels of functional C1-INH protein. Patients with HAE type II have low C4 and functional C1-INH protein level, with a normal or elevated C1-INH antigenic protein level. C1-INH replacement therapies are appropriate for both HAE type I and type II.

Patients with the third type of HAE called HAE with normal C1-INH (HAE nC1-INH), previously referred to as HAE type III, have normal C4 and C1-INH antigenic protein levels.[2] HAE nC1-INH is much less prevalent than HAE types I/II, and the exact cause of HAE nC1-INH has not been determined.[2,4] Pathogenic variants in the genes encoding for Factor XII (regulates bradykinin generation), angiopoietin-1 (involved in vascular permeability), and plasminogen have been associated with HAE nC1-INH; however, the majority of cases have unknown etiology. There are no randomized or controlled clinical trial data available with any therapy for use in HAE nC1-INH.[4-6]

Guidelines

Orladeyo is not yet addressed in guideline recommendations, although positive Phase III data are recognized in 2020 guidelines from the US HAE Association Medical Advisory Board.[8] Per guidelines, the decision to initiate long-term prophylaxis is individualized based on multiple factors and should be made by the patient and an HAE specialist.[4,8] C1-INH concentrate and Takhzyro™ (lanadelumab-flyo subcutaneous injection) are recognized as first-line treatment options for long-term prophylaxis of HAE type I/II attacks.[3,4,8] Androgens are not considered first-line and are contraindicated in certain groups (e.g., pregnancy, prepubescent children, androgen-dependent malignancy).[4] In other populations, the use of androgens for long-term prophylaxis may be considered as second-line but should be considered critically due to potential for adverse events. Therefore, guidelines note that androgens should not be used in patients who have a preference for alternative therapy and that patients should not be required to fail anabolic androgen therapy as a prerequisite to receiving prophylactic C1-INH or Takhzyro therapy.[4,7] Of note, long-term prophylaxis for patients with HAE with normal C1-INH has not been studied in a randomized, placebo-controlled trial; hormonal therapy and antifibrinolytics are generally used for prophylaxis in this scenario.[8]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Orladeyo. Because of the specialized skills required for evaluation and diagnosis of patients with this condition, approval requires Orladeyo to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Documentation: Documentation will be required where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes, laboratory records, and prescription claims records.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Orladeyo is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Hereditary Angioedema (HAE) Due to C1 Inhibitor (C1-INH) Deficiency [Type I or Type II] – Prophylaxis.** Approve Orladeyo for the duration noted if the patient meets one the following criteria (A or B):
   - **E)** Initial therapy. Approve for 1 year if the patient meets the following criteria (i, ii, and iii):
     - **i.** Patient is ≥ 12 years of age; AND
     - **ii.** Patient has HAE type I or type II as confirmed by the following diagnostic criteria (a and b):
       - **a)** Patient has low levels of functional C1-INH protein (< 50% of normal) at baseline, as defined by the laboratory reference values **[documentation required]**; AND
       - **b)** Patient has lower than normal serum C4 levels at baseline, as defined by the laboratory reference values **[documentation required]**; AND
     - **iii.** The medication is prescribed by or in consultation with an allergist/immunologist or a physician who specializes in the treatment of HAE or related disorders.
   - **F)** Patient is currently receiving Orladeyo. Approve for 1 year if the patient meets all of the following criteria (i, ii, iii, and iv):
     - **i.** Patient is ≥ 12 years of age; AND
     - **ii.** Patient has a diagnosis of HAE type I or II **[documentation required]**; AND
     - **iii.** According to the prescriber, the patient has had a favorable clinical response since initiating Orladeyo prophylactic therapy compared with baseline (i.e., prior to initiating prophylactic therapy); AND
       Note: Examples of favorable clinical response include decrease in HAE acute attack frequency, decrease in HAE attack severity, or decrease in duration of HAE attacks.
     - **iv.** The medication is prescribed by or in consultation with an allergist/immunologist or a physician who specializes in the treatment of HAE or related disorders.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Orladeyo is not recommended in the following situations:

20. **Concomitant Use with Other HAE Prophylactic Therapies (e.g., Cinryze®, Haegarda®, Takhzyro).** Orladeyo has not been studied in combination with other prophylactic therapies for HAE, and combination therapy for long-term prophylactic use is not recommended. Patients may use other medications, including Cinryze, for on-demand treatment of acute HAE attacks, and for short-term (procedural) prophylaxis.

21. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Hereditary Angioedema – Takhzyro Prior Authorization Policy

- Takhzyro™ (lanadelumab-flyo for subcutaneous injection – Shire/Takeda)

REVIEW DATE: 08/26/2020

OVERVIEW

Takhzyro, a human monoclonal antibody inhibitor of plasma kallikrein, is indicated for prophylaxis to prevent attacks of hereditary angioedema (HAE) in patients ≥ 12 years of age.[1]

Disease Overview

HAE due to C1 esterase inhibitor (C1-INH) deficiency has two subtypes: HAE type I and HAE type II. HAE diagnosis can be confirmed by measuring functional C1-INH protein levels (usually < 50% of normal in patients with HAE), C4 levels, and C1-INH antigenic levels.[2,3] Patients with HAE type I have low C4 and C1-INH antigenic protein levels, along with low levels of functional C1-INH protein. Patients with HAE type II have low C4 and functional C1-INH protein level, with a normal or elevated C1-INH antigenic protein level. C1-INH replacement therapies are appropriate for both HAE type I and type II.

Patients with the third type of HAE called HAE with normal C1-INH (HAE nC1-INH), previously referred to as HAE type III, have normal C4 and C1-INH antigenic protein levels.[2] HAE nC1-INH is much less prevalent than HAE types I/II, and the exact cause of HAE nC1-INH has not been determined.[2,4] Pathogenic variants in the genes encoding for Factor XII (regulates bradykinin generation), angiopoietin-1 (involved in vascular permeability), and plasminogen have been associated with HAE nC1-INH; however, the majority of cases have unknown etiology. There are no randomized or controlled clinical trial data available with any therapy for use in HAE nC1-INH.[4-6]

Guidelines

According to international/Canadian guidelines (updated 2019), the decision to initiate long-term prophylaxis is individualized based on multiple factors and should be made by the patient and an HAE specialist.[4] C1-INH concentrate and Takhzyro are recognized as treatment options for long-term prophylaxis of HAE type I/II attacks.[3,4] Androgens are not considered first-line and are contraindicated in certain groups (e.g., pregnancy, prepubescent children, androgen-dependent malignancy).[4] In other populations, the use of androgens for long-term prophylaxis may be considered as second-line but should be considered critically due to potential for adverse events. Therefore, guidelines note that androgens should not be used in patients who have a preference for alternative therapy and that patients should not be required to fail anabolic androgen therapy as a prerequisite to receiving prophylactic C1-INH or Takhzyro therapy.[4,7]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Takhzyro. Because of the specialized skills required for evaluation and diagnosis of patients with this condition, approval requires Takhzyro to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Documentation: Documentation will be required where noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes, laboratory records, and prescription claims records.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Takhzyro is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Hereditary Angioedema (HAE) Due to C1 Inhibitor (C1-INH) Deficiency [Type I or Type II] – Prophylaxis.** Approve Takhzyro for the duration noted if the patient meets one the following criteria (A or B):
   - **G)** Initial therapy. Approve for 1 year if the patient meets both of the following criteria (i and ii):
     - **i.** Patient has HAE type I or type II as confirmed by the following diagnostic criteria (a and b):
       - **a)** Patient has low levels of functional C1-INH protein (< 50% of normal) at baseline, as defined by the laboratory reference values **[documentation required]**; AND
       - **b)** Patient has lower than normal serum C4 levels at baseline, as defined by the laboratory reference values **[documentation required]**; AND
     - **ii.** The medication is prescribed by or in consultation with an allergist/immunologist or a physician who specializes in the treatment of HAE or related disorders.
   - **H)** Patients currently receiving Takhzyro prophylaxis. Approve for 1 year if the patient meets all of the following criteria (i, ii, and iii):
     - **i.** Patient has a diagnosis of HAE type I or II **[documentation required]**; AND
     - **ii.** According to the prescriber, the patient has had a favorable clinical response since initiating Takhzyro prophylactic therapy compared with baseline (i.e., prior to initiating prophylactic therapy); AND

       Note: Examples of favorable clinical response include decrease in HAE acute attack frequency, decrease in HAE attack severity, or decrease in duration of HAE attacks.

iii. The medication is prescribed by or in consultation with an allergist/immunologist or a physician who specializes in the treatment of HAE or related disorders.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Takhzyro is not recommended in the following situations:

22. Concomitant Use with Other HAE Prophylactic Therapies (e.g., Cinryze®, Haegarda®). Takhzyro has not been studied in combination with other prophylactic therapies for HAE, and combination therapy for long-term prophylactic use is not recommended. Patients may use other medications, including Cinryze, for on-demand treatment of acute HAE attacks, and for short-term (procedural) prophylaxis.

23. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Hetlioz Prior Authorization Policy

- Hetlioz™ (tasimelteon capsules – Vanda Pharmaceuticals)
- Hetlioz LQ™ (tasimelteon oral suspension – Vanda Pharmaceuticals)

REVIEW DATE: 01/27/2021

OVERVIEW

Hetlioz/Hetlioz LQ, melatonin receptor agonists, are indicated for the following uses:[1]

- Hetlioz is indicated for the treatment of:
  - **i. Non-24-Hour Sleep-Wake Disorder** (Non-24).
  - **ii. Nighttime Sleep Disturbances in Smith-Magenis Syndrome (SMS)**, in patients ≥ 16 years of age.
- Hetlioz LQ is indicated for the treatment of **nighttime sleep disturbances in SMS** in patients 3 to 15 years of age.

Disease Overview

Non-24 is a chronic, circadian rhythm disorder that is due to the misalignment of the endogenous master body clock to the 24-hour day which disrupts the sleep-wake cycle and commonly is thought to be caused by the failure of light to reach the suprachiasmatic nuclei. Patients who are completely blind are particularly susceptible to this condition and the prevalence of non-entrained rhythms in totally blind patients is 55% to 70%.[2-7] It has been estimated that of the 1.3 million people in the US who are blind, 10% of people have no light perception, a risk factor for this disorder,

and reports suggest that as many as one-half to three-quarters of totally blind patients have Non-24, which is approximately 65,000 to 95,000 Americans.[6] Patients can be diagnosed using circadian phase markers (e.g., measurement of urinary melatonin levels, dim light melatonin onset [assessed in blood or saliva], or assessing core body temperature).[2,7-8] Alternative forms of diagnosis include actigraphy and assessment of sleep logs (sleep diaries).[2,7-8] Actigraphy is a non-invasive method of monitoring human rest and activity cycles and involves the use of a portable device to document movement. Other reviews confirm these diagnostic methods.[7-8]

SMS is a rare disorder identified by an array of physical, neurobehavioral, and developmental characteristics.[14] In the United States, the incidence is estimated to be 1 in 15,000 to 25,000 people in the general population. Predominately cases of SMS are related to either a deletion or mutation in the *RAI1* gene. It affects males and females equally and is found in ethnic groups all over the world. Common symptoms comprise of distinctive facial features, skeletal malformations, varying degrees of intellectual disability, speech and motor delays, sleep disturbances, and self-injurious/attention-seeking behaviors. Sleep disturbances start as early as one year of age and continue into adulthood and include shortened sleep cycles with multiple awakenings during the night, early morning arousal from sleep, and increased somnolence during daytime hours. Inability to achieve a normal sleeping pattern appears to aggravate behavioral issues such as impulsivity, aggression, hyperactivity and frequent temper tantrums. Sleep issues in SMS have been attributed to a primary disturbance of the circadian clock disruption and instabilities in melatonin secretion. Physical traits such as muscle weakness, obesity-related breathing difficulties, and facial composition can be underlying factors that affect sleep.

Clinical Efficacy

The efficacy of Hetlioz for Non-24 was established in two Phase III pivotal studies involving totally blind patients who reported no light perception with Non-24 for up to 6 months and evaluated the effects of Hetlioz withdrawal.[1-2] Patients were ≥ 18 years of age and could be enrolled if they had a non-24-hour tau of 24.25 hours or longer as calculated from the rhythm of urinary 6-sulphatoxymelatonin (aMT6s), the major melatonin metabolite. At Month 1, more patients receiving Hetlioz (20%, n = 8/40) were entrained compared with patients randomized to placebo (3%, n = 1/38) [P = 0.0171].[2] Entrainment is defined as the synchronization of the circadian rhythm of the body to the 24-hour day.[2-5] In the Hetlioz group, 29% of patients (n = 12) met responder criteria, defined as patients with both a ≥ 45 minute increase in nighttime sleep and a ≥ 45 minute decrease in daytime nap time, compared with 12% of patients (n = 5) who received placebo (time of endpoint assessment not stated).[1] During the withdrawal period of the trial, which lasted 8 weeks, 90% of patients who continued Hetlioz (n = 9/10) remained entrained compared with 20% of patients randomized to receive placebo (n = 2/10) [P = 0.0026].[2-3]

The role of Hetlioz and Hetlioz LQ for nighttime sleep disturbances in SMS is extremely limited.[1] Data supporting benefits with these agents are lacking and underwhelming. The pivotal trial for SMS is unpublished, included very few patients, and was relatively short-term; this condition would likely require long-term therapy. Only one of the two primary efficacy endpoints was statistically significant after controlling for multiple comparisons.

Guidelines

In 2015, clinical practice guidelines were published by the American Academy of Sleep Medicine (AASM) that addresses non-24-hour sleep-wake rhythm disorder (N24SWD).[5] The guidelines state the N24SWD occurs when the hypothalamic circadian pacemaker does not entrain (synchronize) to the 24 hour day. Patients may experience periodic nighttime insomnia and daytime somnolence as the circadian rhythms of sleep propensity and alertness drift in and out of synchrony with the usual 24-hour day. The condition mainly occurs in patients who are blind. The Task Force state that there is no evidence to support the use of sleep-promoting medications in patients with N24SWD. Data suggests that melatonin entrainment occurs with melatonin at a greater rate than placebo and melatonin can be an effective treatment for N24SWD. The Task Force recommendation was that clinicians use strategically timed melatonin for the treatment of N24SWD in adults who are blind (versus no treatment). There are insufficient data to support use of melatonin among sighted patients with N24SWD (versus no treatment).

The Parents and Researchers Interested in Smith-Magenis Syndrome (PRISMS) created medical management guidelines for the diagnosis, treatment of manifestations, and ongoing surveillance of SMS.[15] The guidelines do not address Hetlioz/Hetlioz LQ. Multidisciplinary treatment with multimodal options provided by practitioners from different disciplines are recommended. The guidelines recognize sleep management is a challenge and no well-controlled treatment trials have been reported. The first suggestion is to incorporate a good sleep routine (e.g., consistent bedtime and bedtime routine, quiet/non-stimulating activities, use of white noise or a rhythmic sound, and

a comfortably cool/dark room). Concerns for sleep apnea should be addressed. Melatonin is endorsed as monotherapy for sleep management. The concomitant use of a morning beta-blocker (acebutolol) with an evening dose of melatonin for 6 to 8 weeks could be beneficial to restore circadian plasma melatonin rhythmicity, decrease daytime sleepiness, improve daytime behavior, and enhance sleep in children with SMS.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Hetlioz/Hetlioz LQ. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Hetlioz/Hetlioz LQ as well as the monitoring required for adverse events and long-term efficacy, approval requires Hetlioz/Hetlioz LQ to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Hetlioz capsules are recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Non-24-Hour Sleep Wake Disorder (Non-24).** Approve for the duration noted if the patient meets one of the following conditions (A or B):
   - **A)** Initial Therapy. Approve for 6 months if the patient meets all of the following criteria (i, ii, iii, iv, and v):
     - **i.** Patient is ≥ 18 years of age; AND
     - **ii.** Patient is totally blind with no perception of light; AND
     - **iii.** Diagnosis of Non-24 is confirmed by meeting ONE of the following conditions (a or b):
       - **a)** Assessment of at least one physiologic circadian phase marker; OR
         Note: Examples of physiologic circadian phase markers include measurement of urinary melatonin levels, dim light melatonin onset (as measured in blood or saliva), and assessment of core body temperature.
       - **b)** If assessment of at least one physiologic circadian phase marker cannot be done, the diagnosis must be confirmed by actigraphy performed for ≥ 1 week plus evaluation of sleep logs recorded for ≥ 1 month; AND
     - **iv.** Patient meets BOTH of the conditions (a and b):
       - **a)** Patient has received at least 6 months of continuous therapy (i.e., 6 consecutive months of daily treatment) with melatonin under the guidance of a physician who specializes in the treatment sleep disorders; AND
       - **b)** Patient had inadequate efficacy with melatonin therapy according to the prescriber; AND
         Note: Examples of efficacy with melatonin therapy include entrainment, clinically meaningful or significant increases in nighttime sleep, and clinically meaningful or significant decreases in daytime sleep.
     - **v.** The medication is prescribed by, or in consultation with, a physician who specializes in the treatment of sleep disorders.
   - **B)** Patient is Currently Receiving Hetlioz. Approve for 1 year if the patient meets all of the following criteria (i, ii, iii, iv, v, and vi):
     - **i.** Patient is ≥ 18 years of age; AND
     - **ii.** Patient is totally blind with no perception of light; AND
     - **iii.** Patient meets both of the conditions (a and b):
       - **a)** Patient has received at least 6 months of continuous therapy (i.e., 6 consecutive months of daily treatment) with melatonin under the guidance of a physician who specializes in the treatment sleep disorders; AND
       - **b)** Patient had inadequate efficacy with melatonin therapy according to the prescriber; AND

Note: Examples of efficacy with melatonin therapy include entrainment, clinically meaningful or significant increases in nighttime sleep, and clinically meaningful or significant decreases in daytime sleep.

iv. Patient meets both of the conditions (a and b):

a) Patient has received at least 6 months of continuous therapy (i.e., 6 consecutive months of daily treatment) with Hetlioz under the guidance of a physician who specializes in the treatment of sleep disorders; AND

Note: Patients who have not received at least 6 months of continuous Hetlioz therapy, or if the therapy has not been continuous (i.e., 6 consecutive months of daily treatment), should follow criteria 1 (initial therapy).

b) Patient has achieved adequate results with Hetlioz therapy according to the prescriber; AND

Note: Examples of adequate results with Hetlioz therapy include entrainment, clinically meaningful or significant increases in nighttime sleep, clinically meaningful or significant decreases in daytime sleep.

v. The medication is prescribed by, or in consultation with, a physician who specializes in the treatment of sleep disorders.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Hetlioz/Hetlioz LQ is not recommended in the following situations:

24. Insomnia, Primary. Many other agents are available.[9] Only limited data have investigated use of Hetlioz in patients with primary insomnia.[10] Further data are needed to establish the safety and efficacy of Hetlioz.

25. Nighttime Sleep Disturbances in Smith-Magenis Syndrome (SMS). Efficacy data for Hetlioz/Hetlioz LQ for nighttime sleep disturbances in SMS supporting benefits with these agents are lacking and underwhelming.[1] The pivotal trial included few patients and is unpublished (limited to the prescribing information).

26. Ramelteon tablets (Rozerem™, generics), Concomitant Therapy. Ramelteon tablets, a melatonin receptor agonist, are indicated for the treatment of insomnia characterized by difficulty with sleep onset.[11] The safety and efficacy of concomitant use of ramelteon tablets and Hetlioz have not been studied and it is suspected that the adverse events with use of these agents with a similar mechanism of action taken together may be additive (e.g., central nervous system effects [somnolence], hepatic impairment). Rozerem has not been studied in Non-24. In the clinical trials with Hetlioz, patients were not permitted to use medications that could interfere with the assessment of circadian rhythms.

27. Sedative Hypnotic Medications or Other Medications for Insomnia or Other Sleep-Related Disorders, Concomitant Therapy (e.g., benzodiazepines [triazolam, temazepam], nonbenzodiazepine hypnotics [e.g., zolpidem, zaleplon], chloral hydrate). There are no data to support the safety and efficacy of hypnotic medications in patients with Non-24.[5] Also, there are no data to determine the safety and efficacy of Hetlioz when used with other sedative hypnotic medications or other medications for insomnia or sleep-related disorders.[12]

28. Sleep-Related Disorders, Other Types (e.g. shift work disorder, jet lag disorder, advanced sleep phase disorder, delayed sleep phase disorder, irregular sleep-wake rhythm disorder). A published investigation details a Phase II study (n = 29) and a Phase III study (n = 411) assessing Hetlioz treatment in adults with transient insomnia associated with shifted sleep and wake time.[13] Further studies are needed to establish the efficacy and safety of Hetlioz in patients with other types of sleep-related disorders.

29. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	No criteria changes.	04/17/2019
Annual Revision	No criteria changes.	04/15/2020
Early Annual Revision	Hetlioz LQ was added to the policy. **Non-24-Hour Sleep Wake Disorder (Non-24).** Initial Therapy: For the exception applying to patients who did not achieve adequate results with melatonin therapy, wording was updated to more generally allow this determination by the prescriber (criteria previously specified this was according to the prescribing physician) and "did not achieve adequate results" was changed to "had inadequate efficacy". The examples of physiologic circadian phase markers and adequate results with melatonin therapy were moved to a Note (previously listed as examples within the criteria). Patient Currently Receiving Hetlioz: Requirement that the patient has previously tried melatonin for at least 6 months of continuous therapy with inadequate efficacy was added to the criteria. For the exception applying to patients who achieved adequate results with Hetlioz therapy, wording was updated to more generally allow this determination by the prescriber (criteria previously specified this was according to the prescribing physician). The examples of adequate results with Hetlioz therapy were moved to a Note (previously listed as examples within the criteria). **Nighttime Sleep Disturbances in Smith-Magenis Syndrome:** This new indication was added to the "Conditions Not Recommended for Approval" section of the policy.	01/27/2021

PRIOR AUTHORIZATION POLICY

POLICY: Homozygous Familial Hypercholesterolemia – Evkeeza Prior Authorization Policy

- Evkeeza™ (evinacumab-dgnb injection for intravenous use – Regeneron)

REVIEW DATE: 02/17/2021; updated 02/24/2021

OVERVIEW

Evkeeza, an angiopoietin-like 3 inhibitor, is indicated as an adjunct to other low-density lipoprotein cholesterol (LDL-C) lowering therapies for the treatment of homozygous familial hypercholesterolemia (HoFH) in adults and pediatric patients ≥ 12 years of age.[1]

In the pivotal trial that led to approval of Evkeeza, patients were receiving additional medications to lower LDL-C levels such as statins (94% [77% of patients at high-intensity statin doses]), a proprotein convertase subtilisin kexin type 9 (PCSK9) inhibitor (77%), ezetimibe (75%), and Juxtapid® (lomitapide capsules). Although some Phase II data are available,[3] the safety and effectiveness of Evkeeza have not been established in patients with other causes of hypercholesterolemia, including those with heterozygous familial hypercholesterolemia (HeFH).[1] The effects of Evkeeza on cardiovascular morbidity and mortality have not been determined.

Disease Overview

Familial hypercholesterolemias, which include HeFH and HoFH, encompass a group of genetic defects that cause severe elevations in LDL-C levels, as well as other lipid parameters.[4,5] HoFH impacts approximately 1 in 300,000 to 1,000,000 persons. The condition is most commonly due to impaired functionality of the low-density lipoprotein (LDL) receptor which leads to a low or absence of clearance of LDL-C from the circulation. Currently known causes of familial hypercholesterolemia include mutations in the LDL receptor, apolipoprotein B (apo B), or proprotein convertase subtilisin kexin type 9 (PCSK9) genes. Patients with familial hypercholesterolemia may have physical findings such as tendon or cutaneous xanthomas, which may occur in childhood. Individuals with familial hypercholesterolemia are at very high risk of atherosclerotic cardiovascular disease (ASCVD) at a premature age. Most guidelines recommended LDL-C targets of < 100 mg/dL for adults and < 70 mg/dL for adults with ASCVD or other risk factors. Statins are the initial treatment for familial hypercholesterolemia. For patients with HoFH, high-intensity statin therapy is recommended, with ezetimibe added as well. Therapy with a PCSK9 inhibitor (e.g., Repatha® [evolocumab injection for subcutaneous use]) is usually the next step. Other non-statin therapies can be considered (e.g., colesevelam tablets or oral suspension, niacin). Combination therapy is required for most patients. LDL apheresis is recommended in certain circumstances. Patients with HoFH should be managed by a lipid specialist. Table 1 provides some of the diagnostic criteria to establish a diagnosis of HoFH. The diagnosis of HoFH can be done by genetic or clinical criteria.

Table 1. Criteria for the Diagnosis of HoFH.[5]

- Genetic confirmation of two mutant alleles at the LDLR, Apo B, PCSK9 or LDLRAP1 gene locus; OR
- An untreated LDL-C > 500 mg/dL* or treated LDL-C > 300 mg/dL* together with either 1) cutaneous or tendon xanthoma before the age of 10 years OR 2) untreated elevated LDL-C levels consistent with heterozygous FH in both parents.

HoFH – Homozygous familial hypercholesterolemia; LDLR – Low-density lipoprotein receptor; Apo B – Apolipoprotein B; PCSK9 – Proprotein convertase subtilisin kexin type 9; LDLRAP1 – Low-density lipoprotein receptor adaptor protein 1; LDL-C – Low-density lipoprotein cholesterol; * These cited LDL-C levels are only indicative and lower levels, especially in children or in untreated patients do not exclude HoFH; FH – Familial hypercholesterolemia.

Guidelines

Evkeeza is not addressed in guidelines. Several guidelines provide strategies for managing familial hypercholesterolemia, including HoFH.

- **American Heart Association/American College of Cardiology [2018]**: In patients with severe primary hypercholesterolemia (LDL-C ≥ 190 mg/dL) begin high-intensity statin therapy.[6] If the LDL-C levels remains ≥ 100 mg/dL, add ezetimibe. If the LDL-C remains ≥ 100 mg/dL on this regimen, consider a PCSK9 inhibitor if the patient has multiple risk factors that increase the risk of ASCVD. Other therapies can also be used (e.g., bile acid sequestrants).
- **European Atherosclerosis Society (2014):** A position paper by this organization recommends lipid-lowering therapy be initiated as soon as possible with LDL-C targets for HoFH of < 100 mg/dL in adults or < 70 mg/dL in adults with clinical ASCVD.[5] Statins are a mainstay of therapy

and are often used in combination with other agents such as ezetimibe. Other agents can be alternatives as well (e.g., Juxtapid® [lomitapide capsules]). Lipoprotein apheresis may also be considered.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Evkeeza. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Evkeeza, as well as the monitoring required for adverse events and long-term efficacy, approval requires Evkeeza to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Documentation: None required.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Evkeeza is recommended in those who meet the following criteria:

FDA-Approved Indication

70. Homozygous Familial Hypercholesterolemia. Approve for 1 year if the patient meets the following criteria (A, B, C, D, and E):

43. Patient is ≥ 12 years of age; AND

44. Patient meets one of the following (i, ii or iii):

i. Patient has had genetic confirmation of two mutant alleles at the low-density lipoprotein receptor (LDLR), apolipoprotein B (apo B), proprotein convertase subtilisin kexin type 9 (PCSK9) or low-density lipoprotein receptor adaptor protein 1 (LDLRAP1) gene locus; OR

ii. Patient has an untreated low-density lipoprotein cholesterol (LDL-C) level > 500 mg/dL AND meets one of the following (a or b); OR

Note: Untreated refers to prior to therapy with any antihyperlipidemic agent.

a) Patient had clinical manifestations of homozygous familial hypercholesterolemia (HoFH) before the age of 10 years; OR

Note: Clinical manifestations of HoFH are cutaneous xanthomas, tendon xanthomas, acrus cornea, tuberous xanthomas, or xanthelasma.

b) Both parents of the patient had untreated LDL-C levels or total cholesterol levels consistent with heterozygous familial hypercholesterolemia (HeFH); OR

Note: An example of HeFH in both parents would be if both had an untreated LDL-C level ≥ 190 mg/dL and/or an untreated total cholesterol level > 250 mg/dL.

iii. Patient has a treated low-density lipoprotein cholesterol (LDL-C) level ≥ 300 mg/dL AND meets one of the following (a or b); AND

Note: Treated refer to after therapy with at least one antihyperlipidemic agent. Some examples of antihyperlipidemic agents include statins (e.g., atorvastatin, rosuvastatin, lovastatin, simvastatin, pravastatin), ezetimibe, a PCSK9 inhibitor (e.g., Repatha® [evolocumab injection for subcutaneous use]), or Juxtapid® (lomitapide capsules).

a) Patient had clinical manifestations of homozygous familial hypercholesterolemia (HoFH) before the age of 10 years; OR

Note: Examples of clinical manifestations of HoFH are cutaneous xanthomas, tendon xanthomas, arcus cornea, tuberous xanthomas or xanthelasma.

b) Both parents of the patient had untreated LDL-C levels or total cholesterol levels consistent with heterozygous familial hypercholesterolemia (HeFH); AND

Note: An example of HeFH in both parents would be if both had an untreated LDL-C ≥ 190 mg/dL and/or an untreated total cholesterol > 250 mg/dL.

45. Patient meets one of the following criteria (i or ii):

i. Patient meets one of the following criteria (a, b, and c):
- **a)** Patient has tried one high-intensity statin therapy (i.e., atorvastatin ≥ 40 mg daily; rosuvastatin tablets ≥ 20 mg daily [as a single-entity or as a combination product]); AND
- **b)** Patient has tried one high-intensity statin along with ezetimibe (as a single entity or as a combination product) for ≥ 8 continuous weeks; AND
- **c)** The low-density lipoprotein cholesterol (LDL-C) level after this treatment regimen remains ≥ 70 mg/dL; OR

ii. Patient has been determined to be statin intolerant by meeting one of the following criteria (a or b):
- **a)** Patient experienced statin-related rhabdomyolysis; OR
  Note: Rhabdomyolysis is statin-induced muscle breakdown that is associated with markedly elevated creatine kinase levels (at least 10 times the upper limit of normal), along with evidence of end organ damage which can include signs of acute renal injury (noted by substantial increases in serum creatinine [Scr] levels [a ≥ 0.5 mg/dL increase in Scr or doubling of the Scr] and/or myoglobinuria [myoglobin present in urine]); OR
- **b)** Patient meets all of the following criteria [(1), (2), and (3)]:
  - **(1)** Patient experienced skeletal-related muscle symptoms; AND
    Note: Examples of skeletal-related muscle symptoms include myopathy (muscle weakness) or myalgia (muscle aches, soreness, stiffness, or tenderness).
  - **(2)** The skeletal-related muscle symptoms occurred while receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products); AND
  - **(3)** When receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products) the skeletal-related muscle symptoms resolved upon discontinuation of each respective statin therapy (atorvastatin and rosuvastatin); AND
    Note: Examples of skeletal-related muscle symptoms include myopathy and myalgia.

46. Patient meets one of the following (i or ii):

i. Patient meets both of the following (a and b):
- **a)** Patient has tried a proprotein convertase subtilisin kexin type 9 (PCSK9) inhibitor for ≥ 8 continuous weeks; AND
  Note: Examples of PCSK9 inhibitors include Repatha® (evolocumab injection for subcutaneous use) and Praluent® (alirocumab injection for subcutaneous use).
- **b)** The low-density lipoprotein cholesterol (LDL-C) level after this PCSK9 inhibitor therapy remains ≥ 70 mg/dL; OR

ii. Patient is known to have two LDL-receptor negative alleles; AND

47. Medication is prescribed by or in consultation with a cardiologist; an endocrinologist; or a physician who focuses in the treatment of cardiovascular risk management and/or lipid disorders.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Evkeeza is not recommended in the following situations:

30. Heterozygous Familial Hypercholesterolemia (HeFH). The safety and effectiveness of Evkeeza have not been established in patients with hypercholesterolemia who do not have HoFH, including those with HeFH.[1]

31. Hyperlipidemia. Although data are available, the prescribing information for Evkeeza states that the safety and efficacy of Evkeeza have not been established in patients with other forms of hypercholesterolemia.[1,3]
Note: This is not associated with homozygous familial hypercholesterolemia and is referred to as combined hyperlipidemia, hypercholesterolemia (pure, primary), dyslipidemia, or increased/elevated low-density lipoprotein cholesterol (LDL-C) levels.

32. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
New Policy	--	02/17/2021
Update	**Homozygous Familial Hypercholesterolemia:** The diagnostic criteria for HoFH were revised. To the criteria which stated that the patient has clinical manifestation of HoFH, the qualifier of "before the age of 10 years" was added. Also, this criterion is no longer an independent diagnostic but is now one of two criteria that must be met under the LDL-C threshold requirements (i.e., that the patient has an untreated LDL-C level > 500 mg/dL or a treated LDL-C ≥ 300 mg/dL). An additional criterion added to the two LDL-C threshold requirements is that the parents of the patient had untreated LDL-C levels or total cholesterol levels consistent with HeFH with examples of these values provided. If the diagnostic pathway is sought through LDL-C thresholds, one of these two criteria must be met (i.e., clinical manifestations or parents of the patient have LDL-C or total cholesterol levels consistent with HeFH).	02/24/2021

HoFH – Homozygous familial hypercholeteorlemia; LDL-C – Low-density lipoprotein cholesterol; HeFH – Heterozygous familial hypercholesterolemia.

PRIOR AUTHORIZATION POLICY

POLICY: Homozygous Familial Hypercholesterolemia Juxtapid Prior Authorization Policy

- Juxtapid® (lomitapide capsules – Aegerion Pharmaceuticals)

REVIEW DATE: 10/14/2020

OVERVIEW

Juxtapid, a microsomal triglyceride transfer protein inhibitor, is indicated as an adjunct to a low fat diet and other lipid modifying therapies, including low-density lipoprotein (LDL) apheresis where available, to reduce low-density lipoprotein cholesterol (LDL-C), total cholesterol (total-C), apolipoprotein B (apo B), and non-high-density lipoprotein cholesterol (non-HDL-C) in patients with homozygous familial hypercholesterolemia (HoFH).[1] Limitations of use include that the safety and efficacy of Juxtapid have not been established in patients with hypercholesterolemia who do not have HoFH, including those with heterozygous familial hypercholesterolemia (HeFH).[1] Also, the effect of Juxtapid on cardiovascular (CV) morbidity and mortality have not been determined.

Repatha® (evolocumab injection for subcutaneous [SC] use), a proprotein convertase subtilisin kexin type 9 (PCSK9) inhibitor, is indicated as an adjunct to diet and other LDL-lowering therapies (e.g., statins, ezetimibe, LDL apheresis) in patients with HoFH who require additional LDL-C lowering.[2] It is notable that patients known to have two LDL-receptor negative alleles (little or no residual function) did not respond

to Repatha. Repatha is well-tolerated and is not associated with hepatotoxicity.[2] Simvastatin, atorvastatin, and rosuvastatin are statins that are indicated for the management of patients with HoFH.[3-5] Ezetimibe is also indicated for use in combination with atorvastatin or simvastatin in patients with HoFH.[6] Ezetimibe/simvastatin tablets are indicated for use in HoFH.[7]

Disease Overview

Familial hypercholesterolemias encompass a group of genetic defects that cause severe elevations in LDL-C levels, as well as other lipid parameters.[8] The condition occurs in approximately 1 in 300 to 500 patients and is present in childhood. There are approximately 1 in one million people with HoFH that have extreme hypercholesterolemia with rapidly advancing atherosclerosis if untreated. Currently known causes of familial hypercholesterolemia include mutations in low-density lipoprotein receptor (LDLR), apolipoprotein B (apo B), or proprotein convertase subtilisin kexin type 9 (PCSK9) genes. Over 1,600 known mutations of the LDLR gene have been documented to cause familial hypercholesterolemia and account for about 85% to 90% of familial hypercholesterolemia cases. Patients with familial hypercholesteromia may have physical findings such as tendon xanthomas, which may occur at a young age. Individuals with familial hypercholesterolemia are at very high risk of coronary heart disease (CHD) at a premature age. Aggressive lipid modifying therapy is recommended to achieve LDL-C reductions of at least 50%. Both children and adults with LDL-C levels ≥ 190 mg/dL following lifestyle modifications will require medication therapy. Statins are the initial treatment for familial hypercholesteromia. Higher risk patients may require intensification of drug therapy to achieve the more aggressive treatment goals. Intensification of medication therapy should be considered if LDL-C remains ≥ 160 mg/dL or if an initial 50% reduction in LDL-C is not achieved. Other non-statin therapies that can be considered include ezetimibe, Repatha, a bile acid sequestrant (colesevelam tablets or oral suspension), or niacin. Most patients that cannot take a statin will require combination medication therapy. LDL apheresis is recommended in certain circumstances. Patients with HoFH should be managed by a lipid specialist.

Guidelines

In 2014, the European Atherosclerosis Society published recommendations regarding HoFH.[9] It notes that HoFH is a rare and life-threatening condition characterized by plasma cholesterol levels > 500 mg/dL, extensive xanthomas, and premature clinical atherosclerotic cardiovascular disease (ASCVD). If untreated, patients with extremely elevated LDL-C levels may develop atherosclerosis prior to the second decade of life. The frequency of HoFH is estimated at 1 in one million patients. The diagnosis of HoFH can be done by genetic or clinical criteria. Table 1 notes some criteria used by clinicians.

Table 1. Criteria for the Diagnosis of HoFH.[9]

- Genetic confirmation of two mutant alleles at the LDLR, Apo B, PCSK9 or LDLRAP1 gene locus; OR
- An untreated LDL-C > 500 mg/dL* or treated LDL-C > 300 mg/dL* together with either 1) cutaneous or tendon xanthoma before the age of 10 years or 2) untreated elevated LDL-C levels consistent with heterozygous FH in both parents.

HoFH – Homozygous familial hypercholesterolemia; LDLR – Low-density lipoprotein receptor; Apo B – Apolipoprotein B; PCSK9 – Proprotein convertase subtilisin kexin type 9; LDLRAP1 – Low-density lipoprotein receptor adaptor protein 1; LDL-C – Low-density lipoprotein cholesterol; * These cited LDL-C levels are only indicative and lower levels, especially in children or in untreated patients do not exclude HoFH; FH – Familial hypercholesterolemia.

The Consensus panel strongly recommends that lipid modifying therapy be initiated as early as possible based on evidence that treatment can delay the onset of clinically evident ASCVD.[9] LDL-C targets in HoFH are < 100 mg/dL in adults [< 135 mg/dL in children] or < 70 mg/dL in adults with clinical ASCVD. Statins have been the prominent treatment in HoFH, even among individuals who are receptor negative. Ezetimibe also provides further reduction. Combination therapy may also include other agents such as bile acid sequestrants, niacin and fibrates. LDL apheresis is also utilized and can decrease plasma LDL-C levels by 55% to 70% relative to pre-treatment levels. These guidelines were published before approval of Repatha which is indicated for use in HoFH.

Safety

Juxtapid has a Boxed Warnings regarding the risk of hepatotoxicity.[1] Juxtapid may cause elevations in liver transaminases. Also, Juxtapid increases hepatic fat (hepatic steatosis) with or without concomitant increases in transaminases. Due to the risk of hepatotoxicity, Juxtapid is available only through a Risk Mitigation and Strategy (REMS) Program. Juxtapid is a Pregnancy Category X medication and may cause fetal harm when given to a pregnant woman based on findings suggesting teratogenicity in animals. Females of reproductive potential should obtain a negative pregnancy test before Juxtapid initiation and should utilize effective contraception during Juxtapid use. Juxtapid is associated with gastrointestinal (GI) adverse events (AEs), which occurred in 93% of patients (n = 27/29). GI AEs included diarrhea (79%), nausea (65%), dyspepsia (38%), vomiting (34%), and abdominal pain (34%). Postmarketing reports regarding severe diarrhea have been associated with use of Juxtapid which have involved hospitalization of patients due to diarrhea-related complications such as volume depletion.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Juxtapid. All approvals are provided for the duration noted below. Because of the specialized skills required for managing patients with HoFH, approval requires Juxtapid to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Documentation: None required.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Juxtapid is recommended in those who meet the following criteria:

FDA-Approved Indication

2. Homozygous Familial Hypercholesterolemia (HoFH). Approve Juxtapid for 1 year if the patient meets the following criteria (A, B, C, D, and E):

48. Patient is aged ≥ 18 years; AND

49. Patient meets one of the following (i, ii, iii or iv):

- **i.** Patient has had genetic confirmation of two mutant alleles at the low-density lipoprotein receptor (LDLR), apolipoprotein B (apo B), proprotein convertase subtilisin kexin type 9 (PCSK9) or low-density lipoprotein receptor adaptor protein 1 (LDLRAP1) gene locus; OR
- **ii.** Patient has an untreated low-density lipoprotein cholesterol (LDL-C) level > 500 mg/dL (prior to treatment with antihyperlipidemic agents); OR
- **iii.** Patient has a treated LDL-C level ≥ 300 mg/dL (after treatment with antihyperlipidemic agents but prior to agents such as Repatha® [evolocumab injection for subcutaneous {SC} use]); OR
- **iv.** Patient has clinical manifestations of HoFH; AND

  Note: Examples of clinical manifestations of HoFH are cutaneous xanthomas, tendon xanthomas, arcus cornea, tuberous xanthomas or xanthelasma.

50. Patient meets one of the following (i or ii):

- **i.** Patient meets both of the following (a and b):
  - **a)** Patient has tried Repatha (evolocumab injection for SC use); AND
  - **b)** Patient has experienced inadequate efficacy or significant intolerance according to the prescriber; OR
- **ii.** Patient is known to have two LDL-receptor negative alleles; AND

51. Patient meets one of the following criteria (i or ii):

- **i.** Patient meets both of the following criteria (a and b):

d) Patient has tried one high-intensity statin therapy (i.e., atorvastatin ≥ 40 mg daily; rosuvastatin tablets ≥ 20 mg daily [as a single-entity or as a combination product])* for ≥ 8 continuous weeks; AND

e) The low-density lipoprotein cholesterol (LDL-C) level after this treatment regimen remains ≥ 70 mg/dL; OR

ii. Patient has been determined to be statin intolerant by meeting one of the following criteria (a or b):

a) Patient experienced statin-related rhabdomyolysis; OR

Note: Rhabdomyolysis is statin-induced muscle breakdown that is associated with markedly elevated creatine kinase (CK) levels (at least 10 times the upper limit of normal), along with evidence of end organ damage which can include signs of acute renal injury (noted by substantial increases in serum creatinine [Scr] levels [a ≥ 0.5 mg/dL increase in Scr or doubling of the Scr] and/or myoglobinuria [myoglobin present in urine]); OR

b) Patient meets all of the following criteria [(1), (2), and (3)]:

(1) Patient experienced skeletal-related muscle symptoms; AND

Note: Examples of skeletal-related muscle symptoms include myopathy (muscle weakness) or myalgia (muscle aches, soreness, stiffness, or tenderness).

(2) The skeletal-related muscle symptoms occurred while receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products); AND

(3) When receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products) the skeletal-related muscle symptoms (e.g., myopathy, myalgia) resolved upon discontinuation of each respective statin therapy (atorvastatin and rosuvastatin); AND

52. Medication is prescribed by or in consultation with a cardiologist; an endocrinologist; or a physician who focuses in the treatment of cardiovascular (CV) risk management and/or lipid disorders.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Juxtapid is not recommended in the following situations:

33. Concurrent use of Juxtapid with Praluent® (alirocumab for SC injection) or Repatha (evolocumab injection for SC use). Repatha, specifically indicated in HoFH, and Praluent are PCSK9 inhibitors and have not been adequately studied concomitantly with Juxtapid therapy.

