Note: Examples of response include improvement in limitation of motion; less joint pain or tenderness; improved function or activities of daily living; decreased duration of morning stiffness or fatigue; reduced dosage of corticosteroids; decreased soft tissue swelling in joints or tendon sheaths; improved laboratory values. The patient may not have a full response, but there should have been a recent or past response to Actemra IV or SC.

10. Rheumatoid Arthritis (RA). Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets the following criteria (i and ii):

i. The patient has tried ONE conventional synthetic disease-modifying antirheumatic drug (DMARD) for at least 3 months; AND
Note: Examples of one conventional DMARD tried include methotrexate (oral or injectable), leflunomide, hydroxychloroquine, and sulfasalazine. An exception to the requirement for a trial of one conventional synthetic DMARD can be made if the patient has already has a 3-month trial at least one biologic (refer to **Appendix** for examples of biologics used for RA). These patients who have already tried a biologic for RA are not required to "step back" and try a conventional synthetic DMARD.

ii. Actemra SC is prescribed by or in consultation with a rheumatologist.

B) Patients Currently Receiving Actemra (SC or IV). Approve for 3 years if the patient has had a response, as determined by the prescriber.
Note: Examples of response include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improved laboratory values; reduced dosage of corticosteroids. The patient may not have a full response, but there should have been a recent or past response to Actemra (SC or IV).

11. Systemic Juvenile Idiopathic Arthritis (SJIA). Approve for the duration noted if the patient meets ONE of the following (A or B):

C) Initial Therapy. Approve for 3 months if the patient meets the following criteria (i and ii):
- **i.** The patient has tried one other systemic agent for this condition; AND
  Note: Examples of one other systemic agent tried include a corticosteroid (oral, IV), a conventional synthetic disease-modifying antirheumatic drug (DMARD) [e.g., methotrexate {MTX}, leflunomide, sulfasalazine], or a 1-month trial of a nonsteroidal anti-inflammatory drug (NSAID). A previous trial of a biologic such as Kineret (anakinra SC injection), a tumor necrosis factor (TNF) inhibitor (e.g., an etanercept product, an adalimumab product, or an infliximb product, or Ilaris [canakinumab for SC injection]) also counts towards a trial of one other systemic agent for SJIA.
- **ii.** Actemra SC is prescribed by or in consultation with a rheumatologist.

D) Patients Currently Receiving Actemra (IV or SC). Approve for 3 years if the patient has had a response, as determined by the prescriber.
Note: Examples of response include improvement in limitation of motion; less joint pain or tenderness; decreased duration of morning stiffness or fatigue; improved function or activities of daily living; reduced dosage of corticosteroids; less joint pain or tenderness; decreased soft tissue swelling in joints or tendon sheaths; improved laboratory values. The patient may not have a full response, but there should have been a recent or past response to Actemra IV or SC.

Other Uses with Supportive Evidence

12. Polymyalgia Rheumatica (PMR). Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 6 months if the patient meets the following criteria (i and ii):
- **i.** The patient has tried one systemic corticosteroid.
  Note: An example of a systemic corticosteroid is prednisone; AND
- **ii.** Actemra SC is prescribed by or in consultation with a rheumatologist.

B) Patient is Currently Receiving Actemra (IV or SC). Approve for 1 year if the patient has had a response, as determined by the prescriber.
Note: Examples of response include reduced corticosteroid dose, normalization of acute phase reactants (e.g., erythrocyte sedimentation rate [ESR], C-reactive protein [CRP]), reduction or resolution of signs or symptoms of PMR. The patient may not have a full response, but there should have been a recent or past response to Actemra (SC or IV).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Actemra SC has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

1. **Concurrent use with a Biologic or with a Targeted Synthetic Disease-Modifying Antirheumatic Drug (DMARD).** Data are lacking evaluating concomitant use of Actemra SC another biologics or with a targeted synthetic DMARD for an inflammatory condition (see **Appendix** for examples).[1,11] Combination therapy with biologics and/or biologics + targeted synthetic DMARDs has a potential for a higher rate of adverse effects and lack of controlled trial data in support of additive efficacy.[12] Note: This does NOT exclude the use of conventional synthetic DMARDs (e.g., methotrexate (MTX), leflunomide, hydroxychloroquine, and sulfasalazine) in combination with Actemra SC.

2. **COVID-19 (Coronavirus Disease 2019).** Forward all requests to the Medical Director.
   Note: This includes requests for cytokine release syndrome associated with COVID-19.

2. **Crohn's Disease.** In a 12-week pilot study conducted in Japan, 36 adults with active Crohn's disease (Crohn's Disease Activity Index [CDAI] ≥ 150 and increased C-reactive protein [CRP]) were randomized, in a double-blind fashion to IV Actemra 8 mg/kg every 2 weeks; or alternating infusions of Actemra 8 mg/kg every 4 weeks and placebo (i.e., alternating with placebo every 2 weeks), or to placebo every 2 weeks.[13] At baseline the CDAI means ranged from 287 to 306. Patients had been treated with corticosteroids, mesalamine-type drugs, metronidazole, or elemental diet. Six patients in the placebo group, 4 on Actemra every 4 weeks and 1 on Actemra every 2 weeks dropped out. The mean reduction in the CDAI score in the Actemra 8 mg/kg every 2 week group was 88 points – from mean 306 to 218. Further studies are needed.

3. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Date Reviewed
Early annual revision	Add criteria for **Polyarticular Juvenile Idiopathic Arthritis**. Criteria approve for initial therapy (4 months) if prescribed by or in consultation with a rheumatologist, and if another therapy has been tried (e.g., methotrexate, sulfasalazine, or leflunomide, an nonsteroidal anti-inflammatory drug, or a biologic disease-modifying antirheumatic drug [prior use of a biologic agent would count towards this requirement]), or Actemra SC is started in combination with a conventional synthetic disease-modifying antirheumatic drug, or the patient has aggressive disease, as determined by the prescriber. Patients currently taking Actemra IV or SC can get authorization for 3 years if there has been a response to therapy. Due to the approval in Polyarticular Juvenile Idiopathic Arthritis, remove this indication from the conditions not recommended for coverage.	05/23/2018
Selected revision	**Polymyalgia Rheumatica:** Due to overlap of Giant Cell Arteritis and Polymyalgia Rheumatica and updated guidelines for diagnosis, remove requirement that patients with Polymyalgia Rheumaticahave imaging results suggestive of large vessel vasculitis.	09/05/2018
Selected revision	**Systemic Juvenile Idiopathic Arthritis:** Criteria were added to approve for this FDA-approved indication. Initial approval is for 3 months if a systemic agent has been tried, and if Actemra SC is prescribed by or in consultation with a rheumatologist. For patients currently taking Actemra IV or SC, the approval is for 3 years if the patient has responded to therapy. Due to this approval, Systemic Juvenile Idiopathic Arthritis was removed from the conditions not recommended for coverage.	09/19/2018
Early annual revision	**Rheumatoid Arthritis:** Add Truxima as an example of a rituximab product.	03/27/2019
Annual revision	**Giant Cell Arteritis:** Examples of one systemic corticosteroid were moved to a Note in the policy (previously listed as examples within the criteria). Examples of a response to therapy were moved to a Note in the policy (previously listed as examples within the criteria). **Polyarticular Juvenile Idiopathic Arthritis:** For the exception applying to patients with aggressive disease, wording was updated to more generally allow this determination by the prescriber (criteria previously specified this was according to the prescribing physician). Examples of one other agent tried for Polyarticular Juvenile Idiopathic Arthritis were moved to a Note in the policy (previously listed as examples within the criteria). Examples of biologics for Polyarticular Juvenile Idiopathic Arthritis were moved to be included in the Appendix (previously listed in a Note in the criteria section). Examples of an absolute contraindication to methotrexate, sulfasalazine, or leflunomide were move to a Note in the policy (previously listed as examples within the criteria). Examples of a response to therapy were moved to a Note in the policy (previously listed as examples within the criteria). **Rheumatoid Arthritis:** Examples of conventional synthetic disease-modifying antirheumatic drugs were moved to a Note in the policy (previously listed as examples within the criteria). Examples of biologics for rheumatoid arthritis were moved to be included in the Appendix (previously listed in a Note in the criteria section). Examples of a response to therapy were moved to a Note in the policy (previously listed as examples within the criteria). **Systemic Juvenile Idiopathic Arthritis:** Examples of one other systemic agent tried for Systemic Juvenile Idiopathic Arthritis were moved to a Note in the policy (previously listed as examples within the criteria). Examples of a response to therapy were moved to a Note in the policy (previously listed as examples within the criteria). **Polymyalgia Rheumatica:** Examples of systemic corticosteroids were moved to a Note in the policy (previously listed as examples within the criteria). Examples of a response to therapy were moved to a Note in the policy (previously listed as examples within the criteria).	03/25/2020

	COVID-19: This indication (including use in cytokine release syndrome associated with COVID-19) was added to the policy as a Condition Not Recommended for Coverage. All reviews are directed to the Medical Director.	

APPENDIX

	Mechanism of Action	Examples of Inflammatory Indications for Products*
Biologics		
Adalimumab SC Products (Humira®, biosimilars)	Inhibition of TNF	AS, CD, PJIA, PsO, PsA, RA, SJIA, UC
Cimzia® (certolizumab pegol SC injection)	Inhibition of TNF	AS, CD, PsO, PsA, RA
Etanercept SC Products (Enbrel®, biosimilars)	Inhibition of TNF	AS, PJIA, PsO, PsA, RA, SJIA
Infliximab IV Products (Remicade®, biosimilars)	Inhibition of TNF	AS, CD, PJIA, PsO, PsA, RA, SJIA, UC
Simponi®, Simponi® Aria™ (golimumab SC injection, golimumab IV infusion)	Inhibition of TNF	SC formulation: AS, PsA, RA, UC
		IV formulation: AS, PsA, RA
Actemra® (tocilizumab IV infusion, tocilizumab SC injection)	Inhibition of IL-6	SC formulation: PJIA, RA, SJIA
		IV formulation: PJIA, RA, SJIA
Kevzara® (sarilumab SC injection)	Inhibition of IL-6	RA
Orencia® (abatacept IV infusion, abatacept SC injection)	T-cell costimulation modulator	SC formulation: PJIA, PSA, RA
		IV formulation: PJIA, PsA, RA
Rituximab IV Products (Rituxan®, biosimilars)	CD20-directed cytolytic antibody	RA
Ilaris (canakinumab SC injection**)**	Inhibition of IL-1β	SJIA
Kineret® (anakinra SC injection)	Inhibition of IL-1	RA, SJIA^
Stelara® (ustekinumab SC injection, ustekinumab IV infusion)	Inhibition of IL-12/23	SC formulation: CD, PsO, PsA, UC
		IV formulation: CD, UC
Siliq™ (brodalumab SC injection)	Inhibition of IL-17	PsO
Cosentyx™ (secukinumab SC injection)	Inhibition of IL-17A	AS, PsO, PsA
Taltz® (ixekizumab SC injection)	Inhibition of IL-17A	AS, PsO, PsA
Ilumya™ (tildrakizumab-asmn SC injection)	Inhibition of IL-23	PsO
Skyrizi™ (risankizumab-rzza SC injection)	Inhibition of IL-23	PsO
Tremfya™ (guselkumab SC injection)	Inhibition of IL-23	PsO
Entyvio™ (vedolizumab IV infusion)	Integrin receptor antagonist	CD, UC
Targeted Synthetic DMARDs		
Otezla® (apremilast tablets)	Inhibition of PDE4	PsO, PsA
Olumiant® (baricitinib tablets)	Inhibition of the JAK pathways	RA
Rinvoq® (upadacitinib extended-release tablets)	Inhibition of the JAK pathways	RA
Xeljanz®, Xeljanz XR (tofacitinib tablets, tofacitinib extended-release tablets)	Inhibition of the JAK pathways	RA, PsA, UC

* Not an all-inclusive list of indication (e.g., oncology indications and rare inflammatory conditions are not listed). Refer to the prescribing information for the respective agent for FDA-approved indications; SC – Subcutaneous; TNF – Tumor necrosis factor; IV – Intravenous, IL – Interleukin; PDE4 – Phosphodiesterase 4; JAK – Janus kinase; AS – Ankylosing spondylitis; CD – Crohn's disease; PJIA – Polyarticular juvenile idiopathic arthritis; PsO – Plaque psoriasis; PsA – Psoriatic arthritis; RA – Rheumatoid arthritis; SJIA – Sytemice juvenile idiopathic arthritis; UC – Ulcerative colitis. ^ Off-label use of SJIA supported in guidelines.

PRIOR AUTHORIZATION POLICY

POLICY: Gonadotropin-Releasing Hormone Agonists – Injectable Long-Acting Products Prior Authorization Policy

- Lupaneta Pack® (leuprolide acetate for depot suspension; norethindrone acetate tablets co-packaged for intramuscular use and oral use, respectively – AbbVie)
- Lupron Depot® (leuprolide acetate suspension for intramuscular injection – Abbott Laboratories)

REVIEW DATE: 01/20/2021; Selected revision 03/03/2021

Overview

Lupaneta Pack is indicated for initial management of the painful symptoms of **endometriosis** and for management of recurrence of symptoms.[1,2]

Lupron Depot (3.75 mg intramuscular (IM) injection every month, 11.25 mg IM injection every 3 months) is indicated for the following conditions:[3,4]

- Preoperative hematologic improvement of women with **anemia caused by uterine leiomyomata** (fibroids) for whom 3 months of hormonal suppression is deemed necessary. (Lupron Depot in combination with iron therapy).
- **Endometriosis**, including pain relief and reduction of endometriotic lesions (Lupron Depot monotherapy).
- **Endometriosis**, initial management of the painful symptoms of endometriosis and management of recurrence of symptoms (Lupron Depot in combination with norethindrone acetate 5 mg daily).

Lupron Depot (7.5 mg IM injection every month, 22.5 mg IM injection every 3 months, 30 mg IM injection every 4 months, and 45 mg IM injection every 6 months) is indicated for the **palliative treatment of advanced prostate cancer**.[5]

Duration of Treatment:

- Lupaneta Pack: Initial treatment course is limited to 6 months; a single retreatment course of up to 6 months is allowed. Total duration of treatment is limited to 12 months.[1,2]
- Lupron Depot 3.75 mg and 11.25 mg:[3,4]
  - Endometriosis: For the first 6 months of treatment, Lupron Depot may be used as monotherapy or in combination with norethindrone acetate. If retreatment is needed, Lupron Depot must be used in combination with norethindrone acetate (for 6 months). Total duration of treatment is limited to 12 months.
  - Uterine leiomyomata (fibroids): Recommended duration of treatment is up to 3 months.
- Lupron Depot 7.5 mg, 22.5 mg, 30 mg, and 45 mg: Labeling does not specify a treatment duration.

Guidelines

Abnormal Uterine Bleeding/Uterine Leiomyomata (Fibroids)

The American College of Obstetricians and Gynecologists (ACOG) practice bulletin regarding the diagnosis of abnormal uterine bleeding in reproductive-aged women discusses the nomenclature of abnormal uterine bleeding. It can be classified by the acronym PALM-COEIN (polyp, adenomyosis, leiomyoma, malignancy and hyperplasia, coagulopathy, ovulatory dysfunction, endometrial, iatrogenic, and not yet classified) and can be further classified by etiology.[6] The term abnormal uterine bleeding can also be paired with descriptive terms that describe the associated bleeding pattern such as heavy menstrual bleeding or intermenstrual bleeding.

The ACOG frequently asked questions (FAQ) #074 (2018) addresses medication use for the treatment of fibroids.[7] Gonadotropin-releasing hormone (GnRH) agonists are noted as medications that can stop the menstrual cycle and shrink fibroids. GnRH analogs are used as short-term preoperative therapy to reduce uterine and leiomyoma volume; long-term therapy should be limited to patients who have contraindications to other medical or surgical treatments.[8] They can also be used for acute abnormal uterine bleeding with an aromatase inhibitor or antagonist to prevent initial estrogen flare and for the treatment of heavy menstrual bleeding caused by leiomyoma-associated hormonal imbalance.[9]

A clinical practice guideline from the Society of Obstetricians and Gynaecologists of Canada notes that leuprolide acetate or combined hormonal contraception should be considered highly effective in preventing abnormal uterine bleeding when initiated prior to cancer treatment in premenopausal women at risk of

thrombocytopenia.[10] The ACOG committee opinion on prevention and management of heavy menstrual bleeding in adolescent patients undergoing cancer treatment lists leuprolide as an option for patients.[11]

Endometriosis

According to the ACOG practice bulletin on the management of endometriosis (2010, reaffirmed 2018), empiric therapy with a 3-month course of a gonadotropin-releasing hormone (GnRH) agonist is appropriate after an appropriate pretreatment evaluation (to exclude other causes of chronic pelvic pain) and failure of initial treatment with oral contraceptives and nonsteroidal anti-inflammatory drugs (NSAIDs).[12]

Other Uses With Supportive Evidence

The Endocrine Society Guideline (2017) for the Treatment of Gender-Dysphoric/Gender-Incongruent Persons note that persons who fulfill criteria for treatment and who request treatment should initially undergo treatment to suppress physical changes of puberty.[13] Pubertal hormonal suppression should typically be initiated after the adolescent first exhibits physical changes of puberty (Tanner stages G2/B2). However, there may be compelling reasons to initiate hormone treatment before the age of 16 years in some adolescents. The guidelines note suppression of pubertal development and gonadal function can be effectively achieved via gonadotropin suppression using GnRH analogs. Long-acting GnRH analogs are the currently preferred treatment option. An advantage to using a GnRH analog is that the effects can be reversed; pubertal suppression can be discontinued if the individual no longer wishes to transition. Upon discontinuation of therapy, spontaneous pubertal development has been shown to resume. The World Professional Association for Transgender Health (WPATH) Standards of Care (version 7) document also recommends the use of GnRH analogs in both male and female adolescents as a fully reversible intervention for pubertal suppression.[14] GnRH can also be used in patients during late puberty to suppress the hypothalamic-pituitary-gonadal axis to allow for lower doses of cross-sex hormones.[15] In addition to use in adolescents, GnRH analog therapy is also used in adults, particularly male-to-female patients.[16]

In addition to the approved indications, GnRH agonists such as long-acting leuprolide, have been used for other conditions. The National Comprehensive Cancer Network (NCCN) guidelines for Adolescent and Young Adult Oncology (version 1.2021 – September 10, 2020) note there are some data to suggest menstrual suppression with GnRH agonists (before the initiation of chemotherapy) may protect ovaries in young women with breast cancer.[17] There are conflicting data regarding the beneficial effects of GnRH agonists on fertility preservation. The NCCN guidelines for Breast Cancer (version 6.2020 – September 8, 2020) note that luteinizing hormone-releasing hormone agonists, such as leuprolide, can be used for ovarian suppression.[18] The guidelines further note that randomized trials have shown that ovarian suppression with GnRH agonist therapy administered during adjuvant chemotherapy in premenopausal women with breast tumors (regardless of hormone receptor status) may preserve ovarian function and diminish the likelihood of chemotherapy-induced amenorrhea. The NCCN guidelines for Head and Neck Cancer (version 1.2021 – November 9, 2020) recommend the use of androgen receptor therapy (i.e., leuprolide, bicalutamide) for androgen receptor-positive, advanced salivary gland tumors with distant metastases.[19] The NCCN guidelines for Ovarian Cancer including Fallopian Tube Cancer and Primary Peritoneal Cancer (version 2.2020 – January 12, 2021) recommend leuprolide as a hormonal therapy option in various settings (e.g., adjuvant therapy, recurrence).[20]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Lupaneta Pack and Lupron-Depot. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Lupaneta Pack and Lupron-Depot as well as the monitoring required for adverse events and long-term efficacy, approval for some of the conditions requires Lupaneta Pack and Lupron-Depot to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

Recommended Authorization Criteria

Coverage of Lupaneta Pack and Lupron Depot is recommended in those who meet the following criteria:

FDA-Approved Indications

36. Endometriosis. Approve Lupron Depot or Lupaneta Pack for 1 year if the patient has tried one of the following (A, B, or C):
- **D)** A contraceptive (e.g., combination oral contraceptives, levonorgestrel-releasing intrauterine systems [e.g., Mirena®, Liletta®]), OR
- **E)** An oral progesterone (e.g., norethindrone tablets), OR
- **F)** A depo-medroxyprogesterone injection, unless contraindicated.

NOTE: An exception to the requirement for a trial of the above therapies can be made if the patient has previously used a gonadotropin-releasing hormone [GnRH] agonist (e.g., Lupron-Depot) or antagonist (e.g., Orilissa).

37. Prostate Cancer. Approve Lupron Depot for 1 year if prescribed by or in consultation with an oncologist.

38. Uterine Leiomyomata (fibroids). Approve Lupron Depot for 3 months.

Other Uses with Supportive Evidence

39. Abnormal Uterine Bleeding. Approve Lupron Depot for 6 months.

40. Breast Cancer. Approve Lupron Depot for 1 year if prescribed by or in consultation with an oncologist.

41. Gender Dysphoric/Gender-Incongruent Persons; Persons Undergoing Gender Reassignment (Female-To-Male [FTM] or Male-To-Female [MTF]). Approve Lupron Depot for 1 year if prescribed by or in consultation with an endocrinologist or a physician who specializes in the treatment of transgender patients.

42. Head and Neck Cancer – Salivary Gland Tumors. Approve Lupron Depot for 1 year if the patient meets the following criteria (A, B, and C):
- **D)** Patient has advanced salivary gland tumors with distant metastases; AND
- **E)** Patient has androgen receptor (AR)-positive disease; AND
- **F)** The medication is prescribed by or in consultation with an oncologist.

43. Ovarian Cancer. Approve Lupron Depot for 1 year if prescribed by or in consultation with an oncologist.

44. Preservation of Ovarian Function/Fertility in Patients Undergoing Chemotherapy. Approve Lupron Depot for 1 year if prescribed by or in consultation with an oncologist.

45. Prophylaxis or Treatment of Uterine Bleeding in Patients with Hematologic Malignancy, or Undergoing Cancer Treatment, or Prior to Bone Marrow/Stem Cell Transplantation (BMT/SCT). Approve Lupron Depot for 1 year if prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Lupron Depot and Lupaneta Pack is not recommended in the following situations:

65. Hirsutism. The Endocrine Society guidelines (2018) on the treatment of hirsutism in premenopausal women suggest against using GnRH agonists except in women with severe forms of hyperandrogenemia, such as ovarian hyperthecosis, who have had a suboptimal response to oral contraceptives and antiandrogens.[21]

66. Menstrual Migraine. A review article notes that GnRH analogs are effective in eliminating menstrual migraines, but their use is limited due to the significant adverse effects of estrogen deficiency, including severe vasomotor symptoms, sleep disruption, and a marked reduction in bone density.[22,23]

67. Premenstrual Syndrome (PMS). On occasion, GnRH analogs are recommended as an aid in the diagnosis of PMS.[24] Use of GnRH analogs results in profound cycle suppression and elimination of PMS symptoms, but these agents should not be used routinely. GnRH analogs are recommended only as a third-line treatment or for the most refractory patients.

68. Polycystic Ovarian Syndrome (PCOS). PCOS guidelines from the Endocrine Society (2013)[25] and review articles[26,27] do not recommend this as a treatment modality.

69. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Early Annual Revision	• Removal of Lupron Depot-Ped and Triptodur and the indication of central precocious puberty. These medications are addressed in the policy: Gonadotropin-Releasing Hormone Agonists for Central Precocious Puberty PA Policy with Preferred Step Therapy. • Updated the following indication, Prophylaxis or Treatment of Uterine Bleeding in Patients with Hematologic Malignancy or Prior to Bone Marrow/Stem Cell Transplantation to include patients undergoing cancer treatment. • Added "if prescribed by or in consultation with an oncologist" to the following diagnoses: Prostate Cancer, Ovarian Cancer, Breast Cancer, Preserve Ovarian Function/Fertility in Patients undergoing Chemotherapy, and Prophylaxis or Treatment of Uterine Bleeding in Patients with Hematologic Malignancy or Undergoing Cancer Treatment, or Prior to Bone Marrow/Stem Cell Transplantation to align with the Lupron Depot Medical Benefit Management policy.	1/30/2019
Selected Revision	• Updated endometriosis criterion: removal of continued pain criteria and removal of prescriber's specialty or consultation specialty. • Added the wording Gender Dysphoric/Gender Incongruent Persons to the diagnosis for Gender Reassignment.	4/10/2019
Annual Revision	No criteria changes.	01/15/2020
Update	09/22/2020: Revised policy name from "Gonadotropin-Releasing Hormone Agonists – Injectable Long-Acting Products (Lupron Depot and Lupaneta Pack) Prior Authorization Policy" to "Gonadotropin-Releasing Hormone Agonists – Injectable Long-Acting Products Prior Authorization Policy".	--
Annual Revision	Head and Neck Cancer – Salivary Gland Tumors: revised "Patient has recurrent disease with distant metastases" to "Patient has advanced salivary gland tumors with distant metastases".	01/20/2021
Selected Revision	Lupron Depot 3.75 mg and 11.25 mg – Uterine leiomyomata (fibroids): Approval duration is changed from 6 months to 3 months, due to revised labeling.	03/03/2021

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Arcalyst Prior Authorization Policy

- Arcalyst® (rilonacept for subcutaneous injection – Regeneron Pharmaceuticals)

REVIEW DATE: 01/20/2021

OVERVIEW

Arcalyst, an interleukin-1 (IL-1) blocker, is indicated for the following uses:[1]

- **Cryopyrin-associated periodic syndromes (CAPS)**, including familial cold autoinflammatory syndrome and Muckle-Wells Syndrome, for treatment of patients ≥ 12 years of age.
- **Deficiency of interleukin-1 receptor antagonist (DIRA),** for maintenance of remission in patients weighing at least 10 kg.

In the pivotal trial for CAPS, patients had significant improvement in symptoms scores were improved with Arcalyst through Week 6 and were maintained through Week 15. In the pivotal trial for DIRA, enrolled patients with a loss of function *IL1RN* mutation who previously experienced a benefit with Kineret (anakinra subcutaneous injection). All patients (n = 6) were in remission at Month 6 and sustained remission for the remainder of the 2-year study.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Arcalyst. Because of the specialized skills required for evaluation and diagnosis of patients treated with Arcalyst as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Arcalyst to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

All reviews for use of Arcalyst for COVID-19 and/or cytokine release syndrome associated with COVID-19 will be forwarded to the Medical Director.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Arcalyst is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Cryopyrin-Associated Periodic Syndromes.** Approve for the duration noted if the patient meets ONE of the following (A or B):
   Note: This includes Familial Cold Autoinflammatory Syndrome, Muckle-Wells Syndrome, and Neonatal Onset Multisystem Inflammatory Disease or chronic infantile neurological cutaneous and articular syndrome.
   - **A)** Initial Therapy. Approve for 3 months if the patient meets the following conditions (i and ii):
     - **i.** Patient is ≥ 12 years of age; AND
     - **ii.** The medication is prescribed by or in consultation with a rheumatologist, geneticist, allergist/immunologist, or dermatologist.
   - **B)** Patient is Currently Receiving Arcalyst. Approve for 3 years if the patient has had a response, as determined by the prescriber.

2. **Deficiency of Interleukin-1 Receptor Antagonist**. Approve for the duration noted if the patient meets one of the following (A or B):
   - **A)** Initial Therapy. Approve for 6 months if the patient meets ALL of the following (i, ii, iii, and iv):
     - **i.** Patient is ≥ 10 kg (22 pounds); AND
     - **ii.** Genetic testing has confirmed a mutation in the *IL1RN* gene; AND
     - **iii.** According to the prescriber, patient has demonstrated a clinical benefit with Kineret (anakinra subcutaneous injection); AND
       Note: Examples of a clinical response with Kineret include normalized acute phase reactants; resolution of fever, skin rash, and bone pain; and reduced dosage of corticosteroids.
     - **iv.** The medication is prescribed by or in consultation with a rheumatologist, geneticist, dermatologist, or a physician specializing in the treatment of autoinflammatory disorders.
   - **B)** Patient is Currently Receiving Arcalyst. Approve for 3 years if the patient has responded to therapy, as determined by the prescriber.
     Note: Examples include sustained remission; continued resolution of fever, skin rash, and bone pain; normalized acute phase reactants.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Arcalyst is not recommended in the following situations:

70. **Concurrent Biologic Therapy.** Arcalyst should not be administered in combination with another biologic agent for an inflammatory condition (see Appendix for examples).[1] Arcalyst has not been used in combination with tumor necrosis factor inhibitors (TNFis). An increased incidence of serious infections has been associated with another interleukin-1 blocker (Kineret® [anakinra subcutaneous injection]) when given in combination with TNFis.

71. **COVID-19 (Coronavirus Disease 2019).** Forward all requests to the Medical Director.
Note: This includes requests for cytokine release syndrome associated with COVID-19.

72. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	No criteria changes.	11/06/2019
Selected Revision	**COVID-19:** This indication (including use in cytokine release syndrome associated with COVID-19) was added to the policy as a Condition Not Recommended for Coverage. All reviews are directed to the Medical Director.	04/01/2020
Annual Revision	No criteria changes.	11/18/2020
Early Annual Revision	**Deficiency of Interleukin-1 Receptor Antagonist:** Criteira for this newly approved condition were added to the policy. For an initial 6-month approval, the patient must weigh ≥ 22 kg, genetic testing must have confirmed a mutation in the *IL1RN* gene, and the patient must have tried Kineret. Additionally, Arcalyst must be prescribed by or in consultation with a specialist. For a patient currently taking Arcalyst, a 3-year approval is authorized in the patient has responded to therapy.	01/20/2021

APPENDIX

	Mechanism of Action	Examples of Inflammatory Indications*
Biologics		
Adalimumab SC Products (Humira®, biosimilars)	Inhibition of TNF	AS, CD, PJIA, PsO, PsA, RA, SJIA, UC
Cimzia® (certolizumab pegol SC injection)	Inhibition of TNF	AS, CD, PsO, PsA, RA
Etanercept SC Products (Enbrel®, biosimilars)	Inhibition of TNF	AS, PJIA, PsO, PsA, RA, SJIA
Infliximab IV Products (Remicade®, biosimilars)	Inhibition of TNF	AS, CD, PJIA, PsO, PsA, RA, SJIA, UC
Simponi®, Simponi® Aria™ (golimumab SC injection, golimumab IV infusion)	Inhibition of TNF	SC formulation: AS, PsA, RA, UC
		IV formulation: AS, PsA, RA
Actemra® (tocilizumab IV infusion, tocilizumab SC injection)	Inhibition of IL-6	SC formulation: PJIA, RA, SJIA
		IV formulation: PJIA, RA, SJIA
Kevzara® (sarilumab SC injection)	Inhibition of IL-6	RA
Orencia® (abatacept IV infusion, abatacept SC injection)	T-cell costimulation modulator	SC formulation: PJIA, PSA, RA
		IV formulation: PJIA, PsA, RA
Rituximab IV Products (Rituxan®, biosimilars)	CD20-directed cytolytic antibody	RA
Ilaris (canakinumab SC injection**)**	Inhibition of IL-1β	SJIA
Kineret® (anakinra SC injection)	Inhibition of IL-1	RA, SJIA^
	Inhibition of IL-12/23	SC formulation: CD, PsO, PsA, UC

Stelara® (ustekinumab SC injection, ustekinumab IV infusion)		IV formulation: CD, UC
Siliq™ (brodalumab SC injection)	Inhibition of IL-17	PsO
Cosentyx™ (secukinumab SC injection)	Inhibition of IL-17A	AS, PsO, PsA
Taltz® (ixekizumab SC injection)	Inhibition of IL-17A	AS, PsO, PsA
Ilumya™ (tildrakizumab-asmn SC injection)	Inhibition of IL-23	PsO
Skyrizi™ (risankizumab-rzza SC injection)	Inhibition of IL-23	PsO
Tremfya™ (guselkumab SC injection)	Inhibition of IL-23	PsO
Entyvio™ (vedolizumab IV infusion)	Integrin receptor antagonist	CD, UC
Targeted Synthetic DMARDs		
Otezla® (apremilast tablets)	Inhibition of PDE4	PsO, PsA
Olumiant® (baricitinib tablets)	Inhibition of the JAK pathways	RA
Rinvoq® (upadacitinib extended-release tablets)	Inhibition of the JAK pathways	RA
Xeljanz®, Xeljanz XR (tofacitinib tablets, tofacitinib extended-release tablets)	Inhibition of the JAK pathways	RA, PsA, UC

* Not an all-inclusive list of indication (e.g., oncology indications and rare inflammatory conditions are not listed). Refer to the prescribing information for the respective agent for FDA-approved indications; SC – Subcutaneous; TNF – Tumor necrosis factor; IV – Intravenous, IL – Interleukin; PDE4 – Phosphodiesterase 4; JAK – Janus kinase; AS – Ankylosing spondylitis; CD – Crohn's disease; PJIA – Polyarticular juvenile idiopathic arthritis; PsO – Plaque psoriasis; PsA – Psoriatic arthritis; RA – Rheumatoid arthritis; SJIA – Systemic juvenile idiopathic arthritis; UC – Ulcerative colitis; ^ Off-label use of SJIA supported in guidelines.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Cimzia Prior Authorization Policy

- Cimzia® (certolizumab pegol for subcutaneous injection [lyophilized powder or solution] – UCB)

REVIEW DATE: 02/24/2021

OVERVIEW

Cimzia, a tumor necrosis factor inhibitor (TNFi), is indicated for the following uses:[1]

- **Ankylosing spondylitis**, for the treatment of adults with active disease.
- **Crohn's disease**, for reducing signs and symptoms and maintaining clinical responses in adults with moderate to severe active disease who have had an inadequate response to conventional therapy.
- **Non-radiographic axial spondyloarthritis**, in patients with objective signs of inflammation.
- **Plaque psoriasis**, for the treatment of adults with moderately to severely active disease who are candidates for systemic therapy or phototherapy.
- **Psoriatic arthritis**, for the treatment of adult patients with active disease.
- **Rheumatoid arthritis**, for the treatment of adults with moderately to severely active disease.

Cimzia may be used as monotherapy or in combination with conventional synthetic disease-modifying antirheumatic drugs (csDMARDs).

Dosing Information

Approved induction dosing is 400 mg given subcutaneously at Weeks 0, 2, and 4. For psoriasis, maintenance dosing is 400 mg given every 2 weeks. For other indications, maintenance dosing is generally given as 400 mg subcutaneously per 28-day period. This dose may be administered as a single 200-mg injection given once every 2 weeks or as two 200-mg doses (400-mg dose) given once every 4 weeks.

Guidelines

TNFis feature prominently in guidelines for treatment of inflammatory conditions.

- **Crohn's Disease:** The American College of Gastroenterology has guidelines for Crohn's disease (2018).[3] TNFis are listed as an option for disease that is resistant to corticosteroids, severely active disease, perianal fistulizing disease, and maintenance of remission. In post-operative Crohn's disease, a TNFi should be started within 4 weeks of surgery to prevent recurrence.
- **Plaque Psoriasis:** Guidelines from the American Academy of Dermatologists and National Psoriasis Foundation (2019) recommend TNFis as a monotherapy treatment option for adults with moderate to severe disease.[4] Based on extrapolation of data, Cimzia is likely to have class characteristics similar to the other TNFis.
- **Psoriatic Arthritis:** Guidelines from ACR (2019) recommend TNFis over other biologics for use in treatment-naïve patients with PsA and in those who were previously treated with an oral therapy.[5]
- **Rheumatoid Arthritis:** Guidelines from the American College of Rheumatology (ACR) [2015] have TNF inhibitors and non-TNF biologics, administered with or without MTX, equally positioned as a recommended therapy following a trial of a conventional synthetic DMARD (e.g., MTX, leflunomide, hydroxychloroquine, sulfasalazine).[6]
- **Spondyloarthritis:** Guidelines for ankylosing spondylitis and nonradiographic axial spondyloarthritis are published by the American College of Rheumatology (ACR)/Spondylitis Association of America/Spondyloarthritis Research and Treatment Network (2019).[2] TNFis are recommended for the initial biologic. In those who are secondary nonresponders to a TNFi, a second TNFi is recommended over switching out of the class.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Cimzia. Because of the specialized skills required for evaluation and diagnosis of patients treated with Cimzia as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Cimzia to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Cimzia is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Ankylosing Spondylitis.** Approve for the duration noted if the patient meets ONE of the following (A or B):
   - **A)** Initial Therapy. Approve for 3 months if prescribed by or in consultation with a rheumatologist.
   - **B)** Patient is Currently Receiving Cimzia. Approve for 3 years if the patient had a response, as determined by the prescriber.

     Note: Examples of a response include decreased pain or stiffness, improved function or activities of daily living. The patient may not have a full response, but there should have been a recent or past response to Cimzia.

2. **Crohn's Disease.** Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets the following (i, ii, and iii):
- **i.** Patient is ≥ 18 years of age; AND
- **ii.** Patient meets one of the following (a or b):
  - **a)** Patient has tried or is currently taking corticosteroids, or corticosteroids are contraindicated in this patient; OR
  - **b)** Patient has tried one other conventional systemic therapy for Crohn's disease; AND
    Note: Examples of systemic therapies for Crohn's disease include azathioprine, 6-mercaptopurine, and methotrexate. A previous trial of a biologic also counts as a trial of one other agent for Crohn's disease. Refer to Appendix for examples of biologics used for Crohn's disease. A trial of mesalamine does not count as a systemic agent for Crohn's disease.

- **iii.** The medication is prescribed by or in consultation with a gastroenterologist.

B) Patient is Currently Receiving Cimzia. Approve for 3 years if the patient had a response, as determined by the prescriber.
Note: The patient may not have a full response, but there should have been a recent or past response to Cimzia. A patient with fistulizing Crohn's disease or Crohn's disease of the ileal pouch must meet the above criteria for Crohn's disease.

3. Non-Radiographic Axial Spondyloarthritis. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets BOTH of the following (i and ii):
- **i.** Patient has objective signs of inflammation, defined as at least one of the following (a or b):
  - **a)** C-reactive protein (CRP) elevated beyond the upper limit of normal for the reporting laboratory; OR
  - **b)** Sacroiliitis reported on magnetic resonance imaging (MRI); AND
- **ii.** The medication is prescribed by or in consultation with a rheumatologist.

B) Patient is Currently Receiving Cimzia. Approve for 3 years if the patient had a response, as determined by the prescriber.
Note: Examples of a response include decreased pain or stiffness, improved function or activities of daily living. The patient may not have a full response, but there should have been a recent or past response to Cimzia.

4. Plaque Psoriasis. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets the following (i, ii, and iii):
- **i.** Patient is ≥ 18 years of age; AND
- **ii.** Patient meets ONE of the following conditions (a or b):
  - **a)** Patient has tried at least at least one traditional systemic agent for psoriasis for at least 3 months, unless intolerant; OR
    Note: Examples of traditional systemic agents for psoriasis include methotrexate, cyclosporine, acitretin tablets, or psoralen plus ultraviolet A light (PUVA). An exception to the requirement for a trial of one traditional systemic agent for psoriasis can be made if the patient has already had a 3-month trial or previous intolerance to at least one biologic. Refer to Appendix for examples of biologics used for psoriasis. A patient who has already tried a biologic for psoriasis is not required to "step back" and try a traditional systemic agent for psoriasis.
  - **b)** Patient has a contraindication to methotrexate, as determined by the prescriber; AND
- **iii.** The medication is prescribed by or in consultation with a dermatologist.

B) Patient is Currently Receiving Cimzia. Approve for 3 years if the patient had a response, as determined by the prescriber.

Note: The patient may not have a full response, but there should have been a recent or past response to Cimzia.

5. **Psoriatic Arthritis.** Approve for the duration noted if the patient meets ONE of the following (A or B):
   - **A)** Initial Therapy. Approve for 3 months if prescribed by or in consultation with a rheumatologist or a dermatologist.
   - **B)** Patient is Currently Receiving Cimzia. Approve for 3 years if the patient had a response, as determined by the prescriber.

     Note: Examples of a response include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improvements in acute phase reactants (for example, C-reactive protein). The patient may not have a full response, but there should have been a recent or past response to Cimzia.

6. **Rheumatoid Arthritis.** Approve for the duration noted if the patient meets ONE of the following (A or B):
   - **A)** Initial Therapy. Approve for 3 months if the patient meets the following (i and ii):
     - **i.** Patient has tried ONE conventional synthetic disease-modifying antirheumatic drug (DMARD) for at least 3 months; AND

       Note: Examples of conventional synthetic DMARDs include methotrexate (oral or injectable), leflunomide, hydroxychloroquine, and sulfasalazine. An exception to the requirement for a trial of one conventional synthetic DMARD can be made if the patient has already had a 3-month trial at least one biologic. Refer to Appendix for examples of biologics used for rheumatoid arthritis. A patient who has already tried a biologic for rheumatoid arthritis is not required to "step back" and try a conventional synthetic DMARD.
     - **ii.** The medication is prescribed by or in consultation with a rheumatologist.
   - **B)** Patient is Currently Receiving Cimzia. Approve for 3 years if the patient had a response, as determined by the prescriber.

     Note: Examples of a response include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improved laboratory values; reduced dosage of corticosteroids. The patient may not have a full response, but there should have been a recent or past response to Cimzia.

Other Uses with Supportive Evidence

7. **Spondyloarthritis, Other Subtypes** Approve for the duration noted if the patient meets ONE of the following conditions (A or B):

   Note: Examples of other subtypes of spondyloarthritis include undifferentiated arthritis and reactive arthritis (Reiter's disease). For ankylosing spondylitis, psoriatic arthritis, or non-radiographic axial spondyloarthrits, refer to the respective criteria under FDA-approved indications.
   - **A)** Initial Therapy. Approve for 3 months if the patient meets ALL of the following (i, ii, and iii):
     - **i.** Patient has arthritis primarily in the knees, ankles, elbows, wrists, hands, and/or feet; AND
     - **ii.** Patient has tried at least ONE conventional synthetic disease-modifying antirheumatic drug (DMARD); AND

       Note: Examples include methotrexate, leflunomide, and sulfasalazine.

iii. The medication is prescribed by or in consultation with a rheumatologist.

B) Patient is Currently Receiving Cimzia. Approve for 1 year if the patient had a response, as determined by the prescriber.
Note: Examples of a response include decreased pain or stiffness, improved function or activities of daily living. The patient may not have a full response, but there should have been a recent or past response to Cimzia.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Cimzia is not recommended in the following situations:

1. **Concurrent Use with a Biologic or with a Targeted Synthetic Disease-Modifying Antirheumatic Drug (DMARD).** Cimzia should not be administered in combination with another biologic or with a targeted synthetic DMARD used for an inflammatory condition (see Appendix for examples). Combination therapy is generally not recommended due to a potentially higher rate of AEs with combinations and lack of data supportive of additional efficacy.[7,8] Note: This does NOT exclude the use of conventional synthetic DMARDs (e.g., methotrexate, leflunomide, hydroxychloroquine, and sulfasalazine) in combination with Cimzia.

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Early Annual Revision	**Non-Radiographic Axial Spondylitis (nr-axSpA):** Due to approval in this condition, criteria were moved from Other Conditions Recommended for Coverage to the FDA-Approved indications section of the policy. To align with the indication, criteria were added to require objective signs of inflammation, defined as C-reactive protein (CRP) elevated beyond the upper limit of normal for the reporting laboratory or sacroiliitis reported on magnetic resonance imaging. For patients continuing therapy, the approval duration was changed to 3 years (previously was 1 year), and applies to patients who are responding to therapy (previously criteria also required the patient to be on Cimzia for ≥ 90 days). **Spondyloarthritis (SpA), Other Subtypes:** Due to Cimzia's approval in nr-axSpA, this off-label approval condition was reworded (previously listed as Spondyloarthritis, Subtypes Other than Ankylosing Spondylitis or Psoriatic Arthritis). There is a note which directs to criteria for FDA-approved subtypes of SpA (AS, PsA, and nr-axSpA).	04/24/2019

	Criteria which approved for patients with primarily axial disease were removed. Criteria were changed to approve for 3 months for patients starting therapy (previously was 1 year). For patients currently receiving therapy, examples of a response to therapy were added; the requirement that patients be on Cimzia for ≥ 90 days was removed.	
Annual Revision	**Ankylosing Spondylitis:** For patients continuing therapy, examples of a response were moved to a note in the policy (previously listed in the criteria for patients continuing therapy). **Crohn's Disease:** The requirement that the patient is an adult was moved into the criteria section for initial therapy. Criteria were clarified to define adult as a patient ≥ 18 years of age. Previously, the requirement that the patient was an adult was listed as part of the diagnosis (i.e., previously listed as Crohn's disease in an adult) and applied to initial and continuation of therapy. Criteria were clarified to state that previously tried therapies for Crohn's disease must have been systemic therapies. Examples of systemic agents were moved to a Note (previously listed as examples within the criteria). Examples of biologics for Crohn's disease were moved to be included in the Appendix (previously listed in a Note in the criteria section). A clarification was also added that mesalamine does not count towards a trial of a systemic therapy. **Non-Radiographic Axial Spondyloarthritis:** Examples of a response to therapy were moved to a Note (previously listed as examples within the criteria). **Plaque Psoriasis:** Examples of traditional systemic agents were moved to a Note (previously listed as examples within the criteria). Examples of biologics for plaque psoriasis were moved to be included in the Appendix (previously listed in a Note in the criteria section). Examples of an absolute contraindication to methotrexate, sulfasalazine, or leflunomide were moved to a Note (previously listed as examples within the criteria). For the exception applying to patients with a contraindication to methotrexate, wording was updated to more generally allow this determination by the prescriber (criteria previously specified this was according to the prescribing physician). **Psoriatic Arthritis:** For patients continuing therapy, examples of a response were moved to a note in the policy (previously listed in the criteria for patients continuing therapy). **Rheumatoid Arthritis:** Examples of conventional synthetic disease-modifying antirheumatic drugs were moved to a Note (previously listed as examples within the criteria). Examples of biologics for Rheumatoid Arthritis were moved to be included in the Appendix (previously listed in a Note in the criteria section). Examples of a response to therapy were moved to a Note (previously listed as examples within the criteria). **Spondyloarthritis (SpA), Other Subtypes:** Examples of conventional synthetic disease-modifying antirheumatic drugs were moved to a Note (previously listed as examples within the criteria). Examples of a response to therapy were moved to a Note (previously listed as examples within the criteria).	04/22/2020
Early Annual Revision	**Crohn's Disease:** To align with other similarly worded policies, wording was changed to specify that previous therapy must have been a conventional systemic therapy (previously required a trial of a systemic agent, with conventional systemic therapies among the examples). **Spondyloarthritis, Other Subtypes:** Examples of other subtypes of spondyloarthritis were moved to a note (previously listed as examples within the indication).	02/24/2021

APPENDIX

	Mechanism of Action	Examples of Inflammatory Indications*
Biologics		
Adalimumab SC Products (Humira®, biosimilars)	Inhibition of TNF	AS, CD, JIA, PsO, PsA, RA, UC
Cimzia® (certolizumab pegol SC injection)	Inhibition of TNF	AS, CD, nr-axSpA, PsO, PsA, RA
Etanercept SC Products (Enbrel®, biosimilars)	Inhibition of TNF	AS, JIA, PsO, PsA
Infliximab IV Products (Remicade®, biosimilars)	Inhibition of TNF	AS, CD, PsO, PsA, RA, UC
Simponi®, Simponi® Aria™ (golimumab SC injection, golimumab IV infusion)	Inhibition of TNF	SC formulation: AS, PsA, RA, UC
		IV formulation: AS, PJIA, PsA, RA
Actemra® (tocilizumab IV infusion, tocilizumab SC injection)	Inhibition of IL-6	SC formulation: PJIA, RA, SJIA
		IV formulation: PJIA, RA, SJIA
Kevzara® (sarilumab SC injection)	Inhibition of IL-6	RA

Orencia® (abatacept IV infusion, abatacept SC injection)	T-cell costimulation modulator	SC formulation: JIA, PSA, RA
		IV formulation: JIA, PsA, RA
Rituximab IV Products (Rituxan®, biosimilars)	CD20-directed cytolytic antibody	RA
Kineret® (anakinra SC injection)	Inhibition of IL-1	JIA^, RA
Stelara® (ustekinumab SC injection, ustekinumab IV infusion)	Inhibition of IL-12/23	SC formulation: CD, PsO, PsA, UC
		IV formulation: CD, UC
Siliq™ (brodalumab SC injection)	Inhibition of IL-17	PsO
Cosentyx™ (secukinumab SC injection)	Inhibition of IL-17A	AS, nr-axSpA, PsO, PsA
Taltz® (ixekizumab SC injection)	Inhibition of IL-17A	AS, nr-axSpA, PsO, PsA
Ilumya™ (tildrakizumab-asmn SC injection)	Inhibition of IL-23	PsO
Skyrizi™ (risankizumab-rzza SC injection)	Inhibition of IL-23	PsO
Tremfya™ (guselkumab SC injection)	Inhibition of IL-23	PsO
Entyvio™ (vedolizumab IV infusion)	Integrin receptor antagonist	CD, UC
Targeted Synthetic DMARDs		
Otezla® (apremilast tablets)	Inhibition of PDE4	PsO, PsA
Olumiant® (baricitinib tablets)	Inhibition of JAK pathways	RA
Rinvoq® (upadacitinib extended-release tablets)	Inhibition of JAK pathways	RA
Xeljanz® (tofacitinib tablets)	Inhibition of JAK pathways	RA, PJIA, PsA, UC
Xeljanz® XR (tofacitinib extended-release tablets)	Inhibition of JAK pathways	RA, PsA, UC

* Not an all-inclusive list of indication (e.g., oncology indications and rare inflammatory conditions are not listed). Refer to the prescribing information for the respective agent for FDA-approved indications; SC – Subcutaneous; TNF – Tumor necrosis factor; IV – Intravenous, IL – Interleukin; PDE4 – Phosphodiesterase 4; JAK – Janus kinase; AS – Ankylosing spondylitis; CD – Crohn's disease; JIA – Juvenile idiopathic arthritis; PsO – Plaque psoriasis; PsA – Psoriatic arthritis; RA – Rheumatoid arthritis; UC – Ulcerative colitis; nr-axSpA – Non-radiographic axial spondyloarthritis; ^ Off-label use of Kineret in JIA supported in guidelines; DMARDs – Disease-modifying antirheumatic drug.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Cosentyx Prior Authorization Policy
- Cosentyx® (secukinumab for subcutaneous injection – Novartis)

REVIEW DATE: 03/04/2020; selected revision 06/24/2020

OVERVIEW

Cosentyx, a human interleukin (IL)-17A antagonist, is indicated in the following conditions:[1]
- **Plaque psoriasis**, in adults with moderate to severe disease who are candidates for systemic therapy or phototherapy.
- **Psoriatic arthritis**, in adults with active disease (given ± methotrexate).
- **Ankylosing spondylitis**, in adults with active disease.
- **Non-radiographic axial spondyloarthritis**, in adults with active disease and objective signs of inflammation.

Safety and efficacy in patients ≤ 18 years of age has not been established. In the pivotal trial for non-radiographic axial spondyloarthritis, patients were required to have objective signs of inflammation, indicated by elevated C-reactive protein and/or sacroiliitis on magnetic resonance imaging.

Guidelines

Il-17 blockers are mentioned in multiple guidelines for treatment of inflammatory conditions. Guidelines recommend assessment of response to initial therapy, most often following 3 months of therapy.
- **Spondyloarthritis:** Guidelines for ankylosing spondylitis and non-radiographic axial spondyloarthritis are published by the American College of Rheumatology (ACR)/Spondylitis Association of America/Spondyloarthritis Research and Treatment Network (2019).[2] Following

primary nonresponse to a tumor necrosis factor inhibitor (TNFi), either Cosentyx or Taltz is recommended; however, if the patient is a secondary nonresponder, a second TNFi is recommended over switching out of the class. In patients with a contraindication to a TNFi, use of an IL-17 blocker is recommended over traditional oral agents such as methotrexate or sulfasalazine.

- **Plaque Psoriasis:** Joint guidelines of care for the management and treatment of psoriasis with biologics were published by the American Academy of Dermatology (AAD) and the National Psoriasis Foundation (2019).[3] All of the biologics are generally recommended for treatment of moderate to severe disease. The AAD also recommends methotrexate (unless contraindicated) and other systemic therapies for treatment of moderate to severe psoriasis.[4] Traditional systemic agents can benefit widespread psoriasis. Studies have assessed response to methotrexate following 6 weeks to 4 months of treatment.
- **Psoriatic Arthritis:** Guidelines from the ACR/National Psoriasis Foundation (2018) generally recommend TNFis as the first-line treatment strategy over other biologics (e.g., IL-17 blockers) with differing mechanisms of action.[5]

Safety

Warnings/Precautions for Cosentyx include infections, pre-treatment evaluation for tuberculosis, exacerbation of Crohn's disease, hypersensitivity reactions, risk of hypersensitivity in latex-sensitive individuals, and vaccinations.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Cosentyx. Because of the specialized skills required for evaluation and diagnosis of patients treated with Cosentyx as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Cosentyx to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Cosentyx is recommended in those who meet the following criteria:

FDA-Approved Indications

D) Ankylosing Spondylitis. Approve for the duration noted if the patient meets ONE of the following (A or B):

- **A)** Initial Therapy. Approve for 3 months if Cosentyx is prescribed by or in consultation with a rheumatologist.
- **B)** Patient is Currently Receiving Cosentyx. Approve for 3 years if the patient has had a response, as determined by the prescriber.
  Note: Examples of a response include decreased pain or stiffness, improved function or activities of daily living. The patient may not have a full response, but there should have been a recent or past response to Cosentyx.

E) Non-Radiographic Axial Spondyloarthritis. Approve for the duration noted if the patient meets ONE of the following (A or B):

- **A)** Initial Therapy. Approve for 3 months if the patient meets BOTH of the following (i and ii):
  - **i.** Patient has objective signs of inflammation, defined as at least one of the following (a or b):
    - **a)** C-reactive protein elevated beyond the upper limit of normal for the reporting laboratory; OR
    - **b)** Sacroiliitis reported on magnetic resonance imaging; AND
  - **ii.** Cosentyx is prescribed by or in consultation with a rheumatologist.
- **B)** Patient is Currently Receiving Cosentyx. Approve for 3 years if the patient has had a response, as determined by the prescriber.
  Note: Examples of a response include decreased pain or stiffness, improved function or activities of daily living. The patient may not have a full response, but there should have been a recent or past response to Cosentyx.

F) Plaque Psoriasis. Approve for the duration noted if the patient meets ONE of the following (A or B):

- **A)** Initial Therapy. Approve for 3 months if the patient meets ALL of the following criteria (i, ii, and iii):
  - **i.** Patient is ≥ 18 years of age; AND
  - **ii.** Patient meets ONE of the following conditions (a or b):
    - **1.** Patient has tried at least at least one traditional systemic agent for psoriasis for at least 3 months, unless intolerant; OR
      Note: Examples include methotrexate, cyclosporine, acitretin, or psoralen plus ultraviolet A light (PUVA). An exception to the requirement for a trial of one traditional systemic agent for psoriasis can be made if the patient has already has a 3-month trial or previous intolerance to at least one biologic for this condition. (Refer to **Appendix** for examples of

biologics used for psoriasis.) These patients who have already tried a biologic for psoriasis are not required to "step back" and try a traditional systemic agent for psoriasis).

2. Patient has a contraindication to methotrexate, as determined by the prescriber; AND

iii. Cosentyx is prescribed by or in consultation with a dermatologist.

B) Patient is Currently Receiving Cosentyx. Approve for 3 years if the patient has responded, as determined by the prescriber.
Note: Patient may not have a full response, but there should have been a recent or past response to Cosentyx.

G) Psoriatic Arthritis. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if Cosentyx is prescribed by or in consultation with a rheumatologist or a dermatologist.

B) Patient is Currently Receiving Cosentyx. Approve for 3 years if the patient has responded, as determined by the prescriber.
Note: Examples of a response include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improvements in acute phase reactants (for example, C-reactive protein). The patient may not have a full response, but there should have been a recent or past response to Cosentyx.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Cosentyx is not recommended in the following situations:

1. **Concurrent Use with other Biologics or Targeted Synthetic Disease-Modifying Antirheumatic Drugs (DMARDs).** Cosentyx should not be administered in combination with another biologic or targeted synthetic DMARD used for an inflammatory condition (See Appendix for examples). Combination therapy is generally not recommended due to a potential for a higher rate of adverse effects with combinations and lack of evidence for additive efficacy.
Note: This does NOT exclude the use of conventional synthetic DMARDs (e.g., methotrexate, leflunomide, hydroxychloroquine, and sulfasalazine) in combination with Cosentyx.

73. **Crohn's Disease.** Exacerbations of Crohn's disease, in some cases serious, occurred in clinical trials with Cosentyx-treated patients.[1] In a Phase II published study in patients with Crohn's disease (n = 59), an intravenous formulation of Cosentyx did not reduce the Crohn's disease activity index by ≥ 50 points compared with placebo and the study was terminated prematurely.[6]

74. Patients < 18 Years of Age. Cosentyx is indicated in adults ≥ 18 years of age. Safety and efficacy in pediatric patients have not been established.[1]

75. Rheumatoid Arthritis. In a published, double-dummy Phase III study, Cosentyx was less effective that current treatments in patients with rheumatoid arthritis who were previously treated with a TNFi.[7] Patients were randomized to one of four treatment groups: 1) induction with an intravenous formulation of Cosentyx (10 mg/kg) followed by Cosentyx 150 mg subcutaneously given once every 4 weeks Q4W) [n = 137]; 2) secukinumab intravenous induction (10 mg/kg) followed by Cosentyx 75 mg subcutaneously Q4W (n = 138). At Week 24, ACR 20 response was significantly better with Cosentyx 150 mg subcutaneously (31%) and Orencia intravenous (43%) vs. placebo (18%). ACR 20 response with Cosentyx 75 mg was 28%, which was not significantly better than the placebo group. ACR 50/70 responses were 17%/10% with Cosentyx 150 mg and 12%/5% with Cosentyx 75 mg which was not significantly different than placebo (9%/5%). The group treated with Orencia intravneous had significantly improved ACR 50/70 responses at Week 24 (28%/12%). Using as observed data, ACR

20/50/70 responses at Week 52 were 63%/46%/19% with Cosentyx 150 mg, 57%/26%/7% with Cosentyx 75 mg, and 75%/52%/23% with Orencia intravenous. There is a published Phase II dose-ranging study (n = 237) evaluating Cosentyx in rheumatoid arthritis.[8-10] The ACR 20 response at Week 16 (using last observation carried forward analysis) was 34%, 46.9%, 46.5%, 53.7% for the 25, 75, 150, and 300 mg doses vs. 36% for placebo; however, this did not achieve statistical significance. After Week 16, patients who responded to Cosentyx sustained their response through Week 52 with patients on the 150 mg dose having the greatest improvement over time (55% and 40% of patients with ACR 50 and ACR 70 responses, respectively, at Week 52). In another Phase II study, Cosentyx did not achieve higher ACR 20 response rates at Week 12 vs. placebo.[11] There was an open-label treatment period where ACR responses were generally maintained through Week 52. Some patients were treated with an intravenous formulation of secukinumab and generally responded similarly to those treated with Cosentyx. In another Phase II study, an intravenous formulation of secukinumab demonstrated limited efficacy in biologic-naïve patients with rheumatoid arthritis associated with the HLA-DRB1 allele.[12]

76. Uveitis. Efficacy is not established for this condition. There was not a statistically significant difference between Cosentyx SC and placebo in three Phase III studies that included patients with Behcet's uveitis (n = 118); active, noninfectious, non-Behcet's uveitis (n = 31); and quiescent, noninfectious, non-Behcet's uveitis (n = 125) [SHEILD, INSURE, and ENDURE studies, respectively].[13]

77. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual revision	No changes to intent of clinical criteria. However, updated the examples of biologics a patients may have tried for psoriasis to include Siliq and Tremfya. Throughout the policy, changed references to Enbrel and Humira to etanercept and adalimumab product with Enbrel and Humira listed as examples of the respective products. Also, updated the Appendix to include all biologics approved since last review.	02/14/2018
Annual revision	Plaque Psoriasis: Add Cimzia and Ilumya to the list of therapies that the patient may have tried prior to Cosentyx.	02/27/2019
Annual revision	**Ankylosing Spondylitis:** Examples of a response to therapy were moved to a Note in the policy (previously listed as examples within the criteria). **Plaque Psoriasis:** For the exception applying to patients with a contraindication to methotrexate, wording was updated to more generally allow this determination by the prescriber (criteria previously specified this was according to the prescribing physician). Examples of biologics for psoriasis were moved to be included in the Appendix (previously listed in a Note in the criteria section). **Psoriatic Arthritis:** Examples of a response to therapy were moved to a Note in the policy (previously listed as examples within the criteria).	03/04/2020
Selected revision	**Non-Radiographic Axial Spondyloarthritis:** This newly approved indication was added to the policy. Criteria approve for initial therapy for 3 months if prescribed by a rheumatologist and the patient has objective signs of inflammation, defined as C-reactive protein elevated beyond the upper limit of normal for the reporting or laboratory sacroiliitis reported on magnetic resonance imaging. For patients currently taking Taltz, criteria approve for 3 years if the patient has responded to therapy. **Plaque psoriasis:** Examples of traditional systemic agent for psoriasis were moved to a Note (previously listed as examples within the criteria).	06/24/2020

APPENDIX

Biologic	Mechanism of Action	Examples of Inflammatory Indications for Products*

Targeted Synthetic DMARDs		
Otezla® (apremilast tablets)	Inhibition of PDE4	PsO, PsA
Olumiant® (baricitinib tablets)	Inhibition of the JAK pathways	RA
Rinvoq® (upadacitinib extended-release tablets)	Inhibition of the JAK pathways	RA
Xeljanz®, Xeljanz XR (tofacitinib tablets, tofacitinib extended-release tablets)	Inhibition of the JAK pathways	RA, PsA, UC

* Not an all-inclusive list of indication (e.g., oncology indications and rare inflammatory conditions are not listed). Refer to the prescribing information for the respective agent for FDA-approved indications; SC – Subcutaneous; TNF – Tumor necrosis factor; IV – Intravenous, IL – Interleukin; PDE4 – Phosphodiesterase 4; JAK – Janus kinase; AS – Ankylosing spondylitis; CD – Crohn's disease; JIA – Juvenile idiopathic arthritis; PsO – Plaque psoriasis; PsA – Psoriatic arthritis; RA – Rheumatoid arthritis; UC – Ulcerative colitis; nr-axSpA – Non-radiographic axial spondyloarthritis; ^ Off-label use of Kineret in JIA supported in guidelines.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Entyvio Intravenous Prior Authorization Policy

- Entyvio™ (vedolizumab intravenous injection – Takeda Pharmaceuticals America, Inc.)

REVIEW DATE: 08/26/2020

OVERVIEW

Entyvio, an integrin receptor antagonist, is indicated for the following uses:[1]

- **Crohn's disease**, in adults with moderately to severely active disease.
- **Ulcerative colitis**, in adults with moderately to severely active disease.

The product labeling states that Entyvio should be discontinued in patients who show no benefit by Week 14. In the pivotal studies evaluating Entyvio, all patients had previously tried corticosteroids and/or conventional agents for Crohn's disease and ulcerative colitis.

Guidelines

The American College of Gastroenterology (ACG) has updated guidelines (2018) for Crohn's disease. Entyvio is among the treatment recommendations for treatment of patients with moderate to severe disease or moderate to high risk disease (for induction of remission as well as maintenance of this remission).[2] Updated ACG guidelines for ulcerative colitis (2019) note that the following agents can be used for induction of remission in moderately to severely active disease: Uceris (budesonide extended-release tablets); oral or intravenous systemic corticosteroids, Entyvio, Xeljanz, or tumor necrosis factor inhibitors (adalimumab, Simponi SC, infliximab).[3]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Entyvio. All approvals are provided for the duration listed below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Entyvio as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Entyvio to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Entyvio is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Crohn's Disease.** Approve for the duration noted if the patient meets ONE of the following (A or B):
   - **C)** Initial Therapy. Approve for 14 weeks if the patient meets ALL of the following (i, ii, and iii):
     - **i.** Patient is ≥ 18 years of age; AND
     - **ii.** Patient meets ONE of the following (a or b):
       1. Patient has tried or is currently taking systemic corticosteroids, or corticosteroids are contraindicated in this patient; OR
       2. Patient has tried one conventional systemic therapy for Crohn's disease; AND
          Note: Examples include azathioprine, 6-mercaptopurine, or methotrexate. An exception to the requirement for a trial of or contraindication to steroids or a trial of one other conventional systemic agent can be made if the patient has already tried at least one biologic. Refer to Appendix for examples of biologics used for Crohn's disease. These patients who have already received a biologic are not required to "step back" and try another agent.
     - **iii.** The medication is prescribed by or in consultation with a gastroenterologist.
   - **D)** Patient is Currently Receiving Entyvio. Approve for 1 year if the patient has had a response to therapy, as determined by the prescriber.

2. **Ulcerative Colitis.** Approve for the duration noted if the patient meets ONE of the following (A or B):
   - **A)** Initial Therapy. Approve for 14 weeks if the patients meets ALL of the following (i, ii, and iii):
     - **a)** Patient is ≥ 18 years of age; AND
     - **b)** Patient has had a trial of ONE systemic agent for ulcerative colitis; AND

Note: Examples include 6-mercaptopurine, azathioprine, cyclosporine, tacrolimus, or a corticosteroid such as prednisone, methylprednisolone. A trial of a biologic also counts as a trial of one systemic agent for UC. Refer to Appendix for examples of biologics used for ulcerative colitis.

c) The medication is prescribed by or in consultation with a gastroenterologist.

B) Patient is Currently Receiving Entyvio. Approve for 1 year if the patient has had a response to therapy, as determined by the prescriber.

Note: Examples of a response to therapy include decreased stool frequency or rectal bleeding.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Entyvio is not recommended in the following situations:

1. **Concurrent Use with Other Biologics or with Targeted Synthetic Disease-Modifying Antirheumatic Drugs (DMARDs) used for an Inflammatory Condition.** Entyvio should not be used in combination with tumor necrosis factor inhibitors or with Tysabri due to increased risk of infections.[1] There is also a increased risk of progressive multifocal leukoencephalopathy if used in combination with Tysabri. Combination therapy with other biologics or with targeted synthetic DMARDs used to treat inflammatory conditions (see Appendix for examples) is generally not recommended due to a potential for a higher rate of adverse effects with combinations and lack of data supportive of additive efficacy.

   Note: This does NOT exclude the use of conventional immunosuppressants (e.g., 6-mercaptopurine, azathioprine) in combination with Entyvio.

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual revision	**Ulcerative colitis** Change criteria to require a 2-month trial of at least one systemic agent, unless intolerant. Add a note stating that a trial of a biologic counts toward this requirement. (Previously, criteria specifically required a 2-month trial of a tumor necrosis factor inhibitor. **Crohn's disease:** Change criteria to require previous trial of corticosteroids (or is currently taking or contraindicated) or a conventional systemic agents. Add a note stating that a trial of a biologic counts toward this requirement of a trial of a previous agent. Previously, criteria specifically required a trial of a tumor necrosis factor inhibitor.	08/29/2018
Selected revision	**Ulcerative Colitis:** For the requirement that another agent be tried prior to Entyvio, remove the requirement that the trial is a duration of at least 2 months (not supported in updated guidelines).	03/27/2019
Early annual revision	**Crohn's Disease:** Move the requirement that the patient is an adult into the criteria section for initial therapy. Clarify criteria to require the patient be an adult ≥ 18	07/31/2019

	years of age. Previously, the requirement that the patient was an adult was listed as part of the diagnosis (i.e., previously listed as Crohn's disease in an adult) and applied to initial and continuation of therapy. **Ulcerative Colitis:** Move the requirement that the patient is an adult into the criteria section for initial therapy. Clarify criteria to require the patient be an adult ≥ 18 years of age. Previously, the requirement that the patient was an adult was listed as part of the diagnosis (i.e., previously listed as ulcerative colitis in an adult) and applied to initial and continuation of therapy. Since a specific duration of therapy is no longer required for patients who have tried another agent for ulcerative colitis, remove the exception for those who are intolerant.	
Annual revision	**Crohn's Disease:** Examples of biologics for Crohn's disease were moved to be included in the Appendix (previously listed in a Note in the criteria section). For the criterion applying to patients currently receiving Entyvio who have responded, wording was updated to more generally allow this determination by the prescriber (criteria previously specified this was according to the prescribing physician). **Ulcerative Colitis:** Examples of biologics for ulcerative colitis were moved to be included in the Appendix (previously listed in a Note in the criteria section). For the criterion applying to a patient currently receiving Entyvio who has responded, wording was updated to more generally allow this determination by the prescriber (criteria previously specified this was according to the prescribing physician). Examples of a response to therapy were moved to a Note in the policy (previously listed as examples within the criteria).	08/26/2020

APPENDIX

Product	Mechanism of Action	Examples of Inflammatory Indications for Products*
Biologics		
Adalimumab SC Products (Humira®, biosimilars)	Inhibition of TNF	AS, CD, JIA, PsO, PsA, RA, UC
Cimzia® (certolizumab pegol SC injection)	Inhibition of TNF	AS, CD, nr-axSpA, PsO, PsA, RA
Etanercept SC Products (Enbrel®, biosimilars)	Inhibition of TNF	AS, JIA, PsO, PsA
Infliximab IV Products (Remicade®, biosimilars)	Inhibition of TNF	AS, CD, PsO, PsA, RA, UC
Simponi®, Simponi® Aria™ (golimumab SC injection, golimumab IV infusion)	Inhibition of TNF	SC formulation: AS, PsA, RA, UC
		IV formulation: AS, PsA, RA
Actemra® (tocilizumab IV infusion, tocilizumab SC injection)	Inhibition of IL-6	SC formulation: PJIA, RA, SJIA
		IV formulation: PJIA, RA, SJIA
Kevzara® (sarilumab SC injection)	Inhibition of IL-6	RA
Orencia® (abatacept IV infusion, abatacept SC injection)	T-cell costimulation modulator	SC formulation: JIA, PSA, RA
		IV formulation: JIA, PsA, RA
Rituximab IV Products (Rituxan®, biosimilars)	CD20-directed cytolytic antibody	RA
Kineret® (anakinra SC injection)	Inhibition of IL-1	JIA^, RA
Stelara® (ustekinumab SC injection, ustekinumab IV infusion)	Inhibition of IL-12/23	SC formulation: CD, PsO, PsA, UC
		IV formulation: CD, UC
Siliq™ (brodalumab SC injection)	Inhibition of IL-17	PsO
Cosentyx™ (secukinumab SC injection)	Inhibition of IL-17A	AS, nr-axSpA, PsO, PsA
Taltz® (ixekizumab SC injection)	Inhibition of IL-17A	AS, nr-axSpA, PsO, PsA
Ilumya™ (tildrakizumab-asmn SC injection)	Inhibition of IL-23	PsO
Skyrizi™ (risankizumab-rzza SC injection)	Inhibition of IL-23	PsO
Tremfya™ (guselkumab SC injection)	Inhibition of IL-23	PsO, PsA
Entyvio™ (vedolizumab IV infusion)	Integrin receptor antagonist	CD, UC
Targeted Synthetic DMARDs		
Otezla® (apremilast tablets)	Inhibition of PDE4	PsO, PsA
Olumiant® (baricitinib tablets)	Inhibition of the JAK pathways	RA
Rinvoq® (upadacitinib extended-release tablets)	Inhibition of the JAK pathways	RA
Xeljanz®, Xeljanz XR (tofacitinib tablets, tofacitinib extended-release tablets)	Inhibition of the JAK pathways	RA, PsA, UC

* Not an all-inclusive list of indication (e.g., oncology indications and rare inflammatory conditions are not listed). Refer to the prescribing information for the respective agent for FDA-approved indications; SC – Subcutaneous; TNF – Tumor necrosis factor; IV – Intravenous, IL – Interleukin; PDE4 – Phosphodiesterase 4; JAK – Janus kinase; AS – Ankylosing spondylitis; CD – Crohn's disease; JIA – Juvenile idiopathic arthritis; PsO – Plaque psoriasis; PsA – Psoriatic arthritis; RA – Rheumatoid arthritis; UC – Ulcerative colitis; nr-axSpA – Non-radiographic axial spondyloarthritis; ^ Off-label use of Kineret in JIA supported in guidelines.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Etanercept Products Prior Authorization Policy

- Enbrel® (etanercept subcutaneous injection – Immunex/Amgen)

REVIEW DATE: 12/02/2020

OVERVIEW

Etanercept products tumor necrosis factor inhibitors (TNFis) approved for the following uses:[1]

- **Ankylosing spondylitis**, for reducing signs and symptoms in patients with active disease.
- **Juvenile idiopathic arthritis**, for reducing the signs and symptoms of moderate or severe active polyarticular disease in patients aged ≥ 2 years.
- **Plaque psoriasis**, for treatment patients 4 years of age or older with chronic moderate to severe plaque psoriasis who are candidates for systemic therapy or phototherapy.

- **Psoriatic arthritis**, ± methotrexate for reducing the signs and symptoms, inhibiting the progression of structural damage of active arthritis, and improving physical function in patients with psoriatic arthritis.
- **Rheumatoid arthritis**, ± methotrexate for reducing the signs and symptoms, inducing major clinical response, inhibiting the progression of structural damage, and improving physical function in patients with moderate or severe active disease.

Guidelines

TNFis feature prominently in guidelines for treatment of inflammatory conditions.