34. Use of Juxtapid in Patients with Heterozygous Familial Hypercholesterolemia (HeFH). The safety and effectiveness of Juxtapid have not been established in patients with hypercholesterolemia who do not have HoFH, including those with HeFH.[1]

35. Use of Juxtapid in Patients with Other Forms of Hyperlipidemia (e.g., primary hyperlipidemia, mixed dyslipidemia). The safety and efficacy of Juxtapid have not been established in patients with hypercholesterolemia who do not have HoFH.[1]

36. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	Kynamro no longer available. Therefore, Kynamro was removed from the listing of examples among the diagnostic criteria for HoFH in reference to the criterion that asks if the treated LDL-C level is ≥ 300 mg/dL (after treatment with antihyperlipidemic agents but prior to agents such as Repatha or Kynamro. Additionally, Kynamro was removed from the listing of medications in which Juxtapid cannot be used with concomitantly.	10/10/2018.
Annual Revision	No criteria changes.	10/09/2019
Annual Revision	**Homozygous Familial Hypercholesterolemia:** For the indication, the citation of "initial and continuing therapy" was removed. Examples of clinical manifestations of homozygous familial hypercholesterolemia were removed from the criteria and placed in a note. For the criteria which requires that the patient try Repatha, the wording that stated "the patient had an inadequate response according to the prescribing physician" was changed to the "patient experienced inadequate efficacy or significant intolerance according to the prescriber." For the criteria that requires that the patient try a statin, it was clarified that the requirement of the low-density lipoprotein cholesterol level remains ≥ 70 mg/dL was associated with "after this treatment regimen". Regarding the definition of rhabdomyolysis, the word "usually" was removed from the explanation associated with markedly elevated creatine kinase levels. Examples of skeletal-related muscle symptoms were moved from the criteria to a Note.	10/14/2020

PRIOR AUTHORIZATION POLICY

POLICY: Human Immunodeficiency Virus – Cabenuva Prior Authorization Policy

- Cabenuva® (cabotegravir extended-release injectable suspension; rilpivirine extended-release injectable suspension, co-packaged – ViiV/GlaxoSmithKline)

REVIEW DATE: 02/03/2021

OVERVIEW

Cabenuva, a two-drug co-packaged product of cabotegravir, a human immunodeficiency virus type-1 (HIV-1) integrase strand-transfer inhibitor, and rilpivirine, an HIV-1 non-nucleoside reverse transcriptase inhibitor, is **indicated as a complete regimen for the treatment of HIV-1 infection in adults to replace their current antiretroviral (ARV) regimen in those who are virologically suppressed (HIV-1 RNA < 50 copies/mL) on a stable ARV regimen with no history of treatment failure and with no known or suspected resistance to cabotegravir or rilpivirine**.[1]

Cabenuva must be administered by a healthcare professional. Prior to starting Cabenuva, healthcare professionals should carefully select patients who agree to the required monthly injection dosing schedule and counsel patients about the importance of adherence to scheduled dosing visits to help maintain viral suppression and reduce the risk of viral rebound and potential development of resistance with missed doses.[1]

Oral lead-in with Vocabria® (cabotegravir tablets) + Edurant® (rilpivirine tablets) should be used for approximately 1 month (at least 28 days) prior to the initiation of Cabenuva to assess the tolerability of cabotegravir and rilpivirine. On the last day of oral lead-in, the first dose of Cabenuva (600 mg/900 mg) is administered; monthly doses of Cabenuva (400 mg/600 mg) are administered starting at Month 3.

Table 1. Recommended Oral Lead-In and IM Injection Dosing Schedule in Adults.[1]

Vocabria + Edurant Lead-In (at Least 28 Days)	Cabenuva Initiation Injections (One-Time Dosing)	Cabenuva Continuation Injections (Once-Monthly Dosing)
Month 1	At Month 2 (On the Last Day of Oral Lead-In Dosing)	Month 3 Onwards
Vocabria (30 mg) QD with a meal	cabotegravir 600 mg (3 mL)	cabotegravir 400 mg (2 mL)
Edurant (25 mg) QD with a meal	rilpivirine 900 mg (3 mL)	rilpivirine 600 mg (2 mL)

IM – Intramuscular.

If monthly Cabenuva doses are missed or delayed by > 7 days and oral therapy has not been taken in the interim, clinically reassess the patient to determine if resumption of Cabenuva remains appropriate. If Cabenuva will be continued, see Table 2 for dosing recommendations.

Table 2. Cabenuva Dosing Recommendation after Missed Injections*.[1]

Time Since Last Dose of Cabenuva	Recommendation
≤ 2 months	Resume with 400 mg (2 mL) cabotegravir and 600 mg (2 mL) rilpivirine IM monthly injections as soon as possible.
> 2 months	Re-initiate the patient with 600 mg (3 mL) cabotegravir and 900 mg (3 mL) rilpivirine IM injections then continue to follow the 400 mg (2 mL) cabotegravir and 600 mg (2 mL) rilpivirine IM monthly injection dosing schedule.

*Refer to oral dosing recommendations if a patient plans to miss a scheduled injection visit; IM – Intramuscular.

Clinical Efficacy

The use of Vocabria + Edurant as an oral lead-in and Cabenuva once monthly for maintenance therapy in adults with HIV-1 was evaluated in two published, Phase III, randomized, multicenter, active-controlled, parallel-arm, open-label, non-inferiority pivotal trials (FLAIR and ATLAS).[3,4] In FLAIR, patients were naïve to antiretroviral therapy and started on Triumeq® (abacavir/dolutegravir/lamivudine tablets) for 20 weeks then continued on Triumeq or were switched to the long-acting regimen of Vocabria/Cabenuva in accordance with the FDA-approved dosing regimen.[3] In ATLAS, patients who were virally suppressed on an oral antiretroviral regimen (excluding Triumeq) continued on their antiretroviral regimen or were switched to the long-acting regimen of Vocabria/Cabenuva in accordance with the FDA-approved dosing regimen.[4] In FLAIR (n = 566), at Week 48, the long-acting regimen was non-inferior to Triumeq; 2.1% and 2.5% of patients, respectively, did not maintain viral suppression (adjusted difference -0.4%; 95% confidence interval [CI]: -2.8, 2.1).[3] In ATLAS (n = 618), at Week 48, the long-acting regimen was non-inferior to patients existing oral antiretrovirals: 1.6% and 1.0% of patients, respectively, did not maintain viral suppression (adjusted difference 0.6%; 95% CI: -1.2, 2.5).[4]

Guidelines

Cabenuva is addressed as an unapproved product in the International Antiviral Society-USA (IAS-USA) Panel Recommendations for Antiretroviral Drugs for Treatment and Prevention of HIV Infection in Adults (2020); Cabenuva and Vocabria have not been addressed in the Department of Health and Human Services (DHHS) Guidelines for the Use of Antiretroviral Agents in Adults and Adolescents with HIV (last updated December 18, 2019).[4,5]

According to the IAS-USA, in the setting of viral suppression, switching from a three-drug regimen to a two-drug regimen is an appropriate strategy to manage toxic side effects, intolerance, adherence, or patient preference provided

that both agents are fully active.[4] Recommended regimens include: dolutegravir/lamivudine (available as Dovato® [dolutegravir/lamivudine tablets] or Tivicay® [dolutegravir tablets] + lamivudine [Epivir®, generics]), dolutegravir/rilpivirine (available as Juluca® [dolutegravir/rilpivirine tablets] or Tivicay + Edurant), a boosted protease inhibitor (lopinavir, atazanavir [Reyataz®, generics], or darunavir [Prezista®, generics]) + lamivudine, or a long-acting injectable two-drug regimen of Cabenuva pending approval by regulatory bodies and availability. The DHHS guidelines provide identical examples of successful strategies for switching from three-drug to two-drug regimens in individuals with suppressed HIV (with the noted absence of Cabenuva likely due to the timing of the last update).[5]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Cabenuva. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Cabenuva as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Cabenuva to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Cabenuva is recommended in those who meet the following criteria:

FDA-Approved Indications

71. Human Immunodeficiency Virus (HIV). Approve for the duration below if the patient meets ONE of the following conditions (A or B):

- **A)** Initial Therapy: Approve for 1 year if the patient meets all of the following (i, ii, iii, iv, and v):
  - **i.** Patient is ≥ 18 years of age; AND
  - **ii.** Patient has HIV type-1 (HIV-1) infection; AND
  - **iii.** Patient has HIV-1 RNA < 50 copies/mL (viral suppression); AND
  - **iv.** Patient has completed, or will complete, and tolerated 1 month of therapy with Vocabria (cabotegravir tablets) + Edurant (rilpivirine tablets), according to the prescriber; AND
  - **v.** The medication is prescribed by or in consultation with a physician who specializes in the treatment of HIV infection.
- **B)** Patient is Currently Receiving Cabenuva: Approve for 1 year if the patient meets all of the following (i and ii):
  - **i.** Patient has HIV type-1 (HIV-1) infection; AND
  - **ii.** Patient has HIV-1 RNA < 50 copies/mL (viral suppression).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Cabenuva is not recommended in the following situations:

79. Pre-exposure Prophylaxis (PrEP). Cabenuva is not indicated for the prevention of human immunodeficiency virus (HIV) in patients who are uninfected, but at risk of acquisition of HIV. Data from two unpublished trials have demonstrated the superiority of cabotegravir extended-release injectable suspension to Truvada® (tenofovir disoproxil fumarate/emtricitabine tablets, generics) for PrEP in cisgender men and transgender men who have sex with men as well as in cisgender women.[5] IAS-USA guidelines recommend cabotegravir extended-release injectable suspension for PrEP in cisgender men and transgender women who have sex with men; every 8 week maintenance dosing is recommended and oral lead-in with Vocabria is optional.[4] The other recommended regimens for PrEP

are daily Truvada (all at-risk populations) or Descovy® (tenofovir alafenamide/emtricitabine tablets) [MSM with/at risk for kidney dysfunction, osteopenia, or osteoporosis]. Truvada and Descovy are FDA-approved for PrEP; neither Vocabria nor Cabenuva are FDA-approved for PrEP.

80. Human Immunodeficiency Virus, Antiretroviral Treatment-Naïve Patients. Cabenuva is indicated as a complete regimen for the treatment of HIV-1 infection in adults to replace their current antiretroviral regimen in those who are virologically suppressed (HIV-1 RNA < 50 copies/mL) on a stable antiretroviral regimen with no history of treatment failure and with no known or suspected resistance to cabotegravir or rilpivirine.[1] In two pivotal trials, patients were either previously treated for 4 months (20 weeks) with Triumeq® (abacavir/dolutegravir/lamivudine tablets) or were on a stable antiretroviral regimen for ≥ 6 months.[2,3]

81. Co-administration with Antiretrovirals for Human Immunodeficiency Virus. Because Cabenuva is a complete regimen, co-administration with other antiretroviral medications for the treatment of HIV-1 infection is not recommended.[1]

82. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Human Immunodeficiency Virus – Rukobia Prior Authorization Policy

- Rukobia™ (fostemsavir extended-release tablets – ViiV)

REVIEW DATE: 07/22/2020

OVERVIEW

Rukobia, a human immunodeficiency virus type-1 (HIV-1) gp120-directed attachment inhibitor, in combination with other antiretroviral(s) [ARVs], is indicated for the treatment of HIV-1 infection in heavily treatment-experienced adults with multidrug-resistant HIV-1 infection failing their current ARV regimen due to resistance, intolerance, or safety considerations.[1]

Disease Overview

Heavily treatment-experienced adults account for approximately 6% of adults living with HIV who are on ARV treatment.[2] These patients have few, if any, treatment options left due to resistance, tolerability, and/or safety

considerations. Heavily treatment-experienced adults are at greater risk of progression to acquired immunodeficiency syndrome (AIDS) and death than non-heavily treatment-experienced adults.

Clinical Efficacy

The efficacy of Rukobia was established in one ongoing, Phase III, multicenter, 96-week pivotal study in Heavily treatment-experienced adults with HIV-1 infection failing their current ARV regimen (BRIGHTE; n = 371).[3,6] Eligible patients were ≥ 18 years of age and had failure of their current ARV regimen (baseline HIV-1 RNA ≥ 400 copies/mL), with no viable ARV combination therapy available because of exhaustion of a least four of six ARV classes (nucleoside reverse transcriptase inhibitors, non-nucleoside reverse transcriptase inhibitors, integrase inhibitors, protease inhibitors, CCR5 antagonists, and entry inhibitors). Exhaustion was defined as the elimination of all ARVs within a given class as a fully active option to pair with Rukobia because of resistance, previous adverse events (AEs), or unwillingness to use Fuzeon® (enfuviritide injection). There were 15 patients who received Trogarzo® (ibalizumab-uiyk injection) in combination with Rukobia.

Guidelines

Treatment with Rukobia is not addressed in guidelines. According to the Department of Health and Human Services Guidelines (December 18, 2019) for the use of antiviral agents in adults and adolescents with HIV infection, treatment-experienced patients with ongoing detectable viremia who lack sufficient treatment options to construct a fully suppressive regimen may be candidates for Trogarzo.[4] Patients who continue to have detectable viremia and who lack sufficient treatment options to construct a fully suppressive regimen may also be candidates for research studies or expanded access programs, or they may qualify for single-patient access to an investigational new drug as specified in FDA regulations. Guidelines note that Rukobia as an agent in late-stage clinical studies. The International Antiviral Society-USA recommendations for the treatment and prevention of HIV in adults (2018) note that Trogarzo may be useful as a fully active agent for patients with multiclass-resistant virus.[5]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Rukobia. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Rukobia as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Rukobia to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Rukobia is recommended in those who meet the following criteria:

FDA-Approved Indications

72. Human Immunodeficiency Virus (HIV) Infection. Approve for the duration noted if the patient meets ONE of the following (A or B):

- **A)** Initial Therapy. Approve for 6 months if the patient meets ALL of the following conditions (i, ii, iii, iv, v, and vi):
  - **i.** The patient is ≥ 18 years of age; AND
  - **ii.** The patient has human immunodeficiency virus type-1 (HIV-1) infection; AND
  - **iii.** According to the prescriber, the patient is failing a current antiretroviral regimen for human immunodeficiency virus (HIV); AND
  - **iv.** According to the prescriber, the patient has exhausted at least FOUR of the following antiretroviral classes, defined as elimination of all antiretrovirals within a given class due to demonstrated or projected resistance to the agent(s) in that class OR due to significant intolerance:
    - **a)** Nucleoside reverse transcriptase inhibitor; OR

Note: Examples of nucleoside reverse transcriptase inhibitors include abacavir, didanosine, emtricitabine, lamivudine, stavudine, tenofovir disoproxil fumarate, tenofovir alafenamide, zidovudine.

b) Non-nucleoside reverse transcriptase inhibitor; OR
Note: Examples of non-nucleoside reverse transcriptase inhibitor include delaviridine, efavirenz, etravirine, nevirapine, nevirapine XR, rilpivirine.

c) Protease inhibitor; OR
Note: Examples of protease inhibitors include atazanavir, darunavir, fosamprenavir, indinavir, nelfinavir, ritonavir, saquinavir, tipranavir.

d) Fusion inhibitor; OR
Note: Examples of fusion inhibitors include Fuzeon (enfuviritide for injection).

e) Integrase strand transfer inhibitor; OR
Note: Examples of integrase strand transfer inhibitors include raltegravir, dolutegravir, elvitegravir.

f) CCR5-antagonist; AND
Note: Examples of CCR5 antagonists include Selzentry® (maraviroc tablets).

v. The requested agent will be taken in combination with an optimized antiviral background regimen including one or more other antiretroviral agents; AND

vi. The requested agent is prescribed by or in consultation with a physician who specializes in the treatment of HIV infection.

B) Patient is Currently Receiving Rukobia. Approve for 1 year if the patient meets ALL of the following conditions (i, ii, and iii):

i. Patient has human immunodeficiency virus type-1 (HIV-1) infection; AND

ii. The requested agent will continue to be taken in combination with an optimized antiviral background regimen including one or more other antiretroviral agents; AND

iii. The patient has responded to a Rukobia-containing regimen, as determined by the prescriber.
Note: Examples of a response are HIV RNA < 40 cells/mm^3, HIV-1 RNA $\geq$ 0.5 $\log_{10}$ reduction from baseline in viral load.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Rukobia is not recommended in the following situations:

83. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Human Immunodeficiency Virus – Trogarzo™ (ibalizumab-uiyk injection for intravenous use – Theratechnologies)

TAC APPROVAL DATE: 04/08/2020

OVERVIEW

Trogarzo is a long-acting humanized immunoglobulin G4 monoclonal antibody indicated in combination with other antiretroviral(s) [ARV{s}] for the treatment of human immunodeficiency virus type-1 (HIV-1) infection in heavily treatment-experienced adults with multidrug resistant (MDR) HIV-1 infection failing their current ARV regimen.[1] It is a chronic therapy administered by a trained healthcare professional intravenously (IV), after diluting the appropriate number of vials in 250 mL of 0.9% Sodium Chloride Injection, USP. Patients should receive a single loading dose of 2,000 mg followed by a maintenance dose of 800 mg once every 2 weeks (Q2W). Trogarzo is available in a single-dose, 2 mL vial containing 150 mg/mL of ibalizumab-uiyk. Each vial delivers approximately 1.33 mL containing 200 mg of ibalizumab-uiyk.

Disease Overview

Multiclass or three-class drug resistant HIV-1 infection is usually defined as the presence of phenotypic or genotypic resistance to resistance to at least one drug in each of the following three classes: the nucleoside reverse transcriptase inhibitors (NRTIs)-, non-nucleoside reverse transcriptase inhibitors (NNRTIs)-, and protease inhibitors (PIs)-classes.[2] Trogarzo blocks HIV-1 from infecting CD4+ T cells by binding to domain 2 of CD4.[1] This interferes with post-attachment steps required for the entry of HIV-1 virus particles into host cells and prevents the viral transmission that occurs via cell-cell fusion. The binding specificity to domain 2 of CD4 allows Trogarzo to block viral entry into host cells without causing immunosuppression. There is no antagonism with other ARVs.

In the pivotal trial for Trogarzo, all patients had documented resistance to at least one ARV from the NRTI, NNRTI, and PI classes. The Table below provides examples of drugs from each class. NOTE: This is not all inclusive.

Table 1. Examples of HIV ARVs by Class.

Drug Class	Examples
NRTIs	Ziagen® (abacavir), Videx EC® (didanosine delayed-release), Videx® Pediatric (didanosine), Emtriva® (emtricitabine), Epivir®, (lamivudine), Zerit®, (stavudine), Viread®, (tenofovir disoproxil fumarate), Retrovir® (zidovudine), Combivir® (lamivudine/zidovudine), Epzicom® (abacavir/lamivudine), Trizivir® (abacavir/lamivudine/zidovudine), Truvada® (emtricitabine/tenofovir disoproxil fumarate), Descovy® (emtricitabine/tenofovir alafenamide)
NNRTIs	Rescriptor® (delavirdine), Sustiva® (efavirenz), Intelence® (etravirine), Viramune® (nevirapine), Viramune® XR™ (nevirapine XR), Edurant® (rilpivirine)
PIs	Reyataz® (atazanavir), Prezista® (darunavir), Lexiva® (fosamprenavir), Crixivan® (indinavir), Viracept® (nelfinavir), Norvir® (ritonavir), Invirase® (saquinavir), Aptivus® (tipranavir), Kaletra® (lopinavir/ritonavir), Prezcobix® (darunavir/cobicistat), and Evotaz® (atazanavir/cobicistat)

Table 1 (continued). Examples of HIV ARVs by Class.

Drug Class	Examples
INSTIs	Isentress® (raltegravir), Isentress® HD (raltegravir), Tivicay® (dolutegravir), and Vitekta® (elvitegravir)
Fusion Inhibitor	Fuzeon® (enfuviritide)
CCR5-Antagonist	Selzentry® (maraviroc tablets)
Combination Products	Biktarvy® (bictegravir/emtricitabine/tenofovir alafenamide tablets), Dutrebis™ (lamivudine/raltegravir potassium), Complera® (emtricitabine/rilpivirine/tenofovir disoproxil fumarate), Odefsey® (emtricitabine/rilpivirine/tenofovir alafenamide), Atripla® (efavirenz/ emtricitabine/tenofovir disoproxil fumarate), Stribild® (cobicistat/elvitegravir/emtricitabine/tenofovir disoproxil fumarate), Triumeq® (abacavir/dolutegravir/lamivudine), and Genvoya® (cobicistat/elvitegravir/emtricitabine/tenofovir alafenamide), Symtuza® (darunavir/cobicistat/emtricitabine/tenofovir alafenamide)

HIV – Human immunodeficiency virus; ARVs – Antiretrovirals; NRTIs – Nucleoside reverse transcriptase inhibitors; NNRTIs – Non-nucleoside reverse transcriptase inhibitors; PIs – Protease inhibitor; INSTIs – Integrase strand-transfer inhibitor.

Guidelines

The Department of Health and Human Services (DHHS) guidelines for the treatment of adults and adolescents with HIV-1 recognize the difficulty in treating patients with extensive resistance.[3] Managing patients with extensive resistance is complex and usually requires consultation with an HIV expert. Patients with ongoing detectable viremia who lack sufficient treatment options to construct a fully suppressive regimen may be candidates for Trogarzo.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Trogarzo. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the of the specialized skills required for evaluation and diagnosis of patients treated with Trogarzo as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Trogarzo to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Trogarzo is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Human Immunodeficiency Virus (HIV) Infection.** Approve for the duration outlined below if the patients meets ONE of the following conditions (A or B):
   - **A)** Initial Therapy. Approve for 6 months if the patient meets ALL of the following conditions (i, ii, iii, iv, v, and vi):
     - **iv.** The patient is ≥ 18 years of age; AND
     - **v.** The patient has an HIV type 1 infection; AND
     - **vi.** According to the prescribing physician, the patient is failing a current antiretroviral regimen for HIV; AND
     - **vii.** The patient has multiple antiretroviral drug resistance as demonstrated by resistance to at least one antiretroviral from at least THREE of the following antiviral classes:
       - **a)** nucleoside reverse transcriptase inhibitor (NRTI) [e.g., abacavir, didanosine, emtricitabine, lamivudine, stavudine, tenofovir disoproxil fumarate, tenofovir alafenamide, zidovudine]; OR
       - **b)** non-nucleoside reverse transcriptase inhibitor (NNRTI) [e.g., delaviridine, efavirenz, etravirine, nevirapine, nevirapine XR, rilpivirine]; OR
       - **c)** protease inhibitor (PI) [e.g., atazanavir, darunavir), fosamprenavir, indinavir, nelfinavir, ritonavir, saquinavir, tipranavir]; OR
       - **d)** fusion inhibitor [e.g., Fuzeon® (enfuviritide for injection)]; OR
       - **e)** integrase strand transfer inhibitor (INSTI) [e.g., raltegravir, raltegravir, dolutegravir, and elvitegravir]; OR

f) CCR5-antagonist [e.g., Selzentry® (maraviroc tablets)]; AND

viii. The requested agent will be taken in combination with an optimized antiviral background regimen including one or more other antiretroviral agents; AND

ix. The requested agent is prescribed by or in consultation with a physician who specializes in the treatment of human immunodeficiency virus (HIV) infection.

B) Patients Currently Receiving Trogarzo. Approve for 1 year if the patient meets ALL of the following conditions (i, ii, and iii):

i. The patient has an HIV type 1 infection; AND

ii. The requested agent will continue to be taken in combination with an optimized antiviral background regimen including one or more other antiretroviral agents; AND

iii. The patient has responded (e.g., HIV-1 RNA $\geq$ 0.5 $\log_{10}$ reduction from baseline in viral load) to a Trogarzo-containing regimen, as determined by the prescribing physician.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Trogarzo has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

84. Human Immunodeficiency Virus (HIV), Type 2. Trogarzo has only been evaluated in HIV-1 infection. The Department of Health and Human Services (DHHS) guidelines for the treatment of adults and adolescents with HIV-1 state that there are no data on the activity of Trogarzo against HIV-2.[3]

85. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Human Immunodeficiency Virus – Vocabria Prior Authorization Policy

- Vocabria® (cabotegravir tablets – ViiV/GlaxoSmithKline)

REVIEW DATE: 02/03/2021

OVERVIEW

Vocabria, a human immunodeficiency virus type-1 (HIV-1) integrase strand-transfer inhibitor, is indicated **in combination with Edurant® (rilpivirine tablets) for the short-term treatment of HIV-1 infection in adults who are virologically suppressed (HIV-1 RNA < 50 copies/mL) on a stable antiretroviral regimen with no history of treatment failure and with no known or suspected resistance to either cabotegravir or rilpivirine, for use as**:[1]

- **Oral lead-in** to assess the tolerability of cabotegravir prior to administration of Cabenuva® (cabotegravir extended-release injectable suspension; rilpivirine extended-release injectable suspension, co-packaged).
- **Oral therapy for patients who will miss planned injection dosing with Cabenuva**.

For oral lead-in, the recommended dose is Vocabria 30 mg QD + Edurant 25 mg QD at approximately the same time each day with a meal for approximately 1 month (28 days).[1] The last oral dose should be taken on the same day monthly injections with Cabenuva injections are started.

If a patient plans to miss scheduled monthly injections of Cabenuva by > 7 days, daily oral therapy is taken to replace up to two consecutive monthly injection visits.[1] The first dose of Vocabria 30 mg + Edurant 25 mg should be taken approximately 1 month after the last maintenance injection dose of Cabenuva and continued until the day injection dosing is restarted.[1,6]

Clinical Efficacy

The use of Vocabria + Edurant as an oral lead-in and Cabenuva once monthly for maintenance therapy in adults with HIV-1 was evaluated in two published, Phase III, randomized, multicenter, active-controlled, parallel-arm, open-label, non-inferiority pivotal trials (FLAIR and ATLAS).[3,4] In FLAIR, patients were naïve to antiretroviral therapy and started on Triumeq® (abacavir/dolutegravir/lamivudine tablets) for 20 weeks then continued on Triumeq or were switched to the long-acting regimen of Vocabria/Cabenuva in accordance with the FDA-approved dosing regimen.[3] In ATLAS, patients who were virally suppressed on an oral antiretroviral regimen (excluding Triumeq) continued on their antiretroviral regimen or were switched to the long-acting regimen of Vocabria/Cabenuva in accordance with the FDA-approved dosing regimen.[4] In FLAIR (n = 566), at Week 48, the long-acting regimen was non-inferior to Triumeq; 2.1% and 2.5% of patients, respectively, did not maintain viral suppression (adjusted difference -0.4%; 95% confidence interval [CI]: -2.8, 2.1).[3] In ATLAS (n = 618), at Week 48, the long-acting regimen was non-inferior to patients existing oral antiretrovirals: 1.6% and 1.0% of patients, respectively, did not maintain viral suppression (adjusted difference 0.6%; 95% CI: -1.2, 2.5).[4]

Guidelines

Cabenuva is addressed as an unapproved product in the International Antiviral Society-USA (IAS-USA) Panel Recommendations for Antiretroviral Drugs for Treatment and Prevention of HIV Infection in Adults (2020); Cabenuva and Vocabria have not been addressed in the Department of Health and Human Services (DHHS) Guidelines for the Use of Antiretroviral Agents in Adults and Adolescents with HIV (last updated December 18, 2019).[4,5]

According to the IAS-USA, in the setting of viral suppression, switching from a three-drug regimen to a two-drug regimen is an appropriate strategy to manage toxic side effects, intolerance, adherence, or patient preference provided that both agents are fully active.[4] Recommended regimens include: dolutegravir/lamivudine (available as Dovato® [dolutegravir/lamivudine tablets] or Tivicay® [dolutegravir tablets] + lamivudine [Epivir®, generics]), dolutegravir/rilpivirine (available as Juluca® [dolutegravir/rilpivirine tablets] or Tivicay + Edurant), a boosted protease inhibitor (lopinavir, atazanavir [Reyataz®, generics], or darunavir [Prezista®, generics]) + lamivudine, or a long-acting injectable two-drug regimen of Cabenuva pending approval by regulatory bodies and availability. The DHHS guidelines provide identical examples of successful strategies for switching from three-drug to two-drug regimens in individuals with suppressed HIV (with the noted absence of Cabenuva likely due the timing of the last update).[5]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Vocabria. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Vocabria as well as the monitoring required for adverse events and long-term efficacy, approval requires Vocabria to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Vocabria is recommended in those who meet the following criteria:

FDA-Approved Indications

73. Human Immunodeficiency Virus (HIV), Oral Lead-In to Assess the Tolerability of cabotegravir.
Approve for 1 month if the patient meets the following criteria (A, B, C, D, E, F, and G):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has HIV type-1 (HIV-1) infection; AND
- **C)** Patient has HIV-1 RNA < 50 copies/mL (viral suppression); AND
- **D)** Patient is currently receiving antiretrovirals for the treatment of HIV-1 with a stable regimen (≥ 4 months); AND
- **E)** The medication will be prescribed in combination with Edurant (rilpivirine tablets); AND
- **F)** If tolerated, Cabenuva (cabotegravir extended-release injectable suspension; rilpivirine extended-release injectable suspension, co-packaged) will be started upon completion of approximately 1 month of therapy with Vocabria + Edurant; AND
- **G)** The medication is prescribed by or in consultation with a physician who specializes in the treatment of HIV infection.

74. Human Immunodeficiency Virus (HIV), Oral Therapy for Planned Missed Doses of Cabenuva.
Approve for up to 2 months if the patient meets the following criteria (A, B, C, D, E, F, and G):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has HIV type 1 (HIV-1) infection; AND
- **C)** Patient has HIV-1 RNA < 50 copies/mL (viral suppression); AND
- **D)** Patient has received ≥ 1 maintenance dose of Cabenuva (400 mg/600 mg); AND
- **E)** Patient plans to miss up to two scheduled doses of Cabenuva by > 7 days, according to the prescriber; AND
- **F)** The medication will be prescribed in combination with Edurant (rilpivirine tablets); AND
- **G)** The medication is prescribed by or in consultation with a physician who specializes in the treatment of HIV infection.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Vocabria is not recommended in the following situations:

86. Pre-exposure Prophylaxis (PrEP). Vocabria is not currently indicated for the prevention of human immunodeficiency virus (HIV) in patients who are uninfected, but at risk of acquisition of HIV. Data from two unpublished trials have demonstrated the superiority of cabotegravir extended-release injectable suspension to Truvada® (tenofovir disoproxil fumarate/emtricitabine tablets, generics) in cisgender men and transgender men who have sex with men as well as in cisgender women.[5] IAS-USA guidelines recommend cabotegravir extended-release injectable suspension in cisgender men and

transgender women who have sex with men; every 8 week maintenance dosing is recommended and oral lead-in with Vocabria is optional.[4] The other recommended regimens for PrEP are daily Truvada (all at-risk populations) or Descovy® (tenofovir alafenamide/emtricitabine tablets) [MSM with/at risk for kidney dysfunction, osteopenia, or osteoporosis]. Truvada and Descovy are FDA-approved for PrEP; neither Vocabria nor Cabenuva are FDA-approved for PrEP.

87. **Human Immunodeficiency Virus, Antiretroviral Treatment-Naïve Patients.** Vocabria is indicated in combination with Edurant (rilpivirine tablets) for the short-term treatment of HIV-1 infection in adults who are virologically suppressed (HIV-1 RNA < 50 copies/mL) on a stable antiretroviral regimen with no history of treatment failure and with no known or suspected resistance to either cabotegravir or rilpivirine.[1] In two pivotal trials, patients were either previously treated for 4 months (20 weeks) with Triumeq® (abacavir/dolutegravir/lamivudine tablets) or were on a stable antiretroviral regimen for ≥ 6 months.[2,3]

88. **Duration of Use for > 2 Consecutive Months.** The recommended duration of Vocabria therapy is 1 month for oral lead-in.[1] Vocabria is also indicated as a daily regimen to replace up to two planned missed injections of Cabenuva (administered once monthly) for up to two consecutive months.

89. **Co-administration with Antiretrovirals for Human Immunodeficiency Virus other than Edurant.** Because Vocabria in combination with Edurant (rilpivirine tablets) is a complete regimen, co-administration with other antiretroviral medications for the treatment of HIV-1 infection is not recommended.[1]

90. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

- TriVisc™ (sodium hyaluronate injection – OrthogenRx)
- Visco-3™ (sodium hyaluronate injection –Bioventus)

REVIEW DATE: 08/26/2020

OVERVIEW

Hyaluronic acid derivatives are indicated for the treatment of pain related to knee osteoarthritis in patients who have failed to respond adequately to conservative nonpharmacologic therapy and to simple analgesics (e.g., acetaminophen).[1-16] The use of intraarticular injections are to restore the normal properties (viscosity and elasticity) of the synovial fluid. Gel-One, Hyalgan, Supartz FX, Synvisc/Synvisc-One, Triluron, and Visco-3 are derived from rooster or chicken combs. The remaining products are derived from non-avian sources and may be useful for patients with allergies to eggs or poultry products. GenVisc 850 has data to support similarity to Supartz FX.[9] All of the products given as a series of five injections (GenVisc 850,

Hyalgan, and Supartz FX) have a corresponding product that is equivalent to three injections (TriVisc, Triluron, and Visco-3, respectively). Although retreatment data are limited, all of these products have data concerning efficacy and/or safety of repeat courses. In many cases, at least 6 months was required or a minimum of 6 months had elapsed prior to injection of a repeat course.

Guidelines

Guidelines for the medical management of osteoarthritis of the hand, hip, and knee are available from the American College of Rheumatology (2019).[17] Multiple non-pharmacological modalities are recommended for knee osteoarthritis, including exercise, self-management programs, weight loss, Tai Chi, and use of assistive devices (i.e., bracing or a cane). Pharmacologic therapy for knee osteoarthritis consists of acetaminophen, oral and topical non-steroidal anti-inflammatory drugs (NSAIDs), tramadol, intraarticular corticosteroid injections, duloxetine, and topical capsaicin. There is limited evidence establishing a benefit of hyaluronic acid intraarticular injections, which contributes to the conditional recommendation against use in knee osteoarthritis. However, when other alternatives have been exhausted or have failed to provide satisfactory benefit, use of intraarticular hyaluronic acid injections may be viewed more favorably than offering no intervention. In the guidelines, no distinction is made between the available intraarticular hyaluronic acid products or between products with various molecular weights.

The Osteoarthritis Research Society International also has guidelines for knee osteoarthritis (2019).[19] These guidelines note that use of intraarticular hyaluronic acid injections are conditionally recommended for patients with knee osteoarthritis. The guidelines comment on the long-term treatment effect with intraarticular hyaluronic acid injections which is associated with symptom improvement beyond 12 weeks and a move favorable safety profile than intraarticular corticosteroid injections.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of hyaluronic acid derivatives indicated for knee osteoarthritis. Because of the specialized skills required for evaluation and diagnosis of patients treated with hyaluronic acid derivative intraarticular products as well as the specialized administration technique, these products are required to be administered by or under the supervision of a physician specializing in rheumatology, orthopedic surgery, or physical medicine and rehabilitation (physiatrist). All approvals are provided for one course of therapy per treated knee. Note that 1 month is a sufficient approval duration for one course of Durolane, Euflexxa, Gel-One, Gelsyn-3, Hymovis, Monovisc, sodium hyaluronate 1% injection, Synvisc, Synvisc-One, Triluron, TriVisc, and Visco-3; 5 weeks is a sufficient approval duration for one course of GenVisc 850, Orthovisc, Hyalgan, and Supartz FX. Previous therapy is required to be verified by a clinician in the Coverage Review Department when noted in the criteria as **[verification of therapies required].**

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of hyaluronic acid derivatives is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Osteoarthritis of the Knee.** Approve one course of therapy per treated knee if the patient meets ONE of the following conditions (A or B):
   - **A)** Initial Therapy. Approve an initial course if the patient meets ALL of the following conditions (i, ii, and iii):

i. Diagnosis of the knee to be treated is confirmed by radiologic evidence of knee osteoarthritis; AND
Note: Examples of radiographic evidence includes x-ray, magnetic resonance imaging (MRI), computed tomography (CT) scan, ultrasound.

ii. Patient has tried at least TWO of the following three modalities of therapy for osteoarthritis (a, b, c):

a) At least one course of physical therapy for knee osteoarthritis;

b) At least TWO of the following pharmacologic therapies [(1), (2), (3), (4)] **[verification of therapies required]**:

(1) Oral or topical nonsteroidal anti-inflammatory drug(s) [NSAID(s)];
Note: Examples of oral NSAIDs include naproxen, ibuprofen, celecoxib. Examples of topical NSAIDs include diclofenac solution or diclofenac gel. A trial of two or more NSAIDs (oral and/or topical) counts as one pharmacologic therapy.

(2) Acetaminophen;

(3) Tramadol (Ultram®/XR, generics);

(4) Duloxetine (Cymbalta®, generics);

c) At least TWO injections of intraarticular corticosteroids to the affected knee; AND

iii. The product is administered by or under the supervision of a physician specializing in rheumatology, orthopedic surgery, or physical medicine and rehabilitation (physiatrist).

B) Patient has Already Received One or More Courses of Hyaluronic Acid Derivative in the Same Knee. Approve ONE repeat course if the patient meets ALL of the following conditions (i, ii, and iii)

i. At least 6 months have elapsed since the last injection with any hyaluronic acid derivative; AND

ii. According to the prescriber, the patient had a response to the previous course of hyaluronic acid derivative therapy for osteoarthritis of the knee and now requires additional therapy for osteoarthritis symptoms; AND
Note: Examples of a response include reduced joint pain, tenderness, or morning stiffness, improved mobility.

iii. The product is administered by or under the supervision of a physician specializing in rheumatology, orthopedic surgery, or physical medicine and rehabilitation (physiatrist).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of hyaluronic acid derivatives is not recommended in the following situations:

18. Acute Ankle Sprain. A randomized, controlled, prospective trial was conducted which assessed the use of intraarticular hyaluronic acid in acute ankle sprains.[20-21] Patients treated with intraarticular hyaluronic acid (n = 79) within 48 hours of injury and again on Day 4 reported a time to pain-free and disability-free return to sport of 11 days (± 8 days) compared with 17 days (± 8 days) for placebo ($P < 0.05$).[18] All patients were also treated with standard of care (rest, ice, compression, and elevation [RICE]). At 24 months, the placebo group experienced an increase in repeat sprains when compared with those treated with an intraarticular hyaluronic acid product (21 recurrent ankle sprains in the placebo group compared with 7 recurrent ankle sprains in the HAD treatment group [$P < 0.001$]) as well as a significant difference in missed days from participation in sport activity (49 days vs. 12 days for the placebo and HAD groups, respectively; $P < 0.001$).[21] More data are needed to determine the role of intraarticular hyaluronic acid products in the treatment of acute ankle sprains.

19. **Osteoarthritis (OA) and Other Pathologic Conditions Involving Joints Other than the Knee** (e.g., hand, hip, ankle, shoulder OA, temporomandibular joint [TMJ], adhesive capsulitis of the shoulder, subacromial impingement). The prescribing information for these agents state in the precautions section that the safety and effectiveness of hyaluronic acid derivatives injections into joints other than the knee have not been established.[1-16] Due to the absence of evidence to support use of intraarticular hyaluronic acid and potential for harm, the guidelines for the management of hand, hip, and knee OA by American College of Rheumatology (2019) do not recommend use of intraarticular hyaluronic acid in patients with hand or hip OA.[17] Small trials have also investigated intraarticular hyaluronic acid in other joints, including ankle OA and hip OA.[23-38] More data are needed to determine if there is a role for intraarticular hyaluronic acid for the treatment of OA involving other joints. A small trial (n = 70) found that intraarticular hyaluronic acid did not result in increased benefit for adhesive capsulitis of the shoulder (also known as frozen shoulder) in patients who were already receiving physical therapy.[39] Another small study (n = 159) did not show benefit of intraarticular hyaluronic acid over corticosteroid or placebo injections in patients with subacromial impingement.[40]

20. **Pathologic Conditions of the Knee Other than Osteoarthritis** (e.g., chondromalacia patellae, osteochondritis dissecans, patellofemoral syndrome, post-anterior cruciate ligament [ACL] reconstruction). Intraarticular hyaluronic acid products are indicated in knee osteoarthritis.[1-16] Adequate, well-designed trials have not clearly established the use of intraarticular hyaluronic acid in other conditions of the knee.[41-42]

21. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Early annual revision	Add TriVisc and Visco-3 to the policy with the same criteria as other agents. Approval duration is for 1 month.	02/07/2018
Early annual revision	Add Synojoynt to the policy with the same criteria as other agents. Approval duration is for 1 month. Adjust approval duration for Euflexxa, Gelsyn-3, and Synvisc to approve for 1 month (previously was 5 weeks) which aligns with other products given as a course of three injections. Clarify that criteria for patients who have already received a course of a hyaluronic acid derivative intraarticular product applies to patients who have already received one or more courses of therapy.	10/31/2018
Early annual revision	Add Triluron to the policy with the same criteria as other agents. Approval duration is for 1 month. Throughout the policy, replace reference to Synojoynt with sodium	07/31/2019

	hyaluronate 1% (aligns with how product is marketed in the US). Remove Supartz from the policy (obsolete).	
Annual revision	**Osteoarthritis of the Knee**: Examples of radiographic evidence, non-steroidal anti-inflammatory drugs, and response to therapy were moved to notes in the criteria (previously listed as examples within the criteria). For the criteria applying to patients previously treated who have responded to therapy, wording was updated to more generally allow this determination by the prescriber (criteria previously specified this was according to the prescribing physician).	08/26/2020

PRIOR AUTHORIZATION POLICY

POLICY: Hyperlipidemia – Nexletol Prior Authorization Policy
- Nexletol™ (bempedoic acid tablets – Esperion)

REVIEW DATE: 03/04/2020

OVERVIEW

Nexletol, an adenosine triphosphate-citrate lyase inhibitor, is indicated as an adjunct to diet and maximally tolerated statin therapy for the treatment of heterozygous familial hypercholesterolemia (HeFH) or established atherosclerotic cardiovascular disease (ASCVD) in adults who require additional lowering of low-density lipoprotein cholesterol (LDL-C). Limitations of Use. The effect of Nexletol on cardiovascular (CV) morbidity and mortality have not been established.

Disease Overview

ASCVD (including CV disease) is a leading cause of morbidity and mortality worldwide.[2-4] ASCVD is defined as patients who have experienced an acute coronary syndrome (ACS) event, those with a history of myocardial infarction (MI), stable or unstable angina or coronary or other revascularizations, stroke, transient ischemic attack, or peripheral arterial disease.[3,4] Lowering LDL-C levels has been strongly correlated to reduce the risk of subsequent CV disease among patients with ASCVD. However, many risk factors contribute to ASCVD including smoking, hypertension, obesity, physical inactivity, poor nutrition, and other clinical conditions (e.g., diabetes, metabolic syndrome). In 2017, CV disease was listed as the underlying cause of death in approximately 859,125 US patients.[2] In 2017, CHD was the leading causes of death attributable to CV disease in the US (42.6%), followed by stroke (17.0%), high blood pressure (10.5%), heart failure (9.4%), diseases of the arteries (2.9%) and other CV diseases (17.6%). When considered independently from CV disease, stroke led to 146,383 US deaths in 2017.

Familial hypercholesterolemia is an autosomal dominant genetic disease that is noted by markedly elevated LDL-C, often at a young age, and premature ASCVD.[5-8] The condition is often undiagnosed and untreated. It is estimated that 620,000 patients in the US have familial hypercholesterolemia which includes HeFH and homozygous familial hypercholesterolemia (HoFH). HeFH is the most common of the defects and occurs in approximately 1 in 200 to 1 in 500 patients. LDL-C levels in adults who are untreated usually are > 220 mg/dL. HoFH is less common (one in 1 million people) and is associated with extremely elevated LDL-C levels (400 mg/dL [untreated]). Diagnosis may be considered by genetic testing. However, because a substantial percentage of patients do not have an identifiable mutation, the condition is clinically diagnosed on the basis of a combination of physical findings, family history, early-onset ASCVD, and LDL-C levels. A LDL-C ≥ 190 mg/dL in adults suggests a diagnosis of HeFH. Patients may also have physical findings such as cutaneous xanthomas, tendon xanthomas, arcus cornea, tuberous xanthomas or xanthelasma). The Simon Broom criteria and the Dutch Lipid Clinical Network Criteria are also useful for diagnosis HeFH and examine various factors such as cholesterol level, the presence of clinical findings, family history, and genetic analysis. Treatment to manage LDL-C levels is needed to prevent CV disease from developing in these patients with statins recommended as first-line. Other therapies are also added to reduce LDL-C.

Guidelines

Many guidelines are available regarding the treatment of patients with dyslipidemia which include the management of HeFH and ASCVD.[3-5,9-12] For patients with elevated LDL-C, statins are the cornerstone of therapy and recommended first-line to be used at maximally tolerated doses due to the established benefits regarding the reduction of CV risks. Atorvastatin 40 mg to 80 mg once daily (QD) and rosuvastatin 20 mg to 40 mg QD are considered high-intensity statins as they achieve LDL-C lowering of ≥ 50%. Other statin regimens, including atorvastatin and rosuvastatin at lower doses are classified as moderate-intensity (LDL-C reductions of 30% to 49%) products and low-intensity agents (LDL-C reductions < 30%). The American Heart Association (AHA)/American College of Cardiology (ACC) guidelines on the management of blood cholesterol (2018) defines ACSVD as ACS, those with a history of MI, stable or unstable angina or coronary or other revascularizations, stroke, transient ischemic attack (TIA), or peripheral arterial disease (PAD).[2,3] An LDL-C < 70 mg/dL is recommended in for most patients with ASCVD to reduce CV risk.