- **Spondyloarthritis:** Guidelines for ankylosing spondylitis and nonradiographic axial spondylitis are published by the American College of Rheumatology (ACR)/Spondylitis Association of America/Spondyloarthritis Research and Treatment Network (2019).[5] TNFis are recommended for the initial biologic. In those who are secondary nonresponders to a TNFi, a second TNFi is recommended over switching out of the class.
- **Juvenile Idiopathic Arthritis (JIA):** There are guidelines from the ACR/Arthritis Foundation for the treatment of JIA (2019) specific to juvenile non-systemic polyarthritis, sacroiliitis, and enthesitis.[3] TNFis are the biologics recommended for polyarthritis, sacroiliitis, enthesitis. Actemra® (tocilizumab intravenous, tocilizumab subcutaneous) and Orencia® (abatacept intravenous, abatacept intravenous) are also among the biologics recommended for polyarthritis. Biologics are recommended following other therapies (e.g., following DMARDs for active polyarthritis or following a nonsteroidal anti-inflammatory drug [NSAID] for active JIA with sacroiliitis or enthesitis). However, there are situations where initial therapy with a biologic may be preferred over other conventional therapies (e.g., if there is involvement of high-risk joints such as the cervical spine, wrist, or hip; high disease activity; and/or those judged to be at high risk of disabling joint damage). TNFis may also be used as second- or third-line treatment for systemic JIA.[4]
- **Plaque Psoriasis:** Guidelines from the American Academy of Dermatologists (AAD) and National Psoriasis Foundation (NPF) [2019] recommend etanercept as a monotherapy treatment option for adults with moderate to severe disease.[7]
- **Psoriatic Arthritis:** Guidelines from ACR (2019) recommend TNFis over other biologics for use in treatment-naïve patients with PsA and in those who were previously treated with an oral therapy.[8]
- **Rheumatoid Arthritis:** Guidelines from ACR (2015) have TNFis and non-TNF biologics, administered ± methotrexate, equally positioned as a recommended therapy following a trial of a conventional synthetic DMARD (e.g., methotrexate, leflunomide, hydroxychloroquine, sulfasalazine).[2]

Other Uses with Supportive Evidence

There are guidelines and/or published data supporting the use of etanercept products in the following conditions:

- **Behcet's Disease:** The European Union Against Rheumatism (EULAR) recommendations (2018) include TNFis for initial or recurrent sight-threatening uveitis.[9] For patients refractory to first-line treatments (e.g., corticosteroids), TNFis are among the treatment options for mucocutaneous manifestations, venous thrombosis, severe or refractory gastrointestinal disease, and recurrent/chronic joint involvement. Recommendations for the use of TNFis in ocular inflammatory disorders from the American Academy of Ophthalmology (AAO) [2014] note that TNFis may be used first-line in patients with ophthalmic manifestations of Behcet's disease and for acute exacerbations of pre-existing Behcet's disease.[8] In particular, the monoclonal antibodies (adalimumab or infliximab products) are recommended for vision-threatening ocular manifestations of Behcet's disease.

- **Graft versus Host Disease:** Guidelines for hematopoietic cell transplantation from the National Comprehensive Cancer network (NCCN) [version 2.2020 – March 23, 2020] list etanercept among the agents used for steroid-refractory disease.[46]
- **Ocular Inflammatory Disorders:** The American Academy of Ophthalmology (AAO) [2014] note that adalimumab may be used in patients with uveitis due to various causes (e.g., spondyloarthropathy-associated or human leukocyte antigen [HLA]-B27-associated uveitis, JIA-associated uveitis, and other posterior uveitides and panuveitis syndromes).[8] TNFis should be considered second-line in vision-threatening JIA-associated uveitis when methotrexate has failed or is not tolerated (strong recommendation) and may be used as corticosteroid-sparing treatment for vision-threatening chronic uveitis from seronegative spondyloarthropathy (strong recommendation). TNFis may also be considered in other patients who have vision-threatening or corticosteroid-dependent disease who have failed first-line therapies and as a second-line immunomodulatory agent for severe ocular inflammatory conditions (including chronic and severe scleritis).
- **Pyoderma Gangrenosum:** Although guidelines are not current, multiple topical and systemic therapies have been used for pyoderma gangrenosum. Oral prednisone is the most common initial immunosuppressant medication.[10-13] Other systemic therapies include cyclosporine, methotrexate, azathioprine, cyclophosphamide, mycophenolate mofetil, and TNFis (i.e., infliximab, etanercept, and adalimumab products). In case reports, TNFis have been effective.
- **Still's Disease:** There are not current guidelines for treatment of Still's disease. However, it presents in adults with features similar to those of systemic onset JIA.[24] In addition, there is a small trial which demonstrated efficacy of etanercept used for this condition.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of etanercept products. Because of the specialized skills required for evaluation and diagnosis of patients as well as the monitoring required for adverse events and long-term efficacy, initial approval requires etanercept products to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of etanercept products is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Ankylosing Spondylitis.** Approve for the duration noted if the patient meets ONE of the following (A or B):
   - **A)** Initial Therapy. Approve for 3 months if prescribed by or in consultation with a rheumatologist.
   - **B)** Patient is Currently Receiving an Etanercept Product. Approve for 3 years if the patient had a response, as determined by the prescriber.
     Note: Examples of a response to therapy include decreased pain or stiffness, or improvement in function or activities of daily living. Patient may not have a full response but there should be some response.

2. **Juvenile Idiopathic Arthritis (JIA) [or Juvenile Rheumatoid Arthritis] (regardless of type of onset).** Approve for the duration noted if the patient meets ONE of the following (A or B):
   Note: This includes a patient with juvenile spondyloarthropathy/active sacroiliac arthritis.
   - **H)** Initial Therapy. Approve for 3 months if the patient meets BOTH of the following criteria (i and ii):
     - **i.** Patient meets one of the following conditions (a, b, c, or d):
       - **i)** Patient has tried one other systemic therapy for this condition; OR
         Note: Examples of other systemic therapy for JIA include methotrexate, sulfasalazine, or leflunomide, a nonsteroidal anti-inflammatory drug (NSAID) [e.g., ibuprofen, naproxen]. A previous trial of a biologic also counts as a trial of one agent for JIA. Refer to Appendix for examples of biologics used for JIA.
       - **j)** Patient will be starting on therapy concurrently with methotrexate, sulfasalazine, or leflunomide; OR
       - **k)** Patient has an absolute contraindication to methotrexate, sulfasalazine, or leflunomide; OR
         Note: Examples of contraindications to methotrexate include pregnancy, breast feeding, alcoholic liver disease, immunodeficiency syndrome, blood dyscrasias.
       - **l)** Patient has aggressive disease, as determined by the prescriber; AND
     - **ii.** The medication is prescribed by or in consultation with a rheumatologist.
   - **B)** Patient is Currently Receiving an Etanercept Product. Approve for 3 years if the patient had a response, as determined by the prescriber.
     Note: Examples of a response include improvement in limitation of motion, less joint pain or tenderness, decreased duration of morning stiffness or fatigue, improved function or activities of daily living, reduced dosage of corticosteroids. Patient may not have a full response but there should be some response.

3. **Plaque Psoriasis**. Approve for the duration noted if the patient meets ONE of the following (A or B):
   - **A)** Initial Therapy. Approve for 3 months if the patient meets the following criteria (i, ii, and iii):
     - **i.** Patient is ≥ 4 years of age; AND
     - **ii.** Patient meets one of the following conditions (a or b):
       - **a)** Patient has tried at least at least one traditional systemic agent for psoriasis for at least 3 months, unless intolerant; OR
         Note: Examples include methotrexate, cyclosporine, acitretin, or psoralen plus ultraviolet A light (PUVA). An exception to the requirement for a trial of one traditional systemic agent for psoriasis can be made if the patient has already has a 3-month trial or previous intolerance to at least one biologic. Refer to Appendix for examples of biologics used for psoriasis. A patient who has already tried a biologic for psoriasis is not required to "step back" and try a traditional systemic agent for psoriasis.

b) Patient has a contraindication to methotrexate, as determined by the prescriber; AND

iii. The medication is prescribed by or in consultation with a dermatologist.

B) Patient is Currently Receiving an Etanercept Product. Approve for 3 years if the patient had a response, as determined by the prescriber.
Note: Patient may not have a full response but there should be some response.

4. Psoriatic Arthritis. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if the agent is prescribed by or in consultation with a rheumatologist or a dermatologist.

B) Patient is Currently Receiving an Etanercept Product. Approve for 3 years if the patient had a response, as determined by the prescriber.
Note: Examples of a response include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improvements in acute phase reactants [for example, C-reactive protein [CRP]). Patient may not have a full response but there should be some response.

5. Rheumatoid Arthritis. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets BOTH of the following (i and ii):

i. Patient has tried ONE conventional synthetic disease-modifying antirheumatic drug (DMARD) for at least 3 months; AND
Note: Examples include methotrexate (oral or injectable), leflunomide, hydroxychloroquine, and sulfasalazine. An exception to the requirement for a trial of one conventional synthetic DMARD can be made if the patient has already has a 3-month trial at least one biologic. Refer to Appendix for examples of biologics used for rheumatoid arthritis. A patient who has already tried a biologic for rheumatoid arthritis is not required to "step back" and try a conventional synthetic DMARD.

ii. The medication is prescribed by or in consultation with a rheumatologist.

B) Patient is Currently Receiving an Etanercept Product. Approve for 3 years if the patient had a response, as determined by the prescriber.
Note: Examples of a response include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improved laboratory values; reduced dosage of corticosteroids. Patient may not have a full response but there should be some response.

Other Uses with Supportive Evidence

6. Behcet's Disease. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets ONE of the following (i or ii):

i. Patient has tried at least one conventional therapy; OR
Note: Examples include systemic corticosteroids (e.g., methylprednisolone), immunosuppressants (e.g., azathioprine, methotrexate, mycophenolate mofetil, cyclosporine, tacrolimus, Leukeran® [chlorambucil], cyclophosphamide, interferon alfa). An exception to the requirement for a trial of one conventional therapy can be made if the patient has already had a trial of at least one tumor necrosis factor inhibitor (e.g., an adalimumab or infliximab product). A patient who has already tried a biologic for Behcet's disease is not required to "step back" and try a conventional therapy.

ii. The medication is prescribed by or in consultation with a rheumatologist, dermatologist, ophthalmologist, gastroenterologist, or neurologist.

B) Patient is Currently Receiving an Etanercept Product. Approve for 1 year if the patient has responded to therapy, as determined by the prescriber.

Note: Patient may not have a full response but there should be some response.

7. **Graft-Versus-Host Disease.** Approve for the duration noted if the patient meets ONE of the following (A or B):
   A) Initial Therapy. Approve for 1 month if the patient meets BOTH of the following (i and ii):
      i. Patient has tried at least one conventional systemic treatment for graft-versus-host disease; AND
      Note: Examples of conventional systemic treatments include systemic corticosteroids (e.g., methylprednisolone), antithymocyte globulin, cyclosporine, tacrolimus, and mycophenolate mofetil.
      ii. The medication is prescribed by or in consultation with an oncologist, hematologist, or a physician affiliated with a transplant center.
   B) Patient is Currently Receiving an Etanercept Product. Approve for 3 months if the patient had a response, as determined by the prescriber.

8. **Pyoderma Gangrenosum.** Approve for the duration noted if the patient meets ONE of the following (A or B):
   A) Initial Therapy. Approve for 4 months if the patient meets BOTH of the following (i and ii):
      14 Patient meets ONE of the following (a or b):
         a) Patient has tried one systemic corticosteroid; OR
         Note: An example is prednisone.
         b) Patient has tried one other immunosuppressant for at least 2 months or was intolerant to one of these agents; AND
         Note: Examples include mycophenolate mofetil and cyclosporine.
      15 The medication is prescribed by or in consultation with a dermatologist.
   B) Patient is Currently Receiving an Etanercept Product. Approve for 1 year if the patient had a response, as determined by the prescriber.
      Note: Patient may not a full response, but there should some response.

9. **Scleritis or Sterile Corneal Ulceration.** Approve for the duration noted if the patient meets ONE of the following (A or B):
   A) Initial Therapy. Approve for 3 months if the patient meets BOTH of the following (i and ii):
      14 Patient has tried one other therapy for this condition; AND
      Note: Examples include oral nonsteroidal anti-inflammatory drugs (NSAIDs) such as indomethacin, naproxen, or ibuprofen; oral, topical (ophthalmic) or intravenous corticosteroids (such as prednisone, prednisolone, methylprednisolone); methotrexate; cyclosporine; or other immunosupressants.
      15 The medication is prescribed by or in consultation with an ophthalmologist.
   B) Patient is Currently Receiving an Etanercept Product. Approve for 1 year if the patient had a response, as determined by the prescriber.
      Note: Examples of a response to therapy include decreased inflammation, reduced use of steroids or immunomodulators, decreased eye pain, redness, and/or photophobia. Patient may not have a full response but there should be some response.

10. Spondyloarthritis, Other Subtypes. Approve for the duration noted if the patient meets ONE of the following (A or B):

Note: This includes undifferentiated arthritis, non-radiographic axial SpA, Reactive Arthritis (Reiter's disease). For Ankylosing Spondylitis or Psoriatic Arthritis, refer to the respective criteria under FDA-approved indications].

C) Initial Therapy. Approve for 3 months if the patient meets BOTH of the following (i and ii):

i. Patient meets ONE of the following conditions (a or b):

a) Patient has arthritis primarily in the knees, ankles, elbows, wrists, hands, and/or feet AND has tried at least ONE conventional synthetic disease-modifying antirheumatic drug (DMARD) has been tried; OR

Note: Examples include methotrexate, leflunomide, sulfasalazine.

b) Patient has axial spondyloarthritis AND has objective signs of inflammation, defined as at least one of the following [(1) or (2)]:

a. C-reactive protein (CRP) elevated beyond the upper limit of normal for the reporting laboratory; OR

b. Sacroiliitis reported on magnetic resonance imaging (MRI); AND

ii. The medication is prescribed by or in consultation with a rheumatologist.

D) Patient is Currently Receiving an Etanercept Product. Approve for 1 year if the patient had a response, as determined by the prescriber.

Note: Examples of a response include decreased pain or stiffness, improved function or activities of daily living. Patient may not have a full response but there should be some response.

11. Still's Disease. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets ALL of the following (i, ii, and iii):

~~14~~ Patient has tried one corticosteroid; AND

~~15~~ Patient has tried one conventional synthetic disease-modifying antirheumatic drug (DMARD) given for at least 2 months or was intolerant; AND

Note: An example is methotrexate.

16 The medication is prescribed by or in consultation with a rheumatologist.

B) Patient is Currently Receiving an Etanercept Product. Approve for 1 year if the patient had a response, as determined by the prescriber.

Note: Patient may not have a full response but there should be some response.

12. Uveitis (including other posterior uveitides and panuveitis syndromes). Approve for the duration noted if the patient meets the ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets BOTH of the following (i and ii):

14 The patient has tried one of the following therapies for this condition: periocular, intraocular, or systemic corticosteroids or immunosuppressives; AND

Note: Examples of corticosteroids include prednisolone, triamcinolone, betamethasone, methylprednisolone, and prednisone. Examples of immunosuppressives include methotrexate, mycophenolate mofetil, azathioprine, and cyclosporine. An exception to the requirement for a trial of one of these therapies can be made if the patient has already tried an adalimumab or infliximab product for uveitis. A patient who has already tried a biologic for uveitis is not required to try another therapy.

15 The medication is prescribed by or in consultation with an ophthalmologist.

B) Patient is Currently Receiving an Etanercept Product. Approve for 1 year if the patient had a response, as determined by the prescriber.

Note: Examples of a response include decreased inflammation, reduced use of steroids or immunomodulators, and improvement in visual acuity. Patient may not have a full response but there should be some response.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of etanercept products is not recommended in the following situations:

1. **Concurrent Use with a Biologic or with a Targeted Synthetic Disease-Modifying Antirheumatic Drug (DMARD).** Etanercept products should not be administered in combination with another biologic or with a targeted synthetic DMARD used for an inflammatory condition (see Appendix for examples). Combination therapy is generally not recommended due to a higher rate of AEs with combinations and lack of data supportive of additional efficacy.
   Note: This does NOT exclude the use of conventional synthetic DMARDs (e.g., methotrexate, leflunomide, hydroxychloroquine, and sulfasalazine) in combination with etanercept products.

2. **Crohn's Disease.** In a double-blind, placebo-controlled trial etanercept (Enbrel) was not effective for the treatment of moderate to severe Crohn's disease.[25] However, arthritis (spondyloarthropathy, ankylosing spondylitis) may be associated with Crohn's disease and etanercept products may be effective for spondyloarthropathy in these patients.[26]

3. **Inflammatory Myopathies (Polymyositis, Dermatomyositis, Inclusion Body Myositis).** Information is conflicting. In one retrospective review of eight patients with either dermatomyositis or polymyositis some patients responded (improved motor strength and decreased fatigue) to treatment with an etanercept product.[27] In this case series, an etanercept product was added on to treatment with corticosteroids, intravenous immunoglobulin (IVIG), and DMARDs; there were no standardized outcome measures. In another case series in patients (n = 5) with dermatomyositis who had not responded to steroids and cytotoxic therapy (methotrexate, azathioprine, cyclosporine), the cytotoxic drugs were discontinued and etanercept was given for at least 3 months.[28] All patients had exacerbation of disease and etanercept was stopped. In a 1-year, double-blind study, patients were randomized to receive etanercept 50 mg weekly (n = 11) or placebo (n = 5).[29] All patients who received placebo were judged as treatment failures whereas five patients in the etanercept group were successfully weaned off of prednisone. More studies are needed demonstrating the efficacy of etanercept and its long-term effects.[30] In a 6-month, open-label study of etanercept in patients with refractory juvenile dermatomyositis (n = 9), minimal improvement was noted in disease activity with some patients experiencing worsening disease.[31]

4. **Hidradenitis Suppurativa.** A prospective, randomized, double-blind, placebo-controlled study assigned patients (n = 20) to treatment with etanercept 50 mg twice weekly or placebo for 12 weeks.[32] Following 12 weeks of treatment, all patients received open-label etanercept for an additional 12 weeks. The study found no statistically significant difference between etanercept 50 mg twice weekly and placebo among physician global assessment, patient global assessment, and the Dermatology Life Quality Index (DLQI) at Week 12 or Week 24. A systematic review (2013) extracted data from case reports and RCTs and recommended against the use of etanercept for treatment of hidradenitis suppurativa.[33]

5. **Polymyalgia Rheumatica (PMR).** ACR/EULAR guidelines for the management of PMR (2015) strongly recommend against the use of TNFis for treatment of PMR.[34] This recommendation is based on lack of evidence for benefit as well as considerable potential for potential harm. While etanercept has been evaluated in small numbers of patients with PMR, efficacy has not been established.[35-37]

6. **Sarcoidosis.** Evidence does not support use of etanercept in ocular or pulmonary disease. Recommendations for the use of TNFis in ocular inflammatory disorders from the AAO (2014) note that infliximab or adalimumab may be considered as second-line immunomodulatory therapy for patients failing or intolerant of standard immunomodulatory agents.[8] A discretionary recommendation (indicating trade-offs are less certain) is that etanercept should not be used in the treatment of ocular

sarcoidosis (moderate-quality evidence). In a double-blind study patients (n = 18) with chronic ocular sarcoidosis and ongoing inflammation were randomized to etanercept or placebo for 6 months.[38] Patients had received ≥ 6 months of therapy with methotrexate and were currently on corticosteroids. For most of the patients, therapy with etanercept was not associated with significant improvement. In a prospective, open-label trial in patients with Stage II or III progressive pulmonary sarcoidosis, treatment with etanercept was frequently associated with early or late treatment failure.[39] This trial was ended early because an excessive number of patients (n = 11/17) had disease progression on etanercept. Recommendations for best practice in the management of pulmonary and systemic sarcoidosis mention infliximab and adalimumab as therapeutic options for management of disease.[40]

7. **Large Vessel Vasculitis (e.g., Giant Cell Arteritis, Takayasu's Arteritis).** Guidelines from EULAR for the management of large vessel vasculitis (e.g., giant cell arteritis, Takayasu's arteritis) do not mention the use of TNFis.[41] Additionally, a meta-analysis of RCTs did not find evidence supporting remission or reduction of corticosteroid dose with the use of TNFis in large vessel vasculitis.[42] In a double-blind trial patients with biopsy proven giant cell arteritis with AEs due to corticosteroids were randomized to etanercept 25 mg twice weekly (n = 8) or placebo (n = 9) for 12 months.[43] Corticosteroids were continued but were reduced if possible according to a predefined protocol. The primary outcome was the ability to withdraw the corticosteroid therapy and control disease activity at 12 months. After 12 months, there was not a statistically significant difference in the proportion of patients able to control disease without corticosteroid therapy with etanercept (50%) vs. placebo (22.2%). However, patients on etanercept had a significantly lower dose of accumulated prednisone during the first year of treatment (P = 0.03). In a retrospective single center study in patients with refractory Takayasu's arteritis (n = 25), patients were treated with infliximab (n = 21) or etanercept (n = 9).[44] Five patients who were initially treated with etanercept were switched to infliximab. Therapy with TNFis was associated with remission in many patients and dose reduction or discontinuation of prednisone and other immunosuppressant therapies. A randomized controlled trial is needed to better define the efficacy and safety of etanercept.

8. **Wegener's Granulomatosis.** Etanercept is not effective in the induction or maintenance of disease remissions in patients with Wegener's. In a double-blind trial, 180 patients with active Wegener's granulomatosis were randomized to etanercept or placebo in combination with standard therapies (e.g., cyclophosphamide, methotrexate, corticosteroids) depending on disease severity.[45] When remission was achieved, standard medications were tapered according to protocol guidelines. Patients were enrolled over 28 months and the mean follow-up was 27 months. Of the 174 patients who were evaluable, 126 patients (72.4%) achieved sustained remissions, but only 86 patients overall (49.4%) maintained their disease remissions throughout the trial. There were no differences between etanercept and the control group in the percent of patients achieving sustained remissions (69.7% vs. 75.3%, P = 0.39); in the percent of patients with sustained periods of low disease activity (86.5% vs. 90.6%); or time to achieve these outcomes. Disease flares were common in both groups. AEs were frequent and often severe. During the study, 56.2% of patients on etanercept and 57.1% on placebo had at least one severe or life-threatening adverse event or died. Six of the etanercept patients and none of the controls developed solid malignancies. Use of etanercept in patients with Wegener's granulomatosis who are receiving immunosuppressant drugs is not recommended.[1]

9. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	**Patients Established on Enbrel:** Remove this criterion for patients currently established on therapy for ≥ 90 days. Patients currently taking an etanercept product are now addressed in the criteria section for each specific indication. • Add a requirement that the patient must have responded to initial therapy for the following indications: Behcet's disease, Graft-Versus-Host Disease, pyoderma gangrenosum, scleritis or sterile corneal ulcerations, Still's disease, Spondyloarthritis, and uveitis. **Previous Therapies:** For these indications, add the following agents to the list of therapies the patient may have tried prior to etanercept: • Plaque Psoriasis: Cimzia, Ilumya • Juvenile Idiopathic Arthritis: Actemra subcutaneous **Behcet's disease:** Modify criteria to change previous therapy from biologic to more specifically say tumor necrosis factor inhibitor. **Conditions Not Recommended for Coverage:** Ocular and Pulmonary Sarcoidosis were combined into one condition (Sarcoidosis) which is not recommended for coverage. **Other:** Policy name was changed to Inflammatory Conditions – Etanercept Products. Throughout the policy, references to Enbrel were reworded to say etanercept products.	11/07/2018
Selected Revision	**Spondyloarthritis, Other Subtypes:** This off-label approval condition was reworded (previously listed as Spondyloarthritis, Subtypes Other than Ankylosing Spondylitis or Psoriatic Arthritis). There is a note which directs to criteria for FDA-approved subtypes of	04/24/2019

	Spondyloarthritis (Ankylosing Spondylitis, Psoriatic Arthritis). Criteria were changed to approve for 3 months for patients starting therapy (previously was 1 year). For patients with primarily axial disease, a criterion was added to require objective signs of inflammation, defined as C-reactive protein (CRP) elevated beyond the upper limit of normal for the reporting laboratory or sacroiliitis reported on magnetic resonance imaging. For patients currently receiving therapy, examples of a response to therapy were added; the requirement that patients be on an etanercept product for ≥ 90 days was removed.	
Annual Revision	**Juvenile Idiopathic Arthritis:** For the exception applying to patients with aggressive disease, wording was updated to more generally allow this determination by the prescriber (criteria previously specified this was according to the prescribing physician). **Plaque Psoriasis:** For the exception applying to patients with a contraindication to methotrexate, wording was updated to more generally allow this determination by the prescriber (criteria previously specified this was according to the prescribing physician). Skyrizi was added to the list of biologics that the patient may have tried prior to etanercept. **Behcet's Disease:** To align with other policies that approve for this condition, the duration of the initial approval was changed to 3 months (previously was 1 year). For patients currently receiving therapy, the requirement that patients be on an etanercept product for ≥ 90 days was removed. **Graft-Versus-Host Disease:** To align with other policies that approve for this condition, the duration of the initial approval was changed to 1 month and the duration of approval for patients currently taking etanercept was changed to 3 months (previously was 1 year for all patients). For patients currently receiving therapy, the requirement that patients be on an etanercept product for ≥ 90 days was removed. **Pyoderma Gangrenosum:** To align with the other policies that approve for this condition, the duration of the initial approval was changed to 4 months (previously was 1 year). For patients currently receiving therapy, the requirement that patients be on an etanercept product for ≥ 90 days was removed. **Scleritis/Sterile Corneal Ulceration:** To align with other policies that approve for this condition, the duration of the initial approval was changed to 3 months (previously was 1 year). For patients currently receiving therapy, the requirement that patients be on an etanercept product for ≥ 90 days was removed. **Still's Disease:** To align with other policies that approve for this condition, the duration of the initial approval was changed to 3 months (previously was 1 year). For patients currently receiving therapy, the requirement that patients be on an etanercept product for ≥ 90 days was removed. **Uveitis:** To align with other policies that approve for this condition, the duration of the initial approval was changed to 3 months (previously was 1 year). For patients currently receiving therapy, the requirement that patients be on an etanercept product for ≥ 90 days was removed.	11/06/2019
Annual Revision	**Juvenile Idiopathic Arthritis:** For the criterion applying to previous therapy, wording was changed to specify this must have been a systemic therapy (criteria previously required a trial of one other agent, with systemic therapies listed among the examples). Examples of biologics were moved to be included in the Appendix (previously listed in a Note in the criteria section). **Plaque Psoriasis:** Examples of biologics were moved to be included in the Appendix (previously listed in a Note in the criteria section). **Rheumatoid Arthritis:** Examples of biologics were moved to be included in the Appendix (previously listed in a Note in the criteria section). **Graft-Versus-Host Disease:** To align with updated NCCN guidelines and other policies, criteria were changed to require at least one conventional systemic treatment prior to an etanercept product. Previously, criteria required that the patient had tried at least one other immunosuprressant or be concurrently receiving an immunosuppressant in combination with an etanercept product.	12/02/2020

APPENDIX

	Mechanism of Action	Examples of Inflammatory Indications for Products*
Biologics		
Adalimumab SC Products (Humira®, biosimilars)	Inhibition of TNF	AS, CD, JIA, PsO, PsA, RA, UC
Cimzia® (certolizumab pegol SC injection)	Inhibition of TNF	AS, CD, nr-axSpA, PsO, PsA, RA
Etanercept SC Products (Enbrel®, biosimilars)	Inhibition of TNF	AS, JIA, PsO, PsA
Infliximab IV Products (Remicade®, biosimilars)	Inhibition of TNF	AS, CD, PsO, PsA, RA, UC
Simponi®, Simponi® Aria™ (golimumab SC injection, golimumab IV infusion)	Inhibition of TNF	SC formulation: AS, PsA, RA, UC
		IV formulation: AS, PJIA, PsA, RA
Actemra® (tocilizumab IV infusion, tocilizumab SC injection)	Inhibition of IL-6	SC formulation: PJIA, RA, SJIA
		IV formulation: PJIA, RA, SJIA
Kevzara® (sarilumab SC injection)	Inhibition of IL-6	RA
Orencia® (abatacept IV infusion, abatacept SC injection)	T-cell costimulation modulator	SC formulation: JIA, PSA, RA
		IV formulation: JIA, PsA, RA
Rituximab IV Products (Rituxan®, biosimilars)	CD20-directed cytolytic antibody	RA
Kineret® (anakinra SC injection)	Inhibition of IL-1	JIA^, RA
Stelara® (ustekinumab SC injection, ustekinumab IV infusion)	Inhibition of IL-12/23	SC formulation: CD, PsO, PsA, UC
		IV formulation: CD, UC
Siliq™ (brodalumab SC injection)	Inhibition of IL-17	PsO
Cosentyx™ (secukinumab SC injection)	Inhibition of IL-17A	AS, nr-axSpA, PsO, PsA
Taltz® (ixekizumab SC injection)	Inhibition of IL-17A	AS, nr-axSpA, PsO, PsA
Ilumya™ (tildrakizumab-asmn SC injection)	Inhibition of IL-23	PsO
Skyrizi™ (risankizumab-rzza SC injection)	Inhibition of IL-23	PsO
Tremfya™ (guselkumab SC injection)	Inhibition of IL-23	PsO
Entyvio™ (vedolizumab IV infusion)	Integrin receptor antagonist	CD, UC
Targeted Synthetic DMARDs		
Otezla® (apremilast tablets)	Inhibition of PDE4	PsO, PsA
Olumiant® (baricitinib tablets)	Inhibition of JAK pathways	RA
Rinvoq® (upadacitinib extended-release tablets)	Inhibition of JAK pathways	RA
Xeljanz® (tofacitinib tablets)	Inhibition of JAK pathways	RA, PJIA, PsA, UC
Xeljanz® XR (tofacitinib extended-release tablets)	Inhibition of JAK pathways	RA, PsA, UC

* Not an all-inclusive list of indication (e.g., oncology indications and rare inflammatory conditions are not listed). Refer to the prescribing information for the respective agent for FDA-approved indications; SC – Subcutaneous; TNF – Tumor necrosis factor; IV – Intravenous, IL – Interleukin; PDE4 – Phosphodiesterase 4; JAK – Janus kinase; AS – Ankylosing spondylitis; CD – Crohn's disease; JIA – Juvenile idiopathic arthritis; PsO – Plaque psoriasis; PsA – Psoriatic arthritis; RA – Rheumatoid arthritis; UC – Ulcerative colitis; nr-axSpA – Non-radiographic axial spondyloarthritis; ^ Off-label use of Kineret in JIA supported in guidelines; DMARDs – Disease-modifying antirheumatic drug.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Ilaris Prior Authorization Policy

- Ilaris® (canakinumab for subcutaneous injection – Novartis)

REVIEW DATE: 04/22/2020; selected revision 06/24/2020

OVERVIEW

Ilaris, an interleukin-1β (IL-1β) blocker, is indicated for the following uses:[1]

- **Cryopyrin-Associated Periodic Syndromes** (CAPS), including Familial Cold Autoinflammatory Syndrome and Muckle-Wells Syndrome, for treatment of patients who are ≥ 4 years of age.
- **Still's Disease**, including Active **adult-onset Still's Disease** and **systemic juvenile idiopathic arthritis** (SJIA), in patients ≥ 2 years of age.
- **Tumor necrosis factor receptor associated periodic syndrome** (TRAPS), in adult and pediatric patients.

- **Hyperimmunoglobulin D Syndrome/mevalonate kinase deficiency**, in adult and pediatric patients.
- **Familial Mediterranean Fever**, in adult and pediatric patients.

In the pivotal study for period fevers (TRAPS, Hyperimmunoglobulin D Syndrome/mevalonate kinase deficiency, and Familial Mediterranean Fever), patients were assessed for a response following 4 months of treatment with Ilaris.

Guidelines

Ilaris is used for a variety of periodic fever syndromes and inflammatory conditions.

- **SJIA:** There are standardized treatment plans published for use of Ilaris.[7,8] At Month 3, patients with unchanged or worsening disease or patients whose steroid dose is > 50% of the starting dose should have an increase in prednisone plus either addition of methotrexate or change to Actemra. Guidelines from the American College of Rheumatology for the management of SJIA (2013) mention Ilaris as a treatment alternative, depending upon the manifestations of SJIA being treated.[9] While there are a number of other effective options for treating synovitis in patients with active SJIA, effective options for treatment of macrophage activation syndrome are much more limited and include Kineret (anakinra subcutaneous injection), calcineurin inhibitors, and systemic corticosteroids (no preferential sequencing noted). Although use of Ilaris is uncertain in some situations, macrophage activation syndrome is a potentially life-threatening situation with limited treatment options.
- **TRAPS:** European guidelines for autoinflammatory disorders (2015) note that IL-1 blockade is beneficial for the majority of patients; maintenance with IL-1 blockade, which may limit corticosteroid exposure, may be used in patients with frequent attacks and/or subclinical inflammation between attacks.
- **Mevalonate Kinase Deficiency:** European guidelines for autoinflammatory disorders (2015) recommend consideration of short-term use of IL-1 blockers for termination of attacks and to limit or prevent steroid adverse events.[5] Maintenance therapy with an IL-1 blocker may be used in patients with mevalonate kinase deficiency and frequent attacks and/or subclinical inflammation between attacks.
- **Familial Mediterranean Fever:** Guidelines for familial Mediterranean fever from the European League Against Rheumatism (EULAR) [2016] note that treatment goals are to prevent the clinical attacks and to suppress chronic subclinical inflammation.[6] IL-1 blockade is an option for patients with protracted febrile myalgia. In patients who develop AA amyloidosis, the maximal tolerated dose of colchicine and biologics (especially IL-1 blockade) are recommended.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Ilaris. Because of the specialized skills required for evaluation and diagnosis of patients treated with Ilaris as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Ilaris to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

All reviews for use of Ilaris for COVID-19 and/or cytokine release syndrome associated with COVID-19 will be forwarded to the Medical Director.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Ilaris is recommended in those who meet the following criteria:

FDA-Approved Indications

3. **Cryopyrin-Associated Periodic Syndromes (CAPS) [including Familial Cold Autoinflammatory Syndrome, Muckle-Wells Syndrome, and Neonatal Onset Multisystem Inflammatory Disease {NOMID} or Chronic Infantile Neurological Cutaneous and Articular {CINCA} Syndrome].** Approve for the duration noted if the patient meets ONE of the following (A or B):
   4. Initial Therapy. Approve for 3 months if the patient meets the following conditions (i and ii):
      i. Patient is ≥ 4 years of age; AND
      ii. Ilaris is prescribed by or in consultation with a rheumatologist, geneticist, allergist/immunologist, or dermatologist.
   5. Patient is Currently Receiving Ilaris. Approve for 3 years if the patient has had a response, as determined by the prescriber.

6. **Familial Mediterranean Fever.** Approve for the duration noted if the patient meets ONE of the following (A or B):
   A) Initial Therapy. Approve for 4 months if prescribed by or in consultation with a rheumatologist, nephrologist, geneticist, gastroenterologist, oncologist, or hematologist.
   B) Patient is Currently Receiving Ilaris. Approve for 3 years if the patient has had a response, as determined by the prescriber.
   Note: The patient may not have a full response, but there should have been a recent or past response to Ilaris.

3. **Hyperimmunoglobulin D Syndrome/Mevalonate Kinase Deficiency.** Approve for the duration noted if the patient meets ONE of the following (A or B):
   A) Initial Therapy. Approve for 4 months if Ilaris is prescribed by or in consultation with a rheumatologist, nephrologist, geneticist, oncologist, or hematologist.
   B) Patient is Currently Receiving Ilaris. Approve for 3 years if the patient has had a response, as determined by the prescriber.
   Note: The patient may not have a full response, but there should have been a recent or past response to Ilaris.

4. **Systemic Juvenile Idiopathic Arthritis (SJIA).** Approve for the duration noted if the patient meets ONE of the following (A or B):
   A) Initial Therapy. Approve for 3 months (which is adequate for three doses) if the patient meets ALL of the following conditions (i, ii, and iii):
      i. Patient is ≥ 2 years of age; AND
      ii. Patient meets ONE of the following conditions (a, b, or c):
         a) Patient has tried at least TWO other biologics; OR
         Note: Examples of biologics for SJIA include Actemra (tocilizumab intravenous infusion, tocilizumab subcutaneous injection), Kineret (anakinra subcutaneous injection), Orencia (abatacept intravenous infusion, abatacept subcutaneous injection), an etanercept product, adalimumab product, or infliximab product.
         b) Patient meets BOTH of the following [(1) and (2)]:
            (1) Patient has features of poor prognosis, as determined by the prescriber; AND
            Note: Examples of features of poor prognosis include arthritis of the hip, radiographic damage, 6-month duration of significant active systemic disease, defined by: fever,

elevated inflammatory markers, or requirement for treatment with systemic glucocorticoids.

(2) Patient has tried Actemra or Kineret; OR

c) Patient meets BOTH of the following [(1) and (2)]:

(1) Patient has features of SJIA with active systemic features with concerns of progression to macrophage activation syndrome, as determined by the prescriber; AND

(2) Patient has tried Kineret; AND

iii. Ilaris is prescribed by or in consultation with a rheumatologist.

B) Patient is Currently Receiving Ilaris. Approve for 3 years if the patient has had a response as determined by the prescriber.

Note: Examples of responses to therapy include resolution of fevers or rash, improvement in limitation of motion, less joint pain or tenderness, decreased duration of morning stiffness or fatigue; improved function or activities of daily living, and reduced dosage of corticosteroids. The patient may not have a full response, but there should have been a recent or past response to Ilaris.

5. Stills Disease, Adult Onset. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months (which is adequate for three doses) if the patient meets ALL of the following conditions (i, ii, and iii):

i. Patient is ≥ 18 years of age; AND

Note: If the patient is < 18 years of age, refer to criteria for systemic juvenile idiopathic arthritis.

ii. Patient meets ONE of the following conditions (a, b, or c):

a) Patient has tried at least TWO other biologics; OR

Note: Examples of biologics include Actemra (tocilizumab intravenous infusion, tocilizumab subcutaneous injection), Kineret (anakinra subcutaneous injection), Orencia (abatacept intravenous infusion, abatacept subcutaneous injection), an etanercept product, adalimumab product, or infliximab product.

b) Patient meets BOTH of the following [(1) and (2)]:

(1) Patient has features of poor prognosis, as determined by the prescriber; AND

Note: Examples of features of poor prognosis include arthritis of the hip, radiographic damage, 6-month duration of significant active systemic disease, defined by: fever, elevated inflammatory markers, or requirement for treatment with systemic glucocorticoids.

(2) Patient has tried Actemra or Kineret; OR

c) Patient meets BOTH of the following [(1) and (2)]:

(1) Patient has active systemic features with concerns of progression to macrophage activation syndrome, as determined by the prescriber; AND

(2) Patient has tried Kineret; AND

iii. Ilaris is prescribed by or in consultation with a rheumatologist.

B) Patient is Currently Receiving Ilaris. Approve for 3 years if the patient has had a response as determined by the prescriber.

Note: Examples of responses to therapy include resolution of fevers or rash, improvement in limitation of motion, less joint pain or tenderness, decreased duration of morning stiffness or fatigue; improved function or activities of daily living, and reduced dosage of corticosteroids. The patient may not have a full response, but there should have been a recent or past response to Ilaris.

5. Tumor Necrosis Factor Receptor Associated Periodic Syndrome (TRAPS). Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 4 months if prescribed by or in consultation with a rheumatologist, geneticist, nephrologist, oncologist, or hematologist.

B) Patient is Currently Receiving Ilaris. Approve for 3 years if the patient has had a response, as determined by the prescriber.
Note: The patient may not have a full response, but there should have been a recent or past response to Ilaris.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Ilaris is not recommended in the following situations:

1. **Concurrent Biologic Therapy.** Ilaris has not been evaluated and should not be administered in combination with another biologic agent for an inflammatory condition (see Appendix for examples). An increased incidence of serious infections has been associated with another IL-1 blocker, Kineret, when given in combination with tumor necrosis factor inhibitor in patients with rheumatoid arthritis. Concomitant administration of Ilaris and other agents that block IL-1 or its receptors is not recommended.

2. **COVID-19 (Coronavirus Disease 2019).** Forward all requests to the Medical Director.
Note: This includes requests for cytokine release syndrome associated with COVID-19.

3. **Rheumatoid Arthritis.** Efficacy is not established.[11,12] In a 12-week, Phase II, placebo-controlled, double-blind study, 277 patients who had failed methotrexate were randomized to Ilaris or placebo.[11] Although the ACR 50 at Week 12 was higher for Ilaris 150 mg (given every 4 weeks) compared with placebo (26.5% vs. 11.4%, respectively; P = 0.028), there was not a statistically significant difference in ACR 50 for the other Ilaris treatment groups (Ilaris 300 mg every 2 weeks; Ilaris 600 mg loading dose followed by 300 mg every 2 weeks).

4. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Olumiant® (baricitinib tablets)	Inhibition of the JAK pathways	RA
Rinvoq® (upadacitinib extended-release tablets)	Inhibition of the JAK pathways	RA
Xeljanz®, Xeljanz XR (tofacitinib tablets, tofacitinib extended-release tablets)	Inhibition of the JAK pathways	RA, PsA, UC

* Not an all-inclusive list of indication (e.g., oncology indications and rare inflammatory conditions are not listed). Refer to the prescribing information for the respective agent for FDA-approved indications; SC – Subcutaneous; IV – Intravenous, TNF – Tumor necrosis factor; IL – Interleukin; PDE4 – Phosphodiesterase 4; JAK – Janus kinase; AS – Ankylosing spondylitis; CD – Crohn's disease; PJIA – Polyarticular juvenile idiopathic arthritis; PsO – Plaque psoriasis; PsA – Psoriatic arthritis; RA – Rheumatoid arthritis; SJIA – Systemic juvenile idiopathic arthritis; UC – Ulcerative colitis; nr-axSpA – Non-radiographic axial sponlyoarthritis; ^ Off-label use of SJIA supported in guidelines; DMARD – Disease-modifying antirheumatic drug.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Ilumya™ (tildrakizumab-asmn for subcutaneous injection – Sun Pharmaceuticals)

DATE REVIEWED: 04/22/2020

OVERVIEW

Ilumya is a humanized immunoglobulin G monoclonal antibody that binds to interleukin (IL)-23, a pro-inflammatory cytokine.[1] It binds to the p19 subunit of IL-23 and inhibits the intracellular and downstream signaling of IL-23 which is required for the terminal differentiation and survival of T helper 17 cells. Ilumya is indicated for treatment of adults with moderate to severe plaque psoriasis who are candidates for systemic therapy or phototherapy. It is administered subcutaneously (SC) at Weeks 0 and 4 and then once every 12 weeks thereafter. Ilumya should be administered by a healthcare professional.

Disease Overview

Although the etiology of psoriasis is not fully established, abnormal keratin formation, epidermal proliferation, activation of the immune system, and hereditary factors appear to play roles in the pathogenesis of the disease. In psoriasis, levels of IL-23p40 and IL-12/23p40 messenger RNA are upregulated but decrease with treatment. By blocking the release of proinflammatory cytokines and chemokines, Ilumya has an inhibitory effect on the inflammatory process.

Guidelines

Joint guidelines from the American Academy of Dermatology and National Psoriasis Medical Board (2019) have been published for management of psoriasis with biologics.[2] These guidelines list Ilumya as a monotherapy treatment option for patients with moderate to severe plaque psoriasis. Guidelines from the European Dermatology Forum (2015) recommend biologics (i.e., etanercept, adalimumab, infliximab, Stelara SC) as second-line therapy for induction and long-term treatment if phototherapy and conventional systemic agents have failed, are contraindicated, or are not tolerated.[3]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Ilumya. Because of the specialized skills required for evaluation and diagnosis of patients treated with Ilumya as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Ilumya to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Ilumya is recommended in those who meet the following criteria:

I) Plaque Psoriasis. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets ALL of the following criteria (i, ii, and iii):

i. The patient is ≥ 18 years of age; AND

ii. The patient meets ONE of the following conditions (a or b):

a) The patient has tried at least at least one traditional systemic agent for psoriasis for at least 3 months, unless intolerant.

Note: Examples of one traditional systemic agent include methotrexate [MTX], cyclosporine, acitretin tablets, or psoralen plus ultraviolet A light [PUVA]). An exception to the requirement for a trial of one traditional systemic agent for psoriasis can be made if the patient has already had a 3-month trial or previous intolerance to at least one biologic. Refer to **Appendix** for examples of biologics used for plaque psoriasis. These patients who have already tried a biologic for psoriasis are not required to "step back" and try a traditional systemic agent for psoriasis); OR

b) The patient has a contraindication to methotrexate (MTX), as determined by the prescriber; AND

iii. Ilumya is prescribed by or in consultation with a dermatologist.

B) Patient is Currently Receiving Ilumya. Approve for 3 years if the patient has responded, as determined by the prescriber.

Note: The patient may not have a full response, but there should have been a recent or past response to Ilumya.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Ilumya has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

78. Concurrent Use with other Biologics or with Targeted Synthetic Disease-Modifying Antirheumatic Drugs (DMARDs). Data are lacking evaluating concomitant use of Ilumya with another biologic or with a targeted synthetic DMARD for an inflammatory condition (see **Appendix** for examples). Combination therapy with biologics and/or biologics + targeted synthetic DMRADs has a potential for a higher rate of adverse effects and lack controlled trial data in support of additive efficacy.[4]

Note: This does NOT exclude the use of MTX (a traditional systemic agent used to treat psoriasis) in combination with Ilumya.

79. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Infliximab Products Prior Authorization Policy

- Avsola™ (infliximab-axxq intravenous infusion – Amgen)
- Inflectra™ (infliximab-dyyb intravenous infusion – Hospira/Pfizer)
- Remicade® (infliximab intravenous infusion – Janssen Biotech, Inc./Johnson & Johnson)
- Renflexis® (infliximab-abda intravenous infusion – Samsung Bioepis/Merck)

REVIEW DATE: 09/23/2020

OVERVIEW

Infliximab products are tumor necrosis factor inhibitors (TNFis) approved for the following indications:[1-3]

- **Ankylosing spondylitis**, for reducing signs and symptoms of active disease.
- **Crohn's disease**, for the following uses:
  - Reducing the signs and symptoms and inducing and maintaining clinical remission in patients ≥ 6 years of age with moderately to severely active Crohn's disease who have had an inadequate response to conventional therapy; AND
  - Reducing the number of draining enterocutaneous and rectovaginal fistulas and maintaining fistula closure in adults with fistulizing Crohn's disease.
- **Plaque psoriasis**, for treatment of adults with chronic severe (i.e., extensive and/or disabling) disease who are candidates for systemic therapy and when other systemic therapies are less appropriate.
- **Psoriatic arthritis**, for reducing signs and symptoms of active arthritis, inhibiting the progression of structural damage and improving physical function.
- **Rheumatoid arthritis**, in combination with methotrexate for reducing signs and symptoms, inhibiting the progression of structural damage and improving physical function in patients with moderately to severely active disease.
- **Ulcerative colitis**, for the following uses:
  - Reducing signs and symptoms, inducing and maintaining clinical remission and mucosal healing, and eliminating corticosteroid use in adults with moderately to severely active disease who have had an inadequate response to conventional therapy; AND
  - Reducing signs and symptoms and inducing and maintaining clinical remission in patients ≥ 6 years of age with moderately to severely active disease who have had an inadequate response to conventional therapy.

Avsola, Inflectra and Renflexis were approved as biosimilar to Remicade, indicating no clinically meaningful differences in safety and effectiveness and the same mechanism of action, route of administration, dosage form, and strength as Remicade.[2-3] However, minor differences in clinically inactive components are allowed. At this time, only biosimilarity has been demonstrated (not interchangeability).

Guidelines

TNFis feature prominently in guidelines for treatment of many inflammatory conditions.

- **Spondyloarthritis:** Guidelines for ankylosing spondylitis and non-radiographic axial spondyloarthritis are published by the American College of Rheumatology (ACR)/Spondylitis Association of America/Spondyloarthritis Research and Treatment Network (2019).[4] Following primary nonresponse to a TNFi, an interleukin (IL)-17 blocker is recommended; however, if the patient is a secondary nonresponder, a second TNFi is recommended over switching out of the class. In patients with a contraindication to a TNFi, use of an IL-17 blocker is recommended over traditional oral agents such as methotrexate or sulfasalazine.
- **Crohn's Disease:** The American College of Gastroenterology (ACG) has guidelines for Crohn's disease (2018).[5] TNFis are listed as an option for disease that is resistant to corticosteroids, severely active disease, perianal fistulizing disease, and maintenance of remission. In post-operative Crohn's disease, a TNFi should be started within 4 weeks of surgery to prevent recurrence.
- **Plaque Psoriasis:** Guidelines from the American Academy of Dermatologists (AAD) and National Psoriasis Foundation (NPF) [2019] recommend infliximab as a monotherapy treatment option for adults with moderate to severe disease.[6]
- **Psoriatic Arthritis:** Guidelines from ACR (2019) recommend TNFis over other biologics for use in treatment-naïve patients with psoriatic arthritis, and in those who were previously treated with an oral therapy.[7]
- **Rheumatoid Arthritis:** Guidelines from the American College of Rheumatology (ACR) [2015] have TNF inhibitors and non-TNF biologics, administered with or without methotrexate, equally positioned as a recommended therapy following a trial of a conventional synthetic disease-modifying antirheumatic drug (DMARD) [e.g., methotrexate, leflunomide, hydroxychloroquine, sulfasalazine].[8]
- **Ulcerative Colitis:** Updated ACG guidelines for ulcerative colitis (2019) note that the following agents can be used for induction of remission in moderately to severely active disease: Uceris tablets; Oral or intravenous systemic corticosteroids Entyvio, Xeljanz, or TNFis.[9] In addition to the approved indication,

clinical guidelines for the management of pouchitis, published in 2009 indicate that first-line therapy for pouchitis is antibiotic therapy (e.g. metronidazole, ciprofloxacin).[11] Other treatment options include maintenance probiotics, oral or topical budesonide, anti-inflammatory drugs (e.g., mesalamine), or immunosuppressive drugs (e.g., infliximab). Guidelines from the American Gastroenterological Association (2020) recommend infliximab for moderate to severe ulcerative colitis.[11]

Other Uses with Supportive Evidence

There are guidelines and/or published data supporting the use of infliximab products in the following conditions:

- **Behcet's Disease:** The European League Against Rheumatism (EULAR) recommendations (2018) include TNFis for initial or recurrent sight-threatening uveitis.[12] For patients refractory to first-line treatments (e.g., corticosteroids), TNFis are among the treatment options for mucocutaneous manifestations, venous thrombosis, severe or refractory gastrointestinal disease, and recurrent/chronic joint involvement. Recommendations for the use of TNFis in ocular inflammatory disorders from the American Academy of Ophthalmology (AAO) [2014] notes that TNFis may be used first-line in patients with ophthalmic manifestations of Behcet's disease and for acute exacerbations of pre-existing Behcet's disease.[13]
- **Graft-Versus-Host Disease:** Guidelines from the National Comprehensive Cancer network (NCCN) [version 2.2020 – March 23, 2020] list infliximab among the agents used for steroid-refractory disease.[19]
- **Hidradenitis Suppurativa:** In a Phase II double-blind, placebo-controlled crossover trial, adult patients with moderate to severe hidradenitis suppurativa were randomized to placebo (n = 23) or infliximab 5 mg/kg (n = 15) at Weeks 0, 2, and 6.[25] After Week 8, patients were unblinded, and placebo patients were offered induction with placebo. Maintenance was continued through 22 weeks of treatment. Following Week 8, more patients in the infliximab-treatment group experienced a 50% or greater decrease in the Hidradenitis Suppurativa Severity Index (HSSI) score (approximately 26% and 5% of patients receiving infliximab and placebo, respectively [data presented graphically]; P = 0.092). In post-hoc analysis, significantly more patients treated with infliximab responded with a 25% to < 50% response (60% and 5.6% for infliximab and placebo, respectively; P < 0.001). Improvement was noted through Week 30. In case series, infliximab has been effective in treating hidradenitis suppurativa that was refractory to other therapies.[26-28]
- **Indeterminate Colitis:** Infliximab has been effective in some patients with refractory indeterminate colitis (retrospective reviews).[29,30] When patients who are refractory to standard therapy can be definitively classified as having ulcerative colitis, colectomy is considered an effective long-term surgical treatment. Patient's with Crohn's disease, however, have a high risk of complications after ileal pouch-anal anastomosis and are treated more aggressively with medical interventions since surgical options cannot offer the same likelihood of success as in ulcerative colitis.
- **Ocular Inflammatory Disorders:** Recommendations for the use of TNFis in ocular inflammatory disorders from the AAO (2014) note that infliximab may be used as second-line corticosteroid-sparing therapy for chronic and severe scleritis.[13] Infliximab may be used in patients with uveitis due to various causes (e.g., spondyloarthropathy-associated or human leukocyte antigen [HLA]-B27-associated uveitis, juvenile idiopathic arthritis-associated uveitis, and other posterior uveitides and panuveitis syndromes).[13] Infliximab should be considered second-line in vision-threatening JIA-associated uveitis when methotrexate has failed or is not tolerated (strong recommendation) and vision-threatening chronic uveitis from seronegative spondyloarthropathy (strong recommendation). Infliximab may also be considered in other patients who have vision-threatening or corticosteroid-dependent disease who have failed first-line therapies. The recommendations point out that studies evaluating infliximab in uveitis included patients with birdshot chorioretinitis (BSCR), a bilateral posterior uveitis generally treated with systemic immunomodulation; these patients showed a good response to infliximab.
- **Immunotherapy-Related Toxicities Associated with Checkpoint Inhibitors:** NCCN has guidelines (version 1.2020 – December 16, 2020) for Management of Immunotherapy-Related Toxicities.[14] Infliximab is recommended to manage inflammatory arthritis, vision changes, and diarrhea/colitis. Some severe toxicities (e.g., pneumonitis, cardiac toxicity, renal failure) may also be treated with infliximab but are more likely to be administered in the hospital setting.
- **Juvenile Idiopathic Arthritis (JIA):** The ACR/Arthritis Foundation Guideline for the treatment of JIA (2019) provides updated recommendations for juvenile non-systemic polyarthritis, sacroiliitis, and enthesitis.[15] Infliximab is among the TNFis recommended as subsequent therapy following treatment with a conventional synthetic DMARD such as methotrexate. TNF antagonists such as infliximab may also be used as second- or third-line treatment for systemic JIA.[16]

- **Pyoderma Gangrenosum:** Although guidelines are not current, multiple topical and systemic therapies have been used for pyoderma gangrenosum. Oral prednisone is the most common initial immunosuppressant medication.[17] Other systemic therapies include cyclosporine, methotrexate, azathioprine, cyclophosphamide, mycophenolate mofetil, and TNFis (i.e., infliximab, etanercept, and adalimumab products). In case reports, TNFis have been effective.
- **Still's Disease:** Still's disease presents in adults with features similar to those of systemic onset JIA.[31-32] In case series, infliximab has been effective in patients with Still's disease that was refractory to therapy with corticosteroids, methotrexate, azathioprine, and cyclophosphamide.[33]
- **Sarcoidosis:** Recommendations for best practice in the management of pulmonary and systemic sarcoidosis recommend glucocorticoids as first-line therapy.[18] Patients who cannot be weaned to a prednisone-equivalent dose of < 10 mg/day are appropriate candidates for steroid-sparing treatment with cytotoxic agents (e.g., methotrexate, azathioprine, leflunomide). If these agents fail or cause toxicity, adalimumab, infliximab, cyclophosphamide, or mycophenolate mofetil are proposed.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of infliximab products. Because of the specialized skills required for evaluation and diagnosis of patients treated with infliximab as well as the monitoring required for adverse events and long-term efficacy, initial approval requires infliximab to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration listed below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of infliximab products is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Ankylosing Spondylitis.** Approve for the duration noted if the patient meets ONE of the following (A or B):
   - **A)** Initial Therapy. Approve for 3 months if prescribed by or in consultation with a rheumatologist.
   - **B)** Patient is Currently Receiving an Infliximab Product. Approve for 1 year if the patient had a response as determined by the prescriber.
     Note: Examples of a response to therapy include decreased pain or stiffness, improved function or activities of daily living. Patient may not have a full response, but there should have been a recent or past response to an infliximab product.

2. **Crohn's Disease.** Approve for the duration noted if the patient meets ONE of the following (A or B):
   - **A)** Initial Therapy. Approve for 3 months if the patient meets the following criteria (i, ii, and iii):
     - **i.** Patient is ≥ 6 years of age; AND
     - **ii.** Patient meets ONE of the following conditions (a, b, c, or d):
       - **a)** Patient has tried or is currently taking corticosteroids, or corticosteroids are contraindicated in this patient; OR
         Note: Examples of corticosteroids are prednisone and methylprednisolone.
       - **b)** Patient has tried one other conventional systemic therapy for Crohn's disease; OR
         Note: Examples of conventional systemic therapies for Crohn's disease include azathioprine, 6-mercaptopurine, or methotrexate. A previous trial of a biologic also counts as a trial of one other agent for Crohn's disease. Refer to Appendix for examples of biologics used for Crohn's disease.
       - **c)** Patient has enterocutaneous (perianal or abdominal) or rectovaginal fistulas; OR
       - **d)** Patient had ileocolonic resection (to reduce the chance of Crohn's disease recurrence); AND
     - **iii.** The medication is prescribed by or in consultation with a gastroenterologist.
   - **B)** Patient is Currently Receiving an Infliximab Product. Approve for 1 year if the patient had a response, as determined by the prescriber.

Note: Patient may not have a full response, but there should have been a recent or past response to an infliximab product.

3. Plaque Psoriasis. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets the following criteria (i, ii, and iii):

i. Patient is ≥ 18 years of age; AND

ii. Patient meets ONE of the following conditions (a or b):

a) Patient has tried at least one traditional systemic agent for psoriasis for at least 3 months, unless intolerant; OR

Note: Examples include methotrexate, cyclosporine, acitretin (Soriatane®, generics), or psoralen plus ultraviolet A light (PUVA). An exception to the requirement for a trial of one traditional systemic agent for psoriasis can be made if the patient already had a 3-month trial or previous intolerance to at least one biologic. Refer to Appendix for examples of biologics used for psoriasis. These patients who have already tried a biologic for psoriasis are not required to "step back" and try a traditional systemic agent for psoriasis.

b) Patient has a contraindication to methotrexate, as determined by the prescriber; AND

iii. The medication is prescribed by or in consultation with a dermatologist.

B) Patient is Currently Receiving an Infliximab Product. Approve for 1 year if the patient had a response, as determined by the prescriber.

Note: Patient may not have a full response, but there should have been a recent or past response to an infliximab product.

4. Psoriatic Arthritis. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if prescribed by or in consultation with a rheumatologist or a dermatologist.

B) Patient is Currently Receiving an Infliximab Product. Approve for 1 year if the patient had a response as determined by the prescriber.

Note: Examples of a response include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improvements in acute phase reactants (for example, C-reactive protein). Patient may not have a full response, but there should have been a recent or past response to an infliximab product.

5. Rheumatoid Arthritis. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets BOTH of the following criteria (i and ii):

i. Patient has tried ONE conventional synthetic disease-modifying antirheumatic drug (DMARD) for at least 3 months; AND

Note: Examples include methotrexate (oral or injectable), leflunomide, hydroxychloroquine, and sulfasalazine. An exception to the requirement for a trial of one conventional synthetic DMARD can be made if the patient already had a 3-month trial of at least one biologic. Refer to Appendix for examples of biologics used for rheumatoid arthritis. These patients who have already tried a biologic are not required to "step back" and try a conventional synthetic DMARD.

ii. The medication is prescribed by or in consultation with a rheumatologist.

B) Patient is Currently Receiving an Infliximab Product. Approve for 1 year if the patient had a response as determined by the prescriber.

Note: Examples of a response include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improved laboratory values; reduced dosage of corticosteroids. Patient may not have a full response, but there should have been a recent or past response to an infliximab product.

6. Ulcerative Colitis. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets the following criteria (i, ii, and iii):

i. Patient is ≥ 6 years of age; AND

ii. Patient meets ONE of the following conditions (a or b):

a) Patient had a trial of one systemic agent or was intolerant to one of these agents for ulcerative colitis; OR

Note: Examples include 6-mercaptopurine, azathioprine, cyclosporine, tacrolimus, or a corticosteroid such as prednisone, methylprednisolone. A previous trial of a biologic also counts as a trial of one systemic agent for ulcerative colitis. Refer to Appendix for examples of biologics used for ulcerative colitis.

b) Patient meets BOTH of the following [(1) and (2)]:

(1) Patient has pouchitis; AND

(2) Patient has tried therapy with an antibiotic, probiotic, corticosteroid enema, or Rowasa® (mesalamine) enema; AND

Note: Examples of antibiotics include metronidazole and ciprofloxacin. Examples of corticosteroid enemas include hydrocortisone enema (Cortenema, generics).

iii. The medication is prescribed by or in consultation with a gastroenterologist.

B) Patient is Currently Receiving an Infliximab Product. Approve for 1 year if the patient had a response as determined by the prescriber.

Note: Examples of a response include decreased stool frequency or rectal bleeding. The patient may not have a full response, but there should have been a recent or past response to an infliximab product.

Other Uses with Supportive Evidence

7. Behcet's Disease. Approve for the duration noted if the patient meets the following criteria (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets BOTH of the following conditions (i and ii):

i. Patient meets ONE of the following (a or b):

a) Patient has tried at least ONE conventional therapy; OR

Note: Examples include systemic corticosteroids (e.g., methylprednisolone), immunosuppressants (azathioprine, methotrexate, mycophenolate mofetil, cyclosporine, tacrolimus, Leukeran® [chlorambucil], cyclophosphamide, interferon alfa). An exception to the requirement for a trial of one conventional therapy can be made if the patient has already had a trial of at least one tumor necrosis factor inhibitor (e.g., an adalimumab product, an etanercept product). These patients who have already tried a biologic for Behcet's disease are not required to "step back" and try a conventional therapy.

b) Patient has ophthalmic manifestations of Behcet's disease; AND

ii. The medication is prescribed by or in consultation with a rheumatologist, dermatologist, ophthalmologist, gastroenterologist, or neurologist.

B) Patient is Currently Receiving an Infliximab Product. Approve for 1 year if the patient had a response, as determined by the prescriber.

Note: Patient may not have a full response by Month 2 or 3, but there should be some response.

8. Graft-Versus-Host Disease. Approve for the duration noted if the patient meets the following criteria (A or B):

A) Initial Therapy. Approve for 1 month if the patient meets BOTH of the following (i and ii):

i. Patient has tried at least one conventional systemic treatment for graft-versus-host disease; AND

Note: Examples of conventional treatments include corticosteroids (e.g., methylprednisolone), antithymocyte globulin, cyclosporine, tacrolimus, and mycophenolate mofetil.

ii. The medication is prescribed by or in consultation with an oncologist, hematologist, or a physician affiliated with a transplant center; OR

B) Patient is Currently Receiving an Infliximab Product. Approve for 3 months if the patient had a response, as determined by the prescriber.

9. Hidradenitis Suppurativa. Approve for the duration noted if the patient meets the following criteria (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets BOTH of the following (i and ii):

i. Patient has tried one other therapy; AND

Note: Examples include intralesional or oral corticosteroids (e.g., triamcinolone, prednisone), systemic antibiotics (e.g., clindamycin, dicloxacillin, erythromycin), and isotretinoin.

ii. The medication is prescribed by or in consultation with a dermatologist.

B) Patient is Currently Receiving an Infliximab Product. Approve for 1 year if the patient had a response, as determined by the prescriber.

10. Immunotherapy-Related Toxicities Associated with Checkpoint Inhibitor Therapy. Approve for the duration noted if the patient meets ONE of the following (A or B):

C) Initial Therapy. Approve for 3 months if the patient meets ALL of the following (i, ii, iii, and iv):

i. Patient developed an immunotherapy-related toxicity involving the gastrointestinal system, inflammatory arthritis, or ocular toxicity; AND
Note: An example of a gastrointestinal system toxicity is colitis. Examples of ocular toxicities include uveitis/iritis, episcleritis, and blepharitis.

ii. Patient developed this immune-related toxicity while receiving a checkpoint inhibitor; AND
Note: Examples of checkpoint inhibitors include Keytruda (pembrolizumab intravenous [IV] infusion), Opdivo (nivolumab IV infusion), Yervoy (ipilimumab IV infusion), Tecentriq (atezolizumab IV infusion), Bavencio (avelumab IV infusion), or Imfinzi (durvalumab IV infusion).

iii. Patient has tried one systemic corticosteroid; AND
Note: Examples include methylprednisone and prednisone.

iv. The medication is prescribed by or in consultation with an oncologist, gastroenterologist, rheumatologist, or ophthalmologist; OR

D) Patient is Currently Receiving an Infliximab Product. Approve for 1 year if the patient has responded and needs continued treatment, as determined by the prescriber.

11. Indeterminate Colitis (defined as colitis that cannot be classified with certainty as either ulcerative colitis or Crohn's disease). Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 4 months if the patient meets ALL of the following (i, ii, iii, iv, and v):

i. Patient is ≥ 6 years of age; AND

ii. Patient has tried one systemic corticosteroid; AND
Note: Examples include prednisone and methylprednisolone.

iii. Patient has tried mesalamine; AND

iv. Patient has tried either azathioprine or 6-mercaptopurine; AND

v. The medication is prescribed by or in consultation with a gastroenterologist.

B) Patient is Currently Receiving an Infliximab Product. Approve for 1 year if the patient had a response, as determined by the prescriber.

12. Juvenile Idiopathic Arthritis (JIA) [or Juvenile Rheumatoid Arthritis] (regardless of type of onset) [Note: This includes patients with juvenile spondyloarthropathy/active sacroiliac arthritis]. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets the following criteria (i and ii):

i. Patient meets ONE of the following conditions (a or b):

a) Patient has tried one other medication for this condition; OR
Note: Examples of other medications for JIA include methotrexate, sulfasalazine, or leflunomide, a nonsteroidal anti-inflammatory drug (NSAID) [e.g., ibuprofen, naproxen]. A previous trial of a biologic also counts as a trial of one medication. Refer to Appendix for examples of biologics used for JIA.

b) Patient has aggressive disease, as determined by the prescriber; AND

ii. The medication is prescribed by or in consultation with a rheumatologist.

B) Patient is Currently Receiving an Infliximab Product. Approve for 1 year if the patient had a response as determined by the prescriber.
Note: Examples of a response include improvement in limitation of motion, less joint pain or tenderness, decreased duration of morning stiffness or fatigue, improved function or activities of daily living, reduced dosage of corticosteroids. The patient may not have a full response, but there should have been a recent or past response to an infliximab product.

13. Pyoderma Gangrenosum. Approve for the duration noted if the patient meets the following criteria (A or B):

A) Initial Therapy. Approve for 4 months if the patient meets BOTH of the following conditions (i and ii):
- **i.** Patient meets ONE of the following conditions (a or b):
  - **A)** Patient has tried one systemic corticosteroid; OR
    Note: An example is prednisone.
  - **B)** Patient has tried one other immunosuppressant for at least 2 months or was intolerant to one of these medications; AND
    Note: Examples include mycophenolate mofetil and cyclosporine.
- **ii.** The medication is prescribed by or in consultation with a dermatologist; OR

B) Patient is Currently Receiving an Infliximab Product. Approve for 1 year if the patient had a response, as determined by the prescriber.
Note: Patient may not have a full response by Month 4 or 5 (after 4 doses), but there should be some response.

14. Sarcoidosis. Approve for the duration noted if the patient meets ONE of the following criteria (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets ALL of the following conditions (i, ii, and iii):
- **i.** Patient has tried at least one corticosteroid; AND
  Note: An example is prednisone.
- **ii.** Patient has tried at least one immunosuppressive medication; AND
  Note: Examples include methotrexate, azathioprine, cyclosporine, Leukeran, Thalomid® (thalidomide capsules), or chloroquine.
- **iii.** The medication is prescribed by or in consultation with a pulmonologist, ophthalmologist, or dermatologist; OR

B) Patient is Currently Receiving an Infliximab Product. Approve for 1 year if the patient had a response, as determined by the prescriber.
Note: The patient may not have a full response by Month 3, but there should be some response.

15. Scleritis or Sterile Corneal Ulceration. Approve for the duration noted if the patient meets ONE of the following criteria (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets BOTH of the following conditions (i and ii):
- **i.** Patient has tried one other therapy for this condition; AND
  Note: Examples include oral non-steroidal anti-inflammatory drugs (NSAIDs) such as indomethacin; oral, topical (ophthalmic) or intravenous corticosteroids (such as prednisone, prednisolone, methylprednisolone); methotrexate; cyclosporine; or other immunosuppressants.
- **ii.** The medication is prescribed by or in consultation with an ophthalmologist; OR

B) Patient is Currently Receiving an Infliximab Product. Approve for 1 year if the patient had a response as determined by the prescriber.
Note: Examples of a response to therapy include decreased inflammation, reduced use of steroids or immunomodulators, decreased eye pain, redness, and/or photophobia. The patient may not have a full response by Month 2 or 3, but there should be some response.

16. Still's Disease. Approve for the duration noted if the patient meets ONE of the following criteria (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets ALL of the following conditions (i, ii, and iii):
- **i.** Patient has tried one corticosteroid; AND
  Note: An example is prednisone.
- **ii.** Patient has tried one conventional synthetic disease-modifying antirheumatic drug (DMARD) given for at least 2 months or was intolerant; AND
  Note: An example is methotrexate.
- **iii.** The medication is prescribed by or in consultation with a rheumatologist.

B) Patient is Currently Receiving an Infliximab Product. Approve for 1 year if the patient had a response, as determined by the prescriber.

Note: Patient may not have a full response by Month 2 or 3, but there should be some response.

17. **Spondyloarthritis, Other Subtypes** (Note: Examples of other subtypes include undifferentiated arthritis, non-radiographic axial spondylitis, Reactive Arthritis [Reiter's disease]. For ankylosing spondylitis or psoriatic arthritis, refer to the respective criteria under FDA-approved indications). Approve for the duration noted if ONE of the following conditions are met (A or B):
    E) Initial Therapy. Approve for 3 months if the patient meets BOTH of the following conditions (i and ii):
        i. Patient meets ONE of the following (a or b):
            a) Patient has arthritis primarily in the knees, ankles, elbows, wrists, hands, and/or feet AND has tried at least ONE conventional synthetic disease-modifying antirheumatic drug (DMARD); OR
            Note: Examples include methotrexate, leflunomide, and sulfasalazine.
            b) Patient has axial spondyloarthritis with objective signs of inflammation, defined as at least one of the following [(1) or (2)]:
                a) C-reactive protein elevated beyond the upper limit of normal for the reporting laboratory; OR
                b) Sacroiliitis reported on magnetic resonance imaging; AND
        ii. The medication is prescribed by or in consultation with a rheumatologist; OR
    F) Patient is Currently Receiving an Infliximab Product. Approve for 1 year if the patient had a response as determined by the prescriber.
    Note: Examples of a response include decreased pain or stiffness, improved function or activities of daily living. The patient may not have a full response, but there should have been a recent or past response to an infliximab product.

18. **Uveitis (including other posterior uveitides and panuveitis syndromes).** Approve for the duration noted if the patient meets ONE of the following criteria (A or B):
    A) Initial Therapy. Approve for 3 months if the patient meets BOTH of the following conditions (i and ii):
        i. Patient has tried one of the following therapies: periocular, intraocular, or systemic corticosteroids, or immunosuppressives; AND
        Note: Examples of corticosteroids include prednisolone, triamcinolone, betamethasone, methylprednisolone, prednisone. Examples of immunosuppressives include methotrexate, mycophenolate mofetil, and cyclosporine. An exception to the requirement for a trial of one of these therapies can be made if the patient has already had a trial of an etanercept product or an adalimumab product for uveitis. These patients who have already tried a biologic for uveitis are not required to try another medication.
        ii. The medication is prescribed by or in consultation with an ophthalmologist.
    B) Patient is Currently Receiving an Infliximab Product. Approve for 1 year if the patient had a response as determined by the prescriber.
    Note: Examples of a response include decreased inflammation, reduced use of steroids or immunomodulators, and improvement in visual acuity. The patient may not have a full response by Month 2 or 3, but there should be some response.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of infliximab products is not recommended in the following situations:

1. **Concurrent Use with a Biologic or with a Targeted Synthetic Disease-Modifying Antirheumatic Drug (DMARD).** Data are lacking evaluating concomitant use of an infliximab product in combination with another biologic or with a targeted synthetic DMARD used for an inflammatory condition (see APPENDIX for examples). Combination therapy with biologics and/or biologics + targeted synthetic DMARDs has a potential for a higher

rate of AEs and lack controlled trial data in support of additive efficacy. Note: This does NOT exclude the use of conventional synthetic DMARDs (e.g., MTX, leflunomide, hydroxychloroquine, and sulfasalazine) in combination with an infliximab product.

2. **Inflammatory Myopathies (Polymyositis, Dermatomyositis, Inclusion Body Myositis).** Exceptions are not recommended. In an open-label pilot study in 13 patients, four infliximab 5 mg/kg infusions given over 14 weeks were not effective in refractory inflammatory myopathies.[36] Infliximab could worsen muscle inflammation in these patients.