In 2015 the AHA published a scientific statement regarding familial hypercholesterolemia. Key points are that the condition may start early (in childhood or adolescence) and is noted by LDL-C levels ≥ 190 mg/dL. Premature CV disease can result. Diagnosis can be confirmed by genetic testing. The Dutch Lipid Clinic Network Criteria and Simon Broome Criteria may also be used which incorporate cholesterol levels, family history, clinical findings, and physical manifestations. Aggressive lipid-lowering therapy is recommended to achieve LDL-C reductions of at least 50%. Statins are the initial treatment for all adults with familial hypercholesterolemia. High- or moderate-intensity statins are recommended; low potency statins are generally inadequate for patients with familial hypercholesterolemia due to the markedly elevated LDL-C levels. If LDL-C does not reach the desired goal or percentage decrease, ezetimibe is recommended to be added to statin therapy. Three drug combinations incorporating a proprotein convertase subtilisin kexin type 9 (PCSK9) inhibitor, a bile acid sequestrant (colesevelam), or niacin is also recommended. For patients with HoFH, the addition of other therapies (e.g., Juxtapid® [lomitapide capsules], low-density lipoprotein apheresis) may be added. In patients with HeFH who have not yet manifested ASCVD, LDL-C levels ≤ 100 mg/dL are recommended.

In 2019 the AHA issued a scientific statement regarding statin safety and associated adverse events.[12] In general, statins are well-tolerated agents that have successfully led to decreased LDL-C levels which led to reductions in CV events (e.g., MI, ischemic stroke). The risk of serious statin-induced muscle injury (e.g., rhabdomyolysis) is low (< 0.01%). In US clinical practice, about 10% of patients stop taking statin therapy due to subjective complaints, of which muscle symptoms without significantly raised CK levels are noted. Data suggests that the muscle symptoms that occur among patients are not caused by the pharmacologic effects of the statin and restarting statin therapy for these patients is important, especially among patients at high risk of CV events, for whom CV event prevention is important. Several studies have shown that patients were believing that they were "statin intolerant". However, many patients were able to subsequently tolerate a statin upon rechallenge and receive the benefits provided with these agents. Other data supports this occurrence.[13-16]

Safety

Warnings/Precautions include hyperuricemia and an increased risk of tendon rupture.[1]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Nexletol. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Nexletol is recommended in those who meet the following criteria:

FDA-Approved Indications

75. Atherosclerotic Cardiovascular Disease (ASCVD). Approve for 1 year if the patient meets the following criteria (A, B, and C):

A) The patient is ≥ 18 years of age; AND

B) The patient has had one of the following conditions or diagnoses (i, ii, iii, iv or v):

- **i.** The patient has had a previous myocardial infarction or has a history of an acute coronary syndrome; OR
- **ii.** The patient has a diagnosis of angina (stable or unstable); OR
- **iii.** The patient has a past history of stroke or transient ischemic attack; OR
- **iv.** The patient has peripheral arterial disease; OR
- **v.** The patient has undergone a coronary or other arterial revascularization procedure in the past (e.g., coronary artery bypass graft, percutaneous coronary intervention, angioplasty, coronary stent procedure); AND

C) The patient meets one of the following criteria (i or ii):

- **i.** The patient meets both of the following criteria (a and b):
  - **a)** The patient has tried one high-intensity statin therapy (i.e., atorvastatin ≥ 40 mg daily; rosuvastatin ≥ 20 mg daily [as a single-entity or as a combination product]) AND ezetimibe (as a single-entity or as a combination product) concomitantly for ≥ 8 continuous weeks; AND
  - **b)** The low-density lipoprotein cholesterol level after this treatment regimen remains ≥ 70 mg/dL; OR
- **ii.** The patient has been determined to be statin intolerant by meeting one of the following criteria (a or b):
  - **a)** The patient experienced statin-related rhabdomyolysis (Note: Statin-induced muscle breakdown that is usually associated with markedly elevated creatine kinase levels [at least 10 times the upper limit of normal], along with evidence of end organ damage which can include signs of acute renal injury [noted by substantial increases in serum creatinine {Scr}levels {a ≥ 0.5 mg/dL increase in Scr or doubling of the Scr}] and/or myoglobinuria [myoglobin present in urine]); OR
  - **b)** The patient experienced skeletal-related muscle symptoms (e.g., myopathy [muscle weakness] or myalgia [muscle aches, soreness, stiffness, or tenderness]) and meets both of the following criteria [(1) and (2)]:
    - **(1)** The skeletal-related muscle symptoms (e.g., myopathy or myalgia) occurred while receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products); AND
    - **(2)** When receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products) the skeletal-related muscle symptoms (e.g., myopathy, myalgia) resolved upon discontinuation of each respective statin therapy (atorvastatin and rosuvastatin).

3. Heterozygous Familial Hypercholesterolemia (HeFH). Approve for 1 year if the patient meets the following criteria (A, B, and C):

53. The patient is ≥ 18 years of age; AND

54. The patient meets one of the following criteria (i, ii, iii, or iv):

- **i.** The patient has an untreated low-density lipoprotein cholesterol (LDL-C) level ≥ 190 mg/dL (prior to treatment with antihyperlipidemic agents); OR
- **ii.** The patient has genetic confirmation of HeFH by mutations in the low-density lipoprotein receptor, apolipoprotein B, proprotein convertase subtilisin kexin type 9 or low-density lipoprotein receptor adaptor protein 1 gene; OR
- **iii.** The patient has been diagnosed with HeFH meeting one of the following diagnostic criteria thresholds (a or b):
  - **a)** The prescriber used the Dutch Lipid Network criteria and the patient has a score > 5; OR

b) The prescriber used the Simon Broome criteria and the patient met the threshold for "definite" or "possible" familial hypercholesterolemia; OR

iv. The patient has clinical manifestations of HeFH (e.g., cutaneous xanthomas, tendon xanthomas, arcus cornea, tuberous xanthomas or xanthelasma); AND

55. The patient meets one of the following criteria (i or ii):

i. The patient meets both of the following criteria (a and b):

a) The patient has tried one high-intensity statin therapy (i.e., atorvastatin ≥ 40 mg daily; rosuvastatin ≥ 20 mg daily [as a single-entity or as a combination product]) AND ezetimibe (as a single-entity or as a combination product) concomitantly for ≥ 8 continuous weeks; AND

b) The LDL-C level after this treatment regimen remains ≥ 70 mg/dL; OR

ii. The patient has been determined to be statin intolerant by meeting one of the following criteria (a or b):

a) The patient experienced statin-related rhabdomyolysis (Note: Statin-induced muscle breakdown that is usually associated with markedly elevated creatine kinase levels [at least 10 times the upper limit of normal], along with evidence of end organ damage which can include signs of acute renal injury [noted by substantial increases in serum creatinine {Scr} levels {a ≥ 0.5 mg/dL increase in Scr or doubling of the Scr}] and/or myoglobinuria [myoglobin present in urine]); OR

b) The patient experienced skeletal-related muscle symptoms (e.g., myopathy [muscle weakness] or myalgia [muscle aches, soreness, stiffness, or tenderness]) and meets both of the following criteria [(1) and (2)]:

(1) The skeletal-related muscle symptoms (e.g., myopathy or myalgia) occurred while receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products); AND

(2) When receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products) the skeletal-related muscle symptoms (e.g., myopathy, myalgia) resolved upon discontinuation of each respective statin therapy (atorvastatin and rosuvastatin).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Nexletol is recommended in those who meet the following criteria:

91. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
New Policy	--	03/04/2020
Update	3/25/2020: No criteria changes. For the diagnosis of ASCVD and HeFH, the criteria question was broken up into two sections as follows: **C.i.** The patient meets both of the following criteria (a and b): **a)** The patient has tried one high-intensity statin therapy (i.e., atorvastatin ≥ 40 mg daily; rosuvastatin ≥ 20 mg daily [as a single-entity or as a combination product]) AND ezetimibe (as a single-entity or as a combination product) concomitantly for ≥ 8 continuous weeks; AND **b)** The LDL-C level after this treatment regimens remains ≥ 70 mg/dL.	--

ASCVD – Atherosclerotic cardiovascular disease; HeFH – Heterozygous familial hypercholesterolemia; LDL –C – Low-density lipoprotein cholesterol.

APPENDIX A.

Simon Broome Register Diagnostic Criteria[15]

Definite Familial Hypercholesterolemia:

a) Raised cholesterol
   (i) Total cholesterol greater than 6.7 mmol/L (260 mg/dL) or LDL-C > 4.0 mmol/L (155 mg/dL) in a child < 16 years;
   (ii) Total cholesterol > 7.5 mmol/L (290 mg/dL) or LDL-C > 4.9 mmol/L (190 mg/dL) in an adult (aged > 16 years);

b) AND
   (i) Tendon xanthomas in the patient or in a first (parent, sibling, or child) or second-degree relative (grandparent, aunt, or uncle);

c) OR
   (i) DNA-based evidence of LDL-receptor, familial defective apo B-100, or PCSK9 mutation.

Possible Familial Hypercholesterolemia:

a) Raised cholesterol
   (i) Total cholesterol greater than 6.7 mmol/L (260 mg/dL) or LDL-C > 4.0 mmol/L (155 mg/dL) in a child < 16 years;
   (ii) Total cholesterol > 7.5 mmol/L (290 mg/dL) or LDL-C > 4.9 mmol/L (190 mg/dL) in an adult;

b) AND at least one of the following:
   (i) Family history of premature myocardial infarction younger than 50 years of age in second-degree relative or younger than 60 years of age in first-degree relative;

c) OR
   (i) Family history of raised cholesterol > 7.5 mmol (290 mg/dL) in adult first-degree or second-degree relative or > 6.7 mmol/L (260 mg/dL) in child or sibling aged < 16 years.

APPENDIX B.
Dutch Lipid Network Criteria for Familial Hypercholesterolemia[16]

Criteria	Score
Family History	
First-degree relative with known premature coronary and/or vascular disease (men < 55 years, women < 60 years)	1
First degree relative with known LDL-C > 95th percentile for age and sex	1
First-degree relative with tendon xanthomata and/or arcus cornealis, OR	2
Children aged < 18 years with LDL-C > 95th percentile for age and sex	2
Clinical History	
Patient with premature CAD (age as above)	2
Patient with premature cerebral or peripheral vascular disease (age as above)	1
Physical Examination	
Tendon xanthomas	6
Arcus cornealis at age < 45 years	4
LDL-C	
LDL-C ≥ 8.5 mmol/L (330 mg/dL)	8
LDL-C 6.5 to 8.4 mmol/L (250 to 329 mg/dL)	5
LDL-C 5.0 to 6.4 mmol/L (190 to 249 mg/dL)	3
LDL-C 4.0 to 4.9 mg/dL (155 to 189 mg/dL)	1
DNA analysis	
Functional mutation LDLR, APOB or PCSK9 gene	8
Stratification	**Total score**
Definite familial hypercholesterolemia	> 8
Probable familial hypercholesterolemia	6 to 8
Possible familial hypercholesterolemia	3 to 5
Unlikely familial hypercholesterolemia	< 3

LDL-C – Low-density lipoprotein cholesterol; CAD – Coronary artery disease; LDLR – Low-density lipoprotein receptor; APOB – Apolipoprotein B; PCSK9 – Proprotein convertase subtilisin kexin type 9.

PRIOR AUTHORIZATION POLICY

POLICY: Hyperlipidemia – Nexlizet Prior Authorization Policy

- Nexlizet™ (bempedoic acid and ezetimibe tablets – Esperion)

REVIEW DATE: 04/01/2020

OVERVIEW
Nexlizet, contains bempedoic acid, an adenosine triphosphate-citrate lyase inhibitor, and ezetimibe, a cholesterol absorption inhibitor. It is indicated as an adjunct to diet and maximally tolerated statin therapy for the treatment of heterozygous familial hypercholesterolemia (HeFH) or established atherosclerotic cardiovascular disease (ASCVD) in adults who require additional lowering of low-density lipoprotein cholesterol (LDL-C). Limitations of Use. The effect of Nexlizet on cardiovascular (CV) morbidity and mortality have not been established.

Disease Overview
ASCVD (including CV disease) is a leading cause of morbidity and mortality worldwide.[2-4] ASCVD is defined as patients who have experienced an acute coronary syndrome (ACS) event, those with a history of myocardial infarction (MI), stable or unstable angina or coronary or other revascularizations, stroke, transient ischemic attack, or peripheral arterial disease.[3,4] Lowering LDL-C levels has been strongly correlated to reduce the risk of subsequent CV disease among patients with ASCVD. However, many risk factors contribute to ASCVD including smoking, hypertension, obesity, physical inactivity, poor nutrition,

and other clinical conditions (e.g., diabetes, metabolic syndrome). In 2017, CV disease was listed as the underlying cause of death in approximately 859,125 US patients.[2] In 2017, CHD was the leading causes of death attributable to CV disease in the US (42.6%), followed by stroke (17.0%), high blood pressure (10.5%), heart failure (9.4%), diseases of the arteries (2.9%) and other CV diseases (17.6%). When considered independently from CV disease, stroke led to 146,383 US deaths in 2017.

Familial hypercholesterolemia is an autosomal dominant genetic disease that is noted by markedly elevated LDL-C, often at a young age, and premature ASCVD.[5-8] The condition is often undiagnosed and untreated. It is estimated that 620,000 patients in the US have familial hypercholesterolemia which includes HeFH and homozygous familial hypercholesterolemia (HoFH). HeFH is the most common of the defects and occurs in approximately 1 in 200 to 1 in 500 patients. LDL-C levels in adults who are untreated usually are > 220 mg/dL. HoFH is less common (one in 1 million people) and is associated with extremely elevated LDL-C levels (400 mg/dL [untreated]). Diagnosis may be considered by genetic testing. However, because a substantial percentage of patients do not have an identifiable mutation, the condition is clinically diagnosed on the basis of a combination of physical findings, family history, early-onset ASCVD, and LDL-C levels. A LDL-C ≥ 190 mg/dL in adults suggests a diagnosis of HeFH. Patients may also have physical findings such as cutaneous xanthomas, tendon xanthomas, arcus cornea, tuberous xanthomas or xanthelasma). The Simon Broom criteria and the Dutch Lipid Clinical Network Criteria are also useful for diagnosis HeFH and examine various factors such as cholesterol level, the presence of clinical findings, family history, and genetic analysis. Treatment to manage LDL-C levels is needed to prevent CV disease from developing in these patients with statins recommended as first-line. Other therapies are also added to reduce LDL-C.

Guidelines

Many guidelines are available regarding the treatment of patients with dyslipidemia which include the management of HeFH and ASCVD.[3-5,9-12] For patients with elevated LDL-C, statins are the cornerstone of therapy and recommended first-line to be used at maximally tolerated doses due to the established benefits regarding the reduction of CV risks. Atorvastatin 40 mg to 80 mg once daily (QD) and rosuvastatin 20 mg to 40 mg QD are considered high-intensity statins as they achieve LDL-C lowering of ≥ 50%. Other statin regimens, including atorvastatin and rosuvastatin at lower doses are classified as moderate-intensity (LDL-C reductions of 30% to 49%) products and low-intensity agents (LDL-C reductions < 30%). The American Heart Association (AHA)/American College of Cardiology (ACC) guidelines on the management of blood cholesterol (2018) defines ACSVD as ACS, those with a history of MI, stable or unstable angina or coronary or other revascularizations, stroke, transient ischemic attack (TIA), or peripheral arterial disease (PAD).[2,3] An LDL-C < 70 mg/dL is recommended in for most patients with ASCVD to reduce CV risk.

In 2015 the AHA published a scientific statement regarding familial hypercholesterolemia. Key points are that the condition may start early (in childhood or adolescence) and is noted by LDL-C levels ≥ 190 mg/dL. Premature CV disease can result. Diagnosis can be confirmed by genetic testing. The Dutch Lipid Clinic Network Criteria and Simon Broome Criteria may also be used which incorporate cholesterol levels, family history, clinical findings, and physical manifestations. Aggressive lipid-lowering therapy is recommended to achieve LDL-C reductions of at least 50%. Statins are the initial treatment for all adults with familial hypercholesterolemia. High- or moderate-intensity statins are recommended; low potency statins are generally inadequate for patients with familial hypercholesterolemia due to the markedly elevated LDL-C levels. If LDL-C does not reach the desired goal or percentage decrease, ezetimibe is recommended to be added to statin therapy. Three drug combinations incorporating a proprotein convertase subtilisin kexin type 9 (PCSK9) inhibitor, a bile acid sequestrant (colesevelam), or niacin is also recommended. For patients with HoFH, the addition of other therapies (e.g., Juxtapid® [lomitapide capsules], low-density lipoprotein apheresis) may be added. In patients with HeFH who have not yet manifested ASCVD, LDL-C levels ≤ 100 mg/dL are recommended.

In 2019 the AHA issued a scientific statement regarding statin safety and associated adverse events.[12] In general, statins are well-tolerated agents that have successfully led to decreased LDL-C levels which led to reductions in CV events (e.g., MI, ischemic stroke). The risk of serious statin-induced muscle injury (e.g., rhabdomyolysis) is low (< 0.01%). In US clinical practice, about 10% of patients stop taking statin therapy due to subjective complaints, of which muscle symptoms without significantly raised CK levels are noted. Data suggests that the muscle symptoms that occur among patients are not caused by the pharmacologic effects of the statin and restarting statin therapy for these patients is important, especially among patients at high risk of CV events, for whom CV event prevention is important. Several studies have shown that patients were believing that they were "statin intolerant". However, many patients were able to subsequently tolerate a statin upon rechallenge and receive the benefits provided with these agents. Other data supports this occurrence.[13-16]

Safety

Warnings/Precautions include hyperuricemia and an increased risk of tendon rupture.[1]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Nexlizet. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Nexlizet is recommended in those who meet the following criteria:

FDA-Approved Indication

76. Atherosclerotic Cardiovascular Disease (ASCVD). Approve for 1 year if the patient meets the following criteria (A, B, and C):

D) The patient is ≥ 18 years of age; AND

E) The patient has had one of the following conditions or diagnoses (i, ii, iii, iv or v):

- **i.** The patient has had a previous myocardial infarction or has a history of an acute coronary syndrome; OR
- **ii.** The patient has a diagnosis of angina (stable or unstable); OR
- **iii.** The patient has a past history of stroke or transient ischemic attack; OR
- **iv.** The patient has peripheral arterial disease; OR
- **v.** The patient has undergone a coronary or other arterial revascularization procedure in the past (e.g., coronary artery bypass graft, percutaneous coronary intervention, angioplasty, coronary stent procedure); AND

F) The patient meets one of the following criteria (i or ii):

- **i.** The patient meets both of the following criteria (a and b):
  - **a)** The patient has tried one high-intensity statin therapy (i.e., atorvastatin ≥ 40 mg daily; rosuvastatin ≥ 20 mg daily [as a single-entity or as a combination product]) for ≥ 8 continuous weeks; AND
  - **b)** The low-density lipoprotein cholesterol level after therapy regimen remains ≥ 70 mg/dL; OR
- **ii.** The patient has been determined to be statin intolerant by meeting one of the following criteria (a or b):
  - **a)** The patient experienced statin-related rhabdomyolysis (Note: Statin-induced muscle breakdown that is usually associated with markedly elevated creatine kinase levels [at least 10 times the upper limit of normal], along with evidence of end organ damage which can include signs of acute renal injury [noted by substantial increases in serum creatinine {Scr}levels {a ≥ 0.5 mg/dL increase in Scr or doubling of the Scr}] and/or myoglobinuria [myoglobin present in urine]); OR
  - **b)** The patient experienced skeletal-related muscle symptoms (e.g., myopathy [muscle weakness] or myalgia [muscle aches, soreness, stiffness, or tenderness]) and meets both of the following criteria [(1) and (2)]:
    - **(1)** The skeletal-related muscle symptoms (e.g., myopathy or myalgia) occurred while receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products); AND
    - **(2)** When receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products) the skeletal-related muscle symptoms (e.g., myopathy, myalgia) resolved upon discontinuation of each respective statin therapy (atorvastatin and rosuvastatin).

4. Heterozygous Familial Hypercholesterolemia (HeFH). Approve for 1 year if the patient meets the following criteria (A, B, and C):

56. The patient is ≥ 18 years of age; AND

57. The patient meets one of the following criteria (i, ii, iii, or iv):

- **i.** The patient has an untreated low-density lipoprotein cholesterol (LDL-C) level ≥ 190 mg/dL (prior to treatment with antihyperlipidemic agents); OR
- **ii.** The patient has genetic confirmation of HeFH by mutations in the low-density lipoprotein receptor, apolipoprotein B, proprotein convertase subtilisin kexin type 9 or low-density lipoprotein receptor adaptor protein 1 gene; OR
- **iii.** The patient has been diagnosed with HeFH meeting one of the following diagnostic criteria thresholds (a or b):
  - **a)** The prescriber used the Dutch Lipid Network criteria and the patient has a score > 5; OR
  - **b)** The prescriber used the Simon Broome criteria and the patient met the threshold for "definite" or "possible" familial hypercholesterolemia; OR
- **iv.** The patient has clinical manifestations of HeFH (e.g., cutaneous xanthomas, tendon xanthomas, arcus cornea, tuberous xanthomas or xanthelasma); AND

58. The patient meets one of the following criteria (i or ii):

- **i.** The patient meets both of the following criteria (a and b):
  - **c)** The patient has tried one high-intensity statin therapy (i.e., atorvastatin ≥ 40 mg daily; rosuvastatin ≥ 20 mg daily [as a single-entity or as a combination product]) for ≥ 8 continuous weeks; AND

d) The LDL-C level after this treatment regimen remains ≥ 70 mg/dL; OR

ii. The patient has been determined to be statin intolerant by meeting one of the following criteria (a or b):

a) The patient experienced statin-related rhabdomyolysis (Note: Statin-induced muscle breakdown that is usually associated with markedly elevated creatine kinase levels [at least 10 times the upper limit of normal], along with evidence of end organ damage which can include signs of acute renal injury [noted by substantial increases in serum creatinine {Scr} levels {a ≥ 0.5 mg/dL increase in Scr or doubling of the Scr}] and/or myoglobinuria [myoglobin present in urine]); OR

b) The patient experienced skeletal-related muscle symptoms (e.g., myopathy [muscle weakness] or myalgia [muscle aches, soreness, stiffness, or tenderness]) and meets both of the following criteria [(1) and (2)]:

(1) The skeletal-related muscle symptoms (e.g., myopathy or myalgia) occurred while receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products); AND

(2) When receiving separate trials of both atorvastatin and rosuvastatin (as single-entity or as combination products) the skeletal-related muscle symptoms (e.g., myopathy, myalgia) resolved upon discontinuation of each respective statin therapy (atorvastatin and rosuvastatin).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Nexlizet is recommended in those who meet the following criteria:

92. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Possible Familial Hypercholesterolemia:

a) Raised cholesterol
   (i) Total cholesterol greater than 6.7 mmol/L (260 mg/dL) or LDL-C > 4.0 mmol/L (155 mg/dL) in a child < 16 years;
   (ii) Total cholesterol > 7.5 mmol/L (290 mg/dL) or LDL-C > 4.9 mmol/L (190 mg/dL) in an adult;

b) AND at least one of the following:
   (i) Family history of premature myocardial infarction younger than 50 years of age in second-degree relative or younger than 60 years of age in first-degree relative;

c) OR
   (i) Family history of raised cholesterol > 7.5 mmol (290 mg/dL) in adult first-degree or second-degree relative or > 6.7 mmol/L (260 mg/dL) in child or sibling aged < 16 years.

APPENDIX B.
Dutch Lipid Network Criteria for Familial Hypercholesterolemia[16]

Criteria	Score
Family History	
First-degree relative with known premature coronary and/or vascular disease (men < 55 years, women < 60 years)	1
First degree relative with known LDL-C > 95th percentile for age and sex	1
First-degree relative with tendon xanthomata and/or arcus cornealis, OR	2
Children aged < 18 years with LDL-C > 95th percentile for age and sex	2
Clinical History	
Patient with premature CAD (age as above)	2
Patient with premature cerebral or peripheral vascular disease (age as above)	1
Physical Examination	
Tendon xanthomas	6
Arcus cornealis at age < 45 years	4
LDL-C	
LDL-C ≥ 8.5 mmol/L (330 mg/dL)	8
LDL-C 6.5 to 8.4 mmol/L (250 to 329 mg/dL)	5
LDL-C 5.0 to 6.4 mmol/L (190 to 249 mg/dL)	3
LDL-C 4.0 to 4.9 mg/dL (155 to 189 mg/dL)	1
DNA analysis	
Functional mutation LDLR, APOB or PCSK9 gene	8
Stratification	**Total score**
Definite familial hypercholesterolemia	> 8
Probable familial hypercholesterolemia	6 to 8
Possible familial hypercholesterolemia	3 to 5
Unlikely familial hypercholesterolemia	< 3

LDL-C – Low-density lipoprotein cholesterol; CAD – Coronary artery disease; LDLR – Low-density lipoprotein receptor; APOB – Apolipoprotein B; PCSK9 – Proprotein convertase subtilisin kexin type 9.

PRIOR AUTHORIZATION POLICY

POLICY: Hyperlipidemia – Omega-3 Fatty Acid Products
- Lovaza® (omega-3-acid ethyl esters capsules – GlaxoSmithKline, generic)
- Vascepa® (icosapent ethyl capsules – Amarin, generic)

REVIEW DATE: 01/13/2021

OVERVIEW
Lovaza, a combination of ethyl esters of omega-3 fatty acids (mainly eicosapentaenoic acid [EPA and docosahexaenoic acid [DHA]) and Vascepa, an esthyl ester of EPA, are indicated for:[1,2]

- **Hypertriglyceridemia** (severe, triglyceride [TG] levels ≥ 500 mg/dL), to reduce TG levels as an adjunct to diet in adults.

Vascepa is also indicated to:[2,3]

- **Reduce the risk of myocardial infarction, stroke, coronary revascularization, and unstable angina** requiring hospitalization in adults with elevated TG levels (≥ 150 mg/dL) and either established cardiovascular (CV) disease or diabetes mellitus with two or more additional risk factors for CV disease, as an adjunct to maximally tolerated statin therapy.

Lovaza and Vascepa have been studied in patients with TG levels ≥ 200 mg/dL and < 500 mg/dL in patients who had persistently high TGs despite treatment with statin therapy and proper dietary modifications.[4,5] In these short-term trials lasting 6 to 12 weeks in duration, the addition of omega-3 fatty acid therapy led to further reductions in TG levels.

Guidelines/Scientific Statements

Several guidelines are available that discuss the management of elevated TG values and have incorporated omega-3 fatty acid products.[6-11] Highlights from a few guidelines are below.

- The **American Diabetes Association Standards of Care** regarding CV disease and risk management (2021) state that Vascepa should be considered for patients with diabetes and atherosclerotic cardiovascular disease (ASCVD) or other cardiac risk factors on a statin with controlled low-density lipoprotein cholesterol levels, but with elevated TG levels (135 to 499 mg/dL) to reduce CV risk.[10]
- The **National Lipid Association** (NLA) published a scientific statement regarding Vascepa (2019).[11] Based on the REDUCE-IT trial, the NLA position is that for patients ≥ 45 years of age with clinical ASCVD, or ≥ 50 years of age with diabetes mellitus requiring medication plus at least one additional risk factor, with fasting TG levels of 135 to 499 mg/dL on high-intensity or maximally tolerated statin therapy (with or without ezetimibe), treatment with Vascepa is recommended for ASCVD risk reduction (Class I evidence rating).

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of omega-3 fatty acid products (Lovaza and Vascepa [both brand and generic]). All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

I. Coverage of **Vascepa** (brand and generic) is recommended in those who meet the following criteria:

FDA-Approved Indication

15. Cardiovascular Risk Reduction in Patients with Elevated Triglycerides. Approve Vascepa (brand or generic) for 3 years if the patient meets all of the following criteria (A, B and C):

A) Patient meets one of the following (i or ii):

i. Patient has established cardiovascular disease; OR

Note: Examples of cardiovascular disease include a previous myocardial infarction (MI); a history of an acute coronary syndrome (ACS) event; angina (stable or unstable); past history of stroke or transient ischemic attack (TIA); peripheral arterial disease (PAD); or the patient has undergone a coronary or other arterial revascularization procedure in the past (e.g., coronary artery bypass graft [CABG], percutaneous coronary intervention [PCI], angioplasty, coronary stent procedure); OR

ii. Patient meets both of the following (a and b):

a) Patient has diabetes; AND

b) According to the prescriber, has at least two additional risk factors for cardiovascular disease.

Note: Examples of risk factors for cardiovascular disease include hypertension; low high-density lipoprotein cholesterol (HDL-C) levels (e.g., ≤ 40 mg/dL); renal dysfunction (creatinine clearance < 60 mL/min); family history of premature coronary disease; presence of

albuminuria; current cigarette smoking; familial hypercholesterolemia; and increased weight (body mass index greater than 25 kg/m^2); AND

B) Prior to initiation of therapy, the patient has a fasting baseline triglyceride level ≥ 150 mg/dL; AND

C) Patient meets one of the following criteria (i or ii):

i. Patient is receiving statin therapy; OR

ii. According to the prescriber the patient cannot tolerate statin therapy.

II. Coverage of **Lovaza** and **Vascepa** (both brand and generic) is recommended in those who meet the following criteria:

FDA-Approved Indication

16. Hypertriglyceridemia with Triglyceride (TG) Levels ≥ 500 mg/dL. Approve Lovaza or Vascepa (both brand or generic) for 3 years if the patient meets the following criteria (A and B):

A) Prior to initiation of therapy, the patient has a fasting baseline triglyceride (TG) level ≥ 500 mg/dL; AND

B) Patient has tried, or is currently receiving, one of the following products: niacin (immediate-release or extended-release), a fibrate, or a statin.

Note: Examples of fibrates include gemfibrozil, fenofibrate and fenofibric acid. Examples of statins include atorvastatin, rosuvastatin, simvastatin, pravastatin, lovastatin, fluvastatin, and Livalo® (pitavastatin tablets). Also, a patient who requests Vascepa may potentially be reviewed under the criteria for Cardiovascular Risk Reduction in Patients with Elevated Triglycerides.

Other Uses with Supportive Evidence

17. Hypertriglyceridemia with Triglyceride (TG) Levels of 150 mg/dL to < 500 mg/dL. Approve Lovaza or Vascepa (both brand or generic) for 3 years if the patient meets the following criteria (A and B):

A) Prior to initiation of therapy, the patient has a fasting baseline triglyceride (TG) level of 150 mg/dL to < 500 mg/dL; AND

B) Patient has tried, or is currently receiving, one of the following products: niacin (immediate-release or extended-release), a fibrate, or a statin.

Note: Examples of fibrates include gemfibrozil, fenofibrate and fenofibric acid. Examples of statins include atorvastatin, rosuvastatin, simvastatin, pravastatin, lovastatin, fluvastatin, and Livalo® (pitavastatin tablets). Also, a patient who requests Vascepa may potentially be reviewed under the criteria for Cardiovascular Risk Reduction in Patients with Elevated Triglycerides.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Lovaza and Vascepa (both brand and generic) is not recommended in the following situations:

37. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	**Hypertriglyceridemia with Triglyceride (TG) Levels ≥ 500 mg/dL:** The option of inadequate efficacy according to the prescribing information of one over-the counter (OTC) omega-3 fatty acid product was removed. **Hypertriglyceridemia with Triglyceride (TG) Levels of 150 mg/dL to < 500 mg/dL:** The option of inadequate efficacy according to the prescribing information of one over-the counter (OTC) omega-3 fatty acid product was removed.	05/08/2019
Early Annual Revision	New criteria were added for the recent FDA-approved indication for Vascepa that addresses its use for "Cardiovascular Risk Reduction in Patients with Elevated Triglycerides". For the FDA-approved indication for Vascepa and Lovaza regarding "Hypertriglyceridemia with Triglyceride (TG) Levels ≥ 500 mg/dL" and the criteria under "Other Uses with Supportive Evidence" that addresses "Hypertriglyceridemia with Triglyceride (TG) Levels of 150 mg/dL to < 500 mg/dL" a note was added that patients requesting Vascepa may potentially be reviewed under those criteria. Also, wording was revised for these two indications to remove the word "pretreatment" and replace it with the phrase "prior to requesting Vascepa or Lovaza".	1/15/2020
Update	3/5/2020: No criteria changes. The title Hyperlipidemia was added to the name of the policy.	--
Annual Revision	It was cited that generic products to Vascepa are available. Also, the following changes were made: **Hypertriglyceridemia with Triglyceride (TG) Levels ≥ 500 mg/dL:** The examples of fibrates and statins were moved from the criteria to a Note. **Hypertriglyceridemia with Triglyceride (TG) Levels of 150 mg/dL to < 500 mg/dL:** The examples of fibrates and statins were moved from the criteria to a Note.	01/13/2021

TG – Triglyceride; OTC – Over-the-counter; FDA – Food and Drug Administration.

PRIOR AUTHORIZATION POLICY

POLICY: Hypoactive Sexual Desire Disorder – Addyi Prior Authorization Policy

- Addyi™ (flibanserin tablets – Sprout Pharmaceuticals)

REVIEW DATE: 12/16/2020

OVERVIEW

Addyi is indicated for the **treatment of premenopausal women with acquired, generalized hypoactive sexual desire disorder (HSDD)** that is characterized by low sexual desire that causes marked distress or interpersonal difficulty and is NOT due to a co-existing medical or psychiatric condition; problems within the relationship; or the effects of a medication or other drug substance.[1] Acquired HSDD refers to HSDD that develops in a patient who previously had no problems with sexual desire. Generalized HSDD refers to HSDD that occurs regardless of the type of stimulation, situation, or partner. Addyi is not indicated for the treatment of HSDD in postmenopausal women or in men. It is also not indicated to enhance sexual performance.

Addyi is a centrally-acting post-synaptic serotonin 1A receptor agonist and a serotonin 2A receptor antagonist.[1] It has been shown to regulate levels of dopamine and norepinephrine and to induce transient decreases in serotonin levels in specific regions of the brain.[1,2] The exact mechanism of action of Addyi in the treatment of HSDD is not known.[1] According to the prescribing information, Addyi should be discontinued after 8 weeks if the patient does not report an improvement in her HSDD symptoms.

The prescribing information notes that Addyi should be discontinued after 8 weeks if the patient does not report any improvement in HSDD symptoms.[1] In the Addyi clinical studies, one of the coprimary efficacy endpoints was assessed by the median increase in the number of satisfying sexual events standardized over

a 28-day period. Since this is an objective measure of efficacy, it is used in the criteria to assess Addyi efficacy during initial therapy.

Safety

Addyi contains a Boxed Warning regarding the use of alcohol and the increase in risk of severe hypotension and syncope.[1] Patients should be counseled to wait at least two hours after consuming one or two standard alcoholic drinks before taking Addyi or skip the dose if they have consumed three or more standard alcoholic drinks that evening.

Guidelines

The American College of Obstetricians and Gynecologists (ACOG) guideline on Female Sexual Dysfunction (2019) notes the importance of recognizing if the loss of sexual interest is due to a co-morbid or undiagnosed condition, or medication.[5] Consultation with or referral to a mental health specialist with expertise and training in the treatment of female sexual dysfunction (e.g., sex therapists, psychologists, marriage/relationship counselors) should be considered based on the physician's level of expertise and the patient's individual needs. The guidelines note that Addyi was approved in 2015 by the FDA to treatment hypoactive sexual desire disorder in premenopausal women without depression. Addyi is noted as a treatment option for HSDD in premenopausal women without depression who are appropriately counseled about the risk of alcohol use during treatment.[5] The guidelines also discuss that systemic review and meta-analysis of existing studies with Addyi show that although the studies were randomized, their overall quality of evidence for efficacy and safety was very low.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Addyi. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Addyi is recommended in those who meet the following criteria:

FDA-Approved Indications

5. Hypoactive Sexual Desire Disorder (HSDD)/Female Sexual Interest/Arousal Disorder (FSIAD).

59. Initial Therapy. Approve for 8 weeks if the patient meets the following criteria (i, ii, iii, iv, v, and vi):

- **i.** Patient is premenopausal; AND
- **ii.** Patient's symptoms of HSDD/FSIAD have persisted for a minimum of 6 months; AND
- **iii.** Patient has had normal sexual desire in the past, prior to the diagnosis of HSDD/FSIAD; AND
- **iv.** Patient does **not** have a diagnosis of depression; AND
- **v.** Other known causes of HSDD/FSIAD, such as co-existing medical or psychiatric conditions, problems within a relationship, effects of medications (e.g., antidepressants), or drug abuse have been ruled out by the prescriber; AND
- **vi.** The prescriber has counseled the patient regarding the interaction with alcohol and Addyi, and the increased risk of hypotension and syncope.

60. Patient is Currently Receiving Addyi. Approve for 6 months if the patient meets the following criteria (i, ii, and iii):

- **i.** Patient is premenopausal; AND

ii. The prescriber confirms that since initiating Addyi therapy, the patient reports a significant improvement in sexual desire and/or a decrease in sexual distress; AND

iii. Patient has not reported any serious or concerning adverse events (e.g., hypotension, syncope, dizziness) while taking Addyi.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Addyi is not recommended in the following situations:

38. **Postmenopausal Patients.** Two published Phase III trials assessed the efficacy of Addyi in postmenopausal women with HSDD.[3-4] In the SNOWDROP trial though there was statistical significance in the primary endpoints (number of satisfying sexual events over 28 days and increase in desire score), the treatment difference between Addyi and placebo was very minimal.[3] The PLUMERIA study was discontinued early by the study sponsor for commercial reasons; however, published data are available for up to Week 16.[4] The improvement from baseline to Week 16 in the Female Sexual Function Index desire domain was significantly greater with Addyi compared with placebo, but the other co-primary endpoint of sexually satisfying events was not significantly different between Addyi and placebo. Addyi is currently not approved for use in postmenopausal women with HSDD/FSIAD symptoms.

39. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	No criteria changes	08/09/2017
Annual Revision	No criteria changes	08/22/2018
Annual Revision	Hypoactive Sexual Desire Disorder (HSDD)/Female Sexual Interest/Arousal Disorder (FSIAD), Initial Criteria: "Premenopausal" was removed from the indication and it was added to the criteria that the patient is premenopausal. The following criteria were added: 1) the patient's symptoms of HSDD/FSIAD have persisted for a minimum of 6 months; 2) the patient does not have a diagnosis of depression; 3) if the patient is currently taking an anti-depressant for a diagnosis other than depression, the prescriber has determined the medication is not contributing to HSDD/FSIAD; and 4) the situation of "problems in a relationship" were added as an example of the criteria that requires other known causes of HSDD/FSIAD have been ruled out. Hypoactive Sexual Desire Disorder (HSDD)/Female Sexual Interest/Arousal Disorder (FSIAD), Continuation Criteria: "Premenopausal" was removed from the indication and it was added to the criteria that the patient is premenopausal. The descriptor of "significant"	08/14/2019

	was added to the criteria that describes the increase in number of satisfying sexual events. The duration of approval for continuation therapy was changed from 12 months to 6 months. Conditions Not Recommended for Approval: The wording of the condition of "HSDD/FSIAD" in postmenopausal women was changed to just state "Postmenopausal Patients".	
Selected Revision	Removal of "The prescriber has evaluated and confirmed the patient's ability to abstain from alcohol use during treatment with Addyi" from initial therapy criteria. Removal of "The prescriber has confirmed that the patient continues to abstain from alcohol while on Addyi therapy" from continuation therapy criteria.	11/6/2019
Early Annual Revision	Hypoactive Sexual Desire Disorder (HSDD)/Female Sexual Interest/Arousal Disorder (FSIAD): • Removal of "if the patient is currently taking an antidepressant for a diagnosis other than depression, the prescriber has determined the medication is not contributing to HSDD/FSIAD." • Addition of "e.g., antidepressants" to other known causes of HSDD/FSIAD being ruled out by the prescriber. • Removal of criteria relating to pre-treatment number of satisfying sexual events. • Continuation of therapy criteria was updated to reporting a significant improvement in sexual desire and/or a decrease in sexual distress.	12/11/2019
Annual Revision	No criteria changes	12/16/2020

PRIOR AUTHORIZATION POLICY

POLICY: Hypoactive Sexual Desire Disorder – Vyleesi Prior Authorization Policy
- Vyleesi™ (bremelanotide subcutaneous injection – AMAG Pharmaceuticals, Inc.)

REVIEW DATE: 12/16/2020

OVERVIEW

Vyleesi is indicated for the **treatment of premenopausal women with acquired, generalized hypoactive sexual desire disorder (HSDD)** as characterized by low sexual desire that causes marked distress or interpersonal difficulty and is NOT due to: a co-existing medical or psychiatric condition, problems with the relationship, or effects of a medication or drug substance. Limitations of Use: Vyleesi is not indicated for the treatment of HSDD in postmenopausal women or in men. Vyleesi is not indicated to enhance sexual performance.[1] Acquired HSDD refers to HSDD that develops in a patient who previously had no problems with sexual desire. Generalized HSDD refers to HSDD that occurs regardless of the type of stimulation, situation, or partner.

In Vyleesi pivotal studies, patients were excluded if they were diagnosed with or being treated for depression, psychosis, bipolar disorder, or substance abuse within 6 months before screening.[2]

The prescribing information for Vyleesi notes that it should be discontinued after 8 weeks if the patient does not report an improvement in her symptoms.[1]

Guidelines

The American College of Obstetricians and Gynecologists (ACOG) guideline on Female Sexual Dysfunction (2019) notes the importance of recognizing if the loss of sexual interest is due to a co-morbid or undiagnosed condition, or medication.[3] Consultation with or referral to a mental health specialist with expertise and training in the treatment of female sexual dysfunction (e.g., sex therapists, psychologists, marriage/relationship counselors) should be considered based on the physician's level of expertise and the patient's individual needs. The guideline does not address Vyleesi, but note that Addyi (flibanserin tablet) was approved in 2015 by the FDA to treatment hypoactive sexual desire

disorder in premenopausal women without depression.[3] Addyi is noted as a treatment option for HSDD in premenopausal women without depression who are appropriately counseled about the risk of alcohol use during treatment.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Vyleesi. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Vyleesi is recommended in those who meet the following criteria:

FDA-Approved Indications

77. Hypoactive Sexual Desire Disorder (HSDD)/Female Sexual Interest/Arousal Disorder (FSIAD).

A) Initial Therapy. Approve for 8 weeks if the patient meets the following criteria (i, ii, iii, iv, and v):
- **i.** Patient is premenopausal; AND
- **ii.** Patient's symptoms of HSDD/FSIAD have persisted for a minimum of 6 months; AND
- **iii.** Patient has had normal sexual desire in the past, prior to the diagnosis of HSDD/FSIAD; AND
- **iv.** Patient has not been diagnosed or treated with depression within the previous 6 months; AND
- **v.** Other known causes of HSDD/FSIAD, such as co-existing medical or psychiatric conditions, problems within a relationship, effects of medications (e.g., antidepressants), or drug abuse have been ruled out by the prescriber.

B) Patient is Currently Receiving Vyleesi. Approve for 6 months if patient meets the following criteria (i and ii):
- **i.** Patient is premenopausal; AND
- **ii.** The prescriber confirms that since initiating Vyleesi therapy, the patient reports a significant improvement in sexual desire and/or a decrease in sexual distress.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Vyleesi is not recommended in the following situations:

93. Postmenopausal Patients. Pivotal trials for Vyleesi included only premenopausal women with acquired, generalized hypoactive sexual desire disorder.[1]

94. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Idiopathic Pulmonary Fibrosis and Related Lung Disease – Esbriet Prior Authorization Policy
- Esbriet® (pirfenidone capsules – Genentech)

REVIEW DATE: 10/21/2020

OVERVIEW
Esbriet, a pyridine, is indicated for the treatment of idiopathic pulmonary fibrosis (IPF).[1]

Disease Overview
IPF is a form of chronic interstitial lung pneumonia associated with histologic pattern of usual interstitial pneumonia (UIP).[8] The condition is specific for patients that have clinical features and the histologic pattern of IUP or a classical high-resolution computed tomography (HRCT) scan for IPF. In this lung condition there is cellular proliferation, interstitial inflammation, fibrosis, or the combination of these findings, within the alveolar wall that is not due to infection or cancer.[9] IPF is rather rare and the prevalence in the US ranges from 10 to 60 cases per 100,000. However, in one study, the prevalence was 494 cases per 100,000 in 2011 in adults > 65 years of age, which is higher than previous information. The disease mainly impacts older adults.[8] Symptoms include a progressive dry cough and exertional dyspnea. Patients experience a high disease burden with hospital admissions. The clinical course varies among patients but the mean survival after symptom onset is usually 3 to 5 years. The cause is unknown but environmental and occupational hazards may play a role, as well as a history of smoking. Medical therapy is only modestly effective and mainly shows the rate of disease progression. Agents FDA-approved for IPF are Ofev® (nintedanib capsules) and Esbriet. Lung transplantation is a therapeutic option.

Clinical Efficacy
The efficacy of Esbriet was assessed in patients with IPF in three Phase III, randomized, double-blind, placebo-controlled, multicenter, multinational trials (n = 1,247).[1-3] In ASCEND (Assessment of Pirfenidone to Confirm Efficacy and Safety in Idiopathic Pulmonary Fibrosis),[1,2] and CAPACITY 004 (Clinical Studies Assessing Pirfenidone in idiopathic pulmonary fibrosis: Research of Efficacy and Safety Outcomes)[1,3] patients were required to have a percent predicted forced vital capacity (%FVC) ≥ 50% at

baseline. Esbriet 2,403 mg/day led to a statistically significant treatment effect regarding the primary efficacy analysis for the change in the %FVC over the study duration of 52 weeks and 72 weeks, respectively. Also, a reduction in the mean decline in forced vital capacity (in mL) was observed in both studies for patients receiving Esbriet 2,403 mg/day compared with placebo.[1-3] Some information suggests that patients who have %FVC < 50% may also have some benefits from therapy.[10-13]

Guidelines

In 2015, the clinical practice guideline from the American Thoracic Society (ATS), European Respiratory Society (ERS), the Japanese Respiratory Society (JRS), and Latin American Thoracic Association (ALAT) on the treatment of idiopathic pulmonary fibrosis were updated.[4] Regarding Esbriet, the guideline suggests use of this medication (conditional recommendation, moderate confidence in estimates of effect). The guideline notes that the data with Esbriet cannot be generalized to patients with IPF who have more severe impairment of pulmonary function tests or for patients with other significant comorbidities.[4]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Esbriet. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Esbriet, initial approval requires Esbriet to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Esbriet is recommended in those who meet the following criteria:

FDA-Approved Indication

6. Idiopathic Pulmonary Fibrosis (IPF). Approve if the patient meets the following criteria (A, B, C, and D).
- **61.** Patient is ≥ 40 years of age; AND
- **62.** Forced vital capacity (FVC) is ≥ 40% of the predicted value; AND
- **63.** Diagnosis of IPF is confirmed by one of the following (i or ii):
  - **i.** Findings on high-resolution computed tomography (HRCT) indicates usual interstitial pneumonia (UIP); OR
  - **ii.** A surgical lung biopsy demonstrates usual interstitial pneumonia (UIP); AND
- **64.** Medication is prescribed by, or in consultation with, a pulmonologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Esbriet is not recommended in the following situations:

40. Esbriet is Being Used Concomitantly with Ofev® (nintedanib capsules). Ofev is another medication indicated for the treatment of IPF. The effectiveness and safety of concomitant use of Esbriet with Ofev have not been established. The 2015 ATS/ERS/JRS, ALAT clinical practice guideline regarding the treatment of idiopathic pulmonary fibrosis (an update of the 2011 clinical practice guidelines) do not recommend taking Ofev and Esbriet in combination.[4] A small exploratory study was done in which patients with IPF receiving Ofev added on Esbriet.[7] Further research is needed to determine the utility of this combination regimen.

41. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Annual Revision	No criteria changes.	12/12/2018
Early Annual Revision	The Policy header was changed to add the description "and Related Lung Disease" to the Idiopathic Pulmonary Fibrosis title. Also, the following criteria changes were made: **1. Idiopathic Pulmonary Fibrosis:** The forced vital capacity threshold was changed from ≥ 50% to ≥ 40%. Previously, only the baseline (before initiation of therapy) values were accepted but now the timing of the assessment is not specified.	10/02/2019
Annual Revision	No criteria changes.	10/21/2020

PRIOR AUTHORIZATION POLICY

POLICY: Idiopathic Pulmonary Fibrosis and Related Lung Disease – Ofev Prior Authorization Policy

- Ofev® (nintedanib capsules – Boehringer Ingelheim)

REVIEW DATE: 10/21/2020

OVERVIEW

Ofev, a kinase inhibitor, is indicated for the following uses:[1]

- Treatment of **chronic fibrosing interstitial lung disease** with a progressive phenotype.

- Treatment of **idiopathic pulmonary fibrosis** (IPF).
- Slowing the rate of decline in pulmonary function in patients with **systemic sclerosis-associated interstitial lung disease**.

Disease Overview
IPF is a form of chronic interstitial lung pneumonia associated with histologic pattern of usual interstitial pneumonia (UIP).[8] The condition is specific for patients that have clinical features and the histologic pattern of IUP or a classical high-resolution computed tomography (HRCT) scan for IPF. In this lung condition there is cellular proliferation, interstitial inflammation, fibrosis, or the combination of these findings, within the alveolar wall that is not due to infection or cancer.[9] IPF is rather rare and the prevalence in the US ranges from 10 to 60 cases per 100,000. However, in one study, the prevalence was 494 cases per 100,000 in 2011 in adults > 65 years of age, which is higher than previous information. The disease mainly impacts older adults.[8] Symptoms include a progressive dry cough and exertional dyspnea. Patients experience a high disease burden with hospital admissions. The clinical course varies among patients but the mean survival after symptom onset is usually 3 to 5 years. The cause is unknown but environmental and occupational hazards may play a role, as well as a history of smoking. Medical therapy is only modestly effective and mainly shows the rate of disease progression. Agents FDA-approved for IPF are Ofev and Esbriet® (pirfenidone capsules and film-coated tablets). Lung transplantation is a therapeutic option.

Interstitial lung disease is a common manifestation of systemic sclerosis and is a leading cause of death.[11-13] Among patients who have systemic sclerosis, up to one-half of patients may have interstitial lung disease.[17] The estimate prevalence and annual incidence of systemic sclerosis-associated interstitial lung disease is 1.7 to 4.2 and 0.1 to 0.4 per 100,000 individuals, respectively.[17] However, it is notable that systemic sclerosis is a connective disease that it not limited to the lungs but impacts the skin, blood vessels, heart, kidneys, gastrointestinal tract, and musculoskeletal system. The condition displays great heterogeneity and can be challenging to treat.[11] When the disease affects the internal organs, significant morbidity and mortality may result. Mycophenolate, cyclophosphamide, and azathioprine are immunosuppressants that are utilized in the treatment of interstitial lung disease associated with systemic sclerosis. Corticosteroids are also used. Ofev is the first medication specifically indicated for this use.[1]

Clinical Efficacy
The clinical efficacy of Ofev if patients with IPF was established in one Phase II study and two Phase III studies that were identical in design (n = 1,231).[1-3] The trials were randomized, double-blind, placebo-controlled studies comparing treatment with Ofev 150 mg BID with placebo for 52 weeks. In the two Phase III studies, patients were ≥ 40 years of age and had a forced vital capacity (FVC) ≥ 50% of the predicted value. The diagnosis was confirmed by HRCT and, if available, surgical lung biopsy specimens were assessed. For all three studies, a statistically significant reduction in the annual rate of decline of FVC was observed in patients receiving Ofev compared with patients receiving placebo. Also, data shows that the proportion of patients that demonstrated categorical declines in lung function was lower for patients given Ofev compared with placebo. Acute IPF exacerbations were also reduced.[1-3] Some information suggests that patients who have FVC < 50% of predicted may also have some benefits from therapy.[14-16]

The efficacy of Ofev was established in SENSCIS, a randomized, double-blind, placebo-controlled Phase III trial in patients ≥ 18 years of age with systemic sclerosis-related interstitial lung disease (n = 576).[1,12] Patients were randomized to Ofev or placebo for at least 52 weeks and up to 100 weeks. Patients had ≥ 10% fibrosis on a chest HRCT scan conducted within the previous 12 months and had an FVC ≥ 40% of predicted. The primary efficacy endpoint was the annual rate of decline in FVC over 52 weeks. The annual rate of decline of FVC over 52 weeks was significantly reduced by 41 mL in patients receiving Ofev vs. placebo (-52 mL for Ofev vs. -93 mL with placebo).

The efficacy of Ofev was assessed in patients ≥ 18 years of age with chronic fibrosis interstitial lung diseases with a progressive phenotype in a Phase III, double-blind, placebo-controlled trial (INBUILD) [n = 663].[1,18,19] Patients receiving Ofev 150 mg BID or placebo for at least 52 weeks and the main endpoint was the annual rate in decline in FVC over 52 weeks. Patients who had a clinical diagnosis of chronic fibrosing interstitial lung disease were involved in the trial if they had relevant fibrosis (greater than 10% fibrotic features) and had clinical signs of progression (e.g., FVC decline ≥ 10%, recent FVC decline ≥ 5% but < 10% with worsening symptoms or imaging, or worsening symptoms and worsening imaging). Patients were required to have an FVC ≥ 45% of predicted and a diffusing capacity of the lung for carbon monoxide of at least 30% and < 80% of predicted.

Guidelines

In 2015, the clinical practice guideline from the American Thoracic Society (ATS), European Respiratory Society (ERS), the Japanese Respiratory Society (JRS), and Latin American Thoracic Association (ALAT) on the treatment of IPF were updated.[4] Regarding Ofev, the guideline suggests use of this medication (conditional recommendation, moderate confidence in estimates of effect). The guideline notes that the data with Ofev focuses on patients with IPF who have mild to moderate impairment in pulmonary function tests. It is not known if the benefits would differ among patients with more severe impairment in pulmonary function testing or in patients who have other comorbidities.[4]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Ofev. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Ofev in many of the conditions, approval requires Ofev to be prescribed by or in consultation with a physician who specializes in the condition being treated in several indications.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Ofev is recommended in those who meet the following criteria:

FDA-Approved Indications

7. **Chronic Fibrosing Interstitial Lung Disease.** Approve for 3 years if the patient meets the following criteria (A, B, C and D):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Forced vital capacity is ≥ 45% of the predicted value; AND
   - **C)** According to the prescriber the patient has fibrosing lung disease impacting more than 10% of lung volume on high-resolution computed tomography; AND
   - **D)** According to the prescriber the patient has clinical signs of progression.

   Note: Examples of clinical signs of progression include a forced vital capacity decline ≥ 10% of the predicted value or forced vital capacity decline ≥ 5% to < 10% with worsening symptoms and/or worsening imaging.

   Note: Examples of conditions include hypersensitivity pneumonitis; idiopathic non-specific interstitial pneumonitis; idiopathic non-specific interstitial pneumonia; unclassifiable idiopathic interstitial pneumonia; autoimmune interstitial lung disease [e.g., rheumatoid arthritis interstitial lung disease]; exposure-related interstitial lung disease; and mixed connective tissue disease interstitial lung disease.

8. **Idiopathic Pulmonary Fibrosis**. Approve for 3 years if the patient meets the following criteria (A, B, C, and D).
   - **65.** Patient is ≥ 40 years of age; AND
   - **66.** Forced vital capacity (FVC) is ≥ 40% of the predicted value; AND
   - **67.** The diagnosis is confirmed by one of the following (i or ii):
     - **i.** Findings on high-resolution computed tomography indicates usual interstitial pneumonia (UIP); OR
     - **ii.** A surgical lung biopsy demonstrates usual interstitial pneumonia; AND
   - **68.** Medication is prescribed by or in consultation with a pulmonologist.

9. **Interstitial Lung Disease Associated with Systemic Sclerosis.** Approve for 3 years if the patient meets the following criteria (A, B, C, and D).
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Forced vital capacity (FVC) is ≥ 40% of the predicted value; AND
   - **C)** Diagnosis is confirmed by high-resolution computed tomography.
   - **D)** Medication is prescribed by or in consultation with a pulmonologist or a rheumatologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Ofev is not recommended in the following situations:

42. **Ofev is Being Used Concomitantly with Esbriet® (pirfenidone capsules)**. Esbriet is another medication indicated for IPF.[6] The effectiveness and safety of concomitant use of Ofev with Esbriet have not been established. The 2015 ATS/ERS/JRS, ALAT clinical practice guideline regarding the treatment of idiopathic pulmonary fibrosis (an update of the 2011 clinical practice guidelines) do not recommend taking Ofev and Esbriet in combination.[4] A small exploratory study was done in which patients with IPF receiving Ofev added-on Esbriet.[7] Further research is needed to determine the utility of this combination regimen. Ofev and Esbriet have not been used concomitantly in the management of systemic sclerosis-associated interstitial lung disease.

43. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Date Reviewed
Annual Revision	No criteria changes	12/12/2018
Early Annual Revision	The Policy header was changed to add the description "and Related Lung Disease" to the Idiopathic Pulmonary Fibrosis title. Also, the following criteria changes were made: **1. Idiopathic Pulmonary Fibrosis:** The forced vital capacity threshold was changed from ≥ 50% to ≥ 40%. Previously, only the baseline (before initiation of therapy) values were accepted but now the timing of the assessment is not specified. **2. Interstitial Lung Disease Associated with Systemic Sclerosis:** New criteria were developed based on this new Food and Drug Administration-approved use.	10/02/2019
Selected Revision	Criteria were changed as follows: **1. Chronic Fibrosing Interstitial Lung Disease:** Criteria were added to address the new indication of use. Criteria are to approve for 3 years of the patient meets all of the following: 1) The patient is ≥ 18 years of age; and 2); the forced vital capacity is ≥ 45% of the predicted value; and 3) according to the prescriber the patient has fibrosing lung disease impacting more than 10% of lung volume on high-resolution computed tomography; and 4) according to the prescriber the patient has clinical signs of progression. Notes were added that detailed clinical signs of progression and examples of conditions.	03/25/2020
Annual Revision	No criteria changes.	10/21/2020

PRIOR AUTHORIZATION POLICY

POLICY: Immune Globulin – Atgam Prior Authorization Policy

- Atgam® (lymphocyte immune globulin, anti-thymocyte globulin [equine] solution for intravenous use – Pfizer)

REVIEW DATE: 12/02/2020

OVERVIEW

Atgam, an immune globulin, is indicated for the following uses:

- **Allograft rejection**: for the management of allograft rejection in renal transplant patients. When administered with conventional therapy at the time of rejection Atgam increases the frequency of resolution of the acute rejection episode.
- **Aplastic anemia**: for the treatment of moderate to severe aplastic anemia in patients unsuitable for bone marrow transplantation. The usefulness of Atgam has not been demonstrated in patients with aplastic anemia who are suitable candidates for bone marrow transplantation or in patients with aplastic anemia secondary to neoplastic disease, storage disease, myelofibrosis, Fanconi's syndrome, or in patients known to have been exposed to myelotoxic agents or radiation.[1]

Guidelines

The use of Atgam is supported in clinical guidelines in a number of situations:[2-9]

- **Acute cellular rejection**: The Kidney Disease Improving Global Outcomes (KDIGO) Clinical Practice Guideline for the Care of Kidney Transplant Recipients (2009), recommend anti-thymocyte globulin (ATG) as a treatment option for induction therapy, given prior to, at the time of, or immediately after transplant.[2] The KDIGO guidelines recommend ATG for the treatment of acute cellular rejection unresponsive to corticosteroids, recurrent acute cellular rejection, and for acute antibody-mediated rejection.
- **Aplastic anemia**: The British Society of Haematology guidelines for the diagnosis and management of aplastic anemia recommends immunosuppressive therapy with Atgam (equine

ATG) plus cyclosporine for the first-line treatment of non-severe aplastic anemia patients requiring treatment, severe or very severe aplastic anemia patients who lack a matched sibling donor, and severe or very severe aplastic anemia patients aged > 35 – 50 years of age.[3,4] A second course of Atgam is recommended following a relapse after the first course of therapy, or after failure to respond to the first course if the patient is ineligible for a matched unrelated donor hematopoietic stem cell transplant. In addition, Atgam is included in conditioning regimens for bone marrow transplantation.[5]

- The National Comprehensive Cancer Network (NCCN) guidelines:[6-9]
  - **Graft-vs-host disease**: The NCCN Hematopoietic Cell Transplantation Clinical Practice Guidelines (Version 2.2020 – March 23, 2020) recommend ATG as additional therapy in conjunction with corticosteroids for the management of acute steroid-refractory disease.[9]
  - **Immunotherapy-related cardiovascular toxicity**: The NCCN Guidelines for the Management of Immunotherapy-Related Toxicities (Version 1.2020 – December 16, 2019), recommend Atgam as additional treatment for severe or life-threatening myocarditis, pericarditis, arrhythmias, or impaired ventricular function, or conduction abnormalities if no improvement within 24 hours of starting pulse-dose methylprednisolone.[6,7]
  - **Myelodysplastic syndrome**: The NCCN Clinical Practice Guidelines (Version 1.2021 – September 11, 2020) recommend Atgam as a treatment option for the management of lower risk disease.[7,8] Treatment with Atgam alone or in combination with cyclosporine is recommended for select patients with clinically relevant thrombocytopenia, neutropenia, or increased marrow blasts; or for select patients with symptomatic anemia.

Other Uses With Supportive Evidence

One case report has been published which summarized the use of equine ATG for the treatment of a patient with fulminant myocarditis secondary to Opdivo® (nivolumab injection for intravenous use) therapy.[10] Equine ATG was administered according to the local protocol for acute cellular rejection and consisted of 500 mg on Day 1 and the dose was titrated by 250 mg daily to maintain a CD2/3 level of 50 – 100/µL for a total of 5 days of treatment. Resolution of ventricular arrhythmias occurred within 3 days of beginning ATG and cardiac enzymes normalized by Day 5. Cardiac biopsy 10 days after beginning ATG treatment revealed histologic improvement with significantly less myocyte necrosis.

Atgam has been utilized as a component of induction therapy for heart and lung transplantation.[11-15] In a retrospective review of 163 consecutive patients undergoing lung transplantation, 65 patients received Atgam and 98 received daclizumab as a component of induction therapy.[11] At two years after transplantation, more patients treated with Atgam had acute rejection (28% vs. 9%, respectively) and bronchiolitis obliterans (23% vs. 6.4%). In another retrospective analysis of lung transplantation in pediatric patients (n = 330), approximately half of the patients received induction therapy and 30% of these patients received horse or rabbit ATG.[12] Overall survival in the patients who received induction therapy was numerically, but not significantly longer than the patients who did not receive induction therapy (77.4 months vs. 50.8 months, respectively). Finally, an article reviewing immunosuppression in lung transplantation states that approximately 20% of the centers that utilize induction therapy use ATG (horse or rabbit).[13] In a clinical trial, patients undergoing heart transplantation were randomized to Atgam (n = 15) or daclizumab (n = 15) as a component of induction therapy.[14] There were no differences in rejection, infection, or malignancy between groups. In addition, 1 year survival was similar between groups (87% in both groups). In a prospective trial, the safety and efficacy of Atgam (n = 21) was compared with OKT3 (n = 20) in patients undergoing heart transplantation.[15] Survival at 12 months, time to first rejection episode, and rejection rate was similar between the two groups. However, viral infections (1.6 vs. 0.8) and adverse events were significantly more common with OKT3 compared with Atgam.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Atgam. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Atgam as well as the monitoring required for adverse events and long-term efficacy, approval requires Atgam to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Atgam is recommended in those who meet the following criteria:

FDA-Approved Indications

78. Allograft Rejection in Solid Organ Transplant. Approve for 1 month if the patient meets the following criteria (A and B):
- **A)** Patient meets one of the following (i or ii):
  - **i.** Atgam is used for induction therapy, prior to, at the time of, or immediately following transplantation; OR
  - **ii.** Atgam is used for the treatment of acute rejection; AND
- **B)** The medication is prescribed by or in consultation with a transplant specialist physician or a physician associated with a transplant center.

79. Aplastic Anemia. Approve for 1 month if the patient meets the following criteria (A, B, and C):
- **A)** Patient has moderate to severe disease; AND
- **B)** Patient is unsuitable for bone marrow transplantation; AND
- **C)** The medication is prescribed by or in consultation with a hematologist or a physician who specializes in the treatment of aplastic anemia.

Other Uses with Supportive Evidence

80. Allogeneic Hematopoietic Stem Cell Transplantation. Approve for 1 month if the patient meets the following criteria (A and B):
- **A)** Atgam is used as part of a conditioning regimen beginning prior to allogeneic hematopoietic stem cell transplantation; AND
- **B)** The medication is prescribed by or consultation with an oncologist or a physician who specializes in allogeneic hematopoietic stem cell transplantation.

81. Graft-Versus-Host Disease. Approve for 1 month if the patient meets the following criteria (A, B, and C):
- **A)** Patient has acute disease; AND
- **B)** Patient's disease is refractory to or resistant to corticosteroid therapy; AND
- **C)** The medication is prescribed by or consultation with an oncologist or a physician who specializes in allogeneic hematopoietic stem cell transplantation.

82. Immune Checkpoint Inhibitor-Related Toxicities. Approve for 1 month if the patient meets the following criteria (A, B, C, and D):
- **A)** Patient has received at least one immune checkpoint inhibitor; AND
  Note: Immune checkpoint inhibitors include Opdivo® (nivolumab injection for intravenous use), Keytruda® (pembrolizumab injection for intravenous use), Tecentriq® (atezolizumab injection for intravenous use), Bavencio® (avelumab injection for intravenous use), Imfinzi® (durvalumab injection for intravenous use), Yervoy® (ipilimumab injection for intravenous use).
- **B)** Patient has life-threatening myocarditis, pericarditis, arrhythmias, or impaired ventricular function according to the prescriber; AND

C) Patient has not improved within 24 hours of starting pulse-dose methylprednisolone; AND
D) The medication is prescribed by or consultation with a cardiologist, oncologist or a physician who specializes in the treatment of immune checkpoint inhibitor-related toxicity.

83. Myelodysplastic Syndrome. Approve for 1 month if the patient meets the following criteria (A, B, and C):
A) Patient has lower risk disease; AND
Note: Lower risk disease is defined as International Prognostic Scoring System (IPSS) risk of low or intermediate-1; IPSS-Revised (IPSS-R) risk of very low, low, or intermediate; World Health Organization Prognostic Scoring System (WPSS) risk of very low, low, or intermediate.
B) Patient has one of the following according to the prescriber (i, ii, iii, or iv):
i. Clinically relevant thrombocytopenia; OR
ii. Clinically relevant neutropenia; OR
iii. Increased marrow blasts; OR
iv. Symptomatic anemia: and
C) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Atgam is not recommended in the following situations:

95. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Immune Globulin – Cytogam Prior Authorization Policy

- Cytogam® (human cytomegalovirus immune globulin intravenous liquid – Saol Therapeutics)

REVIEW DATE: 12/02/2020

OVERVIEW

Cytogam, a human cytomegalovirus (CMV) immune globulin intravenous (IGIV), is indicated for the **prophylaxis of CMV disease** associated with transplantation of kidney, lung, liver, pancreas and heart.[1]

Other Uses With Supportive Evidence

Maternal transmission of CMV to the fetus may occur at any gestation, leading to congenital CMV.[2] A study of 304 pregnant women with a primary CMV infection were offered CMV IGIV. In the therapy group, 157 women were treated with CMV IGIV low dose (100 mg/kg/infusion given once every month) or high dose (200 mg/kg/infusion given once every 2 weeks for up to 3 doses if needed). The trial demonstrated that 56% of patients without CMV IGIV vs. 30% of patients receiving CMV IGIV lead to congenital CMV infection.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Cytogam. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Cytogam as well as the monitoring required for adverse events and long-term efficacy, approval requires Cytogam to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Cytogam is recommended in those who meet the following criteria:

FDA-Approved Indications

84. Prophylaxis of Cytomegalovirus Associated with Solid Organ Transplant. Approve for 4 months if the medication is prescribed by or in consultation with a physician affiliated with a transplant center, hematologist, or an infectious disease physician.

Other Uses with Supportive Evidence

85. Cytomegalovirus Associated with Pregnancy. Approve for 6 months if the medication is prescribed by or in consultation with an infectious disease physician or an obstetrician-gynecologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Cytogam is not recommended in the following situations:

96. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REVIEW DATE: 08/19/2020; Selected revision 9/2/2020

OVERVIEW

Immune globulin intravenous (IVIG) products are of concentrated human immunoglobulins, primarily immunoglobulin G (IgG).

All of the US licensed products (except Octagam 10%) are FDA-approved for replacement therapy in patients with primary immune deficiencies due to defects in humoral immunity. The following indications are FDA-approved:

- **B-cell chronic lymphocytic leukemia (CLL)**, for prevention of bacterial infections in patients with hypogammaglobulinemia and/or recurrent bacterial infections.[6,18,21]
- **Chronic inflammatory demyelinating polyneuropathy (CIDP),** to improve neuromuscular disability and impairment and for maintenance therapy to prevent relapse.[7,9,12]

- **Idiopathic (immune) thrombocytopenic purpura (ITP)**, acute and chronic, when a rapid rise in platelet count is needed to prevent and/or control bleeding or to allow a patient with ITP to undergo surgery.[2,4,6-9,11,12,15,23-25]
- **Kawasaki disease** in pediatric patients for the prevention of coronary artery aneurysm.[6,26]
- **Multifocal motor neuropathy (MMN)** in adults as maintenance therapy to improve muscle strength and disability.[5]
- **Primary humoral immune deficiency (PID)**, for replacement therapy, including but not limited to the humoral immune defect in the following conditions: common variable immunodeficiency (CVID), X-linked agammaglobulinemia (XLA) [congenital agammaglobulinemia], Wiskott-Aldrich Syndrome, and severe combined immunodeficiencies (SCID).[1-10,12,15,16,25] Gammagard Liquid 10%, Gammaked, and Gamunex-C may be administered via intravenous (IV) or subcutaneous (SC) infusion for primary immunodeficiency.[5,7,9] IVIG is also indicated for measles prophylaxis in individuals with PID who have been exposed to measles or who are at high risk of measles exposure.[3,4,7-10,12,13,17,25,45]

IVIG are prepared from pooled plasma collected from a large number of human donors.[1-12,15,16,25] The donors in a typical pool of plasma have a wide range of antibodies against infectious agents. These products have IgG subclasses similar to that found in normal humans. Asceniv contains not only antibodies which satisfy the requirement to treat patients with primary immunodeficiencies (PID), it also has elevated levels of respiratory syncytial virus (RSV) antibodies.[19]

IVIG also is used for many off-label indications. Much of the evidence for clinical effectiveness of IVIG is anecdotal (i.e., case reports, open series, or cohort studies). Some conditions have been studied in controlled trials. Usually IVIG is indicated only if standard approaches have failed, become intolerable, or are contraindicated.

- **Antibody-mediated rejection (AMBR) in transplantation**. Current strategies for treatment of antibody-mediated rejection include plasmapheresis, intravenous immunoglobulin, and T-cell or B-cell-depleting agents.[76] Although there are no controlled trials regarding the most appropriate treatments, the benefits of immune globulin have been well described and has been used as the standard-of-care (along with plasmapheresis) in multiple studies.[18,77] Clinical practice guidelines (2009 Kidney Disease: Improving Global Outcomes) recommends a combination of corticosteroids, plasmapheresis, IVIG, and anti-CD-20 antibody and lymphocyte-depleting antibody for antibody-mediated rejection.[77,78] As in desensitization therapy, much of the information of IVIG use is in patients with kidney transplants, but the same principles apply to transplantation of other organs and tissues. Immune globulin has been used in lung transplant patients to treat ABMR[20,79,80], and a scientific statement from the American Heart Association states that primary therapy for ABMR in patients with heart transplants may include IVIG, plasmapheresis, high-dose corticosteroids, and anti-lymphocyte antibodies.[36]
- **Autoimmune mucocutaneous blistering diseases (pemphigus vulgaris, pemphigus foliaceus, bullous pemphigoid, mucous membrane pemphigoid [cicatricial pemphigoid], and epidermolysis bullosa acquisita.** Conventional therapy (a systemic corticosteroid and an immunosuppressive agent) is started at the same time or before IVIG. Many case reports and uncontrolled case series suggest benefit of IVIG in patients with recalcitrant disease or in those with contraindications to conventional therapy.[28-30]
- **Cytomegalovirus (CMV) pneumonia in patients with cancer or transplant-related infection.** For CMV pneumonia, therapy consists of ganciclovir IV injection (or foscarnet IV injection if CMV is ganciclovir-resistant) and IVIG in combination. The National Comprehensive Cancer Network (NCCN) guidelines on prevention and treatment of cancer-related infections (version 2.2020 – June 5, 2020) note IVIG may be added to ganciclovir or foscarnet for treatment of CMV pneumonia.[31]
- **Dermatomyositis or polymyositis**. IVIG may be used in patients with dermatomyositis with severe active illness for whom other interventions have been unsuccessful or intolerable.[32,33] IVIG

may be considered amongst the treatment options for patients with polymyositis not responding to first line immunosuppressive treatment.[32] In uncontrolled series, IVIG has been effective in polymyositis.

- **Desensitization Therapy Prior to and Immediately after Transplantation**. Patients with preexisting anti-human leukocyte antigen (HLA) antibodies (sensitized patients) are more likely to have a positive cross match with possible donors and have a lower likelihood of receiving a transplant with longer wait times. Most of the information on use of IVIG for desensitization is in patients with kidney transplantation but many of the same principles apply to transplantation of other organs and tissues.[34,35] Current protocols include using low-dose IVIG with plasma exchange or high-dose IVIG with or without B-cell depletions with Rituxan® (rituximab injection for IV infusion).[18]
- **Guillain Barre Syndrome (GBS).** The American Academy of Neurology recommends IVIG in patients who require aid to walk within 2 or 4 weeks from the onset of neuropathic symptoms.[37] The effect of IVIG in GBS has only been investigated in randomized controlled trials in patients who are unable to walk at nadir (i.e., severely affected patients), not in mildly affected patients who are able to walk unaided at nadir.[38] IVIG is not indicated or proven to be effective in mildly affected GBS patients.[32,38]
- **Hematologic neoplasm-associated hypogammaglobulinemia or hypogammaglobulinemia after B-cell targeted therapies (secondary immunodeficiency [SID])**. Clinical guidelines for immunoglobulin use by the National Health Service- England note secondary antibody deficiency can be hypogammaglobinemia associated with therapeutic monoclonals targeted at B-cells and plasma cells, non-Hodgkin's lymphoma, CLL, multiple myeloma, or other relevant B-cell malignancies.[27]
- **Hematopoietic cell transplantation (HCT) to prevent infections**. HCT is defined as transplantation of any blood- or marrow-derived hematopoietic stem cells, regardless of transplant type (i.e., allogeneic or autologous) or cell source (i.e., bone marrow, peripheral blood, or umbilical cord blood). With regard to IVIG, guidelines recommend the following for prevention or preemptive treatment of specific infections in HCT recipients.[39] In adult or adolescent HCT recipients (allogeneic or autologous), IVIG is indicated to prevent bacterial infections in those with severe hypogammaglobulinemia (i.e., serum IgG < 400 mg/dL) during the first 100 days after HCT. In pediatric patients, IVIG is indicated in those with an allogeneic HCT if hypogammaglobulinemia is severe during the first 100 days after HCT. For prevention of bacterial infections beyond 100 days post-HCT (allogeneic or autologous), IVIG is recommended in recipients with severe hypogammaglobulinemia (i.e., serum IgG < 400 mg/dL).
- **Human Immunodeficiency Virus (HIV)-associated thrombocytopenia**. Secondary ITP can occur in patients with HIV infection.[23,24] Effective viral suppression using antiretroviral therapy improves HIV-associated cytopenias, including thrombocytopenia. Treatment of secondary ITP (HIV-associated) with short-term corticosteroid therapy increases the platelet count in a similar manner as in non-HIV infected persons and does not appear to be associated with adverse effects. The American Society of Hematology guidelines for immune thrombocytopenia recommend initial treatment with corticosteroids, IVIG, or Rh0(D) immune globulin for patients with secondary ITP due to HIV.[23,24]
- **Human Immunodeficiency Virus (HIV)-infected infants and children to prevent recurrent bacterial infections**. IVIG is no longer recommended for primary prevention of serious bacterial infections in HIV-infected children unless hypogammaglobulinemia is present or functional antibody deficiency is demonstrated by recurrent bacterial infections.[40] In children with greater than two serious bacterial infections in a 1-year period and who cannot tolerate cART, secondary

prophylaxis is indicated. The first choice of therapy for secondary prophylaxis is trimethoprim-sulfamethoxazole and IVIG every 2 to 4 weeks is an alternative. Clinicians providing care for adolescents are advised to use the US Department of Health and Human Services Adult and Adolescent HIV-guideline for the care of post-pubertal adolescents (sexual maturity rating [SMR] IV and V) and to use the pediatric guideline for guidance on the care of adolescents at SMR III or lower.[40]

- **Immunotherapy-related toxicities associated with checkpoint inhibitor therapy**. NCCN guidelines for the management of immunotherapy-related toxicities (version 1.2020 – December 16, 2020) recommend IVIG for the management of severe pneumonitis after 48 hours of methylprednisolone therapy; as treatment for severe myasthenia gravis; encephalitis; cardiovascular adverse events; inflammatory arthritis; musculoskeletal adverse events; moderate or severe Guillian-Barre Syndrome; severe transverse myelitis; bullous dermatitis; Stevens-Johnson syndrome/toxic epidermal necrolysis.[74] The American Society of Clinical Oncology also has practice guidelines on the management of immune-related adverse events in patients treated with checkpoint inhibitor therapy.[75] These practice guidelines address the above mentioned indications along with other diagnoses (e.g., severe cutaneous skin adverse reactions, myositis, autoimmune hemolytic anemia, immune thrombocytopenia).
- **Lambert-Eaton Myasthenic Syndrome (LEMS)**. LEMS is a rare presynaptic autoimmune disorder of neuromuscular transmission that is characterized by proximal muscle weakness, depressed tendon reflexes, and autonomic dysfunction.[18] Limited but moderate- to high-quality evidence from randomized controlled trials have shown that 3,4-diaminopyridine or IVIG was associated with improved muscle strength score and compounded muscle action potential amplitudes. IVIG may be used as an alternative in patients who do not respond or do not tolerate other therapies.[18]
- **Multiple myeloma**. Patients with multiple myeloma are often functionally hypogammaglobulinemic with total immunoglobulin production being elevated, but the repertoire of antibody production restricted.[31] The NCCN guidelines on multiple myeloma (version 4.2020 – May 8, 2020) recommend that IVIG should be considered in the setting of recurrent, life-threatening infections.[42]
- **Multiple sclerosis (MS), acute severe exacerbation or relapses**. Medication options for relapse management include high dose corticosteroids, intramuscular adrenocorticotrophic hormone, plasmapheresis, and IVIG. IVIG is sometimes used to treat relapses that do not respond to corticosteroids.[43] During pregnancy, relapses severe enough to require treatment can be safely managed with a short-term course of corticosteroids after the first trimester. Methylprednisolone is the preferable agent because it is metabolized before crossing the placenta.[43]
- **Multiple sclerosis (MS), post-partum to prevent relapses**. None of the disease modifying therapy for multiple sclerosis have been approved for use in women who are nursing. IVIG is the treatment of choice for post-partum mothers with MS who are nursing.[44]
- **Myasthenia Gravis**. Recommendations from an international consensus guidance statement for management of adult or juvenile myasthenia gravis include the use of IVIG in some patients.[65] Symptomatic and immunosuppressive treatment of myasthenia gravis includes pyridostigmine as initial therapy in most patients. Corticosteroids or immunosuppressive therapies are used in all patients with myasthenia gravis who have not met treatment goals after an adequate trial of pyridostigmine. A nonsteroidal immunosuppressive agent (e.g., azathioprine, cyclosporine, mycophenolate mofetil, methotrexate, tacrolimus) should be used alone when corticosteroids are contraindicated or refused. In patients with refractory myasthenia gravis, chronic IVIG and chronic plasma exchange (PLEX), cyclophosphamide, or Rituxan may be used. PLEX and IVIG are

recommended as short-term treatments in patients with myasthenia gravis with life-threatening effects such as respiratory insufficiency or dysphagia; to prepare for surgery in patients with significant bulbar dysfunction; when rapid response is needed; when other treatments are not adequate; and before starting corticosteroids if necessary to prevent or minimize exacerbations. IVIG can be considered as maintenance therapy in patients with refractory myasthenia gravis or in patients with relative contraindications to immunosuppressive agents. Refractory myasthenia gravis is defined as the post intervention status is unchanged or worse after corticosteroids and at least two other immunosuppressive agents used in adequate doses for an adequate duration, with persistent symptoms or side effects that limit functioning as defined by the patient or physician.

- **Passive immunization for measles (post-exposure prophylaxis)**. When administered within 6 days of exposure, immune globulin (IG) can prevent or modify measles in patients who are nonimmune.[13] IG therapy is not indicated in persons who have received one dose of measles-containing vaccine at ≥ 12 months, unless they are severely immunocompromised. The Advisory Committee on Immunization Practices (ACIP) recommends the use of IG therapy for post-exposure prophylaxis of measles in the following patients who are at risk for severe disease and complication from measles: infants < 12 months of age; pregnant women without evidence of measles immunity; and severely immunocompromised persons.[13] For infants aged < 12 months intramuscular IG is used; infants aged 6 through 11 months can receive MMR vaccine instead of IG if given within 72 hours of exposure. IVIG is used for pregnant women and severely immunocompromised patients.
- **Passive immunization for Varicella (chickenpox) [post-exposure prophylaxis]**. HIV-infected children without a history of previous chickenpox or children who have not received two doses of varicella vaccine should receive VariZIG or, if not available, IVIG within 10 days (ideally within 4 days) after close contact with a person who has chickenpox or shingles.[41,46] VariZIG is indicated for post-exposure prophylaxis in certain patients without immunity to varicella and is given as soon as possible after exposure, preferably within 4 days, and as late as 10 days after exposure.[47] Whether to administer VariZIG depends on three factors: 1) whether the patient lacks evidence of immunity to varicella; 2) whether the exposure is likely to result in infection; and 3) whether the patient is at greater risk for varicella complications than the general population.[48] For pregnant women who cannot receive VariZIG, clinicians can choose either IVIG or closely monitor the women for signs or symptoms of varicella and institute acyclovir therapy if illness occurs.[46]
- **Pure red blood cell aplasia (PRCA) secondary to chronic (persistent) parvovirus B19 infection and immunologic subtype**. In immunosuppressed patients lacking neutralizing antibodies, IVIG has been useful for the treatment of persistent B19 infection.[49] IVIG has been used to treat severe anemia secondary to chronic B19 infection in the context of solid-organ transplantation, HIV infection, or primary antibody deficiency.[49] A Canadian expert panel of hematologists recommend prednisone followed by cyclophosphamide or cyclosporine as first-line therapy for immunologic type PRCA.[22] It considers IVIG a reasonable second-line option.
- **Stiff-Person Syndrome (Moersch-Woltman Syndrome)**. Per the European Federation of Neurological Societies, IVIG should be reserved for patients who have no symptomatic relief after the use of diazepam and/or baclofen and have severe disability in carrying out daily activities.[32]
- **Thrombocytopenia, feto-neonatal alloimmune**. Antenatal therapy with IVIG administered to the mother is effective in increasing fetal platelet counts in neonatal alloimmune thrombocytopenia.[50,51] First-line therapy for newborns with fetal/neonatal alloimmune thrombocytopenia is antigen-negative compatible platelets; IVIG is adjunctive.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of IVIG products. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with IVIG as well as the monitoring required for adverse events and long term efficacy, initial approval requires IVIG products to be prescribed by or in consultation with a physician who specialized in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of immune globulin intravenous products is recommended in those who meet the following criteria:

FDA-Approved Indications

86. Primary Immunodeficiencies (PID). Approve for the duration noted if the patient meets ONE of the following criteria (A or B):

A) Initial Therapy. Approve for 1 year if the patient meets BOTH of the following criteria (i and ii):

i. The patient meets ONE of the following (a, b, or c):

Note: An exception can be made for the impaired antibody response if, according to the prescriber, the delay caused by pre-vaccination and post-vaccination antibody measurement would be deleterious to the patient's health.

a) The patient has a diagnosis of congenital agammaglobulinemia, X-linked agammaglobulinemia, other agammaglobulinemia due to the absence of B-cells, Wiskott-Aldrich syndrome, ataxia telangiectasia, DiGeorge syndrome, severe combined immunodeficiency (SCID), Hyper-Immunoglobulin M (IgM) syndromes, an IgG level lower than 250 mg/dL, or a primary immune deficiency which has been confirmed by genetic or molecular testing; OR

b) The patient has a diagnosis of common variable immunodeficiency (CVID), unspecified hypogammaglobulinemia, or other immunodeficiencies with significant hypogammaglobulinemia and meets the following (1 and either 2 or 3):

(1) The patient's pretreatment IgG level is below the normal range (age-adjusted and according to the normal reference range for the reporting laboratory); AND

(2) The patient has an impaired antibody response (i.e., failure to product antibodies to specific antigens); OR

(3) The patient has recurrent infections; OR

c) The patient has an IgG subclass deficiency, selective antibody deficiency (SAD), or another confirmed primary immunodeficiency and meets the following criteria (1 and 2):

(1) The patient has an impaired antibody response (i.e., failure to product antibodies to specific antigens); AND

(2) The patient has recurrent infections; AND

ii. The medication is prescribed by or in consultation with an allergist/immunologist, immunologist, otolaryngologist (ear nose and throat [ENT] physician), pulmonologist, or an infectious diseases physician who treats patients with primary immune deficiencies.

B) Patient is Currently Receiving Immune Globulin. Approve for 1 year if the patient has been diagnosed with a primary immunodeficiency and is continuing to receive benefit from the product, according to the prescriber.

Note: Examples of continued benefit with the product includes increased IgG levels or prevention and/or controlling of infections.

87. B-Cell Chronic Lymphocytic Leukemia for Prevention of Bacterial Infections. Approve for the duration noted if the patient meets ONE of the following criteria (A or B):

A) Initial Therapy. Approve for 4 months if the patient meets the following criteria (i or ii, and iii):

i. The patient has an immunoglobulin G (IgG) level < 500 mg/dL (5.0 g/L); OR
ii. The patient has a history of recurrent bacterial infections; AND
iii. The medication is prescribed by or in consultation with an oncologist, hematologist, or infectious diseases physician.

B) Patient is Currently Receiving Immune Globulin. Approve for 1 year if the patient is has a positive response to therapy according to the prescriber.
Note: Examples of a positive response to therapy include maintaining an increased IgG trough level or a decrease in the number of infections.

88. Chronic Inflammatory Demyelinating Polyneuropathy or Polyradiculoneuropathy (CIDP). Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets the following criteria (i and ii)
i. Electrodiagnostic studies support the diagnosis of CIDP; AND
ii. The medication is prescribed by or in consultation with a neurologist.

B) Patient is Currently Receiving Immune Globulin. Approve for 1 year of therapy if the patient has a clinically significant improvement in neurologic symptoms, as determined by the prescriber.
Note: Examples of improvement in neurologic symptoms include improvement in disability; nerve conduction study results improved or stabilized; physical examination show improvement in neurological symptoms, strength, and sensation. The patient may not have a full response after the initial 3 months, but there should be some response.

89. Immune Thrombocytopenia (ITP). Approve for the duration noted if the patient meets ONE of the following (A, B, C, D, or E):

Note: The diagnosis of Immune Thrombocytopenia (ITP) encompasses previous nomenclature, such as Idiopathic Thrombocytopenia, Idiopathic Thrombocytopenic Purpura, Immune Thrombocytopenic Purpura.

A) Initial Therapy – Adult ≥ 18 Years of Age. Approve for 1 year if the patient meets the following criteria (i and ii):
i. The patient meets one of the following (a, b, or c):
a) The patient has tried a systemic corticosteroid (e.g., prednisone); OR
b) There is an urgent need to increase the platelet count quickly; OR
c) A systemic corticosteroid is contraindicated according to the prescriber; AND
ii. The medication is prescribed by or in consultation with a hematologist.

B) Initial Therapy – Patient is < 18 Years of Age. Approve for 1 year if prescribed by or in consultation with a hematologist.

C) Initial Therapy – To Increase Platelet Count Before Surgical or Dental Procedures: Approve for 1 month if prescribed by or in consultation with a hematologist.

D) Initial Therapy – Pregnant Patient. Approve for 6 months if prescribed by or in consultation with a hematologist.

E) Patient is Currently Receiving Immune Globulin. Approve for 1 year if the patient has responded to therapy according to the prescriber.
Note: Examples of responding to therapy include increased platelet counts, absence of significant bleeding, or preventing hemorrhage/ensuring an adequate platelet count in order for delivery in pregnant patients.