3. **Large Vessel Vasculitis (e.g., Giant Cell Arteritis, Takayasu's Arteritis).** Guidelines from EULAR for the management of large vessel vasculitis (e.g., giant cell arteritis, Takayasu's arteritis) do not mention the use of TNF blockers.[37] Additionally, a meta-analysis of RCTs did not find evidence supporting remission or reduction of corticosteroid dose with the use of TNF blockers in large vessel vasculitis.[38] In a controlled trial, 44 patients with newly diagnosed giant cell arteritis that was in glucocorticoid-induced remission were randomized to infliximab 5 mg/kg plus glucocorticoid (n = 28) or placebo plus glucocorticoid (n = 16).[39] Infliximab did not increase the percentage of patients without relapse at Week 22 nor did it increase the percentage of patients whose glucocorticoid dose was decreased to 10 mg/day without relapse. Use of TNF blockers such as infliximab for Takayasu's arteritis is limited to case series where TNF blockers are often used third line, after treatment with corticosteroids and other immunosuppressants (e.g., azathioprine, MTX, cyclophosphamide).[40-44] Infliximab has been effective in a very limited number of patients with vasculitis (e.g., RA, cryoglobulinemia, polyangiitis, polymyalgia rheumatica, Takayasu's arteritis) who were refractory to standard therapy.[40-41,45-49] However, in a randomized study in 51 patients with newly diagnosed polymyalgia rheumatica, adding infliximab 3 mg/kg to prednisone was of no benefit and may have been harmful.[50-51]

4. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	**Immunotherapy-Related Toxicity Related to Checkpoint Inhibitor Therapy:** New indication added to align with guidelines for patients who develop gastrointestinal, joint, or ophthalmic toxicity while on a checkpoint inhibitor. Approval is for 3 months, if the patient has tried a corticosteroid, and if prescribed by or in consultation with a gastroenterologist, ophthalmologist, rheumatologist, or oncologist. Reauthorization is for 1 year, if the patient responded and needs continued treatment, according to the prescriber. **Patients Established on Infliximab:** Remove this criterion for patients currently established on infliximab for ≥ 90 days. Patients currently taking infliximab are now addressed in the criteria section for each specific indication. • To align with the infliximab Prior Authorization Policy, remove requirement that the patient be receiving infliximab for ≥ 90 days for the following indications: rheumatoid arthritis, ankylosing spondylitis, Crohn's disease, plaque psoriasis, psoriatic arthritis, ulcerative colitis, and juvenile idiopathic arthritis. • Add a requirement that the patient must have responded to initial therapy for the following indications: Behcet's disease, graft versus host disease, hidradenitis suppurativa, indeterminate colitis, pyoderma gangrenosum, sarcoidosis, slceritis or sterile corneal ulcerations, Still's disease, spondyloarthritis, and uveitis. **Previous Therapies:** For these indications, add the following agents to the list of therapies the patient may have tried prior to infliximab: • CD: Stelara Intravenous/Subcutaneous • PsO: Cimzia, Illumya, Siliq, Tremfya • UC: Entyvio • JIA: Actemra SC **Behcet's disease:** Modify criteria to change previous therapy from biologic to more specifically say tumor necrosis factor inhibitor. **Other:** Throughout the policy, references to Humira and Enbrel were reworded as adalimumab and etanercept products, respectively, with the innovator names listed as examples of these products.	08/01/2018
Selected Revision	**Ulcerative colitis:** For the requirement that another agent be tried prior to Entyvio, remove the requirement that the trial is a duration of at least 2 months (not supported in updated guidelines).	03/27/2019
Selected Revision	**Spondyloarthritis (SpA), Other Subtypes:** This off-label approval condition was reworded (previously listed as Spondyloarthritis, Subtypes Other than Ankylosing Spondylitis or Psoriatic Arthritis). There is a note which directs to criteria for FDA-approved subtypes of SpA (AS, PsA). For patients with primarily axial disease, a criterion was added to require objective signs of inflammation, defined as C-reactive protein (CRP) elevated beyond the upper limit of normal for the reporting laboratory or sacroiliitis reported on magnetic resonance imaging. For patients currently receiving therapy, examples of a response to therapy were added; the requirement that patients be on an infliximab product for ≥ 90 days was removed.	04/24/2019
Annual Revision	**Crohn's Disease:** Move requirement that the patient be 6 years of age or older into the criteria section for initial therapy. Previously, age was listed as part of the diagnosis (i.e., previously listed as Crohn's disease in a patient ≥ 6 years of age) and applied to initial and continuation of therapy. **Plaque Psoriasis:** For the exception applying to patients with a contraindication to methotrexate, wording was updated to more generally allow this determination by the prescriber (criteria previously specified this was according to the prescribing physician). Skyrizi was added to the list of biologics that the patient may have tried prior to infliximab. **Rheumatoid Arthritis:** Truxima was added to as an example of a rituximab product that the patient may have tried prior to infliximab. **Ulcerative Colitis:** Move requirement that the patient be 6 years of age or older into the criteria section for initial therapy. Previously, age was listed as part of the diagnosis (i.e., previously listed as Ulcerative Colitis in a patient ≥ 6 years of age) and applied to initial and continuation of therapy. **Behcet's Disease:** For patients currently receiving therapy, the requirement that patients be on an infliximab product for ≥ 90 days was removed. **Graft versus Host Disease:** For patients currently receiving therapy, the requirement that patients be on an infliximab product for ≥ 90 days was removed.	08/28/2019

	Hidradentitis Suppurativa: For patients currently receiving therapy, the requirement that patients be on an infliximab product for ≥ 90 days was removed, the requirement that patients be on an infliximab product for ≥ 90 days was removed. **Immunotherapy-Related Toxicities Associated with Checkpoint Inhibitor Therapy:** When a response to therapy is required for patients continuing infliximab, wording was changed to be according to the prescriber (previously worded as prescribing physician). **Indeterminate Colitis:** Move requirement that the patient be 6 years of age or older into the criteria section for initial therapy. Previously, age was listed as part of the diagnosis (i.e., previously listed as Indeterminate Colitis in a patient ≥ 6 years of age) and applied to initial and continuation of therapy. For patients currently receiving therapy, the requirement that patients be on an infliximab product for ≥ 90 days was removed. **Juvenile Idiopathic Arthritis:** For the exception applying to patients with aggressive disease, wording was updated to more generally allow this determination by the prescriber (criteria previously specified this was according to the prescribing physician). **Pyoderma Gangrenosum:** For patients currently receiving therapy, the requirement that patients be on an infliximab product for ≥ 90 days was removed. **Sarcoidosis:** For patients currently receiving therapy, the requirement that patients be on an infliximab product for ≥ 90 days was removed. When a response to therapy is required for patients continuing infliximab, wording was changed to be according to the prescriber (previously worded as prescribing physician). **Scleritis/Sterile Corneal Ulceration:** For patients currently receiving therapy, the requirement that patients be on an infliximab product for ≥ 90 days was removed. When a response to therapy is required for patients continuing infliximab, wording was changed to be according to the prescriber (previously worded as prescribing physician). **Still's Disease:** For patients currently receiving therapy, the requirement that patients be on an infliximab product for ≥ 90 days was removed. **Uveitis:** For patients currently receiving therapy, the requirement that patients be on an infliximab product for ≥ 90 days was removed. When a response to therapy is required for patients continuing infliximab, wording was changed to be according to the prescriber (previously worded as prescribing physician).	
DEU Revision	**Overview:** Update to include new approval indications for biosimilars. No changes to the criteria.	11/25/2019
Selected Revision	Avsola (infliximab-axxq for injection, for intravenous use) [biosimilar to Remicade] was added to the policy. Criteria are the same as for the other infliximab products. Throughout the policy, examples of infliximab products were replaced with a general reference to infliximab products.	06/03/2020
Annual Revision	**Crohn's Disease:** Examples of biologics were moved to be included in the Appendix (previously listed in a Note in the criteria section). For the criterion applying to previous therapy, wording was changed to specify this must have been a conventional systemic therapy (criteria previously required a trial of one other agent, with conventional systemic agents listed among the examples). **Plaque Psoriasis:** Examples of biologics were moved to be included in the Appendix (previously listed in a Note in the criteria section). **Rheumatoid Arthritis:** Examples of biologics were moved to be included in the Appendix (previously listed in a Note in the criteria section). **Ulcerative Colitis:** Examples of biologics were moved to be included in the Appendix (previously listed in a Note in the criteria section). **Graft Versus Host Disease (GVHD):** To align with updated NCCN guidelines and other policies, criteria were changed to require at least one conventional systemic treatment prior to an infliximab product. Previously, criteria required that the patient had tried at least one other immunosuprressant or be concurrently receiving an immunosuppressant in combination with an infliximab product. **Juvenile Idiopathic Arthritis:** Examples of biologics were moved to be included in the Appendix (previously listed in a Note in the criteria section).	09/23/2020

APPENDIX

Biologic	Mechanism of Action	Examples of Inflammatory Indications for Products*
Biologics		
Adalimumab SC Products (Humira®, biosimilars)	Inhibition of TNF	AS, CD, JIA, PsO, PsA, RA, UC
Cimzia® (certolizumab pegol SC injection)	Inhibition of TNF	AS, CD, nr-axSpA, PsO, PsA, RA
Etanercept SC Products (Enbrel®, biosimilars)	Inhibition of TNF	AS, JIA, PsO, PsA
Infliximab IV Products (Remicade®, biosimilars)	Inhibition of TNF	AS, CD, PsO, PsA, RA, UC
Simponi®, Simponi® Aria™ (golimumab SC injection, golimumab IV infusion)	Inhibition of TNF	SC formulation: AS, PsA, RA, UC
		IV formulation: AS, PsA, RA
Actemra® (tocilizumab IV infusion, tocilizumab SC injection)	Inhibition of IL-6	SC formulation: PJIA, RA, SJIA
		IV formulation: PJIA, RA, SJIA
Kevzara® (sarilumab SC injection)	Inhibition of IL-6	RA
Orencia® (abatacept IV infusion, abatacept SC injection)	T-cell costimulation modulator	SC formulation: JIA, PSA, RA
		IV formulation: JIA, PsA, RA
Rituximab IV Products (Rituxan®, biosimilars)	CD20-directed cytolytic antibody	RA
Kineret® (anakinra SC injection)	Inhibition of IL-1	JIA^, RA
Stelara® (ustekinumab SC injection, ustekinumab IV infusion)	Inhibition of IL-12/23	SC formulation: CD, PsO, PsA, UC
		IV formulation: CD, UC
Siliq™ (brodalumab SC injection)	Inhibition of IL-17	PsO
Cosentyx™ (secukinumab SC injection)	Inhibition of IL-17A	AS, nr-axSpA, PsO, PsA
Taltz® (ixekizumab SC injection)	Inhibition of IL-17A	AS, nr-axSpA, PsO, PsA
Ilumya™ (tildrakizumab-asmn SC injection)	Inhibition of IL-23	PsO
Skyrizi™ (risankizumab-rzaa SC injection)	Inhibition of IL-23	PsO
Tremfya™ (guselkumab SC injection)	Inhibition of IL-23	PsO
Entyvio™ (vedolizumab IV infusion)	Integrin receptor antagonist	CD, UC
Targeted Synthetic Disease-Modifying Antirheumatic Drugs		
Otezla® (apremilast tablets)	Inhibition of PDE4	PsO, PsA
Olumiant® (baricitinib tablets)	Inhibition of the JAK pathways	RA
Rinvoq® (upadacitinib extended-release tablets)	Inhibition of the JAK pathways	RA
Xeljanz®, Xeljanz XR (tofacitinib tablets, tofacitinib extended-release tablets)	Inhibition of the JAK pathways	RA, PsA, UC

* Not an all-inclusive list of indication (e.g., oncology indications and rare inflammatory conditions are not listed). Refer to the prescribing information for the respective agent for FDA-approved indications; SC – Subcutaneous; TNF – Tumor necrosis factor; AS – Ankylosing spondylitis; CD – Crohn's disease; JIA – Juvenile idiopathic arthritis; PsO – Plaque psoriasis; PsA – Psoriatic arthritis; RA – Rheumatoid arthritis; UC – Ulcerative colitis; nr-axSpA – Non-radiographic axial spondyloarthritis; IV – Intravenous; PJIA – Polyarticular juvenile idiopathic arthritis; SJIA – Systemic juvenile idiopathic arthritis; ^ Off-label use of Kineret in JIA supported in guidelines; JAK – Janus kinase.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Kevzara Prior Authorization Policy

- Kevzara™ (sarilumab for subcutaneous injection – Regeneron)

REVIEW DATE: 07/01/2020

OVERVIEW

Kevzara, an interleukin-6 (IL-6) receptor inhibitor, is indicated for the treatment of rheumatoid arthritis in adults with moderate to severe active disease who have had an inadequate response or intolerance to one or more disease-modifying anti-rheumatic drugs (DMARDs).[1] Kevzara + conventional synthetic (cs)DMARD has demonstrated superior efficacy over placebo + csDMARD as assessed by American College of Rheumatology (ACR) responses, physical function, and radiographic progression.

Guidelines

Guidelines from the American College of Rheumatology (ACR) [2015], last updated prior to the approval of Kevzara, have TNF inhibitors and non-TNF biologics, administered with or without MTX, equally positioned as a recommended therapy following a trial of a conventional synthetic DMARD (e.g., MTX, leflunomide, hydroxychloroquine, sulfasalazine).[2] Guidelines for treatment of inflammatory conditions recommend assessment of response to initial therapy, most often within 3 months of initiating or changing therapy.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Kevzara. Because of the specialized skills required for evaluation and diagnosis of patients treated with Kevzara as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Kevzara to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the approval duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

All reviews for use of Kevzara for COVID-19 and/or cytokine release syndrome associated with COVID-19 will be forwarded to the Medical Director.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Kevzara is recommended in those who meet one of the following criteria:

FDA-Approved Indications

13. Rheumatoid Arthritis. Approve for the duration noted if the patient meets ONE of the following criteria (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets the following criteria (i and ii):

i. Patient has tried ONE conventional synthetic disease-modifying antirheumatic drug (DMARD) for at least 3 months; AND

Note: Examples of conventional synthetic DMARDs include methotrexate (oral or injectable), leflunomide, hydroxychloroquine, and sulfasalazine. An exception to the requirement for a trial of one conventional synthetic DMARD can be made if the patient has already had a 3-month trial of at least one biologic. Refer to Appendix for examples of biologics used for rheumatoid arthritis. These patients who have already tried a biologic are not required to "step back" and try a conventional synthetic DMARD).

ii. Kevzara is prescribed by or in consultation with a rheumatologist.

B) Patient is Currently Receiving Kevzara. Approve for 3 years if the patient has had a response, as determined by the prescriber.

Note: Examples of a response to therapy include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improved laboratory values; reduced dosage of corticosteroids. The patient may not have a full response, but there should have been a recent or past response to Kevzara.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Kevzara is not recommended in the following situations:

4. Ankylosing Spondylitis. In a Phase II study, Kevzara did not demonstrate efficacy in patients with AS.[3]

5. Concurrent use with a Biologic or with a Targeted Synthetic DMARD. Kevzara should not be administered in combination with another biologic or with a targeted synthetic DMARD used for an inflammatory condition (see Appendix for examples). Combination therapy is generally not recommended due to a potential for a higher rate of adverse effects with combinations and lack of evidence for additive efficacy. Note: This does NOT exclude the use of conventional synthetic DMARDs (e.g., MTX, leflunomide, hydroxychloroquine, and sulfasalazine) in combination with Kevzara.

3. COVID-19 (Coronavirus Disease 2019). Forward all requests to the Medical Director.[4-6]
Note: This includes requests for cytokine release syndrome associated with COVID-19.

6. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Kineret Prior Authorization

- Kineret® (anakinra for subcutaneous injection – Biovitrim)

REVIEW DATE: 01/20/2021

OVERVIEW

Kineret, an interleukin-1 (IL-1) receptor antagonist, indicated for the following uses:[1]

- **Cryopyrin-associated periodic syndromes** (CAPS) for treatment of neonatal-onset multisystem inflammatory disease (NOMID).

- **Deficiency of interleukin-1 receptor antagonist** (DIRA).
- **Rheumatoid arthritis**, to reduce the signs and symptoms and slow the progression of structural damage in adult patients with moderately to severely active disease who have failed one or more disease-modifying antirheumatic drugs (DMARDs) given ± DMARDs other than tumor necrosis factor inhibitors (TNFis).

Guidelines

IL-1 blockers are used for treatment of multiple inflammatory conditions:

- **CAPS:** CAPS encompasses three rare genetic syndromes (familial cold autoinflammatory syndrome, Muckle-Wells syndrome, and NOMID or chronic infantile neurological cutaneous and articular syndrome) that are thought to be one condition along a spectrum of disease severity.[2,3] In many cases, patients with CAPS reported an immediate clinical response to Kineret with rash, fever, and arthritis disappearing within a few days and not recurring during follow-up.[4] Dramatic and persistent normalization of inflammatory markers and hematologic tests have also been achieved.
- **DIRA:** Dysregulation of IL-1 signaling is prominent among autoinflammatory conditions such as DIRA. Thus, Kineret has been successfully used and is indicated to treat DIRA. The approval was based on a natural-history study in nine patients (aged 1 month to 9 years at baseline) with genetically confirmed DIRA.[1] Patients were treated with Kineret for up to 10 years. All nine patients achieved remission while on Kineret for DIRA. In some patients, skin and bone manifestations resolved within days and weeks, respectively.
- **Rheumatoid Arthritis:** Current recommendations for the treatment of rheumatoid arthritis from the American College of Rheumatology (ACR) [2015] do not make a recommendation for the use of Kineret.[5] The recommendations also note that Kineret is used infrequently for rheumatoid arthritis and that TNFis and other non-TNFi biologics (i.e., rituximab, Actemra (tocilizumab intravenous infusion, tocilizumab subcutaneous injection], and Orencia [abatacept intravenous infusion, abatacept subcutaneous injection]) are appropriate initial biologic therapy for most patients with rheumatoid arthritis.
- **Systemic Juvenile Idiopathic Arthritis (SJIA):** The 2013 update of the 2011 ACR recommendations for the treatment of SJIA advise Kineret as appropriate initial therapy in SJIA for patients with active systemic features and varying degrees of synovitis. Kineret is also considered an appropriate second- and third-line agent for all patients with SJIA (in patients with and without active systemic features). Macrophage activation syndrome is a severe and potentially lethal complication associated with SJIA.[7] Case-series have shown rapid remission of macrophage activation syndrome as well as treatment of the underlying condition with the use of Kineret.
- **Still's Disease:** Still's disease presents in adults with features similar to those of SJIA.[8] As in SJIA, Kineret has been effective in reducing fever, symptoms, and markers of inflammation in patients with adult-onset Still's disease who were refractory to conventional treatment with a corticosteroid, nonsteroidal anti-inflammatory drug (NSAID), and/or conventional synthetic DMARDs such as methotrexate.[9-14]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Kineret. Because of the specialized skills required for evaluation and diagnosis of patients treated with Kineret as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Kineret to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

All reviews for use of Kineret for COVID-19 and/or cytokine release syndrome associated with COVID-19 will be forwarded to the Medical Director.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Kineret is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Cryopyrin-Associated Periodic Syndromes.** Approve for the duration noted if the patient meets ONE of the following (A or B):
   - **A)** Initial Therapy. Approve for 3 months if the patient meets BOTH of the following criteria (i and ii):
     - **i.** The medication is being used for treatment of neonatal onset multisystem inflammatory disease (NOMID), familial cold autoinflammatory syndrome (FCAS), Muckle-Wells Syndrome (MWS), and/or chronic infantile neurological cutaneous and articular (CINCA) syndrome; AND
     - **ii.** The medication is prescribed by or in consultation with a rheumatologist, geneticist, or a dermatologist.
   - **B)** Patient is Currently Receiving Kineret. Approve for 3 years if the patient has had a response, as determined by the prescriber.
     Note: Patient may not have a full response, but there should have been a recent or past response to Kineret.

2. **Deficiency of Interleukin-1 Receptor Antagonist**. Approve for the duration noted if the patient meets one of the following (A or B):
   - **A)** Initial Therapy. Approve for 3 months if the patient meets BOTH of the following (i and ii):
     - **i.** Genetic testing has confirmed a mutation in the *IL1RN* gene; AND
     - **ii.** The medication is prescribed by or in consultation with a rheumatologist, geneticist, dermatologist, or a physician specializing in the treatment of autoinflammatory disorders.
   - **B)** Patient is Currently Receiving Kineret. Approve for 3 years if the patient had a response, as determined by the prescriber.
     Note: Examples of a response include normalized acute phase reactants; resolution of fever, skin rash, and bone pain; and reduced dosage of corticosteroids.

3. **Rheumatoid Arthritis**. Approve for the duration noted if the patient meets ONE of the following (A or B):
   - **A)** Initial Therapy. Approve for 3 months if the patient meets BOTH of the following criteria (i and ii):
     - **i.** Patient has had a 3-month trial of a biologic OR targeted synthetic disease-modifying antirheumatic drug (DMARD) for this condition, unless intolerant; AND
       Note: Refer to Appendix for examples of biologics and targeted synthetic DMARDs used for rheumatoid arthritis. Conventional synthetic DMARDs such as methotrexate, leflunomide, hydroxychloroquine, and sulfasalazine do not count.
     - **ii.** The medicaion is prescribed by or in consultation with a rheumatologist.

B) Patient is Currently Receiving Kineret. Approve for 3 years if the patient has had a response, as determined by the prescriber.

Note: Examples of response include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improved laboratory values; reduced dosage of corticosteroids. The patient may not have a full response, but there should have been a recent or past response to Kineret.

Other Uses with Supportive Evidence

4. Systemic Juvenile Idiopathic Arthritis (SJIA). Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets BOTH of the following criteria (i and ii):

i. Patient meets ONE of the following conditions (a, b, or c):

a) Patient has tried one other systemic agent for this condition; OR

Note: Examples of one other systemic agent include a corticosteroid (oral, intravenous); a conventional synthetic disease-modifying antirheumatic drug (DMARD; e.g., methotrexate, leflunomide, sulfasalazine); or a 1-month trial of a nonsteroidal anti-inflammatory drug (NSAID). A previous trial of a biologic (e.g, Actemra [tocilizumab intravenous injection, tocilizumab subcutaneous injection), a tumor necrosis factor inhibitor (e.g., an etanercept product [Enbrel, biosimilars], an adalimumab product [Humira, biosimilars], or an infliximab product [Remicade, biosimilars), or Ilaris (canakinumab subcutaneous injection) also counts towards a trial of one other systemic agent for SJIA.

b) Patient has at least moderate to severe active systemic features of this condition OR the patient has active systemic features with an active joint count of one joint or greater, according to the prescriber; OR

Note: Examples of moderate to severe active systemic features include fever, rash, lymphadenopathy, hepatomegaly, splenomegaly, and serositis.

c) Patient has active systemic features with concerns of progression to macrophage activation syndrome (MAS), as determined by the prescriber; AND

ii. The medication is prescribed by or in consultation with a rheumatologist.

B) Patient is Currently Receiving Kineret. Approve for 3 years if the patient has responded, as determined by the prescriber.

Note: Examples of response include improvement in limitation of motion; less joint pain or tenderness; decreased duration of morning stiffness or fatigue; improved function or activities of daily living; reduced dosage of corticosteroids. The patient may not have a full response, but there should have been a recent or past response to Kineret.

5. Still's Disease. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets BOTH of the following criteria (i and ii):

i. Patient meets ONE of the following conditions (a, b, or c):

a) Patient meets ALL of the following criteria (1 and 2):

(1) Patient has tried one corticosteroid; AND

(2) Patient has had an inadequate response to one conventional synthetic disease-modifying antirheumatic drug (DMARD) such as methotrexate given for at least 2 months or was intolerant to a conventional synthetic DMARD; OR

Note: A previous trial of a biologic (e.g., Actemra [tocilizumab intravenous injection, tocilizumab subcutaneous injection], Arcalyst [rilonacept subcutaneous injection], Ilaris [canakinumab subcutaneous injection]) also counts towards a trial of one other systemic agent for Still's disease.

b) Patient has at least moderate to severe active systemic features of this condition, according to the prescriber; OR
Note: Examples of moderate to severe active systemic features include fever, rash, lymphadenopathy, hepatomegaly, splenomegaly, and serositis.

c) Patient has active systemic features with concerns of progression to macrophage activation syndrome, as determined by the prescriber; AND

ii. The medication is prescribed by or in consultation with a rheumatologist; OR

B) Patient is Currently Receiving Kineret. Approve for 1 year if the patient has responded, as determined by the prescriber.
Note: Examples of response include improvement in limitation of motion; less joint pain or tenderness; decreased duration of morning stiffness or fatigue; improved function or activities of daily living; reduced dosage of corticosteroids. The patient may not have a full response, but there should have been a recent or past response to Kineret.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Kineret is not recommended in the following situations:

1. **Ankylosing Spondylitis.** Kineret has been beneficial in a few patients with ankylosing spondylitis, but results are not consistent.[15,16] In a small open-label study, patients with active ankylosing spondylitis who were refractory to NSAIDs (n = 20) received Kineret 100 mg daily.[16] The Bath Ankylosing Spondylitis Disease Activity Index (BASDAI) score decreased over a 6-month period but was not significant (5.8 at baseline vs. 5.0 at Week 12, and 4.8 at Week 24). No significant change was found in Bath Ankylosing Spondylitis Functional Index (BASFI), patients' and physicians' global assessment or general pain during the study. After 12 weeks, both the assessment in ankylosing spondylitis (ASAS) 20 and 40 responses improved in 10.5% of patients (intent-to-treat analysis). After 24 weeks, ASAS 20 was attained in 26% of patients, ASAS 40 in 21% of patients, and ASAS 70 in 10.5% of patients. Guidelines for axial spondyloarthritis from the Assessment of SpondyloArthritis International Society (ASAS)/European Union Against Rheumatism (EULAR) [2016] do not mention Kineret as a treatment option.[17]

2. **Concurrent Use with a Biologic or with a Targeted Synthetic Disease-Modifying Antirheumatic Drug (DMARD).** Data are lacking evaluating concomitant use of Kineret in combination with another biologic or with a targeted synthetic DMARD used for an inflammatory condition (See Appendix for examples). Combination therapy with biologics and/or biologics + targeted synthetic DMRADs has a potential for a higher rate of adverse effects and lack controlled trial data in support of additive efficacy.[18]
Note: This does NOT exclude the use of conventional synthetic DMARDs (e.g., MTX, leflunomide, hydroxychloroquine, and sulfasalazine) in combination with Kineret.

4. **COVID-19 (Coronavirus Disease 2019).** Forward all requests to the Medical Director.
Note: This includes requests for cytokine release syndrome associated with COVID-19.

3. **Lupus Arthritis.** The effectiveness and safety of Kineret were evaluated in an open 3-month pilot trial in patients (n = 4) with systemic lupus erythematosis (SLE) and severe, therapy-refractory non-erosive polyarthritis (three patients had deforming Jaccoud's arthropathy) and no other uncontrolled major organ involvement.[19] Patients were refractory to NSAIDs, antimalarials, corticosteroids, methotrexate,

cyclophosphamide, and azathioprine. SLE was controlled with stable doses of corticosteroids and/or antirheumatic or immunosuppressive agents; pain was managed with NSAIDs and/or other medications. Patients had improved clinically after 4 weeks on Kineret, but after 12 weeks the clinical activity parameters tended to increase again. The results from this study are preliminary and a larger controlled study is needed.

4. **Osteoarthritis.** In a Phase II study in patients with painful osteoarthritis of the knee, Kineret 150 mg administered by intraarticular injection was well tolerated.[20] The study was not designed to assess the analgesic efficacy of Kineret. Patients with osteoarthritis of the knee were enrolled in a multicenter, double-blind, placebo-controlled study and randomized to Kineret 50 mg, Kineret 150 mg, or placebo for intraarticular injection.[21] Although the injections were well tolerated, there were no significant differences in improvement in knee pain, stiffness, function or cartilage turnover between Kineret doses and placebo. Similar to other studies in this population, there was a significant placebo effect noted.

5. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual revision	Rheumatoid arthritis: Truxima was added as an example of a rituximab product. Oluminat was added as an example of a targeted synthetic disease-modifying antirheumatic drug that could have been taken prior to approval of Kineret.	03/27/2019
Annual revision	**Rheumatoid Arthritis:** Examples of biologics and targeted synthetic disease-modifying antirheumatic drugs were moved to a Note in the policy (previously listed as examples within the criteria). Examples of biologics for rheumatoid arthritis were moved to be included in the Appendix (previously listed in a Note in the criteria section). Examples of a response to therapy were moved to a Note in the policy (previously listed as examples within the criteria). **Cryopyrin-Associated Periodic Syndromes:** The explanation that the patient may not have a full response, but there should have been a recent or past response to Kineret was moved to a Note in the policy (previously stated within criteria). **Systemic Juvenile Idiopathic Arthritis (SJIA):** Examples of one other systemic agent tried for SJIA were moved to a Note in the policy (previously listed as examples within the criteria). Examples of moderate to severe active systemic features were moved to a Note in the policy (previously listed as examples within the criteria). For the exception applying to patients with at least moderate to severe active systemic features of this condition OR the patient has active systemic features with an active joint count of one joint or greater, wording was updated to more generally allow this determination by the prescriber (criteria previously specified this was according to the prescribing physician). For the exception applying to patients currently receiving Kineret who have responded, wording was updated to more generally allow this determination by the prescriber (criteria previously specified this was according to the prescribing physician). Examples of a response to therapy were moved to a Note in the policy (previously listed as examples within the criteria). **Still's Disease:** Criteria were changed to approve for 3 months for patients starting therapy (previously was 1 year). A note was added stating that patients who have already tried a biologic are not required to try one csDMARD for Still's disease prior to approval of Kineret. Exceptions were added for patients if, according to the prescriber, have moderate to severe active features OR active systemic features with concerns of progression to macrophage activation syndrome; these patients are not required to try any other therapies prior to Kineret for Still's disease. For patients currently receiving therapy, examples of a response to therapy were added; the requirement that patients be on Kineret for ≥ 90 days was removed. **COVID-19:** This indication (including use in cytokine release syndrome associated with COVID-19) was added to the policy as a Condition Not Recommended for Coverage. All reviews are directed to the Medical Director.	04/01/2020
Early Annual Revision	**Deficiency of Interleukin-1 Receptor Antagonist:** Criteira for this newly approved condition were added to the policy. For an initial 3-month approval, genetic testing must have confirmed a mutation in the *IL1RN* gene. Additionally, Kineret must be prescribed by or in consultation with a specialist. For a patient currently taking Kineret, a 3-year approval is authorized in the patient has responded to therapy. **Conditions Not Recommended for Coverage:** Under **Osteoarthritis** the qualifier "symptomatic" was removed from the indication for clarity. All requests for osteoarthritis remain denials.	01/20/2021

		IV formulation: AS, PJIA, PsA, RA
Actemra® (tocilizumab IV infusion, tocilizumab SC injection)	Inhibition of IL-6	SC formulation: PJIA, RA, SJIA
		IV formulation: PJIA, RA, SJIA
Kevzara® (sarilumab SC injection)	Inhibition of IL-6	RA
Orencia® (abatacept IV infusion, abatacept SC injection)	T-cell costimulation modulator	SC formulation: JIA, PSA, RA
		IV formulation: JIA, PsA, RA
Rituximab IV Products (Rituxan®, biosimilars)	CD20-directed cytolytic antibody	RA
Kineret® (anakinra SC injection)	Inhibition of IL-1	JIA^, RA
Stelara® (ustekinumab SC injection, ustekinumab IV infusion)	Inhibition of IL-12/23	SC formulation: CD, PsO, PsA, UC
		IV formulation: CD, UC
Siliq™ (brodalumab SC injection)	Inhibition of IL-17	PsO
Cosentyx™ (secukinumab SC injection)	Inhibition of IL-17A	AS, nr-axSpA, PsO, PsA
Taltz® (ixekizumab SC injection)	Inhibition of IL-17A	AS, nr-axSpA, PsO, PsA
Ilumya™ (tildrakizumab-asmn SC injection)	Inhibition of IL-23	PsO
Skyrizi™ (risankizumab-rzza SC injection)	Inhibition of IL-23	PsO
Tremfya™ (guselkumab SC injection)	Inhibition of IL-23	PsO
Entyvio™ (vedolizumab IV infusion)	Integrin receptor antagonist	CD, UC
Targeted Synthetic DMARDs		
Otezla® (apremilast tablets)	Inhibition of PDE4	PsO, PsA
Olumiant® (baricitinib tablets)	Inhibition of JAK pathways	RA
Rinvoq® (upadacitinib extended-release tablets)	Inhibition of JAK pathways	RA
Xeljanz® (tofacitinib tablets)	Inhibition of JAK pathways	RA, PJIA, PsA, UC
Xeljanz® XR (tofacitinib extended-release tablets)	Inhibition of JAK pathways	RA, PsA, UC

* Not an all-inclusive list of indication (e.g., oncology indications and rare inflammatory conditions are not listed). Refer to the prescribing information for the respective agent for FDA-approved indications; SC – Subcutaneous; TNF – Tumor necrosis factor; IV – Intravenous, IL – Interleukin; PDE4 – Phosphodiesterase 4; JAK – Janus kinase; AS – Ankylosing spondylitis; CD – Crohn's disease; JIA – Juvenile idiopathic arthritis; PsO – Plaque psoriasis; PsA – Psoriatic arthritis; RA – Rheumatoid arthritis; UC – Ulcerative colitis; nr-axSpA – Non-radiographic axial spondyloarthritis; ^ Off-label use of Kineret in JIA supported in guidelines; DMARDs – Disease-modifying antirheumatic drug.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Olumiant Prior Authorization Policy

- Olumiant (baricitinib tablets – Lilly)

REVIEW DATE: 07/01/2020

OVERVIEW

Olumiant, an inhibitor of the Janus kinases (JAK) pathways, is indicated for the treatment of rheumatoid arthritis in adults with moderate to severe active disease who have had an inadequate response to one or more tumor necrosis factor inhibitors.[1] It is a targeted synthetic disease-modifying antirheumatic drugs (DMARD) that may be used either as monotherapy or in combination with MTX or other conventional synthetic DMARDs. Olumiant is not recommended for use in combination with other JAK inhibitors, or in combination with biologics or potent immunosuppressants such as azathioprine or cyclosporine.

Guidelines

Guidelines from the American College of Rheumatology (2015), updated prior to the approval of Olumiant, have tumor necrosis factor (TNF) inhibitors and non-TNF biologics, administered with or without MTX, equally positioned as a recommended therapy following a trial of a conventional synthetic DMARD (e.g.,

MTX, leflunomide, hydroxychloroquine, sulfasalazine).[4] Although Olumiant is not yet addressed, another JAK inhibitor (Xeljanz/Xeljanz XR [tofacitinib tablets, tofacitinib extended release tablets]) is not recommended for early RA; in established RA, Xeljanz/XR is most frequently recommended for patients with moderate or high disease activity despite use of multiple biologics. Guidelines for treatment of inflammatory conditions recommend assessment of response to initial therapy, most often within 3 months of initiating or changing therapy.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Olumiant. Because of the specialized skills required for evaluation and diagnosis of patients treated with Olumiant as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Olumiant to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

All reviews for use of Oluminat for COVID-19 and/or cytokine release syndrome associated with COVID-19 will be forwarded to the Medical Director.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Olumiant is recommended in those who meet the following criteria:

FDA-Approved Indications

19. Rheumatoid Arthritis. Approve for the duration noted if the patient meets ONE of the following criteria (A or B):

A) Initial Therapy. Approve for three months if the patient meets BOTH of the following (i and ii):

i. Patient has had a 3-month trial of at least ONE tumor necrosis factor inhibitor (TNFi) for this condition, unless intolerant; AND
Note: Refer to Appendix for examples of tumor necrosis factor inhibitors used for rheumatoid arthritis. Conventional synthetic DMARDs such as methotrexate (MTX), leflunomide, hydroxychloroquine, and sulfasalazine do not count.

ii. Olumiant is prescribed by or in consultation with a rheumatologist.

B) Patients Currently Receiving Olumiant. Approve for 3 years if the patient has had a response as determined by the prescriber.
Note: Examples of a response to therapy include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improved laboratory values; reduced dosage of corticosteroids. The patient may not have a full response, but there should have been a recent or past response to Olumiant.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Olumiant is not recommended in the following situations:

80. Concurrent Use with a Biologic or with a Targeted Synthetic DMARD. Olumiant should not be administered in combination with another biologic or with a targeted synthetic DMARD used for an inflammatory condition (see Appendix for examples).[1] Combination therapy is generally not recommended due to a potential for a higher rate of adverse effects with combinations and lack of evidence for additive efficacy.

81. Concurrent use with Other Potent Immunosuppressants (e.g., azathioprine, cyclosporine).[1] Coadministration with other potent immunosuppressive drugs has the risk of added immunosuppression and has not been evaluated in RA. Note: This does NOT exclude use of Olumiant with MTX; Olumiant has been evaluated with background MTX or combinations of conventional synthetic DMARDs containing MTX.

82. COVID-19 (Coronavirus Disease 2019). Forward all requests to the Medical Director.
Note: This includes requests for cytokine release syndrome associated with COVID-19.

83. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Orencia Intravenous Prior Authorization Policy
- Orencia® (abatacept for intravenous infusion)

REVIEW DATE: 06/17/2020

OVERVIEW

Orencia intravenous, a selective T-cell costimulation modulator, is indicated for the following uses:

- **Rheumatoid arthritis**, for reducing signs and symptoms, inducing major clinical response, inhibiting the progression of structural damage, and improving physical function in adult patients with moderately to severely disease. In RA, Orencia intravenous may be used as monotherapy or concomitantly with disease-modifying antirheumatic drugs (DMARDs) other than tumor necrosis factor inhibitors (TNFis).
- **Juvenile idiopathic arthritis**, for reducing signs and symptoms in pediatric patients ≥ 2 years of age with moderately to severely active polyarticular disease. In juvenile idiopathic arthritis, Orencia intravenous may be used alone or in combination with methotrexate (MTX).
- **Psoriatic arthritis**, in adults with active disease.

Orencia should not be administered concomitantly with TNFis and is not recommended for use concomitantly with other biologics for rheumatoid arthritis. Orencia is available as an intravenous infusion that is dosed on body weight. There is also a subcutaneous injection available in prefilled syringes (50 mg, 87.5 mg, and 125 mg per syringe) to allow for use in adults and weight-based dosing in pediatric patients. Some patients initiating therapy with Orencia subcutaneous will receive a single loading dose with Orencia intravenous.

Guidelines

Orencia is addressed in guidelines for treatment of various inflammatory conditions.

- **Rheumatoid Arthritis:** Guidelines from the American College of Rheumatology (ACR) [2015] have TNFis and non-TNF biologics such as Orencia, administered with or without methotrexate, equally positioned as a recommended therapy following a trial of a conventional synthetic DMARD (e.g., methotrexate, leflunomide, hydroxychloroquine, sulfasalazine).[2]
- **Juvenile Idiopathic Arthritis:** Guidelines (2019) list biologics among the treatment options for subsequent therapy in patients with polyarthritis.[3] Initial therapy with a biologic may be considered for patients with risk factors and involvement of high-risk joints (e.g., cervical spine, wrist, or hip), high disease activity, and/or those judged to be at high risk of disabling joint damage. In patients with active sacroiliitis or enthesitis despite nonsteroidal anti-inflammatory drug, a TNFi is recommended.
- **Psoriatic Arthritis:** Guidelines from ACR (2018) recommend TNFis over other biologics for use in treatment-naïve patients with PsA and in those who were previously treated with an oral therapy.[4] However, Orencia may be considered over other biologics in patients with recurrent or serious infections.

Safety

Orencia intravenous has Warnings concerning risks of serious infection.[1] Prior to initiating therapy with Orencia, patients should be evaluated for active tuberculosis infection. If a serious infection develops, treatment with Orencia should be discontinued.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Orencia intravenous. Because of the specialized skills required for evaluation and diagnosis of patients treated with Orencia as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Orencia intravenous to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

FDA-Approved Indications

2. **Rheumatoid Arthritis.** Approve for the duration noted if the patient meets ONE of the following (A or B):
   - **a)** Initial Therapy. Approve for 3 months if the patient meets the following criteria (i and ii):
     - i. Patient has tried ONE conventional synthetic disease-modifying antirheumatic drug (DMARD) for at least 3 months; AND
       Note: Examples of conventional synthetic DMARDs include methotrexate (oral or injectable), leflunomide, hydroxychloroquine, and sulfasalazine. An exception to the requirement for a trial of one conventional synthetic DMARD can be made if the patient has already has a 3-month trial at least one biologic. Refer to Appendix for examples of biologics used for rheumatoid arthritis. These patients who have already tried a biologic are not required to "step back" and try a conventional synthetic DMARD.
     - ii. The agent is prescribed by or in consultation with a rheumatologist.
   - **b)** Patient is Currently Receiving Orencia (Intravenous or Subcutaneous). Approve for 1 year if the patient has had a response, as determined by the prescriber.
     Note: Examples of a response include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improved laboratory values; reduced dosage of corticosteroids. The patient may not have a full response, but there should have been a recent or past response to Orencia.

3. **Juvenile Idiopathic Arthritis (JIA) [or Juvenile Rheumatoid Arthritis] (regardless of type of onset).** Approve for the duration noted if the patient meets ONE of the following (A or B):
   - **a)** Initial Therapy. Approve for 3 months if the patient meets BOTH of the following criteria (i and ii):
     - i. Patient meets one of the following conditions (a, b, c, or d):
       - **a)** Patient has tried one other agent for this condition; OR
         Note: Examples of therapies which could have been tried include methotrexate, sulfasalazine, or leflunomide, and a nonsteroidal anti-inflammatory drug (NSAID). A biologic also counts as a trial of one agent for JIA. Refer to Appendix for examples of biologics used for JIA.

b) Patient will be starting on therapy concurrently with methotrexate, sulfasalazine, or leflunomide; OR

c) Patient has an absolute contraindication to methotrexate, sulfasalazine, or leflunomide; OR
Note: Examples of absolute contraindications to methotrexate include pregnancy, breast feeding, alcoholic liver disease, immunodeficiency syndrome, blood dyscrasias.

d) Patient has aggressive disease, as determined by the prescriber; AND

ii. The agent is prescribed by or in consultation with a rheumatologist.

b) Patient is Currently Receiving Orencia (Intravenous or Subcutaneous). Approve for 1 year if the patient has had a response, as determined by the prescriber.
Note: Examples of a response include improvement in limitation of motion; less joint pain or tenderness; improved function or activities of daily living; decreased duration of morning stiffness or fatigue; reduced dosage of corticosteroids; decreased soft tissue swelling in joints or tendon sheaths; improved laboratory values. The patient may not have a full response, but there should have been a recent or past response to Orencia.

4. Psoriatic Arthritis. Approve for the duration noted if the patient meets ONE of the following (A or B):

a) Initial Therapy. Approve for 3 months if prescribed by or in consultation with a rheumatologist or a dermatologist.

b) Patient is Currently Receiving Orencia (Intravenous or Subcutaneous). Approve for 1 year if the patient has responded, as determined by the prescriber.
Note: Examples of a response include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improvements in acute phase reactants (for example, C-reactive protein). The patient may not have a full response, but there should have been a recent or past response to Orencia.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Orencia intravenous is not recommended in the following situations:

84. Ankylosing Spondylitis (AS). In an open-label Phase II trial, Orencia was administered by IV infusion on Days 1, 15, 29, and every 28 days thereafter to patients with active AS.[5] Patients received a fixed dosage of Orencia of approximately 10 mg/kg based on body weight. The primary endpoint was a 40% improvement in disease activity at Week 24 in the Assessment of SpondyloArthritis international Society criteria (ASAS 40). At Week 24, the ASAS 40 was 13.3% (n = 2/15) in TNF blocker-naïve patients compared with no responses in patients who had previously failed TNF blockers (n = 15). ASAS 20 response was 26.7% (n = 4/15) in TNF blocker-naïve patients compared with 20% (n = 3/15) in those who had previously failed TNF blockers. A major response was not shown with treatment to Orencia.

85. Concurrent Use with a Biologic or with a Targeted Synthetic DMARD. Orencia IV should not be administered in combination with another biologic or with a targeted synthetic DMARD used for an inflammatory condition (see Appendix for examples). Combination therapy is generally not recommended due to a higher rate of AEs with combinations and lack of data supportive of additional efficacy.[6-7] Note: This does NOT exclude the use of conventional synthetic DMARDs (e.g., MTX, leflunomide, hydroxychloroquine, and sulfasalazine) in combination with Orencia IV.

86. Inflammatory Bowel Disease (i.e., Crohn's Disease [CD], Ulcerative Colitis [UC]). In placebo-controlled trials evaluating the efficacy of Orencia IV for induction and maintenance in adults with active, moderate to severe CD (n = 451) and UC (n = 490), Orencia was no more effective than placebo.[8] Patients were randomized to Orencia 30, 10, or 3 mg/kg IV (according to body weight) or placebo and dosed at Weeks 0, 2, 4, and 8. A total of 90 patients with CD and 131 patients with UC who responded to Orencia IV induction were then randomized to Orencia 10 mg/kg IV or placebo every 4 weeks through Week 52. When used for induction of CD, 17.2%, 10.2%, and 15.5% of patients receiving Orencia 30 mg, 10 mg, and 3 mg/kg IV achieved a clinical response at Weeks 8 and 12 compared with 14.4% of patients receiving placebo (P = not significant [NS] for all comparisons). In patients with CD, response and remission at Week 52 was not significantly different between the Orencia IV and placebo treatment groups. When used as induction therapy in UC, 21.4%, 19.0%, and 20.3% of patients receiving Orencia 30 mg, 10 mg, and 3 mg/kg IV achieved a clinical response at Week 12 compared with 29.5% of patients receiving placebo (P = 0.043 for 10 mg/kg vs. placebo; other comparisons NS). At Week 52, 12.5% (n = 8/64) and 14.1% (n = 9/64) of patients with UC were in remission (P = NS) and 17.2% of patients in each treatment group (n = 11/64 for each group) had achieved a response.

87. Psoriasis. (Note: Patients with concomitant plaque psoriasis and psoriatic arthritis may be reviewed under the psoriatic arthritis criteria above.) In a multicenter, Phase I, 26-week, open-label dose-escalation study, 43 patients with stable plaque psoriasis (10% to 49% body surface area involvement) received four doses of Orencia given as a 1-hour IV infusion on Days 1, 3, 16 and 29.[9] The starting dose was 0.5 mg/kg. Four to six patients were accrued to each of eight dose levels: 0.5, 1, 2, 4, 8, 16, 25 and 50 mg/kg. A parallel control group was matched for age and overall disease severity. In all, 46% of patients on Orencia for IV infusion achieved a 50% or greater sustained improvement in clinical disease activity (Physician's Global Assessment of disease activity) compared with baseline psoriasis evaluation. Progressively greater effects were observed with the highest doses. Further studies are needed to establish safety and efficacy in plaque psoriasis.

88. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date

Annual revision	Throughout the policy, references to Humira, Enbrel, and Rituxan were reworded as adalimumab, etanercept, and rituximab products, respectively, with the innovator names listed as examples of these products. Renflexis and Erelzi were also added as respective examples of infliximab and etanercept products.	05/09/2018
Annual revision	**Rheumatoid Arthritis:** Truxima was added as an example of a rituximab product. To align with the Medical Policy, the duration of approval for patients currently taking Orencia IV or SC was changed to 1 year (previously was 3 years). **Juvenile Idiopathic Arthritis:** Actemra SC was added as an example of an agent which may have been previously tried. To align with the Medical Policy, the duration of approval for patients currently taking Orencia IV or SC was changed to 1 year (previously was 3 years). **Psoriatic Arthritis:** To align with the Medical Policy, the duration of approval for patients currently taking Orencia IV or SC was changed to 1 year (previously was 3 years).	06/05/2019
Annual revision	**Rheumatoid Arthritis:** Examples of conventional synthetic disease-modifying antirheumatic drugs were moved to a Note (previously listed as examples within the criteria). Examples of biologics for Rheumatoid Arthritis were moved to be included in the Appendix (previously listed in a Note in the criteria section). Examples of a response to therapy were moved to a Note (previously listed as examples within the criteria). **Juvenile Idiopathic Arthritis:** Examples of therapies that could have been tried prior to Orencia were moved to a Note (previously listed as examples within the criteria). Examples of biologics were moved to be included in the Appendix (previously listed in a Note in the criteria section). Examples of a response to therapy were moved to a Note (previously listed as examples within the criteria). For the exception applying to patients with aggressive disease, wording was updated to more generally allow this determination by the prescriber (criteria previously specified this was according to the prescribing physician). **Psoriatic Arthritis:** Examples of a response to therapy were moved to a Note (previously listed as examples within the criteria).	06/17/2020

APPENDIX

Products	Mechanism of Action	Examples of Inflammatory Indications for Products*
Biologics		
Adalimumab SC Products (Humira®, biosimilars)	Inhibition of TNF	AS, CD, PJIA, PsO, PsA, RA, SJIA, UC
Cimzia® (certolizumab pegol SC injection)	Inhibition of TNF	AS, CD, nr-axSpA, PsO, PsA, RA
Etanercept SC Products (Enbrel®, biosimilars)	Inhibition of TNF	AS, PJIA, PsO, PsA, RA, SJIA
Infliximab IV Products (Remicade®, biosimilars)	Inhibition of TNF	AS, CD, PJIA, PsO, PsA, RA, SJIA, UC
Simponi®, Simponi® Aria™ (golimumab SC injection, golimumab IV infusion)	Inhibition of TNF	SC formulation: AS, PsA, RA, UC
		IV formulation: AS, PsA, RA
Actemra® (tocilizumab IV infusion, tocilizumab SC injection)	Inhibition of IL-6	SC formulation: PJIA, RA, SJIA
		IV formulation: PJIA, RA, SJIA
Kevzara® (sarilumab SC injection)	Inhibition of IL-6	RA
Orencia® (abatacept IV infusion, abatacept SC injection)	T-cell costimulation modulator	SC formulation: PJIA, PSA, RA
		IV formulation: PJIA, PsA, RA
Rituximab IV Products (Rituxan®, biosimilars)	CD20-directed cytolytic antibody	RA
Ilaris (canakinumab SC injection**)**	Inhibition of IL-1β	SJIA
Kineret® (anakinra SC injection)	Inhibition of IL-1	RA, SJIA^
Stelara® (ustekinumab SC injection, ustekinumab IV infusion)	Inhibition of IL-12/23	SC formulation: CD, PsO, PsA, UC
		IV formulation: CD, UC
Siliq™ (brodalumab SC injection)	Inhibition of IL-17	PsO
Cosentyx™ (secukinumab SC injection)	Inhibition of IL-17A	AS, PsO, PsA
Taltz® (ixekizumab SC injection)	Inhibition of IL-17A	AS, nr-axSpa, PsO, PsA
Ilumya™ (tildrakizumab-asmn SC injection)	Inhibition of IL-23	PsO
Skyrizi™ (risankizumab-rzza SC injection)	Inhibition of IL-23	PsO
Tremfya™ (guselkumab SC injection)	Inhibition of IL-23	PsO
Entyvio™ (vedolizumab IV infusion)	Integrin receptor antagonist	CD, UC
Targeted Synthetic DMARDs		
Otezla® (apremilast tablets)	Inhibition of PDE4	PsO, PsA

Olumiant® (baricitinib tablets)	Inhibition of the JAK pathways	RA
Rinvoq® (upadacitinib extended-release tablets)	Inhibition of the JAK pathways	RA
Xeljanz®, Xeljanz XR (tofacitinib tablets, tofacitinib extended-release tablets)	Inhibition of the JAK pathways	RA, PsA, UC

* Not an all-inclusive list of indication (e.g., oncology indications and rare inflammatory conditions are not listed). Refer to the prescribing information for the respective agent for FDA-approved indications; SC – Subcutaneous; TNF – Tumor necrosis factor; IV – Intravenous, IL – Interleukin; PDE4 – Phosphodiesterase 4; JAK – Janus kinase; AS – Ankylosing spondylitis; CD – Crohn's disease; PJIA – Polyarticular juvenile idiopathic arthritis; PsO – Plaque psoriasis; PsA – Psoriatic arthritis; RA – Rheumatoid arthritis; SJIA – Systemic juvenile idiopathic arthritis; UC – Ulcerative colitis; nr-axSpA – Non-radiographic axial spondyloarthritis; ^ Off-label use of SJIA supported in guidelines.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Orencia Subcutaneous Prior Authorization Policy
- Orencia® (abatacept subcutaneous injection – Bristol Myers Squibb)

REVIEW DATE: 06/17/2020

OVERVIEW

Orencia subcutaneous, a selective T-cell costimulation modulator, is indicated for the following uses:

- **Rheumatoid arthritis**, for reducing signs and symptoms, inducing major clinical response, inhibiting the progression of structural damage, and improving physical function in adult patients with moderately to severely disease. In RA, Orencia intravenous may be used as monotherapy or concomitantly with disease-modifying antirheumatic drugs (DMARDs) other than tumor necrosis factor inhibitors (TNFis).
- **Juvenile idiopathic arthritis**, for reducing signs and symptoms in pediatric patients ≥ 2 years of age with moderately to severely active polyarticular disease. In juvenile idiopathic arthritis, Orencia intravenous may be used alone or in combination with methotrexate (MTX).
- **Psoriatic arthritis**, in adults with active disease.

Orencia should not be administered concomitantly with TNFis and is not recommended for use concomitantly with other biologics for rheumatoid arthritis. The subcutaneous injection is available in prefilled syringes containing three different doses (50 mg, 87.5 mg, and 125 mg per syringe) to allow for weight-based dosing in adults and pediatric patients. It is also available as an intravenous infusion that is dosed on body weight.

Guidelines

Orencia is addressed in guidelines for treatment of various inflammatory conditions.

- **Rheumatoid Arthritis:** Guidelines from the American College of Rheumatology (ACR) [2015] have TNFis and non-TNF biologics such as Orencia, administered with or without MTX, equally positioned as a recommended therapy following a trial of a conventional synthetic DMARD (e.g., MTX, leflunomide, hydroxychloroquine, sulfasalazine).[2]
- **Juvenile Idiopathic Arthritis:** Guidelines (ACR, 2019) list biologics among the treatment options for subsequent therapy in patients with polyarthritis.[3] Initial therapy with a biologic may be considered for patients with risk factors and involvement of high-risk joints (e.g., cervical spine, wrist, or hip), high disease activity, and/or those judged to be at high risk of disabling joint damage. In patients with active sacroiliitis or enthesitis despite nonsteroidal anti-inflammatory drug, a TNFi is recommended.

- **Psoriatic Arthritis:** Guidelines from ACR (2018) recommend TNFis over other biologics for use in treatment-naïve patients with psoriatic arthritis and in those who were previously treated with an oral therapy.[4] However, Orencia may be considered over other biologics in patients with recurrent or serious infections.

Safety

Orencia subcutaneous has Warnings concerning risks of serious infection.[1] Prior to initiating therapy with Orencia, patients should be evaluated for active tuberculosis infection. If a serious infection develops, treatment with Orencia should be discontinued.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Orencia subcutaneous injection. Because of the specialized skills required for evaluation and diagnosis of patients treated with Orencia as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Orencia subcutaneous to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

FDA-Approved Indications

1. **Rheumatoid Arthritis.** Approve for the duration noted if the patient meets ONE of the following (A or B):
   - **A)** Initial Therapy. Approve for 3 months if the patient meets BOTH of the following criteria (i and ii):
     - **i.** Patient has tried ONE conventional synthetic disease-modifying antirheumatic drug (DMARD) for at least 3 months; AND
       Note: Examples of conventional synthetic DMARDs include methotrexate (oral or injectable), leflunomide, hydroxychloroquine, and sulfasalazine. An exception to the requirement for a trial of one conventional synthetic DMARD can be made if the patient has already has a 3-month trial at least one biologic. Refer to Appendix for examples of biologics used for rheumatoid arthritis. These patients who have already tried a biologic are not required to "step back" and try a conventional synthetic DMARD).
     - **ii.** The agent is prescribed by or in consultation with a rheumatologist.
   - **B)** Patient is Currently Receiving Orencia (Intravenous or Subcutaneous). Approve for 3 years if the patient has had a response, as determined by the prescriber.
     Note: Examples of a response include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improved laboratory values; reduced dosage of corticosteroids. The patient may not have a full response, but there should have been a recent or past response to Orencia.

2. **Juvenile Idiopathic Arthritis (JIA) [or Juvenile Rheumatoid Arthritis {JRA}] (regardless of type of onset)**. Approve for the duration noted if the patient meets ONE of the following (A or B):
   - **A)** Initial Therapy. Approve Orencia SC for 3 months if the patient meets BOTH of the following criteria (i and ii):
     - **i.** The patient meets one of the following conditions (a, b, c, or d):
       - **m)** Patient has tried one other agent for this condition; OR
         Note: Examples of therapies which could have been tried include methotrexate, sulfasalazine, or leflunomide, and a nonsteroidal anti-inflammatory drug (NSAID). A biologic also counts as a trial of one agent for JIA. Refer to Appendix for examples of biologics used for JIA.
       - **n)** Patient will be starting on therapy concurrently with methotrexate, sulfasalazine, or leflunomide; OR
       - **o)** Patient has an absolute contraindication to methotrexate, sulfasalazine, or leflunomide; OR
         Note: Examples of absolute contraindications to methotrexate include pregnancy, breast feeding, alcoholic liver disease, immunodeficiency syndrome, blood dyscrasias.
       - **p)** Patient has aggressive disease, as determined by the prescriber; AND

ii. The agent is prescribed by or in consultation with a rheumatologist.

B) Patient is Currently Receiving Orencia (Intravenous or Subcutaneous). Approve for 3 years if the patient has had a response, as determined by the prescriber.
Note: Examples of a response include improvement in limitation of motion; less joint pain or tenderness; improved function or activities of daily living; decreased duration of morning stiffness or fatigue; reduced dosage of corticosteroids; decreased soft tissue swelling in joints or tendon sheaths; improved laboratory values. The patient may not have a full response, but there should have been a recent or past response to Orencia.

3. Psoriatic Arthritis. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if prescribed by or in consultation with a rheumatologist or a dermatologist.

B) Patient is Currently Receiving Orencia (Intravenous or Subcutaneous). Approve for 3 years if the patient has responded, as determined by the prescriber.
Note: Examples of a response include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improvements in acute phase reactants (for example, C-reactive protein). The patient may not have a full response, but there should have been a recent or past response to Orencia.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Orencia subcutaneous is not recommended in the following situations:

89. Ankylosing Spondylitis. In an open-label Phase II trial, Orencia was administered by IV infusion on Days 1, 15, 29, and every 28 days thereafter to patients with active AS.[5] Patients received a fixed dosage of Orencia of approximately 10 mg/kg based on body weight. The primary endpoint was a 40% improvement in disease activity at Week 24 in the Assessment of SpondyloArthritis international Society criteria (ASAS 40). At Week 24, the ASAS 40 was 13.3% (n = 2/15) in TNF blocker-naïve patients compared with no responses in patients who had previously failed TNF blockers (n = 15). ASAS 20 response was 26.7% (n = 4/15) in TNF blocker-naïve patients compared with 20% (n = 3/15) in those who had previously failed TNF blockers. A major response was not shown with treatment to Orencia.

90. Concurrent Use with a Biologic or with a Targeted Synthetic DMARD. Orencia SC should not be administered in combination with another biologic or with a targeted synthetic DMARD used for an inflammatory condition (see APPENDIX for examples). Combination therapy is generally not recommended due to a higher rate of AEs with combinations and lack of data supportive of additional efficacy.[6-7] Note: This does NOT exclude the use of conventional synthetic DMARDs (e.g., MTX, leflunomide, hydroxychloroquine, and sulfasalazine) in combination with Orencia (IV or SC).

91. Inflammatory Bowel Disease (i.e., Crohn's Disease [CD], Ulcerative Colitis [UC]). In placebo-controlled trials evaluating the efficacy of Orencia IV for induction and maintenance in adults with active, moderate to severe CD (n = 451) and UC (n = 490), Orencia was no more effective than placebo.[8] Patients were randomized to Orencia 30, 10, or 3 mg/kg IV (according to body weight) or placebo and dosed at Weeks 0, 2, 4, and 8. A total of 90 patients with CD and 131 patients with UC who responded to Orencia IV induction were then randomized to Orencia 10 mg/kg IV or placebo every 4 weeks through Week 52. When used for induction of CD, 17.2%, 10.2%, and 15.5% of patients receiving Orencia 30 mg, 10 mg, and 3 mg/kg IV achieved a clinical response at Weeks 8 and 12 compared with 14.4% of patients receiving placebo (P = not significant [NS] for all comparisons). In patients with CD, response and remission at Week 52 was not significantly different between the Orencia IV and

placebo treatment groups. When used as induction therapy in UC, 21.4%, 19.0%, and 20.3% of patients receiving Orencia 30 mg, 10 mg, and 3 mg/kg IV achieved a clinical response at Week 12 compared with 29.5% of patients receiving placebo (P = 0.043 for 10 mg/kg vs. placebo; other comparisons NS). At Week 52, 12.5% (n = 8/64) and 14.1% (n = 9/64) of patients with UC were in remission (P = NS) and 17.2% of patients in each treatment group (n = 11/64 for each group) had achieved a response.

92. Psoriasis. (Note: Patients with concomitant plaque psoriasis and psoriatic arthritis may be reviewed under the psoriatic arthritis criteria above.) In the pivotal trial evaluating Orencia SC for PsA, there was not a significant difference at Week 24 in PASI 50 response vs. placebo ± csDMARD (27% vs. 20% with placebo ± csDMARD; P = not significant).[10] In a multicenter, Phase I, 26-week, open-label dose-escalation study, 43 patients with stable plaque psoriasis (10% to 49% body surface area involvement) received four doses of Orencia given as a 1-hour IV infusion on Days 1, 3, 16 and 29.[9] The starting dose was 0.5 mg/kg. Four to six patients were accrued to each of eight dose levels: 0.5, 1, 2, 4, 8, 16, 25 and 50 mg/kg. A parallel control group was matched for age and overall disease severity. In all, 46% of patients on Orencia for IV infusion achieved a 50% or greater sustained improvement in clinical disease activity (Physician's Global Assessment of disease activity) compared with baseline psoriasis evaluation. Progressively greater effects were observed with the highest doses. Further studies are needed to establish safety and efficacy in plaque psoriasis.

93. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual revision	Throughout the policy, references to Humira, Enbrel, and Rituxan were reworded as adalimumab, etanercept, and rituximab products, respectively, with the innovator names listed as examples of these products. Renflexis and Erelzi were also added as respective examples of infliximab and etanercept products.	05/09/2018
Annual revision	**Rheumatoid Arthritis:** Truxima was added as an example of a rituximab product. **Juvenile Idiopathic Arthritis:** Actemra SC was added as an example of an agent which may have been previously tried.	06/05/2019
Annual revision	**Rheumatoid Arthritis:** Examples of conventional synthetic disease-modifying antirheumatic drugs were moved to a Note (previously listed as examples within the criteria). Examples of biologics for Rheumatoid Arthritis were moved to be included in the Appendix (previously listed in a Note in the criteria section). Examples of a response to therapy were moved to a Note (previously listed as examples within the criteria). **Juvenile Idiopathic Arthritis:** Examples of therapies that could have been tried prior to Orencia were moved to a Note (previously listed as examples within the criteria). Examples of biologics were moved to be included in the Appendix (previously listed in a Note in the criteria section). Examples of a response to therapy were moved to a Note (previously listed as examples within the criteria). For the exception applying to patients with aggressive disease, wording was updated to more generally allow this determination by the prescriber (criteria previously specified this was according to the prescribing physician). **Psoriatic Arthritis:** Examples of a response to therapy were moved to a Note (previously listed as examples within the criteria).	06/17/2020

APPENDIX

	Mechanism of Action	Examples of Inflammatory Indications for Products*
Biologics		
Adalimumab SC Products (Humira®, biosimilars)	Inhibition of TNF	AS, CD, PJIA, PsO, PsA, RA, SJIA, UC
Cimzia® (certolizumab pegol SC injection)	Inhibition of TNF	AS, CD, nr-axSpA, PsO, PsA, RA
Etanercept SC Products (Enbrel®, biosimilars)	Inhibition of TNF	AS, PJIA, PsO, PsA, RA, SJIA
Infliximab IV Products (Remicade®, biosimilars)	Inhibition of TNF	AS, CD, PJIA, PsO, PsA, RA, SJIA, UC
Simponi®, Simponi® Aria™ (golimumab SC injection, golimumab IV infusion)	Inhibition of TNF	SC formulation: AS, PsA, RA, UC
		IV formulation: AS, PsA, RA
Actemra® (tocilizumab IV infusion, tocilizumab SC injection)	Inhibition of IL-6	SC formulation: PJIA, RA, SJIA
		IV formulation: PJIA, RA, SJIA
Kevzara® (sarilumab SC injection)	Inhibition of IL-6	RA
Orencia® (abatacept IV infusion, abatacept SC injection)	T-cell costimulation modulator	SC formulation: PJIA, PSA, RA
		IV formulation: PJIA, PsA, RA
Rituximab IV Products (Rituxan®, biosimilars)	CD20-directed cytolytic antibody	RA
Ilaris (canakinumab SC injection**)**	Inhibition of IL-1β	SJIA
Kineret® (anakinra SC injection)	Inhibition of IL-1	RA, SJIA^
Stelara® (ustekinumab SC injection, ustekinumab IV infusion)	Inhibition of IL-12/23	SC formulation: CD, PsO, PsA, UC
		IV formulation: CD, UC
Siliq™ (brodalumab SC injection)	Inhibition of IL-17	PsO
Cosentyx™ (secukinumab SC injection)	Inhibition of IL-17A	AS, PsO, PsA
Taltz® (ixekizumab SC injection)	Inhibition of IL-17A	AS, nr-axSpA, PsO, PsA
Ilumya™ (tildrakizumab-asmn SC injection)	Inhibition of IL-23	PsO
Skyrizi™ (risankizumab-rzza SC injection)	Inhibition of IL-23	PsO
Tremfya™ (guselkumab SC injection)	Inhibition of IL-23	PsO
Entyvio™ (vedolizumab IV infusion)	Integrin receptor antagonist	CD, UC
Targeted Synthetic DMARDs		
Otezla® (apremilast tablets)	Inhibition of PDE4	PsO, PsA
Olumiant® (baricitinib tablets)	Inhibition of the JAK pathways	RA
Rinvoq® (upadacitinib extended-release tablets)	Inhibition of the JAK pathways	RA
Xeljanz®, Xeljanz XR (tofacitinib tablets, tofacitinib extended-release tablets)	Inhibition of the JAK pathways	RA, PsA, UC

* Not an all-inclusive list of indication (e.g., oncology indications and rare inflammatory conditions are not listed). Refer to the prescribing information for the respective agent for FDA-approved indications; SC – Subcutaneous; TNF – Tumor necrosis factor; IV – Intravenous, IL – Interleukin; PDE4 – Phosphodiesterase 4; JAK – Janus kinase; AS – Ankylosing spondylitis; CD – Crohn's disease; PJIA – Polyarticular juvenile idiopathic arthritis; PsO – Plaque psoriasis; PsA – Psoriatic arthritis; RA – Rheumatoid arthritis; SJIA – Systemic juvenile idiopathic arthritis; UC – Ulcerative colitis; nr-axSpA – Non-radiographic axial spondyloarthritis; ^ Off-label use of SJIA supported in guidelines.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Otezla® (apremilast tablets – Amgen)

DATE REVIEWED: 04/29/2020

OVERVIEW

Otezla, an oral phosphodiesterase 4 (PDE4) inhibitor, is indicated for the following indications:

1. Psoriatic arthritis (PsA) in adults; and
2. Plaque psoriasis, in moderate to severe disease in patients who are candidates for phototherapy or systemic therapy; and

3. Behcet's disease, in adults with oral ulcers.[1]

Disease Overview

PDE4 regulates immune and inflammatory processes through control of intracellular cAMP levels and downstream protein kinase A pathways. The production of a number of key inflammatory cytokines is affected by PDE4 including interferon (IFN)γ, tumor necrosis factor (TNF)α, interleukin (IL)-12, and IL-23, thus shaping the immune response.[2] Otezla is a targeted synthetic disease-modifying anti-rheumatic drug (DMARD) that specifically targets intracellular PDE4 and, therefore, has an inhibitory effect on multiple cytokines involved in the inflammatory process.[2-3]

Guidelines

Joint guidelines from the American Academy of Dermatology (AAD) and National Psoriasis Medical Board (2020) have been published for management of psoriasis with systemic nonbiologic therapies.[8] These guidelines list Otezla as a monotherapy treatment option for patients with moderate to severe plaque psoriasis. For treatment of moderate to severe psoriasis in adults, Otezla has a similar level of evidence and strength of recommendations as methotrexate. Additionally, data support use of MTX in combination with other systemic therapies for psoriasis,[4,8] whereas there is no strong evidence supporting combination use of Otezla with other systemic therapies or with phototherapy.[4] Guidelines from the American College of Rheumatology (ACR) [2019] recommend TNF inhibitors over other biologics and Otezla for use in treatment-naïve patients with PsA and in those who were previously treated with an oral therapy.[6]

EULAR recommendations for the management of Behcet's disease (2018) mention Otezla as a treatment option for Behcet's disease with mucocutaneous involvement.[7] Other options include topical steroids, colchicine, azathioprine, thalidomide, interferon-alpha, and TNFis. TNFis are also listed among the therapeutic options for patients who present with eye involvement, refractory venous thrombosis, arterial involvement, refractory/severe gastrointestinal involvement, nervous system involvement, and/or joint involvement.

Safety

Warnings/Precautions for Otezla include depression, weight decrease, and drug interactions with strong cytochrome P450 inducers. The most commonly observed adverse events (AEs) [incidence ≥ 5%] were diarrhea, nausea, and headache.[1] Of note, Otezla does not have Warnings regarding serious infection and malignancy, which are listed for the biologic DMARDs approved for PsA, nor does Otezla have warnings for organ toxicity and laboratory monitoring that are noted with methotrexate (MTX) and leflunomide.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Otezla. Because of the specialized skills required for evaluation and diagnosis of patients treated with Otezla as well as the monitoring required for AEs and long-term efficacy, initial approval requires Otezla to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Otezla is recommended in those who meet the following criteria:

FDA-Approved Indications

20. Plaque Psoriasis. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 4 months if the patient meets ALL of the following criteria (i, ii, and iii):

i. The patient is an adult greater than or equal to 18 years of age; AND

ii. The patient meets ONE of the following conditions (a or b):

a) The patient has tried at least one traditional systemic agent for psoriasis for at least 3 months, unless intolerant.
Note: Examples of traditional systemic agents for psoriasis include methotrexate (MTX), cyclosporine, acitretin tablets, or psoralen plus ultraviolet A light (PUVA). An exception to the requirement for a trial of one traditional systemic agent for psoriasis can be made if the patient has already had a 3-month trial or previous intolerance to at least one biologic. Refer to Appendix for examples of biologics used for plaque psoriasis. These patients who have already tried a biologic for psoriasis are not required to "step back" and try a traditional systemic agent for psoriasis); OR

b) The patient has a contraindication to methotrexate (MTX), as determined by the prescriber; AND

iii. Otezla is prescribed by or in consultation with a dermatologist.

B) Patient is Currently Receiving Otezla. Approve for 3 years if the patient meets BOTH of the following conditions (i and ii):

i. The patient has already received at least 4 months of therapy with Otezla.
Note: Patients who have received < 4 months of therapy or those who are restarting therapy with Otezla should be considered under criterion 1A (Plaque Psoriasis, initial therapy); AND

ii. The patient has had a response, as determined by the prescriber.
Note: There may not be a full response by Month 4, but there should be some response.

21. Psoriatic Arthritis (PsA). Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 4 months if the patient meets the BOTH of following (i and ii):

i. *The patient is an adult greater than or equal to 18 years of age; AND*

ii. Otezla is prescribed by or in consultation with a rheumatologist or a dermatologist.

B) Patient is Currently Receiving Otezla. Approve for 3 years if the patient meets BOTH of the following conditions (i and ii):

i. The patient has already received at least 4 months of therapy with Otezla.
Note: Patients who have received < 4 months of therapy or those who are restarting therapy with Otezla should be considered under criterion 2A [PsA, initial therapy]); AND

ii. The patient has had a response, as determined by the prescriber.

Note: Examples of a response to therapy include: less joint pain, morning stiffness, or fatigue; improved function or activities of daily living, decreased soft tissue swelling in joints or tendon sheaths, improvements in acute phase reactants [for example, C-reactive protein]).

3. **Behcet's Disease.** Approve for the duration noted if the patient meets the following criteria (A or B):
   - **A)** Initial Therapy. Approve for 4 months if the patient meets ALL of the following (i, ii, iii, and iv):
     - **i.** The patient is an adult greater than or equal to 18 years of age; AND
     - **ii.** The patient has oral ulcers or other mucocutaneous involvement; AND
     - **iii.** The patient has tried at least ONE other systemic therapy.
       Note: Examples of systemic therapies include colchicine, systemic corticosteroids, azathioprine, thalidomide, interferon alpha, tumor necrosis factor inhibitors (e.g., adalimumab [Humira], etanercept [Enbrel], certolizumab pegol [Cimzia], golimumab [Simponi/Aria], or infliximab products [Inflectra, Remicade, Renflexis]); AND
     - **iv.** Otezla is prescribed by or in consultation with a rheumatologist or dermatologist.
   - **B)** Patient is Currently Receiving Otezla. Approve for 1 year if the patient is currently taking Otezla for ≥ 120 days and has responded to therapy, as determined by the prescriber.
     Note: Examples of a response to therapy include: a decrease in the number/frequency of oral and/or genital ulcers. Patients who have received < 4 months of therapy or those who are restarting therapy with Otezla should be considered under criterion 3A (Behcet's disease, initial therapy).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Otezla has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

94. **Ankylosing Spondylitis (AS).** Current evidence does not support use of Otezla in AS. In a published double-blind, placebo-controlled Phase II study, patients (n = 38) were randomized in a 1:1 ratio to treatment with Otezla 30 mg BID or placebo.[13] At Week 12, there was not a statistically significant change from baseline compared with placebo in multiple endpoints, including the Bath Ankylosing Spondylitis Disease Activity Index, Functional Index, Global Score, or Metrology Index (BASDAI, BASFI, BAS-G, or BASMI), the Functional Assessment of Chronic Illness Therapy-Fatigue (FACIT-F), or night pain scores.

95. **Concurrent Use with a Biologic or with a Targeted Synthetic DMARD.** Otezla is a small molecule that specifically targets intracellular PDE4 and has an inhibitory effect on multiple cytokines involved in the inflammatory process, including TNF, IFNγ, IL-12, and IL-23.[2-3] Co-administration of Otezla with a biologic or another targeted synthetic DMARD (see Appendix for examples) has the risk of added immunosuppression and has not been evaluated. Note: This does NOT exclude the use of conventional synthetic DMARDs (e.g., MTX, leflunomide, hydroxychloroquine, and sulfasalazine) in combination with Otezla.

96. **Rheumatoid Arthritis (RA).** Current evidence does not support use of Otezla in RA. A multicenter, double-blind, Phase II study (n = 237) randomized patients in a 1:1:1 ratio to treatment with Otezla 20 mg BID, Otezla 30 mg BID, or placebo.[14] All patients were required to take a stable dose of MTX throughout the study. At Week 16, a similar proportion of patients in all treatment groups achieved an American College of Rheumatology (ACR) 20 response (28%, 34%, and 35%, respectively). At Week 16, patients who were non-responders, defined as patients with a swollen joint count and tender joint count that had not improved by at least 20%, were required to enter early escape (patients who were receiving placebo were transitioned to Otezla 20 mg BID and patients receiving Otezla continued on

the assigned therapy for an additional year). At Week 24, all patients who received placebo were similarly transitioned to Otezla. At Weeks 24 and 52, both doses of Otezla were associated with generally similar changes versus placebo, including ACR 20, ACR 50, and ACR 70. A subset of patients underwent magnetic resonance imaging (MRI) evaluation; however, no significant difference in response rates was observed at Week 16. The study was terminated early; data were not analyzed at Year 2 as originally planned.

97. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Date Reviewed
Annual revision	Throughout the policy, references to Humira, Enbrel, and Remicade were reworded as adalimumab, etanercept, and infliximab products, respectively, with the innovator names listed as examples of these products. Erelzi was added as an example of an etanercept product and Renflexis and Inflectra were added as examples of infliximab products. Ilumya, Siliq, Tremfya were added as examples of biologics that may have been previously tried for psoriasis. Simponi Aria and Taltz were added as examples of biologics that may have been previously tried for psoriatic arthritis. To align with updated EULAR guidelines for Behcet's disease, add that the requirement that the patient has mucocutaneous involvement. As a result of this change, update the criterion which requires a specialist to be involved in care (remove ophthalmologist, gastroenterologist, or neurologist and add obstetrician and gynecologist). To further align with guidelines, specify that a TNFi must have been previously tried (previously required any biologic). Since approval condition for Patients Established on Otezla for ≥ 120 days only applies to Behcet's disease, move directly under this condition. Shorten initial approval to 4 months (previously 1 year) and require a response to therapy for continuation of therapy.	06/27/2018
Annual revision	**Plaque Psoriasis and Psoriatic Arthritis:** When a response to therapy is required for patients continuing therapy, wording was changed to be according to the prescriber (previously worded as prescribing physician).	07/17/2019
Selected revision	**Behcet's disease:** Move to FDA-Approved Indications (previously listed under Other Use with Supportive Evidence). To align with the approval condition, revise criteria to include adults ≥ 18 years of age. Coverage criteria was expanded to specify for patients with oral ulcers or other mucocutaneous involvement (previously listed as mucocutaneous involvement without any age limitation). To align with the approval condition, remove obstetrician and gynecologist from the specialists who may be consulted prior to prescribing Otezla. To align with pivotal study population, change criteria to require previous use of another systemic agent (previously specifically required a TNFi, unless exception criteria were met). **Psoriatic Arthritis:** To align with the labeling, limit initial approval to adults ≥ 18 years of age with psoriatic arthritis.	07/31/2019
Early annual revision	**Plaque Psoriasis:** Examples of traditional systemic agents were moved to a Note (previously listed as examples within the criteria). Examples of biologics for plaque psoriasis were moved to be included in the Appendix (previously listed in a Note in the criteria section). For the exception applying to patients with a contraindication to methotrexate, wording was updated to more generally allow this determination by the prescriber (criteria previously specified this was according to the prescribing physician). **Psoriatic Arthritis:** The criterion that requires a 3-month trial or intolerance to a conventional synthetic disease-modifying antirheumatic drug was removed from the policy.	04/29/2020

APPENDIX

	Mechanism of Action	Examples of Inflammatory Indications for Products*
Biologics		
Adalimumab SC Products (Humira®, biosimilars)	Inhibition of TNF	AS, CD, PJIA, PsO, PsA, RA, SJIA, UC
Cimzia® (certolizumab pegol SC injection)	Inhibition of TNF	AS, CD, PsO, PsA, RA
Etanercept SC Products (Enbrel®, biosimilars)	Inhibition of TNF	AS, PJIA, PsO, PsA, RA, SJIA
Infliximab IV Products (Remicade®, biosimilars)	Inhibition of TNF	AS, CD, PJIA, PsO, PsA, RA, SJIA, UC
Simponi®, Simponi® Aria™ (golimumab SC injection, golimumab IV infusion)	Inhibition of TNF	SC formulation: AS, PsA, RA, UC
		IV formulation: AS, PsA, RA
Actemra® (tocilizumab IV infusion, tocilizumab SC injection)	Inhibition of IL-6	SC formulation: PJIA, RA, SJIA
		IV formulation: PJIA, RA, SJIA
Kevzara® (sarilumab SC injection)	Inhibition of IL-6	RA
Orencia® (abatacept IV infusion, abatacept SC injection)	T-cell costimulation modulator	SC formulation: PJIA, PSA, RA
		IV formulation: PJIA, PsA, RA
Rituximab IV Products (Rituxan®, biosimilars)	CD20-directed cytolytic antibody	RA
Ilaris (canakinumab SC injection**)**	Inhibition of IL-1β	SJIA
Kineret® (anakinra SC injection)	Inhibition of IL-1	RA, SJIA^
Stelara® (ustekinumab SC injection, ustekinumab IV infusion)	Inhibition of IL-12/23	SC formulation: CD, PsO, PsA, UC
		IV formulation: CD, UC
Siliq™ (brodalumab SC injection)	Inhibition of IL-17	PsO
Cosentyx™ (secukinumab SC injection)	Inhibition of IL-17A	AS, PsO, PsA
Taltz® (ixekizumab SC injection)	Inhibition of IL-17A	AS, PsO, PsA
Ilumya™ (tildrakizumab-asmn SC injection)	Inhibition of IL-23	PsO
Skyrizi™ (risankizumab-rzza SC injection)	Inhibition of IL-23	PsO
Tremfya™ (guselkumab SC injection)	Inhibition of IL-23	PsO
Entyvio™ (vedolizumab IV infusion)	Integrin receptor antagonist	CD, UC
Targeted Synthetic DMARDs		
Otezla® (apremilast tablets)	Inhibition of PDE4	PsO, PsA
Olumiant® (baricitinib tablets)	Inhibition of the JAK pathways	RA
Rinvoq® (upadacitinib extended-release tablets)	Inhibition of the JAK pathways	RA
Xeljanz®, Xeljanz XR (tofacitinib tablets, tofacitinib extended-release tablets)	Inhibition of the JAK pathways	RA, PsA, UC

* Not an all-inclusive list of indication (e.g., oncology indications and rare inflammatory conditions are not listed). Refer to the prescribing information for the respective agent for FDA-approved indications; SC – Subcutaneous; TNF – Tumor necrosis factor; IV – Intravenous, IL – Interleukin; PDE4 – Phosphodiesterase 4; JAK – Janus kinase; AS – Ankylosing spondylitis; CD – Crohn's disease; PJIA – Polyarticular juvenile idiopathic arthritis; PsO – Plaque psoriasis; PsA – Psoriatic arthritis; RA – Rheumatoid arthritis; SJIA – Systemic juvenile idiopathic arthritis; UC – Ulcerative colitis; ^ Off-label use of SJIA supported in guidelines.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Rinvoq Prior Authorization Policy

- Rinvoq® (upadacitinib extended-release tablets – AbbVie)

REVIEW DATE: 08/26/2020

OVERVIEW

Rinvoq is a Janus kinase inhibitor (JAKi).[1] It is indicated for the treatment of adults with moderately to severely active rheumatoid arthritis who have had an inadequate response or intolerance to methotrexate, either as monotherapy or in combination with methotrexate or other nonbiologic disease-modifying

antirheumatic drugs (DMARDs). Rinvoq is not recommended for use in combination with other JAKis, biologics, or potent immunosuppressants such as azathioprine or cyclosporine.

Across the pivotal studies, response to Rinvoq was assessed at Week 12.

Guidelines

Guidelines from the American College of Rheumatology (ACR) [2015], updated prior to the approval of Rinvoq, have tumor necrosis factor (TNF) inhibitors and non-TNF biologics, administered with or without methotrexate, equally positioned as a recommended therapy following a trial of a conventional synthetic DMARD (e.g., methotrexate leflunomide, hydroxychloroquine, sulfasalazine).[2] Although Rinvoq and Olumiant (baricitinib tablets) [another approved JAKi] are not yet addressed, another JAKi (Xeljanz/Xeljanz XR [tofacitinib tablets, tofacitinib extended release tablets]) is not recommended for early rheumatoid arthrits in established RA, Xeljanz/XR is most frequently recommended for patients with moderate or high disease activity despite use of multiple biologics.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Rinvoq. Because of the specialized skills required for evaluation and diagnosis of patients treated with Rinvoq as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Rinvoq to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

All reviews for use of Rinvoq for COVID-19 and/or cytokine release syndrome associated with COVID-19 will be forwarded to the Medical Director.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Rinvoq is recommended in those who meet the following criteria:

FDA-Approved Indications

22. Rheumatoid Arthritis. Approve Rinvoq for the duration noted if the patient meets ONE of the following criteria (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets ALL of the following (i, ii, and iii):

i. Patient is ≥ 18 years of age; AND

ii. Patient has tried ONE conventional synthetic disease-modifying antirheumatic drug (DMARD) for at least 3 months; AND

Note: Examples include methotrexate [oral or injectable], leflunomide, hydroxychloroquine, and sulfasalazine. An exception to the requirement for a trial of one conventional synthetic DMARD can be made if the patient has already had a 3-month trial of at least one biologic. Refer to Appendix for examples of biologics used for rheumatoid arthritis. These patients who have already tried a biologic for RA are not required to "step back" and try a conventional synthetic DMARD.

iii. The medication is prescribed by or in consultation with a rheumatologist.

B) Patient is Currently Receiving Rinvoq. Approve for 3 years if the patient has had a response, as determined by the prescriber.

Note: Examples of a response to therapy include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improved laboratory values; reduced dosage of corticosteroids. The patient may not have a full response, but there should have been a recent or past response to Rinvoq.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Rinvoq is not recommended in the following situations:

98. Concurrent Use with a Biologic or with a Targeted Synthetic Disease-Modifying Antirheumatic Drug (DMARD). Rinvoq should not be administered in combination with a biologic used for an inflammatory condition (see Appendix for examples).[1] Combination therapy is generally not recommended due to a potential for a higher rate of adverse effects with combinations and lack of evidence supporting additive efficacy. There are no data evaluating combination of Rinvoq with other targeted synthetic DMARD (e.g., Otezla [apremilast tablets], Xeljanz/XR [tofacitinib tablets/extended-release tablets], Olumiant [baricitinib tablets]); therefore, safety and efficacy of this combination is unknown.

99. Concurrent use with Other Potent Immunosuppressants (e.g., azathioprine, cyclosporine).[1] Coadministration with other potent immunosuppressive drugs has the risk of added immunosuppression and has not been evaluated in rheumatoid arthritis. Note: This does NOT exclude use of Rinvoq with methotrexate. Rinvoq has been evaluated with background methotrexate and other conventional synthetic DMARDs.

100. COVID-19 (Coronavirus Disease 2019). Forward all requests to the Medical Director.
Note: This includes requests for cytokine release syndrome associated with COVID-19.

101. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Otezla® (apremilast tablets)	Inhibition of PDE4	PsO, PsA
Olumiant® (baricitinib tablets)	Inhibition of the JAK pathways	RA
Rinvoq® (upadacitinib extended-release tablets)	Inhibition of the JAK pathways	RA
Xeljanz®, Xeljanz XR (tofacitinib tablets, tofacitinib extended-release tablets)	Inhibition of the JAK pathways	RA, PsA, UC

* Not an all-inclusive list of indication (e.g., oncology indications and rare inflammatory conditions are not listed). Refer to the prescribing information for the respective agent for FDA-approved indications; SC – Subcutaneous; TNF – Tumor necrosis factor; AS – Ankylosing spondylitis; CD – Crohn's disease; JIA – Juvenile idiopathic arthritis; PsO – Plaque psoriasis; PsA – Psoriatic arthritis; RA – Rheumatoid arthritis; UC – Ulcerative colitis; nr-axSpA – Non-radiographic axial spondyloarthritis; IV – Intravenous; PJIA – Polyarticular juvenile idiopathic arthritis; SJIA – Systemic juvenile idiopathic arthritis; ^ Off-label use of Kineret in JIA supported in guidelines; JAK – Janus kinase.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Siliq™ (brodalumab for subcutaneous injection – Valeant Pharmaceuticals)

DATE REVIEWED: 04/08/2020

OVERVIEW

Siliq is indicated for treatment of adults with moderate-to-severe plaque psoriasis who are candidates for systemic therapy or phototherapy and have failed to respond or have lost response to other systemic therapies.[1] In plaque psoriasis, the recommended dose is 210 mg subcutaneously (SC) at Week 0, 1, and 2 followed by 210 mg once every 2 weeks (Q2W). Consider discontinuing if an adequate response has not been achieved after 12 to 16 weeks; continued treatment is unlikely to result in greater success. Siliq is intended for use under the guidance and supervision of a physician. Those trained in SC injection technique may self-inject when deemed appropriate.

Disease Overview

IL-17A is a naturally occurring cytokine involved in normal inflammatory and immune responses. However, levels of IL-17A are elevated in psoriatic plaques.[1] Siliq is a human monoclonal immunoglobulin G (IgG)2 antibody which selectively binds to interleukin (IL)-17RA and inhibits its interaction with cytokines IL-17A, IL-17-F, IL-17C, IL-17A/F heterodimer, and IL-25. By blocking IL-17RA, Siliq inhibits IL-17 cytokine-induced responses, including the release of pro-inflammatory cytokines and chemokines involved in the inflammatory process.

Guidelines

Joint guidelines from the American Academy of Dermatology (AAD) and National Psoriasis Medical Board (2019) have been published for management of psoriasis with biologics.[2] These guidelines list Siliq as a monotherapy treatment option for patients with moderate to severe plaque psoriasis. Guidelines from the European Dermatology Forum (EDF) [2015] recommend biologics (i.e., etanercept, adalimumab, infliximab, Stelara SC) as second-line therapy for induction and long-term treatment if phototherapy and conventional systemic agents have failed, are contraindicated, or are not tolerated.[3]

Safety

Siliq has a Boxed Warning, Risk Evaluation and Mitigation Strategy (REMS) program, and limited distribution program due to risks of suicidal ideation and behavior. The REMS program requires prescribers and pharmacies to be certified to prescribe and/or dispense Siliq.[4] Patients must sign a patient-prescriber agreement form and be aware of the need to seek medical attention for any new/worsening suicidal thoughts or behavior, depression, anxiety, or mood changes. Siliq is also contraindicated in Crohn's disease.[1] Other Warnings/Precautions include infections, risk for latent tuberculosis reactivation, and vaccinations.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Siliq. Because of the specialized skills required for evaluation and diagnosis of patients treated with Siliq as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Siliq to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Siliq is recommended in those who meet the following criteria:

FDA-Approved Indications

J) Plaque Psoriasis. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets ALL of the following criteria (i, ii, and iii):

i. The patient is ≥ 18 years of age; AND

ii. The patient meets ONE of the following conditions (a or b):

a) The patient has tried at least at least one traditional systemic agent for psoriasis for at least 3 months, unless intolerant.

Note: Examples of traditional systemic agents for psoriasis include methotrexate (MTX), cyclosporine, acitretin tablets, or psoralen plus ultraviolet A light (PUVA). An exception to the requirement for a trial of one traditional systemic agent for psoriasis can be made if the patient has already had a 3-month trial or previous intolerance to at least one biologic. Refer to **Appendix** for examples of biologics used for plaque psoriasis. These patients who have already tried a biologic for psoriasis are not required to "step back" and try a traditional systemic agent for psoriasis; OR

b) The patient has a contraindication to methotrexate (MTX), as determined by the prescriber; AND

iii. Siliq is prescribed by or in consultation with a dermatologist.

B) Patient is Currently Receiving Siliq. Approve for 3 years if the patient has responded, as determined by the prescriber.

Note: The patient may not have a full response, but there should have been a recent or past response to Siliq.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Siliq has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

102. Concurrent Use with other Biologics or with Targeted Synthetic Disease-Modifying Antirheumatic Drugs (DMARDs). Siliq should not be administered in combination with a biologic used for an inflammatory condition (see Appendix for examples). Combination therapy with biologics and/or biologics + targeted synthetic DMRADs has a potential for a higher rate of adverse effects and lack controlled trial data in support of additive efficacy.[5-6] Note: This does NOT exclude the use of conventional synthetic DMARDs (e.g., MTX, leflunomide, hydroxychloroquine, and sulfasalazine) in combination with Siliq.

103. Crohn's Disease. Siliq is contraindicated in patients with Crohn's disease.[1] There is a published Phase II study evaluating Siliq in Crohn's disease (n = 130) that was terminated early due to a disproportionate number of worsening Crohn's disease and lack of efficacy.[7]

104. Rheumatoid Arthritis. Efficacy has not been established. A published Phase II study (n = 252) did not demonstrate improvement in American College of Rheumatology (ACR) 20/50/70 responses with Siliq vs. placebo for treatment of rheumatoid arthritis in patients who had previously failed methotrexate.[8]

105. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

* Not an all-inclusive list of indication (e.g., oncology indications and rare inflammatory conditions are not listed). Refer to the prescribing information for the respective agent for FDA-approved indications; SC – Subcutaneous; TNF – Tumor necrosis factor; IV – Intravenous, IL – Interleukin; PDE4 – Phosphodiesterase 4; JAK – Janus kinase; AS – Ankylosing spondylitis; CD – Crohn's disease; PJIA – Polyarticular juvenile idiopathic arthritis; PsO – Plaque psoriasis; PsA – Psoriatic arthritis; RA – Rheumatoid arthritis; SJIA – Systemic juvenile idiopathic arthritis; UC – Ulcerative colitis; ^ Off-label use of SJIA supported in guidelines.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Simponi Aria Prior Authorization Policy

- Simponi Aria® (golimumab injection, for intravenous infusion)

REVIEW DATE: 10/07/2020

OVERVIEW

Simponi Aria is a tumor necrosis factor inhibitor (TNFi) indicated for the following conditions:[1]

- **Ankylosing spondylitis**, in adults with active disease.
- **Polyarticular juvenile idiopathic arthritis**, in patients ≥ 2 years of age with active disease.
- **Psoriatic arthritis**, in patients ≥ 2 years of age with active disease.

- **Rheumatoid arthritis**, in combination with methotrexate for treatment of adults with moderately to severely active disease.

Simponi Aria is administered by intravenous infusion by a healthcare professional. Efficacy has not been established for patients switching between the Simponi Aria and Simponi subcutaneous.

Guidelines

TNFis feature prominently in guidelines for treatment of inflammatory conditions.

- **Spondyloarthritis:** Guidelines for ankylosing spondylitis and non-radiographic axial spondyloarthritis are published by the American College of Rheumatology (ACR)/Spondylitis Association of America/Spondyloarthritis Research and Treatment Network (2019).[2] Following primary nonresponse to a TNFi, an interleukin (IL)-17 blocker is recommended; however, if the patient is a secondary nonresponder, a second TNFi is recommended over switching out of the class. In patients with a contraindication to a TNFi, use of an IL-17 blocker is recommended over traditional oral agents such as methotrexate or sulfasalazine.
- **Juvenile Idiopathic Arthritis (JIA):** Simponi (golimumab, route not specified) is among the TNFis recommended in the American College of Rheumatology (ACR)/Arthritis Foundation guidelines for the treatment of JIA (2019) specific to juvenile non-systemic polyarthritis, sacroiliitis, and enthesitis.[4] TNFis are the biologics recommended for polyarthritis, sacroiliitis, enthesitis. Actemra® (tocilizumab intravenous, tocilizumab subcutaneous) and Orencia® (abatacept intravenous, abatacept intravenous) are also among the biologics recommended for polyarthritis. Biologics are recommended following other therapies (e.g., following a conventional synthetic disease-modifying antirheumatic drug [DMARD] for active polyarthritis or following a nonsteroidal anti-inflammatory drug [NSAID] for active JIA with sacroiliitis or enthesitis). However, there are situations where initial therapy with a biologic may be preferred over other conventional therapies (e.g., if there is involvement of high-risk joints such as the cervical spine, wrist, or hip; high disease activity; and/or those judged to be at high risk of disabling joint damage).
- **Psoriatic Arthritis:** Guidelines from ACR (2019) recommend TNFis over other biologics for use in treatment-naïve patients with psoriatic arthritis, and in those who were previously treated with an oral therapy.[5]
- **Rheumatoid Arthritis:** Guidelines from the ACR (2015) have TNFis and non-TNF biologics, administered with or without methotrexate, equally positioned as a recommended therapy following a trial of a conventional synthetic DMARD (e.g., methotrexate, leflunomide, hydroxychloroquine, sulfasalazine).[6]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Simponi Aria. Because of the specialized skills required for evaluation and diagnosis of patients treated with Simponi Aria as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Simponi Aria to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

FDA-Approved Indications

1. **Ankylosing Spondylitis.** Approve for the duration noted if the patient meets ONE of the following (A or B):
   - **A)** Initial Therapy. Approve for 3 months if prescribed by or in consultation with a rheumatologist.
   - **B)** Patient is Currently Receiving Simponi Aria or Subcutaneous. Approve for 1 year if the patient has had a response, as determined by the prescriber.
     Note: Examples of a response to therapy include decreased pain or stiffness, improved function or activities of daily living. The patient may not have a full response, but there should have been a recent or past response to Simponi Aria or subcutaneous.

2. **Juvenile Idiopathic Arthritis (JIA) [or Juvenile Rheumatoid Arthritis] (regardless of type of onset)** [Note: This includes patients with juvenile spondyloarthropathy/active sacroiliac arthritis]. Approve for the duration noted if the patient meets ONE of the following (A or B):
   - **C)** Initial Therapy. Approve for 3 months if the patient meets the following criteria (i and ii):
     - **iii.** Patient meets ONE of the following conditions (a or b):
       - **c)** Patient has tried one other medication for this condition; OR
         Note: Examples of other medications for JIA include methotrexate, sulfasalazine, or leflunomide, a nonsteroidal anti-inflammatory drug (NSAID) [e.g., ibuprofen, naproxen]. A previous trial of a biologic also counts as a trial of one medication. Refer to Appendix for examples of biologics used for JIA.
       - **d)** Patient has aggressive disease, as determined by the prescriber; AND
     - **iv.** The medication is prescribed by or in consultation with a rheumatologist.
   - **D)** Patient is Currently Receiving Simponi Aria or Subcutaneous. Approve for 1 year if the patient had a response as determined by the prescriber.
     Note: Examples of a response include improvement in limitation of motion, less joint pain or tenderness, decreased duration of morning stiffness or fatigue, improved function or activities of daily living, reduced dosage of corticosteroids. The patient may not have a full response, but there should have been a recent or past response to Simponi Aria or subcutaneous.

3. **Psoriatic Arthritis.** Approve for the duration noted if the patient meets ONE of the following (A or B):
   - **A)** Initial Therapy. Approve for 3 months if prescribed by or in consultation with a rheumatologist or dermatologist.
   - **B)** Patient is Currently Receiving Simponi Aria or Subcutaneous. Approve for 1 year if the patient has had a response, as determined by the prescriber.
     Note: Examples of a response to therapy include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improvements in acute phase reactants (for example, C-reactive protein). The patient may not have a full response, but there should have been a recent or past response to Simponi Aria or subcutaneous.

4. **Rheumatoid Arthritis**. Approve for the duration noted if the patient meets ONE of the following (A or B):
   - **A)** Initial Therapy. Approve for 3 months if the patient meets BOTH of the following (i and ii):

i. Patient has tried ONE conventional synthetic disease-modifying antirheumatic drug (DMARD) for at least 3 months; AND

Note: Examples of conventional synthetic DMARDs include methotrexate (oral or injectable), leflunomide, hydroxychloroquine, and sulfasalazine. An exception to the requirement for a trial of one conventional synthetic DMARD can be made if the patient has already has a 3-month trial at least one biologic. Refer to Appendix for examples of biologics used for rheumatoid arthritis. These patients who have already tried a biologic for rheumatoid arthritis are not required to "step back" and try a conventional synthetic DMARD.

ii. The medication is prescribed by or in consultation with a rheumatologist.

B) Patient is Currently Receiving Simponi Aria or Subcutaneous. Approve for 1 year if the patient has had a response, as determined by the prescriber.

Note: Examples of a response to therapy include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improved laboratory values; reduced dosage of corticosteroids. The patient may not have a full response, but there should have been a recent or past response to Simponi Aria or subcutaneous.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Simponi Aria is not recommended in the following situations:

~~7.~~ **Concurrent Use with Biologic or with a Targeted Synthetic Disease-Modifying Antirheumatic Drug (DMARD).** Data are lacking evaluating concomitant use of Simponi Aria in combination with another biologic or with a targeted synthetic DMARD for an inflammatory condition (see Appendix for examples). Combination therapy with biologics and/or biologics + targeted synthetic DMARDs has a potential for a higher rate of adverse events with combinations and lack controlled trial data in support of additive efficacy. Note: This does NOT exclude the use of conventional synthetic DMARDs (e.g., methotrexate, leflunomide, hydroxychloroquine, and sulfasalazine) in combination with Simponi Aria.

8. Ulcerative Colitis. Simponi subcutaneous injection is indicated for treatment of ulcerative colitis.[5] A single-dose induction study in patients with ulcerative colitis (n = 176) evaluated doses of 1 mg/kg, 2 mg/kg, and 4 mg/kg; however, enrollment was stopped due to lower than expected efficacy in the dose-ranging Phase II portion of the study.[6] Appropriate dosing of Simponi Aria in ulcerative colitis is unclear.

9. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Simponi® (golimumab for subcutaneous injection – Janssen Biotech, Inc.)

DATE REVIEWED: 04/29/2020

OVERVIEW

Simponi SC is a recombinant human monoclonal antibody specific for human tumor necrosis factor alpha (TNFα).[1] It is indicated for the following uses:

- Ankylosing spondylitis (AS), for treatment of adults with active AS either alone or in combination with MTX or other non-biologic DMARDs; AND
- Psoriatic arthritis (PsA), for treatment of adults with active PsA either alone or in combination with MTX or other non-biologic disease-modifying antirheumatic drugs (DMARDs); AND
- Rheumatoid arthritis (RA), for treatment of adults with moderate to severe active RA in combination with methotrexate (MTX); AND
- Ulcerative colitis (UC), for inducing and maintaining clinical response, improving endoscopic appearance of the mucosa during induction, inducing clinical remission, and achieving and sustaining clinical remission in induction responders in adults with moderate to severe disease who have demonstrated corticosteroid dependence or who have had an inadequate response to or failed to tolerate oral aminosalicylates, oral corticosteroids, azathioprine, or 6-mercaptopurine.

Disease Overview

TNF is a naturally occurring cytokine that mediates inflammation and modulates cellular immune responses. Increased levels of TNF have been implicated in the pathology of inflammatory conditions such as inflammatory bowel disease, psoriatic arthritis, and rheumatoid arthritis (RA). Increased levels of TNF are found in the synovial fluid of patients with RA and TNF has an important role in both the pathologic inflammation and the joint destruction that are characteristic of this disease. In Crohn's disease, increased levels of TNF are found in the bowel wall in areas involved by Crohn's disease. Simponi SC neutralizes the biological activity of TNFα and inhibits binding of TNFα with its receptors.

Guidelines

TNFis feature prominently in guidelines for treatment of inflammatory conditions.

- Spondyloarthritis: Guidelines for ankylosing spondylitis and nonradiographic axial spondylitis are published by the American College of Rheumatology (ACR)/Spondylitis Association of America/Spondyloarthritis Research and Treatment Network (2019).[2] TNFis are recommended for the initial biologic. In those who are secondary nonresponders to a TNFi, a second TNFi is recommended over switching out of the class.
- Psoriatic Arthritis: Guidelines from ACR (2019) recommend TNFis over other biologics for use in treatment-naïve patients with PsA and in those who were previously treated with an oral therapy.[3]
- Rheumatoid Arthritis: Guidelines from the American College of Rheumatology (ACR) [2015] have TNF inhibitors and non-TNF biologics, administered with or without MTX, equally positioned as a recommended therapy following a trial of a conventional synthetic DMARD (e.g., MTX, leflunomide, hydroxychloroquine, sulfasalazine).[4]

- Ulcerative Colitis: Updated ACG guidelines for UC (2019) note that the following agents can be used for induction of remission in moderately to severely active disease: Uceris tablets; Oral or intravenous systemic corticosteroids Entyvio, Xeljanz, or TNFis (adalimumab, Simponi SC, infliximab).[5]

Safety

Simponi SC has Boxed Warnings concerning risks of serious infection and the risk of malignancy.[1] Prior to initiating therapy, patients should be evaluated for active tuberculosis (TB) infection; in addition, patients should be assessed for latent TB infection periodically during therapy. Patients should also be monitored for signs and symptoms of infection during and after treatment with Simponi SC; if a serious infection or sepsis develops, Simponi SC should be discontinued. Lymphoma and other malignancies have been reported in patients who have taken TNFis such as Simponi SC.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Simponi SC. Because of the specialized skills required for evaluation and diagnosis of patients treated with Simponi SC as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Simponi SC to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration listed below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Simponi SC is recommended in those who meet the following criteria:

FDA-Approved Indications

K) Ankylosing Spondylitis (AS). Approve for the duration noted if the patient meets ONE of the following conditions (A or B):

A) Initial Therapy. Approve for 3 months if prescribed by or in consultation with a rheumatologist.

B) Patients Currently Receiving Simponi (SC or Aria). Approve for 3 years if the patient has had a response, as determined by the prescriber.

Note: Examples of a response include decreased pain or stiffness and improved function or activities of daily living. The patient may not have a full response, but there should have been a recent or past response to Simponi (SC or Aria).

L) Psoriatic Arthritis (PsA). Approve for the duration noted if the patient meets ONE of the following conditions (A or B):

A) Initial Therapy. Approve for 3 months if Simponi SC is prescribed by or in consultation with a rheumatologist or a dermatologist.

B) Patients Currently Receiving Simponi (SC or Aria). Approve for 3 years if the patient has had a response as determined by the prescriber.

Note: Examples of a response include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; and improvements in acute phase reactants such as C-reactive protein (CRP). The patient may not have a full response, but there should have been a recent or past response to Simponi (SC or Aria).

M) Rheumatoid Arthritis (RA). Approve for the duration noted if the patient meets ONE of the following conditions (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets BOTH of the following criteria (i and ii):

i. The patient has tried ONE conventional synthetic disease-modifying antirheumatic drug (DMARD) for at least 3 months.

Note: Examples of conventional synthetic DMARDs include methotrexate (oral or injectable), leflunomide, hydroxychloroquine, and sulfasalazine. An exception to the requirement for a trial of one conventional synthetic DMARD can be made if the patient has already has a 3-month trial at least one biologic. Refer to Appendix for examples of biologics used for RA. These patients who have already tried a biologic for RA are not required to "step back" and try a conventional synthetic DMARD; AND

ii. Simponi SC is prescribed by or in consultation with a rheumatologist.

B) Patients Currently Receiving Simponi (SC or Aria). Approve for 3 years if the patient has had a response, as determined by the prescriber.

Note: Examples of a response include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improved laboratory values; reduced dosage of corticosteroids. The patient may not have a full response, but there should have been a recent or past response to Simponi (SC or Aria).

N) Ulcerative Colitis (UC). Approve for the duration noted if the patient meets ONE of the following conditions (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets BOTH of the following criteria (i, ii. and iii):

i. The patient is ≥ 18 years of age; AND

ii. The patient meets ONE of the following conditions (a or b):

i. Patient has had a trial of one conventional systemic agent or a corticosteroid such as prednisone or methylprednisolone, or was intolerant to one of these agents for ulcerative colitis.

Note: Examples of systemic therapies for ulcerative colitis include 6-mercaptopurine, azathioprine, cyclosporine, and tacrolimus. An exception to this criterion can be made if the patient has already tried a biologic. These patients who have already received a biologic are not required to "step back" and try another agent. Refer to Appendix for examples of biologics used for ulcerative colitis; OR

ii. The patient meets BOTH of the following [(1) and (2)]:

1. The patient has pouchitis; AND

2. The patient has tried therapy with an antibiotic, probiotic, corticosteroid enema, or Rowasa® (mesalamine) enema.

Note: Examples of antibiotics include metronidazole and ciprofloxacin. Hydrocortisone enemas is an examples of a corticosteroid enemas; AND

iii. Simponi SC is prescribed by or in consultation with a gastroenterologist.

B) Patients Currently Receiving Simponi (SC or Aria). Approve for 3 years if the patient has had a response, as determined by the prescriber.

Note: Examples of a response include decreased stool frequency or rectal bleeding. The patient may not have a full response, but there should have been a recent or past response to Simponi (SC or Aria).

Other Uses with Supportive Evidence

O) Spondyloarthritis (SpA), Other Subtypes (e.g., undifferentiated arthritis, non-radiographic axial SpA, Reactive Arthritis [Reiter's disease]) [Note: For AS or PsA, refer to the respective criteria under FDA-approved indications]. Approve for the duration noted if ONE of the following conditions are met (A or B):

G) Initial Therapy. Approve for 3 months if the patient meets BOTH of the following conditions (i and ii):

i. The patient meets ONE of the following (a or b):

a) The patient has arthritis primarily in the knees, ankles, elbows, wrists, hands, and/or feet AND has tried at least ONE conventional synthetic DMARD has been tried.
Note: Examples of conventional synthetic DMARDs include methotrexate (MTX), leflunomide, and sulfasalazine; OR

b) The patient has axial spondyloarthritis AND has objective signs of inflammation, defined as at least one of the following [(1) or (2)]:

(1) C-reactive protein (CRP) elevated beyond the upper limit of normal for the reporting laboratory; OR

(2) Sacroiliitis reported on magnetic resonance imaging (MRI); AND

ii. Simponi SC is prescribed by or in consultation with a rheumatologist.

H) Patients Currently Receiving Simponi (SC or Aria). Approve for 1 year if the patient has had a response, as determined by the prescriber.
Note: Examples of a response include decreased pain or stiffness and improved function or activities of daily living. The patient may not have a full response, but there should have been a recent or past response to Simponi (SC or Aria).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Simponi SC has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

10. **Concurrent Use with a Biologic or with a Targeted Synthetic Disease-Modifying Antirheumatic Drug (DMARD).** Simponi SC should not be administered in combination with another biologic or with a targeted synthetic DMARD used for an inflammatory condition (see Appendix for examples). Combination therapy is generally not recommended due to a potentially higher rate of AEs with combinations and lack of data supportive of additional efficacy.[6,7] Note: This does NOT exclude the use of conventional synthetic DMARDs (e.g., MTX, leflunomide, hydroxychloroquine, and sulfasalazine) in combination with an adalimumab product.

11. **Plaque Psoriasis without Psoriatic Arthritis.** Simponi SC has been studied in patients with psoriatic arthritis who had plaque psoriasis. Plaque psoriasis improved in these patients with a Psoriasis Area Severity Index (PASI)-75 being attained by 40% of patients on Simponi 50 mg SC every 4 weeks and by 58% in the Simponi 100 mg SC group at Week 14.[8] Simponi SC is indicated in patients with psoriatic arthritis, but not in patients with plaque psoriasis without psoriatic arthritis. Prospective, controlled trials are needed to determine safety and efficacy in plaque psoriasis. Other TNFα antagonists (Enbrel, Humira, and Remicade) are indicated for the treatment of plaque psoriasis.

3. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Date Reviewed
Annual revision	Throughout the policy, references to Humira, Enbrel, and Rituxan were reworded as adalimumab, etanercept, and rituximab products, respectively, with the innovator names listed as examples of these products. Erelzi was added as an example of an etanercept product and Renflexis was added as an example of an infliximab product. Entyvio was added as an example of a biologic that may have been previously tried for UC. Since approval conditon for Patients Established on Simponi Aria or SC for ≥ 90 days only applies to Spondyloarthritis, move directly under this condition. For patients established on Simponi Aria or SC for spondyloarthritis, add the requirement that the patient must have responded to previous therapy, as determined by the prescriber.	06/13/2018
Selected revision	**Ulcerative colitis:** For the requirement that another agent be tried prior to Simponi SC, remove the requirement that the trial is a duration of at least 2 months (not supported in updated guidelines).	03/27/2019
Early annual revision	**Spondyloarthritis (SpA), Other Subtypes:** This off-label approval condition was reworded (previously listed as Spondyloarthritis, Subtypes Other than Ankylosing Spondylitis or Psoriatic Arthritis). There is a note which directs to criteria for FDA-approved subtypes of SpA (AS, PsA). Criteria were changed to approve for 3 months for patients starting therapy (previously was 1 year). For patients with primarily axial disease, a criterion was added to require objective signs of inflammation, defined as C-reactive protein (CRP) elevated beyond the upper limit of normal for the reporting laboratory or sacroiliitis reported on magnetic resonance imaging. For patients currently receiving therapy, examples of a response to therapy were added; the requirement that patients be on a golimumab product for ≥ 90 days was removed.	04/24/2019
Annual revision	**Ankylosing Spondylitis:** For patients continuing therapy, examples of a response were moved to a Note in the policy (previously listed in the criteria for patients continuing therapy). **Psoriatic Arthritis:** For patients continuing therapy, examples of a response were moved to a note in the policy (previously listed in the criteria for patients continuing therapy).	04/29/2020

	Rheumatoid Arthritis: Examples of conventional synthetic disease-modifying antirheumatic drugs were moved to a Note (previously listed as examples within the criteria). Examples of biologics for Rheumatoid Arthritis were moved to be included in the Appendix (previously listed in a Note in the criteria section). Examples of a response to therapy were moved to a Note (previously listed as examples within the criteria). **Ulcerative Colitis:** The requirement that the patient is an adult was moved into the criteria section for initial therapy. Criteria were clarified to define adult as a patient ≥ 18 years of age. Previously, the requirement that the patient was an adult was listed as part of the diagnosis (i.e., previously listed as Ulcerative Colitis in an adult) and applied to initial and continuation of therapy. Examples of systemic therapies were moved to a Note (previously listed as examples within the criteria). Examples of antibiotics and corticosteroid enemas were moved to a Note (previously listed as examples within the criteria). Examples of biologics for Ulcerative Colitis were moved to be included in the Appendix (previously listed in a Note in the criteria section). Examples of a response to therapy were moved to a Note (previously listed as examples within the criteria). **Spondyloarthritis (SpA), Other Subtypes:** Examples of conventional synthetic disease-modifying antirheumatic drugs were moved to a Note (previously listed as examples within the criteria). Examples of a response to therapy were moved to a Note (previously listed as examples within the criteria).	

APPENDIX

	Mechanism of Action	Examples of Inflammatory Indications for Products*
Biologics		
Adalimumab SC Products (Humira®, biosimilars)	Inhibition of TNF	AS, CD, PJIA, PsO, PsA, RA, SJIA, UC
Cimzia® (certolizumab pegol SC injection)	Inhibition of TNF	AS, CD, PsO, PsA, RA
Etanercept SC Products (Enbrel®, biosimilars)	Inhibition of TNF	AS, PJIA, PsO, PsA, RA, SJIA
Infliximab IV Products (Remicade®, biosimilars)	Inhibition of TNF	AS, CD, PJIA, PsO, PsA, RA, SJIA, UC
Simponi®, Simponi® Aria™ (golimumab SC injection, golimumab IV infusion)	Inhibition of TNF	SC formulation: AS, PsA, RA, UC
		IV formulation: AS, PsA, RA
Actemra® (tocilizumab IV infusion, tocilizumab SC injection)	Inhibition of IL-6	SC formulation: PJIA, RA, SJIA
		IV formulation: PJIA, RA, SJIA
Kevzara® (sarilumab SC injection)	Inhibition of IL-6	RA
Orencia® (abatacept IV infusion, abatacept SC injection)	T-cell costimulation modulator	SC formulation: PJIA, PSA, RA
		IV formulation: PJIA, PsA, RA
Rituximab IV Products (Rituxan®, biosimilars)	CD20-directed cytolytic antibody	RA
Ilaris (canakinumab SC injection**)**	Inhibition of IL-1β	SJIA
Kineret® (anakinra SC injection)	Inhibition of IL-1	RA, SJIA^
Stelara® (ustekinumab SC injection, ustekinumab IV infusion)	Inhibition of IL-12/23	SC formulation: CD, PsO, PsA, UC
		IV formulation: CD, UC
Siliq™ (brodalumab SC injection)	Inhibition of IL-17	PsO
Cosentyx™ (secukinumab SC injection)	Inhibition of IL-17A	AS, PsO, PsA
Taltz® (ixekizumab SC injection)	Inhibition of IL-17A	AS, PsO, PsA
Ilumya™ (tildrakizumab-asmn SC injection)	Inhibition of IL-23	PsO
Skyrizi™ (risankizumab-rzza SC injection)	Inhibition of IL-23	PsO
Tremfya™ (guselkumab SC injection)	Inhibition of IL-23	PsO
Entyvio™ (vedolizumab IV infusion)	Integrin receptor antagonist	CD, UC
Targeted Synthetic DMARDs		
Otezla® (apremilast tablets)	Inhibition of PDE4	PsO, PsA
Olumiant® (baricitinib tablets)	Inhibition of the JAK pathways	RA

Rinvoq® (upadacitinib extended-release tablets)	Inhibition of the JAK pathways	RA
Xeljanz®, Xeljanz XR (tofacitinib tablets, tofacitinib extended-release tablets)	Inhibition of the JAK pathways	RA, PsA, UC

* Not an all-inclusive list of indication (e.g., oncology indications and rare inflammatory conditions are not listed). Refer to the prescribing information for the respective agent for FDA-approved indications; SC – Subcutaneous; TNF – Tumor necrosis factor; IV – Intravenous, IL – Interleukin; PDE4 – Phosphodiesterase 4; JAK – Janus kinase; AS – Ankylosing spondylitis; CD – Crohn's disease; PJIA – Polyarticular juvenile idiopathic arthritis; PsO – Plaque psoriasis; PsA – Psoriatic arthritis; RA – Rheumatoid arthritis; SJIA – Sytemice juvenile idiopathic arthritis; UC – Ulcerative colitis. ^ Off-label use of SJIA supported in guidelines.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Skyrizi™ (risankizumab-rzaa subcutaneous injection – Abbvie)

TAC APPROVAL DATE: 04/29/2020

OVERVIEW

Skyrizi is a humanized immunoglobulin (Ig)G monoclonal antibody.[1] It binds to interleukin (IL)-23, a naturally occurring cytokine involved in inflammatory and immune responses, that selectively binds to the p19 subunit of the IL-23 cytokine and inhibits its interaction with the IL-23 receptor. Skyrizi is indicated for treatment of adults with moderate to severe plaque psoriasis who are candidates for systemic therapy or phototherapy. In plaque psoriasis, the recommended dose is 150 mg (two injections) subcutaneously (SC) at Weeks 0 and 4 and then once every 12 weeks thereafter. Skyrizi is intended for use under the guidance and supervision of a physician. A patient or care giver trained in SC injection technique may administer Skyrizi, if deemed appropriate.

Disease Overview

Although the etiology of psoriasis is not fully established, abnormal keratin formation, epidermal proliferation, activation of the immune system, and hereditary factors appear to play roles in the pathogenesis of the disease. In psoriasis, levels of IL-23p40 and IL-12/23p40 messenger RNA are upregulated but decrease with treatment. By blocking the release of proinflammatory cytokines and chemokines, Skyrizi has an inhibitory effect on the inflammatory process.

Guidelines

Joint guidelines from the American Academy of Dermatology (AAD) and National Psoriasis Medical Board (2019) have been published for management of psoriasis with biologics.[2] These guidelines list Skyrizi as a monotherapy treatment option for patients with moderate to severe plaque psoriasis. Guidelines from the European Dermatology Forum (EDF) [2015] recommend biologics (i.e., etanercept, adalimumab, infliximab, Stelara SC) as second-line therapy for induction and long-term treatment if phototherapy and conventional systemic agents have failed, are contraindicated, or are not tolerated.[3]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Skyrizi. Because of the specialized skills required for evaluation and diagnosis of patients treated with Skyrizi as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Skyrizi to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Skyrizi is recommended in those who meet the following criteria:

FDA-Approved Indications

P) Plaque Psoriasis. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets ALL of the following criteria (i, ii, and iii):

i. The patient is an adult ≥ 18 years of age; AND

ii. The patient meets ONE of the following conditions (a or b):

c) The patient has tried at least at least one traditional systemic agent for psoriasis for at least 3 months, unless intolerant.

Note: Examples of traditional systemic agents for psoriasis include methotrexate (MTX), cyclosporine, acitretin tablets, or psoralen plus ultraviolet A light (PUVA). An exception to the requirement for a trial of one traditional systemic agent for psoriasis can be made if the patient has already had a 3-month trial or previous intolerance to at least one biologic Refer to Appendix for examples of biologics used for psoriasis. These patients who have already tried a biologic for psoriasis are not required to "step back" and try a traditional systemic agent for psoriasis); OR

d) The patient has a contraindication to methotrexate (MTX), as determined by the prescriber; AND

iii. The agent is prescribed by or in consultation with a dermatologist.

B) Patient is Currently Receiving Skyrizi. Approve for 3 years if the patient has responded, as determined by the prescriber.

Note: The patient may not have a full response, but there should have been a recent or past response to Skyrizi.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Skyrizi has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

106. Concurrent Use with other Biologics or with Targeted Synthetic Disease-Modifying Antirheumatic Drugs (DMARDs). Data are lacking evaluating concomitant use of Skyrizi with another biologic or with a targeted synthetic DMARD for an inflammatory condition (see APPENDIX for examples). Combination therapy with biologics and/or biologics + targeted synthetic DMARDs has a potential for a higher rate of adverse effects and lack controlled trial data in support of additive efficacy.[4] Note: This does NOT exclude the use of MTX (a traditional systemic agent used to treat psoriasis) in combination with Skyrizi.

107. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Stelara Intravenous Prior Authorization Policy

- Stelara® (ustekinumab intravenous infusion – Janssen Biotech)

REVIEW DATE: 09/30/2020

OVERVIEW

Stelara for intravenous infusion, is a human monoclonal antibody against the p40 subunit of the interleukin (IL)-12 and IL-23 cytokines, is indicated in patients ≥ 18 years of age with the following conditions:[1]

- **Crohn's disease**, in patients with moderate to severe active disease; AND
- **Ulcerative colitis**, in patients with moderate to severe active disease.

In Crohn's disease and ulcerative colitis, a single weight-based dose is administered by intravenous infusion. Following induction therapy with the intravenous product, the recommended maintenance is Stelara subcutaneous injection, given as a 90 mg subcutaneous injection administered 8 weeks after the initial intravenous dose, then once every 8 weeks thereafter.

Guidelines

The American College of Gastroenterology (ACG) has guidelines for Crohn's disease (2018).[2] Stelara is a treatment option in patients who have moderate to severe disease despite treatment with another agent (e.g., corticosteroid, thiopurine, methotrexate, or tumor necrosis factor inhibitors). Stelara is not addressed in the 2019 ACG guidelines for ulcerative colitis.[3] Current guidelines for ulcerative colitis from the American Gastroenterological Association (2020) include Stelara among the therapies recommended in the outpatient setting for moderate to severe disease.[4]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Stelara intravenous. Because of the specialized skills required for evaluation and diagnosis of patients treated with Stelara intravenous as well as the monitoring required for adverse events and long-term efficacy, approval requires Stelara intravenous to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for 30 days, which is an adequate duration for the patient to receive one dose.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Stelara intravenous is recommended in those who meet the following criteria:

FDA-Approved Indications

8. Crohn's Disease. Approve a single dose if the patient meets the following criteria (A, B, C, and D):
- **ii.** Patient is ≥ 18 years of age; AND
- **iii.** The medication will be used as induction therapy; AND
- **iv.** Patient meets one of the following conditions (i or ii):
  - **a)** Patient has tried or is currently taking a systemic corticosteroid, or a systemic corticosteroid is contraindicated in this patient; OR
  - **b)** Patient has tried one other conventional systemic therapy for Crohn's disease; AND
    Note: Examples of other agents for Crohn's disease include azathioprine, 6-mercaptopurine , or methotrexate. A previous trial of a biologic also counts as a trial of one other agent for Crohn's disease. Refer to Appendix for examples of biologics used for Crohn's disease.
- **v.** The medication is prescribed by or in consultation with a gastroenterologist.
  Note: Patients with fistulizing Crohn's disease or Crohn's disease of the ileal pouch must meet the above criteria for Crohn's disease in adults.

9. Ulcerative Colitis. Approve a single dose if the patient meets the following criteria (A, B, C, and D):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** The medication will be used as induction therapy; AND
- **C)** Patient has had a trial of one systemic agent for ulcerative colitis; AND
  Note: Examples include 6-mercaptopurine, azathioprine, cyclosporine, tacrolimus, or a corticosteroid such as prednisone or methylprednisolone. A trial of a biologic also counts as a

trial of one systemic agent for UC. Refer to Appendix for examples of biologics used for ulcerative colitis.

D) The medication is prescribed by or in consultation with a gastroenterologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Stelara intravenous is not recommended in the following situations:

5. **Ankylosing Spondylitis (AS).** There are other biologic therapies indicated in AS (e.g., Cimzia, Enbrel® [etanercept SC injection], Humira, Remicade, Simponi for SC use, Cosentyx® [secukinumab SC injection]). More data are needed to demonstrate efficacy of Stelara in this condition. There is a published proof-of-concept trial evaluating Stelara in AS (TOPAS – UsTekinumab for the treatment Of Patients with active Ankylosing Spondylitis).[4] TOPAS was a prospective, open-label study evaluating Stelara 90 mg subcutaneous at Week 0, 4, and 16 in patients (n = 20) with AS. After Week 16, patients were followed through Week 28. Patients who previously failed to respond to tumor necrosis factor inhibitor (TNFi) were excluded, but patients who discontinued a TNFi for reasons other than lack of efficacy were allowed to enroll. The primary endpoint was a 40% improvement in disease activity at Week 24 according to the Assessment of SpondyloArthritis International Society (ASAS) criteria (ASAS40). Efficacy analysis was completed in the intent-to-treat population which included all patients who received at least one dose of Stelara. In all, 65% of patients (95% confidence interval [CI]: 41%, 85%; n = 13/20) achieved an ASAS40 response at Week 24. There was at least a 50% improvement of the BASDAI (Bath Ankylosing Spondylitis Disease Activity Index) achieved by 55% of patients (95% CI: 32%, 77%; n = 11/20); improvement in other secondary endpoints were also noted. However, enthesitis (measured by MASES [Maastricht AS Entheses Score] and SPARCC [SPondyloArthritis Research Consortium of Canada] enthesitis indices) and the number of swollen joints were not significantly improved at Week 24. There was a significant reduction of active inflammation on magnetic resonance imaging at Week 24 compared with baseline in sacroiliac joints.

6. **Concurrent Use with a Biologic or with a Targeted Synthetic Disease-Modifying Antirheumatic Drug (DMARD).** Stelara intravenous should not be administered in combination with another biologic or with a targeted synthetic DMARD for an inflammatory condition (see Appendix for examples). Combination therapy is generally not recommended due to a potential for a higher rate of adverse effects with combinations and lack of additive efficacy. Note: This does NOT exclude the use of conventional agents (e.g., methotrexate, 6-mercaptopurine, azathioprine, and sulfasalazine) in combination with Stelara intravenous.

7. **Children or Adolescents < 18 Years of Age.** Stelara intravenous is indicated in adult patients ≥ 18 years of age.[1] Efficacy and optimal dosing needs to be identified for the intravenous formulation.

8. **Plaque Psoriasis.** Stelara for subcutaneous injection is indicated for treatment of plaque psoriasis.[1] Appropriate dosing of Stelara intravenous in plaque psoriasis is unclear.

9. **Psoriatic Arthritis.** Stelara for subcutaneous injection is indicated for treatment of psoriatic arthritis.[1] Appropriate dosing of Stelara intravenous in psoriatic arthritis is unclear.

10. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Early Annual Revision	Early annual revision to align revision date with new Stelara intravenous medical policy. No changes to the criteria.	08/29/2018
Annual Revision	**Crohn's Disease:** Criteria were added to require that the patient is greater than or equal to 18 years of age, and that Stelara intravenous is being used for Induction Therapy. Previously, these requirements were part of the indication (i.e., previously, approval condition was listed as Crohn's Disease in an adult, Induction Therapy). For approvals, clarify that 30 days is adequate duration for the patient to receive a single dose.	09/11/2019
Selected Revision	**Ulcerative Colitis:** This condition was added to the policy as an FDA-approved use. Criteria approve for one dose if the patient is greater than or equal to 18 years of age and Stelara intravenous is being used for Induction Therapy, and if the patient has tried one other agent for UC. Criteria also require that Stelara intravenous is prescribed by or in consultation with a gastroenterologist.	10/23/2019
Annual Revision	**Crohn's Disease:** Examples of biologics were moved to be included in the Appendix (previously listed in a Note in the criteria section). For the criterion applying to previous therapy, wording was changed to specify this must have been a conventional systemic therapy (criteria previously required a trial of one other agent, with conventional systemic agents listed among the examples). For the criterion applying to previous corticosteroid usage, wording was changed to specify this must have been a systemic corticosteroid that was tried or contraindicated (criteria previously more generally required a trial or contraindication to a corticosteroid without specifying the route of administration). **Ulcerative Colitis:** Examples of biologics were moved to be included in the Appendix (previously listed in a Note in the criteria section).	09/30/2020

APPENDIX

Biologic	Mechanism of Action	Examples of Inflammatory Indications for Products*
Biologics		
Adalimumab SC Products (Humira®, biosimilars)	Inhibition of TNF	AS, CD, JIA, PsO, PsA, RA, UC
Cimzia® (certolizumab pegol SC injection)	Inhibition of TNF	AS, CD, nr-axSpA, PsO, PsA, RA
Etanercept SC Products (Enbrel®, biosimilars)	Inhibition of TNF	AS, JIA, PsO, PsA
Infliximab IV Products (Remicade®, biosimilars)	Inhibition of TNF	AS, CD, PsO, PsA, RA, UC
Simponi®, Simponi® Aria™ (golimumab SC injection, golimumab IV infusion)	Inhibition of TNF	SC formulation: AS, PsA, RA, UC
		IV formulation: AS, PsA, RA
Actemra® (tocilizumab IV infusion, tocilizumab SC injection)	Inhibition of IL-6	SC formulation: PJIA, RA, SJIA
		IV formulation: PJIA, RA, SJIA
Kevzara® (sarilumab SC injection)	Inhibition of IL-6	RA
Orencia® (abatacept IV infusion, abatacept SC injection)	T-cell costimulation modulator	SC formulation: JIA, PSA, RA
		IV formulation: JIA, PsA, RA
Rituximab IV Products (Rituxan®, biosimilars)	CD20-directed cytolytic antibody	RA
Kineret® (anakinra SC injection)	Inhibition of IL-1	JIA^, RA
Stelara® (ustekinumab SC injection, ustekinumab IV infusion)	Inhibition of IL-12/23	SC formulation: CD, PsO, PsA, UC
		IV formulation: CD, UC
Siliq™ (brodalumab SC injection)	Inhibition of IL-17	PsO

Cosentyx™ (secukinumab SC injection)	Inhibition of IL-17A	AS, nr-axSpA, PsO, PsA
Taltz® (ixekizumab SC injection)	Inhibition of IL-17A	AS, nr-axSpA, PsO, PsA
Ilumya™ (tildrakizumab-asmn SC injection)	Inhibition of IL-23	PsO
Skyrizi™ (risankizumab-rzaa SC injection)	Inhibition of IL-23	PsO
Tremfya™ (guselkumab SC injection)	Inhibition of IL-23	PsO
Entyvio™ (vedolizumab IV infusion)	Integrin receptor antagonist	CD, UC
Targeted Synthetic Disease-Modifying Antirheumatic Drugs		
Otezla® (apremilast tablets)	Inhibition of PDE4	PsO, PsA
Olumiant® (baricitinib tablets)	Inhibition of the JAK pathways	RA
Rinvoq® (upadacitinib extended-release tablets)	Inhibition of the JAK pathways	RA
Xeljanz®, Xeljanz XR (tofacitinib tablets, tofacitinib extended-release tablets)	Inhibition of the JAK pathways	RA, PsA, UC

* Not an all-inclusive list of indication (e.g., oncology indications and rare inflammatory conditions are not listed). Refer to the prescribing information for the respective agent for FDA-approved indications; SC – Subcutaneous; TNF – Tumor necrosis factor; AS – Ankylosing spondylitis; CD – Crohn's disease; JIA – Juvenile idiopathic arthritis; PsO – Plaque psoriasis; PsA – Psoriatic arthritis; RA – Rheumatoid arthritis; UC – Ulcerative colitis; nr-axSpA – Non-radiographic axial spondyloarthritis; IV – Intravenous; PJIA – Polyarticular juvenile idiopathic arthritis; SJIA – Systemic juvenile idiopathic arthritis; ^ Off-label use of Kineret in JIA supported in guidelines; JAK – Janus kinase.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Stelara Subcutaneous Prior Authorization Policy
- Stelara® (ustekinumab subcutaneous injection – Janssen Biotech)

REVIEW DATE: 08/05/2020

OVERVIEW

Stelara subcutaneous, an interleukin-12/23 blocker, is indicated for the following uses:[1]
- **Crohn's disease**, in patients ≥ 18 years of age with moderate to severe active disease.
- **Plaque psoriasis**, in patients ≥ 6 years of age with moderate to severe disease who are candidates for phototherapy or systemic therapy.
- **Psoriatic arthritis**, in patients ≥ 18 years of age with active disease, given alone or in combination with methotrexate.
- **Ulcerative colitis**, in patients ≥ 18 years of age with moderate to severe active disease.

A weight-based dose is administered by subcutaneous injection under the supervision of a physician or by the patient or a caregiver. For each condition, the pivotal trials for Stelara subcutaneous assessed a response to therapy on or before Month 3.

Guidelines

Guidelines for the treatment of inflammatory conditions recommend use of Stelara subcutaneous.
- **Crohn's Disease:** The American College of Gastroenterology has guidelines for Crohn's disease (2018).[2] Stelara is a treatment option in patients who have moderate to severe disease despite treatment with another agent (e.g., corticosteroid, thiopurine, methotrexate, or tumor necrosis factor inhibitors).
- **Plaque Psoriasis:** Guidelines (2019) from the American Academy of Dermatology and National Psoriasis Foundation recommend Stelara as a monotherapy treatment option or in combination with other therapies for adults with moderate to severe disease.[3]
- **Psoriatic Arthritis:** Guidelines from the American College of Rheumatology (2018) recommend Stelara after other agents (e.g., tumor necrosis factor inhibitors) have been tried.[4] Stelara may be

used in patients who have active disease despite treatment with other agents, particularly in those with concomitant inflammatory bowel disease.[4]

- **Ulcerative Colitis:** Stelara is not addressed in the 2019 American College of Gastroenterology guidelines for ulcerative colitis.[5] These guidelines note that the following agents can be used for induction of remission in moderately to severely active disease: Uceris (budesonide extended-release tablets); oral or intravenous systemic corticosteroids, Entyvio (vedolizuamb intravenous infusion), Xeljanz (tofacitinib tablets, extended-release tablets), or tumor necrosis factor inhibitors (adalimumab, Simponi SC, infliximab). Guidelines from the American Gastroenterological Association (2020) recommend Stelara for moderate to severe ulcerative colitis.[6]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Stelara subcutaneous. Because of the specialized skills required for evaluation and diagnosis of patients treated with Stelara subcutaneous as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Stelara SC to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration listed below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Stelara subcutaneous is recommended in those who meet the following criteria:

FDA-Approved Indications

10. Crohn's Disease. Approve for the duration noted if the patient meets ONE of the following (A or B):

C) Initial Therapy. Approve for 3 months if the patient meets the following criteria (i, ii, iii, and iv):

vi. Patient is ≥ 18 years of age; AND

vii. Patient meets one of the following conditions (a or b):

a) The patient has tried or is currently taking corticosteroids, or corticosteroids are contraindicated in this patient; OR

b) The patient has tried one conventional systemic therapy for Crohn's disease; AND

Note: Examples of conventional systemic therapy for Crohn's disease include azathioprine, 6-mercaptopurine, or methotrexate. An exception to the requirement for a trial of or contraindication to steroids or a trial of one other conventional systemic agent can be made if the patient has already tried at least one biologic. Refer to Appendix for examples of biologics used for Crohn's disease. These patients who have already received a biologic are not required to "step back" and try another agent.

viii. According to the prescriber, the patient will receive a single induction dose with Stelara intravenous within 2 months of initiating therapy with Stelara subcutaneous; AND

ix. The agent is prescribed by or in consultation with a gastroenterologist.

D) Patient is Currently Receiving Stelara Subcutaneous. Approve for 3 years if the patient has had a response to Stelara subcutaneous, as determined by the prescriber.

Note: Examples of a response to therapy include a decrease in symptoms such as diarrhea, pain, and/or bleeding; and/or improvement in erythrocyte sedimentation rate (ESR), C-reactive protein (CRP), complete blood count (CBC), and/or fecal calprotectin (fCal). The patient may not have a full response, but there should have been a recent or past response to Stelara.

Note: Patients with fistulizing Crohn's disease or Crohn's disease of the ileal pouch must meet the above criteria for Crohn's disease in adults.

11. Plaque Psoriasis. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets ALL of the following criteria (i, ii, and iii):

i. Patient is ≥ 6 years of age; AND

ii. Patient meets ONE of the following conditions (a or b):

a) Patient has tried at least one traditional systemic agent for psoriasis for at least 3 months, unless intolerant; OR

Note: Examples of traditional systemic agents used for psoriasis include methotrexate, cyclosporine, acitretin, or psoralen plus ultraviolet A light (PUVA). An exception to the requirement for a trial of one traditional systemic agent for psoriasis can be made if the patient has already has a 3-month trial or previous intolerance to at least one biologic. Refer to Appendix for examples of biologics used for plaque psoriasis. These patients who have already tried a biologic for psoriasis are not required to "step back" and try a traditional systemic agent for psoriasis.

b) Patient has a contraindication to methotrexate as determined by the prescriber; AND

iii. The agent is prescribed by or in consultation with a dermatologist.

B) Patient is Currently Receiving Stelara Subcutaneous. Approve for 3 years if the patient has responded, as determined by the prescriber.

Note: The patient may not have a full response, but there should have been a recent or past response to Stelara.

12. Psoriatic Arthritis. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if prescribed by or in consultation with a rheumatologist or a dermatologist.

B) Patient is Currently Receiving Stelara Subcutaneous. Approve for 3 years if the patient has responded, as determined by the prescriber.

Note: Examples of a response to therapy include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improvements in acute phase reactants (for example, C-reactive protein). The patient may not have a full response, but there should have been a recent or past response to Stelara.

13. Ulcerative Colitis. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets ALL of the following (i, ii, iii, and iv):

i. The patient ≥ to 18 years of age; AND

ii. The patient has had a trial of one systemic agent for ulcerative colitis; AND

Note: Examples include 6-mercaptopurine, azathioprine, cyclosporine, tacrolimus, or a corticosteroid such as prednisone, methylprednisolone. A trial of a biologic also counts as a trial of one systemic agent for ulcerative colitis. Refer to Appendix for examples of biologics used for ulcerative colitis.

iii. According to the prescriber, the patient will receive a single induction dose with Stelara intravenous within 2 months of initiating therapy with Stelara subcutaneous; AND

iv. The agent is prescribed by or in consultation with a gastroenterologist.

B) Patient is Currently Receiving Stelara Subcutaneous. Approve for 3 years if the patient has had a response to therapy, as determined by the prescriber.

Note: Examples of a response to therapy include decreased stool frequency or rectal bleeding.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Stelara SC is not recommended in the following situations:

11. **Ankylosing Spondylitis.** There are other biologic therapies indicated in ankylosing spondylitis (e.g., Cimzia, Enbrel, Humira, Remicade, Simponi SC, Cosentyx). More data are needed to demonstrate efficacy of Stelara in this condition. There is a published proof-of-concept trial evaluating Stelara in ankylosing spondylitis.[7] TOPAS was a prospective, open-label study evaluating Stelara 90 mg at Week 0, 4, and 16 in patients (n = 20) with ankylosing spondylitis After Week 16, patients were followed through Week 28. Patients who previously failed to respond to TNF blockers were excluded, but patients who discontinued a TNF for reasons other than lack of efficacy were allowed to enroll. The primary endpoint was a 40% improvement in disease activity at Week 24 according to the Assessment of SpondyloArthritis International Society (ASAS) criteria (ASAS40). Efficacy analysis was completed in the intent-to-treat population which included all patients who received at least one dose of Stelara. In all, 65% of patients (95% confidence interval [CI]: 41%, 85%; n = 13/20) achieved an ASAS40 response at Week 24. There was at least a 50% improvement of the BASDAI (Bath Ankylosing Spondylitis Disease Activity Index) achieved by 55% of patients (95% CI: 32%, 77%; n = 11/20); improvement in other secondary endpoints were also noted. However, enthesitis (measured by MASES [Maastricht AS Entheses Score] and SPARCC [SPondyloArthritis Research Consortium of Canada] enthesitis indices) and the number of swollen joints were not significantly improved at Week 24. There was a significant reduction of active inflammation on magnetic resonance imaging at Week 24 compared with baseline in sacroiliac joints.

12. **Concurrent Use with a Biologic or with a Targeted Synthetic Disease-Modifying Antirheumatic Drug (DMARD).** Stelara should not be administered in combination with another biologic agent or with a targeted synthetic DMARD used for an inflammatory condition (see Appendix for examples).[8] Combination therapy is generally not recommended due to a potential for a higher rate of adverse effects with combinations and lack of additive efficacy. Note: This does NOT exclude the use of conventional synthetic DMARDs (e.g., methotrexate leflunomide, hydroxychloroquine, and sulfasalazine) in combination with Stelara.

3. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual revision	**Plaque Psoriasis:** Add Ilumya and Cimzia as biologics that may have been tried prior to Stelara SC. **Conditions Not Recommended for Approval:** Remove exclusion for patients < 12 years of age (addressed in criteria). **Other:** Throughout the policy, remove criteria related to the dose (45 mg vs. 90 mg dose) approved in PA criteria (DQM now in place).	08/29/2018
Annual revision	**Crohn's Disease:** Move requirement that the patient be an adult into the criteria section for initial therapy. Further clarify that the patient must be 18 years of age or older. Previously, age was listed as part of the diagnosis without a specified age (i.e., previously listed as Crohn's disease in an adult) and applied to initial and continuation of therapy. For clarity, "according to the prescriber" was added to the criterion that requires induction with Stelara intravenous.	09/11/2019
Selected revision	**Ulcerative Colitis:** This condition was added to the policy as an FDA-approved use. Criteria approve if the patient is greater than or equal to 18 years of age, has tried one other systemic agent for UC, and the agent is prescribed by or in consultation with a gastroenterologist. Criteria also require that, according to the prescriber, the patient will receive a single induction dose with Stelara IV within 2 months of initiating therapy with Stelara SC. Initial approvals are for 3 months and continuation of therapy is for 3 years.	10/23/2019
Early annual revision	**Crohn's Disease:** Examples of biologics for Crohn's disease were moved to be included in the Appendix (previously listed in a Note in the criteria section). **Plaque Psoriasis:** To align with updated labeling, criteria were changed to approve in patients ≥ 6 years of age (previously approved in patients ≥ 12 years of age). Examples of biologics for plaque psoriasis were moved to be included in the Appendix (previously listed in a Note in the criteria section). **Ulcerative Colitis:** Examples of biologics for ulcerative colitis were moved to be included in the Appendix (previously listed in a Note in the criteria section).	08/05/2020

* Not an all-inclusive list of indication (e.g., oncology indications and rare inflammatory conditions are not listed). Refer to the prescribing information for the respective agent for FDA-approved indications; SC – Subcutaneous; TNF – Tumor necrosis factor; IV – Intravenous, IL – Interleukin; PDE4 – Phosphodiesterase 4; JAK – Janus kinase; AS – Ankylosing spondylitis; CD – Crohn's disease; JIA – Juvenile idiopathic arthritis; PsO – Plaque psoriasis; PsA – Psoriatic arthritis; RA – Rheumatoid arthritis; UC – Ulcerative colitis; nr-axSpA – Non-radiographic axial spondyloarthritis; ^ Off-label use of Kineret in JIA supported in guidelines.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Taltz® (ixekizumab for subcutaneous injection – Eli Lilly and Company)

DATE REVIEWED: 04/08/2020; selected revision 06/10/2020

OVERVIEW

Taltz, an interleukin (IL)-17A blocker, is indicated for the following uses:[1]

- **Ankylosing spondylitis**, in adults with active disease; AND
- **Non-radiographic axial spondyloarthritis**, in adults with active disease and objective signs of inflammation; AND

- **Plaque psoriasis**, in patients ≥ 6 years of age with moderate to severe disease who are candidates for systemic therapy or phototherapy; AND
- **Psoriatic arthritis**, in adults with active disease.

In the pivotal trial for non-radiographic axial spondyloarthritis, patients were required to have objective signs of inflammation, indicated by elevated C-reactive protein and/or sacroilitis on magnetic resonance imaging.

Guidelines

- **Spondyloarthritis:** Guidelines for ankylosing spondylitis and nonradiographic axial spondylitis are published by the American College of Rheumatology (ACR)/Spondylitis Association of America/Spondyloarthritis Research and Treatment Network (2019).[2] Following primary nonresponse to a TNFi, either Cosentyx or Taltz is recommended; however, if the patient is a secondary nonresponder, a second TNFi is recommended over switching out of the class. In patients with a contraindication to a TNFi, use of an IL blocker is recommended over traditional oral agents such as methotrexate or sulfasalazine.
- **Plaque Psoriasis:** Joint guidelines from the American Academy of Dermatology (AAD) and National Psoriasis Medical Board (2019) have been published for management of psoriasis with biologics.[3] These guidelines list Taltz as a monotherapy treatment option for patients with moderate to severe plaque psoriasis. Guidelines from the European Dermatology Forum (EDF) [2015] recommend biologics (i.e., etanercept, adalimumab, infliximab, Stelara SC) as second-line therapy for induction and long-term treatment if phototherapy and conventional systemic agents have failed, are contraindicated, or are not tolerated.[4]
- **Psoriatic Arthritis:** Guidelines from the American College of Rheumatology (ACR) [2019] recommend TNF inhibitors over other biologics for use in treatment-naïve patients with PsA and in those who were previously treated with an oral therapy.[5]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Taltz. Because of the specialized skills required for evaluation and diagnosis of patients treated with Taltz as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Taltz to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Taltz is recommended in those who meet the following criteria:

FDA-Approved Indications

Q) Ankylosing Spondylitis. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if prescribed by or in consultation with a rheumatologist.

B) Patient is Currently Receiving Taltz. Approve for 3 years if the patient has had a response, as determined by the prescriber.

Note: Examples of a response to therapy include decreased pain or stiffness, improved function or activities of daily living. The patient may not have a full response, but there should have been a

recent or past response to Taltz. The patient may not have a full response, but there should have been a recent or past response to Taltz.

2. Non-Radiographic Axial Spondyloarthritis. Approve for the duration noted if the patient meets ONE of the following (A or B):

C) Initial Therapy. Approve for 3 months if the patient meets BOTH of the following (i and ii):

i. The patient has objective signs of inflammation, defined as at least one of the following (a or b):

a) C-reactive protein elevated beyond the upper limit of normal for the reporting laboratory; OR

b) Sacroiliitis reported on magnetic resonance imaging; AND

ii. The agent is prescribed by or in consultation with a rheumatologist.

D) Patients Currently Receiving Taltz. Approve for 3 years if the patient has had a response, as determined by the prescriber.

Note: Examples of a response include decreased pain or stiffness, improved function or activities of daily living. The patient may not have a full response, but there should have been a recent or past response to Taltz.

R) Plaque Psoriasis. Approve Taltz for the duration noted if the patient meets ONE of the following conditions (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets ALL of the following criteria (i, ii, and iii):

i. The patient is ≥ 6 years of age; AND

ii. The patient meets ONE of the following conditions (a or b):

1. The patient has tried at least at least one traditional systemic agent for psoriasis for at least 3 months, unless intolerant; OR

Note: Examples include methotrexate (MTX), cyclosporine, acitretin [Soriatane®, generics], or psoralen plus ultraviolet A light (PUVA). An exception to the requirement for a trial of one traditional systemic agent for psoriasis can be made if the patient has already had a 3-month trial or previous intolerance to at least one biologic. Refer to **Appendix** for examples of biologics used for plaque psoriasis. These patients who have already tried a biologic for psoriasis are not required to "step back" and try a traditional systemic agent for psoriasis).

2. The patient has a contraindication to methotrexate (MTX), as determined by the prescribing physician; AND

iii. The agent is prescribed by or in consultation with a dermatologist.

B) Patient is Currently Receiving Taltz. Approve for 3 years if the patient has responded, as determined by the prescriber.

Note: The patient may not have a full response, but there should have been a recent or past response to Taltz.

S) Psoriatic Arthritis (PsA). Approve Taltz for the duration noted if the patient meets ONE of the following conditions (A or B):

A) Initial Therapy. Approve for 3 months if prescribed by or in consultation with a rheumatologist or a dermatologist.

B) Patient is Currently Receiving Taltz. Approve for 3 years if the patient has responded as determined by the prescriber.

Note: Examples of a response include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improvements in acute phase reactants [for example, C-reactive protein [CRP]). The patient may not have a full response, but there should have been a recent or past response to Taltz.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Taltz has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

108. Concurrent Use with other Biologics or with Targeted Synthetic Disease-Modifying Antirheumatic Drugs (DMARDs). Taltz should not be administered in combination with a biologic used for an inflammatory condition (see Appendix for examples). Combination therapy with biologics and/or biologics + targeted synthetic DMRADs has a potential for a higher rate of adverse effects and lack controlled trial data in support of additive efficacy.[6,7] Note: This does NOT exclude the use of MTX (a traditional systemic agent used to treat psoriasis) in combination with Taltz.

109. Inflammatory Bowel Disease (i.e., Crohn's disease, ulcerative colitis). Exacerbations of inflammatory bowel disease, in some cases serious, occurred in clinical trials with Taltz-treated patients.[1]

110. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Date Reviewed
Annual revision	References to Humira and Enbrel were reworded as adalimumab and etanercept products, respectively, with the innovator names listed as examples of these products. Renflexis and Erelzi were also added as respective examples of infliximab and etanercept products. Ilumya, Siliq, and Tremfya were added as examples of biologics that a patient may have previously tried for plaque psoriasis.	04/04/2018
Annual revision	**Plaque Psoriasis:** Add Cimzia to the list of biologics which may have been tried prior to approval of Taltz.	04/10/2019
Selected revision	**Ankylosing Spondylitis:** Add this new FDA-approved indication to the policy. Criteria approve for 3 months of initial therapy, if prescribed by or in consultation with a rheumatologist. For patients continuing therapy, approval is for 3 years, if patient has responded to therapy.	09/04/2019
Annual revision	**Plaque Psoriasis:** Criteria were changed to require patients be ≥ 6 years of age to receive Taltz for this indication. Previously, criteria required the patient to be an adult ≥ 18 years of age. **Conditions Not Recommended for Approval:** Patients < 18 years of age was removed from the Conditions Not Recommended for Approval.	04/08/2020

Selected revision	**Non-Radiographic Axial Spondyloarthritis:** This newly approved indication was added to the policy. Criteria approve for initial therapy for 3 months if prescribed by a rheumatologist and the patient has objective signs of inflammation, defined as C-reactive protein elevated beyond the upper limit of normal for the reporting or laboratory sacroiliitis reported on magnetic resonance imaging. For patients currently taking Taltz, criteria approve for 3 years if the patient has responded to therapy.	06/10/2020

* Not an all-inclusive list of indication (e.g., oncology indications and rare inflammatory conditions are not listed). Refer to the prescribing information for the respective agent for FDA-approved indications; SC – Subcutaneous; TNF – Tumor necrosis factor; IV – Intravenous, IL – Interleukin; PDE4 – Phosphodiesterase 4; JAK – Janus kinase; AS – Ankylosing spondylitis; CD – Crohn's disease; PJIA – Polyarticular juvenile idiopathic arthritis; PsO – Plaque psoriasis; PsA – Psoriatic arthritis; RA – Rheumatoid arthritis; SJIA – Systemic juvenile idiopathic arthritis; UC – Ulcerative colitis; ^ Off-label use of SJIA supported in guidelines.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Tremfya Prior Authorization Policy

- Tremfya™ (guselkumab for subcutaneous injection– Janssen Biotech/Johnson & Johnson)

REVIEW DATE: 07/22/2020

OVERVIEW

Tremfya, an interleukin (IL)-23 blocker, is indicated for the following uses:[1]

- **Plaque psoriasis**, in adults with moderate to severe disease who are candidates for systemic therapy or phototherapy.

- **Psoriatic arthritis**, in adults with active disease (given ± a conventional synthetic disease-modifying antirheumatic drug).