90. Kawasaki Disease. Approve for 3 months if prescribed by or in consultation with a pediatric cardiologist or a pediatric infectious diseases physician.

91. Multifocal Motor Neuropathy (Treatment). Approve the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 6 months if prescribed by or in consultation with a neurologist.

B) Patient is Currently Receiving Immune Globulin. Approve for 1 year if the patient has improvement in neurologic symptoms as determined by the prescriber.
Note: Examples of improvement in neurologic symptoms include improvement in disability; grip strength improvement (measured with dynamometer); physical examination show improvement in neurological symptoms and strength.

Other Uses with Supportive Evidence

92. Antibody-Mediated Rejection (AMBR) in Transplantation. Approve for 1 year if prescribed by or in consultation with a physician affiliated with a transplant center.

93. Autoimmune Mucocutaneous Blistering Diseases (Pemphigus Vulgaris, Pemphigus Foliaceus, Bullous Pemphigoid, Mucous Membrane Pemphigoid [Cicatricial Pemphigoid], and Epidermolysis Bullosa Acquisita). Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 6 months if the patient meets BOTH of the following criteria (i and ii):

i. The patient meets ONE of the following criteria (a, b, or c):

a) The patient has tried a systemic corticosteroid OR a corticosteroid is contraindicated according to the prescriber AND the patient has tried an immunosuppressive agent OR an immunosuppressive agent is contraindicated according to the prescriber; OR
Note: Examples of immunosuppressive agents include azathioprine, cyclophosphamide, dapsone, methotrexate, cyclosporine, mycophenolate mofetil, and tacrolimus.

b) The patient has rapid, debilitating, progressive disease, that cannot be controlled with a systemic corticosteroid and an immunosuppressive agent; OR

c) The disease is so serious that there is inadequate time for therapy with a systemic corticosteroid and an immunosuppressive agent to have a rapid enough effect; AND

ii. The medication is prescribed by or in consultation with a dermatologist.

B) Patient is Currently Receiving Immune Globulin. Approve for 1 year if the patient has responded to therapy according to the prescriber.
Note: Examples of response to therapy can include healing of previous lesions or fewer new lesions.

94. Cytomegalovirus (CMV) Pneumonia in Patients with Cancer or Transplant-Related Infection. Approve for 2 months if prescribed by or in consultation with an oncologist, hematologist, or an infectious diseases physician.

95. Dermatomyositis or Polymyositis. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 6 months if the patient meets ALL of the following criteria (i, ii and iii):

i. The patient has tried a systemic corticosteroid OR a corticosteroid is contraindicated according to the prescriber; AND

ii. The patient has tried an immunosuppressive agent OR an immunosuppressive agent is contraindicated according to the prescriber; AND
Note: Examples of immunosuppressive agents include azathioprine, methotrexate, cyclosporine, cyclophosphamide, and mycophenolate mofetil.

iii. The medication is prescribed by or in consultation with a neurologist or rheumatologist.

B) Patient is Currently Receiving Immune Globulin. Approve for 1 year if the patient has responded to therapy according to the prescriber.
Note: Examples of a response to therapy includes improved muscle strength, improved neuromuscular symptoms, and improved functional ability.

96. Desensitization Therapy Prior to and Immediately after Transplantation. Approve for 1 year if prescribed by or in consultation with a physician affiliated with a transplant center.

97. Guillain Barré Syndrome (GBS). Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 1 month (this is to provide one course of therapy [divided doses given over 2 to 5 days]) if the patient meets BOTH of the following criteria (i and ii):

i. The patient meets one of the following (a or b):

a) The medication is initiated within 2 weeks and no longer than 4 weeks of onset of neuropathic symptoms; OR
Note: Examples of neuropathic symptoms include weakness, inability to stand or walk without assistance, and respiratory or bulbar weakness.

b) The patient has had a relapse (treatment related fluctuation), but had an initial response to IVIG; AND

ii. The medication is prescribed by or in consultation with a neurologist or a specialist with experience in diagnosing and treating patients with GBS.

B) Patient is Currently Receiving Immune Globulin. Approve for 1 month (this is to provide a second course [divided doses given over 2 to 5 days]) about 3 weeks after the first course.

98. Hematologic Neoplasm-Associated Hypogammaglobulinemia or Hypogammaglobulinemia after B-cell Targeted Therapies (Secondary Immunodeficiency [SID]). Approve for the duration noted if the patient meets ONE of the following (A or B):

Note: Some examples of B-cell targeted therapy are chimeric antigen receptor [CAR]-T cell therapy (e.g., Kymriah [tisagenlecleucel], a rituximab product, Besponsa [inotuzumab ozogamicin]).

Note: Refer to B-Bell Chronic Lymphocytic Leukemia (CLL) for Prevention of Bacterial Infections and Multiple Myeloma for diagnosis-specific criteria.

A) Initial Therapy. Approve for 6 months if the patient meets ALL of the following criteria (i, ii, and iii):

i. The patient has an immunoglobulin G (IgG) level of < 500 mg/dL (5.0 g/L) [excluding paraprotein]; AND

ii. The patient has recurrent or severe bacterial infections or there is a high risk of infection, according to the prescriber; AND

iii. The medication is being prescribed by or in consultation with an oncologist, hematologist, infectious diseases physician, or immunologist.

B) Patients Currently Receiving Immune Globulin. Approve for 6 months if the patient is having a positive response to therapy according to the prescriber.
Note: Examples of a positive response to therapy include maintaining an increased IgG trough level or a decrease in the number of infections.

99. Hematopoietic Cell Transplantation (HCT) to Prevent Bacterial Infection. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets ALL of the following criteria (i, ii, iii, and iv):

i. The patient has had a HCT within the previous year; AND

ii. The patient has an immunoglobulin G (IgG) level < 500 mg/dL (5.0 g/L) OR the patient has multiple myeloma or malignant macroglobulinemia; AND

iii. According to the prescriber the patient has a significant risk of having frequent and/or severe bacterial infections; AND

iv. The medication is prescribed by or in consultation with a hematologist, oncologist, or infectious diseases physician.

B) Patient is Currently Receiving Immune Globulin. Approve for 6 months if the patient is having a positive response to therapy according to the prescriber.

Note: Examples of a positive response to therapy include maintaining an increased IgG trough level, controlling the number of infections, or a decrease in the number of infections.

100. Human Immunodeficiency Virus (HIV)-Associated Thrombocytopenia. Approve for 1 month if the patient meets the following criteria (A and B):

A) The patient meets ONE of the following criteria (i or ii):

i. The patient is receiving combination antiretroviral therapy for their HIV infection; OR

ii. The patient has clinically significant bleeding complications according to the prescriber; AND

B) The medication is prescribed by or in consultation with an infectious diseases specialist or a physician who specializes in the treatment of HIV infections.

101. Human Immunodeficiency Virus (HIV)-Infected Infants and Children to Prevent Recurrent Bacterial Infections. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 6 months if the patient meets the following criteria (i, ii, iii, and iv):

i. The patient is < 18 years of age; AND

ii. The patient is receiving combination antiretroviral therapy; AND

iii. The patient has ONE of the following (a, b, or c):

a) Hypogammaglobulinemia (i.e., IgG < 400 mg/dL [4.0 g/L]); OR

b) Functional antibody deficiency is demonstrated by poor specific antibody titers (that is, the patient does not develop specific antibody responses against protein and polysaccharide antigens); OR

c) Functional antibody deficiency is demonstrated by the patient having recurrent (two or more per year), serious bacterial infections (e.g., bacteremia, meningitis, pneumonia) despite administration of combination antiretroviral therapy and appropriate antimicrobial prophylaxis; AND

iv. The medication is prescribed by or in consultation with an infectious diseases specialist or an immunologist.

B) Patient is Currently Receiving Immune Globulin. Approve for 1 year if the frequency and/or severity of infections have decreased according to the prescriber.

102. Immunotherapy-Related Toxicities Associated with Checkpoint Inhibitor Therapy. Approve for the duration noted if the patient meets ONE of the following (A or B):

Note: Examples of checkpoint inhibitors are: Keytruda (pembrolizumab), Opdivo (nivolumab), Yervoy (ipilimumab), Tecentriq (atezolizumab), Bavencio (avelumab), Imfinzi (durvalumab).

A) Initial Therapy. Approve for 1 month if the patient meets the following criteria (i, ii, or iii):

i. The patient has tried a systemic corticosteroid and has not adequately responded to therapy; OR

Note: Examples of systemic corticosteroids include prednisone, methylprednisolone.

ii. The medication is being started with a systemic corticosteroid; OR

iii. A corticosteroid is contraindicated per the prescriber.

B) Patient is Currently Receiving Immune Globulin. Approve for 6 months if the patient is having a positive response to therapy, as determined by the prescriber, and the prescriber has determined extended therapy is required.

103. Lambert-Eaton Myasthenic Syndrome (LEMS). Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 1 month (to allow for one course of therapy [divided doses given over 2 to 5 days]) if the patient meets the following criteria (i, ii, and iii):

i. The patient is having refractory weakness after symptomatic treatment of LEMS with an amifampridine product (e.g., Firdapse, Ruzurgi), guanidine, or pyridostigmine; AND

ii. The patient meets ONE of the following (a or b):

a) The patient has paraneoplastic LEMS; OR

b) The patient has non-paraneoplastic LEMS AND has tried a systemic corticosteroid (e.g., prednisone) or another immunosuppressive agent (e.g., azathioprine), or has a contraindication to corticosteroids and/or immunosuppressive agents, according to the prescriber; AND

iii. The medication is prescribed by or in consultation with a neurologist.

B) Patient is Currently Receiving Immune Globulin. Approve for 1 year if the patient has a response or continued effectiveness, according to the prescriber.

Note: Examples of a response to therapy include improved muscle strength or other clinical response.

104. Multiple Myeloma. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 6 months if the patient meets the following criteria (i and ii):

i. The patient has severe recurrent bacterial infections according to the prescriber; AND

ii. The medication is prescribed by or in consultation with a hematologist, oncologist, or infectious diseases specialist.

B) Patient is Currently Receiving Immune Globulin. Approve for 1 year.

105. Multiple Sclerosis (MS), Acute Severe Exacerbation or Relapses. Approve for 1 month (this is to provide one course of therapy [either a single dose or in divided doses given over 1 to 5 days]) if the patient meets BOTH of the following criteria (A and B):

A) The patient meets ONE of the following criteria (i or ii):

i. The patient has either not responded to or has had a significant adverse reaction with systemic corticosteroids (e.g., methylprednisolone sodium succinate injection) OR plasma exchange; OR

Note: A trial of Acthar® H.P. gel [repository corticotropin injection; adrenocorticotropic hormone, ACTH] would also count toward meeting this requirement.

ii. A systemic corticosteroid is contraindicated according to the prescriber; AND

B) The medication is prescribed by or in consultation with a neurologist or a physician who specializes in the treatment of MS.

106. Multiple Sclerosis (MS), Post-Partum to Prevent Relapses. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 6 months if the patient meets the following criteria (i and ii):

i. The patient is not currently receiving a disease modifying therapy (DMT) for MS to prevent relapses; AND

Note: Disease modifying therapy can include Avonex® (interferon beta-1a injection, IM), Plegridy® (peginterferon beta-1a SC injection), Rebif® (interferon beta-1a injection, SC), Betaseron®/Extavia® (interferon beta-1b injection), Copaxone®/Glatopa™ (glatiramer acetate

injection, SC), Gilenya® (fingolimod capsules), Lemtrada™ (alemtuzumab injection for IV use), Aubagio® (teriflunomide tablets), Mavenclad® (cladribine tablets), Mayzent® (siponimoid tablets), Tecfidera® (dimethyl fumarate capsules), Vumerity® (diroximel fumarate capsules), Zeposia® (ozanimod capsules), Tysabri® (natalizumab injection), Novantrone® (mitoxantrone injection).

ii. The medication is prescribed by or in consultation with a neurologist or a physician who specializes in the treatment of MS.

B) Patient is Currently Receiving Immune Globulin. Approve for a second 6 months of therapy if the patient is not taking a disease modifying therapy (DMT) for MS.

Note: Disease modifying therapy can include: Avonex (interferon beta-1a injection, IM), Plegridy (peginterferon beta-1a SC injection), Rebif (interferon beta-1a injection, SC), Betaseron/Extavia (interferon beta-1b injection), Copaxone/Glatopa (glatiramer acetate injection, SC), Gilenya (fingolimod capsules), Lemtrada (alemtuzumab injection for IV use), Aubagio (teriflunomide tablets), Mavenclad (cladribine tablets), Mayzent (siponimoid tablets), Tecfidera (dimethyl fumarate capsules), Vumerity (diroximel fumarate capsules), Zeposia (ozanimod capsules), Tysabri (natalizumab injection), Novantrone (mitoxantrone injection).

107. Myasthenia Gravis. Approve for the duration noted if the patient meets ONE of the following (A or B or C):

A) Initial Therapy for Short-Term (Acute) Use. Approve for 5 days (to allow for one course of therapy to be given in divided doses over 2 to 5 consecutive days) if the patient meets the following (i and ii):

i. The patient meets ONE of the following conditions (a, b, c, or d):

a) The patient has an exacerbation of myasthenia gravis; OR

b) The patient requires stabilization of myasthenia gravis before surgery; OR

c) The patient has been started on an immunosuppressive drug and is waiting for full effect; OR

Note: Examples of immunosuppressive drugs include azathioprine, cyclosporine, cyclophosphamide, mycophenolate mofetil, methotrexate, or tacrolimus.

d) The patient is starting therapy with a corticosteroid and IVIG is being given to prevent or minimize exacerbations; AND

ii. The medication is prescribed by or in consultation with a neurologist.

B) Initial Therapy for Maintenance. Approve for 1 year if the patient meets ALL of the following (i, ii, iii, and iv):

i. The patient has refractory myasthenia gravis; AND

ii. The patient has tried pyridostigmine; AND

iii. The patient has tried immunosuppressive therapy with at least one of the following agents: azathioprine, cyclosporine, cyclophosphamide, mycophenolate mofetil, methotrexate, tacrolimus AND has had an inadequate response; AND

iv. The medication is prescribed by or in consultation with a neurologist.

C) Patient is Currently Receiving Immune Globulin for Maintenance Therapy. Approve for 1 year if the patient is responding according to the prescriber.

108. Passive Immunization for Measles (Post-Exposure Prophylaxis). Approve for 1 day (to allow for a single dose) if the patient meets ONE of the following criteria (A or B):

Note: For patients with primary immune deficiency, see criteria for PID.

A) The patient is pregnant and meets the following criteria (i and ii):

i. The patient has been exposed to measles and the medication will be given within 6 days of exposure; AND

ii. The patient does not have evidence of immunity to measles (i.e., the patient does not have a history of the disease or age-appropriate vaccination); OR

B) The patient meets ALL of the following criteria (i, ii, and iii):

i. The patient is severely immunocompromised; AND
Note: Examples of severe immunocompromised status include patients with bone marrow transplant, graft-versus-host disease (GVHD), acute lymphoblastic leukemia (ALL), acquired immunodeficiency syndrome (AIDS), or human immunodeficiency virus (HIV)-infected patients.

ii. The patient has been exposed to measles; AND

iii. The medication will be given within 6 days of exposure.

109. Passive Immunization for Varicella (Chickenpox) [Post-Exposure Prophylaxis]. Approve for 1 day (to allow for a single dose) if the patient meets ONE of the following criteria (A or B):

A) The patient is human immunodeficiency virus (HIV)-infected and meets ALL of the following criteria (i, ii, and iii):

i. VariZIG® (varicella zoster immune globulin [human] IM injection) is not available; AND

ii. The patient does not have evidence of immunity to varicella (i.e., patient does not have a history of the disease or age-appropriate vaccination); AND

iii. The medication is prescribed by or in consultation with an infectious diseases specialist or an immunologist; OR

B) The patient is not HIV-infected and meets ALL of the following criteria (i, ii, iii, and iv):

i. VariZIG (varicella zoster immune globulin [human] IM injection is not available; AND

ii. The patient does not have evidence of immunity to varicella (i.e., the patient does not have a history of the disease or age-appropriate vaccination); AND

iii. The patient meets ONE of the following criteria (a or b):

a) The patient is immune compromised; OR

b) The patient is pregnant; AND

iv. The medication is prescribed by or in consultation with an infectious diseases specialist or immunologist.

110. Pure Red Blood Cell Aplasia (PRCA) Secondary to Chronic (Persistent) Parvovirus B19 Infection. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 2 months if the patient meets ALL of the following criteria (i, ii and iii):

i. The patient has a chronic immunodeficiency condition; AND
Note: Examples of a chronic immunodeficiency condition include patients with HIV infection, solid organ transplants (e.g., renal, liver), chemotherapy for hematologic malignancy.

ii. The patient has clinically significant anemia as determined by the prescriber OR the patient is transfusion dependent; AND

iii. The medication is prescribed by or in consultation with an infectious diseases specialist, immunologist, hematologist, or transplant specialist.

B) Patient is Currently Receiving Immune Globulin. Approve for 3 months in patients who responded with an increase in hemoglobin to previous IVIG therapy but relapse when off IVIG or in patients who respond and require maintenance therapy to prevent relapse.

111. Pure Red Blood Cell Aplasia (PRCA), Immunologic Subtype. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 1 month if the patient meets ALL of the following criteria (i, ii, and iii):

i. The patient has tried a systemic corticosteroid (e.g., prednisone); AND

ii. The patient has tried either cyclophosphamide or cyclosporine; AND

iii. The medication is prescribed by or in consultation with an infectious diseases specialist, immunologist, hematologist, or transplant specialist.

B) Patient is Currently Receiving Immune Globulin. Approve for 1 month if the patient has responded with an increase in hemoglobin and reticulocytosis, according to the prescriber.

112. Stiff-Person Syndrome (Moersch-Woltman Syndrome). Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets the following criteria (i and ii):

i. The patient meets ONE of the following criteria (a or b):

a) The patient has tried a benzodiazepine (e.g., diazepam) or baclofen; OR

b) The patient has contraindications to both a benzodiazepine AND baclofen according to the prescriber; AND

ii. The medication is prescribed by or in consultation with a neurologist.

B) Patient is Currently Receiving Immune Globulin. Approve for 1 year if the patient as responded to therapy according to the prescriber.

Note: Examples of response to therapy includes reduced stiffness or frequency of spasms, ability to walk unassisted.

113. Thrombocytopenia, Feto-neonatal Alloimmune. Approve for 6 months if the pregnant mother or newborn patient is prescribed the medication by or in consultation with a hematologist or an obstetrician.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of immune globulin intravenous is not recommended in the following situations:

97. Adrenoleukodystrophy. Evidence does not support IVIG use.[18]

98. Alzheimer's Disease (AD). In one multicenter, double-blind, Phase III, placebo-controlled trial, 390 patients with mild to moderate AD were randomized to therapy with IVIG 400 mg/kg or 200 mg/kg or to placebo given every 2 weeks for 18 months.[61] There was no statistically significant difference in the rate of cognitive decline when compared to placebo (mean 7.4 in the 400 mg/kg group; 8.9 in the 200 mg/kg group; 8.4 in the placebo group). There was not a statistically significant change in functional ability when compared to placebo (mean of -11.4 in the 400 mg/kg group; -12.4 in the 200 mg/kg group; -11.4 in the placebo group). Large placebo-controlled trials with a longer observation period are needed to established efficacy, determine the optimal dose regimen, and to confirm the safety of IVIG in the general AD poputation.[52,53]

99. Amyotrophic Lateral Sclerosis. There is insufficient evidence to recommend IVIG.[18]

100. Anemia, Aplastic. Evidence does not support IVIG use.[22]

101. Asthma. Global Initiative for Asthma (GINA) guidelines for asthma management and prevention do not include recommendations for use of IVIG.[54]

102. Atopic Dermatitis. Limited data exist to determine the utility of rituximab, omalizumab, intravenous immunoglobulin, and oral calcineurin inhibitors in the management of atopic dermatitis.[55]

103. Autism. Evidence does not support IVIG use.[18] Well-controlled, double-blind trials are needed.

104. Chronic Fatigue Syndrome. Evidence does not support IVIG use.[56] One randomized, placebo-controlled trial did not find benefits in quality of life measures nor the Profile of Mood States for IVIG.[56] Although scores were improved in IVIG and placebo treatment groups, no significance between group differences was demonstrated.

105. Complex Regional Pain Syndrome (Reflex Sympathetic Dystrophy). There is insufficient evidence to recommend IVIG. In one single center study a single dose of 0.5 g of IVIG per kg produced a decrease in pain intensity by 50% or more compared to placebo in 3 of 12 patients.[57] In a randomized, placebo-controlled, multicenter trial, low-dose immunoglobulin treatment for 6 weeks was not effective in relieving pain in patients with moderate-to-severe complex regional pain syndrome.[58] Well-controlled large-scale trials are needed.

106. Crohn's Disease. There is insufficient evidence to recommend IVIG. In one single center case collection report, 19 patients with acute Crohn's disease (Crohn's Disease Activity Index [CDAI] 284.1 ± 149.8) who were resistant to steroids received IVIG daily for 7 to 10 days.[59] Four weeks after completing therapy, 14 patients were in clinical remission (CDAI < 150). Spontaneous remissions cannot be excluded. Prospective, randomized, placebo-controlled trials are needed to determine if IVIG has a role in the treatment of Crohn's disease.

107. Cystic Fibrosis. There is insufficient evidence to recommend IVIG. In one single-center retrospective case review of 16 children with cystic fibrosis, IVIG was reportedly effective.[60] Well-designed, controlled trials are needed.[18]

108. Diabetes Mellitus, Immunotherapy. Evidence does not support IVIG use.[18,62,63] In one 2-year randomized controlled trial, IVIG was given every 2 months to children and adults with type 1 diabetes.[62] No beneficial effect was shown with IVIG compared with control and the authors concluded that IVIG therapy is unlikely to be a viable option for immunotherapy.

109. Fibromyalgia Syndrome. There is insufficient evidence to recommend IVIG. In one open-label single center study, 15 patients with fibromyalgia syndrome and distal demyelinating polyneuropathy received IVIG 400 mg/kg given daily for 5 days.[64] Pain, tenderness, and strength reportedly improved. These patients were not diagnosed with CIPD. Double-blind, placebo controlled trials are needed to determine if IVIG is effective in fibromyalgia syndrome.

110. Heart Failure, Chronic. There is insufficient evidence to recommend IVIG. In one randomized, placebo-controlled trial, IVIG given monthly for 26 weeks improved left ventricular ejection fraction (LVEF) in patients with chronic heart failure and LVEF < 40%.[66] In another controlled trial in patients with recent onset dilated cardiomyopathy and LVEF < 40%, IVIG, given for 2 consecutive days with no maintenance IVIG, did not improve LVEF more than placebo. Larger trials are needed in well-defined populations (cause and severity) to determine if IVIG has a role in the treatment of heart failure.

111. Human Immunodeficiency Virus (HIV) Infection, Adults, for Prophylaxis of Infections. IVIG is not listed in the recommendations for post exposure prophylaxis for occupational exposures to HIV; antiretroviral therapy should be used in certain circumstances after exposure to HIV infection.[67]

112. In Vitro Fertilization (IVF). There is insufficient evidence to recommend IVIG administration as part of IVF outcomes.[68]

113. Polyneuropathy, Organomegaly, Endocrinopathy, Monoclonal Gammopathy, and Skin Changes (POEMS) Syndrome. Evidence does not support IVIG use.[18]

114. Post-Polio Syndrome. There is insufficient evidence to recommend IVIG. Post-polio syndrome is characterized by new muscle weakness, atrophy, fatigue, and pain developing several years after the acute polio. A 2015 Cochrane Review concluded there was moderate- and low-quality evidence that IVIG has no beneficial effect of activity limitations in the short term and long term, respectively.[69] The evidence for effectiveness of IVIG on muscle strength is inconsistent.

115. Recurrent Spontaneous Pregnancy Loss (RSPL) [Including Antiphospholipid Antibody-Positive Patients]. Evidence does not support IVIG use.[70-73] In one double-blind pilot study, IVIG did not improve obstetric or neonatal outcomes beyond those achieved with a heparin and low-dose aspirin regimen.[70] In another double-blind trial (n = 82 of whom 47 had an index pregnancy) live birth rates did not differ significantly between IVIG-treated and placebo-treated women (70% vs. 63%; P =0.76; odds ratio [OR]: 1.37 [95% CI: 0.41, 4.61]).[71] The American Society for Reproductive Medicine practice committee states that several trials and meta-analyses concluded that IVIG is ineffective for primary recurrent pregnancy loss and this treatment is not recommended.[73]

116. Selective Immune Globulin A (IgA) Deficiency as the Sole Immunologic Abnormality. Evidence does not support use of IVIG.[14,18] Selective IgA deficiency is defined as a serum IgA level less than 0.07 g/L, but normal serum IgG and IgM levels in a patient greater than 4 years of age in whom other causes of hypogammaglobulinemia have been excluded.[14] Selective IgA deficiency may co-exist in some patients with poor specific IgG antibody production, with or without IgG2 subclass deficiency.[14,18] Some of these patients with a concomitant specific antibody defect might benefit from therapy with IVIG.

117. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Selected revision	**Immunodeficiency, Primary Humoral (Treatment)**: Criteria were added for patients currently receiving IVIG to approve for 1 year for the following conditions: CVID, other combined immunodeficiencies with significant hypogammaglobulinemia or antibody production defect, or unspecified hypogammaglobulinemia, if the frequency and/or severity of infections have decreased according to the prescribing physician. The conditions of XLA, SCID, Wiskott-Aldrich syndrome, and hyper-IgM syndromes are approved for 1 year. **B-Cell CLL for Prevention of Bacterial Infections**: Initial approval is for 4 months (previous duration was 1 year). For patients currently receiving IVIG, approval is for 1 year if the patient is maintaining an IgG trough (pre-dose) level of about 500 mg/dL and up to 700 mg/dL to prevent bacterial infections. **CIDP or Polyradiculoneuropathy**: Initial approval is for 3 months (previous duration was 1 year). For patients currently receiving IVIG, approval is for 1 year if the patient has a clinically significant improvement in neurologic symptoms (for example, improvement in disability; nerve conduction study results improved or stabilized; physical examination show improvement in neurological symptoms, strength, and sensation) as determined by the prescribing physician (a neurologist or in consultation with a neurologist). The patient may not have a full response after the initial 3 months, but there should be some response. **ITP or IT, Acute and Chronic**: Criteria were added for patients currently receiving IVIG to approve for 1 year in children, adolescents, and adults with persistent or chronic ITP/IT, if the patient responded with increased platelet count and/or absence of significant bleeding and the patient requires additional therapy with IVIG to prevent bleeding, according to the prescribing physician. Patients requiring additional therapy for acute bleeding, to increase platelet counts before surgical or dental procedures, pregnant patients are reviewed using the Initial Therapy criteria. **MMN (Treatment)**: Initial approval is for 6 months (previous duration was 1 year). For patients currently receiving IVIG, approval is for 1 year if the patient has improvement in neurologic symptoms as determined by the prescribing physician (a neurologist or in consultation with a neurologist). IVIG should be discontinued in patients who do not respond after the first 6 months of therapy. Approve for 1 year in patients who are responding (that is, maintaining optimal function) according to the prescribing physician. **Autoimmune Mucocutaneous Blistering Diseases (Pemphigus Vulgaris, Pemphigus Foliaceus, Bullous Pemphigoid, Mucous Membrane Pemphigoid [Cicatricial Pemphigoid], and Epidermolysis Bullosa Acquisita)**: Initial approval is for 6 months (previous duration was 1 year). For patients currently receiving IVIG, approval is for 1 year if the patient has responded (previous lesions are healing and there are fewer new lesions) according to the prescribing physician. **Dermatomyositis or Polymyositis**: Initial approval is for 6 months (previous duration was 1 year). For patients currently receiving IVIG, approval is for 1 year if the patient has responded (such as improved muscle strength, improved neuromuscular symptoms, improved functional ability) according to the prescribing physician. **Desensitization Therapy Prior to and Immediately after Solid Organ (Kidney, Heart, Lung, Liver, Intestinal) Transplantation**: Initial approval is for 4 months (previous duration was 1 year). For patients currently receiving IVIG, approval is for 1 year if given before transplantation and is for 1 dose if given post-transplantation. **Guillain Barré Syndrome**: For patients currently receiving IVIG, approval is for 1 month (to provide a second course of divided doses given over 2 to 5 days) about 3 weeks after the first course. **HCT to Prevent Bacterial Infection**: Initial approval is for 3 months (previous duration was 6 months). For patients currently receiving IVIG, approval is for 6 months if the patient requires IVIG to maintain trough IgG levels greater than 400 to 500 mg/dL AND who according to the prescribing physician have significant risk of having frequent and/or severe bacterial infections despite antibiotic therapy. **HIV-Infected Infants and Children to Prevent Recurrent Bacterial Infections**: Initial approval is for 6 months (previous duration was 1 year). For patients currently receiving IVIG, approval is for 1 year if the frequency and/or severity of infections have decreased according to the prescribing physician.	02/07/2018

	LEMS, Treatment: Initial approval is for 1 month (to allow for one course of therapy [divided doses given over 2 to 5 days]) [previous duration was 1 year]. For patients currently receiving IVIG, approval is for 1 year if the patient has a response (for example, improved muscle strength, other clinical response) or continued effectiveness, according to the prescribing physician. **Multiple Myeloma**: Initial approval is for 6 months (previous duration was 1 year). For patients currently receiving IVIG, approval is for 1 year. **MS, Acute Severe Exacerbation**: Approval is for 1 month (this is to provide one course of therapy [either a single dose or in divided doses given over 1 to 5 days]) [previous duration was 5 days]. **MS, Post-Partum to Prevent Relapses**: For patients currently receiving IVIG, approval is for a second 6 months of therapy if the patient is not taking a DMT (examples listed) for MS. Initial therapy remains at 6 months. **Myasthenia Gravis**: For patients currently receiving IVIG for maintenance therapy, approval is 1 year if the patient is responding according to the prescribing physician. Duration for short-term (acute) therapy for exacerbations or relapses remain at the same duration (one course of therapy). **PRCA Secondary to Chronic (Persistent) Parvovirus B19 Infection**: Initial approval is for 2 months (previous duration was 3 months). For patients currently receiving IVIG, approval is for 3 months in patients who responded with an increase in hemoglobin to previous IVIG therapy, but relapse when off IVIG or in patients who respond and require maintenance therapy to prevent relapse. **PRCA, Immunologic Subtype**: Initial approval is for 1 month (previous duration was 2 months). For patients currently receiving IVIG, approval is for 1 month if the patient has responded with an increase in hemoglobin and reticulocytosis, according to the prescribing physician. **Stiff-Person Syndrome (Moersch-Woltman Syndrome)**: Initial approval is for 3 months (previous duration was 1 year). For patients currently receiving IVIG, approval is for 1 year if the patient has responded (such as reduced stiffness or frequency of spasms, ability to walk unassisted) according to the prescribing physician.	
Selected revision	**Immunodeficiencies, Primary Humoral**: Age in patients with CVID or Unspecified hypogammaglobulinemia revised to be at least 2 years of age. Previously the age was at least 4 years.	03/14/2018
Annual revision	**Criteria created for the following diagnoses**: Antibody-Mediated Rejection (ABMR) in Solid Organ Transplant (e.g., Kidney, Heart, Lung, Liver), Hematologic Neoplasm-Associated Hypogammaglobulinemia (Secondary Immunodeficiency [SID]), and Immunotherapy-Related Toxicities Associated with Checkpoint Inhibitor Therapy. **B-Cell Chronic Lymphocytic Leukemia (CLL) for Prevention of Bacterial Infections**: Updated criteria to IgG level below 500 mg/dL OR a history of recurrent bacterial infections. Previously both were required. **Cytomegalovirus (CMV) Interstitial Pneumonia in Patients with Hematopoietic Cell Transplantation (HCT)** updated to Cytomegalovirus (CMV) Interstitial Pneumonia in Patients with Cancer or Transplant-Related Infection. **Removed the following conditions not recommended for approval**: Cytomegalovirus (CMV) Infection, Preemptive Therapy for CMV Infection or Treatment of CMV Disease, in Allogeneic Hematopoietic Cell (HCT) Recipients and Cytomegalovirus (CMV) Infections, Prophylaxis or Treatment in Solid Organ Transplantation. **Updated the condition not recommended for approval**: Cytomegalovirus (CMV) Disease Prophylaxis in Hematopoietic Cell Transplantation (HCT) Recipients to include Solid Organ Transplantation. **Removed specific age limit in the following diagnosis**: Passive Immunization for Varicella (Chickenpox) [Post-Exposure Prophylaxis] **Updated age to < 18 years old (previously < 13 years of age) in the following diagnosis**: Human Immunodeficiency Virus (HIV) Infected Infants and Children to Prevent Recurrent Bacterial Infections.	07/03/2020
DEU revision	Added Panzyga to the policy.	10/29/2018
Selected revision	**Immunodeficiency, Primary Humoral (Treatment)**: For the unspecified hypogammaglobulinemia diagnosis in the criterion that requires that the patient has markedly impaired antibody response to protein testing with polysaccharide antigen (pneumococcus), the option of "OR according to the prescribing physician the delay	01/16/2019

	caused by pre-vaccination and post-vaccination antibody measurement would be deleterious to the patient's health" was added.	
Annual revision	**Asceniv was added to the policy** with the same criteria as all other immune globulin products. **Immunodeficiency, Primary Humoral (Treatment) was updated to Primary Immunodeficiencies (PID)**: Criteria for PID was updated to the following: Approval if (along with prescribing by a physician specialist) the patient has a diagnosis of congenital agammaglobulinemia, X-linked agammaglobulinemia, other agammaglobulinemia due to the absence of B-cells, Wiskott-Aldrich syndrome, ataxia telangiectasia, DiGeorge syndrome, severe combined immunodeficiency (SCID), Hyper-Immunoglobulin M (IgM) syndrome, an IgG level lower than 250 mg/dL, or a primary immune deficiency which has been confirmed by genetic or molecular testing. For a diagnosis of common variable immunodeficiency (CVID), unspecified hypogammaglobulinemia, or other immunodeficiencies with significant hypogammaglobulinemia, approval if (along with prescribing physician specialist) the patients pretreatment IgG level is below the normal range AND either an impaired antibody response or recurrent infections. For a diagnosis of IgG subclass deficiency or selective antibody deficiency, approval if (along with prescribing physician specialist) the patient has an impaired antibody response and has recurrent infections. Criteria for patients currently receiving intravenous immune globulin for this diagnosis were updated to approve if the patient has been diagnosed with a primary immunodeficiency and is continuing to receive benefit from the product. **Chronic Inflammatory Demyelinating Polyneuropathy or Polyradiculoneuropathy (CIDP)**: The criterion, electrodiagnostic studies to support the diagnosis of CIDP, was added. **Hematologic Neoplasm-Associated Hypogammaglobulinemia or Hypogammaglobulinemia after B-cell Targeted Therapies (Secondary Immunodeficiency [SID])** approval condition was changed to as listed. Previously listed as Hematologic Neoplasm-Associated Hypogammaglobulinemia (Secondary Immunodeficiency [SID]). An immunologist physician was added to the list of physician specialists. **Immunotherapy-Related Toxicities Associated with Checkpoint Inhibitor Therapy**: Added the criteria or IVIG is being started with a systemic corticosteroid for Initial Therapy. **Lambert-Eaton Myasthenic Syndrome (LEMS)**: The approval condition was changed to as listed; previously, listed as "Lambert-Eaton Myasthenic Syndrome, Treatment". Criteria regarding the patient having refractory weakness after symptomatic treatment of LEMS with an amifampridine product (e.g., Firdapse, Ruzurgi), guanidine, or pyridostigmine was added. Criteria regarding non-paraneoplastic LEMS was updated to having tried a systemic corticosteroid (e.g., prednisone) or another immunosuppressive agent (e.g., azathioprine), or has a contraindication to corticosteroids and/or immunosuppressive agents, according to the prescriber. **Multiple Myeloma**: the following criteria was removed "the patient has stable (plateau phase) disease (> 3 months from diagnosis). **Multiple Sclerosis (MS), Acute Severe Exacerbation** was updated to include the wording "or relapses." Acthar HP gel was removed as one of the required alternatives. Criteria was updated as to only a corticosteroid would require to be contraindicated, according to the prescriber. **Multiple Sclerosis (MS), Post-Partum to Prevent Relapses**: Mavenclad and Mayzent were added as disease modifying therapy. **Thrombocytopenia, Fetal Alloimmune**, was updated to include not only the pregnant patient, but the newborn as well. Criteria that the patient is pregnant and receiving antenatal therapy was removed. **Wording in each applicable criteria** that referenced "determined by the prescribing physician" was changed to "determined by the prescriber." **Conditions Not Recommended for Approval**: The following were removed from the list: Cytomegalovirus Disease Prophylaxis in Hematopoietic Cell Transplantation Recipients or in Solid Organ Transplantation; Epilepsy, Pediatric Intractable; Graft Versus Host Disease, Acute (Within First 100 days After Hematopoietic Cell Transplantation); Graft Versus Host Disease, Chronic, Prevention in Hematopoietic Cell Transplantation (HCT) Recipient; Hematopoietic Cell Transplantation in	7/31/2019

	Allogeneic Recipients from Human Leukocyte Antigen Identical Sibling Donors; Immune Globulin M Paraprotenicemic Demyelinating Neuropathy (or Other Paraproteinemic Demyelinating Neuropathies); Infantile Spasms (West Syndrome); Marburg Variant Multiple Sclerosis; Multiple Sclerosis, Primary Progressive; Multiple Sclerosis, Secondary Progressive; Multiple Sclerosis, Relapsing Remitting for the Prevention of Relapses; Nephropathy, Membranous; Systemic Lupus Erythematosus; Systemic Sclerosis (Scleroderma); and Thrombocytopenia, Heparin-Induced. **Polyneuropathy** was added to the Condition of Organomegaly, Endocrinopathy, Monoclonal Gammopathy, and Skin Changes (POEMS Syndrome).	
Annual revision	**Primary Immunodeficiencies (PID)**: In Initial Therapy, the wording of "or another confirmed primary immunodeficiency" was added. For Continuation Therapy, the examples of benefits from the product were moved to a Note and the wording "according to the prescriber" was added. **B-Cell Chronic Lymphocytic Leukemia for Prevention of Bacterial Infections**: Added "having a positive response to therapy according to the prescriber" and placed current examples of a positive response as a note. **Chronic Inflammatory Demyelinating Polyneuropathy (CIDP) or Polyradiculoneuropathy**: For Continuation Therapy, moved examples of a clinically significant improvement to a note. Removed a neurologist or in consultation with a neurologist for continuation criteria. **Idiopathic (Immune) Thrombocytopenic Purpura (ITP) or Immune Thrombocytopenia [IT] Acute and Chronic** was updated to Immune Thrombocytopenia (ITP). The following note was added: The diagnosis of Immune Thrombocytopenia (ITP) encompasses previous nomenclature, such as Idiopathic Thrombocytopenia, Idiopathic Thrombocytopenic Purpura, Immune Thrombocytopenic Purpura. In Initial Therapy for adults ≥ 18 years of age (previously > 17 years of age), criteria were updated to require the patient try a systemic corticosteroid, or there is an urgent need to increase platelet count quickly, or to allow if a systemic corticosteroid is contraindicated according to the prescriber. Previous criteria that separated out adults and children with acute bleeding and those with persistent or chronic disease were removed. Previous criteria of specifying platelet counts for adults with acute bleeding, persistent or chronic disease, and to increase platelet counts prior to surgery were removed. The requirement for adults that a corticosteroid be started with immune globulin if there is an urgent need to increase the platelet count quickly was removed. In Initial Therapy for children and adolescents (< 18 years of age) [previously ≤ 17 years of age], to increase platelet counts before surgical procedures, and pregnant patients, the criteria were updated to only include a requirement for the prescriber's specialty. Previous criteria that addressed children and adolescents with inaccessibility issues, activity level, and noncompliance were removed. The specific wording regarding pregnant patients, including "before normal vaginal delivery, cesarean section, or spinal or epidural anesthesia" and "pregnant patient in any trimester" was removed and replaced with the general term of "pregnant patients". The duration of approval was updated from 2 weeks and 3 months, per the respective classifications, to 6 months for any pregnant patient. For Continuation Therapy, a requirement was added that the patient has responded to therapy according to the prescriber; and the examples of responding to therapy were moved to a Note. **Kawasaki Disease**: The criteria were updated from approval of a single dose to an approval duration of 3 months. The criterion that the patient had signs and symptoms required for a second dose of immune globulin was removed since the intent of the criteria assumed the patient was given a first dose of the product in the hospital. **Multifocal Motor Neuropathy (MMN)**. For Continuation Therapy, moved examples of a clinically significant improvement to a note. Removed a neurologist or in consultation with a neurologist for continuation criteria. **Antibody-Mediated Rejection (ABMR) in Solid Organ Transplantation (e.g., Kidney, Heart, Lung, Liver)** was updated to Antibody-Mediated Rejection (ABMR) in Transplantation. **Autoimmune Mucocutaneous Blistering Diseases**. In the initial therapy criteria, examples of immunosuppressive agents were updated to notes. In the continuation criteria, examples of response to therapy were updated to notes.	08/19/2020

	Cytomegalovirus (CMV) Interstitial Pneumonia in Patients with Cancer or Transplant-Related Infection was updated to Cytomegalovirus (CMV) Pneumonia in Patients with Cancer or Transplant-Related Infection. **Dermatomyositis or Polymyositis**. In the initial therapy criteria, examples of immunosuppressive agents were updated to notes. In the continuation criteria, examples of response to therapy were updated to notes. **Desensitization Therapy Prior to and Immediately after Solid Organ (Kidney, Heart, Lung, Liver, Intestinal) Transplantation** was updated to Desensitization Therapy Prior to and Immediately after Transplantation. In Continuation Therapy, the criterion regarding the timing of administration was removed. Criteria was updated to approve for 1 year if the product is prescribed by or in consultation with a physician affiliated with a transplant center. **Guillain Barre Syndrome (GBS)**. Neuropathic symptoms were moved from criterion to a note. **Hematologic Neoplasm-Associated Hypogammaglobulinemia or Hypogammaglobulinemia after B-cell Targeted Therapies (Secondary Immunodeficieny [SID])**. Added IgG level in units of g/L. Continuation criteria: updated wording to having a positive response to therapy according to the prescriber and moved examples of a positive response to a note. **Hematopoietic Cell Transplantation (HCT) to Prevent Bacterial Infection**. Added IgG level in units of g/L. Continuation criteria: updated wording to having a positive response to therapy according to the prescriber and moved examples of a positive response to a note. **Human Immunodeficiency Virus (HIV)-Infected Infants and Children to Prevent Recurrent Bacterial Infections**. Added IgG level in units of g/L. **Immunotherapy-Related Toxicities Associated with Checkpoint Inhibitor Therapy**. Initial therapy criteria- moved examples of systemic corticosteroid therapy to a note. **Lambert-Eaton Myasthenic Syndrome (LEMS)**. Continuation criteria- moved examples of a response to therapy to a note. **Myasthenia Gravis**. Moved examples of immunosuppressive drugs to notes. **Passive Immunization for Measles (Post-Exposure Prophylaxis).** Moved examples of severe immunocompromised status into a note. **Pure Red Blood Cell Aplasia (PRCA) Secondary to Chronic [Persistent] Parvovirus B19**. Moved examples of chronic immunodeficiency conditions to a note. **Stiff-Person Syndrome (Moersch-Woltman Syndrome)**. Continuation therapy – moved examples of response to therapy to a note.	
Selected Revision	From continuation criteria, removed the wording "intravenous."	09/02/2020

REVIEW DATE: 08/19/2020; Selected revision 09/02/2020

OVERVIEW

Immune globulin subcutaneous (SCIG) products are concentrated human immunoglobulins, primarily immunoglobulin G (IgG), that are prepared from pooled plasma collected from a large number of human donors. SCIG products are indicated for the following uses:

- **Chronic inflammatory demyelinating polyneuropathy**, for maintenance therapy in adults.[4]
- **Primary humoral immune deficiency (PID),** for replacement therapy, including but is not limited to the humoral defect in the following conditions: common variable immunodeficiency, X-linked agammaglobulinemia (congenital agammaglobulinemia), Wiskott-Aldrich syndrome, and severe combined immunodeficiencies (SCID).[1-5,7-9] SCIG is also indicated for measles prophylaxis in individuals with PID who have been exposed to measles or who are at high risk of measles exposure.[2-4,6,9]

Hizentra, Cuvitru, Xembify, and Cutaquig are indicated as a subcutaneous (SC) infusion only.[4,7-9] Gammagard Liquid, Gammaked, and Gamunex-C may be administered as a SC infusion or an intravenous infusion for PID.[1-3] HyQvia is indicated for SC infusion only, with sequential infusion of the recombinant human hyaluronidase first and followed 10 minutes later with the immune globulin infusion.[5] The recombinant human hyaluronidase acts locally to increase dispersion and absorption of the immune globulin. HyQvia has a Limitation of Use that the safety and efficacy of chronic use of recombinant human hyaluronidase in HyQvia have not been established in conditions other than PID. The safety of HyQvia has also not been established in children.[5]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of SCIG products. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with SCIG as well as the monitoring required for adverse events and long-term efficacy, initial approval requires SCIG products to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

I. Coverage of Cutaquig, Cuvitru, Gammagard Liquid, Gammaked, Gamunex-C, Hizentra, and Xembify (all listed products except HyQvia) is recommended in those who meet the following criteria:

FDA-Approved Indications

114. Primary Immunodeficiencies (PID). Approve for the duration noted if the patient meets ONE of the following criteria (A or B):

A) Initial Therapy. Approve for 1 year if the patient meets BOTH of the following criteria (i and ii):

i. The patient meets ONE of the following (a, b, or c):

Note: An exception can be made for the impaired antibody response if, according to the prescriber, the delay caused by pre-vaccination and post-vaccination antibody measurement would be deleterious to the patient's health.

a) The patient has a diagnosis of congenital agammaglobulinemia, X-linked agammaglobulinemia, other agammaglobulinemia due to the absence of B-cells, Wiskott-Aldrich syndrome, ataxia telangiectasia, DiGeorge syndrome, severe combined immunodeficiency (SCID), Hyper-Immunoglobulin M (IgM) syndromes, an IgG level lower than 250 mg/dL, or a primary immune deficiency which has been confirmed by genetic or molecular testing; OR

b) The patient has a diagnosis of common variable immunodeficiency (CVID), unspecified hypogammaglobulinemia, or other immunodeficiencies with significant hypogammaglobulinemia and meets the following (1 and either 2 or 3):

(1) The patient's pretreatment IgG level is below the normal range (age-adjusted and according to the normal reference range for the reporting laboratory); AND
(2) The patient has an impaired antibody response (i.e., failure to produce antibodies to specific antigens); OR
(3) The patient has recurrent infections; OR

c) The patient has an IgG subclass deficiency, selective antibody deficiency (SAD), or another confirmed primary immunodeficiency and meets the following (1 and 2):
(1) The patient has an impaired antibody response (i.e., failure to produce antibodies to specific antigens); AND
(2) The patient has recurrent infections; AND

ii. The medication is prescribed by or in consultation with an allergist/immunologist, immunologist, otolaryngologist (ear nose and throat [ENT] physician), pulmonologist, or an infectious diseases physician who treats patients with primary immune deficiencies.

B) Patient is Currently Receiving Immune Globulin. Approve for 1 year if the patient has been diagnosed with a primary immunodeficiency and, according to the prescriber, the patient is continuing to receive benefit from the product.
Note: Examples of receiving benefit from the product would include increased IgG levels, preventing or controlling infections.

115. Chronic Inflammatory Demyelinating Polyneuropathy or Polyradiculoneuropathy (CIDP). Approve for the duration noted if the patient meets ONE the following criteria (A or B):

A) Initial Therapy. Approve for 1 year if the patient meets ALL of the following (i, ii, and iii):
i. The patient is ≥ 18 years of age; AND
ii. Electrodiagnostic studies support the diagnosis of CIDP; AND
iii. The medication has been prescribed by or in consultation with a neurologist; AND

B) Patient is Currently Receiving Immune Globulin. Approve for 1 year if the patient has a clinically significant improvement in neurologic symptoms, as determined by the prescriber.
Note: Examples of improvement in neurologic symptoms include improvement in disability; nerve conduction study results improved or stabilized; physical examination show improvement in neurological symptoms, strength, and sensation.

II. Coverage of HyQvia is recommended in those who meet the following criteria:

FDA-Approved Indications

1. Primary Immunodeficiencies (PID). Approve for the duration noted if the patient meets ONE of the following criteria (A or B):

A) Initial Therapy. Approve for 1 year if the patient meets ALL of the following criteria (i, ii and iii):
i. The patient is ≥ 18 years of age; AND
ii. The patient meets ONE of the following (a, b, or c):
Note: An exception can be made for the impaired antibody response if, according to the prescriber, the delay caused by pre-vaccination and post-vaccination antibody measurement would be deleterious to the patient's health.

a) The patient has a diagnosis of congenital agammaglobulinemia, X-linked agammaglobulinemia, other agammaglobulinemia due to the absence of B-cells, Wiskott-Aldrich syndrome, ataxia telangiectasia, DiGeorge syndrome, severe combined immunodeficiency (SCID), Hyper-Immunoglobulin M (IgM) syndromes, an IgG level lower than 250 mg/dL, or a primary immune deficiency which has been confirmed by genetic or molecular testing; OR

b) The patient has a diagnosis of common variable immunodeficiency (CVID), unspecified hypogammaglobulinemia, or other immunodeficiencies with significant hypogammaglobulinemia and meets the following (1 and either 2 or 3):

(1) The patient's pretreatment IgG level is below the normal range (age-adjusted and according to the normal reference range for the reporting laboratory); AND
(2) The patient has an impaired antibody response (i.e., failure to produce antibodies to specific antigens); OR
(3) The patient has recurrent infections; OR

c) The patient has an IgG subclass deficiency, selective antibody deficiency (SAD), or another confirmed primary immunodeficiency and meets the following (1 and 2):
(1) The patient has an impaired antibody response (i.e., failure to produce antibodies to specific antigens); AND
(2) The patient has recurrent infections; AND

iii. The medication is prescribed by or in consultation with an allergist/immunologist, immunologist, otolaryngologist (ear nose and throat [ENT] physician), pulmonologist, or an infectious diseases physician who treats patients with primary immune deficiencies.

B) Patient is Currently Receiving Immune Globulin. Approve for 1 year if the patient has been diagnosed with a primary immunodeficiency and, according to the prescriber, the patient is continuing to receive benefit from the product.
Note: Example of receiving benefit from the product would include increased IgG levels, preventing or controlling infections.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of SCIG is not recommended in the following situations:

118. Selective Immune Globulin A (IgA) Deficiency as the Sole Immunologic Abnormality. Selective IgA deficiency is defined as a serum IgA level less than 0.07 g/L, but normal serum IgG and IgM levels in a patient > 4 years of age in whom other causes of hypogammaglobulinemia have been excluded.[11] Selective IgA deficiency may co-exist in some patients with poor specific IgG antibody production, with or without IgG2 subclass deficiency.[10,11] Some of these patients with a concomitant specific antibody defect may benefit from therapy with SCIG.

119. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual revision	Added criteria for the diagnosis chronic inflammatory demyelinating polyneuropathy (CIDP).	07/11/2018
Selected revision	Cutaquig was added to the policy with the same criteria that applies to the other products with the exception of HyQvia. **Immunodeficiency, Primary Humoral (Treatment)**: For the unspecified hypogammaglobulinemia diagnosis in the criterion that requires that the patient has markedly impaired antibody response to protein testing with polysaccharide antigen (pneumococcus), the option of "OR according to the prescribing physician the delay caused by pre-vaccination and post-vaccination antibody measurement would be deleterious to the patient's health" was added.	01/16/2019
Annual Revision	Xembify was added to the policy with the same criteria that applies to the other products with the exception of HyQvia. **Immunodeficiency, Primary Humoral (Treatment) was updated to Primary Immunodeficiencies (PID)**: Criteria for PID was updated to the following: Approval if (along with prescribing by a physician specialist) the patient has a diagnosis of congenital agammaglobulinemia, X-linked agammaglobulinemia, other agammaglobulinemia due to the absence of B-cells, Wiskott-Aldrich syndrome, ataxia telangiectasia, DiGeorge syndrome, severe combined immunodeficiency (SCID), Hyper-Immunoglobulin M (IgM) syndrome, an IgG level lower than 250 mg/dL, or a primary immune deficiency which has been confirmed by genetic or molecular testing. For a diagnosis of common variable immunodeficiency (CVID), unspecified hypogammaglobulinemia, or other immunodeficiencies with significant hypogammaglobulinemia, approval if (along with prescribing physician specialist) the patients pretreatment IgG level is below the normal range AND either an impaired antibody response or recurrent infections. For a diagnosis of IgG subclass deficiency or selective antibody deficiency, approval if (along with prescribing physician specialist) the patient has an impaired antibody response and has recurrent infections. Criteria for patients currently receiving subcutaneous immune globulin for this diagnosis were updated to approve if the patient has been diagnosed with a primary immunodeficiency and is continuing to receive benefit from the product. **Chronic Inflammatory Demyelinating Polyneuropathy or Polyradiculoneuropathy (CIDP)**: the criterion, electrodiagnostic studies to support the diagnosis of CIDP, was added. Wording in reference to "determined by the prescribing physician" was changed to "determined by the prescriber."	07/31/2019
Annual Revision	**Primary Immunodeficiencies (PID)**: In Initial Therapy, the wording of "or another confirmed primary immunodeficiency" was added. For Continuation Therapy, the examples of benefits from the product were moved to a Note and the wording "according to the prescriber" was added. **Chronic Inflammatory Demyelinating Polyneuropathy (CIDP) or Polyradiculoneuropathy**: For Continuation Therapy, moved examples of a clinically significant improvement to a note. Removed a neurologist or in consultation with a neurologist for continuation criteria. **Removed the following condition not recommended for approval**: HyQvia in Patients < 18 years of Age. Age is already addressed in the HyQvia criteria.	08/19/2020
Selected Revision	For continuation criteria, removed the wording "subcutaneous."	09/02/2020

PRIOR AUTHORIZATION POLICY

POLICY: Immunologicals – Cinqair Prior Authorization Policy

- Cinqair® (reslizumab injection for intravenous use – Teva Respiratory)

REVIEW DATE: 02/17/2021

OVERVIEW

Cinqair, an interleukin-5 antagonist monoclonal antibody, is indicated for **severe asthma** as add-on maintenance treatment of patients ≥ 18 years of age who have an eosinophilic phenotype.[1] Limitations of Use: Cinqair is not indicated for the treatment of other eosinophilic conditions or for the relief of acute bronchospasm/status asthmaticus.

Clinical Efficacy

The Cinqair pivotal studies included adult and adolescent patients with moderate to severe asthma.[2-4] In general, patients were required to have baseline blood eosinophil levels ≥ 400 cells/microliter despite therapy with a medium to high dose inhaled corticosteroid (ICS) with or without a second controller medication (two of the studies).[2-4] In one study that did not require patients to have elevated eosinophils at baseline, clinical benefit in regard to forced expiratory volume in 1 second (FEV_1) was not statistically significant with Cinqair vs. placebo. However, a significant improvement was observed in a subgroup of patients with baseline eosinophil levels ≥ 400 cells/microliter.

Guidelines

The Global Initiative for Asthma (GINA) Global Strategy for Asthma Management and Prevention (2020) proposes a step-wise approach to asthma treatment.[5] Cinqair is listed as an option for add-on therapy in patients ≥ 18 years of age with difficult-to-treat, severe eosinophilic asthma (i.e., asthma that cannot be managed by therapy with an ICS/long-acting $beta_2$-agonist [LABA] combination with or without an additional controller). Higher blood eosinophil levels, more exacerbations in the previous year, adult-onset asthma, nasal polyposis, and maintenance oral corticosteroids at baseline may predict a good asthma response to Cinqair.

According to the European Respiratory Society (ERS)/American Thoracic Society (ATS) guidelines (2014; updated in 2020), severe asthma is defined as asthma which requires treatment with a high-dose ICS in addition to a second controller medication (and/or systemic corticosteroids) to prevent it from becoming uncontrolled, or asthma which remains uncontrolled despite this therapy.[6,7] Uncontrolled asthma is defined as asthma that worsens upon tapering of high-dose ICS or systemic corticosteroids or asthma that meets one of the following four criteria:

1) Poor symptom control: Asthma Control Questionnaire consistently ≥ 1.5 or Asthma Control Test < 20;
2) Frequent severe exacerbations: two or more bursts of systemic corticosteroids in the previous year;
3) Serious exacerbations: at least one hospitalization, intensive care unit stay, or mechanical ventilation in the previous year;
4) Airflow limitation: FEV_1 < 80% predicted after appropriate bronchodilator withholding.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Cinqair. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Cinqair as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Cinqair to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Cinqair is recommended in those who meet the following criteria:

FDA-Approved Indications

10. Asthma. Approve Cinqair for the duration noted if the patient meets one of the following conditions (A or B):

69. Initial Therapy. Approve for 6 months if the patient meets the following criteria (i, ii, iii, iv, and v):

- **i.** Patient is ≥ 18 years of age; AND
- **ii.** Patient has a blood eosinophil count ≥ 400 cells per microliter within the previous 4 weeks or within 4 weeks prior to treatment with any anti-interleukin-5 therapy; AND
  Note: Examples of anti-interleukin-5 therapies include Cinqair, Fasenra® (benralizumab injection for subcutaneous use), and Nucala® (mepolizumab injection for subcutaneous use).
- **iii.** Patient has received at least 3 consecutive months of combination therapy with BOTH of the following (a and b):
  - **a)** An inhaled corticosteroid; AND
  - **b)** At least one additional asthma controller or asthma maintenance medication; AND

  Note: Examples of additional asthma controller or asthma maintenance medications are inhaled long-acting beta$_2$-agonists, inhaled long-acting muscarinic antagonists, leukotriene receptor antagonists, anti-interleukin-5 therapies (e.g., Cinqair, Fasenra, Nucala), and theophylline. Use of a combination inhaler containing both an inhaled corticosteroid and a long-acting beta$_2$-agonist would fulfil the requirement for both criteria a and b.
- **iv.** Patient has asthma that is uncontrolled or was uncontrolled at baseline as defined by ONE of the following (a, b, c, d, or e):
  - **a)** Patient experienced two or more asthma exacerbations requiring treatment with systemic corticosteroids in the previous year; OR
  - **b)** Patient experienced one or more asthma exacerbation(s) requiring hospitalization or an Emergency Department visit in the previous year; OR
  - **c)** Patient has a forced expiratory volume in 1 second (FEV_1) < 80% predicted; OR
  - **d)** Patient has an FEV_1/forced vital capacity (FVC) < 0.80; OR
  - **e)** Patient has asthma that worsens upon tapering of oral corticosteroid therapy; AND

  Note: "Baseline" is defined as prior to receiving any Cinqair or other anti-interleukin-5 therapies (i.e., Fasenra or Nucala).
- **v.** The medication is prescribed by or in consultation with an allergist, immunologist, or pulmonologist.

70. Patient is Currently Receiving Cinqair. Approve for 1 year if the patient meets the following criteria (i, ii, and iii):

- **i.** Patient has already received at least 6 months of therapy with Cinqair; AND
  Note: A patient who has received < 6 months of therapy or who is restarting therapy with Cinqair should be considered under criterion 1A (Asthma, Initial Therapy).

ii. Patient continues to receive therapy with one inhaled corticosteroid or one inhaled corticosteroid-containing combination inhaler; AND

iii. Patient has responded to therapy as determined by the prescriber.
Note: Examples of a response to Cinqair therapy are decreased asthma exacerbations; decreased asthma symptoms; decreased hospitalizations, emergency department/urgent care, or medical clinic visits due to asthma; and decreased requirement for oral corticosteroid therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Cinqair is not recommended in the following situations:

44. Concurrent use of Cinqair with Another Anti-Interleukin Monoclonal Antibody. The efficacy and safety of Cinqair used in combination other anti-interleukin monoclonal antibodies (e.g., Nucala® [mepolizumab injection for subcutaneous use], Fasenra® [benralizumab subcutaneous injection], Dupixent® [dupilumab subcutaneous injection]) have not been established.

45. Concurrent use of Cinqair with Xolair® (omalizumab injection for subcutaneous use). Xolair is a recombinant humanized immunoglobulin G (IgG)1κ monoclonal antibody indicated for use in patients ≥ 6 years of age with moderate to severe persistent asthma and who have a positive skin test or *in vitro* reactivity to a perennial aeroallergen and whose symptoms are inadequately controlled with ICSs.[8] Xolair is also indicated for chronic idiopathic urticaria in adults and adolescents 12 years of age and older who remain symptomatic despite H_1 antihistamine treatment and for nasal polyps, as add-on maintenance treatment in patients ≥ 18 years of age with an inadequate response to nasal corticosteroids. The efficacy and safety of Cinqair in combination with Xolair have not been established.

46. Eosinophilic Esophagitis, or Eosinophilic Gastroenteritis. Cinqair is not indicated for the treatment of eosinophilic conditions other than asthma.[1] In addition to a small pilot study, one randomized, double-blind, placebo controlled study (n =226) evaluated the efficacy of Cinqair in pediatric and adolescent patients with eosinophilic esophagitis.[9,10] In this study, patients were randomly assigned to receive Cinqair IV at varying doses for 12 weeks. At Week 15, peak esophageal eosinophil counts were reduced from baseline and all reductions with Cinqair were significant compared with placebo. Improvements in physician's global assessment scores were also observed in all groups (including placebo), but the difference between Cinqair and placebo was not statistically significant. Guidelines for the management of eosinophilic esophagitis from the American Gastroenterological Association (AGA) and the Joint Task Force on Allergy-Immunology Practice Parameters (2020) only recommend using anti-interleukin-5 therapies in the context of a clinical trial.[11] Additional, well-controlled trials are needed to determine the role of Cinqair in the treatment of eosinophilic esophagitis and eosinophilic gastroenteritis.

47. Hypereosinophilic Syndrome. Cinqair is not indicated for the treatment of eosinophilic conditions other than asthma.[1] One very small pilot study (n = 4) evaluated the safety and efficacy of Cinqair in patients with hypereosinophilic syndrome who were refractory to or intolerant of treatment with conventional therapy.[12] A single dose of Cinqair resulted in a response in two of four patients. In the two responders, blood eosinophil counts dropped to within the normal range within 48 hours of the Cinqair infusion and this was accompanied by an improvement in clinical signs and symptoms. The 2019 World Health Organization (WHO)-defined eosinophilic disorders update on diagnosis, risk stratification, and management notes that Cinqair has not been evaluated extensively for the treatment of hypereosinophilic syndrome; use of anti-interleukin-5 approaches for the treatment of hypereosinophilic syndrome remains investigational.[13] Corticosteroids are the cornerstone of therapy

for several forms of hypereosinophilic syndrome. In patients who have idiopathic hypereosinophilic syndrome and end organ damage, enrollment into an anti-interleukin-5/anti-interleukin-5 receptor antibody clinical trial is recommended as second-line therapy. Similarly, in patients with lymphocyte-variant hypereosinophilic syndrome, enrollment into an anti-interleukin-5/anti-interleukin-5 receptor antibody clinical trial is also recommended as second-line therapy. Additional, well-controlled trials are needed to determine the role of Cinqair in the treatment of hypereosinophilic syndrome.

48. Nasal Polyps. Cinqair is not indicated for the treatment of nasal polyps.[1] One double-blind, placebo-controlled, randomized safety and pharmacokinetic study (n = 24) evaluated the use of Cinqair in patients with nasal polyps.[14] Patients received a single infusion of either Cinqair 3 mg/kg, Cinqair 1 mg/kg, or placebo. It was reported that blood eosinophil counts and concentrations of eosinophil cation protein were reduced for up to 8 weeks following the Cinqair infusion. Nasal polyp scores improved for approximately 4 weeks in one-half of patients receiving active treatment. Additionally, a pooled subgroup analysis from the two pivotal Cinqair asthma exacerbation trials found that in patients with inadequately controlled asthma and chronic sinusitis with nasal polyps (n = 150) Cinqair demonstrated enhanced efficacy. Patients in this subgroup experienced an 83% reduction the clinical asthma exacerbation rate with Cinqair vs. placebo.[15] The magnitude of this reduction was greater than that observed with the overall study population. A 2014 Practice Parameter on the Diagnosis and Management of Rhinosinusitis and a 2020 Practice Parameter for the Management of Rhinitis from the from the Joint Task Force on Practice Parameters (JTFPP), representing the American Academy of Allergy, Asthma, & Immunology (AAAAI); the American College of Allergy, Asthma, & Immunology (ACAAI); and the Joint Council of Allergy, Asthma, & Immunology note that Cinqair has shown benefit in the treatment of patients with chronic rhinosinusitis with nasal polyps.[16-19] However, it is noted that Cinqair is not approved for this use. A 2015 Clinical Practice Guideline update on Adult Sinusitis from the American Academy of Otolaryngology (AAO) address the management of nasal polyps, but do not address Cinqair[20] Additional, well-designed, controlled trials are needed to determine the role of Cinqair in the treatment of patients with nasal polyps who do not have asthma.

49. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Early Annual Revision	Updated initial therapy criteria for "Asthma in Patients with Severe Disease and an Eosinophilic Phenotype" to more concisely state the previous therapies required. Added the following note: An exception to the requirement for a trial of one additional asthma controller/maintenance medication (criterion b) can be made if the patient has already received anti-IL-5 therapy (e.g., Cinqair, Fasenra, Nucala) used concomitantly with an ICS for at least 3 consecutive months.	01/23/2019
Selected Revision	**Asthma**: Approval indication was changed from "Asthma in Patients with Severe Disease and an Eosinophilic Phenotype" to "Asthma". Wording in reference to "according to the prescribing physician" was changed to "according to the prescriber". Added Wixela Inhub, a generic to Advair Diskus, to list of examples of asthma controller/maintenance medications.	10/23/2019
Annual Revision	• **Asthma**: Removed lists of examples of inhaled asthma controller/maintenance medications. • **Hypereosinophilic Syndrome**: Condition not recommended for approval was changed from "Hypereosinophilic Syndrome, Idiopathic" to "Hypereosinophilic Syndrome".	02/12/2020
Annual Revision	No criteria changes.	02/17/2021

IL – Interleukin; ICS – Inhaled corticosteroids.

PRIOR AUTHORIZATION POLICY

POLICY: Immunologicals – Dupixent Prior Authorization Policy

- Dupixent® (dupilumab subcutaneous injection – Regeneron/sanofi-aventis)

REVIEW DATE: 02/17/2021

OVERVIEW

Dupixent, an interleukin-4 receptor alpha (IL-4Rα) antagonist, is indicated for the following uses:[1]

- **Asthma,** as an add-on maintenance treatment in patients ≥ 12 years of age with moderate-to-severe disease with an eosinophilic phenotype or with oral corticosteroid dependent asthma. Limitation of Use: Dupixent is not indicated for the relief of acute bronchospasm or status asthmaticus.

- **Atopic dermatitis,** for the treatment of patients ≥ 6 years of age with moderate to severe disease whose disease is not adequately controlled with topical prescription therapies or when those therapies are not advisable.
- **Chronic rhinosinusitis with nasal polyposis (CRSwNP),** as an add-on maintenance treatment in adult patients with inadequately controlled disease.

Clinical Efficacy

Asthma

Two Dupixent pivotal studies included patients ≥ 12 years of age who had moderate to severe persistent asthma that was uncontrolled despite treatment with a medium- to high-dose inhaled corticosteroid (ICS) and up to two additional controller medications.[2,4] Dupixent significantly reduced the annual exacerbation rate compared with placebo, but higher baseline eosinophil levels were correlated with larger asthma exacerbation reductions and greater increases in lung function parameters than were observed in patients with lower baseline blood eosinophil levels (i.e., < 150 cells/microliter). In a third study, oral corticosteroid-dependent patients with severe asthma were able to significantly reduce their oral corticosteroid doses and had reduced exacerbations with Dupixent compared with placebo.[3]

Atopic Dermatitis

The three pivotal Dupixent studies enrolled adults with moderate to severe chronic atopic dermatitis.[1,5,6] Patients had atopic dermatitis that affected ≥ 10% of their body surface area (BSA) and had a recent history of an inadequate response to a sufficient course of topical therapy (e.g., corticosteroids and/or calcineurin inhibitors). Dupixent was found to be more effective in achieving an Investigator's Global Assessment (IGA) score of 0 (clear) or 1 (almost clear) and a reduction of ≥ 2 points from baseline to Week 16 compared with placebo. Additional studies established the efficacy of Dupixent in patients 6 to 17 years of age.[1,7,26]

Chronic Rhinosinusitis with Nasal Polyposis (CRSwNP)

Two randomized, double-blind, multicenter, placebo-controlled studies evaluated the efficacy of Dupixent in adult patients with CRSwNP.[1,8-10] Patients enrolled in these studies were also treated with intranasal corticosteroids and had failed treatment with sino-nasal surgery or systemic corticosteroids (or were ineligible or intolerant to). Dupixent was found to significantly improve both the change from baseline to Week 24 in bilateral endoscopic nasal polyp score (NPS) and the change from baseline in the nasal congestion/obstruction score (averaged over 28 days) compared with placebo.

Guidelines

Asthma Guidelines

The Global Initiative for Asthma (GINA) Global Strategy for Asthma Management and Prevention (2020) proposes a step-wise approach to asthma treatment.[11] The majority of patients can be managed with an ICS with or without a long-acting beta$_2$-agonist (LABA) and/or an additional controller. Dupixent is listed as an option for add-on therapy in patients ≥ 12 years of age with severe Type 2 asthma or asthma that requires treatment with an oral corticosteroid. Higher blood eosinophil levels and higher fractional concentration of exhaled nitric oxide (FeNO) may predict a good asthma response to Dupixent.

According to the European Respiratory Society (ERS)/American Thoracic Society (ATS) guidelines (2014; updated in 2020), severe asthma is defined as asthma which requires treatment with a high-dose ICS in addition to a second controller medication (and/or systemic corticosteroids) to prevent it from becoming uncontrolled, or asthma which remains uncontrolled despite this therapy.[12,23] Uncontrolled asthma is defined as asthma that worsens upon tapering of high-dose ICS or systemic corticosteroids or asthma that meets one of the following four criteria:

5) Poor symptom control: Asthma Control Questionnaire consistently ≥ 1.5 or Asthma Control Test < 20;
6) Frequent severe exacerbations: two or more bursts of systemic corticosteroids in the previous year;
7) Serious exacerbations: at least one hospitalization, intensive care unit stay, or mechanical ventilation in the previous year;
8) Airflow limitation: FEV_1 80% predicted after appropriate bronchodilator witholding.

Atopic Dermatitis Guidelines

European consensus guidelines for the treatment of atopic dermatitis (2018) from multiple European dermatology associations, including the European Dermatology Forum (EDF), the European Academy of Dermatology and Venereology (EADV), and the European Academy of Allergy and Clinical Immunology (EAACI), recommend Dupixent as a disease-modifying drug for patients with moderate to severe atopic dermatitis, in whom topical treatment does not produce a sufficient response and other systemic treatment is not advisable.[13] These guidelines note that daily emollients should be used with Dupixent and it may be combined with other topical anti-inflammatory medications as needed. US guidelines do not address Dupixent.[14-16] However, they reinforce that most patients with atopic dermatitis can achieve disease control with non-pharmacologic interventions (e.g., emollients), standard topical anti-inflammatory therapies (e.g., topical corticosteroids, topical calcineurin inhibitors), and elimination of exacerbating factors.

Chronic Rhinosinusitis with Nasal Polyposis (CRSwNP) Guidelines

A 2014 Practice Parameter on the Diagnosis and Management of Rhinosinusitis and a 2020 Practice Parameter for the Management of Rhinitis from the JTFPP recommend nasal corticosteroids be used in patients with chronic rhinosinusitis with nasal polyps, as they decrease nasal polyp size, prevent regrowth of nasal polyps following surgical removal, and improve nasal symptoms.[17-19,24] Short courses of oral corticosteroids are also recommended. Endoscopic surgical intervention may be considered as an adjunct to medical therapy in patients with chronic rhinosinusitis that is not responsive or is poorly responsive to medical therapy. Dupilumab is listed as a treatment option, but specific recommendations were not made. A 2015 Clinical Practice Guideline update on Adult Sinusitis from the American Academy of Otolaryngology makes similar recommendations, stating that clinicians should recommend saline nasal irrigation, topical intranasal corticosteroids, or both for symptom relief in patients with CRS (with or without nasal polyps).[20] Dupixent is not addressed.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Dupixent. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Dupixent as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Dupixent to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Dupixent is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Asthma.** Approve Dupixent for the duration noted if the patient meets one of the following conditions (A or B):
   - **A)** Initial Therapy. Approve for 6 months if the patient meets the following criteria (i, ii, iii, iv and v):
     - **i.** Patient is ≥ 12 years of age; AND
     - **ii.** Patient meets ONE of the following criteria (a or b):
       - **a)** Patient has a blood eosinophil level ≥ 150 cells per microliter within the previous 6 weeks or within 6 weeks prior to treatment with any anti-interleukin therapy or Xolair; OR
         Note: Examples of anti-interleukin therapies include Dupixent, Nucala® (mepolizumab injection for subcutaneous use), Cinqair® (reslizumab injection for intravenous use), and Fasenra® (benralizumab injection for subcutaneous use).
       - **b)** Patient has oral (systemic) corticosteroid-dependent asthma according to the prescriber (e.g., the patient has received ≥ 5 mg oral prednisone or equivalent per day for ≥ 6 months); AND
     - **iii.** Patient has received at least 3 consecutive months of combination therapy with BOTH of the following (a and b):
       - **a)** An inhaled corticosteroid; AND
       - **b)** At least one additional asthma controller or asthma maintenance medication; AND

       Note: Examples of additional asthma controller or asthma maintenance medications are inhaled long-acting $beta_2$-agonists, inhaled long-acting muscarinic antagonists, leukotriene receptor antagonists, anti-interleukin-5 therapies (e.g., Cinqair, Fasenra, Nucala), and theophylline. Use of a combination inhaler containing both an inhaled corticosteroid and a long-acting $beta_2$-agonist would fulfil the requirement for both criteria a and b.
     - **iv.** Patient has asthma that is uncontrolled or was uncontrolled at baseline as defined by ONE of the following (a, b, c, d or e):
       - **a)** Patient experienced two or more asthma exacerbations requiring treatment with systemic corticosteroids in the previous year; OR
       - **b)** Patient experienced one or more asthma exacerbation(s) requiring hospitalization or an Emergency Department visit in the previous year; OR
       - **c)** Patient has a forced expiratory volume in 1 second (FEV_1) < 80% predicted; OR
       - **d)** Patient has an FEV_1/forced vital capacity (FVC) < 0.80; OR
       - **e)** Patient has asthma that worsens upon tapering of oral corticosteroid therapy; AND

       Note: "Baseline" is defined as prior to receiving any Nucala or other anti-interleukin- 5 therapies (i.e., Fasenra or Nucala).
     - **v.** The medication is prescribed by or in consultation with an allergist, immunologist, or pulmonologist.

B) Patient is Currently Receiving Dupixent. Approve for 1 year if the patient meets the following criteria (i, ii, and iii):

i. Patient has already received at least 6 months of therapy with Dupixent; AND
Note: A patient who has received < 6 months of therapy or who is restarting therapy with Dupixent should be considered under criterion 1A (Asthma, Initial Therapy).

ii. Patient continues to receive therapy with one inhaled corticosteroid or one inhaled corticosteroid-containing combination inhaler; AND

iii. Patient has responded to therapy as determined by the prescriber.
Note: Examples of a response to Dupixent therapy are decreased asthma exacerbations; decreased asthma symptoms; decreased hospitalizations or emergency department visits due to asthma; decreased requirement for oral corticosteroid therapy.

2. Atopic Dermatitis. Approve Dupixent for the duration noted if the patient meets one of the following conditions (A or B):

71. Initial Therapy. Approve for 4 months if the patient meets the following criteria (i, ii, and iii):

i. Patient is ≥ 6 years of age; AND

ii. Patient meets ONE of the following (a or b):

a) Patient has atopic dermatitis involvement estimated to be ≥ 10% of the body surface area (BSA) according to the prescriber and meets ALL of the following criteria ([1], [2], and [3]):

(1) Patient has tried at least one medium-, medium-high, high-, and/or super-high-potency prescription topical corticosteroid; AND

(2) This topical corticosteroid was applied daily for at least 28 consecutive days; AND

(3) Inadequate efficacy was demonstrated with this topical corticosteroid therapy, according to the prescriber; OR

b) Patient has atopic dermatitis involvement estimated to be < 10% of the body surface area (BSA) according to the prescriber and meets ALL of the following criteria ([1], [2], [3], and [4]):

(1) Patient has atopic dermatitis affecting ONLY the following areas: face, eyes/eyelids, skin folds, and/or genitalia; AND

(2) Patient has tried tacrolimus ointment (Protopic®, generics); AND

(3) Tacrolimus ointment (Protopic, generics) was applied daily for at least 28 consecutive days; AND

(4) Inadequate efficacy was demonstrated with tacrolimus ointment (Protopic, generics), according to the prescriber; AND

iii. The medication is prescribed by or in consultation with an allergist, immunologist, or dermatologist.

72. Patient is Currently Receiving Dupixent. Approve for 1 year if the patient meets the following criteria (i and ii):

i. Patient has already received at least 4 months of therapy with Dupixent; AND
Note: A patient who has received < 4 months of therapy or who is restarting therapy with Dupixent should be considered under criterion 2A (Atopic Dermatitis, Initial Therapy).

ii. Patient has responded to therapy as determined by the prescriber.
Note: Examples of a response to Dupixent therapy are marked improvements in erythema, induration/papulation/edema, excoriations, and lichenification; reduced pruritus; decreased requirement for other topical or systemic therapies; reduced body surface area (BSA) affected with atopic dermatitis; or other responses observed.

3. Chronic Rhinosinusitis with Nasal Polyposis. Approve Dupixent for the duration noted if the patient meets one of the following conditions (A or B):

A) Initial Therapy. Approve for 6 months if the patient meets the following criteria (i, ii, iii, iv and v):

i. Patient is ≥ 18 years of age; AND

ii. Patient is currently receiving therapy with an intranasal corticosteroid; AND

iii. Patient is experiencing significant rhinosinusitis symptoms such as nasal obstruction, rhinorrhea, or reduction/loss of smell according to the prescriber; AND

iv. Patient meets ONE of the following (a or b):

a) Patient has received treatment with a systemic corticosteroid within the previous 2 years or has a contraindication to systemic corticosteroid therapy; OR

b) Patient has had prior surgery for nasal polyps; AND

v. Dupixent is prescribed by or in consultation with an allergist, immunologist, or an otolaryngologist (ear, nose and throat [ENT] physician specialist).

B) Patient is Currently Receiving Dupixent. Approve for 1 year if the patient meets the following criteria (i, ii and iii):

i. Patient has already received at least 6 months of therapy with Dupixent; AND
Note: A patient who has received < 6 months of therapy or who is restarting therapy with Dupixent should be considered under criterion 3A [Chronic Rhinosinusitis with Nasal Polyposis, Initial Therapy]).

ii. Patient continues to receive therapy with an intranasal corticosteroid; AND

iii. Patient has responded to therapy as determined by the prescriber.
Note: Examples of a response to Dupixent therapy are reduced nasal polyp size, improved nasal congestion, reduced sinus opacification, decreased sino-nasal symptoms, improved sense of smell.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Dupixent is not recommended in the following situations:

50. Concurrent use of Dupixent with another Anti-Interleukin Monoclonal Antibody. The efficacy and safety of Dupixent in combination with other anti-interleukin monoclonal antibodies (e.g., Cinqair, Nucala, Fasenra) have not been established.

51. Concurrent use of Dupixent with Xolair® (omalizumab injection for subcutaneous use). Xolair is a recombinant humanized immunoglobulin G (IgG)1κ monoclonal antibody indicated for use in patients ≥ 6 years of age with moderate to severe persistent asthma and who have a positive skin test or *in vitro* reactivity to a perennial aeroallergen and whose symptoms are inadequately controlled with inhaled corticosteroids.[21] Xolair is also indicated for chronic idiopathic urticaria in adults and adolescents 12 years of age and older who remain symptomatic despite H_1 antihistamine treatment and for nasal polyps, as add-on maintenance treatment in patients ≥ 18 years of age with an inadequate response to nasal corticosteroids. The efficacy and safety of Dupixent used in combination with Xolair have not been established.

52. Eosinophilic Esophagitis. One small, phase II study (n = 45) evaluated the efficacy of Dupixent in patients with active eosinophilic esophagitis.[27] Compared with placebo, Dupixent was found to reduce dysphagia, histologic features of disease, and abnormal endoscopic features. There areongoing Phase III studies that are evaluating the use of Dupixent in pediatric and adult patients with eosinoiphilic esophagitis. Results are anticipated in 2022.[22] Guidelines for the management of eosinophilic esophagitis from the American Gastroenterological Association (AGA) and the Joint Task Force on Allergy-Immunology Practice Parameters (2020) only recommend using anti-interleukin-5 therapies in the context of a clinical trial.[25]

53. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Early Annual Revision	• Updated initial therapy criteria for "Asthma in Patients with Moderate to Severe Disease" to state that the blood eosinophil level requirement of ≥ 150 cells per microliter should be from a level prior to treatment with Xolair, as well as prior to treatment with any anti-interleukin (IL) agent. Previously criteria only noted the level should be prior to any anti-IL therapy. • Updated initial therapy criteria for "Asthma in Patients with Moderate to Severe Disease" to more concisely state the previous therapies required. Added the following note: An exception to the requirement for a trial of one additional asthma controller/maintenance medication (criterion b) can be made if the patient has already received anti-IL-5 therapy (e.g., Cinqair, Fasenra, Nucala) or Xolair used concomitantly with an ICS for at least 3 consecutive months. • Updated initial therapy criteria for "Asthma in Patients with Moderate to Severe Disease" to state that the patient's asthma is uncontrolled or was uncontrolled prior to starting any anti-IL therapy (e.g., Cinqair, Fasenra, Nucala, Dupixent) or Xolair. Previously criteria only stated it should be uncontrolled prior to anti-IL therapy.	01/23/2019
Selected Revision	Changed the age requirement for "Atopic Dermatitis, Moderate to Severe" from ≥ 18 years of age to ≥ 12 years of age.	03/12/2019
Selected Revision	• Asthma: Approval indication was changed from "Asthma in Patients with Moderate to Severe Disease" to "Asthma". Wording in reference to "according to the prescribing physician" was changed to "according to the prescriber". • Atopic Dermatitis: Approval indication was changed from "Atopic Dermatitis, Moderate to Severe" to "Atopic Dermatitis". Duration of initial approval was clarified to 4 months (previously 16 weeks). Wording in reference to "according to the prescribing physician" was changed to "according to the prescriber". • Chronic Rhinosinusitis with Nasal Polyposis: Added new approval criteria for this indication which include an age requirement, involvement of a specialist, current intranasal corticosteroid therapy, the presence of significant rhinosinusitis symptoms, and previous systemic therapy (or contraindication) or surgery for nasal polyps. • Conditions Not Recommended for Approval: Removed "Nasal Polyps".	07/10/2019
Annual Revision	• Asthma: Removed lists of examples of inhaled asthma controller/maintenance medications.	02/12/2020
Selected Revision	• Added the following to the Policy Statement: All reviews will be forwarded to a Pharmacist.	03/25/2020
Selected Revision	• Atopic Dermatitis: Age requirement changed from ≥ 12 years of age to ≥ 6 years of age.	06/03/2020
Selected Revision	• Updated the Policy Statement to: All reviews will be forwarded to a Pharmacist or Medical Director.	6/10/2020
Update	Date: 06/16/2020 • Asthma: No criteria changes. Removed "urgent care and medical visits" from the examples of a response to Dupixent therapy in the criteria for Patients Continuing Dupixent Therapy.	NA
Selected Revision	• Updated the Policy Statement to remove: All reviews will be forwarded to a Pharmacist or Medical Director.	07/29/2020
Annual Revision	No criteria changes.	02/17/2021

PRIOR AUTHORIZATION POLICY

POLICY: Immunologicals – Fasenra Prior Authorization Policy

- Fasenra® (benralizumab injection for subcutaneous use – AstraZeneca)

REVIEW DATE: 02/17/2021

OVERVIEW

Fasenra, an interleukin-5 receptor alpha (IL-5Rα)-directed cytolytic monoclonal antibody, is indicated for **severe asthma** as add-on maintenance treatment of patients ≥ 12 years of age who have an eosinophilic phenotype.[1] Limitations of Use: Fasenra is not indicated for the treatment of other eosinophilic conditions or for the relief of acute bronchospasm/status asthmaticus.

Clinical Efficacy

Two of the Fasenra pivotal trials included patients 12 to 75 years of age with severe asthma not controlled with inhaled corticosteroid (ICS)/long-acting beta$_2$-agonist (LABA) therapy.[2-4] The addition of Fasenra to existing therapy significantly reduced annualized asthma exacerbation rates in patients with baseline blood eosinophil levels ≥ 300 cells/microliter. The magnitude of the improvements observed with Fasenra in this patient population were larger than those observed in patients with lower baseline eosinophil levels (e.g., < 150 cells/microliter). Another pivotal study involved adults with severe asthma receiving high-dose ICS/LABA and chronic oral corticosteroid (OCS) therapy who had a baseline blood eosinophil level ≥ 150 cells/microliter.[4] At Week 28, significantly more patients receiving Fasenra were able to reduce their OCS dose compared with placebo.

Guidelines

The Global Initiative for Asthma (GINA) Global Strategy for Asthma Management and Prevention (2020) proposes a step-wise approach to asthma treatment.[5] Fasenra is listed as an option for add-on therapy in patients ≥ 12 years of age with difficult-to-treat, severe eosinophilic asthma (i.e., asthma that cannot be managed by therapy with an ICS/LABA combination with or without an additional controller). Higher blood eosinophil levels, more exacerbations in the previous year, adult-onset asthma, nasal polyposis, and maintenance oral corticosteroids at baseline may predict a good asthma response to Fasenra.

According to the European Respiratory Society (ERS)/American Thoracic Society (ATS) guidelines (2014; updated in 2020), severe asthma is defined as asthma which requires treatment with a high-dose ICS in addition to a second controller medication (and/or systemic corticosteroids) to prevent it from becoming uncontrolled, or asthma which remains uncontrolled despite this therapy.[6,7] Uncontrolled asthma is defined as asthma that worsens upon tapering of high-dose ICS or systemic corticosteroids or asthma that meets one of the following four criteria:

9) Poor symptom control: Asthma Control Questionnaire consistently ≥ 1.5 or Asthma Control Test < 20;
10) Frequent severe exacerbations: two or more bursts of systemic corticosteroids in the previous year;
11) Serious exacerbations: at least one hospitalization, intensive care unit stay, or mechanical ventilation in the previous year;
12) Airflow limitation: FEV_1 < 80% predicted after appropriate bronchodilator withholding.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Fasenra. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Fasenra as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Fasenra to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Fasenra is recommended in those who meet the following criteria:

FDA-Approved Indications

11. Asthma. Approve Fasenra for the duration noted if the patient meets one of the following conditions (A or B):

73. Initial Therapy. Approve for 6 months if the patient meets the following criteria (i, ii, iii, iv, and v):

- **i.** Patient is ≥ 12 years of age; AND
- **ii.** Patient has a blood eosinophil count ≥ 150 cells per microliter within the previous 6 weeks or within 6 weeks prior to treatment with any anti-interleukin-5 therapy; AND
  Note: Examples of anti-interleukin-5 therapies include Fasenra, Cinqair® (reslizumab injection for intravenous use), and Nucala® (mepolizumab injection for subcutaneous use).
- **iii.** Patient has received at least 3 consecutive months of combination therapy with BOTH of the following (a and b):
  - **a)** An inhaled corticosteroid; AND
  - **b)** At least one additional asthma controller or asthma maintenance medication; AND

  Note: Examples of additional asthma controller or asthma maintenance medications are inhaled long-acting beta$_2$-agonists, inhaled long-acting muscarinic antagonists, leukotriene receptor antagonists, anti-interleukin-5 therapies (e.g., Cinqair, Fasenra, Nucala), and theophylline. Use of a combination inhaler containing both an inhaled corticosteroid and a long-acting beta$_2$-agonist would fulfil the requirement for both criteria a and b.
- **iv.** Patient has asthma that is uncontrolled or was uncontrolled at baseline as defined by ONE of the following (a, b, c, d, or e):
  - **a)** Patient experienced two or more asthma exacerbations requiring treatment with systemic corticosteroids in the previous year; OR
  - **b)** Patient experienced one or more asthma exacerbation(s) requiring hospitalization or an Emergency Department visit in the previous year; OR
  - **c)** Patient has a forced expiratory volume in 1 second (FEV_1) < 80% predicted; OR
  - **d)** Patient has an FEV_1/forced vital capacity (FVC) < 0.80; OR
  - **e)** The patient has asthma that worsens upon tapering of oral corticosteroid therapy; AND

  Note: "Baseline" is defined as prior to receiving any Fasenra or other anti-interleukin- 5 therapies (i.e., Cinqair or Nucala).
- **v.** The medication is prescribed by or in consultation with an allergist, immunologist, or pulmonologist.