Guidelines

Joint guidelines from the American Academy of Dermatology and National Psoriasis Medical Board (2019) have been published for management of psoriasis with biologics.[2] These guidelines list Tremfya as a monotherapy treatment option for patients with moderate to severe plaque psoriasis. It is recommended that a response to therapy be ascertained after 12 weeks of continuous therapy. Guidelines from the European Dermatology Forum (2015) recommend biologics (i.e., etanercept, adalimumab, infliximab, Stelara SC) as second-line therapy for induction and long-term treatment if phototherapy and conventional systemic agents have failed, are contraindicated, or are not tolerated.[3]

Guidelines from the American College of Rheumatology/National Psoriasis Foundation (2018) were published prior to approval of Tremfya for psoriatic arthritis. However, these guidelines generally recommend tumor necrosis factor inhibitors as the first-line treatment strategy over other biologics (e.g., IL-17 blockers, IL-12/23 inhibitor) with differing mechanisms of action.[4]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Tremfya. Because of the specialized skills required for evaluation and diagnosis of patients treated with Tremfya as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Tremfya to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tremfya is recommended in those who meet the following criteria:

FDA-Approved Indications

T) Plaque Psoriasis. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets ALL of the following (i, ii, and iii):

i. Patient is an adult ≥ 18 years of age; AND

ii. Patient meets ONE of the following conditions (a or b):

a) Patient has tried at least at least one traditional systemic agent for psoriasis for at least 3 months, unless intolerant; OR

Note: Examples include methotrexate (MTX), cyclosporine, acitretin [Soriatane®, generics], or psoralen plus ultraviolet A light (PUVA). An exception to the requirement for a trial of one traditional systemic agent for psoriasis can be made if the patient has already had a 3-month trial or previous intolerance to at least one biologic for this condition. (Refer to **Appendix** for examples of biologics used for psoriasis.) These patients who have already tried a biologic for psoriasis are not required to "step back" and try a traditional systemic agent for psoriasis).

b) Patient has a contraindication to methotrexate, as determined by the prescriber; AND

iii. The requested agent is prescribed by or in consultation with a dermatologist.

B) Patient is Currently Receiving Tremfya. Approve for 3 years if the patient has responded, as determined by the prescriber. The patient may not have a full response, but there should have been a recent or past response to Tremfya.

U) Psoriatic Arthritis. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 3 months if Tremfya is prescribed by or in consultation with a rheumatologist or a dermatologist.

B) Patient is Currently Receiving Tremfya. Approve for 3 years if the patient has responded, as determined by the prescriber.

Note: Examples of a response include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improvements in acute phase reactants (for example, C-reactive protein). The patient may not have a full response, but there should have been a recent or past response to therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tremfya is not recommended in the following situations:

111. Concurrent Use with other Biologics or with Targeted Synthetic Disease-Modifying Antirheumatic Drugs (DMARDs). Data are lacking evaluating concomitant use of Tremfya in combination with another biologic or with a targeted synthetic DMARD for an inflammatory condition (see Appendix for examples). Combination therapy with biologics and/or biologics + targeted synthetic DMARDs has a potential for a higher rate of adverse effects and lack controlled trial data in support of additive efficacy.

Note: This does NOT exclude the use of MTX (a traditional systemic agent used to treat psoriasis) in combination with Tremfya.

112. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual revision	Plaque Psoriasis: • Update the list of previous therapies to include Ilumya and Cimzia. • References to Humira and Enbrel were reworded as adalimumab and etanercept products, respectively, with the innovator names listed as examples of these products. Renflexis was added as an example of an infliximab product.	08/01/2018
Annual revision	**Plaque Psoriasis:** For the exception applying to patients with a contraindication to methotrexate, wording was updated to more generally allow this determination by the prescriber (criteria previously specified this was according to the prescribing physician). Skyrizi was added to the list of biologics that the patient may have tried prior to Tremfya.	07/31/2019
Annual revision	**Plaque Psoriasis:** Examples of biologics for psoriasis were moved to be included in the Appendix (previously listed in a Note in the criteria section). **Psoriatic Arthritis:** This newly approved indication was added to the policy. Criteria approve for initial therapy for 3 months if prescribed by a rheumatologist or dermatologist. For patients currently taking, criteria approve for 3 years if the patient responded to therapy.	07/22/2020

Xeljanz®, Xeljanz XR (tofacitinib tablets, tofacitinib extended-release tablets)	Inhibition of the JAK pathways	RA, PsA, UC

* Not an all-inclusive list of indication (e.g., oncology indications and rare inflammatory conditions are not listed). Refer to the prescribing information for the respective agent for FDA-approved indications; SC – Subcutaneous; TNF – Tumor necrosis factor; IV – Intravenous, IL – Interleukin; PDE4 – Phosphodiesterase 4; JAK – Janus kinase; AS – Ankylosing spondylitis; CD – Crohn's disease; JIA – Juvenile idiopathic arthritis; PsO – Plaque psoriasis; PsA – Psoriatic arthritis; RA – Rheumatoid arthritis; UC – Ulcerative colitis; nr-axSpA – Non-radiographic axial spondyloarthritis; ^ Off-label use of Kineret in JIA supported in guidelines.

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Xeljanz/Xeljanz XR Prior Authorization Policy

- Xeljanz®/Xeljanz XR (tofacitinib tablets, oral solution/extended-release tablets – Pfizer)

REVIEW DATE: 07/15/2020; selected revision 10/07/2020 and 03/03/2021

OVERVIEW

Xeljanz/Xeljanz XR is an inhibitor of the Janus kinases (JAK) pathways.[1] Xeljanz/XR tablets are approved for the following uses:

- **Polyarticular juvenile idiopathic arthritis**, in patients ≥ 2 years of age with active disease. Note: This indication is for Xeljanz only (not the XR formulation).

- **Psoriatic arthritis**, in adults who have had an inadequate response or intolerance to methotrexate or other disease-modifying antirheumatic drugs (DMARDs). In psoriatic arthritis, Xeljanz/Xeljanz XR should be used in combination with a conventional synthetic DMARD.
- **Rheumatoid arthritis**, in adults with moderately to severely active disease who have had an inadequate response or intolerance to methotrexate.
- **Ulcerative colitis**, in adults with moderately to severely active disease who have had an inadequate response or who are intolerant to tumor necrosis factor inhibitors (TNFis).

Xeljanz oral solution is only indicated for **polyarticular juvenile idiopathic arthritis**.

For all indications, Xeljanz/Xeljanz XR is not recommended for use in combination with biologics or potent immunosuppressants such as azathioprine or cyclosporine.

Guidelines

Guidelines for treatment of inflammatory conditions recommend assessment of response to initial therapy, most often within 3 months of initiating or changing therapy. In ulcerative colitis, the Prescribing Information recommends discontinuation of Xeljanz/Xeljanz XR if adequate therapeutic response is not achieved by Week 16.

- **Juvenile idiopathic arthritis (JIA):** Xeljanz is not addressed in the American College of Rheumatology (ACR)/Arthritis Foundation guidelines for the treatment of JIA (2019) specific to juvenile non-systemic polyarthritis, sacroiliitis, and enthesitis.[2] TNFis are the biologics recommended for polyarthritis, sacroiliitis, enthesitis. Actemra® (tocilizumab intravenous, tocilizumab subcutaneous) and Orencia® (abatacept intravenous, abatacept intravenous) are also among the biologics recommended for polyarthritis. Biologics are recommended following other therapies (e.g., following DMARDs for active polyarthritis or following a nonsteroidal anti-inflammatory drug [NSAID] for active JIA with sacroiliitis or enthesitis). However, there are situations where initial therapy with a biologic may be preferred over other conventional therapies (e.g., if there is involvement of high-risk joints such as the cervical spine, wrist, or hip; high disease activity; and/or those judged to be at high risk of disabling joint damage).
- **Psoriatic arthritis:** Guidelines from ACR (2019) recommend TNFis over other biologics and Xeljanz for use in treatment-naïve patients with psoriatic arthritis and in those who were previously treated with an oral therapy.[3]
- **Rheumatoid arthritis:** Guidelines from ACR (2015) have TNFis and non-TNF biologics, administered with or without methotrexate, equally positioned as a recommended therapy following a trial of a conventional synthetic DMARD (e.g., methotrexate, leflunomide, hydroxychloroquine, sulfasalazine).[4]
- **Ulcerative colitis:** Guidelines from the American College of Gastroenterology for UC (2019) note that the following agents can be used for induction of remission in moderately to severely active disease: Uceris tablets; Oral or intravenous systemic corticosteroids Entyvio, Xeljanz, or TNFis (adalimumab, Simponi SC, infliximab).[5] Guidelines from the American Gastroenterological Association (2020) recommend Xeljanz only after failure of or intolerance to a TNFi.[6]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Xeljanz/Xeljanz XR. Because of the specialized skills required for evaluation and diagnosis of a patient treated with Xeljanz/Xeljanz XR as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Xeljanz/Xeljanz XR to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

All reviews for use of Xeljanz/Xeljanz XR for COVID-19 and/or cytokine release syndrome associated with COVID-19 will be forwarded to the Medical Director.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Xeljanz/Xeljanz XR is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Juvenile Idiopathic Arthritis (JIA) [or Juvenile Rheumatoid Arthritis] (regardless of type of onset)** [Note: This includes a patient with juvenile spondyloarthropathy/active sacroiliac arthritis]. Approve Xeljanz tablets (not the Xeljanz XR formulation) or oral solution for the duration noted if the patient meets ONE of the following (A or B):
   - **A)** Initial Therapy. Approve for 3 months if the patient meets the following criteria (i and ii):
     - **i.** Patient meets ONE of the following conditions (a or b):
       - **a)** Patient has tried one other medication for this condition; OR
         Note: Examples of other medications for JIA include methotrexate, sulfasalazine, or leflunomide, a nonsteroidal anti-inflammatory drug (NSAID) [e.g., ibuprofen, naproxen]. A previous trial of a biologic also counts as a trial of one medication. Refer to Appendix for examples of biologics used for JIA.
       - **b)** Patient has aggressive disease, as determined by the prescriber; AND
     - **ii.** The medication is prescribed by or in consultation with a rheumatologist.
   - **B)** Patient is Currently Receiving Xeljanz. Approve for 3 years if the patient had a response as determined by the prescriber.
     Note: Examples of a response include improvement in limitation of motion, less joint pain or tenderness, decreased duration of morning stiffness or fatigue, improved function or activities of daily living, reduced dosage of corticosteroids. The patient may not have a full response, but there should have been a recent or past response to Xeljanz.

2. **Psoriatic Arthritis.** Approve Xeljanz/XR tablets (not oral solution) for the duration noted if the patient meets ONE of the following criteria (A or B):
   - A) Initial Therapy. Approve for 3 months if the patient meets ALL of the following (i, ii, iii, and iv):
     - **i.** Patient is ≥ 18 years of age; AND
     - **ii.** Patient has tried ONE conventional synthetic disease-modifying antirheumatic drug (DMARD) for at least 3 months; AND
       Note: Examples include methotrexate (oral or injectable), leflunomide, hydroxychloroquine, and sulfasalazine. An exception to the requirement for a trial of one conventional synthetic DMARD can be made if the patient has already has a 3-month trial at least one biologic. Refer to Appendix for examples of biologics used for psoriatic arthritis. A patient who has already tried a biologic is not required to "step back" and try a conventional synthetic DMARD).
     - **iii.** The medication will be used concomitantly with methotrexate or another conventional synthetic DMARD, unless contraindicated; AND
       Note: Examples of other conventional synthetic DMARDs include leflunomide and sulfasalazine.
     - **iv.** The agent is prescribed by or in consultation with a rheumatologist or a dermatologist.
   - **B)** Patient is Currently Receiving Xeljanz/Xeljanz XR. Approve for 3 years if the patient meets BOTH of the following (i and ii):
     - **i.** The medication will be used concomitantly with methotrexate or another conventional synthetic DMARD, unless contraindicated; AND

Note: Examples of other conventional synthetic DMARDs include leflunomide and sulfasalazine.

ii. Patient has responded as determined by the prescriber.
Note: Examples of a response to therapy include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improvements in acute phase reactants (for example, C-reactive protein). The patient may not have a full response, but there should have been a recent or past response to Xeljanz/Xeljanz XR.

3. Rheumatoid Arthritis. Approve Xeljanz/XR tablets (not oral solution) for the duration noted if the patient meets ONE of the following criteria (A or B):

A) Initial Therapy. Approve for 3 months if the patient meets ALL of the following (i, ii, and iii):
- **i.** Patient is ≥ 18 years of age; AND
- **ii.** Patient has tried ONE conventional synthetic disease-modifying antirheumatic drug (DMARD) for at least 3 months; AND
  Note: Examples include methotrexate (oral or injectable), leflunomide, hydroxychloroquine, and sulfasalazine. An exception to the requirement for a trial of one conventional synthetic DMARD can be made if the patient has already has a 3-month trial at least one biologic. Refer to Appendix for examples of biologics used for rheumatoid arthritis. A patient who have already tried a biologic is not required to "step back" and try a conventional synthetic DMARD).
- **ii.** The medication is prescribed by or in consultation with a rheumatologist.

B) Patient is Currently Receiving Xeljanz/Xeljanz XR. Approve for 3 years if the patient has had a response, as determined by the prescriber.
Note: Examples of a response to therapy include less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improved laboratory values; reduced dosage of corticosteroids. The patient may not have a full response, but there should have been a recent or past response to Xeljanz/Xeljanz XR.

4. Ulcerative Colitis. Approve Xeljanz/XR tablets (not oral solution) for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 4 months if the patient meets ALL of the following (i, ii, and iii):
- **i.** Patient is ≥ 18 years of age; AND
- **ii.** Patient has had a trial of at least ONE tumor necrosis factor inhibitor for ulcerative colitis; AND
  Note: Examples of a tumor necrosis factor inhibitor include an adalimumab product, an infliximab product, Simponi SC (golimumab SC injection).
- **iii.** The agent is prescribed by or in consultation with a gastroenterologist.

B) Patient is Currently Receiving Xeljanz/Xeljanz XR. Approve for 3 years if the patient has had a response, as determined by the prescriber.
Note: Examples of a response include decreased stool frequency or rectal bleeding. The patient may not have a full response, but there should have been a recent or past response to Xeljanz/ Xeljanz XR.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Xeljanz/Xeljanz XR is not recommended in the following situations:

113. Concurrent Use with a Biologic or with a Targeted Synthetic DMARD. Xeljanz/XR should not be administered in combination with a biologic used for an inflammatory condition (see Appendix for examples).[1] Combination therapy is generally not recommended due to a potential for a higher rate of

adverse effects with combinations and lack of evidence supporting additive efficacy. There are no data evaluating combination of Xeljanz/XR with a targeted synthetic DMARD (e.g., Otezla); therefore, safety and efficacy of this combination is unknown.

114. Concurrent use with Other Potent Immunosuppressants (e.g., azathioprine, tacrolimus, cyclosporine, mycophenolate mofetil).[1] Coadministration with other potent immunosuppressive drugs has the risk of added immunosuppression and has not been evaluated in RA. In UC, Xeljanz is not recommended for use in combination with potent immunosuppressants such as azathioprine and cyclosporine.
Note: This does NOT exclude use of Xeljanz/Xeljanz XR with methotrexate for RA; Xeljanz/Xeljanz XR has been evaluated in patients with rheumatoid arthritis taking background methotrexate, leflunomide, or combinations of DMARDs containing methotrexate and/or leflunomide.

115. COVID-19 (Coronavirus Disease 2019). Forward all requests to the Medical Director.
Note: This includes requests for cytokine release syndrome associated with COVID-19.

116. Renal Transplantation. More data are needed. A Phase IIb study in kidney transplant patients (n = 331) found Xeljanz was equivalent to cyclosporine in preventing acute rejection.[7] However, based on Phase IIb studies, there are concerns of Epstein Barr Virus-associated post-transplant lymphoproliferative disorder (PTLD) in certain transplant patients receiving Xeljanz.[1,6]

117. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	**Rheumatoid arthritis:** Truxima was added as an example of a rituximab product.	06/18/2019
Selected Revision	**Ulcerative Colitis:** To align with updated labeling, revise criteria to approve if the patient has previously tried at least one tumor necrosis factor inhibitor for ulcerative colitis (previously, criteria required a trial of one systemic therapy, unless intolerant). Move the requirement that the patient is an adult into the criteria section for initial therapy. Clarify criteria to require the patient be ≥ 18 years of age. Previously, the requirement that the patient was an adult was listed as part of the diagnosis (i.e., previously listed as ulcerative colitis in an adult) and applied to initial and continuation. **Rheumatoid Arthritis:** To align with labeling, limit initial approval to adults ≥ 18 years of age.	07/31/2019

	Psoriatic Arthritis: To align with the labeling, limit initial approval to adults ≥ 18 years of age.	
Selected Revision	**Ulcerative Colitis:** Change policy to approve either Xeljanz or Xeljanz XR for this condition. Previously, only Xeljanz was able to be approved for this condition.	12/18/2019
Selected Revision	**COVID-19:** This indication (including use in cytokine release syndrome associated with COVID-19) was added to the policy as a Condition Not Recommended for Coverage. All reviews are directed to the Medical Director.	04/01/2020
Annual Revision	**Psoriatic Arthritis:** Examples of biologics for psoriatic arthritis were moved to be included in the Appendix (previously listed in a Note in the criteria section). **Rheumatoid Arthritis:** Examples of biologics for rheumatoid arthritis were moved to be included in the Appendix (previously listed in a Note in the criteria section).	07/15/2020
Selected Revision	**Juvenile Idiopathic Arthritis:** This approval condition was added to align with the new FDA approval for Xeljanz. Criteria approve Xeljanz (not the Xeljanz XR formulation) for 3 months if prescribed by or in consulation with a rheumatologist, and if the patient has tried one other medication for this condition, or if. according to the prescriber, the patient has aggressive disease. For a patient already taking Xeljanz, criteria approve for 3 years if the patient has responded to initial therapy.	10/07/2020
Selected Revision	Xeljanz oral solution was added to the policy. **Juvenile Idiopathic Arthritis:** Xeljanz solution was added as an approvable formulation for this indication.	03/03/2021

APPENDIX

Biologic	Mechanism of Action	Examples of Inflammatory Indications for Products*
Biologics		
Adalimumab SC Products (Humira®, biosimilars)	Inhibition of TNF	AS, CD, JIA, PsO, PsA, RA, UC
Cimzia® (certolizumab pegol SC injection)	Inhibition of TNF	AS, CD, nr-axSpA, PsO, PsA, RA
Etanercept SC Products (Enbrel®, biosimilars)	Inhibition of TNF	AS, JIA, PsO, PsA
Infliximab IV Products (Remicade®, biosimilars)	Inhibition of TNF	AS, CD, PsO, PsA, RA, UC
Simponi®, Simponi® Aria™ (golimumab SC injection, golimumab IV infusion)	Inhibition of TNF	SC formulation: AS, PsA, RA, UC
		IV formulation: AS, PJIA, PsA, RA
Actemra® (tocilizumab IV infusion, tocilizumab SC injection)	Inhibition of IL-6	SC formulation: PJIA, RA, SJIA
		IV formulation: PJIA, RA, SJIA
Kevzara® (sarilumab SC injection)	Inhibition of IL-6	RA
Orencia® (abatacept IV infusion, abatacept SC injection)	T-cell costimulation modulator	SC formulation: JIA, PSA, RA
		IV formulation: JIA, PsA, RA
Rituximab IV Products (Rituxan®, biosimilars)	CD20-directed cytolytic antibody	RA
Kineret® (anakinra SC injection)	Inhibition of IL-1	JIA^, RA
Stelara® (ustekinumab SC injection, ustekinumab IV infusion)	Inhibition of IL-12/23	SC formulation: CD, PsO, PsA, UC
		IV formulation: CD, UC
Siliq™ (brodalumab SC injection)	Inhibition of IL-17	PsO
Cosentyx™ (secukinumab SC injection)	Inhibition of IL-17A	AS, nr-axSpA, PsO, PsA
Taltz® (ixekizumab SC injection)	Inhibition of IL-17A	AS, nr-axSpA, PsO, PsA
Ilumya™ (tildrakizumab-asmn SC injection)	Inhibition of IL-23	PsO
Skyrizi™ (risankizumab-rzza SC injection)	Inhibition of IL-23	PsO
Tremfya™ (guselkumab SC injection)	Inhibition of IL-23	PsO
Entyvio™ (vedolizumab IV infusion)	Integrin receptor antagonist	CD, UC
Targeted Synthetic DMARDs		
Otezla® (apremilast tablets)	Inhibition of PDE4	PsO, PsA
Olumiant® (baricitinib tablets)	Inhibition of the JAK pathways	RA
Rinvoq® (upadacitinib extended-release tablets)	Inhibition of the JAK pathways	RA
Xeljanz® (tofacitinib tablets)	Inhibition of the JAK pathways	RA, PJIA, PsA, UC
Xeljanz® XR (tofacitinib extended-release tablets)	Inhibition of the JAK pathways	RA, PsA, UC

* Not an all-inclusive list of indication (e.g., oncology indications and rare inflammatory conditions are not listed). Refer to the prescribing information for the respective agent for FDA-approved indications; SC – Subcutaneous; TNF – Tumor necrosis factor; IV – Intravenous, IL – Interleukin; PDE4 – Phosphodiesterase 4; JAK – Janus kinase; AS – Ankylosing spondylitis; CD – Crohn's disease; JIA – Juvenile idiopathic arthritis; PsO – Plaque psoriasis; PsA – Psoriatic arthritis; RA – Rheumatoid arthritis; UC – Ulcerative colitis; nr-axSpA – Non-radiographic axial spondyloarthritis; ^ Off-label use of Kineret in JIA supported in guidelines; DMARDs – Disease-modifying antirheumatic drug.

PRIOR AUTHORIZATION POLICY

POLICY: Interferon – Actimmune® (interferon gamma-1b subcutaneous injection – Horizon Pharma)

DATE REVIEWED: 04/15/2020

OVERVIEW

Actimmune is indicated for reducing the frequency and severity of serious infections associated with chronic granulomatous disease (CGD) of patients ≥ 1 year of age.[1] Actimmune is also indicated for delaying time to disease progression age with severe, malignant osteopetrosis (SMO) of patients ≥ 1 month of age. Actimmune has shown a treatment-related enhancement of superoxide production by phagocytes and was found to enhance osteoclast function in vivo. Actimmune, an interferon gamma, is a single-chain polypeptide containing 140 amino acids. Specific effects

of interferon gamma include the enhancement of the oxidative metabolism of macrophages, antibody dependent cellular cytotoxicity, activation of natural killer cells, and the expression of Fc receptors and major histocompatibility antigens.[1]

Disease Overview

Chronic Granulomatous Disease

CGD is an inherited primary immunodeficiency caused by functional impairment of the dihydronicotinamide-adenine dinucleotide phosphate (NADPH) oxidase complex in neutrophilic granulocytes and monocytes characterized by recurrent and severe infections, dysregulated inflammation, and autoimmunity.[2] CGD may present any time from infancy to late adulthood; however, the vast majority of affected individuals are diagnosed before age five years.[3] Some people with chronic granulomatous disease do not have any identified mutation gene. The cause of the condition in these individuals is unknown.[4] Mutations in the CYBA, CYBB, NCF1, NCF2, or NCF4 gene can cause CGD.
The American Academy of Allergy, Asthma & Immunology (AAAAI) and the American College of Allergy, Asthma & Immunology (ACAAI) have jointly accepted responsibility for establishing the practice parameter for the diagnosis and management of primary immunodeficiency.[5] Screening for CGD should include direct measurement of superoxide production (nitroblue tetrazolium reduction test [NBT] or dihydrorhodamine 123 [DHR] oxidation test) confirmed with testing for genetic mutation in the genes that make up the NADPH.[6] Neutrophils from a small sample of peripheral blood are activated to produce superoxide which is detected by the NBT, which is converted from a yellow water-soluble compound to a dark-blue insoluble formazan that can be clearly detected microscopically. Activation of neutrophils with phorbol myristate acetate results in oxidation of DHR to a fluorescent compound, rhodamine 123, which can be measured by flow cytometry. Flow cytometry can distinguish between the different genetic forms of CGD. Summary statement 153 of the practice parameter recommends patients with CGD be given prophylaxis with antimicrobial agents and Actimmune.

Severe, Malignant Osteopetrosis

SMO is an inherited disorder characterized by an osteoclast defect, leading to bone density overgrowth, and by deficient phagocyte oxidative metabolism. This leads to accumulation of bone with defective structure, making them brittle and susceptible to fracture. In some cases, this is also accompanied by skeletal abnormalities.[7] About thirty percent of all cases of osteopetrosis the cause of the condition is unknown, however, nine gene-related mutations are associated with osteopetrosis (CA2, CLCN7, IKBKG, ITGB3, OSTM1, PLEKHM1, TCIRG1, TNFRSF11A, TNFSF11).[8] The Osteopetrosis Working Group developed expert consensus guidelines for the diagnosis and management of osteopetrosis.[9] The guidelines recommend diagnosis is determined by classic radiographic (X-ray) features of osteopetrosis followed up by genetic testing to differentiate between the different forms of osteopetrosis with unique complications. The guidelines suggests the use of Actimmune to be considered experimental in noninfantile osteopetrosis with limited clinical experience. Furthermore, acknowledging the FDA indication for SMO and advising the indication pertains only to severe infantile osteopetrosis.

In both disorders, the exact mechanism(s) of Actimmune's treatment effect has not been established. Changes in superoxide levels during Actimmune therapy do not predict efficacy and should not be used to assess patient response to therapy.[1]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Actimmune. Because of the specialized skills required for evaluation and diagnosis of patients treated with Actimmune as well as the monitoring required for adverse events and long-term efficacy, approval requires Actimmune to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Actimmune is recommended in those who meet the following criteria:

FDA-Approved Indications

116. Chronic Granulomatous Disease. Approve for 1 year if the patient meets of the following criteria (A and B):

A) Diagnosis has been established by a molecular genetic test identifying a gene-related mutation linked to chronic granulomatous disease; AND

Note: Examples of gene-related mutations linked to chronic granulomatous disease include biallelic pathogenic variants in *CYBA*, *CYBB*, *NCF1*, *NCF2*, and *NCF4*.

B) The medication is prescribed by, or in consultation with, an immunologist.

117. Malignant Osteopetrosis, Severe Infantile. Approve for 1 year if the patient meets of the following criteria (A and B):

A) Diagnosis has been established by one of the following (i or ii)

i. Patient has had a radiographic (X-ray) imaging demonstrating skeletal features related to osteopetrosis; OR

ii. Patient has had a molecular genetic test identifying a gene-related mutation linked to malignant osteopetrosis, severe infantile; AND

B) The medication is prescribed by, or in consultation with, an endocrinologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Actimmune has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

118. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Iron Replacement – Feraheme Prior Authorization Policy

- Feraheme® (ferumoxytol injection for intravenous use – AMAG Pharmaceuticals)

REVIEW DATE: 12/16/2020

OVERVIEW

Feraheme, an iron replacement product, is indicated for the **treatment of iron deficiency anemia** in patients ≥ 18 years of age for the following uses:[1]

- **Chronic kidney disease** (CKD).
- **Intolerance to oral iron or have had unsatisfactory response to oral iron**.

Guidelines

The KDIGO guidelines for anemia in CKD (2012) make various recommendations regarding iron therapy.[2] For adults with CKD and anemia not on iron or erythroid stimulating agent (ESA) therapy, a trial of intravenous (IV) iron (or in non-dialysis patients with CKD, alternatively, a 1 to 3 month trial of oral iron therapy) is recommended if an increase in Hb concentration without starting ESA treatment is desired and transferrin saturation (TSAT) is ≤ 30% and ferritin is ≤ 500 ng/mL. For adults with CKD on ESA therapy who are not receiving iron supplementation, a trial of IV iron (or in non-dialysis CKD patients, alternatively, a 1 to 3 month trial of oral iron therapy) is recommended if an increase in Hb concentration or a decrease in ESA dose is desired and TSAT is ≤ 30% and ferritin is ≤ 500 ng/mL. For all pediatric patients with CKD with anemia not on iron or ESA therapy, oral iron (or IV iron in patients receiving hemodialysis) is recommended when TSAT is ≤ 20% and ferritin is ≤ 100 ng/mL. For all pediatric patients with CKD who are receiving ESA therapy but not receiving iron supplementation, it is recommended to administer oral iron (or IV iron for patients receiving hemodialysis) to maintain TSAT > 20% and ferritin > 100 ng/dL.

The National Comprehensive Cancer Network guidelines on Hematopoietic Growth Factors (version 2.2020 – January 27, 2020) discuss the management of cancer- and chemotherapy-induced anemia.[3] IV iron therapy is considered an option for patients with absolute iron deficiency (ferritin < 30 ng/mL and TSAT < 20%), functional iron deficiency (ferritin = 30 to 500 ng/mL and TSAT < 50%), and possible functional iron deficiency (ferritin = 501 to 800 ng/mL and TSAT < 50%).

A 2017 focused update of the 2013 American College of Cardiology Foundation/American Heart Association guideline for the management of heart failure.[4] It states that in patients with New York Heart Association class II or III heart failure, absolute iron deficiency (ferritin < 100 ng/mL) or functional iron deficiency (ferritin = 100 to 300 mg/mL if transferring saturation is < 20%), and with or without anemia, IV iron replacement may be reasonable to improve function status and quality of life.[4] Benefits noted with IV iron therapies included improvement in functional capacity, improvements in the six-minute walk test and improved functional capacity.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Feraheme. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Feraheme as well as the monitoring required for adverse events and long-term efficacy, approval requires Feraheme to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Feraheme is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Iron Deficiency Anemia in Patients with Chronic Kidney Disease who are on Dialysis**. Approve for 3 years.

2. **Iron Deficiency Anemia in Patients with Chronic Kidney Disease who are not on Dialysis**. Approve for 1 year if the patient meets the following criteria (A and B):
   A) Patient is ≥ 18 years of age; AND
   B) Feraheme is prescribed by, or in consultation with a nephrologist or hematologist.

3. **Iron Deficiency Anemia, Other.** Approve for 1 year if the patient meets the following (A and B):
   A) Patient is ≥ 18 years of age; AND
   B) Patient meets one of the following (i, ii, iii, or iv):
      i. Patient meets both of the following (a and b):
         a) Patient has tried oral iron supplementation; AND
         b) According to the prescriber, oral iron supplementation was ineffective or intolerable; OR
      ii. Patient has a condition which, per the prescriber, will interfere with oral iron absorption (e.g., inflammatory bowel disease, Crohn's disease); OR
      iii. Patient is currently receiving an erythroid stimulating agent; OR
      Note: Examples of erythroid stimulating agents include an epoetin alfa product, a darbepoetin alfa product, or a methoxy polyethylene glycol-epoetin beta product.
      iv. The medication is being requested for cancer- or chemotherapy-related anemia.

Other Uses with Supportive Evidence

4. **Iron Deficiency Associated with Heart Failure.** Approve for 1 year if the patient meets the following criteria (A and B):
   A) Patient is ≥ 18 years of age; AND
   B) Feraheme is being prescribed by, or in consultation with a cardiologist or hematologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Feraheme is not recommended in the following situations:

120. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Iron Replacement – Ferrlecit Prior Authorization Policy

- Ferrlecit® (sodium ferric gluconate complex in sucrose injection for intravenous use – sanofi-aventis)

REVIEW DATE: 12/16/2020

OVERVIEW

Ferrlecit, an iron replacement product, is indicated for the **treatment of iron deficiency anemia** in patients ≥ 6 years of age with **chronic kidney disease** (CKD) **receiving hemodialysis** who are receiving supplemental epoetin therapy.[1]

Guidelines

The KDIGO guidelines for anemia in CKD (2012) make various recommendations regarding iron therapy.[2] For adults with CKD and anemia not on iron or erythroid stimulating agent (ESA) therapy, a trial of intravenous (IV) iron (or in non-dialysis patients with CKD, alternatively, a 1 to 3 month trial of oral iron therapy) is recommended if an increase in Hb concentration without starting ESA treatment is desired and transferrin saturation (TSAT) is ≤ 30% and ferritin is ≤ 500 ng/mL. For adults with CKD on ESA therapy who are not receiving iron supplementation, a trial of IV iron (or in non-dialysis CKD patients, alternatively, a 1 to 3 month trial of oral iron therapy) is recommended if an increase in Hb concentration or a decrease in ESA dose is desired and TSAT is ≤ 30% and ferritin is ≤ 500 ng/mL. For all pediatric patients with CKD with anemia not on iron or ESA therapy, oral iron (or IV iron in patients receiving hemodialysis) is recommended when TSAT is ≤ 20% and ferritin is ≤ 100 ng/mL. For all pediatric patients with CKD who are receiving ESA therapy but not receiving iron supplementation, it is recommended to administer oral iron (or IV iron for patients receiving hemodialysis) to maintain TSAT > 20% and ferritin > 100 ng/dL.

The National Comprehensive Cancer Network guidelines on Hematopoietic Growth Factors (version 2.2020 – January 27, 2020) discuss the management of cancer- and chemotherapy-induced anemia.[3] IV iron therapy is considered an option for patients with absolute iron deficiency (ferritin < 30 ng/mL and TSAT < 20%), functional iron deficiency (ferritin = 30 to 500 ng/mL and TSAT < 50%), and possible functional iron deficiency (ferritin = 501 to 800 ng/mL and TSAT < 50%).

A 2017 focused update of the 2013 American College of Cardiology Foundation/American Heart Association guideline for the management of heart failure.[4] It states that in patients with New York Heart Association class II or III heart failure, absolute iron deficiency (ferritin < 100 ng/mL) or functional iron deficiency (ferritin = 100 to 300 mg/mL if transferring saturation is < 20%), and with or without anemia, IV iron replacement may be reasonable to improve function status and quality of life.[4] Benefits noted with IV iron therapies included improvement in functional capacity, improvements in the six-minute walk test and improved functional capacity.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Ferrlecit. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Ferrlecit as well as the monitoring required for adverse events and long-term efficacy, approval requires Ferrlecit to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Ferrlecit is recommended in those who meet the following criteria:

FDA-Approved Indications

5. **Iron Deficiency Anemia in Patients with Chronic Kidney Disease who are on Dialysis**. Approve for 3 years.

Other Uses with Supportive Evidence

6. **Iron Deficiency Anemia in Patients with Chronic Kidney Disease who are not on Dialysis**. Approve for 1 year if the patient meets the following criteria (A and B):
   - **C)** Patient is ≥ 6 years of age; AND
   - **D)** Ferrlecit is prescribed by, or in consultation with a nephrologist or hematologist.

7. **Iron Deficiency Anemia, Other.** Approve for 1 year if the patient meets the following (A and B):
   - **C)** Patient is ≥ 6 years of age; AND
   - **D)** Patient meets one of the following (i, ii, iii, or iv):
     - **i.** Patient meets both of the following (a and b):
       - **a)** Patient has tried oral iron supplementation; AND
       - **b)** According to the prescriber, oral iron supplementation was ineffective or intolerable; OR
     - **ii.** Patient has a condition which, per the prescriber, will interfere with oral iron absorption (e.g., inflammatory bowel disease, Crohn's disease); OR
     - **iii.** Patient is currently receiving an erythroid stimulating agent; OR
       Note: Examples of erythroid stimulating agents include an epoetin alfa product, a darbepoetin alfa product, or a methoxy polyethylene glycol-epoetin beta product.
     - **iv.** The medication is being requested for cancer- or chemotherapy-related anemia.

8. **Iron Deficiency Associated with Heart Failure.** Approve for 1 year if the patient meets the following criteria (A and B):
   - **C)** Patient is ≥ 6 years of age; AND
   - **D)** Ferrlecit is being prescribed by, or in consultation with a cardiologist or hematologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Ferrlecit is not recommended in the following situations:

121. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

- INFeD® (iron dextran injection for intravenous or intramuscular use – Actavis Pharma)

REVIEW DATE: 12/16/2020

OVERVIEW

INFeD, an iron replacement product, is indicated for the treatment of patients with documented **iron deficiency in whom oral administration is unsatisfactory or impossible**.[1]

Guidelines

The KDIGO guidelines for anemia in CKD (2012) make various recommendations regarding iron therapy.[2] For adults with CKD and anemia not on iron or erythroid stimulating agent (ESA) therapy, a trial of intravenous (IV) iron (or in non-dialysis patients with CKD, alternatively, a 1 to 3 month trial of oral iron therapy) is recommended if an increase in Hb concentration without starting ESA treatment is desired and transferrin saturation (TSAT) is ≤ 30% and ferritin is ≤ 500 ng/mL. For adults with CKD on ESA therapy who are not receiving iron supplementation, a trial of IV iron (or in non-dialysis CKD patients, alternatively, a 1 to 3 month trial of oral iron therapy) is recommended if an increase in Hb concentration or a decrease in ESA dose is desired and TSAT is ≤ 30% and ferritin is ≤ 500 ng/mL. For all pediatric patients with CKD with anemia not on iron or ESA therapy, oral iron (or IV iron in patients receiving hemodialysis) is recommended when TSAT is ≤ 20% and ferritin is ≤ 100 ng/mL. For all pediatric patients with CKD who are receiving ESA therapy but not receiving iron supplementation, it is recommended to administer oral iron (or IV iron for patients receiving hemodialysis) to maintain TSAT > 20% and ferritin > 100 ng/dL.

The National Comprehensive Cancer Network guidelines on Hematopoietic Growth Factors (version 2.2020 – January 27, 2020) discuss the management of cancer- and chemotherapy-induced anemia.[3] IV iron therapy is considered an

option for patients with absolute iron deficiency (ferritin < 30 ng/mL and TSAT < 20%), functional iron deficiency (ferritin = 30 to 500 ng/mL and TSAT < 50%), and possible functional iron deficiency (ferritin = 501 to 800 ng/mL and TSAT < 50%).

A 2017 focused update of the 2013 American College of Cardiology Foundation/American Heart Association guideline for the management of heart failure.[4] It states that in patients with New York Heart Association class II or III heart failure, absolute iron deficiency (ferritin < 100 ng/mL) or functional iron deficiency (ferritin = 100 to 300 mg/mL if transferring saturation is < 20%), and with or without anemia, IV iron replacement may be reasonable to improve function status and quality of life.[4] Benefits noted with IV iron therapies included improvement in functional capacity, improvements in the six-minute walk test and improved functional capacity.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of INFeD. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with INFeD as well as the monitoring required for adverse events and long-term efficacy, approval requires INFeD to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of INFeD is recommended in those who meet the following criteria:

FDA-Approved Indications

9. Iron Deficiency Anemia, Other. Approve for 1 year if the patient meets one of the following (A, B, C, or D):
- **E)** Patient meets both of the following (i and ii):
  - **i.** Patient has tried oral iron supplementation; AND
  - **ii.** According to the prescriber, oral iron supplementation was ineffective or intolerable; OR
- **F)** Patient has a condition which, per the prescriber, will interfere with oral iron absorption (e.g., inflammatory bowel disease, Crohn's disease); OR
- **G)** Patient is currently receiving an erythroid stimulating agent; OR
  Note: Examples of erythroid stimulating agents include an epoetin alfa product, a darbepoetin alfa product, or a methoxy polyethylene glycol-epoetin beta product.
- **H)** The medication is being requested for cancer- or chemotherapy-related anemia.

Other Uses with Supportive Evidence

10. Iron Deficiency Anemia in Patients with Chronic Kidney Disease who are on Dialysis. Approve for 3 years.

11. Iron Deficiency Anemia in Patients with Chronic Kidney Disease who are not on Dialysis. Approve for 1 year if the medication is prescribed by, or in consultation with a nephrologist or hematologist.

12. Iron Deficiency Associated with Heart Failure. Approve for 1 year if the medication is being prescribed by, or in consultation with a cardiologist or hematologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of INFeD is not recommended in the following situations:

122. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Iron Replacement – Injectafer Prior Authorization Policy

- Injectafer® (ferric carboxymaltose injection for intravenous use – American Regent)

REVIEW DATE: 12/16/2020

OVERVIEW

Injectafer, an iron replacement product, is indicated for the **treatment of iron deficiency anemia** in patients ≥ 18 years of age for the following uses:[1]

- **Intolerance to oral iron or have had unsatisfactory response to oral iron**.
- **Non-dialysis chronic kidney disease** (CKD).

Guidelines

The KDIGO guidelines for anemia in CKD (2012) make various recommendations regarding iron therapy.[2] For adults with CKD and anemia not on iron or erythroid stimulating agent (ESA) therapy, a trial of intravenous (IV) iron (or in non-dialysis patients with CKD, alternatively, a 1 to 3 month trial of oral iron therapy) is recommended if an increase in Hb concentration without starting ESA treatment is desired and transferrin saturation (TSAT) is ≤ 30% and ferritin is ≤ 500 ng/mL. For adults with CKD on ESA therapy who are not receiving iron supplementation, a trial of IV iron (or in non-dialysis CKD patients, alternatively, a 1 to 3 month trial of oral iron therapy) is recommended if an increase in Hb concentration or a decrease in ESA dose is desired and TSAT is ≤ 30% and ferritin is ≤ 500 ng/mL. For all pediatric patients with CKD with anemia not on iron or ESA therapy, oral iron (or IV iron in patients receiving hemodialysis) is recommended when TSAT is ≤ 20% and ferritin is ≤ 100 ng/mL. For all pediatric patients with CKD who are receiving ESA therapy but not receiving iron supplementation, it is recommended to administer oral iron (or IV iron for patients receiving hemodialysis) to maintain TSAT > 20% and ferritin > 100 ng/dL.

The National Comprehensive Cancer Network guidelines on Hematopoietic Growth Factors (version 2.2020 – January 27, 2020) discuss the management of cancer- and chemotherapy-induced anemia.[3] IV iron therapy is considered an option for patients with absolute iron deficiency (ferritin < 30 ng/mL and TSAT < 20%), functional iron deficiency (ferritin = 30 to 500 ng/mL and TSAT < 50%), and possible functional iron deficiency (ferritin = 501 to 800 ng/mL and TSAT < 50%).

A 2017 focused update of the 2013 American College of Cardiology Foundation/American Heart Association guideline for the management of heart failure.[4] It states that in patients with New York Heart Association class II or III heart failure, absolute iron deficiency (ferritin < 100 ng/mL) or functional iron deficiency (ferritin = 100 to 300 mg/mL if transferring saturation is < 20%), and with or without anemia, IV iron replacement may be reasonable to improve function status and quality of life.[4] Benefits noted with IV iron therapies included improvement in functional capacity, improvements in the six-minute walk test and improved functional capacity.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Injectafer. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Injectafer as well as the monitoring required for adverse events and long-term efficacy, approval requires Injectafer to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Injectafer is recommended in those who meet the following criteria:

FDA-Approved Indications

13. **Iron Deficiency Anemia in Patients with Chronic Kidney Disease who are not on Dialysis**. Approve for 1 year if the patient meets the following criteria (A and B):
    - **E)** Patient is ≥ 18 years of age; AND
    - **F)** Injectafer is prescribed by, or in consultation with a nephrologist or hematologist.

14. **Iron Deficiency Anemia, Other.** Approve for 1 year if the patient meets the following (A and B):
    - **I)** Patient is ≥ 18 years of age; AND
    - **J)** Patient meets one of the following (i, ii, iii, or iv):
        - **i.** Patient meets both of the following (a and b):
            - **a)** Patient has tried oral iron supplementation; AND
            - **b)** According to the prescriber, oral iron supplementation was ineffective or intolerable; OR
        - **ii.** Patient has a condition which, per the prescriber, will interfere with oral iron absorption (e.g., inflammatory bowel disease, Crohn's disease); OR
        - **iii.** Patient is currently receiving an erythroid stimulating agent; OR
          Note: Examples of erythroid stimulating agents include an epoetin alfa product, a darbepoetin alfa product, or a methoxy polyethylene glycol-epoetin beta product.
        - **iv.** The medication is being requested for cancer- or chemotherapy-related anemia.

Other Uses with Supportive Evidence

15. **Iron Deficiency Anemia in Patients with Chronic Kidney Disease who are on Dialysis**. Approve for 3 years.

16. **Iron Deficiency Associated with Heart Failure.** Approve for 1 year if the patient meets the following criteria (A and B):
    - **E)** Patient is ≥ 18 years of age; AND
    - **F)** Injectafer is being prescribed by, or in consultation with a cardiologist or hematologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Injectafer is not recommended in the following situations:

123. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Iron Replacement – Monoferric Prior Authorization Policy

- Monoferric® (ferric derisomaltose injection for intravenous use – Pharmacosmos)

REVIEW DATE: 12/16/2020

OVERVIEW

Feraheme, an iron replacement product, is indicated for the **treatment of iron deficiency anemia** in patients ≥ 18 years of age for the following uses:[1]

- **Chronic kidney disease** (CKD).
- **Intolerance to oral iron or have had unsatisfactory response to oral iron**.

Guidelines

The KDIGO guidelines for anemia in CKD (2012) make various recommendations regarding iron therapy.[2] For adults with CKD and anemia not on iron or erythroid stimulating agent (ESA) therapy, a trial of intravenous (IV) iron (or in non-dialysis patients with CKD, alternatively, a 1 to 3 month trial of oral iron therapy) is recommended if an increase in Hb concentration without starting ESA treatment is desired and transferrin saturation (TSAT) is ≤ 30% and ferritin is ≤ 500 ng/mL. For adults with CKD on ESA therapy who are not receiving iron supplementation, a trial of IV iron (or in non-dialysis CKD patients, alternatively, a 1 to 3 month trial of oral iron therapy) is recommended if an increase in Hb concentration or a decrease in ESA dose is desired and TSAT is ≤ 30% and ferritin is ≤ 500 ng/mL. For all pediatric patients with CKD with anemia not on iron or ESA therapy, oral iron (or IV iron in patients receiving hemodialysis) is recommended when TSAT is ≤ 20% and ferritin is ≤ 100 ng/mL. For all pediatric patients with CKD who are receiving ESA therapy but not receiving iron supplementation, it is recommended to administer oral iron (or IV iron for patients receiving hemodialysis) to maintain TSAT > 20% and ferritin > 100 ng/dL.

The National Comprehensive Cancer Network guidelines on Hematopoietic Growth Factors (version 2.2020 – January 27, 2020) discuss the management of cancer- and chemotherapy-induced anemia.[3] IV iron therapy is considered an option for patients with absolute iron deficiency (ferritin < 30 ng/mL and TSAT < 20%), functional iron deficiency (ferritin = 30 to 500 ng/mL and TSAT < 50%), and possible functional iron deficiency (ferritin = 501 to 800 ng/mL and TSAT < 50%).

A 2017 focused update of the 2013 American College of Cardiology Foundation/American Heart Association guideline for the management of heart failure.[4] It states that in patients with New York Heart Association class II or III heart failure, absolute iron deficiency (ferritin < 100 ng/mL) or functional iron deficiency (ferritin = 100 to 300 mg/mL if transferring saturation is < 20%), and with or without anemia, IV iron replacement may be reasonable to

improve function status and quality of life.[4] Benefits noted with IV iron therapies included improvement in functional capacity, improvements in the six-minute walk test and improved functional capacity.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Monoferric. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Monoferric as well as the monitoring required for adverse events and long-term efficacy, approval requires Monoferric to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Monoferric is recommended in those who meet the following criteria:

FDA-Approved Indications

17. Iron Deficiency Anemia in Patients with Chronic Kidney Disease who are not on Dialysis. Approve for 1 year if the patient meets the following criteria (A and B):
- **G)** Patient is ≥ 18 years of age; AND
- **H)** Monoferric is prescribed by, or in consultation with a nephrologist or hematologist.

18. Iron Deficiency Anemia, Other. Approve for 1 year if the patient meets the following (A and B):
- **K)** Patient is ≥ 18 years of age; AND
- **L)** Patient meets one of the following (i, ii, iii, or iv):
  - **i.** Patient meets both of the following (a and b):
    - **a)** Patient has tried oral iron supplementation; AND
    - **b)** According to the prescriber, oral iron supplementation was ineffective or intolerable; OR
  - **ii.** Patient has a condition which, per the prescriber, will interfere with oral iron absorption (e.g., inflammatory bowel disease, Crohn's disease); OR
  - **iii.** Patient is currently receiving an erythroid stimulating agent; OR
    Note: Examples of erythroid stimulating agents include an epoetin alfa product, a darbepoetin alfa product, or a methoxy polyethylene glycol-epoetin beta product.
  - **iv.** The medication is being requested for cancer- or chemotherapy-related anemia.

Other Uses with Supportive Evidence

19. Iron Deficiency Anemia in Patients with Chronic Kidney Disease who are on Dialysis. Approve for 3 years.

20. Iron Deficiency Associated with Heart Failure. Approve for 1 year if the patient meets the following criteria (A and B):
- **G)** Patient is ≥ 18 years of age; AND
- **H)** Monoferric is being prescribed by, or in consultation with a cardiologist or hematologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Monoferric is not recommended in the following situations:

124. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Iron Replacement – Venofer Prior Authorization Policy

- Venofer® (iron sucrose injection, for intravenous use – American Regent)

REVIEW DATE: 12/16/2020

OVERVIEW

Venofer, an iron replacement product, is indicated for the treatment of **iron deficiency anemia in patients with chronic kidney disease** (CKD).[1]

Guidelines

The KDIGO guidelines for anemia in CKD (2012) make various recommendations regarding iron therapy.[2] For adults with CKD and anemia not on iron or erythroid stimulating agent (ESA) therapy, a trial of intravenous (IV) iron (or in non-dialysis patients with CKD, alternatively, a 1 to 3 month trial of oral iron therapy) is recommended if an increase in Hb concentration without starting ESA treatment is desired and transferrin saturation (TSAT) is ≤ 30% and ferritin is ≤ 500 ng/mL. For adults with CKD on ESA therapy who are not receiving iron supplementation, a trial of IV iron (or in non-dialysis CKD patients, alternatively, a 1 to 3 month trial of oral iron therapy) is recommended if an increase in Hb concentration or a decrease in ESA dose is desired and TSAT is ≤ 30% and ferritin is ≤ 500 ng/mL. For all pediatric patients with CKD with anemia not on iron or ESA therapy, oral iron (or IV iron in patients receiving hemodialysis) is recommended when TSAT is ≤ 20% and ferritin is ≤ 100 ng/mL. For all pediatric patients with CKD who are receiving ESA therapy but not receiving iron supplementation, it is recommended to administer oral iron (or IV iron for patients receiving hemodialysis) to maintain TSAT > 20% and ferritin > 100 ng/dL.

The National Comprehensive Cancer Network guidelines on Hematopoietic Growth Factors (version 2.2020 – January 27, 2020) discuss the management of cancer- and chemotherapy-induced anemia.[3] IV iron therapy is considered an option for patients with absolute iron deficiency (ferritin < 30 ng/mL and TSAT < 20%), functional iron deficiency (ferritin = 30 to 500 ng/mL and TSAT < 50%), and possible functional iron deficiency (ferritin = 501 to 800 ng/mL and TSAT < 50%).

A 2017 focused update of the 2013 American College of Cardiology Foundation/American Heart Association guideline for the management of heart failure.[4] It states that in patients with New York Heart Association class II or III heart failure, absolute iron deficiency (ferritin < 100 ng/mL) or functional iron deficiency (ferritin = 100 to 300 mg/mL if transferring saturation is < 20%), and with or without anemia, IV iron replacement may be reasonable to improve function status and quality of life.[4] Benefits noted with IV iron therapies included improvement in functional capacity, improvements in the six-minute walk test and improved functional capacity.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Venofer. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with

Venofer as well as the monitoring required for adverse events and long-term efficacy, approval requires Venofer to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Venofer is recommended in those who meet the following criteria:

FDA-Approved Indications

21. Iron Deficiency Anemia in Patients with Chronic Kidney Disease who are on Dialysis. Approve for 3 years.

22. Iron Deficiency Anemia in Patients with Chronic Kidney Disease who are not on Dialysis. Approve for 1 year if the medication is prescribed by, or in consultation with a nephrologist or hematologist.

Other Uses with Supportive Evidence

23. Iron Deficiency Anemia, Other. Approve for 1 year if the patient meets one of the following (A, B, C, or D):

M) Patient meets both of the following (i and ii):
- **i.** Patient has tried oral iron supplementation; AND
- **ii.** According to the prescriber, oral iron supplementation was ineffective or intolerable; OR

N) Patient has a condition which, per the prescriber, will interfere with oral iron absorption (e.g., inflammatory bowel disease, Crohn's disease); OR

O) Patient is currently receiving an erythroid stimulating agent; OR
Note: Examples of erythroid stimulating agents include an epoetin alfa product, a darbepoetin alfa product, or a methoxy polyethylene glycol-epoetin beta product.

P) The medication is being requested for cancer- or chemotherapy-related anemia.

24. Iron Deficiency Associated with Heart Failure. Approve for 1 year if the medication is being prescribed by, or in consultation with a cardiologist or hematologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Venofer is not recommended in the following situations:

125. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Keveyis Prior Authorization Policy

- Keveyis® (dichlorphenamide tablets – Taro Pharmaceuticals)

REVIEW DATE: 12/02/2020

OVERVIEW

Keveyis, a carbonic anhydrase inhibitor, is indicated for the treatment of **primary hyperkalemic periodic paralysis** (HyperPP), **primary hypokalemic periodic paralysis** (HypoPP), and related variants.[1] These conditions are heterogeneous and response to Keveyis may vary; therefore, prescribers should evaluate the patient's response to Keveyis after 2 months to decide whether it should be continued.

Disease Overview

The primary periodic paralyses are rare muscle disorders caused by autosomal dominant genetic mutations in ion channels.[2,3] The altered channels cannot properly regulate the flow of ions into muscle cells, which reduces the ability of skeletal muscles to contract, leading to severe muscle weakness or paralysis.[4] Genetic testing is recommended as the first diagnostic step; a heterozygous pathogenic mutation can be identified in 60% to 70% of periodic paralysis cases.[5] When a genetic mutation cannot be identified, periodic paralyses can be distinguished based on clinical presentation. Other causes of hypokalemia or hyperkalemia should be excluded.[5]

Regarding treatment, oral potassium salts can be taken as maintenance/prophylactic therapy for patients with HypoPP; however, this does not completely prevent attacks.[6] Although data are limited to case reports and single-blind trials, acetazolamide, another carbonic anhydrase inhibitor, has been used historically for primary periodic paralysis. Acetazolamide treatment is beneficial in approximately 50% of patients with HypoPP and it has no effect in 30% of affected patients. It can also exacerbate symptoms in 20% of patients. Keveyis has been reported to be 30 times more potent than acetazolamide in vitro.[7] Prior to initiating Keveyis it is important to verify if the patient has had exacerbation with acetazolamide, since Keveyis is considered to be more potent and may potentially lead to more exacerbations.[8]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Keveyis. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Keveyis, as well as the monitoring required for adverse events and long-term efficacy, approval requires Keveyis to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Keveyis is recommended in those who meet the following criteria:

FDA-Approved Indications

23. Hypokalemic Periodic Paralysis (HypoPP) and Related Variants. Approve for the duration noted if the patient meets the following criteria (A or B):

A) Initial Therapy. Approve for 2 months if the patient meets the following criteria (i, ii, iii, iv, v, and vi):

i. Patient has a confirmed diagnosis of primary hypokalemic periodic paralysis by meeting at least ONE of the following (a, b, or c):

a) Patient has had a serum potassium concentration of less than 3.5 mEq/L during a paralytic attack; OR

b) Patient has a family history of the condition; OR

c) Patient has a genetically confirmed skeletal muscle calcium or sodium channel mutation; AND

ii. The prescriber has excluded other reasons for acquired hypokalemia (e.g., renal, adrenal, or thyroid dysfunction; renal tubular acidosis; diuretic or laxative abuse); AND

iii. Patient has had improvements in paralysis attack symptoms with potassium intake; AND

iv. Patient has tried oral acetazolamide therapy; AND

v. According to the prescriber, acetazolamide therapy did not worsen the paralytic attack frequency or severity in the patient; AND

vi. The medication is prescribed by or in consultation with a neurologist or a physician who specializes in the care of patients with primary periodic paralysis (e.g., muscle disease specialist, physiatrist).

B) Patient is Currently Receiving Keveyis. Approve for 1 year if the patient has responded to Keveyis (e.g., decrease in the frequency or severity of paralytic attacks) as determined by the prescriber.

24. Hyperkalemic Periodic Paralysis (HyperPP) and Related Variants. Approve for the duration noted if the patient meets the following criteria (A or B):

A) Initial Therapy. Approve for 2 months if the patient meets the following criteria (i, ii, iii, iv and v):

i. Patient has a confirmed diagnosis of primary hyperkalemic periodic paralysis by meeting at least ONE of the following criteria (a, b, c, or d):

a) Patient has had an increase from baseline in serum potassium concentration of greater than or equal to 1.5 mEq/L during a paralytic attack; OR

b) Patient has had a serum potassium concentration during a paralytic attack of greater than 5.0 mEq/L; OR

c) Patient has a family history of the condition; OR

d) Patient has a genetically confirmed skeletal muscle sodium channel mutation; AND

ii. The prescriber has excluded other reasons for acquired hyperkalemia (e.g., drug abuse, renal and adrenal dysfunction); AND

iii. Patient has tried oral acetazolamide therapy; AND

iv. According to the prescriber, acetazolamide therapy did not worsen the paralytic attack frequency or severity in the patient; AND

v. The medication is prescribed by or in consultation with a neurologist or a physician who specializes in the care of patients with primary periodic paralysis (e.g., muscle disease specialist, physiatrist).

B) Patient is Currently Receiving Keveyis. Approve for 1 year if the patient has responded to Keveyis (e.g., decrease in the frequency or severity of paralytic attacks) as determined by the prescriber.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Keveyis is not recommended in the following situations:

119. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	**Hypokalemic Periodic Paralysis (HypoPP) and Related Variants:** Criterion added that the prescribing physician has excluded other causes of acquired hypokalemia.	12/19/2018
Annual Revision	"Prescribing physician" updated to "prescriber" throughout criteria.	12/18/2019
Annual Revision	**Hypokalemic Periodic Paralysis (HypoPP) and Related Variants:** Removed examples of oral acetazolamide products from criteria; oral acetazolamide is now only available generically. **Hyperkalemic Periodic Paralysis (HyperPP) and Related Variants:** Removed examples of oral acetazolamide products from criteria; oral acetazolamide is now only available generically.	12/02/2020

PRIOR AUTHORIZATION POLICY

POLICY: Lidocaine Patch Prior Authorization Policy

- Lidoderm® (lidocaine 5% patch – Endo Pharmaceuticals, generics)
- ZTlido™ (lidocaine 1.8% topical system – Scilex)

REVIEW DATE: 08/19/2020

OVERVIEW

Lidocaine 5% patch and ZTlido are indicated for the relief of pain associated with postherpetic neuralgia (PHN).[1,2]

Lidocaine is an amide-type local anesthetic agent whose neuronal membrane stabilizing effect produces a local analgesic effect when applied transdermally.[1,2] The lidocaine penetration into intact skin is adequate to produce an analgesic effect, but less than the amount needed to produce a complete sensory block. In a single-dose, crossover study in healthy volunteers, ZTlido demonstrated equivalent exposure and peak concentration of lidocaine to lidocaine patch 5% (Lidoderm, generics).[2]

Other Uses with Supportive Evidence

Lidocaine 5% patches have been shown to be effective in treating low back pain in open-label studies in patients not achieving adequate pain relief despite as needed or stable doses of non-selective nonsteroidal anti-inflammatory drugs (NSAIDs), cyclooxygenase-2 (COX-2) inhibitors, gabapentin, tramadol, or opioids.[3-5] The guidelines for treatment of low back pain (2017) do not address the use of topical lidocaine; however, various other agents are used for pain associated with low back pain.[6] In patients with acute or subacute low back pain, the guidelines recommend NSAIDs or skeletal muscle relaxants as pharmacologic treatment options (strong recommendation; moderate-quality evidence). In patients with chronic low back pain who have had an inadequate response to nonpharmacologic therapy, the guidelines recommend consideration of pharmacologic treatment with NSAIDs as first-line therapy or tramadol or duloxetine as second-line therapy. Of note, tramadol is a narcotic and, like other opioids, is associated with the risk for abuse. Clinicians should only consider opioids as an option in patients who have failed the aforementioned treatments and only if the potential benefits outweigh the risks for individual patients and after a discussion of known risks and realistic benefits with patients (weak recommendation; moderate-quality evidence). Moderate-quality evidence showed no difference in pain between tricyclic antidepressants (TCAs) or selective serotonin reuptake inhibitors (SSRIs) vs. placebo, and low-quality evidence showed no differences in function for antidepressants. Moderate-quality evidence showed that duloxetine was associated with a small improvement in pain intensity and function vs. placebo.

Lidocaine 5% patch has been shown to be effective in treating neuropathic pain of various forms and etiologies as monotherapy and, more commonly, as adjunctive therapy to a stable analgesic regimen.[3,7-14] There is evidence to suggest that lidocaine 5% patch, along with several other analgesics (i.e., opioids, tramadol, TCAs), can be effective as first-line therapy in the management of neuropathic pain.[12] The 2011 evidence-based guideline on treatment of painful diabetic neuropathy, published by the American Academy of Neurology (AAN), indicates the lidocaine 5% patch may be considered for the treatment of painful diabetic neuropathy.[15] Recommendations for the pharmacological management of neuropathic pain, published by the Mayo Foundation, indicate that lidocaine 5% patch has shown efficacy in patients with varying types of neuropathic pain, and are considered a first-line therapy.[16]

Several open-label trials have shown lidocaine 5% patches to be effective in treating pain associated with osteoarthritis of the knee both as monotherapy and in combination with other analgesics (e.g., NSAIDs, COX-2 inhibitors, opioids, tramadol, acetaminophen).[17-20] In one open-label comparative trial (prematurely terminated before enrollment goals were achieved due to safety concerns surrounding the entire COX-2 class),[21] treatment of knee osteoarthritis with lidocaine 5% patches (1 ⅓ patches applied every 24 hours) resulted in comparable reductions in pain intensity scores as celecoxib 200 mg/day.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of lidocaine patches. All approvals are provided for the duration noted below.

Automation: When available, the ICD-10 codes for postherpetic polyneuropathy (B02.23) will be used as part of automation to allow approval of the requested medication.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of lidocaine patches is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Postherpetic Neuralgia (PHN).** Approve for 3 years.

Other Uses with Supportive Evidence

2. **Low Back Pain.** Approve for 3 years after trying at least three pharmacologic therapies with each one from a different class of medication used to treat low back pain.
   Note: Examples of different classes of pharmacologic therapies for low back pain include acetaminophen, nonsteroidal anti-inflammatory drugs, muscle relaxants, celecoxib, duloxetine, gabapentin. Examples of nonsteroidal anti-inflammatory drugs include etodolac, meloxicam, and nabumetone. Examples of muscle relaxants include carisoprodol, chlorzoxazone, cyclobenzaprine, metaxalone, methocarbamol, and orphenadrine.

3. **Neuropathic Pain.** Approve for 3 years.
   Note: For neuropathic pain due to radiculopathy or sciatica, please refer to the Not Recommended for Approval section for Radiculopathy or Sciatica.

4. **Osteoarthritis.** Approve for 3 years after trying at least three pharmacologic therapies with each one from a different class of medication used for the treatment of osteoarthritis.
   Note: Examples of different classes of pharmacologic therapies for osteoarthritis include acetaminophen, celecoxib, nonsteroidal anti-inflammatory drugs, salicylates, intraarticular glucocorticoids, intraarticular hyaluronan, topical capsaicin, and topical methylsalicylate.[22] Examples of nonsteroidal anti-inflammatory drugs include etodolac, meloxicam, and nabumetone.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Coverage of lidocaine patches is not recommended in the following situations:

120. **Carpal Tunnel Syndrome.** Two open-label trials have investigated the lidocaine 5% patch for the relief of pain associated with carpal tunnel symdrome.[23,24] In an open-label, parallel-group, single-center, active-controlled trial,[23] 40 patients with carpal tunnel syndrome were randomized to daily treatment with lidocaine patch 5% or an injection of lidocaine 1% plus methylprednisolone. After 4 weeks of treatment, both groups reported statistically significant improvement in pain scores. A 6-week, randomized, parallel-group, open-label multicenter study[24] found that lidocaine 5% patches given every 24 hours and naproxen 500 mg twice daily both led to significant reductions is the Average Pain Intensity scores in 100 patients with carpal tunnel syndrome. The 2016 American Academy of Orthopaedic Surgeons (AAOS) guidelines on carpal tunnel syndrome do not mention topical lidocaine in their recommendations for treatment.[25] In addition, the AAOS guidelines have a supplemental evidence table that addresses the studies AAOS evaluated for their guidelines. This table states that the above-referenced articles were excluded from their guidelines because they used non-validated outcome measures.

121. **Fibromyalgia.** There are no data available on the use of lidocaine patches in treating pain associated with fibromyalgia.

122. **Myofascial Pain as Adjunctive Therapy.** Published data are limited to small ($n \leq 60$ in each study) studies of lidocaine 5% patches.[26-29] Larger, controlled studies are needed to fully determine the place in therapy of lidocaine patches for the treatment of myofascial pain.

123. **Pain Associated with Rib Fractures.** Lidocaine 5% patch did not significantly improve pain control in patients with traumatic rib fractures in one randomized, double-blind, placebo-controlled study.[30] A retrospective chart analysis found lidocaine patches decreased pain scores in 29 patients with rib

fractures vs. 29 matched controls, with no change in narcotic use and no difference in time to return to baseline activity.[31] A small (n = 44) double-blind, placebo-controlled study in hospitalized patients with traumatic rib fracture in Taiwan found that lidocaine 5% patch decreased pain scores after Day 5 of therapy vs. placebo, with no difference in oral opioid use but decreased meperidine injection use.[32] Larger, controlled studies are needed to fully determine the place in therapy of lidocaine 5% patch for the treatment of pain associated with rib fractures.

124. Radiculopathy. Published data on the use of lidocaine patches in treating pain associated with radiculopathy is limited.[11,33] Larger, controlled studies are needed to fully determine the place in therapy of lidocaine patches for the treatment of radiculopathy.

125. Rheumatoid Arthritis (RA). There are no data available on the use of lidocaine patches in treating pain associated with RA.

126. Sciatica. There are no data available on the use of lidocaine patches in treating pain associated with sciatica.

127. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Selected Revision	Addition of ZTlido to policy. No change to criteria.	10/3/2018
Annual Revision	For the Other Use with Supportive Evidence of Osteoarthritis, the words "of the hand, hip, or knee" were removed from the requirement to try at least three pharmacologic therapies with each one from a different class of medication used for the treatment of osteoarthritis of the hand, hip, and knee. Radiculopathy was added to the policy as a Condition Not Recommended for Approval.	08/07/2019
Annual Revision	No change to criteria. ICD-9 codes were removed from the Automation section because they are no longer used. For the approval conditions of Low Back Pain and Osteoarthritis, examples of different classes of pharmacologic therapies were moved to notes.	08/19/2020

PRIOR AUTHORIZATION POLICY

POLICY: Lipodystrophy – Egrifta® (tesamorelin injection – EMD Serono)

DATE REVIEWED: 04/15/2020

OVERVIEW

Egrifta is an analog of human growth hormone-releasing factor (GRF), indicated for the reduction of excess abdominal fat in human immunodeficiency virus (HIV)-infected patients with lipodystrophy.[1-3] At this time, the long-term cardiovascular (CV) safety and potential long-term CV benefit are not established and careful consideration should be given to continue Egrifta in patients who do not show a clear efficacy response, as judged by the degree of reduction in visceral adipose tissue.[1] Egrifta has a weight-neutral effect and is not indicated for weight loss management. There are no data supporting improved compliance with anti-retroviral therapies in HIV-positive patients who take Egrifta. In the pivotal trial, all patients had lipodystrophy and excess abdominal fat, evidenced by a waist circumference ≥ 95 cm (≥ 94 cm for women) and a waist-to-hip ratio ≥ 0.94 (≥ 0.88 for women). Patients were required to be on a stable antiretroviral regimen for at least 8 weeks. Safety and effectiveness of Egrifta have been established in patients between the ages of 18 and 65 years of age.

Disease Overview

Lipodystrophy is the change in body fat which affects some patients with HIV infection, either due HIV infection or due to medication to treat HIV.[5] Egrifta binds and stimulates human GRF receptors with similar potency as endogenous GRF. GRF stimulates the synthesis and pulsatile release of endogenous growth hormone (GH), which is both anabolic and lipolytic. GH exerts its effect by interacting with receptors on a variety of target cells resulting in the pharmacodynamic effect. A decrease in nocturnal secretion of GH and insulin-like growth factor 1 (IGF-1) is associated with increased visceral adipose tissue (VAT) in patients with HIV-associated lipodystrophy.[2] Egrifta increases secretion of GH and has been shown to decrease VAT and spare subcutaneous adipose tissue (SAT).[3-4] Egrifta is contraindicated in patients with disruption of the hypothalamic-pituitary axis due to hypophysectomy, hypopituitarism, pituitary tumor or surgery, head irradiation, or head trauma; patients with known hypersensitivity to Egrifta or mannitol; pregnant women; and in patients with an active malignancy.[1] Any pre-existing malignancy should be inactive; patients should complete treatment prior to beginning Egrifta.

Other Therapies

There are no other therapies approved specifically for treatment of HIV-associated lipodystrophy and treatment options are limited.[5-6] Administration of GH has demonstrated a significant decrease in VAT, but also a decrease in SAT, compared with placebo.[7] Management strategies for lipodystrophy include: switching antiretroviral therapy, exercise and diet, cosmetic procedures (e.g., liposuction, facial fillers), and prevention of lipodystrophy by selection of regimens less likely to cause lipohypertrophy.[6]

Safety

Because the long-term CV safety and potential long-term CV benefit are not established, careful consideration should be given whether to continue Egrifta treatment in patients who do not show a clear efficacy response, as judged by the degree of reduction in visceral adipose tissue measured by waist circumference or CT scan. In the pivotal studies, efficacy of Egrifta was assessed at Week 26. Because Egrifta induces the release of endogenous GH (a known growth factor) and increases serum IGF-1, the benefits of treatment should be weighed against the increased risk of malignancies in HIV-positive patients. Since the effect of prolonged IGF-1 elevations on the development or progression of malignancies is unknown, monitor IGF-1 levels closely during Egrifta therapy and consider discontinuation in patients with persistent elevations of IGF-1 levels (e.g., > 3 standard deviation scores [SDS]), especially if the patient has not experienced a robust response. Egrifta should be used with caution in patients who develop glucose intolerance or diabetes; discontinuation of therapy should be considered for patients who do not show a clear efficacy response.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Egrifta. Because of the specialized skills required for evaluation and diagnosis of patients treated with Egrifta as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Egrifta to be prescribed by or in consultation with a physician who specializes in the condition being treated. In the approval indication, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: men are defined as individuals with the biological traits of a man, regardless of the individual's gender identity or gender expression. When approvals are authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Egrifta is recommended in those who meet the following criteria:

FDA-Approved Indications

C) Lipodystrophy in Human Immunodeficiency Virus (HIV)-Infected Patients. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 6 months if the patient meets ALL of the following criteria (i, ii, iii, iv, and v):

ii. The patient is ≥ 18 years of age; AND

iii. Egrifta is prescribed for the reduction of excess abdominal fat; AND

iv. The patient meets ONE of the following (1 or 2):

a) If male*, waist circumference is ≥ 95 cm (37.4 in) and waist-to-hip ratio is ≥ 0.94; OR

b) If female*, waist circumference is ≥ 94 cm (37 in) and waist-to-hip ratio is ≥ 0.88; AND

v. The patient has been stable on an anti-retroviral regimen for at least 8 weeks.
Note: Examples include antiretroviral regimens containing protease inhibitors, nucleoside reverse-transcriptase inhibitors, and/or nonnucleoside reverse-transcriptase inhibitors; AND

vi. Egrifta is prescribed by or in consultation with an endocrinologist or a physician specializing in the treatment of human immunodeficiency virus (HIV) infection (e.g., infectious disease [ID], oncology).

B) Patient is Currently Receiving Egrifta. Approve for 1 year if the patient has responded, as determined by the prescriber.
Note: Examples of a response include reduction in visceral adipose tissue measured by waist circumference or computed tomography (CT) scan.

***** Refer to the Policy Statement.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Egrifta has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

128. Abdominal Obesity in Patients without Human Immunodeficiency Virus (HIV) Infection. More data are needed. Egrifta has been studied in a very limited number patients who have abdominal obesity without HIV infection.[8] To be eligible for the published trial, patients were required to have a peak stimulated GH no higher than 9 µg/L on a standardized GH-releasing hormone (GHRH)-arginine stimulation test. Patients (n = 60) were randomized in a 1:1 ratio to treatment with Egrifta 2 mg once

daily (QD) or placebo. The primary endpoint was the change in VAT from baseline. Over 12 months (using last observation carried forward [LOCF]), VAT improved significantly in patients treated with Egrifta compared with placebo (net treatment effect vs. placebo: -35 [95% confidence interval {CI}: -58, -12]; P = 0.003). Treatment with Egrifta increased IGF-1 by 90%, decreased triglycerides by 20%, and decreased log C-reactive protein (CRP) by 24% compared with placebo. There was no effect on total cholesterol, high-density lipoprotein cholesterol (HDL-C), or low-density lipoprotein cholesterol (LDL-C) in the treatment groups.

129. **Human Immunodeficiency Virus (HIV)-Related Cachexia, Weight Loss, or Fat Distribution other than Lipodystrophy.** Egrifta has not been studied in these conditions.

130. **Patients > 65 Years of Age.** There is no information on the use of Egrifta in patients greater than 65 years of age with HIV and lipodystrophy.[1]

131. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Annual revision	**Lipodystrophy in Human Immunodeficiency Virus (HIV)-Infected Patients:** Add a criterion that requires patients initiating therapy to be stable on an antiretroviral regimen for	04/15/2020

	at least 8 weeks. For initial therapy, criteria were added to require the patient has lipodystrophy and excess abdominal fat, as evidenced by waist circumference (≥ 95 cm for men and ≥9 4 cm for women) and waist-to-hip ratio (≥ 0.94 for men and ≥ 0.88 for women). For patients continuing therapy, the approval duration was changed to be 1 year (previously was 3 years). Examples of a response to therapy were moved to a Note in the criteria. **Conditions Not Recommended for Coverage:** Patients > 65 Years of Age were added to this section of the policy.	
Update	**04/16/2020:** The following was added to the Policy Statement: In the approval indication, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: men are defined as individuals with the biological traits of a man, regardless of the individual's gender identity or gender expression.	--

PRIOR AUTHORIZATION POLICY

POLICY: Lipodystrophy – Myalept Prior Authorization Policy

- Myalept® (metreleptin for subcutaneous injection – Aegerion)

REVIEW DATE: 10/21/2020

OVERVIEW

Myalept, a recombinant analog of human leptin, is indicated as an adjunct to diet as replacement therapy to treat complications of leptin deficiency in patients with congenital or acquired generalized lipodystrophy.[1] Limitations of Use: The safety and efficacy of Myalept have not been established for the treatment of complications of partial lipodystrophy, liver disease (including nonalcoholic steatophepatitis [NASH], human immunodeficiency virus (HIV)-related lipodystrophy, or metabolic disease (including diabetes mellitus and hypertriglyceridemia) without concurrent evidence of generalized lipodystrophy.