74. Patient is Currently Receiving Fasenra. Approve for 1 year if the patient meets the following criteria (i, ii, and iii):

- **i.** Patient has already received at least 6 months of therapy with Fasenra; AND

Note: A patient who has received < 6 months of therapy or who is restarting therapy with Fasenra should be considered under criterion 1A (Asthma, Initial Therapy).

ii. Patient continues to receive therapy with one inhaled corticosteroid or one inhaled corticosteroid-containing combination inhaler; AND

iii. Patient has responded to therapy as determined by the prescriber.
Note: Examples of a response to Fasenra therapy are decreased asthma exacerbations; decreased asthma symptoms; decreased hospitalizations, emergency department/urgent care, or medical clinic visits due to asthma; and decreased requirement for oral corticosteroid therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Fasenra is not recommended in the following situations:

54. Chronic Obstructive Pulmonary Disease (COPD). Fasenra is not indicated for the treatment of COPD.[1] One double-blind, placebo-controlled, Phase IIa study (n = 101) evaluated the efficacy and safety of Fasenra in patients 40 to 80 years of age with eosinophilia and moderate to severe COPD.[8] The annualized rate of acute COPD exacerbations was not reduced with Fasenra compared with placebo. Lung function was also not significantly improved with Fasenra vs. placebo. Numerically greater (although non-significant) improvements in exacerbations and lung function were observed with Fasenra vs. placebo in patients with baseline blood eosinophil levels of 200 cells/microliter or more. Two double-blind, placebo-controlled, Phase III studies (GALATHEA and TERRANOVA) also evaluated Fasenra in patients with moderate to very severe COPD (n = 1,120 and n = 1,545 patients, respectively, with eosinophils ≥ 220 cells/mm^3).[9] Following, 56 weeks of therapy, the annualized COPD exacerbation rates were not statistically significantly reduced with Fasenra vs. placebo in either study. Current COPD guidelines from the Global Initiative for Chronic Lung Disease (GOLD) [2021] note the negative data with Fasenra and state that further studies are needed.[10]

55. Concurrent use of Fasenra with Another Anti-Interleukin Monoclonal Antibody. The efficacy and safety of Fasenra used in combination with other anti-interleukin monoclonal antibodies (e.g., Nucala® [mepolizumab injection for subcutaneous use], Cinqair® [reslizumab injection for intravenous use], Dupixent® [dupilumab subcutaneous injection]) have not been established.

56. Concurrent use of Fasenra with Xolair® (omalizumab injection for subcutaneous use). Xolair is a recombinant humanized immunoglobulin G (IgG)1κ monoclonal antibody indicated for use in adults and adolescents (aged ≥ 6 years) with moderate to severe persistent asthma and who have a positive skin test or *in vitro* reactivity to a perennial aeroallergen and whose symptoms are inadequately controlled with ICSs.[11] Xolair is also indicated for chronic idiopathic urticaria in adults and adolescents 12 years of age and older who remain symptomatic despite H_1 antihistamine treatment and for nasal polyps, as add-on maintenance treatment in patients ≥ 18 years of age with an inadequate response to nasal corticosteroids. The efficacy and safety of Fasenra used in combination with Xolair have not been established.

57. Hypereosinophilic Syndrome. Fasenra is not indicated for the treatment of eosinophilic conditions other than asthma.[1] A small, randomized, double-blind, placebo-controlled, Phase II trial (n = 20) evaluated the efficacy of Fasenra in patients who had platelet-derived growth factor receptor alpha (PDGFRA)-negative hypereosinophilic syndrome with an absolute eosinophil count of 1,000 cells/mm^3.[12] At Week 12, 90% of patients receiving Fasenra (n = 9/10) vs. 30% of patients receiving placebo (n = 3/10) achieved a 50% or greater reduction in the absolute eosinophil count (P = 0.02). Following the randomized phase, all patients received open-label Fasenra 30 mg every 4 weeks. During this time, 74% of patients (n = 14/19) had sustained clinical and hematologic responses for 48 weeks.

The 2019 World Health Organization (WHO)-defined eosinophilic disorders update on diagnosis, risk stratification, and management notes that corticosteroids remain the cornerstone of therapy for several forms of hypereosinophilic syndrome.[13] Use of anti-interleukin (IL)-5 approaches for the treatment of hypereosinophilic syndrome remains investigational. In patients who have idiopathic hypereosinophilic syndrome and end organ damage, enrollment into an anti-IL-5/anti-IL-5 receptor antibody clinical trial is recommended as second-line therapy. Similarly, in patients with lymphocyte-variant hypereosinophilic syndrome, enrollment into an anti-IL-5/anti-IL-5 receptor antibody clinical trial is also recommended as second-line therapy. Further investigation is warranted.

58. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Early Annual Revision	Updated initial therapy criteria for "Asthma in Patients with Severe Disease and an Eosinophilic Phenotype" to more concisely state the previous therapies required. Added the following note: An exception to the requirement for a trial of one additional asthma controller/maintenance medication (criterion b) can be made if the patient has already received anti-IL-5 therapy (e.g., Cinqair, Fasenra, Nucala) used concomitantly with an ICS for at least 3 consecutive months.	01/23/2019
Update	Added data regarding Fasenra for the treatment of COPD and hypereosinophilic syndrome. Date: 06/24/2019.	--
Annual Revision	• **Asthma**: Approval indication was changed from "Asthma in Patients with Severe Disease and an Eosinophilic Phenotype" to "Asthma". Wording in reference to "according to the prescribing physician" was changed to "according to the prescriber". Removed lists of examples of inhaled asthma controller/maintenance medications. • **Hypereosinophilic Syndrome**: Condition not recommended for approval was changed from "Hypereosinophilic Syndrome, Idiopathic" to "Hypereosinophilic Syndrome".	02/12/2020
Annual Revision	No criteria changes.	02/17/2021

IL – Interleukin; ICS – Inhaled corticosteroid; COPD – Chronic obstructive pulmonary disease.

PRIOR AUTHORIZATION POLICY

POLICY: Immunologicals – Nucala Prior Authorization Policy

- Nucala® (mepolizumab injection for subcutaneous use – GlaxoSmithKline)

REVIEW DATE: 02/17/2021

OVERVIEW

Nucala, an interleukin-5 antagonist monoclonal antibody, is indicated for the following uses:[1]

- **Asthma**, as add-on maintenance treatment of patients ≥ 6 years of age with severe disease and an eosinophilic phenotype. Limitations of Use: Nucala is not indicated for the relief of acute bronchospasm or status asthmaticus.
- **Eosinophilic granulomatosis with polyangiitis** (EGPA) [formerly known as Churg-Strauss Syndrome] in adult patients.
- **Hypereosinophilic syndrome** (HES) in patients ≥ 12 years of age who have had HES for ≥ 6 months without an identifiable non-hematologic secondary cause.

Clinical Efficacy

Asthma

The efficacy of Nucala was established in three studies in patients ≥ 12 years of age with severe asthma and eosinophilic inflammation despite therapy with an inhaled corticosteroid and another maintenance medication.[1-4] In general, patients were required to have elevated eosinophils at baseline (e.g., peripheral blood eosinophil count ≥ 150 cells/microliter at screening or ≥ 300 cells/microliter at some time during the previous year). In patients with a history of frequent exacerbations (i.e., two or more asthma exacerbations requiring systemic corticosteroid therapy within the previous year), Nucala significantly reduced the rate of clinically significant asthma exacerbations per patient per year compared with placebo. Additionally, in a study of patients with asthma requiring maintenance treatment with oral corticosteroids, significantly more patients who received 24 weeks of Nucala therapy were able to reduce their oral corticosteroid dose compared with placebo. Use of Nucala in patients 6 to 11 years of age with severe eosinophilic asthma is supported by the clinical trials in adults and adolescents along with additional pharmacokinetic, pharmacodynamic, and safety studies conducted specifically in patients 6 to 11 years of age.

Eosinophilic Granulomatosis with Polyangiitis (EGPA)
One study evaluated the efficacy of Nucala in patients ≥ 18 years of age with relapsing or refractory EGPA who had received ≥ 4 weeks of a stable oral corticosteroid dose (i.e., prednisolone, prednisone).[5] Patients were also required to have a baseline relative eosinophil level of 10% or an absolute eosinophil level > 1,000 cells per microliter; however, the baseline mean absolute eosinophil level was approximately 175 cells per microliter across both treatment groups. While remission benefit of Nucala was demonstrated in the overall patient population, the magnitude of improvements observed with Nucala were larger in patients with baseline eosinophil levels ≥ 150 cells per microliter than in patients with lower baseline levels.

Hypereosinophilic Syndrome
One study evaluated the efficacy of Nucala in patients ≥ 12 years of age with hypereosinophilic syndrome for ≥ 6 months.[6] Patients with non-hematologic secondary hypereosinophilic syndrome and those with FIP1L1-PDGFRα kinase-positive hypereosinophilic syndrome were excluded. All patients had a baseline blood eosinophil count ≥ 1,000 cells per microliter and had experienced two or more hypereosinophilic flares within the previous 12 months. Additionally, all patients had been on stable therapy for their hypereosinophilic syndrome (e.g., oral corticosteroids, immunosuppressive agents, or cytotoxic therapy) for 4 weeks or more prior to randomization. Over the 32-week treatment period, significantly fewer patients experienced one or more hypereosinophilic syndrome flares with Nucala compared with placebo.

Guidelines
Asthma Guidelines
The Global Initiative for Asthma (GINA) Global Strategy for Asthma Management and Prevention (2020) proposes a step-wise approach to asthma treatment.[7] Nucala is listed as an option for add-on therapy in patients ≥ 6 years of age with difficult-to-treat, severe eosinophilic asthma (i.e., asthma that cannot be managed by therapy with an ICS/long-acting beta$_2$-agonist [LABA] combination with or without an additional controller). Higher blood eosinophil levels, more exacerbations in the previous year, adult-onset asthma, nasal polyposis, and maintenance corticosteroids at baseline may predict a good asthma response to Nucala.

According to the European Respiratory Society (ERS)/American Thoracic Society (ATS) guidelines (2014; updated in 2020), severe asthma is defined as asthma which requires treatment with a high-dose ICS in addition to a second controller medication (and/or systemic corticosteroids) to prevent it from becoming uncontrolled, or asthma which remains uncontrolled despite this therapy.[8,9] Uncontrolled asthma is defined as asthma that worsens upon tapering of high-dose ICS or systemic corticosteroids or asthma that meets one of the following four criteria:

13) Poor symptom control: Asthma Control Questionnaire consistently ≥ 1.5 or Asthma Control Test < 20;
14) Frequent severe exacerbations: two or more bursts of systemic corticosteroids in the previous year;
15) Serious exacerbations: at least one hospitalization, intensive care unit stay, or mechanical ventilation in the previous year;
16) Airflow limitation: FEV_1 < 80% predicted after appropriate bronchodilator withholding.

EGPA Guidelines
Current EGPA guidelines do not address Nucala or the other anti-interleukin (IL)-5 therapies. The 2016 European League Against Rheumatism (EULAR) recommendations for the management of anti-neutrophil cytoplasmic autoantibody (ANCA)-associated vasculitis address EGPA.[10] All patients should be managed in close collaboration with or at centers of expertise where specialists can provide appropriate interventions and monitoring. For remission-induction in patients with new onset organ- or life-threatening ANCA-associated vasculitis, a combination of corticosteroids and either cyclophosphamide or rituximab is recommended (Level 3 evidence, Grade C recommendation for EGPA specifically). For maintenance of

remission of EGPA, a combination of low-dose corticosteroids and azathioprine should be used (Level 3 evidence, Grade C recommendation); maintenance therapy should be considered for 24 months at a minimum.

In 2015, a Consensus Task Force comprised of experts from Europe and the United States published recommendations for the evaluation and management of EGPA.[11] These recommendations are similar to the EULAR guidance and also conclude that EGPA should be managed in collaboration with, or in, centers specializing in the management of small- and medium-sized-vessel vasculitides. In general, it is appropriate to use corticosteroids to induce EGPA remission; these medications are the cornerstone of therapy for EGPA.

Hypereosinophilia Guidelines

The 2019 World Health Organization (WHO)-defined eosinophilic disorders update on diagnosis, risk stratification, and management notes that corticosteroids remain the cornerstone of therapy for several forms of HES.[12] Use of anti-IL-5 approaches for the treatment of HES remains investigational. This document was published prior to the approval of Nucala for HES. However, it is recommended that patients with idiopathic HES and end organ damage as well as those with lymphocyte-variant HES should consider enrollment into an anti-IL-5/anti-IL-5 receptor antibody clinical trial (as second-line therapy).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Nucala. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Nucala as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Nucala to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Nucala is recommended in those who meet the following criteria:

FDA-Approved Indications

12. Asthma. Approve Nucala for the duration noted if the patient meets one of the following conditions (A or B):

75. Initial Therapy. Approve for 6 months if the patient meets the following criteria (i, ii, iii, iv, and v):

- **i.** Patient is ≥ 6 years of age; AND
- **ii.** Patient has a blood eosinophil level ≥ 150 cells per microliter within the previous 6 weeks or within 6 weeks prior to treatment with any anti-interleukin-5 therapy; AND
  Note: Examples of anti-interleukin-5 therapies include Nucala, Cinqair® (reslizumab injection for intravenous use), and Fasenra® (benralizumab injection for subcutaneous use).
- **iii.** Patient has received at least 3 consecutive months of combination therapy with BOTH of the following (a and b):
  - **a)** An inhaled corticosteroid; AND
  - **b)** At least one additional asthma controller or asthma maintenance medication; AND

  Note: Examples of additional asthma controller or asthma maintenance medications are inhaled long-acting beta$_2$-agonists, inhaled long-acting muscarinic antagonists, leukotriene receptor antagonists, anti-interleukin-5 therapies (e.g., Cinqair, Fasenra, Nucala), and

theophylline. Use of a combination inhaler containing both an inhaled corticosteroid and a long-acting beta$_2$-agonist would fulfil the requirement for both criteria a and b.

iv. Patient has asthma that is uncontrolled or was uncontrolled at baseline as defined by ONE of the following (a, b, c, d, or e):

a) Patient experienced two or more asthma exacerbations requiring treatment with systemic corticosteroids in the previous year; OR

b) Patient experienced one or more asthma exacerbation(s) requiring hospitalization or an Emergency Department visit in the previous year; OR

c) Patient has a forced expiratory volume in 1 second (FEV_1) < 80% predicted; OR

d) Patient has an FEV_1/forced vital capacity (FVC) < 0.80; OR

e) The patient has asthma that worsens upon tapering of oral corticosteroid therapy; AND

Note: "Baseline" is defined as prior to receiving any Nucala or other anti-interleukin-5 therapies (i.e., Fasenra or Nucala).

v. The medication is prescribed by or in consultation with an allergist, immunologist, or pulmonologist.

76. Patient is Currently Receiving Nucala. Approve for 1 year if the patient meets the following criteria (i, ii, and iii):

i. Patient has already received at least 6 months of therapy with Nucala; AND
Note: A patient who has received < 6 months of therapy or who is restarting therapy with Nucala should be considered under criterion 1A (Asthma, Initial Therapy).

ii. Patient continues to receive therapy with one inhaled corticosteroid or one inhaled corticosteroid-containing combination inhaler; AND

iii. Patient has responded to therapy as determined by the prescriber.
Note: Examples of a response to Nucala therapy are decreased asthma exacerbations; decreased asthma symptoms; decreased hospitalizations, emergency department/urgent care, or medical clinic visits due to asthma; and decreased requirement for oral corticosteroid therapy.

13. Eosinophilic Granulomatosis with Polyangiitis (EGPA) [formerly known as Churg-Strauss Syndrome]. Approve Nucala for the duration noted if the patient meets one of the following conditions (A or B):

14. Initial Therapy. Approve for 6 months if the patient meets the following conditions (i, ii, iii, and iv):

i. Patient is ≥ 18 years of age; AND

ii. Patient has/had a blood eosinophil level ≥ 150 cells per microliter within the previous 6 weeks or within 6 weeks prior to treatment with any anti-interleukin-5 therapy; AND
Note: Examples of anti-interleukin-5 therapies include Nucala, Cinqair, and Fasenra.

iii. Patient has tried therapy with a corticosteroid (e.g., prednisone) for a minimum of 4 weeks; AND

iv. The medication is prescribed by or in consultation with an allergist, immunologist, pulmonologist, or rheumatologist.

15. Patient is Currently Receiving Nucala. Approve for 1 year if the patient meets the following criteria (i and ii):

i. Patient has already received at least 6 months of therapy with Nucala; AND
Note: A patient who has received < 6 months of therapy or who is restarting therapy with Nucala should be considered under criterion 2A (Eosinophilic Granulomatosis with Polyangiitis, Initial Therapy).

ii. Patient has responded to therapy as determined by the prescriber.
Note: Examples of a response to Nucala therapy are reduced rate of relapse, corticosteroid dose reduction, and reduced eosinophil levels.

16. **Hypereosinophilic Syndrome.** Approve Nucala for the duration noted if the patient meets one of the following conditions (A or B):
    17. Initial Therapy. Approve for 8 months if the patient meets the following conditions (i, ii, iii, iv, v, vi, and vii):
        - **i.** Patient is ≥ 12 years of age; AND;
        - **ii.** Patient has had hypereosinophilic syndrome for ≥ 6 months; AND
        - **iii.** Patient has FIP1L1-PDGFRα-negative disease; AND
        - **iv.** Patient does NOT have an identifiable non-hematologic secondary cause of hypereosinophilic syndrome according to the prescriber; AND
          Note: Examples of secondary causes of hypereosinophilic syndrome include drug hypersensitivity, parasitic helminth infection, human immunodeficiency virus infection, non-hematologic malignancy.
        - **v.** Patient has/had a blood eosinophil level ≥ 1,000 cells per microliter prior to treatment with any anti-interleukin-5 therapy; AND
          Note: Examples of anti-interleukin-5 therapies include Nucala, Cinqair, and Fasenra.
        - **vi.** Patient has tried at least one other treatment for hypereosinophilic syndrome for a minimum of 4 weeks; AND
          Note: Treatments for hypereosinophilic syndrome include systemic corticosteroids, hydroxyurea, cyclosporine, imatinib, methotrexate, tacrolimus, and azathioprine.
        - **vii.** Nucala is prescribed by or in consultation with an allergist, immunologist, pulmonologist, or rheumatologist.
    18. Patient is Currently Receiving Nucala. Approve for 1 year if the patient meets the following criteria (i and ii):
        - **i.** Patient has already received at least 8 months of therapy with Nucala; AND
          Note: A patient who has received < 8 months of therapy or who is restarting therapy with Nucala should be considered under criterion 3A (Hypereosinophilic Syndrome, Initial Therapy).
        - **ii.** Patient has responded to therapy as determined by the prescriber.
          Note: Examples of a response to Nucala therapy are decreased number of flares, improved fatigue, reduced corticosteroid requirements, and decreased eosinophil levels.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Nucala is not recommended in the following situations:

59. **Atopic Dermatitis.** Nucala is not indicated for the treatment of atopic dermatitis.[1] In one small study, intravenous (IV) mepolizumab significantly reduced peripheral blood eosinophil counts in patients with moderate to severe atopic dermatitis.[13,14] However, mepolizumab IV therapy did not result in clinical success as assessed by Physician's Global Assessment of Improvement scores compared with placebo. Other clinical outcomes were also not significantly improved with mepolizumab IV. Another small study evaluated subcutaneous Nucala in patients with moderate to severe atopic dermatitis.[15] Following 16 weeks of therapy, Nucala did not demonstrate efficacy, with 11% (n = 2/11) of patients meeting the primary endpoint of treatment success with Nucala vs. 0 with placebo.

60. **Chronic Obstructive Pulmonary Disease (COPD).** Nucala is not indicated for the treatment of COPD.[1] Two Phase III studies, METREX (n = 836) and METREO (n = 675) evaluated Nucala in patients with COPD who had a history of moderate or severe exacerbations despite treatment with inhaled triple therapy (inhaled corticosteroid/long-acting muscarinic antagonist/long-acting beta$_2$-agonist).[16] METREX included patients regardless of eosinophil counts, but did include a subgroup of patients who were considered to have an eosinophilic phenotype (eosinophil count ≥ 150 cells/microliter) [n = 462]. METREO only included patients with an eosinophilic phenotype (defined

as an eosinophil count ≥ 150 cells/microliter at screening or ≥ 300 cells/microliter within the previous year). Overall, lower COPD exacerbation rates were observed with Nucala vs. placebo; however, none of these reductions were statistically significant in either the METREX overall modified intent to treat (mITT) population or the METREO mITT population (which included all eosinophilic phenotype patients). In the subgroup of patients in the METREX study with an eosinophilic phenotype, the COPD exacerbation rates were statistically lower with Nucala vs. placebo, as was the difference in the time to first exacerbation. In July 2018, the FDA's Pulmonary Allergy Drugs Advisory Committee voted against approval of Nucala as an add-on treatment to inhaled corticosteroid-based maintenance treatments to reduce flare-ups in patients with COPD.[17] The Committee had concerns about the defining criteria for the eosinophilic phenotype of COPD as well as the lack of data on patient asthma history. Subsequently, in September 2018, the FDA rejected the approval of Nucala for COPD citing the need for additional clinical data. Current COPD guidelines from the Global Initiative for Chronic Lung Disease (GOLD) [2021] note the mixed data with Nucala.[18] The guidelines state that further studies are needed to determine if Nucala may have a role in a highly selected subgroup of patients with eosinophilic COPD.

61. Concurrent use of Nucala with another Anti-Interleukin Monoclonal Antibody. The efficacy and safety of Nucala used in combination with other anti-interleukin monoclonal antibodies (e.g., Cinqair, Fasenra, Dupixent® [dupilumab subcutaneous injection]) have not been established.

62. Concurrent use of Nucala with Xolair® (omalizumab injection for subcutaneous use). Xolair is a recombinant humanized immunoglobulin G (IgG)1κ monoclonal antibody indicated for use in patients ≥ 6 years of age with moderate to severe persistent asthma and who have a positive skin test or *in vitro* reactivity to a perennial aeroallergen and whose symptoms are inadequately controlled with ICSs.[19] Xolair is also indicated for chronic idiopathic urticaria in adults and adolescents 12 years of age and older who remain symptomatic despite H_1 antihistamine treatment and for nasal polyps, as add-on maintenance treatment in patients ≥ 18 years of age with an inadequate response to nasal corticosteroids. The efficacy and safety of Nucala used in combination with Xolair have not been established. A small number of case reports detailing combination use of Nucala and Xolair are available for both FDA-approved and off-label uses.[20-22] Further investigation is warranted.

63. Eosinophilic Esophagitis, Eosinophilic Gastroenteritis, or Eosinophilic Colitis. Nucala is not indicated for the treatment of eosinophilic esophagitis, eosinophilic gastroenteritis or eosinophilic colitis.[1] A few small studies have reported IV mepolizumab to be efficacious in these conditions.[23-25] Of note, Nucala is not approved for IV administration.[1] Guidelines for the management of eosinophilic esophagitis from the American Gastroenterological Association (AGA) and the Joint Task Force on Allergy-Immunology Practice Parameters (2020) only recommend using anti-interleukin-5 therapies in the context of a clinical trial.[26] Further research is warranted to determine if Nucala has a place in therapy in the treatment of these conditions.

64. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	Updated initial therapy criteria for "Asthma in Patients with Severe Disease and an Eosinophilic Phenotype" to more concisely state the previous therapies required. Added the following note: An exception to the requirement for a trial of one additional asthma controller/maintenance medication (criterion b) can be made if the patient has already received anti-IL-5 therapy (e.g., Cinqair, Fasenra, Nucala) used concomitantly with an ICS for at least 3 consecutive months.	01/23/2019
Selected Revision	• **Asthma**: Approval indication was changed from "Asthma in Patients with Severe Disease and an Eosinophilic Phenotype" to "Asthma". Age approval changed from ≥ 12 years of age to ≥ 6 years of age. Wording in reference to "according to the	09/25/2019

	prescribing physician" was changed to "according to the prescriber". Added Wixela Inhub, a generic to Advair Diskus, to list of examples of asthma controller/maintenance medications. • **EGPA**: Wording in reference to "according to the prescribing physician" was changed to "according to the prescriber".	
Annual Revision	• **Asthma**: Removed lists of examples of inhaled asthma controller/maintenance medications. • **Hypereosinophilic Syndrome**: Condition not recommended for approval was changed from "Hypereosinophilic Syndrome, Idiopathic" to "Hypereosinophilic Syndrome".	02/12/2020
Selected Revision	• Added "Hypereosinophilic Syndrome" to "FDA-Approved Indications". • Removed "Hypereosinophilic Syndrome" from "Conditions Not Recommended for Approval".	10/28/2020
Annual Revision	"Nasal Polyps" removed from "Conditions Not Recommended for Approval".	02/17/2021

IL – Interleukin; ICS – Inhaled corticosteroid; EGPA – Eosinophilic granulomatosis with polyangiitis.

PRIOR AUTHORIZATION POLICY

POLICY: Immunologicals – Xolair Prior Authorization Policy

- Xolair® (omalizumab injection for subcutaneous use – Genentech/Novartis)

REVIEW DATE: 02/17/2021

OVERVIEW

Xolair, an anti-immunoglobulin E (IgE) monoclonal antibody, is indicated in the following conditions:[1]

- **Asthma,** in patients ≥ 6 years of age with moderate to severe persistent disease who have a positive skin test or *in vitro* reactivity to a perennial aeroallergen and whose symptoms are inadequately controlled with inhaled corticosteroids (ICSs). Xolair has been shown to decrease the incidence of asthma exacerbations in these patients. Limitations of Use: Xolair is not indicated for the relief of acute bronchospasm or status asthmaticus. It is also not indicated for the treatment of other allergic conditions.
- **Chronic idiopathic urticaria**, in patients ≥ 12 years of age who remain symptomatic despite H1 antihistamine treatment. Limitation of Use: Xolair is not indicated for the treatment of other forms of urticaria.
- **Nasal polyps**, as add-on maintenance treatment in patients ≥ 18 years of age with an inadequate response to nasal corticosteroids.

Dosing of Xolair for the treatment of asthma or nasal polyps is based on body weight and the serum total immunoglobulin E (IgE) level measured before the start of treatment.[1] Dosing for these indications is only provided for patients with a pretreatment serum IgE level ≥ 30 IU/mL. Dosing of Xolair in patients with chronic idiopathic urticaria is not dependent on serum IgE level or body weight.

Clinical Efficacy

Asthma Clinical Efficacy

In general, the pivotal studies in which Xolair demonstrated its efficacy for the treatment of asthma included patients with moderate to severe allergic asthma who had a positive skin test to perennial aeroallergens.[1-11] Patients also had a baseline IgE level between 30 and 700 IU/mL and were experiencing asthma symptoms despite ICS therapy (with or without a second controller such as an inhaled long-acting $beta_2$-agonist [LABA]). There are data to support the use of Xolair in patients ≥ 6 years of age. In the majority of the Xolair trials, efficacy was assessed as early as 16 weeks.

Chronic Idiopathic Urticaria Clinical Efficacy

Efficacy and safety of Xolair in the treatment of chronic idiopathic urticaria was established in two pivotal studies in patients 12 to 75 years of age who had symptomatic chronic idiopathic urticaria despite having used an H1-receptor antagonist for ≥ 2 weeks.[1,12,13] Chronic idiopathic urticaria was defined as a patient having hives, angioedema, or both that recur for > 6 weeks and have no apparent external trigger. One of the studies included a 12-week double-blind treatment period, while the other was longer with 24 weeks of double-blind treatment.

Nasal Polyps Clinical Efficacy

Two pivotal studies evaluated the efficacy of Xolair in patients ≥ 18 years of age with persistent bilateral nasal polyps, despite treatment with intranasal corticosteroids.[1,14] Patients were also required to have nasal congestion, impaired health-related quality of life, and a serum IgE level between 30 IU/mL and 1,500 IU/mL. There was no requirement for prior systemic corticosteroid treatment or prior surgery. However, 60% of patients had previously undergone nasal polyp surgery and 22% of patients reported use of a systemic corticosteroid in the previous year. Patients continued treatment with intranasal corticosteroids throughout the study. Across both studies, efficacy was evaluated at Week 24.

Guidelines

Asthma Guidelines

The Global Initiative for Asthma (GINA) Global Strategy for Asthma Management and Prevention (2020) proposes a step-wise approach to asthma treatment.[15] Xolair is listed as an option for add-on therapy in patients ≥ 6 years of age with moderate or severe allergic asthma that is uncontrolled by medium- to high-dose ICS/LABA therapy.

According to the European Respiratory Society (ERS)/American Thoracic Society (ATS) guidelines (2014; updated in 2020), severe asthma is defined as asthma which requires treatment with a high-dose ICS in addition to a second controller medication (and/or systemic corticosteroids) to prevent it from becoming uncontrolled, or asthma which remains uncontrolled despite this therapy.[16,17] Uncontrolled asthma is defined as asthma that worsens upon tapering of high-dose ICS or systemic corticosteroids or asthma that meets one of the following four criteria:

17) Poor symptom control: Asthma Control Questionnaire consistently ≥ 1.5 or Asthma Control Test < 20;
18) Frequent severe exacerbations: two or more bursts of systemic corticosteroids in the previous year;
19) Serious exacerbations: at least one hospitalization, intensive care unit stay, or mechanical ventilation in the previous year;
20) Airflow limitation: FEV_1 < 80% predicted after appropriate bronchodilator withholding.

Chronic Urticaria Guidelines

A Practice Parameter on the Diagnosis and Management of Acute and Chronic Urticaria from the Joint Task Force on Practice Parameters (JTFPP), representing the American Academy of Allergy, Asthma, & Immunology (AAAAI); the American College of Allergy, Asthma, & Immunology (ACAAI); and the Joint Council of Allergy, Asthma, & Immunology (JCAAI) [2014] and guideline from the European Academy of Allergy and Clinical Immunology (EAACI)/Global Allergy and Asthma European Network (GA[2]LEN)/European Dermatology Forum (EDF)/World Allergy Organization (WAO) [2018] define chronic urticaria as urticaria that has been continuously or intermittently present for at least 6 weeks.[18,19] Continuous therapy with antihistamines (second generation H1-antagonists) is generally recommended as first-line pharmacologic treatment for urticaria following trigger avoidance. If symptoms persist following 2 to 4 weeks of initial therapy, the dose of the second generation H1-antagonist should be increased to up to 4-fold. For patients with refractory chronic urticaria, the addition of Xolair may be considered.

Nasal Polyp Guidelines

A 2014 Practice Parameter on the Diagnosis and Management of Rhinosinusitis and a 2020 Practice Parameter for the Management of Rhinitis from the JTFPP recommend nasal corticosteroids be used in patients with chronic rhinosinusitis with nasal polyps, as they decrease nasal polyp size, prevent regrowth of nasal polyps following surgical removal, and improve nasal symptoms.[20-23] Short courses of oral corticosteroids are also recommended. Endoscopic surgical intervention may be considered as an adjunct to medical therapy in patients with chronic rhinosinusitis that is not responsive or is poorly responsive to medical therapy. The parameter lists Xolair as a therapy that may be considered for the treatment of nasal polyps based on the limited data available at the time of publication. A 2015 Clinical Practice Guideline update on Adult Sinusitis from the American Academy of Otolaryngology (AAO) makes similar recommendations, stating that clinicians should recommend saline nasal irrigation, topical nasal corticosteroids, or both for symptom relief in patients with chronic rhinosinusitis (with or without nasal polyps).[24] The AAO guidelines do not address Xolair.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Xolair. All approvals are provided for the duration noted below. In cases where approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Xolair, as well as the monitoring required for adverse events and long-term efficacy, approval requires Xolair to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Xolair is recommended in those who meet one of the following criteria:

FDA-Approved Indications

18. Asthma. Approve Xolair for the duration noted if the patient meets one of the following conditions (A or B):

A) Initial Therapy. Approve for 4 months if the patient meets the following criteria (i, ii, iii, iv, v, and vi):

i. Patient is ≥ 6 years of age; AND

ii. Patient has a baseline immunoglobulin E (IgE) level ≥ 30 IU/mL; AND
Note: "Baseline" is defined as prior to receiving any Xolair or anti-interleukin 4/13 therapy (i.e., Dupixent® [dupilumab subcutaneous injection]).

iii. Patient has a baseline positive skin test or *in vitro* test (i.e., a blood test) for allergen-specific immunoglobulin E (IgE) for one or more perennial aeroallergens and/or for one or more seasonal aeroallergens; AND
Note: "Baseline" is defined as prior to receiving any Xolair or anti-interleukin 4/13 therapy (i.e. Dupixent). Examples of perennial aeroallergens are house dust mite, animal dander, cockroach, feathers, and mold spores. Examples of seasonal aeroallergens are grass, pollen, and weeds.

iv. Patient has received at least 3 consecutive months of combination therapy with BOTH of the following (a and b):

a) An inhaled corticosteroid; AND

b) At least one additional asthma controller or asthma maintenance medication; AND
Note: Examples of additional asthma controller or asthma maintenance medications are inhaled long-acting beta$_2$-agonists, inhaled long-acting muscarinic antagonists, leukotriene receptor antagonists, Dupixent® (dupilumab subcutaneous injection), and theophylline. Use of a combination inhaler containing both an inhaled corticosteroid and additional asthma controller/maintenance medication(s) would fulfil the requirement for both criteria a and b.

v. Patient has asthma that is uncontrolled or was uncontrolled at baseline as defined by ONE of the following (a, b, c, d, or e):

a) Patient experienced two or more asthma exacerbations requiring treatment with systemic corticosteroids in the previous year; OR

b) Patient experienced one or more asthma exacerbation(s) requiring hospitalization or an Emergency Department visit in the previous year; OR

c) Patient has a forced expiratory volume in 1 second (FEV_1) < 80% predicted; OR

d) Patient has an FEV_1/forced vital capacity (FVC) < 0.80; OR

e) Patient has asthma that worsens upon tapering of oral corticosteroid therapy; AND
Note: "Baseline" is defined as prior to receiving any Xolair or anti-interleukin 4/13 therapy (i.e. Dupixent® [dupilumab subcutaneous injection]).

vi. The medication is prescribed by or in consultation with an allergist, immunologist, or pulmonologist.

B) Patient is Currently Receiving Xolair. Approve for 1 year if the patient meets the following criteria (i, ii, and iii):

i. Patient has already received at least 4 months of therapy with Xolair; AND
Note: A patient who has received < 4 months of therapy or who is restarting therapy with Xolair should be considered under criterion 1A (Asthma, Initial Therapy).

ii. Patient continues to receive therapy with one inhaled corticosteroid or one inhaled corticosteroid-containing combination inhaler; AND

iii. Patient has responded to therapy as determined by the prescriber.

Note: Examples of a response to Xolair therapy are decreased asthma exacerbations; decreased asthma symptoms; decreased hospitalizations, emergency department/urgent care, or medical clinic visits due to asthma; decreased reliever/rescue medication use; and improved lung function parameters.

19. Chronic Idiopathic Urticaria (Chronic Spontaneous Urticaria). Approve Xolair for the duration noted if the patient meets one of the following conditions (A or B):

A) Initial Therapy. Approve for 4 months if the patient meets the following criteria (i, ii, and iii):

i. Patient is ≥ 12 years of age; AND

ii. Patient has/had urticaria for > 6 weeks (prior to treatment with Xolair), with symptoms present > 3 days per week despite daily non-sedating H_1 antihistamine therapy with doses that have been titrated up to a maximum of four times the standard FDA-approved dose; AND

Note: Examples of non-sedating H_1 antihistamine therapy are cetirizine, desloratadine, fexofenadine, levocetirizine, and loratadine.

iii. The medication is prescribed by, or in consultation with an allergist, immunologist, or dermatologist.

B) Patient is Currently Receiving Xolair. Approve Xolair for 1 year if the patient meets the following criteria (i and ii):

i. Patient has already received at least 4 months of therapy with Xolair; AND

Note: A patient who has received < 4 months of therapy or who is restarting therapy with Xolair should be considered under criterion 2A (Chronic Idiopathic Urticaria, Initial Therapy).

ii. Patient has responded to therapy as determined by the prescriber.

Note: Examples of a response to Xolair therapy are decreased severity of itching, decreased number and/or size of hives.

20. Nasal Polyps. Approve Xolair for the duration noted if the patient meets one of the following conditions (A or B):

21. Initial Therapy. Approve for 6 months if the patient meets the following criteria (i, ii, iii, iv, v, and vi):

22. Patient is ≥ 18 years of age; AND

23. Patient has a baseline immunoglobulin E (IgE) level ≥ 30 IU/mL; AND
Note: "Baseline" is defined as prior to receiving any Xolair or anti-interleukin 4/13 therapy (i.e., Dupixent® [dupilumab subcutaneous injection]).

24. Patient is experiencing significant rhinosinusitis symptoms such as nasal obstruction, rhinorrhea, or reduction/loss of smell according to the prescriber; AND

25. Patient is currently receiving therapy with an intranasal corticosteroid; AND

26. Patient meets ONE of the following (a or b):

27. Patient has received treatment with a systemic corticosteroid for chronic rhinosinusitis with nasal polyps within the previous 2 years or has a contraindication to systemic corticosteroid therapy; OR

28. Patient has had prior surgery for nasal polyps; AND

29. The medication is prescribed by or in consultation with an allergist, immunologist, or an otolaryngologist (ear, nose and throat [ENT] physician specialist).

30. Patient is currently receiving Xolair. Approve for 1 year if the patient meets the following criteria (i, ii, and iii):

31. Patient has already received at least 6 months of therapy with Xolair; AND
Note: A patient who has received < 6 months of therapy or who is restarting therapy with Xolair should be considered under criterion 3A (Nasal Polyps, Initial Therapy).

32. Patient continues to receive therapy with an intranasal corticosteroid; AND

33. Patient has responded to Xolair therapy as determined by the prescriber.
Note: Examples of a response to Xolair therapy are reduced nasal polyp size, improved nasal congestion, reduced sinus opacification, decreased sino-nasal symptoms, and/or improved sense of smell.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Xolair is not recommended in the following situations:

1. Atopic Dermatitis. One single-center, double-blind, placebo-controlled trial, Atopic Dermatitis Anti-IgE Pediatric Trial (ADAPT) evaluated the efficacy of Xolair in patients 4 to 19 years of age with severe atopic dermatitis (n = 62).[25] After 24 weeks of therapy, the difference in the objective Scoring Atopic Dermatitis [SCORAD] index with Xolair vs. placebo was -6.9 (P = 0.01). This was statistically significant; however, the clinical significance is unknown. Quality of life measurements were also improved with Xolair. Smaller studies have not shown benefit and case studies have yielded mixed results.[25-27] Additional larger, well-designed clinical trials are needed to determine if Xolair has a role in the treatment of atopic dermatitis. Atopic dermatitis guidelines from the American Academy Dermatology (AAD) [2014] note that data are limited to determine if Xolair is efficacious.[28] These guidelines do not make a recommendation regarding Xolair use in this patient population. European consensus guidelines for the treatment of atopic dermatitis (2018) also note the mixed data and state that they cannot recommend Xolair for the treatment of atopic dermatitis.[29]

2. Concurrent use of Xolair with an Anti-Interleukin (IL) Monoclonal Antibody. The efficacy and safety of Xolair used in combination with IL antagonist monoclonal antibodies (e.g., Cinqair® [reslizumab injection for intravenous use], Fasenra™ [benralizumab injection for subcutaneous use], Nucala® [mepolizumab injection for subcutaneous use], Dupixent® [dupilumab subcutaneous injection]) have not been established. There are very limited case reports describing the combined use of Nucala and Xolair for severe asthma as well as off-label indications.[30-32] Further investigation is warranted.

3. Eosinophilic Gastroenteritis, Eosinophilic Esophagitis, or Eosinophilic Colitis. There are limited and conflicting data from very small studies and case series on the use of Xolair for the treatment of eosinophilic gastrointestinal conditions.[33-36] Guidelines for the management of eosinophilic esophagitis from the American Gastroenterological Association (AGA) and the Joint Task Force on Allergy-Immunology Practice Parameters (2020) recommend against the use of Xolair in patients with this condition.[37]

4. **Latex Allergy in Health Care Workers with Occupational Latex Allergy.** A small European study assessed the effects of Xolair treatment in health care workers (n = 18) with occupational latex allergy.[38] Xolair use in these patients resulted in a reduction in mean conjunctival challenge test scores as compared with placebo-treated patients after 16-weeks of therapy. Also, three patients who did not respond to Xolair treatment during the double-blind phase responded during the 16-week open-label phase. Thus the overall ocular response rate for all patients in the open-label phase was 93.8% (n = 15/16). Also 11 of 15 patients in the open-label phase had a negative response to a latex glove challenge test (4 patients had a mild response). Well-controlled trials are needed.

5. **Peanut and Other Food Allergies.** Limited data are available regarding the use of Xolair to facilitate desensitization to food allergens. A Phase II multicenter clinical trial was initiated using Xolair in patients with peanut allergy; however, it was discontinued prematurely due to concerns regarding the safety of the oral peanut challenges in some patients.[39] Insufficient data were obtained to reach any conclusions about the efficacy of Xolair. Data are also available from a small pilot study examining the use of Xolair to facilitate rapid oral desensitization in high-risk peanut-allergic patients.[40] There are also minimal data (a Phase I study and a case series) on the use of Xolair to facilitate desensitization in patients with severe cow's milk allergy.[41-44] Additionally, a Phase I study and a Phase II study have evaluated the use of Xolair to facilitate desensitization in patients with multiple food allergies.[45,46] Guidelines for the diagnosis and management of food allergy in the US from the National Institute of Allergy and Infectious Diseases (NIAID) [2010] indicate there are currently no medications recommended to prevent IgE-mediated or non-IgE-mediated food-induced allergic reactions from occurring in an individual with existing food allergies.[47] The Practice Parameter on Food Allergy from the Joint Task Force on Practice Parameters (JTFPP), representing the American Academy of Allergy, Asthma, & Immunology (AAAAI); the American College of Allergy, Asthma, & Immunology (ACAAI); and the Joint Council of Allergy, Asthma, & Immunology (JCAAI) [2014] also states that immunotherapies (such as the oral immunotherapy desensitization described above) show promise for the treatment of food allergy; however, there is currently inadequate evidence that the therapeutic benefit outweighs the risk.[48] Trials of these have been uncontrolled, small studies, which are subject to selection bias and uncertain safety profiles. However, treatment with anti-IgE monoclonal antibodies might increase the threshold for doses needed to stimulate an allergic reaction and potentially may enhance the safety profile for patients. Additional well-controlled trials are needed.

6. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Early Annual Revision	• Updated initial therapy criteria for "Asthma in Patients with Moderate to Severe Persistent Disease" to state that the baseline IgE level ≥ 30 IU/mL should be prior to treatment with Xolair or anti-IL-4/13 therapy (Dupixent). Previously criteria only noted the level should be prior to Xolair therapy. • Updated initial therapy criteria for "Asthma in Patients with Moderate to Severe Persistent Disease" to more concisely state the previous therapies required. Added the following note: An exception to the requirement for a trial of one additional asthma controller/maintenance medication (criterion b) can be made if the patient has already received anti-IL-4/13 therapy (Dupixent) used concomitantly with an ICS for at least 3 consecutive months. • Updated initial therapy criteria for "Asthma in Patients with Moderate to Severe Persistent Disease" to state that the patient's asthma is uncontrolled or was uncontrolled prior to receiving any Xolair or anti-IL-4/13 therapy (Dupixent). Previously criteria only stated it should be uncontrolled prior to Xolair therapy.	01/23/2019
Annual Revision	• **Asthma**: Approval indication was changed from "Asthma in Patients with Moderate to Severe Persistent Disease" to "Asthma". Removed examples of *in vitro* allergen-specific IgE tests: ELISA (ImmunoCAP™) or RAST. Wording in reference to "according to the prescribing physician" was changed to "according to the prescriber". Removed lists of examples of inhaled asthma controller/maintenance medications. • **Chronic Idiopathic Urticaria**: Wording in reference to "according to the prescribing physician" was changed to "according to the prescriber". • **Allergic Rhinitis**: Approval indication was changed from "Allergic Rhinitis, Seasonal or Perennial" to "Allergic Rhinitis". Updated requirement that patient have a positive skin test or in vitro test for allergen-specific IgE for "one or more relevant allergens" to "one or more perennial aeroallergens AND/OR for one or more seasonal aeroallergens" (previously criteria listed both perennial and aeroallergen examples as relevant allergens, updated wording to be consistent with Asthma approval criteria). Wording in reference to "second-generation/less-sedating antihistamines" was changed to "non-sedating H_1 antihistamines". Wording in reference to "according to the prescribing physician" was changed to "according to the prescriber". Removed lists of examples of intranasal antihistamines and intranasal corticosteroids.	02/12/2020
Selected Revision	• Removed Allergic Rhinitis as an "Other Use with Supported Evidence"	03/25/2020
Selected Revision	• **Nasal Polyps**: Added new approval criteria for this indication which include an age requirement, a minimum IgE level at baseline, the presence of significant rhinosinusitis symptoms, current intranasal corticosteroid therapy, previous systemic therapy (or contraindication) or surgery for nasal polyps, and involvement of a specialist.	12/16/2020
Annual Revision	No criteria changes.	02/17/2021

IgE – Immunoglobulin E; IL – Interleukin; ICS – Inhaled corticosteroids; ELISA – Enzyme-linked immunoabsorbant assay; RAST – Radioallergosorbent test.