Disease Overview

Generalized lipodystrophy is a rare, "ultra-orphan", chronic, heterogeneous, and life-threatening disorder in which there is an abnormality of adipose tissue distribution and insufficient fat tissue, which is required for normal metabolic function.[2] Robust epidemiological data are not available. Approximately 400 cases of generalized lipodystrophy have been reported in the literature.[2,3] A recent publication estimates the prevalence of all types of lipodystrophy to be between 1.3 and 4.7 cases per million based on available literature, with the prevalence of generalized lipodystrophy estimated to be much lower at approximately 0.23 cases per million.[24] Although there is heterogeneity in the lipodystrophy syndromes, all share the feature of subcutaneous (SC) adipose tissue loss resulting in more severe metabolic abnormalities (e.g., diabetes mellitus and hypertriglyceridemia) than generally noted with obesity.[4-5]

Guidelines

Guidelines on the diagnosis and management of lipodystrophy syndromes were published in 2016 and endorsed by multiple groups of endocrine experts, including the Endocrine Society, the Pediatric Endocrine Society, the American Diabetes Association, and the American Association of Clinical Endocrinologists.[7] These guidelines note that lipodystrophy is an incurable condition and no treatment will regrow adipose tissue. Myalept is the only drug specifically indicated for the treatment of lipodystrophy. Myalept, along with diet, is recommended as the first-line treatment for metabolic and endocrine abnormalities in patients with generalized lipodystrophy (Class I, Level B). In children, Myalept may also be used to prevent the development of comorbidities (Class IIb, Level C). While not FDA-approved for use in patients with partial lipodystrophy, the guidelines state that Myalept may be used in this setting, if the patient is hypoleptinemic (leptin < 4 ng/mL) and has a glycosylated hemoglobin (HbA1c) > 8% and/or triglycerides > 500 mg/dL (Class IIb, Level B); although it is noted that response to.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Myalept. Because of the specialized skills required for evaluation and diagnosis of patients treated with Myalept, as well as the monitoring required for adverse events and long-term efficacy, approval requires Myalept to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Myalept is recommended in those who meet the following criteria:

FDA-Approved Indication

25. Generalized Lipodystrophy (Congenital or Acquired): Approve for 3 years if the medication is prescribed by, or in consultation with, an endocrinologist or a geneticist physician specialist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Myalept is not recommended in the following situations:

132. General Obesity not associated with Congenital Leptin Deficiency. Myalept is contraindicated in patients with general obesity not associated with congenital leptin deficiency.[1] Myalept was previously evaluated in two clinical development programs for obesity, both as monotherapy (n > 1,100) and in combination with Symlin® (pramlintide acetate for injection; n > 600).[4] Published studies on the effects of leptin therapy in these patients without leptin deficiency yielded conflicting efficacy results.[8-9] The studies involving obese patients (some with type 2 diabetes mellitus), with the exception of one dose-escalation trial, failed to show significant weight loss with Myalept therapy and resulted in clinically insignificant changes in other metabolic parameters, such as insulin sensitivity.[10-14] One additional randomized, double-blind, placebo-controlled crossover study evaluated the efficacy of leptin administration to promote further weight reduction in patients who had undergone Roux-en-Y gastric bypass surgery.[20] Following 16 weeks of therapy, Myalept was not found to promote additional decreases in body weight compared with placebo.

133. Human Immunodeficiency Virus (HIV)-related Lipodystrophy. Myalept is not indicated for the treatment of patients with HIV-related lipodystrophy.[1] Results from four small studies of patients with HIV-associated lipodystrophy and leptin deficiency showed mixed results with Myalept therapy.[15-18] One study found significantly improved fasting insulin levels, insulin resistance and high-density lipoprotein (HDL) levels, but no significant differences in fasting glucose levels, free-fatty acid levels, or low-density lipoprotein (LDL) levels when Myalept was compared with placebo.[15] Another demonstrated improved fasting insulin levels, but no difference in intravenous glucose disappearance, fasting serum glucose concentration, glycosylated hemoglobin (HbA_{1C}) levels, body mass index (BMI), or lipid parameters after treatment with Myalept.[16] Two additional studies found that therapy with Myalept improved some, but not all metabolic parameters in patients infected with HIV.[17,18] More information is needed to determine if Myalept is a safe and effective treatment for HIV-related lipodystrophy.

134. Partial Lipodystrophy. The safety and efficacy of Myalept in the treatment of the complications of partial lipodystrophy have not been established.[1] The effects of Myalept therapy in patients with partial lipodystrophy have been evaluated; the pivotal trial of Myalept included a subset of patients (n

= 24) with partial lipodystrophy.[19] Overall, patients with partial lipodystrophy had milder baseline metabolic abnormalities than patients with generalized lipodystrophy. Following 12 months of Myalept therapy, patients experienced a reduction in HbA_{1C}, fasting plasma glucose, and fasting triglycerides; however, the magnitude of the improvements was less than those observed in patients with generalized lipodystrophy. There are data showing sustained improvements out to 36 months as well.[25] Additional data also highlight the heterogeneity of partial lipodystrophy; Myalept may provide improvement in some metabolic parameters in certain patients with partial lipodystrophy, but more data are needed to confirm these benefits.[21-23] Current lipodystrophy guidelines (2016) outline certain patients with partial lipodystrophy that may benefit from Myalept therapy, but indicate a lower level of evidence to support use in this patient population compared with generalized lipodystrophy.[7] Myalept prescribing information continues to list partial lipodystrophy as a limitation of use.[1]

135. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Lucemyra Prior Authorization Policy

- Lycemyra™ (lofexidine tablets – US WorldMeds)

REVIEW DATE: 07/22/2020

OVERVIEW

Lucemyra, a central alpha-2 adrenergic agonist, is indicated for mitigation of opioid withdrawal symptoms to facilitate abrupt opioid discontinuation in adults.[1] The usual Lucemyra starting dosage is 0.54 mg (three 0.18 mg tablets) four times daily (QID) during the period of peak withdrawal symptoms (generally the first 5 to 7 days following last use of opioid) with dosing guided by symptoms and adverse events. There should be 5 to 6 hours between each dose. The total daily dosage of Lucemyra should not exceed 2.88 mg (16 tablets), and no single dose should exceed 0.72 mg (four tablets). Lucemyra treatment may continue for up to 14 days with dosing guided by symptoms. Discontinue Lucemyra with a gradual dose reduction over a 2- to 4-day period to mitigate Lucemyra withdrawal symptoms (e.g., reducing by one tablet per dose every 1 to 2 days). The Lucemyra dose should be reduced, held, or discontinued for individuals who demonstrate a greater sensitivity to Lucemyra adverse events. Lower doses may be appropriate as opioid withdrawal symptoms wane. Lucemyra can be administered in the presence or absence of food. Dosage adjustments are recommended for patients with hepatic or renal impairment. In the pivotal trials for Lucemyra, patients also had access to a variety of support medications for withdrawal symptoms (e.g., guaifenesin, antacids, docusate sodium, psyllium, bismuth sulfate, acetaminophen, and zolpidem).

Clonidine is not approved by the FDA for use in opioid withdrawal but it has been extensively studied and used for this indication outside the US.[2,3] Clonidine reduces withdrawal symptoms such as nausea, vomiting, diarrhea, cramps, and sweating. Doses of 0.1 mg to 0.3 mg every 6 to 8 hours, to a maximum dose of 1.2 mg/day, may be used to assist in the management of opioid withdrawal symptoms. As with Lucemyra, clonidine can be combined with other non-narcotic medications targeting specific opioid

withdrawal symptoms such as benzodiazepines for anxiety, loperamide for diarrhea, acetaminophen or nonsteroidal anti-inflammatory drugs (NSAIDs) for pain, and ondansetron or other agents for nausea.

Disease Overview

Opioid addiction (or opioid use disorder) is a primary, chronic and relapsing central nervous system (CNS) disease of brain reward, motivation, memory, and related circuitry characterized by an individual pathologically pursuing reward and/or relief by substance use and other behaviors.[4] Since the 1990s, opioid use and abuse have risen markedly in the US.[5] Symptoms of opioid withdrawal include the following: autonomic (diarrhea, rhinorrhea, diaphoresis, lacrimation, shivering, nausea, emesis, piloerection); CNS arousal (sleeplessness, restlessness, tremors); pain (abdominal cramping, bone pains, diffuse muscle aching); and craving for the opioid medication. Symptoms of opioid withdrawal usually begin two to three half-lives after the last opioid dose (6 to 12 hours for short half-life opioids such as heroin and morphine and 36 to 48 hours for long half-life opioids such as methadone).[6] Following cessation of a short half-life opioid, symptoms reach peak intensity within 2 to 4 days, with most of the physical withdrawal signs no longer apparent after 7 to 14 days. As with the onset of withdrawal, the duration also varies with the half-life of the opioid used and the duration of use. While opioid withdrawal is rarely life-threatening, the combination of uncomfortable symptoms and intense craving makes completion of withdrawal difficult for most people.

Guidelines

The American Psychiatric Association (APA) practice guideline for the treatment of patients with substance use disorders (2006) notes several strategies as effective treatments for opioid dependence including the abrupt discontinuation of the opioid with the use of clonidine to suppress withdrawal symptoms and clonidine-naltrexone detoxification, where withdrawal symptoms are precipitated by naltrexone and then suppressed by clonidine.[2] The guidelines note that the completion rate for clonidine-treated outpatients is relatively low and roughly comparable to that of methadone withdrawal.

The American Society of Addiction Medicine (ASAM) practice guideline for the treatment of opioid use disorder (2020) discusses two primary strategies for the management of opioid withdrawal.[3] In one strategy, alpha-2 adrenergic agonists (i.e., clonidine, Lucemyra) are used along with other non-narcotic medications to reduce withdrawal symptoms. The use of non-opioid medications may be the only option available in some healthcare settings and may also assist the transition of patients to opioid antagonist medications (i.e., naltrexone) helping to prevent subsequent relapse. Comparative data are limited but Lucemyra and clonidine appear to be similarly effective in the treatment of opioid withdrawal with hypotension occurring less frequently with Lucemyra. While clonidine is not FDA-approved for the treatment of opioid withdrawal, it has been extensively used off-label for this purpose. Clonidine can be combined with other non-narcotic medications targeting specific opioid withdrawal symptoms. ASAM states that alpha-2 adrenergic agonists are safe and effective for management of opioid withdrawal. However, the guideline notes that methadone and buprenorphine are more effective in reducing the symptoms of opioid withdrawal, in retaining patients in withdrawal management, and in supporting the completion of withdrawal management.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Lucemyra. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Lucemyra as well as the monitoring required for adverse events, initial approval requires Lucemyra to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Lucemyra is recommended in those who meet the following criteria:

FDA-Approved Indications

26. Opioid Withdrawal Symptoms. Approve for 2 weeks (14 days) if the patient meets the following criteria (A and B):
- **77.** Lucemyra is being used to facilitate abrupt opioid discontinuation; AND
- **78.** Patient has a history of clonidine use (e.g., patches, tablets) and experienced unacceptable toxicity and/or inadequate efficacy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Lucemyra is not recommended in the following situations:

136. Cannabis Use Disorder (Cannabis Dependence). One published study has evaluated the safety and efficacy of dronabinol and lofexidine in treating cannabis dependence (n = 156).[7] In this 11-week, placebo-controlled study, the combined intervention did not show efficacy as a treatment for cannabis use disorder.

137. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Lupus – Benlysta Prior Authorization Policy

- Benlysta® (belimumab intravenous injection – Human Genome Sciences/GlaxoSmithKline)

REVIEW DATE: 01/20/2021

OVERVIEW

Benlysta intravenous, a B-lymphocyte stimulator (BLyS)-specific inhibitor, is indicated for the following uses:[1]

- **Lupus nephritis**, in adults with active disease who are receiving standard therapy.
- **Systemic lupus erythematosus** (SLE), in patients ≥ 5 years of age with active, autoantibody-positive, systemic disease in those who are receiving standard therapy.

Benlysta intravenous has not been studied and is not recommended in those with severe active central nervous system lupus, or in combination with other biologics. In some of the clinical trials involving Benlysta, Black patients had a lower response rate for the primary endpoint relative to Black patients receiving placebo; therefore, caution is recommended when considering Benlysta in Black patients. Of note, there is also a subcutaneous formulation of Benlysta with a similar indication except use is limited to adults ≥ 18 years.

Guidelines

Benlysta is addressed in the following guidelines:

- **Lupus Nephritis:** Guidelines for lupus nephritis are available from the European League Against Rheumatism (EULAR) and European Renal Association/European Dialysis and Transplant Association (ERA-EDTA) [2019].[3] Benlysta may be considered as add-on treatment for non-responding/refractory lupus nephritis, to facilitate glucocorticoid sparing, control extra-renal lupus activity, and decrease the risk for extra-renal flares.
- **SLE:** Guidelines from the EULAR (2019) recommend consideration of add-on therapy with Benlysta for patients who have an inadequate response to standard of care (e.g., combinations of hydroxychloroquine and glucocorticoids with or without immunosuppressive agents).[2] EULAR defines an inadequate response as residual disease activity not allowing tapering of glucocorticoids and/or frequent relapses.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Benlysta intravenous. Approvals are authorized for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Benlysta intravenous as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Benlysta intravenous to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Benlysta IV is recommended in those who meet the following criteria:

FDA-Approved Indications

D) Lupus Nephritis. Approve for the duration noted if the patient meets ONE of the following (A or B):

1. Initial Therapy. Approve for 6 months if the patient meets ALL of the following conditions (i, ii, iii, and iv):

a. Patient is ≥ 18 years of age; AND

b. Patient has autoantibody-positive SLE, defined as positive for antinuclear antibodies (ANA) and/or anti-double-stranded DNA (anti-dsDNA) antibody; AND

c. Patient meets ONE of the following (a or b):

a) The medication is being used concurrently with at least one other standard therapy; OR
Note: Examples of standard therapies include azathioprine, mycophenolate mofetil, cyclophosphamide.

b) Patient is determined to be intolerant to standard therapy due to a significant toxicity, as determined by the prescriber; AND

ii. The medication is prescribed by or in consultation with a nephrologist or rheumatologist.

B) Patient is Currently Receiving Benlysta Intravenous or Subcutaneous. Approve for 1 year if the patient meets ALL of the following criteria (i, ii, and iii):

i. Patient meets ONE of the following (a or b):

a) The medication is being used concurrently with at least one other standard therapy; OR
Note: Examples of standard therapies include azathioprine, mycophenolate mofetil, cyclophosphamide.

b) Patient is determined to be intolerant to standard therapy due to a significant toxicity, as determined by the prescriber; AND

ii. The medication is prescribed by or in consultation with a nephrologist or rheumatologist.; AND

iii. Patient has responded to Benlysta subcutaneous or intravenous, as determined by the prescriber.
Note: Examples of a response include improvement in organ dysfunction, reduction in flares, reduction in corticosteroid dose, decrease of anti-dsDNA titer, and improvement in complement levels (i.e., C3, C4).

2. Systemic Lupus Erythematosus. Approve for the duration noted if the patient meets ONE of the following (A or B):

E) Initial Therapy. Approve for 4 months if the patient meets ALL of the following conditions (i, ii, iii, and iv):

i. Patient is ≥ 5 years of age; AND

ii. Patient has autoantibody-positive SLE, defined as positive for antinuclear antibodies (ANA) and/or anti-double-stranded DNA (anti-dsDNA) antibody; AND
Note: Not all patients with SLE are positive for anti-dsDNA, but most will be positive for ANA.

iii. Patient meets ONE of the following (a or b):

a) The medication is being used concurrently with at least one other standard therapy; OR
Note: Examples of standard therapies include an antimalarial (e.g., hydroxychloroquine), systemic corticosteroid (e.g., prednisone), and other immunosuppressants (e.g., azathioprine, mycophenolate mofetil, methotrexate).

b) Patient is determined to be intolerant to standard therapy due to a significant toxicity, as determined by the prescriber; AND

iv. The medication is prescribed by or in consultation with a rheumatologist, clinical immunologist, nephrologist, neurologist, or dermatologist.

B) Patient is Currently Receiving Benlysta Intravenous or Subcutaneous. Approve for 1 year if the patient meets ALL of the following criteria (i, ii, and iii):

i. Patient meets ONE of the following (a or b):

a) The medication is being used concurrently with at least one other standard therapy; OR

Note: Examples of standard therapies include an antimalarial (e.g., hydroxychloroquine), systemic corticosteroid (e.g., prednisone), and other immunosuppressants (e.g., azathioprine, mycophenolate mofetil, methotrexate).

b) Patient is determined to be intolerant to standard therapy due to a significant toxicity, as determined by the prescriber; AND

ii. The medication is prescribed by or in consultation with a rheumatologist, clinical immunologist, nephrologist, neurologist, or dermatologist; AND

iii. Patient has responded to Benlysta subcutaneous or intravenous, as determined by the prescriber.

Note: Examples of a response include reduction in flares, reduction in corticosteroid dose, decrease of anti-dsDNA titer, improvement in complement levels (i.e., C3, C4), or improvement in specific organ dysfunction (e.g., musculoskeletal, blood, hematologic, vascular, others).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Benlysta Intravenous is not recommended in the following situations:

1. **Concurrent Use with Other Biologics.** Benlysta intravenous has not been studied and is not recommended in combination with other biologics.[1] Safety and efficacy have not been established with these combinations. See APPENDIX for examples of other biologics that should not be taken in combination with Benlysta.

2. **Rheumatoid Arthritis.** A Phase II dose-ranging study evaluating patients with rheumatoid arthritis showed only small American College of Rheumatology 20 responses with Benlysta (e.g., American College of Rheumatology [ACR] 20 response at Week 24 was 28% with Benlysta 10 mg/kg).[4] Numerous other agents are available with higher ACR responses and established efficacy for RA.

3. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

New policy	---	05/27/2020
Early Annual Revision	**Lupus Nephritis:** This newly approved condition was added to the policy. For initial therapy the patient must be ≥ 18 years of age. Criteria approve for 6 months for initial therapy (1 year for continuation), if the medication is being used concurrently with at least one other standard therapy unless intolerant. For continuation, the patient must also have demonstrated a response to initial therapy. For all approvals, Benlysta must be prescribed by or in consultation with a specialist.	01/20/2021

	Conditions Not Recommended for Approval: Concurrent use with cyclophosphamide was removed from the Conditions Not Recommended for Coverage (no longer supported in the labeling).

Olumiant® (baricitinib tablets)	Inhibition of the JAK pathways	RA
Rinvoq® (upadacitinib extended-release tablets)	Inhibition of the JAK pathways	RA
Xeljanz®, Xeljanz XR (tofacitinib tablets, tofacitinib extended-release tablets)	Inhibition of the JAK pathways	RA, PsA, UC

* Not an all-inclusive list of indication (e.g., oncology indications and rare inflammatory conditions are not listed). Refer to the prescribing information for the respective agent for FDA-approved indications; SC – Subcutaneous; TNF – Tumor necrosis factor; IV – Intravenous, IL – Interleukin; PDE4 – Phosphodiesterase 4; JAK – Janus kinase; AS – Ankylosing spondylitis; CD – Crohn's disease; PJIA – Polyarticular juvenile idiopathic arthritis; PsO – Plaque psoriasis; PsA – Psoriatic arthritis; RA – Rheumatoid arthritis; SJIA – Systemic juvenile idiopathic arthritis; UC – Ulcerative colitis; ^ Off-label use of SJIA supported in guidelines.

PRIOR AUTHORIZATION POLICY

POLICY: Lupus – Benlysta Subcutaneous Prior Authorization Policy

- Benlysta® (belimumab subcutaneous injection – Human Genome Sciences/GlaxoSmithKline)

REVIEW DATE: 01/20/2021

OVERVIEW

Benlysta subcutaneous, a B-lymphocyte stimulator (BLyS)-specific inhibitor, is indicated for the following uses:[1]

- **Lupus nephritis**, in adults with active disease who are receiving standard therapy.
- **Systemic lupus erythematosus** (SLE), in patients ≥ 18 years of age with active, autoantibody-positive, systemic disease in those who are receiving standard therapy.

Benlysta subcutaneous has not been studied and is not recommended in those with severe active central nervous system lupus, or in combination with other biologics. In some of the clinical trials involving Benlysta, Black patients had a lower response rate for the primary endpoint relative to Black patients receiving placebo; therefore, caution is recommended when considering Benlysta in Black patients. Of note, there is also an intravenous formulation of Benlysta with a similar indication except use is expanded to those ≥ 5 years of age.

Guidelines

Benlysta is addressed in the following guidelines:

- **Lupus Nephritis:** Guidelines for lupus nephritis are available from the European league Against Rheumatism (EULAR) and European Renal Association/European Dialysis and Transplant Association (ERA-EDTA) [2019].[3] Benlysta may be considered as add-on treatment for non-responding/refractory lupus nephritis, to facilitate glucocorticoid sparing, control extra-renal lupus activity, and decrease the risk for extra-renal flares.
- **SLE:** Guidelines from the EULAR (2019) recommend consideration of add-on therapy with Benlysta for patients who have an inadequate response to standard of care (e.g., combinations of hydroxychloroquine and glucocorticoids with or without immunosuppressive agents).[2] EULAR defines an inadequate response as residual disease activity not allowing tapering of glucocorticoids and/or frequent relapses.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Benlysta subcutaneous. Because of the specialized skills required for evaluation and diagnosis of patients treated with Benlysta subcutaneous as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Benlysta subcutaneous to be prescribed by or in consultation with a physician who specializes in the condition being treated. Approvals are authorized for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Benlysta subcutaneous is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Lupus Nephritis.** Approve for the duration noted if the patient meets ONE of the following (A or B):
   - **A)** Initial Therapy. Approve for 6 months if the patient meets ALL of the following conditions (i, ii, iii, and iv):
     - **i)** Patient is ≥ 18 years of age; AND
     - **ii)** Patient has autoantibody-positive SLE, defined as positive for antinuclear antibodies (ANA) and/or anti-double-stranded DNA (anti-dsDNA) antibody; AND
     - **iii)** Patient meets ONE of the following (a or b):
       - **a)** The medication is being used concurrently with at least one other standard therapy; OR
         Note: Examples of standard therapies include azathioprine, mycophenolate mofetil, cyclophosphamide).

b) Patient is determined to be intolerant to standard therapy due to a significant toxicity, as determined by the prescriber; AND

iv) The medication is prescribed by or in consultation with a nephrologist or rheumatologist.

B) Patient is Currently Receiving Benlysta Subcutaneous or Intravenous. Approve for 1 year if the patient meets ALL of the following criteria (i, ii, and iii):

i) Patient meets ONE of the following (a or b):

a) The medication is being used concurrently with at least one other standard therapy; OR
Note: Examples of standard therapies include azathioprine, mycophenolate mofetil, cyclophosphamide).

b) Patient is determined to be intolerant to standard therapy due to a significant toxicity, as determined by the prescriber; AND

ii) The medication is prescribed by or in consultation with a nephrologist or rheumatologist; AND

iii) Patient has responded to Benlysta subcutaneous or intravenous, as determined by the prescriber.
Note: Examples of a response include improvement in organ dysfunction, reduction in flares, reduction in corticosteroid dose, decrease of anti-dsDNA titer, and improvement in complement levels (i.e., C3, C4).

2. Systemic Lupus Erythematosus. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 4 months if the patient meets ALL of the following conditions (i, ii, iii, and iv):

i) Patient is ≥ 18 years of age; AND

ii) Patient has autoantibody-positive SLE, defined as positive for antinuclear antibodies (ANA) and/or anti-double-stranded DNA (anti-dsDNA) antibody; AND
Note: Not all patients with SLE are positive for anti-dsDNA, but most will be positive for ANA.

iii) Patient meets ONE of the following (a or b):

a) The medication is being used concurrently with at least one other standard therapy; OR
Note: Examples of standard therapies include an antimalarial (e.g., hydroxychloroquine), systemic corticosteroid (e.g., prednisone), and other immunosuppressants (e.g., azathioprine, mycophenolate mofetil, methotrexate).

b) Patient is determined to be intolerant to standard therapy due to a significant toxicity, as determined by the prescriber; AND

iv) The medication is prescribed by or in consultation with a rheumatologist, clinical immunologist, nephrologist, neurologist, or dermatologist.

B) Patient is Currently Receiving Benlysta Subcutaneous or Intravenous. Approve for 1 year if the patient meets ALL of the following criteria (i, ii, and iii):

i) Patient meets ONE of the following (a or b):

a) The medication is being used concurrently with at least one other standard therapy; OR
Note: Examples of standard therapies include an antimalarial (e.g., hydroxychloroquine), systemic corticosteroid (e.g., prednisone), and other immunosuppressants (e.g., azathioprine, mycophenolate mofetil, methotrexate).

b) Patient is determined to be intolerant to standard therapy due to a significant toxicity, as determined by the prescriber; AND

ii) The medication is prescribed by or in consultation with a rheumatologist, clinical immunologist, nephrologist, neurologist, or dermatologist; AND

iii) Patient has responded to Benlysta subcutaneous or intravenous, as determined by the prescriber.
Note: Examples of a response include reduction in flares, reduction in corticosteroid dose, decrease of anti-dsDNA titer, improvement in complement levels (i.e., C3, C4), or

improvement in specific organ dysfunction (e.g., musculoskeletal, blood, hematologic, vascular, others).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Benlysta subcutaneous is not recommended in the following situations:

138. Concurrent Use with Other Biologics. Benlysta has not been studied and is not recommended in combination with other biologics.[1] Safety and efficacy have not been established with these combinations. See APPENDIX for examples of other biologics that should not be taken in combination with Benlysta.

139. Rheumatoid Arthritis. A Phase II dose-ranging study evaluating patients with rheumatoid arthritis showed only small ACR 20 responses with Benlysta (e.g., ACR 20 response at Week 24 was 28% with Benlysta 10 mg/kg).[4] Numerous other agents are available with higher ACR responses and established efficacy for rheumatoid arthritis.

140. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Early Annual Revision	**Systemic Lupus Erythematosus:** For patients continuing on therapy with Benlysta, the requirement that the patient is ≥ 18 years of age was removed from the policy. This age criterion now only applies to those initiating therapy with Benlysta SC.	05/09/2019
Annual Revision	**Systemic Lupus Erythematosus:** Clarify in criteria that autoantibody-positive SLE is defined as patients who are positive for antinuclear antibodies (ANA) and/or anti-double-stranded DNA antibody (previously this was listed as an i.e. in the criteria). Examples standard therapies were moved to a Note in the criteria section (previously listed within the criteria). For the exceptions applying to patients with an intolerance to standard therapy, wording was updated to more generally allow this determination by the prescriber (criteria previously specified this was according to the prescribing physician). Examples of a response to therapy were moved to a note (previously included within the criteria).	05/27/2020
Early Annual Revision	**Lupus Nephritis:** This newly approved condition was added to the policy. For initial therapy the patient must be ≥ 18 years of age. Criteria approve for 6 months for initial therapy (1 year for continuation), if the medication is being used concurrently with at least one other standard therapy unless intolerant. For continuation, the patient must also have also demonstrated a response to initial therapy. For all approvals, Benlysta much be prescribed by or in consultation with a specialist. **Conditions Not Recommended for Coverage:** Concurrent use with cyclophosphamide intravenous was removed from the Conditions Not Recommended for Coverage (no longer supported in the labeling).	01/20/2021

PRIOR AUTHORIZATION POLICY

POLICY: Lupus – Lupkynis Prior Authorization Policy

- Lupkynis™ (voclosporin capsules – Aurinia)

REVIEW DATE: 01/27/2021

OVERVIEW

Lupkynis, a calcineurin inhibitor immunosuppressant, is indicated in combination with a background immunosuppressive therapy regimen for the treatment of adults with active **lupus nephritis**.[1] Safety and efficacy have not been established in combination with cyclophosphamide and is not recommended. The recommended starting dose is 23.7 mg twice daily taken on an empty stomach, used in combination with

mycophenolate mofetil and corticosteroids. Dose modifications are required based on estimated glomerular filtration rate (eGFR). Lupkynis is not recommended if baseline eGFR is ≤ 45 mL/min/1.73 m^2 unless the benefit exceeds the risk. If therapeutic benefit is not apparent by Week 24, consider discontinuation of Lupkynis.

Guidelines

Guidelines for lupus nephritis from EULAR/ERA-EDTA (European League Against Rheumatism-European Renal Association-European Dialysis and Transplant Association) [2019] recommend treatment based on disease classification.[2] Patient survival, long-term preservation of kidney function, and prevention of organ damage are among the goals of treatment. First-line initial therapy for patients with class III or IV disease (± class V) includes mycophenolate mofetil or intravenous cyclophosphamide, in combination with glucocorticoids. In pure class V disease, the first-line choice is mycophenolate mofetil + glucocorticoids. Following a response to initial therapy, mycophenolate mofetil or azathioprine (± low-dose glucocorticoids) are the drugs of choice for subsequent immunosuppressive treatment. Mycophenolate mofetil in combination with a calcineurin inhibitor (especially tacrolimus) are among the alternative therapies for those with nephrotic-range proteinuria or for class V nephritis.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Lupkynis. Because of the specialized skills required for evaluation and diagnosis of patients treated with Lupkynis as well as the monitoring required for adverse events and long-term efficacy, approval requires Lupkynis to be prescribed by or in consultation with a physician who specializes in the condition being treated. Approvals are authorized for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Lupkynis is recommended in those who meet the following criteria:

FDA-Approved Indications

3. Lupus Nephritis. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy. Approve for 6 months if the patient meets ALL of the following conditions (i, ii, iii, iv, and v):
- **i)** Patient is ≥ 18 years of age; AND
- **ii)** Patient has autoantibody-positive systemic lupus erythematosus (SLE), defined as positive for antinuclear antibodies (ANA) and/or anti-double-stranded DNA (anti-dsDNA) antibody; AND
- **iii)** Patient meets ONE of the following (a or b):
  - **a)** The medication is being used concurrently with mycophenolate mofetil and a systemic corticosteroid; OR
  - **b)** According to the prescriber, patient is not a candidate for mycophenolate mofetil and a systemic corticosteroid due to inadequate efficacy OR significant intolerance with these medications; AND
- **iv)** Patient has an estimated glomerular filtration rate (eGFR) > 45 mL/min/m^2; AND
- **v)** The medication is prescribed by or in consultation with a nephrologist or rheumatologist.

B) Patient is Currently Receiving Lupkynis. Approve for 1 year if the patient meets ALL of the following criteria (i, ii, iii, and iv):
- **i)** Patient is ≥ 18 years of age; AND
- **ii)** Patient meets ONE of the following (a or b):

a) The medication is being used concurrently with mycophenolate mofetil and a systemic corticosteroid; OR

b) According to the prescriber, patient is not a candidate for mycophenolate mofetil and a systemic corticosteroid due to inadequate efficacy OR significant intolerance with these medications; AND

iii) The medication is prescribed by or in consultation with a nephrologist or rheumatologist; AND

iv) Patient has responded to Lupkynis, as determined by the prescriber.
Note: Examples of a response include improvement in organ dysfunction, reduction in flares, reduction in corticosteroid dose, decrease of anti-dsDNA titer, and improvement in complement levels (i.e., C3, C4).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Lupkynis is not recommended in the following situations:

141. **Concurrent Use with Biologics or with Cyclophosphamide.** Lupkynis has not been studied in combination with other biologics or cyclophosphamide.[1] Safety and efficacy have not been established with these combinations. See APPENDIX for examples of biologics that should not be taken in combination with Lupkynis.

142. **Plaque Psoriasis.** In a Phase III trial, voclosporin was inferior to cyclosporine, which is an established therapy for plaque psoriasis.[3,4] Numerous other FDA-approved therapies are available with established efficacy for plaque psoriasis.

143. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Lyrica® CR (pregabalin extended-release tablets – Pfizer)

DATE REVIEWED: 03/04/2020

OVERVIEW

Lyrica CR is indicated for the management of neuropathic pain associated with diabetic peripheral neuropathy (DPN) and postherpetic neuralgia (PHN).[1] The efficacy of Lyrica CR has not been established for the management of fibromyalgia or as adjunctive therapy for adults with partial onset seizures. Lyrica CR is an analog of the neurotransmitter gamma-aminobutyric acid (GABA). Lyrica CR is dosed once daily (QD), and it is a Schedule V controlled substance.

Gabapentin immediate-release (IR) [Neurontin, generics] is also a GABA analog.[2] Gabapentin is indicated for the management of PHN in adults and as adjunctive therapy in the treatment of partial onset seizures, with and without secondary generalization, in adults and pediatric patients ≥ 3 years of age with epilepsy. Gabapentin IR has been used off-label extensively and is included as a treatment option in various guidelines. Pregabalin immediate-release capsules and oral solution are approved for neuropathic pain associated with DPN, PHN, adjunctive therapy for the treatment of partial onset seizures in patients ≥ 1 month of age, fibromyalgia, and neuropathic pain associated with spinal cord injury.[3] Like Lyrica CR, pregabalin immediate-release is a Schedule V controlled substance.

Disease Overview

These drugs exert their pharmacologic action by binding to the alpha-2-delta subunit of voltage-gated calcium channels.[4] The binding of this subunit reduces the release of several neurotransmitters including glutamate, noradrenaline, and substance P.

PHN is the persistence of the pain of herpes zoster > 3 months after resolution of the rash; it is relatively common, affecting 10 to 15% of those with herpes zoster.[5] The time interval used in the clinical case definition of PHN varies in the literature from 1 to 6 months after resolution of the rash. The incidence of PHN increases with age. The duration of PHN is highly variable; in one longitudinal study, only 48% of patients who developed PHN were symptomatic 1 year after onset. Thus, the natural history of resolution of PHN over time is a confounder in the evaluation of treatment efficacy and may limit the ability to generalize the results of controlled clinical trials in this population. Administration of antiviral agents within 72 hours of the onset of herpes zoster can reduce the intensity and duration of acute illness, and can prevent PHN. Efforts to prevent herpes zoster and PHN are important in that 40% to 50% of patients with PHN do not respond to any treatment.

The diabetic neuropathies are a heterogeneous group of disorders with diverse clinical manifestations.[6] The early recognition and appropriate management of neuropathy in the patient with diabetes is important. Diabetic neuropathy is a diagnosis of exclusion. Up to 50% of diabetic peripheral neuropathy (DPN) may be asymptomatic. Painful diabetic neuropathy (PDN) affects 16% of patients with diabetes, and it is frequently unreported (12.5%) and more frequently untreated (39%).[7] If not recognized and if preventive foot care is not implemented, patients are at risk for injuries to their insensate feet.[6] Recognition and treatment of autonomic neuropathy may improve symptoms, reduce sequelae, and improve quality of life. Glycemic control can effectively prevent DPN in type 1 diabetes and may modestly slow their progression in type 2 diabetes but does not reverse neuronal loss. Therapeutic strategies (pharmacologic and nonpharmacologic) for the relief of painful DPN can potentially reduce pain and improve quality of life.

Clinical Efficacy

Support for the efficacy of Lyrica CR for the management of PHN and DPN was based on the efficacy of IR Lyrica for these indications, along with one study of Lyrica CR in adults with PHN.[1] This 19-week, randomized, withdrawal study compared Lyrica CR 82.5 mg, 165 mg, 247.5 mg, 330 mg, 495 mg, or 660 mg QD with placebo. Those enrolled were required to have pain present for > 3 months after healing of the herpes zoster skin rash and a baseline pain score ≥ 4 on the numeric rating scale (NRS)-Pain (assessed over a 1 week recall period). Patients who responded to treatment in the single-blind phase of the study (≥ 50% reduction in pain) moved into the double-blind phase and were randomized to the Lyrica CR dose achieved in the single-blind phase or placebo. Patients were treated for ≤ 3 months following randomization. Lyrica CR demonstrated statistically significant improvement in the efficacy endpoint of change in mean pain score from baseline compared with placebo. In the Lyrica CR arm, 80% of patients achieved ≥ 30% improvement and 74% of patients achieved ≥ 50% improvement in pain intensity. In the placebo group, 65% of patients achieved ≥ 30% improvement and 55% of patients achieved ≥ 50% improvement in pain intensity.

Guidelines

Various guidelines for the treatment of DPN, neuropathic pain, PHN, and restless legs syndrome recommend gabapentin or pregabalin immediate-release as treatment options.[5-14] Guidelines have not been updated to address Lyrica CR.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Lyrica CR. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Lyrica CR is recommended in those who meet the following criteria:

FDA-Approved Indications

27. Neuropathic Pain Associated with Diabetic Peripheral Neuropathy (DPN). Approve Lyrica CR for 1 year if the patient the patient meets ONE of the following criteria (A or B):
- **A)** Patient has tried gabapentin immediate-release (brand [Neurontin] or generic) or generic pregabalin; OR
- **B)** Patient is currently established on therapy with Lyrica CR.

28. Postherpetic Neuralgia. Approve Lyrica CR for 1 year if the patient meets ONE of the following criteria (A or B):
- **A)** Patient has tried gabapentin immediate-release (brand [Neurontin] or generic) or generic pregabalin; OR
- **B)** Patient is currently established on therapy with Lyrica CR.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Lyrica CR has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

144. Fibromyalgia. A double-blind, placebo-controlled, randomized withdrawal trial of Lyrica CR in adults with fibromyalgia failed to demonstrate efficacy.[1]

145. Partial Onset Seizures. A double-blind, placebo-controlled, randomized trial of Lyrica CR as adjunctive therapy in adults with partial onset seizures failed to demonstrate efficacy.[1]

146. Restless Legs Syndrome. No data are available for Lyrica CR for the treatment of restless legs at this time.

147. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Makena (hydroxyprogesterone caproate) Prior Authorization Policy

- Makena® (hydroxyprogesterone caproate injection [subcutaneous and intramuscular] – AMAG Pharmaceuticals, generics [intramuscular only])

REVIEW DATE: 09/30/2020

OVERVIEW

Makena is an injectable progestin indicated to reduce the risk of preterm birth in women with a singleton pregnancy who have a history of singleton spontaneous preterm birth.[1] The effectiveness of Makena is based on improvement in the proportion of women who delivered < 37 weeks of gestation. There are no clinical trials demonstrating a direct clinical benefit, such as improvement in neonatal mortality and morbidity. While there are many risk factors for preterm birth, safety and efficacy of Makena has been demonstrated only in women with a prior spontaneous singleton preterm birth. It is not intended for use in women with multiple gestations or other risk factors for preterm birth. Makena is administered by the intramuscular route at a dose of 250 mg (1 mL) once weekly or by the subcutaneous route using an auto-injector at a dose of 275 mg (1.1 mL) once weekly; both products require administration by a healthcare professional. Generic Makena, hydroxyprogesterone caproate injection, is available for IM administration only. Makena should be administered beginning between 16 weeks, 0 days and 20 weeks, 6 days gestation and continued once weekly until week 37 (through 36 weeks, 6 days) of gestation or delivery, whichever occurs first.

GUIDELINES

As of October 2019, the American College of Obstetricians and Gynecologists continues to recommend progesterone supplementation starting at 16 to 24 weeks of gestation to women with a singleton gestation and a prior spontaneous preterm birth.[2,3] The Society for Maternal-Fetal Medicine statement on the use of 17-alpha hydroxyprogesterone caproate for prevention of recurrent preterm birth (2019) states it is reasonable to use 17-alpha hydroxyprogesterone caproate in women with a very-high-risk profile.[4] For women at risk of recurrent spontaneous preterm birth, the risk-benefit discussion should incorporate a shared decision-making approach.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Makena (hydroxyprogesterone caproate). All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Makena (hydroxyprogesterone caproate) and generics are recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Reduce Risk of Preterm Birth.** Approve for up to 5 months of therapy (21 injections) in patients who meet the following criteria (A, B, and C):
   - **A)** Patient is pregnant with a singleton pregnancy; AND
   - **B)** Patient has a history of singleton spontaneous preterm birth prior to 37 weeks gestation; AND
   - **C)** Treatment will begin in patients who are at least 16 weeks, 0 days of gestation, according to the prescribing physician or other prescriber.

   Note: In cases where there was an inaccuracy in dating the pregnancy, a one-month authorization may be granted to patients who have already received 21 injections and are < 37 weeks pregnant.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Makena (hydroxyprogesterone caproate) is not recommended in the following situations:

1. **History of a Threatened Preterm Birth.** Makena is not indicated in pregnant women who experienced a past threatened preterm birth but delivered a full-term infant after 36 completed weeks gestation.[1]

2. **Infertility.** Some studies have evaluated hydroxyprogesterone caproate as the progesterone used for *in vitro* fertilization.[5,6] However, progesterone in oil or vaginally administered progesterone are mentioned for use during the luteal phase and in early pregnancy in the treatment of infertility by an educational bulletin by the Practice Committee of the American Society of Reproductive Medicine.[7]

3. **Patients Pregnant with Multiple Gestations.** Makena is not indicated in patients pregnant with multiple gestations (e.g., twins, triplets, or other multiples).[1] Hydroxyprogesterone caproate has failed to decrease preterm birth in women pregnant with twins and triplets.[8-10] In a randomized, double-blind, placebo-controlled study in 661 women, delivery or fetal death prior to Week 35 occurred in 41.5% of women pregnant with twins in the hydroxyprogesterone caproate group compared to 37.3% of those pregnant with twins in the placebo group (relative risk [RR]: 1.1; 95% confidence interval [CI]: 0.9, 1.5).[8] In a randomized, double-blind, placebo-controlled study in women pregnant with triplets (n = 134), treatment with hydroxyprogesterone caproate did not affect the rate of delivery or fetal loss prior to Week 35 (RR: 1.0; 95% CI: 0.9, 1.1).[9] In an another randomized, double-blind, placebo-controlled study, 56 women pregnant with triplets were assigned to treatment with hydroxyprogesterone caproate and 25 women were assigned to placebo.[10] There was not a significant difference in delivery prior to Week 28, 32, or 35 in either treatment group; however, significantly more stillbirths/miscarriages occurred in the hydroxyprogesterone group (8%) compared to no stillbirths/miscarriages in the placebo group (P = 0.01). In one randomized, double-blind, controlled trial in unselected women with twin pregnancies, intramuscular 17P (not Makena; another marketed product in Europe) did not reduce preterm birth before 37 weeks of gestation; however, it did reduce neonatal morbidity parameters and also increased birthweight.[11] Other studies in women with multiple gestations (primarily twin gestations) have not shown a prolonged gestation or a reduction in neonatal morbidity with 17P compared with placebo.[12-14]

4. **Pregnant Patient with Short Cervix Without a History of a Prior Singleton Spontaneous Preterm Birth.** Makena is not indicated for use in pregnant women with short cervix and no history of singleton SPTB prior to 37 weeks gestation.[1]

5. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Metabolic Disorders – Carbaglu Prior Authorization Policy

- Carbaglu (carglumic acid tablets for oral suspension – Orphan Europe, SARL/Recordati Rare Diseases)

REVIEW DATE: 03/03/2021

OVERVIEW

Carbaglu, a carbamoyl phosphate synthetase 1 (CPS 1) activator, is indicated in adults and pediatric patients for the following conditions:[1]

- **N-acteylglutamate synthase (NAGS) deficiency** with chronic hyperammonemia or acute hyperammonemia (as adjunct therapy to standard of care).
- **Propionic acidemia or methylmalonic acidemia** with acute hyperammonemia (as adjunct therapy to standard of care).

For NAGS deficiency, the prescribing information notes that treatment with Carbaglu should be initiated as soon as the disorder is suspected, which may be as soon as birth.[1]

For acute hyperammonemia due to propionic acidemia or methylmalonic acidemia, Carbaglu is indicated as adjunctive therapy for acute treatment.[1] In this setting, Carbaglu should be continued until the patient's ammonia level is < 50 micromol/L and for a maximum duration of 7 days.

Disease Overview

NAGS Deficiency

Carbaglu is a synthetic analog of N-acetylglutamate, which activates CPS 1, the first reaction in the urea cycle.[1] The function of the urea cycle is to convert ammonia into urea for urinary excretion. In the case of NAGS deficiency, N-acetylglutamate is not sufficiently produced due to lack of the NAGS enzyme.[2] NAGS deficiency is the rarest urea cycle disorder with an estimated incidence of less than 1:2,000,000 live births. Age of diagnosis can vary from neonatal to adulthood; based on literature review, most cases present in the early neonatal period. Therefore, newborn screening is of limited value as patients are likely to be symptomatic before screening results are available. Common presenting features include poor feeding, vomiting, lethargy, decreased consciousness, seizures, and hypotonia. Laboratory abnormalities include hyperammonemia which can lead to significant morbidity and mortality in severe cases. Genetic testing is required to confirm the diagnosis; however, given the delays involved with genetic testing, it has been suggested that a therapeutic trial of Carbaglu should be initiated for any patient with unexplained hyperammonemia.

Propionic Acidemia and Methylmalonic Acidemia

In propionic and methylmalonic acidemias, other enzymatic defects result in accumulation of propionyl-coenzyme A (CoA), which acts as a competitive inhibitor for NAGS.[3,4] The incidence of propionic acidemia is 1:100,000 to 1:150,000, and the incidence of methylmalonic acidemia is 1:50,000.[3] According to guidelines for management of propionic acidemia and methylmalonic acidemia (2014), these disorders should be considered in any newborn/child (critically ill or not) with unexplained metabolic acidosis (with elevated anion gap); elevated lactate; hyperammonemia; leukopenia, thrombocytopenia, anemia; and/or urine ketone bodies. If ammonia is increased, further metabolic investigations should be performed immediately but specific treatment must not be delayed. Carbaglu is supported as part of the initial management plan for symptomatic hyperammonemia both in patients with known propionic/methylmalonic acidemia and in undiagnosed patients. Other elements of initial management include cessation of protein intake, use of intravenous glucose and insulin, and other medications such as carnitine and vitamin B_{12}. Extracorporeal detoxification (i.e., dialysis) may be used in some cases, particularly for extremely elevated ammonia levels.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Carbaglu. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Carbaglu as well as the monitoring required for adverse events and long-term efficacy, approval requires Carbaglu to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Carbaglu is recommended in those who meet the following criteria:

FDA-Approved Indications

118. N-Acetylglutamate Synthase Deficiency with Hyperammonemia. Approve for the duration noted below if the patient meets ALL of the following criteria (A, B, and C):

A) According to the prescriber, diagnosis is supported by one of the following (i or ii):

i. Approve for 1 year if genetic testing confirmed a mutation leading to N-acetylglutamate synthase deficiency; OR

ii. Approve for 3 months if the patient has hyperammonemia diagnosed with an ammonia level above the upper limit of the normal reference range for the reporting laboratory.
Note: Reference ranges are dependent upon patient's age; AND

B) The medication is prescribed in conjunction with a protein-restricted diet; AND

C) The medication is prescribed by or in consultation with a metabolic disease specialist (or specialist who focuses in the treatment of metabolic diseases).

119. Propionic Acidemia or Methylmalonic Acidemia with Hyperammonemia, Acute Treatment. Approve for 7 days if the patient meets the following criteria (A, B, and C):

A) Patient's plasma ammonia level is ≥ 50 micromol/L; AND

B) The medication is prescribed in conjunction with other ammonia-lowering therapies; AND
Note: Examples of other ammonia-lowering therapies include intravenous glucose, insulin, L-carnitine, protein restriction, and dialysis.

C) The medication is prescribed by or in consultation with a metabolic disease specialist (or specialist who focuses in the treatment of metabolic diseases).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Carbaglu is not recommended in the following situations:

126. Propionic Acidemia or Methylmalonic Acidemia with Hyperammonemia, Maintenance. Chronic use of Carbaglu (beyond 7 days) for propionic acidemia or methylmalonic acidemia is not indicated.[1] There is no clinical evidence for long-term use of Carbaglu in propionic acidemia or methylmalonic acidemia.[3]

127. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Annual Revision	**Propionic Acidemia or Methylmalonic Acidemia with Hyperammonemia, Acute Treatment:** This condition was added to FDA-approved indications based on updated labeling. **Propionic Acidemia or Methylmalonic Acidemia with Hyperammonemia, Maintenance:** This condition was added to Conditions Not Recommended for Approval.	03/03/2021

PRIOR AUTHORIZATION POLICY

POLICY: Metabolic Disorders – Cysteamine (Oral) Products

- Cystagon (cysteamine bitartrate capsules – Mylan Pharmaceuticals)
- Procysbi (cysteamine bitartrate delayed-release capsule, delayed release granules – Raptor Therapeutics Inc.)

DATE REVIEWED: 03/11/2020

OVERVIEW

Cystagon and Procysbi are cystine-depleting agent indicated for the management of nephropathic cystinosis in adults and children.[1-2] Note that Procysbi is indicated specifically in patients who are 1 year of age and older.[1] Therapy with a cysteamine product should be initiated promptly once the diagnosis is confirmed (i.e., increased white blood cell cystine concentration). Cystagon needs to be administered four times daily, whereas Procysbi (a delayed-release formulation of cysteamine) is given once every 12 hours.[1-2] For patients who are unable to swallow capsules, both products have instructions for opening the capsules and administering in food and/or liquids.

Disease Overview

Cystinosis is a very rare autosomal recessive inborn error of metabolism in which the transport of cystine out of lysosomes is abnormal.[3-5] As a result of deficient or absent cystinosin (which normally transports cystine out of the lysosome),

cystine accumulates within lysosomes and forms crystals in many tissues, including the kidneys, liver, bone marrow, pancreas, muscle, rectal mucosa, brain and eye. Diagnosis is confirmed by measuring cystine levels in polymorphonuclear leukocytes.[6] Molecular genetic testing idenitifies a characteristic mutation of the *CTNS* gene. Prenatal diagnosis is possible (i.e., by elevation of cystine in amniotic fluid or chorionic villi). Patients with cystinosis also experience growth failure and rickets, and cystine deposits in the cornea cause photophobia.[3-5] Over time, most organs are damaged. Cysteamine products are aminothiols that act as cystine-depleting agents.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of cysteamine oral products (Cystagon and Procysbi). All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with cysteamine oral products (Cystagon and Procysbi) as well as the monitoring required for adverse events and long-term efficacy, approval requires cysteamine oral products (Cystagon and Procysbi) to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of cysteamine oral products (Cystagon and Procysbi) is recommended in those who meet the following criteria:

FDA-Approved Indications

120. Cystinosis, Nephropathic. Approve for 1 year if the patient meets the following criteria (A, B, and C):

A) According to the prescriber, the diagnosis was confirmed by one of the following (i or ii):

i. Genetic testing confirmed a mutation of the *CTNS* gene; OR

ii. White blood cell cystine concentration above the upper limit of the normal reference range for the reporting laboratory.

Note: The methods used for measuring cystine vary among individual laboratories and depend upon the assay method used by the individual laboratory; values obtained from using different assay methods may not be interchangeable; AND

B) The patient will not be using Cystagon and Procysbi concurrently; AND

C) The medication is prescribed by or in consultation with a nephrologist or a metabolic disease specialist (or specialist who focuses in the treatment of metabolic diseases).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Cysteamine oral products (Cystagon and Procysbi) have not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

128. Concomitant Therapy with Cystagon and Procysbi. There are no data available to support concomitant use.

129. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revisior	Summary of Changes	Date Reviewed
New Policy	--	03/13/2019
Annual revision	No criteria changes,	03/11/2020

PRIOR AUTHORIZATION POLICY

POLICY: Metabolic Disorders – Cysteamine Ophthalmic Solution Prior Authorization Policy

- Cystadrops® (cysteamine 0.37% ophthalmic solution – Recordati Rare Diseases)
- Cystaran® (cysteamine 0.44% ophthalmic solution – Leadiant Biosciences)

REVIEW DATE: 03/11/2020; selected revision 09/16/2020

OVERVIEW

Cystamine ophthalmic solution is a cystine-depleting agent indicated for the treatment of corneal cystine crystal accumulation in patients with cystinosis.[1,2] The recommended dose is one drop into each eye four times daily during waking hours (Cystadrops) or one drop into each eye every waking hour (Cystaran).

Disease Overview

Cystinosis is a rare autosomal recessive inborn error of metabolism in which the transport of cystine out of lysosomes is abnormal.[3-5] As a result of deficient or absent cystinosin (which normally transports cystine out of the lysosome), cystine accumulates within lysosomes and forms crystals in many tissues, including the kidneys, liver, bone marrow, pancreas, muscle, rectal mucosa, brain and eye. Patients with cystinosis also experience growth failure and rickets, and cystine deposits in the cornea cause photophobia. With time, most organs are damaged. Patients may present only with corneal crystal deposition but no associated systemic manifestations; the kidney, retina, and other organs are free of cystine accumulation in these patients. In patients without systemic symptoms, diagnosis of ocular cystinosis is often in adulthood when corneal crystal deposits are noted on ocular examination.[6] Of note, with oral cysteamine the concentration obtained in corneal tissue is inadequate and does not affect corneal cystine crystals. Topical treatment is required to dissolve existing cystine crystals.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of cystamine ophthalmic solution. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with cystamine ophthalmic solution as well as the monitoring required for adverse events and long-term efficacy, approval requires cystamine ophthalmic solution to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of cystamine ophthalmic solution is recommended in those who meet the following criteria:

FDA-Approved Indications

121. Cystinosis, Corneal Cysteine Crystal Deposits. Approve for 1 year if the patient meets the following criteria (A and B):

- **A)** The patient has corneal cysteine crystal deposits confirmed by slit-lamp examination; AND
- **B)** The agent is prescribed by or in consultation with an ophthalmologist or a metabolic disease specialist (or specialist who focuses in the treatment of metabolic diseases).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of cystamine ophthalmic solution is recommended in those who meet the following criteria:

130. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Metabolic Disorders – Dojolvi Prior Authorization Policy

- Dojolvi™ (triheptanoin oral liquid – Ultragenyx)

REVIEW DATE: 07/22/2020; selected revision 11/11/2020

OVERVIEW

Dojolvi, a synthetic medium odd-chain triglyceride, is indicated as a source of calories and fatty acids for the treatment of adults and pediatric patients with molecularly **confirmed long-chain fatty acid oxidation disorders (LC-FAODs)**.[1]

For patients receiving another medium-chain triglyceride product, discontinue prior to the first dose of Dojolvi.

Disease Overview

LC-FAODs are a group of autosomal recessive genetic metabolic disorders in which the body is unable to properly oxidize long-chain fatty acid in the mitochondria (normally an important energy pathway when glucose is low).[2,3] The four most commonly affected enzymes are carnitine palmitoyl transferase 2 (CPT-2), very long-chain acyl-CoA dehydrogenase (VLCAD), long-chain 3-hydroxyacyl-CoA dehydrogenase (LCHAD), and mitochondrial trifunctional protein (TFP).[4] Other less common mutations may also occur.[2,4] Onset may occur anywhere from the neonatal period to adulthood. Clinical manifestations are heterogeneous and not well correlated with genotype.[2] Diagnosis of LC-FAODs has increased with the use of routine newborn screening. Newborn screening tests measure acylcarnitines in dried blood spots.[5] Abnormal newborn screening results or the presence of symptoms associated with LC-FAODs warrant further evaluation involving plasma acylcarnitine measurement, enzyme activity assays, and/or genetic testing. The activity of specific enzymes can be measured in lymphocytes or skin fibroblasts since these cells express all enzymes involved in long-chain fatty acid oxidation.[3] Mutation analysis can identify the specific genetic defect. However, new mutations and variants are regularly identified, requiring functional studies such as enzyme activity measurements for confirmation of the diagnosis.

Guidelines

A consensus statement regarding treatment recommendations in LC-FAODs was published in 2009; Dojolvi is not specifically addressed, although medium-chain triglycerides (MCT) are discussed more broadly.[6] Dietary recommendations are provided for VLCAD deficiency but it is noted that these can also be applied to similar disorders, such as CPT-2 deficiency. For symptomatic patients with VLCAD deficiency, long-chain fat content of the diet is suggested to be 25% to 30% of total energy. The diet should be enriched with MCT to provide 20% of total energy from MCT. In asymptomatic VLCAD deficiency, the necessity of dietary long-chain fat restriction is under debate. Per the consensus statement, the current recommendation is to mildly reduce fat content to 30% to 40% of total energy in these patients. However, it is noted that the clinical course is not predictable. Even for patients in whom long-chain triglyceride restriction is deemed unnecessary, MCT supplementation (especially prior to exercise) may still be needed. For LCHAD and TFP deficiency, both symptomatic and asymptomatic patients should follow long-chain fat restriction with MCT supplementation.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Dojolvi. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Dojolvi as well as the monitoring required for adverse events and long-term efficacy, approval requires Dojolvi to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Dojolvi is recommended in those who meet the following criteria:

FDA-Approved Indications

122. Long-Chain Fatty Acid Oxidation Disorders. Approve for 1 year if the patient meets the following criteria (A, B, C, and D):

- **A)** Patient has a molecularly confirmed diagnosis of a long-chain fatty acid oxidation disorder based on at least TWO of the following (TWO of i, ii, or iii):
  - **i.** Disease-specific elevations of acylcarnitines on a newborn blood spot or in plasma; OR
  - **ii.** Enzyme activity assay (in cultured fibroblasts or lymphocytes) below the lower limit of the normal reference range for the reporting laboratory; OR
    Note: Examples of enzyme assays include carnitine palmitoyl transferase 2 (CPT-2), very long-chain acyl-CoA dehydrogenase (VLCAD), long-chain 3-hydroxyacyl-CoA dehydrogenase (LCHAD), and mitochondrial trifunctional protein (TFP).
  - **iii.** Genetic testing demonstrating pathogenic mutation in a gene associated with long-chain fatty acid oxidation disorders; AND
    Note: Examples of genes associated with long-chain fatty acid disorders include *CPT2* (encodes CPT-2), *ACADVL* (encodes VLCAD), *HADHA* (encodes LCHAD and TFP), and *HADHB* (encodes TFP).
- **B)** Patient will not use any other medium-chain triglyceride products concomitantly with Dojolvi; AND
- **C)** Patient meets at least one of the following (i, ii, or iii):
  - **i.** According to the prescriber, the patient has had inadequate efficacy or significant intolerance to an over-the-counter (nutraceutical supplements) medium-chain triglyceride product (other than Dojolvi); OR
  - **ii.** According to the prescriber, the patient has a history of at least one severe or recurrent manifestation of long-chain fatty acid oxidation disorders (i.e., cardiomyopathy, rhabdomyolysis, or hypoglycemia); OR
  - **iii.** Patient is currently receiving Dojolvi; AND
- **D)** The medication is prescribed by, or in consultation with, a metabolic disease specialist or a physician who specializes in the management of long-chain fatty acid oxidation disorders.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Dojolvi is not recommended in the following situations:

131. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Metabolic Disorders – Imcivree Prior Authorization Policy

- Imcivree™ (setmelanotide subcutaneous injection – Rhythm Pharmaceuticals)

REVIEW DATE: 01/06/2021; selected revision 01/20/2021

OVERVIEW

Imcivree, a melanocortin 4 receptor agonist, is indicated for chronic weight management in patients ≥ 6 years of age with **obesity due to proopiomelanocortin (POMC), proprotein convertase subtilisin/kexin type 1 (PCSK1), or leptin receptor (LEPR) deficiency**, confirmed by genetic testing demonstrating variants in *POMC*, *PCSK1*, or *LEPR* genes that are interpreted as pathogenic, likely pathogenic, or of uncertain significance.[1]

As a limitation of use, Imcivree is not indicated for obesity due to suspected POMC, PCSK1, or LEPR deficiency with *POMC*, *PCSK1*, or *LEPR* variants classified as benign or likely benign.[1] Imcivree is also not indicated for obesity not related to POMC, PCSK1, or LEPR deficiency, including obesity associated with other genetic syndromes and general (polygenic) obesity.

Weight loss should be evaluated after 12 to 16 weeks of Imcivree treatment.[1] If a patient has not lost at least 5% of baseline body weight, or 5% of baseline body mass index for a patient with continued growth potential, Imcivree should be discontinued as it is unlikely that the patient will achieve and sustain clinically meaningful weight loss with continued treatment.

Disease Overview

Monogenic obesity is a rare and severe early-onset form of obesity.[2] Unlike general obesity, environmental factors are much less impactful on obesity development in these patients. Fewer than 50 patients worldwide have been identified with POMC deficiency (*POMC* or *PCSK1* mutations); the prevalence of LEPR deficiency is unknown but is expected to account less than 3% of severe early-onset obesity. The true prevalence of these disorders is unknown and likely underestimated due to lack of provider awareness and genetic testing.[3] Clinical presentation is mainly characterized by major hyperphagia and ravenous hunger.[2] Patients with these disorders experience very rapid and early increase in weight, occurring within the first few days of life to early childhood. Lifestyle interventions may provide initial weight loss but are very difficult to maintain long-term in this population due to constant, insatiable hunger.[4] Isolated case reports of bariatric surgery have demonstrated some efficacy but are generally regarded as

disappointing relative to the general population, likely related to the underlying energy imbalance. Caution is urged before considering bariatric surgery in patients with monogenic obesity disorders.

In the pivotal trial for Imcivree, eligible patients were ≥ 6 years of age with obesity due to POMC deficiency (homozygous or compound heterozygous variants in *POMC* or *PCSK1*) or LEPR deficiency (homozygous or compound heterozygous variants in *LEPR*).[3] For patients 6 to < 18 years of age, obesity was defined as bodyweight > 95th percentile for age on growth chart assessment. For patients ≥ 18 years of age, obesity was defined as a BMI ≥ 30 kg/m^2.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Imcivree. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Imcivree as well as the monitoring required for adverse events and long-term efficacy, approval requires Imcivree to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Imcivree is recommended in those who meet the following criteria:

FDA-Approved Indications

123. Obesity Due to Proopiomelanocortin (POMC), Proprotein Convertase Subtilisin/Kexin Type 1 (PCSK1), or Leptin Receptor (LEPR) Deficiency. Approve for the duration noted if the patient meets the following criteria (A or B):

A) Initial Therapy. Approve for 4 months if the patient meets the following criteria (i, ii, iii, and iv):
- **i.** Patient is ≥ 6 years of age; AND
- **ii.** Patient meets both of the following criteria (a and b):
  - **a)** Genetic testing demonstrates homozygous or compound heterozygous mutations in one of the following genes: *POMC*, *PCSK1*, or *LEPR*; AND
  - **b)** The genetic variant is interpreted as pathogenic, likely pathogenic, or of uncertain significance; AND
- **iii.** Patient meets one of the following criteria (a or b):
  - **a)** Patient is ≥ 18 years of age: Patient currently has a body mass index (BMI) ≥ 30 kg/m^2; OR
  - **b)** Patient is 6 to 17 years of age: Patient currently has a BMI ≥ 95th percentile for age and sex; AND
- **iv.** Imcivree is prescribed by or in consultation with an endocrinologist, a geneticist, or a physician who specializes in metabolic disorders.

B) Patient is currently receiving Imcivree. Approve for 1 year if the patient meets the following criteria:

(Note: For patients who have not completed at least 4 months of Imcivree therapy, refer to Initial Therapy criteria).
- **i.** Patient is ≥ 6 years of age; AND
- **ii.** Patient meets both of the following criteria (a and b):
  - **a)** Genetic testing demonstrates homozygous or compound heterozygous mutations in one of the following genes: *POMC*, *PCSK1*, or *LEPR*; AND
  - **b)** The genetic variant is interpreted as pathogenic, likely pathogenic, or of uncertain significance; AND
- **iii.** Patient meets one of the following criteria (a or b):
  - **a)** Patient has lost ≥ 5% of baseline body weight since initiating Imcivree therapy; OR

b) Patient meets both of the following (1 and 2):
(1) Patient has continued growth potential; AND
(2) Patient has lost ≥ 5% of baseline BMI since initiating Imcivree therapy; AND

iv. Imcivree is prescribed by or in consultation with an endocrinologist, a geneticist, or a physician who specializes in metabolic disorders.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Imcivree is not recommended in the following situations:

132. Other Genetic Obesity Syndromes. (Note: Examples of genetic obesity syndromes include Prader-Willi syndrome, Bardet-Biedl syndrome, and Alström syndrome). Imcivree is not indicated for genetic obesity syndromes other than POMC-, PCSK1-, or LEPR-deficient obesity. Studies are currently underway in Bardet-Biedl and Alström syndromes.[5]

133. General Obesity. Imcivree is not indicated in this setting and there are no clinical data to support its use.[1]

134. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Metabolic Disorders – Nitisinone Products

- Orfadin (nitisinone capsules and suspension – Sobi, Inc., generic [capsules only])
- Nityr (nitisinone tablets – Cycle Pharmacetuicals)

REVIEW DATE: 11/04/2020

OVERVIEW

Nitisinone products are hydroxy-phenylpyruvate dioxygenase inhibitors indicated for the treatment of adult and pediatric patients with **hereditary tyrosinemia type 1** in combination with dietary restriction of tyrosine and phenylalanine.[1-2]

Disease Overview

Hereditary tyrosinemia type 1 is a genetic disorder characterized by elevated blood levels of the amino acid tyrosine.[3-4] It is caused by mutations in the *FAH* gene, which lead to a deficiency of the enzyme fumarylacetoacetate hydrolase that is required for the breakdown of tyrosine. Symptoms usually appear in the first few months after birth and include failure to thrive, diarrhea, vomiting, jaundice, cabbage-like odor, and increased tendency to bleed. Diagnosis is most often via newborn screening (i.e., elevated alpha-fetoprotein and succinylacetone); however, carrier genetic testing and prenatal diagnosis by detection of succinylacetone in the amniotic fluid is also possible. Treatment should be immediately upon diagnosis with a diet restricted in tyrosine and phenylalanine and with nitisinone, which blocks the second step in the tyrosine degradation pathway.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of nitisinone products. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with nitisinone products as well as the monitoring required for adverse events and long-term efficacy, approval requires the agent to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of nitisinone products is recommended in those who meet the following criteria:

FDA-Approved Indications

124. Hereditary Tyrosinemia Type 1. Approve for 1 year if the patient meets the following criteria (A, B, C, and D):

- **A)** According to the prescriber, diagnosis is supported by one of the following (i or ii):
  - **i.** Genetic testing confirmed a mutation of the *FAH* gene; OR
  - **ii.** Patient has elevated serum levels of alpha-fetoprotein (AFP) and succinylacetone; AND
- **B)** The medication is prescribed in conjunction with a tyrosine- and phenylalanine-restricted diet; AND
- **C)** Patient will not be taking the requested agent concurrently with another nitisinone product.
  Note: Examples of nitisinone products include Orfadin, generic nitisinone capsules, and Nityr. Concurrent use of these agents is not allowed; AND
- **D)** The medication is prescribed by or in consultation with a metabolic disease specialist (or specialist who focuses in the treatment of metabolic diseases).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of nitisinone products is not recommended in the following situations:

135. Concomitant Therapy with Nitisinone Products. Note: For example, concomitant use of Orfadin, generic nitisinone capsules, and/or Nityr. There are no data available to support concomitant use.

136. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Metabolic Disorders – Oxlumo Prior Authorization Policy

- Oxlumo™ (lumasiran injection for subcutaneous use – Alnylam Pharmaceuticals)

REVIEW DATE: 12/16/2020

OVERVIEW

Oxlumo is a hydroxyacid oxidase 1 (*HAO1*)-directed small interfering RNA indicated for the treatment of **primary hyperoxaluria type 1** to lower urinary oxalate levels in pediatric and adult patients.[1]

Disease Overview

Primary hyperoxaluria type 1 is a rare autosomal recessive inborn error of glyoxylate metabolism that results in the overproduction of oxalate, which forms insoluble calcium oxalate crystals that accumulate in the kidney and other organs.[4] Mutations in the alanine:glyoxylate aminotransferase gene (AGXT) cause primary hyperoxaluria type 1.[5] European studies estimate the prevalence of primary hyperoxaluria type 1 to be 1 to 3 cases per 1 million individuals in the population.[3]

Clinical Efficacy

The efficacy of Oxlumo for the treatment of primary hyperoxaluria type 1 was established in two pivotal studies.[1-3] One randomized, double-blind study included patients ≥ 6 years of age with confirmed AGXT mutations and urinary oxalate excretion ≥ 0.7 mmol/24 hr/1.73 m^2.[2] The least squares mean percent change from baseline to Month 6 (averaged over Months 3 through 6) in the 24-hour urinary oxalate corrected for body surface area was significantly reduced with Oxlumo compared with placebo.[1,2] By Month 6, 52% of Oxlumo-treated patients achieved a normal 24-hour urinary oxalate corrected for body surface area (BSA) compared with 0 placebo-treated patients. A second, single-arm study included patients < 6 years of age with a genetically-confirmed primary hyperoxaluria type 1 diagnosis and an elevated spot urinary oxalate:creatinine ratio for age/weight.[3] Oxlumo-treated patients achieved a 71% reduction from baseline to Month 6 (averaged over Months 3 through 6) in the spot urinary oxalate:creatinine ratio.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Oxlumo. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Oxlumo as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Oxlumo to be prescribed by or in consultation with a physician who specializes in the condition being treated. All reviews will be forwarded to the Medical Director for evaluation.

Documentation: Documentation is required for use of Oxlumo as noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes, laboratory tests, claims records, and/or other information. Subsequent coverage reviews for a patient who has previously met the documentation requirements and related criteria in the *Oxlumo Prior Authorization Policy* through the Coverage Review Department, and who is requesting reauthorization, the criteria utilized do NOT require re-submission of documentation for reauthorization, except for the criterion requiring documentation of a continued benefit from Oxlumo therapy.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Oxlumo is recommended in those who meet the following criteria:

FDA-Approved Indications

125. Primary Hyperoxaluria Type 1. Approve Oxlumo for the duration noted if the patient meets one of the following criteria (A or B):

- **A)** Initial Therapy. Approve for 6 months if the patient meets the following criteria (i, ii, iii, and iv):
  - **i.** Patient has had a genetic test confirming the diagnosis of Primary Hyperoxaluria Type 1 via identification of an alanine:glyoxylate aminotransferase gene (AGXT) mutation **[documentation required]**; AND
  - **ii.** Patient has elevated urine oxalate excretion as demonstrated by ONE of the following (a or b):
    - **a)** Patient has a urinary oxalate excretion ≥ 0.7 mmol/24 hours/1.73 meters^2 **[documentation required]**; OR
    - **b)** Patient has a urinary oxalate:creatinine ratio above the age-specific upper limit of normal **[documentation required]**; AND
  - **iii.** Patient has not previously received a liver transplant for Primary Hyperoxaluria Type 1; AND
  - **iv.** The medication is prescribed by or in consultation with a nephrologist or urologist.
- **B)** Patient is Currently Receiving Oxlumo. Approve for 1 year if, according to the prescriber, the patient is continuing to derive benefit from Oxlumo as determined by the most recent (i.e., within the past 6 months) objective measurement **[documentation required]**.
  Note: Examples of objective measurements of a response to Oxlumo therapy are reduced urinary oxalate excretion, decreased urinary oxalate:creatinine ratio, or reduced plasma oxalate levels from baseline (i.e., prior to Oxlumo therapy) or improved or stabilized clinical signs/symptoms of Primary Hyperoxaluria Type 1 (e.g., nephrocalcinosis, formation of renal stones, renal impairment).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Oxlumo is not recommended in the following situations:

137. Primary Hyperoxaluria Type 2 (PH2). Oxlumo is not expected to be effective for the treatment of PH2, because its mechanism of action does not affect the metabolic pathways causing hyperoxaluria in PH2.[1] Oxlumo has not been studied for the treatment of patients with PH2.

138. Primary Hyperoxaluria Type 3 (PH3). Oxlumo is not expected to be effective for the treatment of PH3, because its mechanism of action does not affect the metabolic pathways causing hyperoxaluria in PH3.[1] Oxlumo has not been studied for the treatment of patients with PH3.

139. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Metabolic Disorders – Phenylbutyrate Products

- Buphenyl (sodium phenylbutyrate tablets and powder for oral solution – Horizon Pharma, generics)
- Ravicti (glycerol phenylbutyrate oral liquid – Horizon Pharma)

DATE REVIEWED: 03/11/2020

OVERVIEW

Buphenyl is indicated as adjunctive therapy in the chronic management of patients with urea cycle disorders involving deficiencies of carbamylphosphate synthetase, ornithine transcarbamylase, or argininosuccinic acid synthetase.[1] It is indicated in all patients with neonatal-onset deficiency (complete enzymatic deficiency, presenting within the first 28 days of life). It is also indicated in patients with late-onset disease (partial enzymatic deficiency, presenting after the first month of life) who have a history of hyperammonemic encephalopathy. Early diagnosis is important so that treatment is initiated early for improved survival. Any episode of acute hyperammonemia should be treated as a life-threatening emergency. Buphenyl must be combined with dietary protein restriction and, in some cases, essential amino acid supplementation. Of note, Buphenyl tablet/powder contains 124 mg of sodium per gram of sodium phenylbutyrate (12.4% w/w) or about 2.5 grams of sodium in 40 tablets; safety or efficacy data unavailable for > 40 tablets/day. Therefore, it should be used with great care, if at all, in patients with congestive heart failure or severe renal insufficiency, and in clinical states in which there is sodium retention with edema.

Ravicti is indicated for use as a nitrogen-binding agent for chronic management patients with urea cycle disorders that cannot be managed by dietary protein restriction and/or amino acid supplementation alone.[2] Ravicti must be used with dietary protein restriction and, in some cases, dietary supplements (e.g., essential amino acids, arginine, citrulline, protein-free calorie supplements). Ravicti is not indicated for the treatment of acute hyperammonemia in patients with urea cycle disorders. Safety and efficacy for the treatment of N-acetyl glutamate synthase (NAGS) deficiency have not been established.