PRIOR AUTHORIZATION POLICY

POLICY: Infectious Disease – Daraprim Prior Authorization Policy

- Daraprim® (pyrimethamine tablets – Vyera Pharmaceuticals)

REVIEW DATE: 10/28/2020

OVERVIEW

Daraprim is indicated for the treatment of **toxoplasmosis** when used conjointly with a sulfonamide, since synergism exists with this combination.[1]

Toxoplasmosis is an infection caused by the protozoan parasite, *Toxoplasma gondii*.[2] In the US, it is estimated that 11% of the population ≥ 6 years of age have been infected with *Toxoplasma*. The incidence is > 60% in some areas of the world. The parasite can be transmitted by food (e.g., by eating undercooked, contaminated meat or shellfish), through infected cats (cats become infected by eating infected rodents, birds, or other small animals), or by mother-to-child (congenital) transmission.

Pyrimethamine, a folic acid antagonist, is considered to be the most effective drug against toxoplasmosis and is a standard component of therapy.[2] Leucovorin, a folinic acid, protects the bone marrow from the toxic effects of pyrimethamine and is often prescribed in conjunction with pyrimethamine.

Guidelines

The guidelines for the prevention and treatment of opportunistic infections in adults and adolescents with human immunodeficiency (HIV) [2020] recommend pyrimethamine as the drug of choice for treatment and chronic maintenance treatment (secondary prophylaxis) of *Toxoplasma gondii* encephalitis.[3] Pyrimethamine is recommended as an option for: primary prophylaxis of *Toxoplasma gondii* encephalitis; primary prophylaxis and chronic maintenance treatment (secondary prophylaxis) of *Pneumocystis* pneumonia; and chronic maintenance treatment (secondary prophylaxis) and treatment of cystoisosporiasis (formerly isosporiasis).[3] The drug of choice for these conditions is trimethoprim-sulfamethoxazole.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Daraprim. All approvals are provided for 1 year in duration unless otherwise noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Daraprim is recommended in those who meet one of the following criteria:

FDA-Approved Indications

20. Treatment of Toxoplasmosis. Approve for 1 year.

Other Uses with Supportive Evidence

21. **Cystoisosporiasis (formerly known as isosporiasis) – Chronic Maintenance Treatment (Secondary Prophylaxis).** Approve for 1 year if the patient has tried one other therapy for this condition.
    Note: Other therapies used for this condition include trimethoprim-sulfamethoxazole and ciprofloxacin.

22. **Cystoisosporiasis (formerly known as isosporiasis) – Treatment.** Approve for 1 year if the patient has tried one other therapy for this condition.
    Note: Other therapies used for this condition include trimethoprim-sulfamethoxazole and ciprofloxacin.

~~23.~~ ***Pneumocystis*** **Pneumonia – Chronic Maintenance Therapy (Secondary Prophylaxis).** Approve for 1 year if the patient has tried one other therapy for this condition.
Note: Other therapies used for this condition include trimethoprim-sulfamethoxazole, dapsone, aerosolized pentamidine (via Respirgard II™ nebulizer), and atovaquone.

~~24.~~ ***Pneumocystis*** **Pneumonia – Primary Prophylaxis.** Approve for 1 year if the patient has tried one other therapy for this condition.
Note: Other therapies used for this condition include trimethoprim-sulfamethoxazole, dapsone, aerosolized pentamidine (via Respirgard II™ nebulizer), and atovaquone.

~~25.~~ ***Toxoplasma gondii*** **Encephalitis – Chronic Maintenance Therapy (Secondary Prophylaxis).** Approve for 1 year.

~~26.~~ ***Toxoplasma gondii*** **Encephalitis – Primary Prophylaxis.** Approve for 1 year if the patient has tried one other therapy for this condition.
Note: Other therapies used for this condition include trimethoprim-sulfamethoxazole and atovaquone.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Coverage of Daraprim is not recommended in the following situations:

7. **Malaria – Chemoprophylaxis or Treatment.** Daraprim is no longer indicated for the treatment of acute malaria or for chemoprophylaxis of malaria.[1] Even when malaria was an approved indication, the Centers for Disease Control and Prevention (CDC) did not include Daraprim as a recommended therapy for malaria (due to widespread resistance).

8. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

New Policy	--	10/02/2019
Annual Revision	• **Cystoisosporiasis (formerly known as isosporiasis) – Chronic Maintenance Treatment (Secondary Prophylaxis):** Deleted option for approval for patients who have contraindications to other therapies. Examples of treatment options were added as a Note. • **Cystoisosporiasis (formerly known as isosporiasis) – Treatment:** Deleted option for approval for patients who have contraindications to other therapies. Examples of treatment options were added as a Note. • ***Pneumocystis* Pneumonia – Chronic Maintenance Therapy (Secondary Prophylaxis):** Deleted option for approval for patients who have contraindications to other therapies. Examples of treatment options were added as a Note. • ***Pneumocystis* Pneumonia – Primary Prophylaxis:** Deleted option for approval for patients who have contraindications to other therapies. Examples of treatment options were added as a Note. • ***Toxoplasma gondii* Encephalitis – Chronic Maintenance Therapy (Secondary Prophylaxis):** Deleted criterion "Approve for 1 year if the patient has tried one other therapy for this condition or has contraindications to that therapy". • ***Toxoplasma gondii* Encephalitis – Primary Prophylaxis:** Deleted option for approval for patients who have contraindications to other therapies. Examples of treatment options were added as a Note.	10/28/2020

PRIOR AUTHORIZATION POLICY

POLICY: Infectious Disease – Pretomanid Prior Authorization Policy

- Pretomanid tablets (Global Alliance for TB Drug Development/Mylan Laboratories)

REVIEW DATE: 10/21/2020

OVERVIEW

Pretomanid, a nitroimidazole, is indicated as part of a combination regimen with Sirturo® (bedaquiline tablets) and linezolid tablets or oral suspension (Zyvox®, generics) for the treatment of adults with pulmonary extensively drug resistant (XDR) or treatment-intolerant or nonresponsive multidrug-resistant (MDR) tuberculosis (TB).[1] Limitation of use: Pretomanid is not indicated for use in patients with the following conditions: drug-sensitive TB, latent infections due to *Mycobacterium tuberculosis*, extra-pulmonary infection due to *M. tuberculosis*, MDR-TB that is not treatment-intolerant or nonresponsive to standard therapy. The safety and effectiveness of Pretomanid when used with drugs other than Sirturo and linezolid have not been established.

The prescribing information notes the total duration of treatment with Pretomanid to be 26 weeks.[1] The World Health Organization (WHO) Global Tuberculosis Report 2020 notes that treatment ranges from 6 to

20 months for MDR-TB or rifampicin-resistant TB (RR-TB) and possibly longer if there is additional drug resistance or if clinical and laboratory outcomes at the end of treatment are unsatisfactory.[2]

Globally, drug-resistant TB is a public health crisis.[2] In 2019, close to half a million people developed RR-TB. Of these cases, 78% were MDR-TB. Overall, 3.3% of new TB cases and 17.7% of previously treated cases were MDR/RR-TB. The global treatment success rate for MDR/RR-TB is 57%.

Guidelines

Pretomanid has not been added to the WHO consolidated guidelines for the treatment of drug-resistant TB (including MDR-TB and RR-TB) [2019]; these guidelines were consolidated from eight previously issued WHO guideline documents.[3] Treatment of MDR/RR-TB should be started with at least four TB drugs that are likely to be effective. It is recommended that the regimen be comprised of either levofloxacin or moxifloxacin, Sirturo, linezolid, and one of: clofazimine (only available through a single-person treatment investigational new drug protocol through the FDA), cycloserine, or terizidone. If these drugs cannot be used, the following drugs can be selected: ethambutol, delamanid (available through a compassionate use program), pyrazinamide, imipenem-cilastatin or meropenem, amikacin or streptomycin, Trecator® (ethionamide) or prothionamide (not available in the US), or Paser® (p-aminosalicyclic acid).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Pretomanid. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Pretomanid as well as monitoring required for adverse events and long-term efficacy, approval requires Pretomanid to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Pretomanid is recommended in those who meet the following criteria:

FDA-Approved Indications

34. Tuberculosis, Pulmonary Extensively Drug Resistant or Treatment-Intolerant or Nonresponsive Multidrug-Resistant. Approve for 9 months if the patient meets the following criteria (A, B, and C):
- **C)** Patient is ≥ 18 years of age; AND
- **D)** Pretomanid is prescribed in combination with Sirturo® (bedaquiline tablets) and linezolid tablets or oral suspension (Zyvox®, generics); AND
- **E)** The medication is prescribed by or in consultation with an infectious diseases specialist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Pretomanid is not recommended in the following situations:

9. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Infectious Disease – Sirturo® Prior Authorization Policy

- Sirturo® (bedaquiline fumarate tablets – Janssen Therapeutics, Division of Janssen Products LP)

REVIEW DATE: 10/21/2020

OVERVIEW

Sirturo, a diarylquinolone antimycobacterial, is indicated as part of a combination therapy in the treatment of adult and pediatric patients (≥ 5 years and weighing ≥ 15 kg) with pulmonary multidrug-resistant tuberculosis (MDR-TB).[1] Sirturo should be used when an effective treatment regimen cannot otherwise be provided. Limitations of use: Sirturo should not be used for latent infections due to *Mycobacterium tuberculosis*, drug-sensitive tuberculosis (TB), extra-pulmonary TB, and infections caused by non-tuberculous mycobacteria. The safety and efficacy of Sirturo in the treatment of patients infected with human immunodeficiency virus (HIV) with MDR-TB have not been established as clinical data are limited.

Sirturo should be used in combination with at least three other drugs to which the patient's MDR-TB isolate has been shown to be susceptible *in vitro*.[1] If *in vitro* testing results are not available, Sirturo may be initiated in combination with at least four other drugs to which the patient's MDR-TB isolate is likely to be susceptible.

The prescribing information notes the total duration of treatment with Sirturo to be 24 weeks (adults and pediatric patients).[1] However, the World Health Organization (WHO) Global Tuberculosis Report 2020 notes that treatment ranges from 6 to 20 months for MDR-TB or rifampicin-resistant TB (RR-TB) and possibly longer if there is additional drug resistance or if clinical and laboratory outcomes at the end of treatment are unsatisfactory.[2]

Globally, drug-resistant TB is a public health crisis.[2] In 2019, close to half a million people developed RR-TB. Of these cases, 78% were MDR-TB. Overall, 3.3% of new TB cases and 17.7% of previously treated cases were MDR/RR-TB. The global treatment success rate for MDR/RR-TB is 57%.

Guidelines

The WHO issued consolidated guidelines for the treatment of drug-resistant TB (including MDR-TB and RR-TB) in 2019; these guidelines were consolidated from eight previously issued WHO guideline documents.[3] Treatment of MDR/RR-TB should be started with at least four TB drugs that are likely to be effective. It is recommended that the regimen be comprised of either levofloxacin or moxifloxacin, Sirturo,

linezolid, and one of: clofazimine (only available through a single-person treatment investigational new drug protocol through the FDA), cycloserine, or terizidone. If these drugs cannot be used, the following drugs can be selected: ethambutol, delamanid (available through a compassionate use program), pyrazinamide, imipenem-cilastatin or meropenem, amikacin or streptomycin, Trecator® (ethionamide) or prothionamide (not available in the US), or Paser® (p-aminosalicyclic acid).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Sirturo. All approvals are provided for the duration noted below. In cases where approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Sirturo as well as monitoring required for adverse events and long-term efficacy, approval requires Sirturo to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Sirturo is recommended in those who meet the following criteria:

FDA-Approved Indications

35. Tuberculosis, Pulmonary Multidrug-Resistant or Extensively Drug-Resistant. Approve for 9 months if the patient meets the following criteria (A, B, C, and D):

- **F)** Patient is ≥ 5 years of age; AND
- **G)** Patient weighs ≥ 15 kg; AND
- **H)** Sirturo is prescribed as part of a combination regimen with other anti-tuberculosis agents; AND
- **I)** The medication is prescribed by or in consultation with an infectious diseases specialist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Sirturo is not recommended in the following situations:

10. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Actemra® (tocilizumab for intravenous infusion – Genentech/Roche)

DATE REVIEWED: 03/25/2020

OVERVIEW

Actemra for intravenous (IV) injection is a recombinant humanized interleukin-6 (IL-6) receptor inhibitor indicated for the following conditions:[1]

1. cytokine release syndrome, in patients ≥ 2 years of age with severe or life-threatening disease associated with chimeric antigen receptor (CAR) T-cell therapy; AND
2. Polyarticular juvenile idiopathic arthritis (PJIA), for the treatment of active in patients 2 years of age and older; AND
3. Rheumatoid arthritis (RA), for treatment of adults with moderate to severe active disease who have had an inadequate response to one or more disease modifying antirheumatic drugs (DMARDs); AND
4. Systemic juvenile idiopathic arthritis (SJIA), for the treatment of active disease in patients two years of age and older.

Actemra IV has been shown to inhibit and slow structural joint damage, improve physical function, and achieve a major clinical response in patients taking methotrexate (MTX). In RA, Actemra IV can be given alone or in combination with other nonbiologic DMARDs. For PJIA and SJIA, Actemra IV can be given alone or in combination with MTX. Actemra is also available as a subcutaneous (SC) formulation which, in addition to RA, is indicated for giant cell arteritis (GCA).

Disease Overview

Targeting IL-6 is a therapeutic option for treatment of chronic inflammatory diseases such as RA.[2] IL-6 has been shown to be involved in diverse physiological processes and is also produced by synovial and endothelial cells leading to local production of IL-6 in joints affected by inflammatory processes such as RA. Actemra is an IL-6 receptor monoclonal antibody that binds to soluble and membrane-bound IL-6 receptors and has been shown to inhibit IL-6-mediated signaling through these receptors.[1] In CRS (reported in 79% to 94% of patients receiving CAR T-cell therapy), there are high levels of IL-6; therefore, IL-6 signaling is inhibited with Actemra IV.[1,3-5]

Guidelines

Il-6 blockers are mentioned in multiple guidelines for treatment of inflammatory conditions.

- Cytokine Release Syndrome: The National Comprehensive Cancer Network (NCCN) clinical practice guidelines for Management of Immunotherapy-Related Toxicities (version 1.2020 – December 16, 2019) give specific recommendations for use of Actemra in the management of inflammatory arthritis, cytokine release syndrome, and CAR T-cell-related toxicities.[6]
    - For immune checkpoint inhibitor-related inflammatory arthritis, infliximab or Actemra may be considered for refractory or severe arthritis not responding to steroids and anti-inflammatory agents.
- PJIA: The American College of Rheumatology (ACR)/Arthritis Foundation guidelines for the treatment of JIA (2019) specific to juvenile non-systemic polyarthritis, sacroiliitis, and enthesitis.[7] For patients without risk factors, initial therapy with a DMARD is conditionally recommended over a biologic (including Actemra). Biologics (e.g., Actemra) are conditionally recommended as initial treatment when combined with a DMARD over biologic monotherapy.
- RA: Guidelines from the ACR (2015) for the treatment of rheumatoid arthritis have tumor necrosis factor (TNF) inhibitors and non-TNF biologics (such as Actemra) equally positioned as a recommended therapy following a trial of a conventional synthetic DMARD (e.g., MTX, leflunomide, hydroxychloroquine, sulfasalazine).[9]
- SJIA: The 2013 update of the 2011 ACR recommendations for the treatment of SJIA mention Actemra as a second- or third-line agent in patients with active systemic features and varying degrees of synovitis and in patients without active systemic features and varying degrees of

synovitis.[8] Nonsteroidal anti-inflammatory drugs NSAIDs, systemic glucocorticoids, Kineret, TNF inhibitors, and MTX are among other treatment options.

- Castleman's Disease: The NCCN clinical practice guidelines for B-cell Lymphomas (version 1.2020 – January 22, 2020) mention Actemra as a second-line therapy for relapsed or refractory unicentric Castleman's disease in patients who are HIV- and HHV-8-negative.[10] For multicentric Castleman's disease (MCD), the guidelines list Actemra as a subsequent therapy for relapsed, refractory, or progressive MCD.

Other Uses With Supportive Evidence

Still's disease presents in adults with features similar to those of SJIA.[11] Actemra IV has been effective in reducing fever, symptoms, and markers of inflammation in patients who were refractory to treatment with prednisone, MTX, Kineret, and/or a TNF antagonist.[11-20] Prospective, randomized, controlled trials are needed.

COVID-19 (Coronavirus Disease 2019)

COVID-19 is a novel coronavirus that has not previously been identified and with no approved treatments.[24] COVID-19 can cause mild to severe illness, including symptoms of fever, cough, shortness of breath, myalgia, and/or fatigue. In COVID-19, the body may respond to the virus by overproducing immune cells and their signaling molecules in a phenomenon called cytokine release storm.[25] By inhibiting IL-6, Actemra is speculated to associated with better clinical outcomes, such as decreased systemic inflammation, improved survival rate, better hemodynamic and improved of respiratory distress. Clinical trials are underway evaluating Actemra in patients with severe or critical cytokine release syndrome.

In a retrospective analysis from China, 21 patients with severe or critical COVID-19 were treated with Actemra IV (18 patients received one dose [400 mg IV] and 3 patients received a second dose within 12 hours).[26] All patients had a 1-week history of routine treatment prior to Actemra. All patients received standard therapy, including lopinavir, methylprednisolone, other symptom relievers, and oxygen therapy. The mean age of enrolled patients was 57 years (range 25 to 88 years), and the majority (n = 18/21) were male. Overall, 17 patients were categorized with severe disease (defined as respiratory rate $\geq$ 30 breaths/min, peripheral oxygen saturation [SpO2] $\leq$ 93% [room air], and/or partial pressure of arterial oxygen/percentage of inspired oxygen [PaO2/FiO2] $\leq$ 300 mmHg). There were also four patients categorized as critical (defined as respiratory failure requiring mechanical ventilation; shock; or intensive care unit admission combined with other organ failure). All patients had abnormal computed tomography (CT) of the chest, primarily with plaque-like, ground-glass opacities and focal consolidation, mainly distributed in the peripheral (especially the subpleural) region. Mean IL-6 expression levels (132.38 ± 278.54 pg/ml) prior to administration of Actemra suggested upregulation of IL-6. Body temperature of all patients normalized on the first day after receiving Actemra and remained stable thereafter. After treatment, CT scans showed that the chest lesions were absorbed in 19 patients (90.5%). At the time this analysis was published, 19 patients (90.5%) were discharged (average of 13.5 days after the treatment with Actemra) and the remaining patients continued to recover. There have been no reports of subsequent pulmonary infection, deterioration of illness, or death.

Safety

Actemra has boxed warnings concerning risks of serious infection.[1] Prior to initiating therapy, patients should be evaluated for active tuberculosis (TB) infection, and periodically during therapy patients should be assessed for latent TB infection. If a serious infection develops, treatment with Actemra should be interrupted until infection is controlled. The prescribing information for Kymriah and Yescarta have Boxed Warnings regarding CRS that may be severe or life-threatening.[3-4] Both have a Risk Evaluation and Mitigation Strategy (REMS) which requires at least two doses of Actemra on hand prior to infusion and during the recovery process.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Actemra IV. Because of the specialized skills required for evaluation and diagnosis of patients treated with Actemra IV as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Actemra IV to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration listed below. When approvals are authorized in months, 1 month is equal to 30 days. When authorized in weeks, 1 week is equal to 7 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Actemra IV is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Cytokine Release Syndrome (CRS) Associated with Chimeric Antigen Receptor (CAR) T-Cell Therapy.** Approve Actemra IV for 1 week (which is adequate duration to receive 4 doses) if prescribed for a patient who has been or will be treated with a chimeric antigen receptor (CAR) T-cell therapy.
   Note: Examples of CAR T-cell therapy include Kymriah™ (tisagenlecleucel IV suspension) and Yescarta™ (axicabtagene ciloleucel IV suspension). If the patient has **CRS due to COVID-19** (coronavirus disease 2019) refer to the criteria for Other Uses With Supportive Evidence (below).

2. **Polyarticular Juvenile Idiopathic Arthritis (PJIA).** Approve for the duration noted if the patient meets ONE of the following (A or B):
   A) Initial Therapy. Approve for 4 months if the patient meets BOTH of the following criteria (i and ii):
      i. The patient meets one of the following conditions (a, b, c, or d):
         a) The patient has tried one other agent for this condition.
         Note: Examples of one other agent tried include methotrexate (MTX), sulfasalazine, leflunomide, or a nonsteroidal anti-inflammatory drug (NSAID). A biologic (refer to **Appendix** for examples of biologics used for PJIA) also counts as a trial of one agent for PJIA; OR
         b) The patient will be starting on Actemra IV concurrently with methotrexate (MTX), sulfasalazine, or leflunomide; OR
         c) The patient has an absolute contraindication to methotrexate (MTX), sulfasalazine, or leflunomide; OR
         Note: Examples of absolute contraindication to methotrexate include pregnancy, breast feeding, alcoholic liver disease, immunodeficiency syndrome, and blood dyscrasias.
         d) The patient has aggressive disease, as determined by the prescriber; AND
      ii. The agent is prescribed by or in consultation with a rheumatologist.
   B) Patients Currently Receiving Actemra (IV or SC). Approve for 1 year if the patient has had a response, as determined by the prescriber.
   Note: Examples of response include improvement in limitation of motion; less joint pain or tenderness; improved function or activities of daily living; decreased duration of morning stiffness or fatigue; reduced dosage of corticosteroids; decreased soft tissue swelling in joints or tendon sheaths; improved laboratory values. The patient may not have a full response, but there should have been a recent or past response to Actemra IV or SC.

3. **Rheumatoid Arthritis (RA).** Approve for the duration noted if the patient meets ONE of the following (A or B):
   A) Initial Therapy. Approve for 3 months if the patient meets the following criteria (i and ii):

i. The patient has tried ONE conventional synthetic disease-modifying antirheumatic drug (DMARD) for at least 3 months.
Note: Examples of one conventional DMARD tried include methotrexate (oral or injectable), leflunomide, hydroxychloroquine, and sulfasalazine. An exception to the requirement for a trial of one conventional synthetic DMARD can be made if the patient has already had a 3-month trial of at least one biologic (refer to **Appendix** for examples of biologics used for RA). These patients who have already tried a biologic for RA are not required to "step back" and try a conventional synthetic DMARD; AND

ii. The agent is prescribed by or in consultation with a rheumatologist.

B) Patients Currently Receiving Actemra (IV or SC). Approve for 1 year if the patient has had a response, as determined by the prescriber.
Note: Examples of response include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improved laboratory values; reduced dosage of corticosteroids. The patient may not have a full response, but there should have been a recent or past response to Actemra IV or SC.

4. Systemic Juvenile Idiopathic Arthritis (SJIA). Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets the following criteria (i and ii):

i. The patient has tried one other systemic agent for this condition.
Note: Examples of one other systemic agent tried include a corticosteroid (oral, IV), a conventional synthetic disease-modifying antirheumatic drug (DMARD) [e.g., methotrexate {MTX}, leflunomide, sulfasalazine], or a 1-month trial of a nonsteroidal anti-inflammatory drug (NSAID). A previous trial of a biologic such as Kineret (anakinra SC injection), a tumor necrosis factor (TNF) inhibitor (e.g., an etanercept product, an adalimumab product, or an infliximb product, or Ilaris [canakinumab for SC injection]) also counts towards a trial of one other systemic agent for SJIA; AND

ii. The agent is prescribed by or in consultation with a rheumatologist.

B) Patients Currently Receiving Actemra (IV or SC). Approve for 1 year if the patient has had a response, as determined by the prescriber.
Note: Examples of response include improvement in limitation of motion; less joint pain or tenderness; decreased duration of morning stiffness or fatigue; improved function or activities of daily living; reduced dosage of corticosteroids; less joint pain or tenderness; decreased soft tissue swelling in joints or tendon sheaths; improved laboratory values. The patient may not have a full response, but there should have been a recent or past response to Actemra IV or SC.

Other Uses with Supportive Evidence

5. Castleman's Disease. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 4 months if the agent is prescribed by or in consultation with an oncologist or hematologist; OR

B) Patients Currently Receiving Actemra (IV or SC). Approve for 1 year if the patient has responded, as determined by the prescriber.
Note: Examples of response include normalization of C-reactive protein (CRP), erythrocyte sedimentation rate (ESR), fibrinogen, albumin, and hemoglobin; resolution of constitutional symptoms; increased body mass index (BMI), and reduction in lymphadenopathy.

6. COVID-19 (Coronavirus Disease 2019). Approve for 1 week if, according to the prescriber, the patient has cytokine release syndrome associated with COVID-19.

Note: Denials for patients diagnosed with COVID-19 are forwarded to the Medical Director.

7. **Inflammatory Arthritis Associated with Checkpoint Inhibitor Therapy.** Approve for 3 months if the patient meets ONE of the following (A or B):
   Note: Examples of checkpoint inhibitors include Keytruda (pembrolizumab IV infusion), Opdivo (nivolumab IV infusion), Yervoy (ipilimumab IV infusion), Tecentriq (atezolizumab IV infusion), Bavencio (avelumab IV infusion), Imfinzi (durvalumab IV infusion), and Libtayo® (cemiplimab-rwlc IV infusion).
   A) Initial Therapy. Approve for 3 months if the patient meets ALL of the following (i, ii, and iii):
      i. The patient is symptomatic despite a trial of at least ONE systemic corticosteroid.
      Note: Examples of a systemic corticosteroid include methylprednisolone and prednisone; AND
      ii. The patient has tried at least ONE systemic nonsteroidal anti-inflammatory agent (NSAID).
      Note: Examples of systemic NSAIDs include ibuprofen and naproxen; AND
      iii. The agent is prescribed by or in consultation with a rheumatologist or an oncologist.
   B) Patients Currently Receiving Actemra (IV or SC). Approve for 1 year if the patient has had a response, as determined by the prescriber.
      Note: Examples of response include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improved laboratory values; reduced dosage of corticosteroids. The patient may not have a full response, but there should have been a recent or past response to Actemra IV or SC.

7. **Still's Disease.** Approve for the duration noted if the patient meets ONE of the following (A or B):
   A) Initial Therapy. Approve for 3 months if the patient meets ALL of the following (i, ii, and iii):
      i. The patient has tried one corticosteroid; AND
      ii. The patient has tried one conventional synthetic disease-modifying antirheumatic drug (DMARD) such as methotrexate (MTX) given for at least 2 months or was intolerant to a conventional synthetic DMARD; AND
      iii. The agent is prescribed by or in consultation with a rheumatologist.
   B) Patients Currently Receiving Actemra (IV or SC). Approve for 1 year if the patient has responded, as determined by the prescriber.
      Note: Examples of response include normalization of C-reactive protein (CRP), erythrocyte sedimentation rate (ESR), or ferritin serum levels; decrease in number of tender or swollen joints; resolution of fever.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Actemra IV has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

1. **Concurrent Use with a Biologic or with a Targeted Synthetic Disease-Modifying Antirheumatic Drug (DMARD).** Data are lacking evaluating concomitant use of Actemra IV another biologic or with a targeted synthetic DMARD used for an inflammatory condition (see **Appendix** for examples). Combination therapy with biologics and/or biologics + targeted synthetic DMARDs has a potential for a higher rate of adverse effects and lack of controlled trial data in support of additive efficacy.[21-22]
   Note: This does NOT exclude the use of conventional synthetic DMARDs (e.g., methotrexate [MTX], leflunomide, hydroxychloroquine, and sulfasalazine) in combination with Actemra IV.

2. **Crohn's Disease.** In a 12-week pilot study conducted in Japan, 36 adults with active Crohn's disease (Crohn's Disease Activity Index [CDAI] ≥ 150 and increased CRP) were randomized, in a double-blind fashion to Actemra 8 mg/kg IV every 2 weeks; or alternating infusions of Actemra 8 mg/kg IV every 4 weeks and placebo (i.e., alternating with placebo every 2 weeks), or to placebo every 2 weeks.[23] At baseline the CDAI means ranged from 287 to 306. Patients had been treated with corticosteroids, mesalamine-type drugs, metronidazole, or elemental diet. Six patients in the placebo group, four patients on Actemra IV every 4 weeks and one patient on Actemra IV every 2 weeks dropped out. The mean reduction in the CDAI score in the Actemra 8 mg/kg IV every 2 week group was 88 points (from mean 306 to 218). Further studies are needed.

3. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Date Reviewed
Annual revision	Add approval criteria for Inflammatory Arthritis associated with checkpoint inhibitors (3 months initial) if the patient has tried at least one steroid and at least one nonsteroidal anti-inflammatory drug and if prescribed by or in consultation with a rheumatologist or an oncologist; approval is for 1 year if patient is currently responding to therapy. Throughout the policy, references to Humira, Enbrel, and Rituxan were reworded as adalimumab, etanercept, and rituxumab products, respectively, with the innovator names listed as examples of these products. Renflexis and Erelzi were also added as respective examples of infliximab and etanercept products. Abatacept SC was added as an example of a biologic that a patient may have previously tried for Polyarticular Juvenile Idiopathic Arthritis. Kevzara was added as examples of a biologic that a patient may have previously tried for Rheumatoid Arthritis. For Systemic Juvenile Idiopathic Arthritis, the criterion that directs patients to a systemic agent prior to approval was reworded to clarify its intent such that patients are now directed to a systemic agent, with conventional synthetic disease-modifying antirheumatic drugs, corticosteroids, and nonsteroidal anti-inflammatory drugs listed as examples. A note was added that prior use of a biologic agent would count towards this requirement; previously, criteria were worded more generally as a "systemic" agent and both conventional and biologic agents were listed together as examples.	03/21/2018
Annual revision	**Rheumatoid Arthritis:** Add Truxima as an example of a rituximab product. **Inflammatory Arthritis Associated with Checkpoint Inhibitor Therapy:** Add Yervoy, Tecentriq, Bavencio, Imfinzi, and Libtayo as examples of checkpoint inhibitors. **Patient is Currently Taking (for Rheumatoid Arthritis, Systemic Juvenile Idiopathic Arthritis, Polyarticular Juvenile Idiopathic Arthritis:** To align with the medical policy, change duration of approval to 1 year (previously was 3 years). **Castleman's Disease:** To align with the medical policy, change initial approval to a 4 month duration. For continuation of therapy, require a response (criteria previously approved continuation of therapy if the patient was on therapy for ≥ 90 days). **Still's Disease:** To align with the medical policy, change initial approval to a 3 month duration. For continuation of therapy, require a response (criteria previously approved continuation of therapy if the patient was on therapy for ≥ 90 days).	03/27/2019
Annual revision	**Cytokine Release Syndrome:** This condition was clarified to specify that it must be Associated with Chimeric Antigen Receptor (CAR) T-Cell Therapy to qualify for this condition for coverage. A note was added to clarify that cases of CRS due to COVID-19 are to be referred to a separate condition for coverage (Other Uses With Supportive Evidence). Examples of chimeric antigen receptor T-cell therapy were moved to a Note in the policy (previously listed as examples within the criteria). **Polyarticular Juvenile Idiopathic Arthritis:** For the exception applying to patients with aggressive disease, wording was updated to more generally allow this determination by the prescriber (criteria previously specified this was according to the prescribing physician). Examples of one other agent tried for Polyarticular Juvenile Idiopathic Arthritis were moved to a Note in the policy (previously listed as examples within the criteria). Examples of biologics for Polyarticular Juvenile Idiopathic Arthritis were moved to be included in the Appendix (previously listed in a Note in the criteria section). Examples of an absolute contraindication to methotrexate, sulfasalazine, or leflunomide were move to a Note in the policy (previously listed as examples within the criteria). Examples of a response to therapy were moved to a Note in the policy (previously listed as examples within the criteria). **Rheumatoid Arthritis:** Examples of conventional synthetic disease-modifying antirheumatic drugs were moved to a Note in the policy (previously listed as examples within the criteria). Examples of biologics for Rheumatoid Arthritis were moved to be included in	03/25/2020

	the Appendix (previously listed in a Note in the criteria section). Examples of a response to therapy were moved to a Note in the policy (previously listed as examples within the criteria). **Systemic Juvenile Idiopathic Arthritis:** Examples of one other systemic agent tried for Systemic Juvenile Idiopathic Arthritis were moved to a Note in the policy (previously listed as examples within the criteria). Examples of a response to therapy were moved to a Note in the policy (previously listed as examples within the criteria). **Castleman's Disease:** For the exception applying to patients currently receiving Actemra who have responded, wording was updated to more generally allow this determination by the prescriber (criteria previously specified this was according to the prescribing physician). Examples of a response to therapy were moved to a Note in the policy (previously listed as examples within the criteria). **Inflammatory Arthritis Associated with Checkpoint Inhibitor Therapy:** Examples of a steroid were moved to a Note in the policy (previously listed as examples within the criteria). Examples of a nonsteroidal anti-inflammatory agent were moved to a Note in the policy (previously listed as examples within the criteria). Examples of a response to therapy were moved to a Note in the policy (previously listed as examples within the criteria). Criteria requiring a previous therapy were clarified to specify systemic therapies must have been tried (i.e., systemic corticosteroid, systemic NSAID). **Still's Disease:** For the exception applying to patients currently receiving Actemra who have responded, wording was updated to more generally allow this determination by the prescriber (criteria previously specified this was according to the prescribing physician). Examples of a response to therapy were moved to a Note in the policy (previously listed as examples within the criteria). **COVID-19:** This off-label indication was added to the policy as 1-week approval if the patient has cytokine release syndrome.	

APPENDIX

	Mechanism of Action	Examples of Inflammatory Indications for Products*
Biologics		
Adalimumab SC Products (Humira®, biosimilars)	Inhibition of TNF	AS, CD, PJIA, PsO, PsA, RA, SJIA, UC
Cimzia® (certolizumab pegol SC injection)	Inhibition of TNF	AS, CD, PsO, PsA, RA
Etanercept SC Products (Enbrel®, biosimilars)	Inhibition of TNF	AS, PJIA, PsO, PsA, RA, SJIA
Infliximab IV Products (Remicade®, biosimilars)	Inhibition of TNF	AS, CD, PJIA, PsO, PsA, RA, SJIA, UC
Simponi®, Simponi® Aria™ (golimumab SC injection, golimumab IV infusion)	Inhibition of TNF	SC formulation: AS, PsA, RA, UC
		IV formulation: AS, PsA, RA
Actemra® (tocilizumab IV infusion, tocilizumab SC injection)	Inhibition of IL-6	SC formulation: PJIA, RA, SJIA
		IV formulation: PJIA, RA, SJIA
Kevzara® (sarilumab SC injection)	Inhibition of IL-6	RA
Orencia® (abatacept IV infusion, abatacept SC injection)	T-cell costimulation modulator	SC formulation: PJIA, PSA, RA
		IV formulation: PJIA, PsA, RA
Rituximab IV Products (Rituxan®, biosimilars)	CD20-directed cytolytic antibody	RA
Ilaris (canakinumab SC injection**)**	Inhibition of IL-1β	SJIA
Kineret® (anakinra SC injection)	Inhibition of IL-1	RA, SJIA^
Stelara® (ustekinumab SC injection, ustekinumab IV infusion)	Inhibition of IL-12/23	SC formulation: CD, PsO, PsA, UC
		IV formulation: CD, UC
Siliq™ (brodalumab SC injection)	Inhibition of IL-17	PsO
Cosentyx™ (secukinumab SC injection)	Inhibition of IL-17A	AS, PsO, PsA
Taltz® (ixekizumab SC injection)	Inhibition of IL-17A	AS, PsO, PsA
Ilumya™ (tildrakizumab-asmn SC injection)	Inhibition of IL-23	PsO
Skyrizi™ (risankizumab-rzza SC injection)	Inhibition of IL-23	PsO
Tremfya™ (guselkumab SC injection)	Inhibition of IL-23	PsO
Entyvio™ (vedolizumab IV infusion)	Integrin receptor antagonist	CD, UC
Targeted Synthetic DMARDs		
Otezla® (apremilast tablets)	Inhibition of PDE4	PsO, PsA

Olumiant® (baricitinib tablets)	Inhibition of the JAK pathways	RA
Rinvoq® (upadacitinib extended-release tablets)	Inhibition of the JAK pathways	RA
Xeljanz®, Xeljanz XR (tofacitinib tablets, tofacitinib extended-release tablets)	Inhibition of the JAK pathways	RA, PsA, UC

* Not an all-inclusive list of indication (e.g., oncology indications and rare inflammatory conditions are not listed). Refer to the prescribing information for the respective agent for FDA-approved indications; SC – Subcutaneous; TNF – Tumor necrosis factor; IV – Intravenous, IL – Interleukin; PDE4 – Phosphodiesterase 4; JAK – Janus kinase; AS – Ankylosing spondylitis; CD – Crohn's disease; PJIA – Polyarticular juvenile idiopathic arthritis; PsO – Plaque psoriasis; PsA – Psoriatic arthritis; RA – Rheumatoid arthritis; SJIA – Sytemice juvenile idiopathic arthritis; UC – Ulcerative colitis. ^ Off-label use of SJIA supported in guidelines.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Actemra® (tocilizumab for subcutaneous administration – Genentech/Roche)

DATE REVIEWED: 03/25/2020

OVERVIEW

Actemra for subcutaneous (SC) injection is a recombinant humanized interleukin-6 (IL-6) receptor inhibitor indicated for the following conditions:[1]

1. Rheumatoid arthritis (RA), for treatment of adults with moderate to severe active disease who have had an inadequate response to one or more disease modifying antirheumatic drugs (DMARDs); AND
2. Giant cell arteritis (GCA) in adults; AND
3. Polyarticular juvenile idiopathic arthritis (PJIA), for the treatment of active in patients 2 years of age and older; AND
4. Systemic juvenile idiopathic arthritis (SJIA), for the treatment of active disease in patients two years of age and older.

In RA and PJIA, Actemra SC can be given alone or in combination with methotrexate (MTX) [or with other nonbiologic DMARDs in RA]. Actemra is also available as an intravenous (IV) formulation which, in addition to RA and PJIA and SJIA, is indicated in chimeric antigen receptor (CAR) T-cell-induced severe or life-threatening cytokine release syndrome; however, the IV formulation is not indicated in GCA.

Disease Overview

IL-6 is a pro-inflammatory cytokine that is involved in various physiologic processes.[1] It has been shown to be involved in diverse physiological processes and is also produced by synovial and endothelial cells leading to local production of IL-6 in joints affected by inflammatory processes such as RA. Actemra binds to soluble and membrane-bound IL-6 receptors and has been shown to inhibit IL-6-mediated signaling through these receptors.

Clinical Efficacy

GCA and Polymyalgia Rheumatica (PMR)

In the pivotal trial evaluating Actemra SC for GCA (n = 251), patients were treated with corticosteroids in an open-label fashion (20 mg to 60 mg/day) during the screening period prior to treatment with Actemra SC.[2-3] Sustained remission at Week 52 was achieved in 56% of patients who received Actemra SC every week + 26-week prednisone taper and 53% of patients who received Actemra every other week + 26-week prednisone taper vs. in 14% of patients in the 26-week prednisone taper and 18% of patients in the 52-week prednisone taper. The pivotal trial evaluating Actemra SC for GCA allowed patients with the presence of

PMR and evidence of large-vessel vasculitis by angiography or imaging (e.g., magnetic resonance imaging [MRI], computed tomography angiography [CTA], positron emission tomography – computed tomography [PET/CT]) to be included in the study. This aligns with recent recommendations from the European League Against Rheumatism (EULAR) [2018] which state the diagnosis of GCA may be made without biopsy if there is a high suspicion of GCA and a positive imaging test.[4] Additional small studies and/or case reports support use of Actemra in patients with PMR without documented symptoms of GCA.[5-7]

Guidelines

Il-6 blockers are mentioned in multiple guidelines for treatment of inflammatory conditions.

- PJIA: The American College of Rheumatology (ACR)/Arthritis Foundation guidelines for the treatment of JIA (2019) specific to juvenile non-systemic polyarthritis, sacroiliitis, and enthesitis.[8] For patients without risk factors, initial therapy with a DMARD is conditionally recommended over a biologic (including Actemra). Biologics (e.g., Actemra) are conditionally recommended as initial treatment when combined with a DMARD over biologic monotherapy.
- SJIA: The 2013 update of the 2011 ACR recommendations for the treatment of SJIA mention Actemra as a second- or third-line agent in patients with active systemic features and varying degrees of synovitis and in patients without active systemic features and varying degrees of synovitis.[9] Nonsteroidal anti-inflammatory drugs NSAIDs, systemic glucocorticoids, Kineret, TNF inhibitors, and MTX are among other treatment options.
- RA: Guidelines from the ACR (2015) for the treatment of rheumatoid arthritis have tumor necrosis factor (TNF) inhibitors and non-TNF biologics (such as Actemra) equally positioned as a recommended therapy following a trial of a conventional synthetic DMARD (e.g., MTX, leflunomide, hydroxychloroquine, sulfasalazine).[10]

Safety

Actemra SC has Boxed Warnings regarding increased risk of developing serious infections which may lead to hospitalization or death. Patients who develop a serious infection should interrupt treatment with Actemra SC until infection is controlled. Patients should be monitored during and after treatment with Actemra SC, including tuberculosis.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Actemra SC. Because of the specialized skills required for evaluation and diagnosis of patients treated with Actemra SC as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Actemra SC to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the approval duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

All reviews for use of Actemra SC for COVID-19 and/or cytokine release syndrome associated with COVID-19 will be forwarded to the Medical Director.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Actemra SC is recommended in those who meet one of the following criteria:

FDA-Approved Indications

8. Giant Cell Arteritis (GCA). Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 6 months if the patient meets the following criteria (i and ii):

i. The patient has tried one systemic corticosteroid; AND
Note: An example of a systemic corticosteroid is prednisone.

ii. Actemra SC is prescribed by or in consultation with a rheumatologist.

B) Patient is Currently Receiving Actemra (IV or SC). Approve for 1 year if the patient has had a response, as determined by the prescriber.
Note: Examples of response include reduced corticosteroid dose, normalization of acute phase reactants (e.g., erythrocyte sedimentation rate [ESR], C-reactive protein [CRP]), reduction or resolution of signs or symptoms of GCA. The patient may not have a full response, but there should have been a recent or past response to Actemra (SC or IV).

9. Polyarticular Juvenile Idiopathic Arthritis (PJIA). Approve for the duration noted if the patient meets ONE of the following (A or B):

B) Initial Therapy. Approve for 4 months if the patient meets BOTH of the following criteria (i and ii):

i. The patient meets one of the following conditions (a, b, c, or d):

e) The patient has tried one other agent for this condition.
Note: Examples of one other agent tried include methotrexate (MTX), sulfasalazine, leflunomide, or a nonsteroidal anti-inflammatory drug (NSAID). A biologic (refer to **Appendix** for examples of biologics used for JIA) also counts as a trial of one agent for JIA; OR

f) The patient will be starting on Actemra SC concurrently with methotrexate (MTX), sulfasalazine, or leflunomide; OR

g) The patient has an absolute contraindication to methotrexate (MTX), sulfasalazine, or leflunomide.
Note: Examples of absolute contraindication to methotrexate include pregnancy, breast feeding, alcoholic liver disease, immunodeficiency syndrome, and blood dyscrasias; OR

h) The patient has aggressive disease, as determined by the prescriber; AND

ii. Actemra SC is prescribed by or in consultation with a rheumatologist.

C) Patients Currently Receiving Actemra (IV or SC). Approve for 3 years if the patient has had a response, as determined by the prescriber.