Disease Overview

Urea cycle disorders are rare inborn errors of metabolism which result from mutations in the genes encoding for one of the six enzymes necessary for normal function of the urea cycle: arginase, citrullinemia, arginosuccinic acid synthetase, N-acetyl glutamate synthetase, ornithine transcarbamylase, and carbamyl phosphate synthetase.[3-4] They lead to increased amounts of ammonia in the blood which may cause disturbed brain function and severe brain damage. Signs of disease include decreased mental awareness, vomiting, combativeness, slurred speech, unstable gait, and unconsciousness. Diagnosis begins with a clinical suspicion of hyperammonemia.[6] Typically, patients have normal glucose and electrolyte levels. Enzymatic diagnosis and/or genetic testing is also available; however, treatment should not be delayed while waiting for a final diagnosis. Most deaths have occurred during an episode of acute hyperammonemic encephalopathy.[3-4] Treatment includes use of alternative waste nitrogen excretion pathways (e.g., Buphenyl, Ravicti); other treatments may include hemodialysis, dietary protein restriction, and, in some cases, essential amino acid supplementation.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Phenylbutyrate Products (Buphenyl, Ravicti). All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Phenylbutyrate Products (Buphenyl, Ravicti) as well as the monitoring required for adverse events and long-term efficacy, approval requires these agents to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Phenylbutyrate Products (Buphenyl, Ravicti) is recommended in those who meet the following criteria:

FDA-Approved Indications

126. Urea Cycle Disorders (Note: Examples include deficiencies of carbamylphosphate synthetase, ornithine transcarbamylase, or argininosuccinic acid synthetase). Approve for the duration noted if the patient meets ALL of the following (A, B, C, and D):

- **A)** According to the prescriber, the diagnosis was confirmed by one of the following (i or ii):
  - **i.** Approve for 1 year if genetic testing confirmed a mutation resulting in a urea cycle disorder; OR
  - **ii.** Approve for 3 months if the patient has hyperammonemia diagnosed with an ammonia level above the upper limit of the normal reference range for the reporting laboratory.
    Note: Reference ranges are dependent upon patient's age; AND
- **B)** The medication is prescribed in conjunction with a protein-restricted diet; AND
- **C)** The patient will not be taking Buphenyl and Ravicti concurrently; AND
- **D)** The medication is prescribed by or in consultation with a metabolic disease specialist (or specialist who focuses in the treatment of metabolic diseases).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Phenylbutyrate Products (Buphenyl, Ravicti) have not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

140. Concomitant Therapy with Buphenyl and Ravicti. There are no data available to support concomitant use.

141. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Metabolic Disorders – Tiopronin Products Prior Authorization Policy

- Thiola® (tiopronin tablets – Mission Pharmacal)
- Thiola® EC (tiopronin delayed-release tablets – Mission Pharmacal)

REVIEW DATE: 09/16/2020

OVERVIEW

Thiola and Thiola EC are indicated, in combination with high fluid intake, alkali, and diet modification, for the prevention of cystine kidney stone formation in adults and pediatric patients ≥ 20 kg with severe homozygous cystinuria, who are not responsive to these measures alone.[1,2]

Disease Overview

Cystinuria is an autosomal recessive disorder of abnormal cystine transport.[3] The estimated prevalence is 1:7,000 to 1:10,000 individuals in the US. Excessive undissolved cystine in the urine leads to formation of stones in the kidney, bladder, and/or ureter. Symptoms typically begin to manifest between 10 and 30 years of age, although elevated cystine excretion may be found in infancy. Diagnosis is made clinically based on quantitative urinary cystine assays; genetic testing is not routine as it does not change medical management.[4] Homozygotes exhibit urinary cystine excretion > 300 to 400 mg/L/day, whereas heterozygotes have intermediate urinary cystine excretion. Treatment is directed at decreasing urinary cystine concentration (generally targeting a urine cystine < 250 mg/L) and enhancing solubility.[4,5] Tiopronin products work by binding to cystine and increasing urinary solubility.[4]

Guidelines

According to the American Urological Association guideline for medical management of kidney stones (2014), all patients with cystine kidney stones should be encouraged to drink large amounts of fluid to maintain low urinary cystine concentrations; often volumes of 4 liters per day are required.[5] Recommended dietary modifications include restriction of sodium and animal proteins. Alkalization of urine is also used to improve cystine solubility. This can be achieved through increased fruit and vegetable intake and/or with medications such as potassium citrate. The guideline recommends tiopronin for patients with cystine kidney stones who are unresponsive to increased fluid intake, dietary modification, and urinary alkalization.

Captopril, another thiol agent, has not been shown to be effective for the prevention of recurrent cystine stones. D-penicillamine may be associated with more adverse events and is not preferred.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of tiopronin products (Thiola, Thiola EC). All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with tiopronin products, approval requires the requested medication to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Thiola or Thiola EC is recommended in those who meet the following criteria:

FDA-Approved Indications

25. Cystinuria. Approve for 1 year if the patient meets the following criteria (A, B, and C):

- **E)** Diagnosis of cystinuria has been confirmed based on laboratory testing (e.g., urinary cystine crystals present on microscopy, quantitative urine cystine assay); AND
- **F)** According to the prescriber, the patient has had an inadequate response to high fluid intake, dietary modification, and urinary alkalization; AND
- **G)** The medication is prescribed by, or in consultation with, a nephrologist, urologist, or physician who specializes in the treatment of cystinuria.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Thiola or Thiola EC is not recommended in the following situations:

4. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Metabolic Disorders – Xuriden Prior Authorization Policy
- Xuriden® (uridine triacetate oral granules – Wellstat Therapeutics)

REVIEW DATE: 07/29/2020

OVERVIEW
Xuriden, a pyrimidine analog for uridine replacement, is indicated for the treatment of hereditary orotic aciduria.[1] Xuriden is supplied as oral granules in a 2 gram packet. The recommended starting dose is 60 mg/kg once daily, which may be increased to 120 mg/kg (not to exceed 8 grams) once daily for insufficient efficacy. Any unused portion of a packet must be discarded; it should not be saved for subsequent doses.

Disease Overview
Hereditary orotic aciduria, also known as orotic aciduria type 1, is an extremely rare, autosomal recessive genetic disorder estimated to affect less than 1:1,000,000 live births.[1-3] Only about 20 cases have been reported in the medical literature.[2] In hereditary orotic aciduria, mutation in the *UMPS* gene leads to defective uridine 5'monophosphate synthase.[1,2] Deficiency in this enzyme prevents the last two steps in pyrimidine biosynthesis, leading to inadequate levels of uridine monophosphate and excess levels of orotic acid (a uridine precursor). Because the condition is so rare, hereditary orotic aciduria is not fully understood. Affected infants may develop megaloblastic anemia, developmental delays, or failure to thrive. Orotic acid crystals in the urine can lead to urinary obstruction. Xuriden replaces uridine in the circulation, and as a result of feedback inhibition, overproduction of orotic acid is reduced. Diagnosis is made by detailed patient and family history as well as thorough clinical evaluation and examination of urine. Most individuals have their diagnosis confirmed through molecular genetic testing; however, this is only available at specialized laboratories.

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of Xuriden. Because of the specialized skills required for evaluation and diagnosis of patients treated with Xuriden, approval requires the requested medication to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Xuriden is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Hereditary Orotic Aciduria (Orotic Aciduria Type 1).** Approve for 1 year if the patient meets the following criteria (A and B):
   - **A)** Patient has hereditary orotic aciduria confirmed by at least one of the following (i or ii):
     - **i.** Molecular genetic testing confirming mutation in the *UMPS* gene; OR
     - **ii.** Clinical diagnosis supported by both of the following (a and b):
       - **a)** First-degree family relative (i.e., parent or sibling) with hereditary orotic aciduria; AND

b) Urinary orotic acid level above the normal reference range for the reporting laboratory; AND

B) Xuriden is prescribed by, or in consultation with, a metabolic specialist, geneticist, or physician specializing in the condition being treated.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Xuriden is not recommended in the following situations:

5. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Methergine® (methylergonovine maleate tablets, USP – Lupin Pharma, generics)

DATE REVIEWED: 05/27/2020

OVERVIEW

Methylergonovine is a semi-synthetic ergot alkaloid used for the prevention and control of postpartum hemorrhage.[1] Methylergonovine is indicated for management of uterine atony, hemorrhage and subinvolution of the uterus following delivery of the placenta.

The National Headache Foundation notes that methylergonovine can cause constriction of the smooth muscles in the blood vessels and this effect can be helpful in treating vascular headaches, such as migraines.[2] Although methylergonovine is more commonly used for prevention of migraine headaches, it can be taken for acute attacks. However, methylergonovine should only be used for limited periods of time in most patients and only under careful supervision of a physician. The dose of methylergonovine used for migraines is 0.2 to 0.4 mg three times a day; a maximum dose of 1.6 mg/day has been reported (eight 0.2 mg tablets per day).[3]

Disease Overview, Migraine

Migraine, a chronic neurologic disease, is characterized by attacks of throbbing headache with sensitivities to light and sound.[4] The treatment of migraines is individualized and choice of therapy is based on many factors, including: patient preference; severity and frequency of attacks; the presence, type, and severity of associated symptoms; treatment response to prior therapies; presence of comorbid and coexistent illness; contraindications (e.g., cardiovascular disease); and use of concomitant medications.

Guidelines/Recommendations

An updated assessment of the preventive and acute treatment of migraine by the American Headache Society (2018) reaffirms previous migraine guidelines. The current update lists the triptans and dihydroergotamine (DHE) as effective treatments for moderate or severe acute migraine attacks and mild to moderate attacks that respond poorly to nonsteroidal anti-inflammatory drugs (NSAIDs) or caffeinated combinations (e.g., aspirin + acetaminophen + caffeine). Opioid medications are probably effective; however, they are not recommended for regular use. The recommendation remains that clinicians must consider medication efficacy, potential side effects, and potential medication-related adverse events when prescribing acute medications for migraines. Treatment at the first sign of pain improves the probability of achieving freedom from pain and reduces attack-related disability. Migraine patients who need to use acute treatments on a regular basis should limit treatment to an average of two headache days per week, and patients who exceed this limit should be offered preventive treatment. Therapies that are used for migraine prevention include antiepileptics (divalproex sodium, valproate sodium, topiramate), beta-blockers (metoprolol, propranolol, timolol), onabotulinumtoxin A, and frovatriptan (for short-term preventive treatment of menstrual migraine).

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of methylergonovine prescriptions with quantities exceeding 28 tablets per 30 days. Twenty-eight (28) tablets per month will be sufficient to treat uterine atony, hemorrhage and subinvolution of the uterus following the delivery of the placenta (FDA-approved indication). Because of the specialized skills required for evaluation and diagnosis of patients with migraines who are treated with methylergonovine as well as the monitoring required for adverse events and long-term efficacy, approval requires methylergonovine to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for 1 year in duration unless otherwise noted below.

Automation: Methylergonovine prescriptions for 28 tablets (0.2 mg strength) per 30 days are excluded from Prior Authorization (PA). The PA policy will only apply to methylergonovine prescriptions with quantities exceeding 28 tablets per 30 days.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of methylergonovine is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Uterine Atony, Hemorrhage and Subinvolution of the Uterus.** Do not approve. The initial quantity of 28 tablets is sufficient to treat this condition; quantities > 28 tablets for this indication will not be approved.

Other Uses with Supportive Evidence

2. **Migraine Headaches (Acute Treatment).** Approve methylergonovine for 1 year if the patient meets ONE of the following criteria (A or B):
   - **F)** Patient is already receiving methylergonovine therapy; OR
   - **G)** The patient meets all of the following criteria (i, ii, and iii):
     - **i.** Patient has tried and had inadequate efficacy and/or unacceptable side effects to at least one triptan therapy.

Note: Examples of triptans: almotriptan, eletriptan, frovatriptan, naratriptan, rizatriptan, sumatriptan, and zolmitriptan); AND

ii. Patient has tried and had inadequate efficacy and/or unacceptable side effects to at least one other type of abortive therapy.

Note: Examples of abortive therapies include analgesics [acetaminophen, nonsteroidal anti-inflammatories {NSAIDs}], butalbital-containing products [butalbital-acetaminophen, butalbital-acetaminophen-caffeine, butalbital-acetaminophen-caffeine-codeine, butalbital-aspirin-caffeine, butalbital-aspirin-caffeine-codeine], dihydroergotamine [DHE, Migranal®, generics]); AND

iii. The medication is prescribed by, or in consultation with, a neurologist or headache specialist.

3. **Migraine Headaches (Prophylaxis).** Approve methylergonovine for 1 year if the patient meets both of the following criteria (A and B):

A) Patient has tried at least two other prophylactic pharmacologic therapies, each from a different pharmacologic class.

Note: Examples of prophylactic pharmacologic therapies include angiotensin receptor blocker [e.g., candesartan], angiotensin converting enzyme inhibitor [e.g., lisinopril], anticonvulsant [e.g., divalproex sodium, sodium valproate, topiramate], beta-blocker [e.g., atenolol, metoprolol, nadolol, propranolol, timolol], calcium channel blocker [e.g., diltiazem, verapamil], tricyclic antidepressant [e.g., amitriptyline], other antidepressant [e.g., venlafaxine]); AND

B) The medication is prescribed by, or in consultation with, a neurologist or headache specialist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Methylergonovine has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below.

148. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Migraine – Nurtec™ ODT (rimegepant sulfate orally disintegrating tablet – Biohaven)

DATE REVIEWED: 03/04/2020; selected revision 06/03/2020

OVERVIEW

Nurtec ODT is indicated for the acute treatment of migraine with or without aura in adults.[1] Limitations of Use: Nurtec ODT is not indicated for the prevention of migraine. The recommended dose of Nurtec ODT is 75 mg taken orally. The maximum dose is 75 mg in a 24 hour period. The safety of treating more than 15 migraines in a 30 day period has not been established.

Disease Overview

Migraine is a common, ongoing condition marked by paroxysmal, unilateral attacks of moderate to severe throbbing headache which is aggravated by routine physical activity (e.g., walking or climbing stairs) and associated with nausea, vomiting, and/or photophobia and phonophobia.[2] Migraine headache episodes typically last 4 to 72 hours, if untreated. Migraine affects approximately 15% of US adults.[3] Migraines have been defined as chronic or episodic. Chronic migraine is described by the International Headache Society as headache occurring on ≥ 15 days/month for more than 3 months, which has the features of migraine headache on ≥ 8 days/month.[2] Episodic migraine is characterized by headaches that occur < 15 days/month.[4] Patients with episodic migraine may transform to chronic migraine over time at a rate of about 2.5% of patients per year. Potential strategies for preventing migraine transformation include preventing and treating headaches, lifestyle modifications, or effective management of comorbidities (e.g., obesity, obstructive sleep apnea, depression, anxiety). Episodic migraine is more common than chronic migraine; however, chronic migraine is associated with a markedly greater personal and societal burden.

Triptans (e.g., almotriptan, eletriptan, frovatriptan, naratriptan, rizatriptan, sumatriptan, and zolmitriptan) are considered the gold standard for acute treatment of moderate to severe migraine headaches or mild to moderate migraine headaches that respond poorly to over-the-counter (OTC) analgesics. An updated assessment of the **preventive and acute treatment of migraine by the American Headache Society** (2018) lists the triptans and dihydroergotamine as effective treatments for moderate or severe acute migraine attacks and mild to moderate attacks that respond poorly to nonsteroidal anti-inflammatory drugs (NSAIDs) or caffeinated combinations (e.g., aspirin + acetaminophen + caffeine).[5] Treat at the first sign of pain to improve the probability of achieving freedom from pain and reduce attack-related disability.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Nurtec ODT. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Nurtec ODT is recommended in those who meet the following criteria:

FDA-Approved Indications

127. Migraine, Acute Treatment. Approve for 1 year if the patient meets the following criteria (A and B):

- **A)** The patient is ≥ 18 years of age; AND
- **B)** The patient meets ONE of the following (i or ii):
  - **i.** The patient has tried at least one triptan therapy; OR

ii. The patient has a contraindication to triptan(s) according to the prescriber.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Nurtec ODT has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

142. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Migraine – Reyvow Prior Authorization Policy

- Reyvow™ (lasmiditan tablet – Lilly)

REVIEW DATE: 12/16/2020

OVERVIEW

Reyvow, a serotonin (5-HT) subtype 1F receptor agonist, is indicated for the **acute treatment of migraine** with or without aura in adults.[1] Limitations of Use: Reyvow is not indicated for the preventive treatment of migraine.

Reyvow is a first-in-class ditan that binds with high affinity and selectivity to the 5-HT_{1F} receptor.[1-4] Activation of this receptor does not constrict blood vessels. Migraine involves activation and sensitization of trigeminal nociceptors in the dura mater. Reyvow acts on the trigeminal system without causing vasoconstriction because of its low affinity for 5-HT_{1B} receptors. The recommended dose is 50 mg, 100 mg, or 200 mg as needed with or without food.[1] No more than one dose should be taken in 24 hours; a second dose has not been shown to be effective for the same migraine attack. Reyvow should not be taken unless the patient can wait at least 8 hours between dosing and driving or operating machinery. The safety of treating an average of more than four migraine attacks in a 30-day period has not been established.

Disease Overview

Migraine is a common, ongoing condition marked by paroxysmal, unilateral attacks of moderate to severe throbbing headache which is aggravated by routine physical activity (e.g., walking or climbing stairs) and associated with nausea, vomiting, and/or photophobia and phonophobia.[5] Migraines have been defined as chronic or episodic. Chronic migraine is described by the International Headache Society as headache occurring on ≥ 15 days/month for more than 3 months, which has the features of migraine headache on ≥ 8 days/month. Episodic migraine is characterized by

headaches that occur < 15 days/month.[6] Patients with episodic migraine may transform to chronic migraine over time. Potential strategies for preventing migraine transformation include preventing and treating headaches, lifestyle modifications, or effective management of comorbidities (e.g., obesity, obstructive sleep apnea, depression, anxiety). Episodic migraine is more common than chronic migraine; however, chronic migraine is associated with a markedly greater personal and societal burden.

Guidelines

Triptans (e.g., almotriptan, eletriptan, frovatriptan, naratriptan, rizatriptan, sumatriptan, and zolmitriptan) are considered the gold standard for acute treatment of moderate to severe migraine headaches or mild to moderate migraine headaches that respond poorly to over-the-counter (OTC) analgesics. An updated assessment of the **preventive and acute treatment of migraine by the American Headache Society** (2018) lists the triptans and dihydroergotamine as effective treatments for moderate or severe acute migraine attacks and mild to moderate attacks that respond poorly to nonsteroidal anti-inflammatory drugs (NSAIDs) or caffeinated combinations (e.g., aspirin + acetaminophen + caffeine).[7] Treat at the first sign of pain to improve the probability of achieving freedom from pain and reduce attack-related disability.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Reyvow. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Reyvow is recommended in those who meet the following criteria:

FDA-Approved Indications

128. Migraine, Acute Treatment. Approve for 1 year if the patient meets the following criteria (A and B):

- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient meets ONE of the following (i or ii):
  - **i.** Patient has tried at least one triptan therapy; OR
  - **ii.** Patient has a contraindication to triptan(s) according to the prescriber.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Reyvow is not recommended in the following situations:

PRIOR AUTHORIZATION POLICY

POLICY: Multiple Sclerosis – Ampyra Prior Authorization Policy

- Ampyra® (dalfampridine extended-release tablets – Acorda Therapeutics, generic)

REVIEW DATE: 10/14/2020

OVERVIEW

Ampyra is a potassium channel blocker that is indicated to improve walking in adults with multiple sclerosis (MS).[1] This was demonstrated by an increase in walking speed.

Safety

Ampyra is contraindicated in patients with a history of seizures; moderate or severe renal impairment (estimated creatinine clearance [CrCl] ≤ 50 mL/min); and in those with a history of hypersensitivity to Ampyra or 4-aminopyridine.[1]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Ampyra. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Ampyra as well as the monitoring required for adverse events and long-term efficacy, approval requires Ampyra to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Ampyra is recommended in those who meet the following criteria:

FDA-Approved Indications

46. Multiple Sclerosis (MS). Approve for the duration noted below if the patient meets one of the following criteria (A or B):

A) Initial Therapy. Approve for 4 months if the patient meets all of the following (i, ii, and iii):
- **i.** Patient is ≥ 18 years of age; AND
- **ii.** Ampyra is being used to improve or maintain mobility; AND
- **iii.** Medication is prescribed by or in consultation with a neurologist or a physician who specializes in the treatment of multiple sclerosis; OR

B) Patient Currently Receiving Ampyra. Approve for 1 year of the patient meets all of the following (i, ii, iii, and iv):
- **i.** Patient is ≥ 18 years of age; AND
- **ii.** Ampyra is being used to improve or maintain mobility; AND
- **iii.** Medication is prescribed by or in consultation with a neurologist or a physician who specializes in the treatment of multiple sclerosis; AND
- **iv.** According to the prescriber the patient has responded to or is benefiting from therapy.
  Note: Examples of response or benefits include an increase in walking speed and/or improvement in strength, coordination, ambulation, or balance.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Ampyra is not recommended in the following situations:

149. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	No criteria changes	08/15/2018
Early Annual Revision	Generic Ampyra was added to the policy. The approval duration was changed from 3 years of 1 year.	10/03/2018
Annual Revision	No criteria changes.	10/02/2019
Annual Revision	**Multiple Sclerosis:** Criteria are now broken down into patients receiving initial therapy and patients currently receiving Ampyra. Regarding initial approval, criteria are now to approve for 4 months (previously, the duration of approval was 1 year). Criteria were added that the agent is approved if the patient is ≥ 18 years of age. Also, regarding the criterion that requires that the patient is using Ampyra to improve mobility (in a patient with multiple sclerosis), the wording "or maintain (mobility)" was added. The approval duration for patients currently receiving Ampyra continues to be 1 year. Criteria for patients receiving initial therapy and for patients currently receiving Ampyra are the same except for patients currently receiving Ampyra, the patient has to demonstrate response or benefit from therapy, according to the prescriber. A note was added that examples of response or benefits include an increase in walking speed and/or improvement in strength, coordination or balance.	10/14/2020

PRIOR AUTHORIZATION POLICY

POLICY: Multiple Sclerosis – Aubagio Prior Authorization Policy

- Aubagio® (teriflunomide tablets – Genzyme/Sanofi)

REVIEW DATE: 08/05/2020; selected revision 09/09/2020

OVERVIEW

Aubagio, a pyrimidine synthesis inhibitor, is indicated for the treatment of patients with relapsing forms of multiple sclerosis (MS) to include clinically isolated syndrome, relapsing remitting disease, and active secondary progressive disease, in adults.[1]

Disease Overview

MS is a chronic, inflammatory, demyelinating, autoimmune disease of the central nervous system (CNS) that impacts almost 1,000,000 people in the US.[2] The condition is marked by inflammation and demyelination, as well as degenerative alterations. Patients usually experience relapses and remissions in their neurological symptoms. For most patients, the onset of MS symptoms occurs when patients are 20 to 40 years of age; however, children can get MS and new onset disease can occur in older adults. The MS disease course is heterogeneous but has some patterns. Approximately 85% to 90% of patients have a relapsing pattern at onset. However, this transitions over time in patients who are untreated to a worsening with very few or no relapses or magnetic resonance imaging (MRI) activity (secondary progressive MS). Around 10% to 15% of patients have a steady progression of symptoms over time (primary progressive MS), marked by some clinical manifestations or by MRI activity. Primary progressive MS is generally diagnosed in patients on the upper level of the typical age range (e.g., almost 40 years of age) and the distribution is equivalent among the two genders. Advances in the understanding of the MS disease process, as well as in MRI technology, spurned updated disease course descriptions in 2013,[3] as well as in 2017.[4] The revised disease courses are clinically isolated syndrome, relapsing remitting MS, primary progressive MS, and secondary progressive MS.[2-4] Clinically isolated syndrome is now more recognized among the course descriptions of MS. It is the first clinical presentation of MS that displays characteristics of inflammatory demyelination that may possibly be MS but has yet to fulfill diagnostic criteria. It is notable that the other MS designations can be further characterized considering whether patients have active disease (or not active), as well as if disease is worsening or stable. Disability in MS is commonly graded on the deterioration of mobility per the Expanded Disability Status Scale (EDSS) an ordinal scale that ranges from 0 to 10, with higher scores indicating greater disability.

Guidelines

In September 2019, a consensus paper was updated by the MS Coalition that discusses the use of disease-modifying therapies in MS.[2] Many options from various disease classes, involving different mechanisms of action and modes of administration, have shown benefits in patients with MS.

Safety

Aubagio has a Boxed Warning regarding hepatotoxicity and the risk of embryofetal toxicity.[1]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Aubagio. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Aubagio as well as the monitoring required for adverse events and long-term efficacy, approval requires Aubagio to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Aubagio is recommended in those who meet the following criteria:

FDA-Approved Indication

1. Multiple Sclerosis. Approve for 1 year if the patient meets the following criteria (A and B):

A) Patient has a relapsing form of multiple sclerosis; AND
Note: Examples of relapsing forms of multiple sclerosis (MS) include clinically isolated syndrome, relapsing remitting disease, and active secondary progressive disease.

B) Medication is prescribed by or in consultation with a neurologist or a physician who specializes in the treatment of multiple sclerosis.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Aubagio is not recommended in the following situations:

150. Concurrent Use with Other Disease-Modifying Agents Used for Multiple Sclerosis.
Note: Examples of disease modifying agents used for multiple sclerosis include Avonex® (interferon beta 1a injection [intramuscular]), Betaseron®/Extavia® (interferon beta-1b injection), Rebif® (interferon beta-1a injection [subcutaneous]), Copaxone®/Glatopa® (glatiramer acetate injection), Plegridy® (peginterferon beta-1a injection), Gilenya® (fingolimod tablets), Mavenclad® (cladribine tablets), Mayzent® (siponomid tablets), Tecfidera® (dimethyl fumarate delayed-release capsules), Bafiertam® (monomethyl fumarate delayed-release capsules), Vumerity® (diroximel fumarate delayed-release capsules), Zeposia® (ozanimod capsules), Ocrevus® (ocrelizumab injection for intravenous use), Tysabri® (natalizumab injection for intravenous infusion), Lemtrada® (alemtuzumab injection for intravenous use), and Kesimpta® (ofatumumab injection for subcutaneous use).[2] These agents are not indicated for use in combination. Additional data are required to determine if use of disease-modifying MS agents in combination is safe and provides added efficacy.

151. Non-Relapsing Forms of Multiple Sclerosis.
Note: An example of a non-relapsing form of multiple sclerosis is primary progressive multiple sclerosis. The efficacy of Aubagio has not been established in patients with multiple sclerosis with non-relapsing forms of multiple sclerosis.[1]

152. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Multiple Sclerosis – Avonex Prior Authorization Policy

- Avonex® (interferon beta-1a injection for intramuscular use – Biogen)

REVIEW DATE: 08/05/2020; selected revision 09/09/2020

OVERVIEW

Avonex is indicated for the treatment of patients with relapsing forms of multiple sclerosis (MS) to include clinically isolated syndrome, relapsing remitting disease, and active secondary progressive disease in adults.[1]

Disease Overview

MS is a chronic, inflammatory, demyelinating, autoimmune disease of the central nervous system (CNS) that impacts almost 1,000,000 people in the US.[2] The condition is marked by inflammation and demyelination, as well as degenerative alterations. Patients usually experience relapses and remissions in their neurological symptoms. For most patients, the onset of MS symptoms occurs when patients are 20 to 40 years of age; however, children can get MS and new onset disease can occur in older adults. The MS disease course is heterogeneous but has some patterns. Approximately 85% to 90% of patients have a relapsing pattern at onset. However, this transitions over time in patients who are untreated to a worsening with very few or no relapses or magnetic resonance imaging (MRI) activity (secondary progressive MS). Around 10% to 15% of patients have a steady progression of symptoms over time (primary progressive MS), marked by some clinical manifestations or by MRI activity. Primary progressive MS is generally diagnosed in patients on the upper level of the typical age range (e.g., almost 40 years of age) and the

distribution is equivalent among the two genders. Advances in the understanding of the MS disease process, as well as in MRI technology, spurned updated disease course descriptions in 2013,[3] as well as in 2017.[4] The revised disease courses are clinically isolated syndrome, relapsing remitting MS, primary progressive MS, and secondary progressive MS.[2-4] Clinically isolated syndrome is now more recognized among the course descriptions of MS. It is the first clinical presentation of MS that displays characteristics of inflammatory demyelination that may possibly be MS but has yet to fulfill diagnostic criteria. It is notable that the other MS designations can be further characterized considering whether patients have active disease (or not active), as well as if disease is worsening or stable. Disability in MS is commonly graded on the deterioration of mobility per the Expanded Disability Status Scale (EDSS) an ordinal scale that ranges from 0 to 10, with higher scores indicating greater disability.

Guidelines

In September 2019, a consensus paper was updated by the MS Coalition that discusses the use of disease-modifying therapies in MS.[2] Many options from various disease classes, involving different mechanisms of action and modes of administration, have shown benefits in patients with MS.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Avonex. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Avonex as well as the monitoring required for adverse events and long-term efficacy, approval requires Avonex to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Avonex is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **Multiple Sclerosis.** Approve for 3 years if the patient meets the following criteria (A and B):
   - **R)** Patient has a relapsing form of multiple sclerosis; AND
     Note: Examples of relapsing forms of multiple sclerosis (MS) include clinically isolated syndrome, relapsing remitting disease, and active secondary progressive disease.
   - **S)** Medication is prescribed by or in consultation with a neurologist or a physician who specializes in the treatment of multiple sclerosis.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Avonex is not recommended in the following situations:

22. **Concurrent Use with Other Disease-Modifying Agents Used for Multiple Sclerosis.**
    Note: Examples of disease modifying agents used for multiple sclerosis include Betaseron®/Extavia® (interferon beta-1b injection), Rebif® (interferon beta-1a injection [subcutaneous]), Copaxone®/Glatopa® (glatiramer acetate injection), Plegridy® (peginterferon beta-1a injection), Aubagio® (teriflunomide tablets), Gilenya® (fingolimod tablets), Mavenclad® (cladribine tablets), Mayzent® (siponimod tablets), Tecfidera® (dimethyl fumarate delayed-release capsules), Bafiertam® (monomethyl fumarate delayed-release capsules), Vumerity® (diroximel fumarate delayed-release capsules), Zeposia® (ozanimod capsules), Ocrevus® (ocrelizumab injection for intravenous use),

Tysabri® (natalizumab injection for intravenous infusion), Lemtrada® (alemtuzumab injection for intravenous use), and Kesimpta® (ofatumumab injection for subcutaneous use).[2] These agents are not indicated for use in combination. Additional data are required to determine if use of disease-modifying MS agents in combination is safe and provides added efficacy.

23. Non-Relapsing Forms of Multiple Sclerosis.
Note: An example of a non-relapsing form of multiple sclerosis is primary progressive multiple sclerosis. The efficacy of Avonex has not been established in patients with multiple sclerosis with non-relapsing forms of multiple sclerosis.[1]

24. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Multiple Sclerosis – Betaseron/Extavia Prior Authorization Policy

- Betaseron® (interferon beta-1b injection for subcutaneous use – Bayer)
- Extavia® (interferon beta-1b injection for subcutaneous use – Novartis)

REVIEW DATE: 08/05/2020; selected revision 09/09/2020

OVERVIEW

Betaseron and Extavia are indicated for the treatment of relapsing forms of multiple sclerosis (MS) to include clinically isolated syndrome, relapsing-remitting disease, and active secondary progressive disease in adults.[1,2] Extavia and Betaseron are essentially the same formulation of interferon beta-1b. The only difference is that Extavia is supplied with a 27 gauge needle compared to a 30 gauge needle that is given with Betaseron.

Disease Overview

MS is a chronic, inflammatory, demyelinating, autoimmune disease of the central nervous system (CNS) that impacts almost 1,000,000 people in the US.[3] The condition is marked by inflammation and demyelination, as well as degenerative alterations. Patients usually experience relapses and remissions in their neurological symptoms. For most patients, the onset of MS symptoms occurs when patients are 20 to 40 years of age; however, children can get MS and new onset disease can occur in older adults. The MS disease course is heterogeneous but has some patterns. Approximately 85% to 90% of patients have a relapsing pattern at onset. However, this transitions over time in patients who are untreated to a worsening with very few or no relapses or magnetic resonance imaging (MRI) activity (secondary progressive MS). Around 10% to 15% of patients have a steady progression of symptoms over time (primary progressive MS), marked by some clinical manifestations or by MRI activity. Primary progressive MS is generally diagnosed in patients on the upper level of the typical age range (e.g., almost 40 years of age) and the distribution is equivalent among the two genders. Advances in the understanding of the MS disease process, as well as in MRI technology, spurned updated disease course descriptions in 2013,[4] as well as in 2017.[5] The revised disease courses are clinically isolated syndrome, relapsing remitting MS, primary progressive

MS, and secondary progressive MS.[3-5] Clinically isolated syndrome is now more recognized among the course descriptions of MS. It is the first clinical presentation of MS that displays characteristics of inflammatory demyelination that may possibly be MS but has yet to fulfill diagnostic criteria. It is notable that the other MS designations can be further characterized considering whether patients have active disease (or not active), as well as if disease is worsening or stable. Disability in MS is commonly graded on the deterioration of mobility per the Expanded Disability Status Scale (EDSS) an ordinal scale that ranges from 0 to 10, with higher scores indicating greater disability.

Guidelines

In September 2019, a consensus paper was updated by the MS Coalition that discusses the use of disease-modifying therapies in MS.[3] Many options from various disease classes, involving different mechanisms of action and modes of administration, have shown benefits in patients with MS.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Betaseron and Extavia. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Betaseron/Extavia as well as the monitoring required for adverse events and long-term efficacy, approval requires Betaseron and Extavia to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Betaseron/Extavia is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **Multiple Sclerosis.** Approve for 3 years if the patient meets the following criteria (A and B):
   - **A)** Patient has a relapsing form of multiple sclerosis; AND
     Note: Examples of relapsing forms of multiple sclerosis (MS) include clinically isolated syndrome, relapsing remitting disease, and active secondary progressive disease.
   - **B)** Medication is prescribed by or in consultation with a neurologist or a physician who specializes in the treatment of multiple sclerosis.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Betaseron/Extavia is not recommended in the following situations:

~~25.~~ **Concurrent Use with Other Disease-Modifying Agents Used for Multiple Sclerosis.**
Note: Examples of disease modifying agents used for multiple sclerosis include Avonex® (interferon beta 1a injection [intramuscular]), Rebif® (interferon beta-1a injection [subcutaneous]), Copaxone®/Glatopa® (glatiramer acetate injection), Plegridy® (peginterferon beta-1a injection), Aubagio® (teriflunomide tablets), Gilenya® (fingolimod tablets), Mavenclad® (cladribine tablets), Mayzent® (siponimod tablets), Tecfidera® (dimethyl fumarate delayed-release capsules), Bafiertam® (monomethyl fumarate delayed-release capsules), Vumerity® (diroximel fumarate delayed-release capsules), Zeposia® (ozanimod capsules), Ocrevus® (ocrelizumab injection for intravenous use), Tysabri® (natalizumab injection for intravenous infusion), Lemtrada® (alemtuzumab injection for intravenous use), and Kesimpta® (ofatumumab injection for subcutaneous use).[3] These agents are not

indicated for use in combination. Additional data are required to determine if use of disease-modifying multiple sclerosis agents in combination is safe and provides added efficacy.

26. Non-Relapsing Forms of Multiple Sclerosis.
Note: An example of a non-relapsing form of multiple sclerosis is primary progressive multiple sclerosis. The efficacy of Betaseron/Extavia have not been established in patients with multiple sclerosis with non-relapsing forms of multiple sclerosis.[1]

27. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

MS – Multiple sclerosis.

PRIOR AUTHORIZATION POLICY

POLICY: Multiple Sclerosis – Dimethyl Fumarate (Tecfidera) Prior Authorization Policy

- Tecfidera® (dimethyl fumarate delayed-release capsules – Biogen, generic)

REVIEW DATE: 08/05/2020; selected revision 09/09/2020

OVERVIEW

Dimethyl fumarate is indicated for the treatment of patients with relapsing forms of multiple sclerosis (MS) to include clinically isolated syndrome, relapsing remitting disease, and active secondary progressive MS in adults.[1]

Disease Overview

MS is a chronic, inflammatory, demyelinating, autoimmune disease of the central nervous system (CNS) that impacts almost 1,000,000 people in the US.[2] The condition is marked by inflammation and demyelination, as well as degenerative alterations. Patients usually experience relapses and remissions in their neurological symptoms. For most patients, the onset of MS symptoms occurs when patients are 20 to 40 years of age; however, children can get MS and new onset disease can occur in older adults. The MS disease course is heterogeneous but has some patterns. Approximately 85% to 90% of patients have a relapsing pattern at onset. However, this transitions over time in patients who are untreated to a worsening with very few or no relapses or magnetic resonance imaging (MRI) activity (secondary progressive MS). Around 10% to 15% of patients have a steady progression of symptoms over time (primary progressive MS), marked by some clinical manifestations or by MRI activity. Primary progressive MS is generally diagnosed in patients on the upper level of the typical age range (e.g., almost 40 years of age) and the distribution is equivalent among the two genders. Advances in the understanding of the MS disease process, as well as in MRI technology, spurned updated disease course descriptions in 2013,[3] as well as in 2017.[4] The revised disease courses are clinically isolated syndrome, relapsing remitting MS, primary progressive MS, and secondary progressive MS.[2-4] Clinically isolated syndrome is now more recognized among the course descriptions of MS. It is the first clinical presentation of MS that displays characteristics of inflammatory demyelination that may possibly be MS but has yet to fulfill diagnostic criteria. It is notable that the other MS designations can be further characterized considering whether patients have active disease (or not active), as well as if disease is worsening or stable. Disability in MS is commonly graded on the deterioration of mobility per the Expanded Disability Status Scale (EDSS) an ordinal scale that ranges from 0 to 10, with higher scores indicating greater disability.

Guidelines

In September 2019, a consensus paper was updated by the MS Coalition that discusses the use of disease-modifying therapies in MS.[2] Many options from various disease classes, involving different mechanisms of action and modes of administration, have shown benefits in patients with MS.

Safety

Progressive multifocal leukoencephalopathy has occurred in patients with MS treated with dimethyl fumarate, including a fatal case.[1]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of dimethyl fumarate. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with dimethyl fumarate as well as the monitoring required for adverse events and efficacy, approval requires dimethyl fumarate to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of dimethyl fumarate is recommended in those who meet the following criteria:

FDA-Approved Indication

1. Multiple Sclerosis. Approve for 1 year if the patient meets the following criteria (A and B):
- **C)** Patient has a relapsing form of multiple sclerosis; AND
  Note: Examples of relapsing forms of multiple sclerosis include clinically isolated syndrome, relapsing remitting disease, and active secondary progressive disease.
- **D)** Medication is prescribed by or in consultation with a neurologist or a physician who specializes in the treatment of multiple sclerosis.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of dimethyl fumarate is not recommended in the following situations:

156. Concurrent Use with Other Disease-Modifying Agents Used for Multiple Sclerosis. Note: Examples of disease modifying agents used for multiple sclerosis include Aubagio® (teriflunomide tablets), Avonex® (interferon beta 1a injection [intramuscular]), Betaseron®/Extavia® (interferon beta-1b injection), Rebif® (interferon beta-1a injection [subcutaneous]), Copaxone®/Glatopa® (glatiramer acetate injection), Plegridy® (peginterferon beta-1a injection), Gilenya® (fingolimod tablets), Mavenclad® (cladribine tablets), Mayzent® (siponomid tablets), Bafiertam® (monomethyl fumarate delayed-release capsules), Vumerity® (diroximel fumarate delayed-release capsules), Zeposia® (ozanimod capsules), Ocrevus® (ocrelizumab injection for intravenous use), Tysabri® (natalizumab injection for intravenous infusion), Lemtrada® (alemtuzumab injection for intravenous use), and Kesimpta® (ofatumumab injection for subcutaneous use).[2] These agents are not indicated for use in combination. Additional data are required to determine if use of disease-modifying multiple sclerosis agents in combination is safe and provides added efficacy.

157. Non-Relapsing Forms of Multiple Sclerosis.
Note: An example of a non-relapsing form of multiple sclerosis is primary progressive multiple sclerosis. The efficacy of dimethyl fumarate has not been established in patients with multiple sclerosis with non-relapsing forms of multiple sclerosis.[1]

158. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Multiple Sclerosis – Gilenya Prior Authorization Policy

- Gilenya® (fingolimod capsules – Novartis)

REVIEW DATE: 08/05/2020; selected revision 09/09/2020

OVERVIEW

Gilenya, a sphingosine 1-phosphate receptor modulator, is indicated for the treatment of patients with relapsing forms of multiple sclerosis (MS), to include clinically isolated syndrome, relapsing remitting disease, and active secondary progressive disease in patients 10 years of age and older.[1]

Disease Overview

MS is a chronic, inflammatory, demyelinating, autoimmune disease of the central nervous system (CNS) that impacts almost 1,000,000 people in the US.[2] The condition is marked by inflammation and demyelination, as well as degenerative alterations. Patients usually experience relapses and remissions in their neurological symptoms. For most patients, the onset of MS symptoms occurs when patients are 20 to 40 years of age; however, children can get MS and new onset disease can occur in older adults. The MS disease course is heterogeneous but has some patterns. Approximately 85% to 90% of patients have a relapsing pattern at onset. However, this transitions over time in patients who are untreated to a worsening with very few or no relapses or magnetic resonance imaging (MRI) activity (secondary progressive MS).

Around 10% to 15% of patients have a steady progression of symptoms over time (primary progressive MS), marked by some clinical manifestations or by MRI activity. Primary progressive MS is generally diagnosed in patients on the upper level of the typical age range (e.g., almost 40 years of age) and the distribution is equivalent among the two genders. Advances in the understanding of the MS disease process, as well as in MRI technology, spurned updated disease course descriptions in 2013,[3] as well as in 2017.[4] The revised disease courses are clinically isolated syndrome, relapsing remitting MS, primary progressive MS, and secondary progressive MS.[2-4] Clinically isolated syndrome is now more recognized among the course descriptions of MS. It is the first clinical presentation of MS that displays characteristics of inflammatory demyelination that may possibly be MS but has yet to fulfill diagnostic criteria. It is notable that the other MS designations can be further characterized considering whether patients have active disease (or not active), as well as if disease is worsening or stable. Disability in MS is commonly graded on the deterioration of mobility per the Expanded Disability Status Scale (EDSS) an ordinal scale that ranges from 0 to 10, with higher scores indicating greater disability.

Guidelines

In September 2019, a consensus paper was updated by the MS Coalition that discusses the use of disease-modifying therapies in MS.[2] Many options from various disease classes, involving different mechanisms of action and modes of administration, have shown benefits in patients with MS.[2] The American Academy of Neurology has practice guidelines regarding disease-modifying therapies for adults with MS.[5] The guidelines cites Gilenya as one of the agents to consider for patients with MS who have highly active disease.

Safety

The initiation of Gilenya leads to decreases in heart rate.[1] After the first dose of Gilenya, the heart rate decreases are noted within an hour and generally are greatest at 6 hours, although the effects can be observed 24 hours after the first dose in some patients. The first dose of Gilenya should be given in a setting with resources to appropriately manage symptomatic bradycardia. Observe patients for 6 hours after the first Gilenya dose for signs and symptoms of bradycardia. Patients with prolonged QTc interval at baseline or during the observation period, or taking medications with known risks of torsades de pointes, should be observed overnight with continuous electrocardiographic (ECG) monitoring. When restarting Gilenya after discontinuation for more than 14 days after the first treatment month, perform first-dose monitoring. There are several contraindications for use which mainly include patients with background cardiovascular disease. Gilenya is associated with serious toxicities such as decreased heart rate and/or atrioventricular condition after the first dose; an increased risk of infections; macular edema; pulmonary toxicity; and elevated liver enzymes. Cases of progressive multifocal leukoencephalopathy (PML) have occurred in patients who were given Gilenya in the postmarketing setting.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Gilenya. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Gilenya as well as the monitoring required for adverse events and efficacy, approval requires Gilenya to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Gilenya is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Multiple Sclerosis.** Approve for 1 year if the patient meets all of the following criteria (A and B):
   - **A)** Patient has a relapsing form of multiple sclerosis; AND
     Note: Examples of relapsing forms of multiple sclerosis (MS) include clinically isolated syndrome, relapsing remitting disease, and active secondary progressive disease.
   - **B)** Medication is prescribed by or in consultation with a neurologist or a physician who specializes in the treatment of multiple sclerosis.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Gilenya is not recommended in the following situations:

159. Concurrent Use with Other Disease-Modifying Agents Used for Multiple Sclerosis.
Note: Examples of disease-modifying agents used for multiple sclerosis include Avonex® (interferon beta 1a injection [intramuscular]), Betaseron®/Extavia® (interferon beta-1b injection), Rebif® (interferon beta-1a injection [subcutaneous]), Copaxone®/Glatopa® (glatiramer acetate injection), Plegridy® (peginterferon beta-1a injection), Aubagio® (teriflunomide tablets), Mavenclad® (cladribine tablets), Mayzent® (siponimod tablets), Tecfidera® (dimethyl fumarate delayed-release capsules), Bafiertam® (monomethyl fumarate delayed-release capsules), Vumerity® (diroximel fumarate delayed-release capsules), Zeposia® (ozanimod capsules), Ocrevus® (ocrelizumab injection for intravenous use), Tysabri® (natalizumab injection for intravenous infusion), Lemtrada® (alemtuzumab injection for intravenous use), and Kesimpta® (ofatumumab injection for subcutaneous use).[2] These agents are not indicated for use in combination. Additional data are required to determine if use of disease-modifying multiple sclerosis agents in combination is safe and provides added efficacy.

160. Non-Relapsing Forms of Multiple Sclerosis.
Note: An example of a non-relapsing form of multiple sclerosis is primary progressive multiple sclerosis. In the INFORMS trial Gilenya did not slow disease progression in patients with primary progressive multiple sclerosis.[6]

161. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Multiple Sclerosis – Glatiramer Products Prior Authorization Policy

- Copaxone® (glatiramer acetate for subcutaneous injection [20 mg/mL and 40 mg/mL] – Teva, generic)
- Glatopa® (glatiramer acetate for subcutaneous injection [20 mg/mL and 40 mg/mL] – Sandoz)

REVIEW DATE: 08/05/2020; selected revision 09/09/2020

OVERVIEW

Copaxone, Glatopa and generic glatiramer acetate are indicated for the treatment of relapsing forms of multiple sclerosis (MS) to include clinically isolated syndrome, relapsing remitting disease, and active secondary progressive disease, in adults.[1-4]

Disease Overview

MS is a chronic, inflammatory, demyelinating, autoimmune disease of the central nervous system (CNS) that impacts almost 1,000,000 people in the US.[5] The condition is marked by inflammation and demyelination, as well as degenerative alterations. Patients usually experience relapses and remissions in their neurological symptoms. For most patients, the onset of MS symptoms occurs when patients are 20 to 40 years of age; however, children can get MS and new onset disease can occur in older adults. The MS disease course is heterogeneous but has some patterns. Approximately 85% to 90% of patients have a relapsing pattern at onset. However, this transitions over time in patients who are untreated to a worsening with very few or no relapses or magnetic resonance imaging (MRI) activity (secondary progressive MS). Around 10% to 15% of patients have a steady progression of symptoms over time (primary progressive MS), marked by some clinical manifestations or by MRI activity. Primary progressive MS is generally diagnosed in patients on the upper level of the typical age range (e.g., almost 40 years of age) and the distribution is equivalent among the two genders. Advances in the understanding of the MS disease process, as well as in MRI technology, spurned updated disease course descriptions in 2013,[6] as well as in 2017.[7] The revised disease courses are clinically isolated syndrome, relapsing remitting MS, primary progressive MS, and secondary progressive MS.[5-7] Clinically isolated syndrome is now more recognized among the course descriptions of MS. It is the first clinical presentation of MS that displays characteristics of inflammatory demyelination that may possibly be MS but has yet to fulfill diagnostic criteria. It is notable that the other MS designations can be further characterized considering whether patients have active disease

(or not active), as well as if disease is worsening or stable. Disability in MS is commonly graded on the deterioration of mobility per the Expanded Disability Status Scale (EDSS) an ordinal scale that ranges from 0 to 10, with higher scores indicating greater disability.

Guidelines

In September 2019, a consensus paper was updated by the MS Coalition that discusses the use of disease-modifying therapies in MS.[5] Many options from various disease classes, involving different mechanisms of action and modes of administration, have shown benefits in patients with MS.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Copaxone (20 mg/mL and 40 mg/mL) and Glatopa (20 mg/mL and 40 mg/mL). All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Copaxone/Glatopa as well as the monitoring required for adverse events and long-term efficacy, approval requires Copaxone/Glatopa to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of glatiramer is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **Multiple Sclerosis.** Approve for 3 years if the patient meets the following criteria (A and B):
   - **T)** Patient has a relapsing form of multiple sclerosis; AND
     Note: Examples of relapsing forms of multiple sclerosis (MS) include clinically isolated syndrome, relapsing remitting disease, and active secondary progressive disease.
   - **U)** Medication is prescribed by or in consultation with, a neurologist or a physician who specializes in the treatment of multiple sclerosis.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of glatiramer is not recommended in the following situations:

28. **Concurrent Use with Other Disease-Modifying Agents Used for Multiple Sclerosis.**
    Note: Examples of disease modifying agents used for multiple sclerosis include Avonex® (interferon beta-1a injection [intramuscular]), Betaseron®/Extavia® (interferon beta-1b injection), Rebif® (interferon beta-1a injection [subcutaneous]), Plegridy® (peginterferon beta-1a injection), Aubagio® (teriflunomide tablets), Gilenya® (fingolimod tablets), Mavenclad® (cladribine tablets), Mayzent® (siponimod tablets), Tecfidera® (dimethyl fumarate delayed-release capsules), Bafiertam® (monomethyl fumarate delayed-release capsules), Vumerity® (diroximel fumarate delayed-release capsules), Zeposia® (ozanimod capsules), Ocrevus® (ocrelizumab injection for intravenous use), Tysabri® (natalizumab injection for intravenous infusion), Lemtrada® (alemtuzumab injection for intravenous use), and Kesimpta® (ofatumumab injection for subcutaneous use).[2] These agents are not indicated for use in combination. Additional data are required to determine if use of disease-modifying multiple sclerosis agents in combination is safe and provides added efficacy.

29. **Non-Relapsing Forms of Multiple Sclerosis.**

Note: An example of non-relapsing form of multiple sclerosis is primary progressive multiple sclerosis. The efficacy of Copaxone and Glatopa have not been established in patients with multiple sclerosis with non-relapsing forms of multiple sclerosis.[1-4]

30. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

MS – Multiple sclerosis.

PRIOR AUTHORIZATION POLICY

POLICY: Multiple Sclerosis – Kesimpta Prior Authorization Policy

- Kesimpta® (ofatumumab injection for subcutaneous use – Novartis)

REVIEW DATE: 08/26/2020

OVERVIEW

Kesimpta, a CD20-directed cytolytic antibody, is indicated for the treatment of relapsing forms of multiple sclerosis (MS) to include clinically isolated syndrome, relapsing remitting disease, and active secondary progressive MS in adults.[1]

Disease Overview

MS is a chronic, inflammatory, demyelinating, autoimmune disease of the central nervous system (CNS) that impacts almost 1,000,000 people in the US.[2] The condition is marked by inflammation and demyelination, as well as degenerative alterations. Patients usually experience relapses and remissions in their neurological symptoms. For most patients, the onset of MS symptoms occurs when patients are 20 to 40 years of age; however, children can get MS and new onset disease can occur in older adults. The MS disease course is heterogeneous but has some patterns.

Approximately 85% to 90% of patients have a relapsing pattern at onset. However, this transitions over time in patients who are untreated to a worsening with very few or no relapses or magnetic resonance imaging (MRI) activity (secondary progressive MS). Around 10% to 15% of patients have a steady progression of symptoms over time (primary progressive MS), marked by some clinical manifestations or by MRI activity. Primary progressive MS is generally diagnosed in patients on the upper level of the typical age range (e.g., almost 40 years of age) and the distribution is equivalent among the two genders. Advances in the understanding of the MS disease process, as well as in MRI technology, spurned updated disease course descriptions in 2013,[3] as well as in 2017.[4] The revised disease courses are clinically isolated syndrome, relapsing remitting MS, primary progressive MS, and secondary progressive MS.[2-4] Clinically isolated syndrome is now more recognized among the course descriptions of MS. It is the first clinical presentation of MS that displays characteristics of inflammatory demyelination that may possibly be MS but has yet to fulfill diagnostic criteria. It is notable that the other MS designations can be further characterized considering whether patients have active disease (or not active), as well as if disease is worsening or stable. Disability in MS is commonly graded on the deterioration of mobility per the Expanded Disability Status Scale (EDSS) an ordinal scale that ranges from 0 to 10, with higher scores indicating greater disability.

Guidelines

In September 2019, a consensus paper was updated by the MS Coalition that discusses the use of disease-modifying therapies in MS.[2] Many options from various disease classes, involving different mechanisms of action and modes of administration, have shown benefits in patients with MS.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Kesimpta. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Kesimpta as well as the monitoring required for adverse events and long-term efficacy, approval requires Kesimpta to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Kesimpta is recommended in those who meet the following criteria:

FDA-Approved Indications

130. Multiple Sclerosis. Approve for 1 year if the patient meets the following criteria (A, B and C):
- **A)** Patient has a relapsing form of multiple sclerosis; AND
- **B)** Patient is ≥ 18 years; AND
- **C)** Medication is prescribed by or in consultation with a neurologist or a physician who specializes in the treatment of multiple sclerosis.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Kesimpta is not recommended in the following situations:

162. Concurrent Use with Other Disease Modifying Agents Used for Multiple Sclerosis.

Note: Examples of disease modifying agents used for multiple sclerosis include Aubagio® (teriflunomide tablets), Avonex® (interferon beta 1a injection for intramuscular use), Betaseron®/Extavia® (interferon beta-1b injection for subcutaneous use), Rebif® (interferon beta-1a injection for subcutaneous use), Copaxone®/Glatopa® (glatiramer acetate injection for subcutaneous use), glatiramer acetate injection, Plegridy® (peginterferon beta-1a injection for subcutaneous use), Tecfidera® (dimethyl fumarate delayed-release capsules), Gilenya® (fingolimod capsules), Mavenclad® (cladribine tablets), Mayzent® (siponomid tablets), Bafiertam® (monomethyl fumarate delayed-release capsules), Vumerity® (diroximel fumarate delayed-release capsules), Zeposia® (ozanimod capsules), Ocrevus® (ocrelizumab injection for intravenous use), Tysabri® (natalizumab injection for intravenous infusion), and Lemtrada® (alemtuzumab injection for intravenous use).[2] These agents are not indicated for use in

combination. Additional data are required to determine if use of disease-modifying multiple sclerosis agents in combination is safe provides added efficacy.

163. Non-Relapsing Forms of Multiple Sclerosis.
Note: An example of a non-relapsing form of multiple sclerosis is primary progressive multiple sclerosis. The efficacy of Kesimpta has not been established in patients with multiple sclerosis with non-relapsing forms of multiple sclerosis.[1]

164. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
New Policy	--	08/26/2020

PRIOR AUTHORIZATION POLICY

POLICY: Multiple Sclerosis – Lemtrada Prior Authorization Policy

- Lemtrada® (alemtuzumab injection for intravenous use – Genzyme)

REVIEW DATE: 11/11/2020

OVERVIEW

Lemtrada, a CD52-directed cytolytic monoclonal antibody, is indicated for the treatment of patients with relapsing forms of **multiple sclerosis** (MS) to include relapsing remitting disease and active secondary progressive MS in adults.[1] Lemtrada is not recommended for use in patients with clinically isolated syndrome because of its safety profile.

Due to its safety profile, use of Lemtrada should generally be reserved for patients who have had an inadequate response to two or more medications indicated for the treatment of MS.[1] Lemtrada contains the same active ingredient found in Campath® (alemtuzumab injection for intravenous use). The safety and efficacy of Lemtrada have not been established in pediatric patients < 17 years of age.

Disease Overview

MS is a chronic, inflammatory, demyelinating, autoimmune disease of the central nervous system that impacts almost 1,000,000 people in the US.[2] The condition is marked by inflammation and demyelination, as well as degenerative alterations. Patients usually experience relapses and remissions in their neurological symptoms. For most patients, the onset of MS symptoms occurs when patients are 20 to 40 years of age; however, children can get MS and new onset disease can occur in older adults. The MS disease course is heterogeneous but has some patterns. Approximately 85% to 90% of patients have a

relapsing pattern at onset. However, this transitions over time in patients who are untreated to a worsening with very few or no relapses or magnetic resonance imaging (MRI) activity (secondary progressive MS). Around 10% to 15% of patients have a steady progression of symptoms over time (primary progressive MS), marked by some clinical manifestations or by MRI activity. Primary progressive MS is generally diagnosed in patients on the upper level of the typical age range (e.g., almost 40 years of age) and the distribution is equivalent among the two genders. Advances in the understanding of the MS disease process, as well as in MRI technology, spurned updated disease course descriptions in 2013,[3] as well as in 2017.[4] The revised disease courses are clinically isolated syndrome, relapsing remitting MS, primary progressive MS, and secondary progressive MS.[2-4] Clinically isolated syndrome is now more recognized among the course descriptions of MS. It is the first clinical presentation of MS that displays characteristics of inflammatory demyelination that may possibly be MS but has yet to fulfill diagnostic criteria.

Guidelines

In September 2019, a consensus paper was updated by the MS Coalition that discusses the use of disease-modifying therapies in MS.[2] Many options from various disease classes, involving different mechanisms of action and modes of administration, have shown benefits in patients with MS.

A practice guideline recommendation regarding disease-modifying agents for adults with MS from the American Academy of Neurology (2018) states to consider Lemtrada for patients with MS who have highly active disease.[5]

Safety

Lemtrada is available only through a restricted Risk Evaluation Mitigation Strategy (REMS) program called the LEMTRADA REMS Program due to the risks of autoimmunity, infusion reactions, stroke, and malignancies.[1] Use of Lemtrada is contraindicated in patients who has infection with human immunodeficiency virus and those with active infection. Progressive multifocal leukoencephalopathy has occurred in a patient with MS who received Lemtrada.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Lemtrada. All approvals are noted for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Lemtrada, as well as the monitoring required for adverse events and long-term efficacy, approval requires Lemtrada to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Documentation: Documentation is required for use of Lemtrada at initiation as noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes magnetic resonance imaging (MRI) reports, and/or other information.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Lemtrada injection is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **Multiple Sclerosis.** Approve for the duration noted if the patient meets one of the following (A or B):

A) Initial Therapy (this includes patients who have started but not completed the first course of Lemtrada Therapy). Approve for 5 days in patients who meet all of the following criteria (i, ii, iii, and iv):

i. Patient is ≥ 17 years of age; AND

ii. Patient has a relapsing form of multiple sclerosis; AND
Note: Examples of relapsing forms of multiple sclerosis include relapsing remitting disease and active secondary progressive disease.

iii. Patient meets one of the following (a or b):

a) According to the prescriber the patient has experienced inadequate efficacy or significant intolerance to two disease-modifying agents used for multiple sclerosis; OR
Note: Examples include Avonex® (interferon beta-1a injection [intramuscular]), Rebif® (interferon beta-1a injection [subcutaneous]), Betaseron®/Extavia® (interferon beta-1b injection), glatiramer acetate injection (Copaxone®/Glatopa®, generic), Plegridy® (peginterferon beta-1a injection), Gilenya® (fingolimod capsules), Aubagio® (teriflunomide tablets), Mavenclad® (cladribine tablets), Mayzent® (siponimod tablets), Vumerity® (diroximel fumarate delayed-release capsules), Tysabri® (natalizumab injection for intravenous use), Bafiertam™ (monomethyl fumarate delayed-release capsules), dimethyl fumarate delayed-release capsules (Tecfidera®, generic), Zeposia® (ozanimod capsules), Kesimpta® (ofatumumab injection for subcutaneous use), and Ocrevus® (ocrelizumab injection for intravenous use).

b) According to the prescriber, the patient has highly active or aggressive multiple sclerosis by meeting one of the following [(1), (2), (3), or (4)]:

(1) Patient has demonstrated rapidly-advancing deterioration(s) in physical functioning (e.g., loss of mobility/or lower levels of ambulation, severe changes in strength or coordination) **[documentation required]**; OR

(2) Disabling relapse(s) with suboptimal response to systemic corticosteroids **[documentation required]**; OR

(3) Magnetic resonance imaging [MRI] findings suggest highly-active or aggressive multiple sclerosis (e.g., new, enlarging, or a high burden of T2 lesions or gadolinium-enhancing lesions) **[documentation required]**; OR

(4) Manifestations of multiple sclerosis-related cognitive impairment **[documentation required]**; AND

iv. Medication is prescribed by or in consultation with a neurologist or a physician who specializes in the treatment of multiple sclerosis; OR

B) Patient Who Has Completed a Previous Lemtrada Therapy Course. Approve for 3 days if the patient meets all of the following (i, ii, iii and iv):

i. Patient is ≥ 17 years of age; AND

ii. Patient has a relapsing form of multiple sclerosis; AND
Note: Examples of relapsing forms of multiple sclerosis include relapsing remitting disease and active secondary progressive disease.

iii. At least 12 months has elapsed from the last dose of any prior Lemtrada treatment course; AND

iv. Medication is prescribed by or in consultation with a neurologist or a physician that specializes in the treatment of multiple sclerosis.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Lemtrada is not recommended in the following situations:

1. **Clinically Isolated Syndrome.** Lemtrada is not recommended for use in patients with clinically isolated syndrome due to its safety profile.[1]

2. **Concurrent Use with Other Disease-Modifying Agents Used for Multiple Sclerosis.** Lemtrada should not be given in combination with other disease-modifying agents used for multiple sclerosis. Concomitant use of Lemtrada with immunosuppreisve therapies could increase the risk of immunosuppression.
   Note: Examples include Avonex® (interferon beta-1a injection [intramuscular]), Rebif® (interferon beta-1a injection [subcutaneous]), Betaseron®/Extavia® (interferon beta-1b injection), glatiramer acetate injection (Copaxone®/Glatopa®, generic), Plegridy® (peginterferon beta-1a injection), Gilenya® (fingolimod capsules), Aubagio® (teriflunomide tablets), Mavenclad® (cladribine tablets), Mayzent® (siponimod tablets), Vumerity® (diroximel fumarate delayed-release capsules), Tysabri® (natalizumab injection for intravenous use), Bafiertam™ (monomethyl fumarate delayed-release capsules), dimethyl fumarate delayed-release capsules (Tecfidera®, generic), Zeposia® (ozanimod capsules), Kesimpta® (ofatumumab injection for subcutaneous use), and Ocrevus® (ocrelizumab injection for intravenous use).

3. **Human Immunodeficiency Virus (HIV) Infection.** Use of Lemtrada is contraindicated in patients who are infected with HIV because Lemtrada causes prolonged reductions of CD4+ lymphocyte counts.[1]

4. **Non-Relapsing Forms of Multiple Sclerosis.** The efficacy of Lemtrada has not been established in patients with multiple sclerosis with non-relapsing forms of the disease.[1]
   Note: An example of a non-relapsing form of multiple sclerosis is primary progressive multiple sclerosis.

5. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Selected Revision	**1. Multiple Sclerosis:** The phrase "Relapsing forms" (of MS) was removed from the cited indication. For initial therapy, Mavenclad and Mayzent were added among the list of disease-modifying MS agents that count as a trial towards the requirement that patients must have tried two agents and had an inadequate response or are unable to tolerate. The criteria were revised to reflect the recent change to the prescribing information that more than two Lemtrada treatment courses can be given. The wording which described directives following completion of "one prior course of Lemtrada" was changed to state that the patient "has completed a previous course" with the requirement added that at least 12 months has elapsed from the last dose of any prior Lemtrada treatment course. **2. Conditions Not Recommended for Approval:** The condition of Patient with Relapsing Forms of MS who is Requesting a Third (or more) Course of Lemtrada Therapy	05/29/2019

	was removed. For clarity, Mavenclad and Mayzent were added to the list of disease-modifying MS therapies in which Lemtrada should not be used with concomitantly.	
Annual Revision	The following criteria changes were made: 1. **Multiple Sclerosis:** The phrase "Relapsing forms" was removed from the stated indication. Criteria were revised such that the examples of relapsing forms of MS were removed. The word "prescriber" replaced the phrase of "prescribing physician" in applicable criteria. Vumerity and glatiramer acetate injection were added as medications trials that count toward the requirement of a trial of two disease-modifying agents used for MS. 2. **Conditions Not Recommended for Approval:** "Children with MS Who Are < 17 Years of Age" was removed as this is duplicative to the requirement in the approval criteria. The Regarding "Concurrent Use with Other Disease-Modifying Agents for MS", the examples of glatiramer acetate injection, Vumerity, Mavenclad and Mayzent were added. The criteria that stated "Primary Progressive (Chronic Progressive) MS was changed to state "Non-Relapsing Forms of MS" with a note that an example is Primary Progressive MS. Clinically Isolated Syndrome was added as a Condition Not Recommended for Approval as now recommended in the Lemtrada prescribing information.	11/13/2019
Annual Revision	The following changes were made: 1. **Multiple Sclerosis:** For the criteria that requires that the patient try two other disease-modifying medications for MS, the wording regarding this trial was changed from and "has had an inadequate response or is unable to tolerate" to "has experienced inadequate efficacy or significant intolerance." Also, examples of MS disease-modifying therapies were added to the Note. A Note was added after the requirement that the patient have a relapsing form of MS that examples of relapsing forms of MS include relapsing remitting disease and active secondary progressive disease. 2. **Conditions Not Recommended for Approval:** For the criteria regarding "Concurrent Use with Other Disease-Modifying Agents Used for MS", additional agents were added. For the condition of HIV, the phrase "Patients With" was removed from the cited condition.	11/11/2020

MS – Multiple sclerosis; HIV – Human immunodeficiency virus.

PRIOR AUTHORIZATION POLICY

POLICY: Multiple Sclerosis – Mavenclad Prior Authorization Policy

- Mavenclad® (cladribine tablets – EMD Serono)

REVIEW DATE: 08/05/2020; selected revision 09/09/2020

OVERVIEW

Mavenclad, a purine antimetabolite, is indicated for the treatment of relapsing forms of multiple sclerosis (MS), to include relapsing remitting disease, and active secondary progressive disease, in adults.[1] Due to its safety profile, use of Mavenclad is generally recommended for patients who have had an inadequate response to, or are unable to tolerate, an alternative drug for the treatment of MS.[1] A limitation of use is that Mavenclad is not recommended for use in patients with clinically isolated syndrome because of its safety profile.

Disease Overview

MS is a chronic, inflammatory, demyelinating, autoimmune disease of the central nervous system (CNS) that impacts almost 1,000,000 people in the US.[2] The condition is marked by inflammation and demyelination, as well as degenerative alterations. Patients usually experience relapses and remissions in their neurological symptoms. For most patients, the onset of MS symptoms occurs when patients are 20 to 40 years of age; however, children can get MS and new onset disease can occur in older adults. The MS disease course is heterogeneous but has some patterns. Approximately 85% to 90% of patients have a relapsing pattern at onset. However, this transitions over time in patients who are untreated to a worsening with very few or no relapses or magnetic resonance imaging (MRI) activity (secondary progressive MS).

Around 10% to 15% of patients have a steady progression of symptoms over time (primary progressive MS), marked by some clinical manifestations or by MRI activity. Primary progressive MS is generally diagnosed in patients on the upper level of the typical age range (e.g., almost 40 years of age) and the distribution is equivalent among the two genders. Advances in the understanding of the MS disease process, as well as in MRI technology, spurned updated disease course descriptions in 2013,[3] as well as in 2017.[4] The revised disease courses are clinically isolated syndrome, relapsing remitting MS, primary progressive MS, and secondary progressive MS.[2-4] Clinically isolated syndrome is now more recognized among the course descriptions of MS. It is the first clinical presentation of MS that displays characteristics of inflammatory demyelination that may possibly be MS but has yet to fulfill diagnostic criteria. It is notable that the other MS designations can be further characterized considering whether patients have active disease (or not active), as well as if disease is worsening or stable. Disability in MS is commonly graded on the deterioration of mobility per the Expanded Disability Status Scale (EDSS) an ordinal scale that ranges from 0 to 10, with higher scores indicating greater disability.

Guidelines

In September 2019, a consensus paper was updated by the MS Coalition that discusses the use of disease-modifying therapies in MS.[2] Many options from various disease classes, involving different mechanisms of action and modes of administration, have shown benefits in patients with MS.

Safety

Mavenclad has a Boxed Warning regarding malignancies and the risk of teratogenicity.[1] Mavenclad may increase the risk of malignancy. Also, Mavenclad is a cytotoxic drug. Special handling instructions and disposal procedures should be followed. There are several contraindications associated with the use of Mavenclad including: patients with current malignancy; pregnant women, women and men of reproductive potential who do not plan to use effective contraception during Mavenclad dosing and for 6 months after the last dose in each treatment course; human immunodeficiency virus (HIV); active chronic infection (e.g., hepatitis or tuberculosis); history of hypersensitivity to cladribine; and women intending to breastfeed on a treatment day in which Mavenclad is administered and for 10 days after the last dose. Warnings and Precautions for Mavenclad include lymphopenia, infections, hematologic toxicity, graft-versus-host disease with blood transfusion, and liver injury.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Mavenclad. All approvals are provided for the duration cited below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Mavenclad as well as the monitoring required for adverse events and long-term efficacy, approval requires Mavenclad to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Mavenclad is recommended in those who meet the following criteria:

FDA-Approved Indications

3. **Multiple Sclerosis.** Approve for 1 year if the patient meets the following criteria (A and B):
   - **C)** Patient has a relapsing form of multiple sclerosis; AND
     Note: Examples of relapsing forms of multiple sclerosis include relapsing-remitting disease and active secondary progressive disease.

D) Medication is prescribed by or in consultation with a neurologist or a physician that specializes in the treatment of multiple sclerosis.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Mavenclad is not recommended in the following situations:

165. Clinically Isolated Syndrome. Mavenclad is not recommended for use in patients with clinically isolated syndrome due to its safety profile.[1]

166. Current Use with Other Disease-Modifying Agents Used for Multiple Sclerosis.
Note: Examples of disease modifying agents used for multiple sclerosis include Avonex® (interferon beta 1a injection [intramuscular]), Betaseron®/Extavia® (interferon beta-1b injection), Rebif® (interferon beta-1a injection [subcutaneous]), Copaxone®/Glatopa® (glatiramer acetate injection), Plegridy® (peginterferon beta-1a injection), Aubagio® (teriflunomide tablets), Gilenya® (fingolimod tablets), Mayzent® (siponimod tablets), Tecfidera® (dimethyl fumarate delayed-release capsules), Bafiertam® (monomethyl fumarate delayed-release capsules), Vumerity® (diroximel fumarate delayed-release capsules), Zeposia® (ozanimod capsules), Ocrevus® (ocrelizumab injection for intravenous use), Tysabri® (natalizumab injection for intravenous infusion), Lemtrada® (alemtuzumab injection for intravenous use), and Kesimpta® (ofatumumab injection for subcutaneous use).[2] These agents are not indicated for use in combination. Additional data are required to determine if use of disease-modifying multiple sclerosis agents in combination is safe and provides added efficacy.

167. Non-Relapsing Forms of Multiple Sclerosis.
Note: An example of a non-relapsing form of multiple sclerosis is primary progressive multiple sclerosis. The efficacy of Mavenclad has not been established in patients with multiple sclerosis with non-relapsing forms of the disease.[1]

168. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Multiple Sclerosis – Mayzent Prior Authorization Policy

- Mayzent® (siponimod tablets – Novartis)

REVIEW DATE: 08/05/2020; selected revision 09/09/2020

OVERVIEW

Mayzent, a sphingosine 1-phosphate receptor modulator, is indicated for the treatment of relapsing forms of multiple sclerosis (MS), to include clinically isolated syndrome, relapsing remitting disease, and active secondary progressive disease in adults.[1]

Disease Overview

MS is a chronic, inflammatory, demyelinating, autoimmune disease of the central nervous system (CNS) that impacts almost 1,000,000 people in the US.[2] The condition is marked by inflammation and demyelination, as well as degenerative alterations. Patients usually experience relapses and remissions in their neurological symptoms. For most patients, the onset of MS symptoms occurs when patients are 20 to 40 years of age; however, children can get MS and new onset disease can occur in older adults. The MS disease course is heterogeneous but has some patterns. Approximately 85% to 90% of patients have a relapsing pattern at onset. However, this transitions over time in patients who are untreated to a worsening with very few or no relapses or magnetic resonance imaging (MRI) activity (secondary progressive MS). Around 10% to 15% of patients have a steady progression of symptoms over time (primary progressive MS), marked by some clinical manifestations or by MRI activity. Primary progressive MS is generally diagnosed in patients on the upper level of the typical age range (e.g., almost 40 years of age) and the distribution is equivalent among the two genders. Advances in the understanding of the MS disease process, as well as in MRI technology, spurned updated disease course descriptions in 2013,[3] as well as in 2017.[4] The revised disease courses are clinically isolated syndrome, relapsing remitting MS, primary progressive MS, and secondary progressive MS.[2-4] Clinically isolated syndrome is now more recognized among the course descriptions of MS. It is the first clinical presentation of MS that displays characteristics of inflammatory demyelination that may possibly be MS but has yet to fulfill diagnostic criteria. It is notable that the other MS designations can be further characterized considering whether patients have active disease (or not active), as well as if disease is worsening or stable. Disability in MS is commonly graded on the deterioration of mobility per the Expanded Disability Status Scale (EDSS) an ordinal scale that ranges from 0 to 10, with higher scores indicating greater disability.

Guidelines

In September 2019, a consensus paper was updated by the MS Coalition that discusses the use of disease-modifying therapies in MS.[2] Many options from various disease classes, involving different mechanisms of action and modes of administration, have shown benefits in patients with MS.

Safety

The initiation of Mayzent leads to decreases in heart rate.[1] First-dose 6-hour monitoring is recommended in certain patients with preexisting cardiac conditions. Additional monitoring beyond 6 hours may also be required. After the initial titration is complete, if Mayzent therapy is interrupted for four or more consecutive daily doses, reinitiate treatment with Day 1 of the titration regimen and also complete first-dose monitoring for patients for whom it is recommended. The most common adverse events with Mayzent include headache, hypertension, and transaminase elevations. Mayzent has Warnings/Precautions regarding infections, macular edema, bradyarrhythmias and atrioventricular conduction delays, respiratory effects, liver injury, increased blood pressure, and posterior reversible encephalopathy syndrome.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Mayzent. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Mayzent as well as the monitoring required for adverse events and long-term efficacy, approval requires Mayzent to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Mayzent is recommended in those who meet the following criteria:

FDA-Approved Indications

4. Multiple Sclerosis. Approve for 1 year if the patient meets the following criteria (A and B):

A) Patient has a relapsing form of multiple sclerosis; AND
Note: Examples of relapsing forms of multiple sclerosis (MS) include clinically isolated syndrome, relapsing remitting disease, and active secondary progressive disease.

B) Medication is prescribed by or in consultation with neurologist or a physician who specializes in the treatment of multiple sclerosis.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Mayzent is recommended in those who meet the following criteria:

169. Current Use with Other Disease-Modifying Agents Used for Multiple Sclerosis.

Note: Examples of disease-modifying agents used for multiple sclerosis include Avonex® (interferon beta 1a injection [intramuscular]), Betaseron®/Extavia® (interferon beta-1b injection), Rebif® (interferon beta-1a injection [subcutaneous]), Copaxone®/Glatopa® (glatiramer acetate injection), Plegridy® (peginterferon beta-1a injection), Aubagio® (teriflunomide tablets), Gilenya® (fingolimod tablets), Mavenclad® (cladribine tablets), Tecfidera® (dimethyl fumarate delayed-release capsules), Bafiertam® (monomethyl fumarate delayed-release capsules), Vumerity® (diroximel fumarate delayed-release capsules), Zeposia® (ozanimod capsules), Ocrevus® (ocrelizumab injection for intravenous use), Tysabri® (natalizumab injection for intravenous infusion), Lemtrada® (alemtuzumab injection for intravenous use), and Kesimpta® (ofatumumab injection for subcutaneous use).[2] These agents are not

indicated for use in combination. Additional data are required to determine if use of disease-modifying multiple sclerosis agents in combination is safe and provides added efficacy.

170. Non-Relapsing Forms of Multiple Sclerosis.
Note: An example of a non-relapsing form of multiple sclerosis is primary progressive multiple sclerosis. The efficacy of Mayzent has not been established in patients with multiple sclerosis with non-relapsing forms of the disease.[1]

171. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Early Annual Revision	The following criteria changes were made. **Multiple Sclerosis:** The criterion that requires that the patient has a relapsing form of MS was revised to remove the phrase that stated "to include relapsing remitting MS or active secondary progressive MS". **Conditions Not Recommended for Approval:** For patients with Non-Relapsing Forms of MS, the example of primary progressive MS is now listed as a note. Regarding Use with Other Disease-Modifying Agents for MS, the examples were listed as a note with Mavenclad added.	07/17/2019
Annual Revision	The following criteria changes were made: **Conditions Not Recommended for Approval:** Bafiertam, Vumerity, and Zeposia were added to the Note that provides examples of disease-modifying MS agents in which Mayzent should not be used with concurrently.	08/05/2020
Selected Revision	**Multiple Sclerosis:** Examples of relapsing forms of MS were added in a Note. **Conditions Not Recommended for Approval:** Regarding Use with Other Disease-Modifying Agents for MS, Kesimpta was added to the list of examples provided in the Note.	09/09/2020

MS – Multiple sclerosis.

PRIOR AUTHORIZATION POLICY

POLICY: Multiple Sclerosis – Ocrevus Prior Authorization Policy

- Ocrevus® (ocrelizumab injection for intravenous use – Genentech/Roche)

REVIEW DATE: 11/11/2020

OVERVIEW

Ocrevus is a CD20-directed cytolytic antibody indicated for the treatment of adults with:[1]

- **Relapsing forms of multiple sclerosis** (MS) to include to include clinically isolated syndrome, relapsing remitting MS, and active secondary progressive MS.

- **Primary progressive MS**.

Disease Overview

MS is a chronic, inflammatory, demyelinating, autoimmune disease of the central nervous system that impacts almost 1,000,000 people in the US.[2] The condition is marked by inflammation and demyelination, as well as degenerative alterations. Patients usually experience relapses and remissions in their neurological symptoms. For most patients, the onset of MS symptoms occurs when patients are 20 to 40 years of age; however, children can get MS and new onset disease can occur in older adults. The MS disease course is heterogeneous but has some patterns. Approximately 85% to 90% of patients have a relapsing pattern at onset. However, this transitions over time in patients who are untreated to a worsening with very few or no relapses or magnetic resonance imaging (MRI) activity (secondary progressive MS). Around 10% to 15% of patients have a steady progression of symptoms over time (primary progressive MS), marked by some clinical manifestations or by MRI activity. Primary progressive MS is generally diagnosed in patients on the upper level of the typical age range (e.g., almost 40 years of age) and the distribution is equivalent among the two genders. Advances in the understanding of the MS disease process, as well as in MRI technology, spurned updated disease course descriptions in 2013,[3] as well as in 2017.[4] The revised disease courses are clinically isolated syndrome, relapsing remitting MS, primary progressive MS, and secondary progressive MS.[2-4] Clinically isolated syndrome is now more recognized among the course descriptions of MS. It is the first clinical presentation of MS that displays characteristics of inflammatory demyelination that may possibly be MS but has yet to fulfill diagnostic criteria.

Guidelines

In September 2019, a consensus paper was updated by the MS Coalition that discusses the use of disease-modifying therapies in MS.[2] Many options from various disease classes, involving different mechanisms of action and modes of administration, have shown benefits in patients with MS.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Ocrevus. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Ocrevus as well as the monitoring required for adverse events and long-term efficacy, approval requires Ocrevus to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Documentation: None.
Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Ocrevus is recommended in those who meet the following criteria:

FDA-Approved Indications

2. **Multiple Sclerosis, Relapsing Forms.** Approve for 1 year if the patient meets all of the following criteria (A, B, and C):
   - **E)** Patient is ≥ 18 years of age; AND
   - **F)** Patient has a relapsing form of multiple sclerosis; AND
     Note: Examples of relapsing forms of multiple sclerosis include clinically isolated syndrome, relapsing remitting disease, and active secondary progressive disease.

G) Medication is prescribed by or in consultation with a physician who specializes in the treatment of MS and/or a neurologist.

29. Multiple Sclerosis, Primary Progressive. Approve for 1 year if the patient meets all of the following criteria (A and B):

79. Patient is ≥ 18 years of age; AND

80. Medication is prescribed by or in consultation with a physician who specializes in the treatment of MS and/or a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Ocrevus is not recommended in the following situations:

172. Concurrent Use with Other Disease-Modifying Agents Used for Multiple Sclerosis. Ocrevus is not indicated for use in combination with other multiple sclerosis disease-modifying therapies and the safety and efficacy have not been adequately established. The concomitant use of Ocrevus with other immune-modulating or immunosuppressive therapies is anticipated to increase the risk of immunosuppression.[1]

Note: Examples include Avonex® (interferon beta-1a injection [intramuscular]), Rebif® (interferon beta-1a injection [subcutaneous]), Betaseron®/Extavia® (interferon beta-1b injection), glatiramer acetate injection (Copaxone®/Glatopa®, generic), Plegridy® (peginterferon beta-1a injection), Gilenya® (fingolimod capsules), Aubagio® (teriflunomide tablets), Mavenclad® (cladribine tablets), Mayzent® (siponimod tablets), Vumerity® (diroximel fumarate delayed-release capsules), Tysabri® (natalizumab injection for intravenous use), Bafiertam™ (monomethyl fumarate delayed-release capsules), dimethyl fumarate delayed-release capsules (Tecfidera®, generic), Zeposia® (ozanimod capsules), Kesimpta® (ofatumumab injection for subcutaneous use), and Lemtrada® (alemtuzumab injection for intravenous use).

173. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Multiple Sclerosis – Plegridy Prior Authorization Policy

- Plegridy® (peginterferon beta-1a injection for subcutaneous or intramuscular use – Biogen Idec)

REVIEW DATE: 08/05/2020; selected revision 09/09/2020 and 02/17/2021

OVERVIEW

Plegridy, an interferon beta product, is indicated for the treatment of relapsing forms of multiple sclerosis (MS) to include clinically isolated syndrome, relapsing remitting disease, and active secondary progressive disease in adults.[1]

Disease Overview

MS is a chronic, inflammatory, demyelinating, autoimmune disease of the central nervous system that impacts almost 1,000,000 people in the US.[2] The condition is marked by inflammation and demyelination, as well as degenerative alterations. Patients usually experience relapses and remissions in their neurological symptoms. For most patients, the onset of MS symptoms occurs when patients are 20 to 40 years of age; however, children can get MS and new onset disease can occur in older adults. The MS disease course is heterogeneous but has some patterns. Approximately 85% to 90% of patients have a relapsing pattern at onset. However, this transitions over time in patients who are untreated to a worsening with very few or no relapses or magnetic resonance imaging (MRI) activity (secondary progressive MS). Around 10% to 15% of patients have a steady progression of symptoms over time (primary progressive MS), marked by some clinical manifestations or by MRI activity. Primary progressive MS is generally diagnosed in patients on the upper level of the typical age range (e.g., almost 40 years of age) and the distribution is equivalent among the two genders. Advances in the understanding of the MS disease process, as well as in MRI technology, spurned updated disease course descriptions in 2013,[3] as well as in 2017.[4] The revised disease courses are clinically isolated syndrome, relapsing remitting MS, primary progressive MS, and secondary progressive MS.[2-4] Clinically isolated syndrome is now more recognized among the course descriptions of MS. It is the first clinical presentation of MS that displays characteristics of inflammatory demyelination that may possibly be MS but has yet to fulfill diagnostic criteria. It is notable that the other MS designations can be further characterized considering whether patients have active disease (or not active), as well as if disease is worsening or stable. Disability in MS is commonly graded on the deterioration of mobility per the Expanded Disability Status Scale (EDSS) an ordinal scale that ranges from 0 to 10, with higher scores indicating greater disability.

Guidelines

In September 2019, a consensus paper was updated by the MS Coalition that discusses the use of disease-modifying therapies in MS.[2] Many options from various disease classes, involving different mechanisms of action and modes of administration, have shown benefits in patients with MS.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Plegridy. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Plegridy as well as the monitoring required for adverse events and long-term efficacy, approval requires Plegridy to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Plegridy is recommended in those who meet the following criteria:

FDA-Approved Indication

2. Multiple Sclerosis. Approve for 3 years if the patient meets the following criteria (A and B):

V) Patient has a relapsing form of multiple sclerosis; AND
Note: Examples of relapsing forms of multiple sclerosis (MS) include clinically isolated syndrome, relapsing remitting disease, and active secondary progressive disease.

W) Medication is prescribed by or in consultation with a neurologist or a physician who specializes in the treatment of multiple sclerosis.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Plegridy is not recommended in the following situations:

31. Concurrent Use with Other Disease-Modifying Agents Used for Multiple Sclerosis.
Note: Examples of disease modifying agents used for multiple sclerosis include Avonex® (interferon beta-1a injection [intramuscular]), Betaseron®/Extavia® (interferon beta-1b injection), Rebif® (interferon beta-1a injection [subcutaneous]), Copaxone®/Glatopa® (glatiramer acetate injection), Aubagio® (teriflunomide tablets), Gilenya® (fingolimod tablets), Mavenclad® (cladribine tablets), Mayzent® (siponimod tablets), Tecfidera® (dimethyl fumarate delayed-release capsules), Bafiertam® (monomethyl fumarate delayed-release capsules), Vumerity® (diroximel fumarate delayed-release capsules), Zeposia® (ozanimod capsules), Ocrevus® (ocrelizumab injection for intravenous use), Tysabri® (natalizumab injection for intravenous infusion), Lemtrada® (alemtuzumab injection for intravenous use), and Kesimpta® (ofatumumab injection for subcutaneous use).[2] These agents are not indicated for use in combination. Additional data are required to determine if use of disease-modifying multiple sclerosis agents in combination is safe and provides added efficacy.

32. Non-Relapsing Forms of Multiple Sclerosis.
Note: An example of a non-relapsing form of multiple sclerosis is primary progressive multiple sclerosis. The efficacy of Plegridy has not been established in patients with multiple sclerosis with non-relapsing forms of multiple sclerosis.[1]

33. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Multiple Sclerosis – Vumerity Prior Authorization Policy
- Vumerity® (diroximel fumarate delayed-release capsules – Biogen/Alkermes)

REVIEW DATE: 08/05/2020; selected revision 09/09/2020

OVERVIEW

Vumerity is indicated for the treatment of patients with relapsing forms of multiple sclerosis (MS) to include clinically isolated syndrome, relapsing remitting disease, and active secondary progressive MS in adults.[1]

Disease Overview

MS is a chronic, inflammatory, demyelinating, autoimmune disease of the central nervous system (CNS) that impacts almost 1,000,000 people in the US.[2] The condition is marked by inflammation and demyelination, as well as degenerative alterations. Patients usually experience relapses and remissions in their neurological symptoms. For most patients, the onset of MS symptoms occurs when patients are 20 to 40 years of age; however, children can get MS and new onset disease can occur in older adults. The MS disease course is heterogeneous but has some patterns. Approximately 85% to 90% of patients have a relapsing pattern at onset. However, this transitions over time in patients who are untreated to a worsening with very few or no relapses or magnetic resonance imaging (MRI) activity (secondary progressive MS). Around 10% to 15% of patients have a steady progression of symptoms over time (primary progressive MS), marked by some clinical manifestations or by MRI activity. Primary progressive MS is generally diagnosed in patients on the upper level of the typical age range (e.g., almost 40 years of age) and the distribution is equivalent among the two genders. Advances in the understanding of the MS disease process, as well as in MRI technology, spurned updated disease course descriptions in 2013,[3] as well as in 2017.[4] The revised disease courses are clinically isolated syndrome, relapsing remitting MS, primary progressive MS, and secondary progressive MS.[2-4] Clinically isolated syndrome is now more recognized among the course descriptions of MS. It is the first clinical presentation of MS that displays characteristics of inflammatory demyelination that may possibly be MS but has yet to fulfill diagnostic criteria. It is notable that the other MS designations can be further characterized considering whether patients have active disease (or not active), as well as if disease is worsening or stable. Disability in MS is commonly graded on the deterioration of mobility per the Expanded Disability Status Scale (EDSS) an ordinal scale that ranges from 0 to 10, with higher scores indicating greater disability.

Guidelines

In September 2019, a consensus paper was updated by the MS Coalition that discusses the use of disease-modifying therapies in MS.[2] Many options from various disease classes, involving different mechanisms of action and modes of administration, have shown benefits in patients with MS.

Safety

Progressive multifocal leukoencephalopathy has occurred in patients with MS treated with dimethyl fumarate delayed-release capsules, which has the same active metabolite as Vumerity.[1]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Vumerity. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and

diagnosis of patients treated with Vumerity as well as the monitoring required for adverse events and efficacy, approval requires Vumerity to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Vumerity is recommended in those who meet the following criteria.

FDA-Approved Indication

1. **Multiple Sclerosis.** Approve for 1 year if the patient meets the following criteria (A and B):
   - **E)** Patient has a relapsing form of multiple sclerosis; AND
     Note: Examples of relapsing forms of multiple sclerosis (MS) include clinically isolated syndrome, relapsing remitting disease, and active secondary progressive disease.
   - **F)** Medication is prescribed by or in consultation with a neurologist or a physician who specializes in the treatment of multiple sclerosis.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Vumerity is not recommended in the following situations:

174. Concurrent Use with Other Disease-Modifying Agents Used for Multiple Sclerosis.
Note: Examples of disease modifying agents used for multiple sclerosis include Aubagio® (teriflunomide tablets), Avonex® (interferon beta 1a injection [intramuscular]), Betaseron®/Extavia® (interferon beta-1b injection), Rebif® (interferon beta-1a injection [subcutaneous]), Copaxone®/Glatopa® (glatiramer acetate injection), Plegridy® (peginterferon beta-1a injection), Gilenya® (fingolimod tablets), Mavenclad® (cladribine tablets), Mayzent® (siponomid tablets), Tecfidera® (dimethyl fumarate delayed-release capsules), Bafiertam® (monomethyl fumarate delayed-release capsules), Zeposia® (ozanimod capsules), Ocrevus® (ocrelizumab injection for intravenous use), Tysabri® (natalizumab injection for intravenous infusion), Lemtrada® (alemtuzumab injection for intravenous use), and Kesimpta® (ofatumumab injection for subcutaneous use).[2] These agents are not indicated for use in combination. Additional data are required to determine if use of disease-modifying multiple sclerosis agents in combination is safe and provides added efficacy.

175. Non-Relapsing Forms of Multiple Sclerosis.
Note: An example of a non-relapsing form of multiple sclerosis is primary progressive multiple sclerosis. The efficacy of Vumerity has not been established in patients with multiple sclerosis with non-relapsing forms of multiple sclerosis.[1]

176. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Multiple Sclerosis – Zeposia Prior Authorization Policy

- Zeposia® (ozanimod capsules – Celegene)

REVIEW DATE: 08/05/2020; selected revision 09/09/2020

OVERVIEW

Zeposia, a sphingosine 1-phosphate receptor modulator, is indicated for the treatment of relapsing forms of multiple sclerosis (MS), to include clinically isolated syndrome, relapsing remitting disease, and active secondary progressive disease in adults.[1]

Disease Overview

MS is a chronic, inflammatory, demyelinating, autoimmune disease of the central nervous system (CNS) that impacts almost 1,000,000 people in the US.[2] The condition is marked by inflammation and demyelination, as well as degenerative alterations. Patients usually experience relapses and remissions in their neurological symptoms. For most patients, the onset of MS symptoms occurs when patients are 20 to 40 years of age; however, children can get MS and new onset disease can occur in older adults. The MS disease course is heterogeneous but has some patterns. Approximately 85% to 90% of patients have a relapsing pattern at onset. However, this transitions over time in patients who are untreated to a worsening with very few or no relapses or magnetic resonance imaging (MRI) activity (secondary progressive MS). Around 10% to 15% of patients have a steady progression of symptoms over time (primary progressive MS), marked by some clinical manifestations or by MRI activity. Primary progressive MS is generally diagnosed in patients on the upper level of the typical age range (e.g., almost 40 years of age) and the distribution is equivalent among the two genders. Advances in the understanding of the MS disease process, as well as in MRI technology, spurned updated disease course descriptions in 2013,[3] as well as in 2017.[4] The revised disease courses are clinically isolated syndrome, relapsing remitting MS, primary progressive MS, and secondary progressive MS.[2-4] Clinically isolated syndrome is now more recognized among the course descriptions of MS. It is the first clinical presentation of MS that displays characteristics of inflammatory demyelination that may possibly be MS but has yet to fulfill diagnostic criteria. It is notable that the other MS designations can be further characterized considering whether patients have active disease (or not active), as well as if disease is worsening or stable. Disability in MS is commonly graded on the deterioration of mobility per the Expanded Disability Status Scale (EDSS) an ordinal scale that ranges from 0 to 10, with higher scores indicating greater disability.

Guidelines

In September 2019, a consensus paper was updated by the MS Coalition that discusses the use of disease-modifying therapies in MS.[2] Many options from various disease classes, involving different mechanisms of action and modes of administration, have shown benefits in patients with MS.

Safety

Various assessments are required prior to the first dose of Zeposia (e.g., complete blood count, cardiac evaluation).[1] The most common adverse events with Zeposia include upper respiratory tract infection, hepatic transaminase elevations, orthostatic hypotension, urinary tract infection, back pain, and hypertension. Zeposia has Warnings/Precautions regarding infections, macular edema, bradyarrhythmias and atrioventricular conduction delays, respiratory effects, liver injury, increased blood pressure, and respiratory effects. Due to the time it takes to eliminate the drug from the body after cessation of treatment, the potential risk of the fetus may persist, therefore, women of childbearing potential should use effective contraception to avoid pregnancy during and for up to 3 months after cessation of Zeposia therapy.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Zeposia. All approvals are provided for the duration cited below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Zeposia as well as the monitoring required for adverse events and long-term efficacy, approval requires Zeposia to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zeposia is recommended in those who meet the following criteria:

FDA-Approved Indications

5. Multiple Sclerosis. Approve for 1 year if the patient meets the following criteria (A and B):

- **A)** Patient has a relapsing form of multiple sclerosis; AND
  Note: Examples of relapsing forms of multiple sclerosis (MS) include clinically isolated syndrome, relapsing remitting disease, and active secondary progressive disease.
- **B)** Medication is prescribed by or in consultation with neurologist or a physician who specializes in the treatment of multiple sclerosis.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Zeposia is not recommended in the following situations:

177. Current Use with Other Disease-Modifying Agents Used for Multiple Sclerosis.

Note: Examples of disease-modifying agents used for multiple sclerosis include Avonex® (interferon beta 1a injection [intramuscular]), Betaseron®/Extavia® (interferon beta-1b injection), Rebif® (interferon beta-1a injection [subcutaneous]), Copaxone®/Glatopa® (glatiramer acetate injection), Plegridy® (peginterferon beta-1a injection), Aubagio® (teriflunomide tablets), Gilenya® (fingolimod tablets), Mavenclad® (cladribine tablets), Mayzent® (siponimod tablets), Tecfidera® (dimethyl fumarate delayed-release capsules), Vumerity® (diroximel fumarate delayed-release capsules), Bafiertam® (monomethyl fumarate delayed-release capsules), Ocrevus® (ocrelizumab injection for intravenous use), Tysabri® (natalizumab injection for intravenous infusion), Lemtrada® (alemtuzumab

injection for intravenous use), and Kesimpta® (ofatumumab injection for subcutaneous use).[2] These agents are not indicated for use in combination. Additional data are required to determine if use of disease-modifying multiple sclerosis agents in combination is safe and provides added efficacy.

178. Non-Relapsing Forms of Multiple Sclerosis.
Note: An example of a non-relapsing form of multiple sclerosis is primary progressive multiple sclerosis. The efficacy of Zeposia has not been established in patients with multiple sclerosis with non-relapsing forms of the disease.[1]

179. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Selected Revision	**Multiple Sclerosis:** Examples of relapsing forms of MS were added in a Note. **Conditions Not Recommended for Approval:** Regarding Use with Other Disease-Modifying Agents for MS, Kesimpta was added to the list of examples provided in the Note.	09/09/2020

PRIOR AUTHORIZATION POLICY

POLICY: Multiple Sclerosis and Crohn's Disease – Tysabri Prior Authorization Policy
- Tysabri® (natalizumab injection for intravenous use – Biogen)

REVIEW DATE: 11/11/2020

OVERVIEW

Tysabri, an integrin receptor antagonist, is indicated for the treatment of:[1]
- Relapsing forms of **multiple sclerosis (MS)** to include clinically isolated syndrome, relapsing remitting disease, and active secondary progressive disease in adults as monotherapy in adults.[1]
- **Crohn's disease**, inducing and maintaining clinical response and remission in adults with moderately to severely active disease with evidence of inflammation who have had an inadequate response to, or are unable to tolerate, conventional Crohn's disease therapies and inhibitors of tumor necrosis factor (TNF)-α.

Tysabri increases the risk of progressive multifocal leukoencephalopathy (PML).[1] When initiating and continuing treatment with Tysabri in patients with MS, physicians should consider whether the expected

benefit of Tysabri is sufficient to offset the risks. Tysabri should not be used in combination with immunosuppressants (e.g., azathioprine, 6-mercaptopurine, cyclosporine, methotrexate) or inhibitors of TNFα. The safety and effectiveness in pediatric patients with MS or Crohn's disease below the age of 18 years of age have not been established.

Disease Overview

Multiple Sclerosis (MS)

MS is a chronic, inflammatory, demyelinating, autoimmune disease of the central nervous system that impacts almost 1,000,000 people in the US.[2] The condition is marked by inflammation and demyelination, as well as degenerative alterations. Patients usually experience relapses and remissions in their neurological symptoms. For most patients, the onset of MS symptoms occurs when patients are 20 to 40 years of age; however, children can get MS and new onset disease can occur in older adults. The MS disease course is heterogeneous but has some patterns. Approximately 85% to 90% of patients have a relapsing pattern at onset. However, this transitions over time in patients who are untreated to a worsening with very few or no relapses or magnetic resonance imaging (MRI) activity (secondary progressive MS). Around 10% to 15% of patients have a steady progression of symptoms over time (primary progressive MS), marked by some clinical manifestations or by MRI activity. Primary progressive MS is generally diagnosed in patients on the upper level of the typical age range (e.g., almost 40 years of age) and the distribution is equivalent among the two genders. Advances in the understanding of the MS disease process, as well as in MRI technology, spurned updated disease course descriptions in 2013,[3] as well as in 2017.[4] The revised disease courses are clinically isolated syndrome, relapsing remitting MS, primary progressive MS, and secondary progressive MS.[2-4] Clinically isolated syndrome is now more recognized among the course descriptions of MS. It is the first clinical presentation of MS that displays characteristics of inflammatory demyelination that may possibly be MS but has yet to fulfill diagnostic criteria.

Crohn's Disease

Crohn's disease is a chronic inflammatory disease of the gastrointestinal tract.[6] The prevalence has been increasing worldwide.[7] Common symptoms of Crohn's disease include abdominal pain, diarrhea, fatigue, weight loss, fever, anemia, and recurrent fistulas. Adults with Crohn's disease may be at risk of bone fractures, as well as thromboembolism. Other extraintestinal manifestations may occur (e.g., primary sclerosing cholangitis). Younger patients may experience growth failure.[6,7] The chronic intestinal inflammation over time leads to intestinal complications such as strictures, fistulas, and abscesses. Only 20% to 30% of patients with Crohn's disease will have a nonprogressive or indolent course. Therefore, it is appropriate to identify therapies that will achieve adequate control for the patient. Many different therapies are available including corticosteroids, immunomodulators (e.g., azathiopurine, 6-mercaptopurine), and anti-TNF agents (e.g., infliximab products, adalimumab products, Cimzia® [certolizumab pegol injection for subcutaneous use]).

Guidelines

A practice guideline recommendation regarding disease-modifying agents for adults with MS from the American Academy of Neurology (2018) states to consider Tysabri for patients with MS who have highly active disease.[5]

In September 2019, a consensus paper was updated by the MS Coalition that discusses the use of disease-modifying therapies in MS.[2] Many options from various disease classes, involving different mechanisms of action and modes of administration, have shown benefits in patients with MS.

The American College of Gastroenterology has guidelines on management of Crohn's disease in adults (2018).[7] Anti-TNF agents (e.g., infliximab products, adalimumab products, Cimzia® [certolizumab pegol injection for subcutaneous use]) should be used to treat Crohn's disease that is resistant to treatment with corticosteroids, thiopurines or methotrexate. For patients with moderately to severely active Crohn's

disease and objective evidence of active disease, anti-integrin therapy (with Entyvio® [vedolizumab injection for intravenous use) with or without an immunomodulator is more effective than placebo and should be considered for use for induction of symptomatic remission in patients with Crohn's disease. Tysabri is more effective than placebo and should be considered to be used for induction of symptomatic response and remission in patients with active Crohn's disease (strong recommendation; high level of evidence). Tysabri should be used for maintenance of Tysabri-induced remission of Crohn's disease only if serum antibody to John Cunningham virus is negative. Stelara® (ustekinumab injection for subcutaneous or intravenous use) should be given for moderate to severe Crohn's disease patients who failed treatment with corticosteroids, thiopurines, methotrexate, or anti-TNF inhibitors or who have had no prior exposure to anti-TNF inhibitors.

Safety

Tysabri has a Boxed Warning regarding the risk of PML. Tysabri is available only through a special restricted distribution Risk Evaluation and Mitigation Strategy (REMS) program called the TOUCH® Prescribing Program.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Tysabri. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Tysabri as well as the monitoring required for adverse events and long-term efficacy, approval requires Tysabri to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Documentation: Documentation is required for use of Tysabri at initiation for MS as noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes magnetic resonance imaging (MRI) reports, and/or other information.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tysabri injection is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Multiple Sclerosis.** Approve for 1 year if the patient meets one of the following criteria (A or B):
   - **A)** Initial Therapy. Approve for 1 year if the patient meets all of the following criteria (i, ii, iii and iv):
     - **i.** Patient is ≥ 18 years of age; AND
     - **ii.** Patient has a relapsing form of multiple sclerosis; AND
       Note: Examples of relapsing forms of multiple sclerosis include clinically isolated syndrome, relapsing remitting disease, and active secondary progressive disease.
     - **iii.** Patient meets one of the following (a or b):
       - **a)** According to the prescriber the patient has experienced inadequate efficacy or significant intolerance to one disease-modifying agent used for MS; OR
         Note: Examples include Avonex® (interferon beta-1a injection [intramuscular]), Rebif® (interferon beta-1a injection [subcutaneous]), Betaseron®/Extavia® (interferon beta-1b injection), glatiramer acetate injection (Copaxone®/Glatopa®, generic), Plegridy® (peginterferon beta-1a injection), Gilenya® (fingolimod capsules), Aubagio®

(teriflunomide tablets), Mavenclad® (cladribine tablets), Mayzent® (siponimod tablets), Vumerity® (diroximel fumarate delayed-release capsules), Ocrevus® (ocrelizumab injection for intravenous use), Bafiertam™ (monomethyl fumarate delayed-release capsules), dimethyl fumarate delayed-release capsules (Tecfidera®, generic), Zeposia® (ozanimod capsules), Kesimpta® (ofatumumab injection for subcutaneous use), and Lemtrada® (alemtuzumab injection for intravenous use).

b) According to the prescriber the patient has highly-active or aggressive multiple sclerosis by meeting one of the following [(1), (2), (3), or (4)]:

(5) Patient has demonstrated rapidly-advancing deterioration(s) in physical functioning (e.g., loss of mobility/or lower levels of ambulation, severe changes in strength or coordination) **[documentation required]**; OR

(6) Disabling relapse(s) with suboptimal response to systemic corticosteroids **[documentation required]**; OR

(7) Magnetic resonance imaging [MRI] findings suggest highly-active or aggressive multiple sclerosis (e.g., new, enlarging, or a high burden of T2 lesions or gadolinium-enhancing lesions) **[documentation required]**; OR

(8) Manifestations of multiple sclerosis-related cognitive impairment **[documentation required]**; AND

iv. Medication is prescribed by or in consultation with a physician who specializes in the treatment of multiple sclerosis and/or a neurologist; AND

B) Patient is currently receiving Tysabri. Approve for 1 year if the patient meets all of the following criteria (i, ii, and iii):

i. Patient is ≥ 18 years of age; AND

ii. Patient has a relapsing form of multiple sclerosis; AND
Note: Examples of relapsing forms of multiple sclerosis include clinically isolated syndrome, relapsing remitting disease, and active secondary progressive disease.

iii. Medication is prescribed by or in consultation with a physician who specializes in the treatment of multiple sclerosis and/or a neurologist.

2. Crohn's Disease. Approve for the duration noted below if the patient meets one of the following criteria (A OR B):

A) Initial Therapy. Approve for 3 months if the patient meets all of the following criteria (i, ii, iii, and iv):

i. Patient is ≥ 18 years of age; AND

ii. Patient has moderately to severely active Crohn's disease; AND

iii. Patient has tried at least two biologics for Crohn's disease; AND
Note: Examples include an adalimumab product, Cimzia (certolizumab pegol for SC injection), an infliximab product, Entyvio (vedolizumab injection for IV use), or Stelara (ustekinzumab for SC injection or for IV infusion).

iv. Medication is prescribed by or in consultation with a gastroenterologist; OR

B) Patient is Currently Receiving Tysabri. Approve for 1 year if the patient meets all of the following criteria (i, ii and iii):

i. Patient is ≥ 18 years of age; AND

ii. Patient has had a response as determined by the prescriber; AND
Note: Examples of a response are reduced number of liquid/soft stools, reduced abdominal pain, and less use of antidiarrheal agents.

iii. Medication is prescribed by or in consultation with a gastroenterologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tysabri is not recommended in the following situations:

1. **Concurrent Use with an Immunosuppressant Agent in Patients with Crohn's Disease.** Ordinarily, patients who are receiving chronic immunosuppressant or immunomodulatory therapy or who have systemic medical conditions resulting in significantly compromised immune function should not take Tysabri.[1]
   Note: Examples include 6-mercaptopurine, azathioprine, cyclosporine, methotrexate, an infliximab product, an adalimumab product, Cimzia, Entyvio and Stelara.

2. **Concurrent Use with Other Disease-Modifying Agents Used for Multiple Sclerosis (MS).** Tysabri is only indicated as monotherapy due to an increased risk of PML.[1]
   Note: Examples include Avonex® (interferon beta-1a injection [intramuscular]), Rebif® (interferon beta-1a injection [subcutaneous]), Betaseron®/Extavia® (interferon beta-1b injection), glatiramer acetate injection (Copaxone®/Glatopa®, generic), Plegridy® (peginterferon beta-1a injection), Gilenya® (fingolimod capsules), Aubagio® (teriflunomide tablets), Mavenclad® (cladribine tablets), Mayzent® (siponimod tablets), Vumerity® (diroximel fumarate delayed-release capsules), Ocrevus® (ocrelizumab injection for intravenous use), Bafiertam™ (monomethyl fumarate delayed-release capsules), dimethyl fumarate delayed-release capsules (Tecfidera®, generic), Zeposia® (ozanimod capsules), Kesimpta® (ofatumumab injection for subcutaneous use), and Lemtrada® (alemtuzumab injection for intravenous use).

3. **Non-Relapsing Forms of Multiple Sclerosis.** The safety and efficacy of Tysabri have not been established in patients with primary progressive multiple sclerosis.
   Note: An example of a non-relapsing form of multiple sclerosis is primary progressive multiple sclerosis.

4. **Ulcerative Colitis.** Efficacy data with use of Tysabri are limited.[8]

5. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	The following criteria changes were made: **5. Multiple Sclerosis:** The notation of "Relapsing Forms" was removed from the stated indication. Criteria were revised such that the example of relapsing forms of MS were	11/13/2019

	removed. The word "prescriber" replaced the phrase "prescribing physician" in applicable criteria. Vumerity and glatiramer acetate were added as medication alternatives that count toward the requirement of a trial of one disease-modifying agent used for MS. 6. **Crohn's Disease:** Regarding the requirement that patients have moderate or severely active Crohn's disease, patients no longer are required to have "evidence of inflammation, that is C-reactive protein", as this is no longer recommended in related guidelines. The word "prescriber" replaced the phrase "prescribing physician" in applicable criteria. 7. **Conditions Not Recommended for Approval:** "Children with MS or Crohn's Disease" was removed as this is duplicative to the age requirement in the approval criteria. Regarding "Concurrent Use with Other Disease-Modifying Agents Used for MS", the examples of glatiramer acetate injection, Vumerity, Mavenclad, and Mayzent were added. The condition that stated "Primary Progressive (Chronic Progressive MS)" was changed to state "Non-Relapsing Forms of MS" with a note that an example is Primary Progressive MS. The condition of "Immune Compromised Patients with MS or Crohn's Disease" was removed.	
Update	02/07/2020: No criteria changes. The title Crohn's Disease was added to the header on the name of the policy.	--
Annual Revision	The following changes were made: 5. **Multiple Sclerosis:** For the criteria that requires that the patient try two other disease-modifying medications for MS, the wording regarding this trial was changed from and "has had an inadequate response or is unable to tolerate" to "has experienced inadequate efficacy or significant intolerance." Additional agents were added as examples of MS disease-modifying therapies in the Note. A Note was added after the requirement that the patient have a relapsing form of MS that examples of relapsing forms of MS include clinically isolated syndrome, relapsing remitting disease and active secondary progressive disease. 6. **Crohn's Disease:** Examples of a response for patients currently receiving Tysabri was removed from the criteria and placed in a Note. 7. **Conditions Not Recommended for Approval:** For the criteria regarding "Concurrent Use with Other Disease-Modifying Agents Used for MS", examples of agents were added to the Note.	11/11/2020

MS – Multiple sclerosis.

PRIOR AUTHORIZATION POLICY

POLICY: Muscular Dystrophy – Amondys 45 Prior Authorization Policy

- Amondys 45™ (casimersen intravenous infusion – Sarepta)

REVIEW DATE: 02/26/2021

OVERVIEW

Amondys 45, an antisense oligonucleotide, is indicated for the treatment of **Duchenne muscular dystrophy** (DMD) in patients who have a confirmed mutation of the DMD gene that is amenable to exon 45 skipping.[1] This indication was granted accelerated approval based on an increase in dystrophin in skeletal muscle observed in patients treated with Amondys 45. The prescribing information notes that continued FDA-approval for this indication may be contingent upon verification of clinical benefit in a confirmatory trial.

Amondys 45 is an antisense oligonucleotide designed to bind to exon 45 of dystrophin pre-mRNA, resulting in exclusion of this exon during mRNA processing in patients with genetic mutations that are amenable to exon 45 skipping. These patients represent up to 8% of all patients with DMD.[2] This genetic manipulation intends to restore the reading frame of the resulting mRNA. The result would be production of a shortened, but partially functional dystrophin protein as seen in less severe forms of muscular dystrophy (e.g., Becker muscular dystrophy).

Guidelines

Amondys 45 is not addressed in guidelines for DMD. There are guidelines for the diagnosis and management of DMD available from the DMD Care Considerations Working Group (2018).[3] Genetic testing for a DMD mutation in a blood sample is always required. By fully characterizing the mutation, the predicted effect on the reading frame can be identified, which is the major determinant of phenotype and will determine eligibility for mutation-specific clinical trials. In patients with no mutation identified but with signs/symptoms of DMD, a muscle biopsy is clinically indicated. Glucocorticoids slow decline in muscle strength and function in DMD. Use of corticosteroids reduces the risk of scoliosis and stabilizes pulmonary function. Continued treatment after the patient loses ambulation provides a reduction in the risk of progressive scoliosis and stabilization of pulmonary function tests. Therefore, glucocorticoids should be considered for all patients with DMD. Exondys 51 (eteplirsen intravenous infusion) is mentioned as an emerging product, approved by an accelerated pathway for those with a mutation in the dystrophin gene amenable to exon 51 skipping.

POLICY STATEMENT

The prescribing information for Amondys 45 states that approval is based on dystrophin production in a limited number of patients (n = 27 treated with Amondys 45) with DMD, but continued approval may be contingent upon a confirmatory trial. Due to inadequate clinical efficacy data, **approval is not recommended** for Amondys 45.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
None.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Coverage of Amondys 45 is not recommended in the following situations:

1. **Duchenne Muscular Dystrophy (DMD).** Due to inadequate clinical efficacy data, approval is not recommended. A systemic review and meta-analysis of other exon skipping therapies (i.e., Exondys 51, drisapersen) does not show benefit of these therapies for DMD.[4] The prescribing information notes that continued approval for this indication may be contingent upon verification of clinical benefit in a confirmatory trial.[1] FDA has required a post-marketing trial to verify clinical efficacy of Amondys 45. Thus, patients are still being recruited for the pivotal Phase III ESSENCE study, to further evaluate safety and efficacy in ambulatory boys with DMD.[5]

   Amondys 45 is under evaluation in one ongoing, Phase III pivotal study (ESSENCE) in patients with DMD amenable to exon 45 skipping.[1] The primary endpoint is the effect of Amondys 45 change from baseline in the total distance walked during the 6-Minute Walk Test (6MWT) at Week 96.[5] Functional outcomes were among the secondary endpoints. In an interim analysis from 43 evaluable patients (n = 27 treated with Amondys 45; n = 16 treated with placebo), the proportion of normal dystrophin protein level was higher at Week 48 with Amondys 45 (1.74% of normal at Week 48 vs. 0.93% of normal at baseline) vs. placebo (0.76% of normal at Week 48 vs. 0.54% of normal at baseline) [P = 0.004 for Amondys 45 vs. placebo).[1] Results from the primary endpoint (6MWT) and functional outcomes have not been reported.

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY
Type of Revision	Summary of Changes	Review Date
New Policy	--	02/26/2021

PRIOR AUTHORIZATION POLICY

POLICY: Muscular Dystrophy – Emflaza Prior Authorization Policy
- Emflaza™ (deflazacort tablets and oral suspension – PTC Therapeutics, Inc.)

REVIEW DATE: 01/20/2021

OVERVIEW

Emflaza is a corticosteroid indicated for the treatment of patients ≥ 2 years of age with **Duchenne muscular dystrophy** (DMD).[1] The efficacy and safety of Emflaza have not been established in patients < 2 years of age.

Disease Overview

DMD is an X-linked recessive disease affecting 1 in 3,600 to 6,000 newborn male infants.[2] The disease is attributed to large frame-shift deletions in the DMD gene (chromosome Xp21) which lead to loss of a structural protein of muscle cells (dystrophin).[3] Females carriers are usually asymptomatic but some may show mild symptoms.[2] Most patients present with symptoms of DMD between the ages of 3 and 5 years. There are wide variances in how quickly DMD progresses, but without intervention death is at approximately 19 years of age.[2-3] With respiratory, cardiac, orthopedic and rehabilitative interventions and use of corticosteroids, children born today can have a life expectancy of up to 40 years.

Clinical Efficacy

The efficacy and safety of Emflaza were established in two pivotal trials in boys with DMD who were ≥ 5 years of age.[4-5] In one study, treatment consisted of Emflaza 0.9 mg/kg/day, Emflaza 1.2 mg/kg/day, or prednisone 0.75 mg/kg/day (n = 196).[4] The primary efficacy analysis, mean change from baseline to Week 12 in average muscle strength (assessed by modified Medical Research Council [MRC]), demonstrated a significant least squares (LS) mean difference in favor of active treatment vs. placebo: Emflaza 0.9 mg/kg/day (0.25 vs. -0.1, P = 0.17), Emflaza 1.2 mg/kg/day (0.36 vs. -0.1, P = 0.0003), and prednisone 0.75 mg/kg/day (0.37 vs. -0.1, P = 0.0002). Adverse events (AEs) differed between prednisone and Emflaza treatment groups. Cushingoid appearance (69.4%), erythema (41.8%), and hirsutism (39.3%) were observed in a numerically greater proportion of patients in the prednisone group compared with either dose of Emflaza. Central obesity was reported in a statistically significant greater proportion of patients treated with prednisone vs. Emflaza. Psychiatric AEs were generally reported at a higher rate in the prednisone group compared with both Emflaza groups.

Guidelines

There are guidelines for the diagnosis and management of DMD available from the DMD Care Considerations Working Group (updated 2018).[6] Dystrophin gene deletion and duplication testing are usually the first test done to confirm a diagnosis of DMD. If deletion/duplication testing is negative, dystrophin gene sequencing is done to look for remaining types of mutations. If generic testing does not confirm a diagnosis of DMD, then a muscle biopsy should be performed to test for the presence of dystrophin protein. These guidelines additionally discuss the benefits of glucocorticoids in patients with DMD. These benefits include the loss of ambulation at a later age, preservation of upper limb and respiratory function, and avoidance of scoliosis surgery. Although the benefits of glucocorticoids are well established, based on available data, there is uncertainty about which specific products and doses are best.[6]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Emflaza. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Emflaza as well as the monitoring required for adverse events and long-term efficacy, approval requires Emflaza to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Documentation: Documentation is required for use of Emflaza as noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes, prescription claims records, prescription receipts, and/or other information.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Emflaza is recommended in those who meet the following criteria:

FDA-Approved Indications

30. Duchenne Muscular Dystrophy (DMD). Approve for 1 year if the patient meets the following criteria (A or B):

A) Initial Therapy. Approve if the patient meets the following criteria (i, ii, and iii):

i. Patient is 2 years of age and older; AND

ii. Patient meets ONE of the following conditions (a or b):

a) Patient has tried prednisone or prednisolone for ≥ 6 months **[documentation required]** AND according to the prescriber, the patient has had at least one of the following significant intolerable adverse effects (AEs) [1, 2, 3, or 4]:

1) Cushingoid appearance **[documentation required]**; OR

2) Central (truncal) obesity **[documentation required]**; OR

3) Undesirable weight gain defined as ≥ 10% of body weight gain increase over a 6-month period **[documentation required]**; OR

4) Diabetes and/or hypertension that is difficult to manage according to the prescriber **[documentation required]**; OR

b) According to the prescriber, the patient has experienced a severe behavioral adverse event (AE) while on prednisone or prednisolone therapy that has or would require a prednisone or prednisolone dose reduction **[documentation required]**.

iii. The medication is prescribed by or in consultation with a physician who specializes in the treatment of Duchenne muscular dystrophy and/or neuromuscular disorders.

B) Patient is currently receiving Emflaza. Approve if the patient meets the following criteria (i, ii, and iii):

i. Patient has tried prednisone or prednisolone **[documentation required]**; AND

ii. According to the prescriber, the patient has responded to or continues to have improvement or benefit from Emflaza therapy **[documentation required]**; AND

Note: Examples of improvement or benefit from Emflaza therapy would include improvements in motor function (time from supine to standing, time to climb four stairs, time to run or walk 30 feet), improvement in muscle strength, improve pulmonary function, etc.

iii. The medication is prescribed by or in consultation with a physician who specializes in the treatment of Duchenne muscular dystrophy and/or neuromuscular disorders.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Emflaza is not recommended in the following situations:

180. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	No criteria changes	3/13/2019
Selected Revision	For Duchenne Muscular Dystrophy, the FDA-approved age for use was updated to patients 2 years of age and older. Previously the approved age was ≥ to 5 years of age.	6/26/2019
Annual Revision	Throughout the policy, updated prescribing physician to prescriber	3/11/2020
Early Annual Revision	Throughout the policy, prednisolone was added in places referencing prednisone. Added continuation criteria for patients currently receiving Emflaza: Continuation criteria requires a trial of prednisone or prednisolone; documentation of response; and prescribing by or in consultation with a physician who specializes in the treatment of Duchenne muscular dystrophy and/or neuromuscular disorders.	01/20/2021

PRIOR AUTHORIZATION POLICY

POLICY: Muscular Dystrophy – Exondys 51™ (eteplirsen intravenous infusion – Sarepta)

DATE REVIEWED: 04/15/2020

OVERVIEW

Exondys 51 is indicated for the treatment of Duchenne muscular dystrophy (DMD) in patients who have a confirmed mutation of the DMD gene that is amenable to exon 51 skipping.[1] Exondys 51 was approved for this indication under accelerated approval based on an increase in dystrophin observed in the skeletal muscle of some patients who received the drug. However, a clinical benefit of Exondys has not been established. The prescribing information notes that continued FDA-approval for this indication may be contingent upon verification and description of clinical benefit in confirmatory trials.

Disease Overview

DMD is an X-linked recessive disease affecting 1 in 3,600 to 6,000 newborn male infants.[2] The disease is attributed to large frame-shift deletions in the DMD gene (chromosome Xp21) which lead to loss of a structural protein of muscle cells (dystrophin).[3] Over 4,700 mutations on the DMD gene have been identified which lead to a deficiency in production of dystrophin.[2] Therefore, the type of mutation and its effect on the production of dystrophin accounts for the variable phenotypic expression.[4] Females carriers are usually asymptomatic but some may show mild symptoms.[2] There are wide variances in how quickly DMD progresses, but without intervention death is at approximately 19 years of age.[2-4] With respiratory, cardiac, orthopedic and rehabilitative interventions and use of corticosteroids, children born today can have a life expectancy of up to 40 years.

Exondys 51 is an antisense oligonucleotide designed to bind to exon 51 of dystrophin pre-mRNA, resulting in exclusion of this exon during mRNA processing in patients with genetic mutations that are amenable to exon 51 skipping.[1] These patients represent approximately 13% of all patients with DMD.[5] This genetic manipulation intends to restore the reading frame of the resulting mRNA. The result would be production of a shortened, but partially functional dystrophin protein as seen in less severe forms of muscular dystrophy (e.g., Becker muscular dystrophy).

Guidelines

There are guidelines for the diagnosis and management of DMD available from the DMD Care Considerations Working Group (2018).[4] Genetic testing for a DMD mutation in a blood sample is always required. By fully characterizing the mutation, the predicted effect on the reading frame can be identified, which is the major determinant of phenotype and will determine eligibility for mutation-specific clinical trials. In patients with no mutation identified but with signs/symptoms of DMD, a muscle biopsy is clinically indicated. Glucocorticoids slow decline in muscle strength and function in DMD. Use of corticosteroids reduces the risk of scoliosis and stabilizes pulmonary function. Continued treatment after the patient loses ambulation provides a reduction in the risk of progressive scoliosis and stabilization of pulmonary function tests. Therefore, glucocorticoids should be considered for all patients with DMD. Exondys 51 is mentioned as an emerging product, approved by an accelerated pathway for those with a mutation in the dystrophin gene amenable to exon 51 skipping.

POLICY STATEMENT

The prescribing information for Exondys 51 states that a clinical benefit has not been established. Due to the lack of clinical efficacy data, **approval is not recommended** for Exondys 51.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

None.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Exondys 51 has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

3. **Duchenne Muscular Dystrophy (DMD).** Due to the lack of clinical efficacy data, approval is not recommended for Exondys 51. The prescribing information for Exondys 51 states that a clinical benefit has not been established.[1] Furthermore, a systemic review and meta-analysis does not show benefit of exon-skipping therapies for DMD.[10] FDA has required a randomized, controlled trial evaluation post-marketing to establish efficacy of Exondys 51. Results are expected in 2021.

   The efficacy of Exondys 51 was evaluated in open-label studies in patients with DMD that is amenable to exon 51 skipping.[1,6-9] One study (n = 12) assessed the effect of Exondys 51 on dystrophin and the potential clinical benefit; however, there was insufficient information on dystrophin levels prior to treatment so it is not possible to estimate a treatment effect on dystrophin levels. The adjusted mean change in the 6-minute walk test (6MWT) from baseline to Week 24 was -25.8 (±30.6) meters for placebo; -128.2 (±31.6) meters for Exondys 51, 30 mg/kg; and -0.3 (±31.2) meters for Exondys 51, 50 mg/kg. An extension of this study evaluated the same patients and compared disease progression with matched historical controls; at Month 36 the difference in 6MWT distance for Exondys 51 vs. historical control was 121 meters in favor of the Exondys 51 cohort (P = 0.028). Over 36 months, ambulation

was lost in 16.7% of patients (n = 2/12) treated with Exondys 51 vs. 46.2% of patients (n = 6/13) in the historical control cohort. The average dystrophin protein level after 180 weeks of treatment with Exondys 51 was 0.93% of the dystrophin level in healthy subjects. But because there was insufficient information on baseline dystrophin levels prior to treatment, it is not possible to estimate a treatment effect. Following 240 weeks of treatment, the percent predicted forced vital capacity (FVC%p) was a decrease of 2.3% per year with Exondys 51 compared with a decrease of 4.1% in a natural history cohort.[11] In patients treated with Exondys 51, the percent predicted maximum inspiratory pressure (MIP%p) decreased by 1% per year, and the percent predicted maximum expiratory pressure (MEP%p) decreased by 2.6% per year. However, MIP and MEP were not assessed in the natural history cohort. Another study included 12 new patients with DMD and reports only on the effect of Exondys 51 on dystrophin levels; further clinical efficacy data are not yet available for these 12 patients.[7-9] After 48 weeks of treatment with Exondys 51 the dystrophin level was 0.44% ± 0.43% of the dystrophin level in healthy subjects ($P < 0.05$). The median increase after 48 weeks was 0.1%.

4. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Muscular Dystrophy – Viltepso Prior Authorization Policy
- Viltepso™ (viltolarsen for intravenous injection)

REVIEW DATE: 08/19/2020

OVERVIEW

Viltepso, an antisense oligonucleotide, is indicated for the treatment of Duchenne muscular dystrophy (DMD) in patients who have a confirmed mutation of the DMD gene that is amenable to exon 53 skipping.[1] This indication was granted accelerated approval based on an increase in dystrophin in skeletal muscle observed in patients treated with Viltepso. The prescribing information notes that continued FDA-approval for this indication may be contingent upon verification of clinical benefit in a confirmatory trial.

Viltepso is an antisense oligonucleotide designed to bind to exon 53 of dystrophin pre-mRNA, resulting in exclusion of this exon during mRNA processing in patients with genetic mutations that are amenable to exon 53 skipping.[1] These patients represent up to 10% of all patients with DMD.[2] This genetic manipulation intends to restore the reading frame of the resulting mRNA. The result would be production of a shortened, but partially functional dystrophin protein as seen in less severe forms of muscular dystrophy (e.g., Becker muscular dystrophy). Of note, the reading frame of certain deletions (e.g., exon 52 deletions) can be restored by skipping either exon 51 or exon 53.[3] Approximately 8% of mutations are amenable to skipping exon 53 with Viltepso but are not amenable to skipping of exon 51.

Guidelines

Viltepso and other exon 53 skipping therapies are not addressed in guidelines for DMD. There are guidelines for the diagnosis and management of DMD available from the DMD Care Considerations Working Group (2018).[4] Genetic testing for a DMD mutation in a blood sample is always required. By fully characterizing the mutation, the predicted effect on the reading frame can be identified, which is the major determinant of phenotype and will determine eligibility for mutation-specific clinical trials. In patients with no mutation identified but with signs/symptoms of DMD, a muscle biopsy is clinically indicated. Glucocorticoids slow decline in muscle strength and function in DMD. Use of corticosteroids reduces the risk of scoliosis and stabilizes pulmonary function. Continued treatment after the patient loses ambulation provides a reduction in the risk of progressive scoliosis and stabilization of pulmonary function

tests. Therefore, glucocorticoids should be considered for all patients with DMD. Exondys 51 (eteplirsen intravenous infusion) is mentioned as an emerging product, approved by an accelerated pathway for those with a mutation in the dystrophin gene amenable to exon 51 skipping.

POLICY STATEMENT

The prescribing information for Viltepso states that approval is based on dystrophin production in a limited number of patients (n = 8 treated with the approved dose) with DMD, but approval may be contingent upon a confirmatory trial. Due to inadequate clinical efficacy data, **approval is not recommended** for Viltepso.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

None.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Viltepso is not recommended in the following situations:

5. **Duchenne Muscular Dystrophy (DMD).** Due to inadequate clinical efficacy data, approval is not recommended for Viltepso. A systemic review and meta-analysis of other exon skipping therapies (i.e., Exondys 51, drisapersen) does not show benefit of these therapies for DMD.[5] The prescribing information notes that continued approval for this indication may be contingent upon verification of clinical benefit in a confirmatory trial.[1] FDA has required a post-marketing trial to verify clinical efficacy of Viltepso. Thus, patients are being recruited for the Phase III RACER53 study, to further evaluate safety and efficacy of Viltepso in 74 ambulatory boys with DMD.

   Viltepso is under evaluation in one ongoing Phase II pivotal study in patients with DMD amenable to exon 53 skipping.[6] The primary endpoint is the effect of Viltepso on dystrophin as a surrogate outcome marker. Functional outcomes were among the secondary endpoints and were compared with a natural history cohort controlled for age, functional status, geographic location, and glucocorticoid treatment status. In this pivotal study (n = 16), the proportion of normal dystrophin protein level was higher at Week 25 (0.6% of normal at baseline vs. 5.9% of normal at Week 24 biopsy). The change from baseline in some functional outcomes were significantly improved with Viltepso vs. the natural history cohort (time to run walk 10 meters [0.23 meters/second vs. -0.04 meters/second], time to stand from supine [-0.19 seconds vs. 0.66 seconds], and distance on the 6-minute walk test [28.9 meters vs. -65.3 meters]). However, velocity in the time to stand from supine test, time to climb 4 stairs test, North Star Ambulatory Assessment test, and measures of muscle strength by isometric testing were not significantly different from the control group.

6. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Muscular Dystrophy – Vyondys 53 Prior Authorization Policy
- Vyondys 53™ (golodirsen intravenous infusion – Sarepta)

REVIEW DATE: 12/16/2020

OVERVIEW

Vyondys 53 is indicated for the treatment of Duchenne muscular dystrophy (DMD) in patients who have a confirmed mutation of the DMD gene that is amenable to exon 53 skipping.[1] Vyondys 53 was approved for this indication under accelerated approval based on an increase in dystrophin observed in the skeletal muscle of patients who received the drug. The prescribing information notes that continued FDA-approval for this indication may be contingent upon verification of clinical benefit in confirmatory trials.

Disease Overview

DMD is an X-linked recessive disease affecting 1 in 3,600 to 6,000 newborn male infants.[2] The disease is attributed to large frame-shift deletions in the DMD gene (chromosome Xp21) which lead to loss of a structural protein of muscle cells (dystrophin).[3] Over 4,700 mutations on the DMD gene have been identified which lead to a deficiency in production of dystrophin.[2] Therefore, the type of mutation and its effect on the production of dystrophin accounts for the variable phenotypic expression.[4] Females carriers are usually asymptomatic but some may show mild symptoms.[2] There are wide variances in how quickly DMD progresses, but without intervention death is at approximately 19 years of age.[2-4] With respiratory, cardiac, orthopedic and rehabilitative interventions, and use of corticosteroids, children born today can have a life expectancy of up to 40 years.

Vyondys 53 is an antisense oligonucleotide designed to bind to exon 53 of dystrophin pre-mRNA, resulting in exclusion of this exon during mRNA processing in patients with genetic mutations that are amenable to exon 53 skipping.[1] These patients represent up to 10% of all patients with DMD.[5] This genetic manipulation intends to restore the reading frame of the resulting mRNA. The result would be production of a shortened, but partially functional dystrophin protein as seen in less severe forms of muscular dystrophy (e.g., Becker muscular dystrophy). Of note, the reading frame of certain deletions (e.g., exon 52 deletions) can be restored by skipping either exon 51 or exon 53.[6] Approximately 8% of mutations are amenable to skipping exon 53 with Vyondys 53 but are not amenable to skipping of exon 51.

Guidelines

There are guidelines for the diagnosis and management of DMD available from the DMD Care Considerations Working Group (2018).[4] Genetic testing for a DMD mutation in a blood sample is always required. By fully characterizing the mutation, the predicted effect on the reading frame can be identified,

which is the major determinant of phenotype and will determine eligibility for mutation-specific clinical trials. In patients with no mutation identified but with signs/symptoms of DMD, a muscle biopsy is clinically indicated. Glucocorticoids slow decline in muscle strength and function in DMD. Use of corticosteroids reduces the risk of scoliosis and stabilizes pulmonary function. Continued treatment after the patient loses ambulation provides a reduction in the risk of progressive scoliosis and stabilization of pulmonary function tests. Therefore, glucocorticoids should be considered for all patients with DMD. Exondys 51 (eteplirsen intravenous infusion) is mentioned as an emerging product, approved by an accelerated pathway for those with a mutation in the dystrophin gene amenable to exon 51 skipping. However, these guidelines do not specifically address exon 53 skipping or mention Vyondys 53 in the guidelines.

POLICY STATEMENT

The prescribing information for Vyondys 53 states that approval is based on dystrophin production in a limited number of patients (n = 25) with DMD, but approval may be contingent upon a confirmatory trial. Due to inadequate clinical efficacy data, **approval is not recommended** for Vyondys 53.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

None.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Vyondys 53 has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

7. **Duchenne Muscular Dystrophy (DMD).** Due to inadequate clinical efficacy data, approval is not recommended for Vyondys 53. A systemic review and meta-analysis of other exon skipping therapies (i.e., Exondys 51, drisapersen) does not show benefit of these therapies for DMD.[9] The prescribing information notes that continued approval for this indication may be contingent upon verification of clinical benefit in confirmatory trials.[1] FDA has required a post-marketing trial to verify clinical efficacy of Vyondys 53.

   The efficacy of Vyondys 53 was evaluated in one unpublished, open-label study in patients with DMD that is amenable to exon 53 skipping.[1,7,8] Dystrophin protein at Week 48 and 6-minute walk test (6MWT) results at Week 144 were the primary clinical endpoints. Among the patients who received Vyondys 53 in Part 2 of the study (n = 25) the normal dystrophin protein increased from baseline (0.10%) through Week 48 (1.02%; $P < 0.001$). In individual patient biopsies at Week 48, the dystrophin level ranged from 0.09% to 4.3%, with a mean per-patient 16.0-fold increase in dystrophin. At Week 48, the mean level of exon 53 skipping increased to 18.6% (SD, 13.2%; range, 2.6% to 150.3%) vs. 2.6% (SD, 4.1%; range, 0.0 to 14.7%) at baseline. The percent dystrophin-positive fibers scoring increased from 1.4% (SD, 2.4%; range, 0.06% to 9.8%) at baseline to 10.5% (SD, 10.1%; range, 0.9% to 32.6%) [$P < 0.001$) at Week 48. There was a mean per-patient 13.5-fold increase in percent dystrophin-positive fibers from baseline through Week 48. 6MWT results have not yet been reported.

8. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

DATE REVIEWED: 04/22/2020

OVERVIEW

Natpara, a replica of the endogenous parathyroid hormone, is indicated as an adjunct to calcium and vitamin D to control hypocalcemia in patients with hypoparathyroidism.[1] There are several limitations to Natpara use: because of the potential risk of osteosarcoma, Natpara is recommended only for patients who cannot be well-controlled on calcium supplements and active forms of vitamin D alone; it was not studied in patients with hypoparathyroidism caused by calcium-sensing receptor mutations; and it was not studied in patients with acute post-surgical hypoparathyroidism. The dose of Natpara should be individualized based on total serum calcium and 24-hour urinary calcium excretion. The initial dose of Natpara is 50 mcg once daily (QD) given as a subcutaneous injection; the dose may be decreased to as low as 25 mcg/day or increased to the maximum daily dose of 100 mcg.

Before initiating and during therapy with Natpara, 25-hydroxyvitamin D stores should be sufficient and serum calcium concentration should be > 7.5 mg/dL before initiating Natpara therapy.[1] In the pivotal study, a responder to Natpara therapy was defined as an individual who had: ≥ 50% reduction from baseline in the dose of active vitamin D, ≥ 50% reduction from baseline in the dose of oral calcium supplementation, and an albumin-corrected total serum calcium concentration between 7.5 mg/dL and 10.6 mg/dL.[1]

Natpara has a Boxed Warning about the risk of osteosarcoma.[1] Parathyroid hormone has been shown to increase the incidence of osteosarcoma in male and female rats; the risk was dependent on dose and treatment duration. A risk to humans could not be excluded. Natpara is available only through a restricted

Risk Evaluation and Mitigation Strategy (REMS) program; only certified healthcare providers can prescribe and only certified pharmacies can dispense Natpara.

Disease Overview

Hypoparathyroidism is a rare endocrine disorder that affects approximately 60,000 individuals in the US.[2,3] This condition is characterized by low calcium and high phosphate levels and low or inappropriately normal parathyroid hormone level.[4] The parathyroid hormone plays a critical role in maintaining calcium homeostasis and bone metabolism (osteoclasts and osteoblasts).[3,5-7] In some cases, the parathyroid glands produce insufficient parathyroid hormone and in other cases, the parathyroid glands have been removed.[2,5,8] The goals of treatment of hypoparathyroidism are to maintain serum calcium and the calcium-phosphate product within the normal range and avoid hypercalciuria.[4] The standard of care includes oral calcium and (active or parental) vitamin D to manage the hypocalcemia that results from the condition.[6-8] While these products maintain serum calcium concentration within normal limits and minimize the symptoms of hypocalcemia, they do not address the physiologic aspects of hypoparathyroidism. Additionally, there are long-term complications associated with calcium and vitamin D therapy, including renal function deterioration, renal stones, and soft tissue calcification.[3,6,9-11]

Guidelines/Recommendations

A consensus statement released in 2019 notes the use of calcium supplements and active vitamin D as the conventional therapy for hypoparathyroidism.[12] Although these therapies address the hypocalcemic aspect of hypoparathyroidism, they fail to provide a physiologic replacement of parathyroid hormone. Natpara therapy should be considered in patients experiencing inadequate control of serum calcium; patients who require > 2.5 g of calcium or > 1.5 µg of calcitriol per day to control serum calcium or symptoms; patients with hypercalciuria, renal stones, nephrocalcinosis, stone risk or reduced creatinine clearance or estimated glomerular filtration rate (eGFR) (< 60 mL/min); or patients with hyperphosphatemia and/or calcium-phosphate product > 55 mg^2/dL^2 or 4.4 $mmol^2/L^2$. Natpara therapy may also be beneficial in patients who have malabsorption or who are intolerant of large doses of oral calcium supplements or who are noncompliant with taking several tablets a day.

The First International Conference on the Management of Hypoparathyroidism provided some guidelines on the management of this condition (2016).[9] Conventional management of chronic hypoparathyroidism includes use of calcium supplements, active vitamin D or analogs, magnesium, thiazide diuretics (when necessary to help manage hypercalciuria and low salt diet), and phosphate binders and low phosphate diet (if necessary to control hyperphosphatemia). Natpara therapy may be considered in patients with well-established chronic hypoparathyroidism of any etiology except for autosomal dominant hypocalcemia; variable and inconsistent control of the serum calcium with frequent episodes of hypo- and hypercalcemia; nephrolithiasis, nephrocalcinosis, or reduced creatinine clearance or eGFR to < 60 mL/min; hypercalciuria and/or other biochemical indices or renal stone risk; persistently elevated serum phosphate and/or calcium-phosphate product (> 55 mg^2/dL^2 or 4.4 $mmol^2/L^2$); excessive amounts of oral medications required to control symptoms such as > 2.5 g of calcium or > 1.5 µg of active vitamin D, or both; and a gastrointestinal tract disorder that might lead to variable calcium and vitamin D absorption.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Natpara. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Natpara as well as the monitoring required for adverse events and long-term efficacy, approval requires Natpara to be prescribed by, or in consultation with, a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Natpara is recommended in those who meet the following criteria:

FDA-Approved Indications

31. Chronic Hypoparathyroidism. Approve for 3 years if the patient meets ONE of the following conditions (A or B):

A) Initial Therapy. Approve if the patient meets ALL of the following criteria (i, ii, iii, and iv)

- **i.** The patient cannot be well-controlled on calcium supplements and active forms of vitamin D alone; AND
- **ii.** The patient's 25-hydroxyvitamin D stores are sufficient (before initiating Natpara therapy) per the prescriber; AND
- **iii.** The patient's serum calcium concentration is > 7.5 mg/dL before initiating Natpara therapy; AND
- **iv.** The medication is prescribed by, or in consultation with, an endocrinologist.

B) Patient is Currently Receiving Natpara. Approve if the patient meets ALL of the following criteria (i, ii, and iii):

- **i.** The patient cannot be well-controlled on calcium supplements and active forms of vitamin D alone; AND
- **ii.** The patient's 25-hydroxyvitamin D stores are sufficient (during Natpara therapy) per the prescriber ; AND
- **iii.** The patient is responding to Natpara therapy (e.g., reduction in the patient's oral calcium dose; reduction in the patient's active vitamin D dose; maintenance of a stable albumin-corrected total serum calcium concentration), as determined by the prescriber.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Natpara has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

181. Acute Post-Surgical Hypoparathyroidism. Natpara was only studied in patients with chronic hypoparathyroidism.

182. Hypoparathyroidism Caused by Calcium-Sensing Receptor Mutations. Natpara was not studied in this patient population.

183. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Neurology – Brineura® (cerliponase alfa injection for intraventricular use – BioMarin)

DATE REVIEWED: 04/08/2020

OVERVIEW

Brineura is indicated to slow the loss of ambulation in symptomatic pediatric patients ≥ 3 years of age with late infantile neuronal ceroid lipofuscinosis type 2 (CLN2), also known as tripeptidyl peptidase 1 (TPP1) deficiency.[1] Brineura is recombinant human TPP1 produced using recombinant DNA technology. The recommended dose of Brineura is 300 mg administered once every other week (QOW) via intracerebroventricular (ICV) infusion. Following Brineura administration, the patient must also receive an infusion of intraventricular electrolytes. The drug is administered into the cerebral spinal fluid via a surgically implanted reservoir and catheter. It should only be administered by or under the direction of a physician who is knowledgeable in ICV administration.

Disease Overview

CLN2 disease is an extremely rare neurodegenerative disorder that is part of a group neuronal ceroid lipofuscinoses (NCLs) sometimes referred to as Batten disease.[2] NCL diseases are a heterogenous group of incurable neurodegenerative lysosomal storage diseases. They manifest as early impairment of vision, loss of cognitive and motor functions, seizures, and premature death. To date, 13 genetic mutations have been discovered to cause the multiple variations of the disease (e.g., CLN1, CLN2, CLN3 etc.). Classic late infantile NCL disease is caused by a mutation in the CLN2 gene, which encodes for lysosomal TPP1. Without TPP1, lysosomal storage materials accumulate, contributing to the progressive and persistent neurogeneration.[2] In CLN2 disease, symptom onset is typically between 2 and 4 years of age, and lifespan is to around 6 to 14 years. Other NCLs result in deficiencies in enzymes other than TPP1. As Brineura is human recombinant TPP1, its efficacy is specific to CLN2 disease.

Clinical Efficacy

The efficacy of Brineura in CLN2 disease was assessed in patients 3 to 8 years of age and compared with a natural history cohort.[1] All patients had confirmed TPP1 deficiency. The Motor domain of the CLN2 Clinical Rating Scale assessed declining function, with scores ranging from 3 (indicating grossly normal) to 0 (profoundly impaired). Decline was defined as having an unreversed 2-category decline or an unreversed score of 0. At Week 96, the matched analysis demonstrated fewer patients declined in the Motor domain with Brineura-treated patients (n = 1/17) compared with untreated patients in the natural history cohort (n = 11/17).

Guidelines

Recently published expert recommendations state that patients with a suspected NCL disorder require NCL-specific diagnostic testing.[3] Patients require assessment by a metabolic specialist/geneticist, an NCL specialist, or a pediatric neurologist with experience in diagnosis NCL disorders. While there is no standardized method for identifying patients CLN2 disease, diagnosis is generally based on biochemical measurement of enzyme activity and genetic testing.[3-4]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Brineura. All approvals are provided for the duration noted below. Because of the of the specialized skills required for evaluation and diagnosis of patients treated with Brineura as well as the monitoring required for adverse events and long-term efficacy, approval requires Brineura to be prescribed by or in consultation with a physician who specializes in the condition being treated.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Brineura is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **Late Infantile Neuronal Ceroid Lipofuscinosis Type 2 (CLN2).** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
   - **B)** The patient is ≥ 3 years of age; AND
   - **C)** The patient has a diagnosis of CLN2 disease as confirmed by ONE of the following (i or ii):
     - i. The patient has had a genetic test which confirms the diagnosis of CLN2 disease; OR
     - ii. The patient has had a test which confirms reduced activity of tripeptidyl peptidase 1 (TPP1); AND
   - **D)** Brineura is prescribed by or in consultation with a metabolic specialist, geneticist, pediatric neurologist, or a physician specializing in the treatment of neuronal ceroid lipofuscinoses (NCLs).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Brineura has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval).

1. **Neuronal Ceroid Lipofuscinoses (NCLs) other than late infantile ceroid lipofuscinosis type 2 (CLN2) [e.g., CLN1, CLN3, CLN10, CLN13, and others].** Brineura has not been studied for NCLs involving mutations in genes other than CLN2.[1]

2. Coverage is not recommended for circumstances *not* listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Neurology – Radicava® (edaravone intravenous injection – Mitsubishi Tanabe)

DATE REVIEWED: 04/08/2020

OVERVIEW

Radicava is indicated for the treatment of amyotrophic lateral sclerosis (ALS).[1] It is an anti-oxidative, free radical scavenger which eliminates lipid peroxide and hydroxyl radicals; however, it is unknown exactly how Radicava exerts its therapeutic effect in ALS.[1-2]

Disease Overview

ALS, also known as Lou Gehrig's disease, is a rapidly progressive, paralyzing disease characterized by degeneration of upper motor neurons (UMNs) and lower motor neurons (LMNs) in the brain, brainstem, and the spinal cord resulting in muscle weakness.[2-4] Patients with ALS typically present with painless, progressive muscle atrophy and weakness, which eventually leads to paralysis and death, primarily due to respiratory failure. The accurate diagnosis of ALS is challenging and delays in diagnosis are common (average diagnostic delay of 11 to 12 months or more). The El Escorial criteria (used in the clinical studies of Radicava) were developed to standardize the diagnosis of ALS (revised by Airlie House in 1999).[3-5] The average survival following diagnosis of ALS is approximately 3 years; 50% of patients will die within 30 months of symptom onset. However, median survival can range from months to several years and the rate of progression of the disease varies considerably between patients.

Clinical Efficacy

The efficacy of Radicava was established in one Phase III, randomized, double-blind, placebo-controlled, Japanese trial (published) [n = 137].[6] This study enrolled patients who had a "definite" or "probable" diagnosis of ALS (based on El Escorial and revised Airlie House criteria; criteria provided in the Appendix) and were living independently at the time of screening. Patients also were required to have functionally retained most activities of daily living (defined as a score of two points or better on each individual item of the ALS Functional Rating Scale – Revised [ALSFRS-R]), have normal respiratory function (i.e., a percent-predicted forced vital capacity [FVC] value ≥ 80%), and have a disease duration of ≤ 2 years. Overall, 91% of patients were also receiving riluzole. The decline in the ALSFRS-R scores from baseline to Week 24 was statistically significantly less with Radicava compared with placebo.[1,6] In a separate study involving patients with longer disease duration, reduced respiratory function, and less certain ALS diagnosis, Radicava did not demonstrate benefit vs. placebo.[7]

Guidelines

The American Academy of Neurology (AAN) practice parameter on the care of patients with ALS (last updated 2009; reaffirmed 2014) does not yet address Radicava.[8-9] The practice parameter states that riluzole is safe and effective for slowing disease progression to a modest degree and should be offered to patients with ALS. However, riluzole may result in fatigue in some patients and if the risk of fatigue outweighs modest survival benefits, discontinuation of riluzole may be considered. Referral to a specialized multidisciplinary clinic should be considered for patients with ALS to optimize health care delivery, prolong survival, and enhance quality of life. Additionally, noninvasive mechanical ventilation may lengthen survival and can be considered to improve quality of life and slow FVC decline. The European Federation of Neurological Societies (EFNS) guidelines on the clinical management of ALS (2012) also recommend patients be offered treatment with riluzole as early as possible after diagnosis.[10] However, patients with progressive muscular atrophy, primary lateral sclerosis, or hereditary spastic paraplegia should not be treated with riluzole.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Radicava. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the of the specialized skills required for evaluation and diagnosis of patients treated with Radicava as well as the monitoring required for adverse events and long-term efficacy, approval requires Radicava to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Radicava is recommended in those who meet the following criteria:

FDA-Approved Indications

2. Amyotrophic Lateral Sclerosis (ALS). Approve for 6 months if the patient meets ONE of the following (A or B):

E) Initial Therapy. Approve if the patient meets ALL of the following (i, ii, iii, iv, v, and vi):

i. According to the prescriber, the patient has a "definite" or "probable" diagnosis of amyotrophic lateral sclerosis (ALS) based on the application of the El Escorial or the revised Airlie House diagnostic criteria; AND

ii. Patient has a score of two points or more on each item of the ALS Functional Rating Scale – Revised (ALSFRS-R) [i.e., has retained most or all activities of daily living]; AND

iii. Patient has a percent-predicted forced vital capacity (FVC) ≥ 80% (i.e., has normal respiratory function); AND

iv. Patient has been diagnosed with ALS for ≤ 2 years; AND

v. Patient has received or is currently receiving riluzole tablets (Rilutek®, generics), Tiglutik® (riluzole oral suspension), or Exservan™ (riluzole oral film); AND

vi. Radicava is prescribed by or in consultation with a neurologist, a neuromuscular disease specialist, or a physician specializing in the treatment of ALS.

F) Patients Currently Receiving Radicava. Approve if the patient meets ALL of the following (i, ii, and iii):

i. Radicava is prescribed by or in consultation with a neurologist, a neuromuscular disease specialist, or a physician specializing in the treatment of ALS; AND

ii. According to the prescriber, the patient continues to benefit from therapy; AND

iii. The patient is not requiring invasive ventilation.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Radicava has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

184. **Aneurysmal Subarachnoid Hemorrhage.** Radicava is not indicated for the treatment of aneurysmal subarachnoid hemorrhage (SAH).[1] One randomized controlled study (published) [n = 91] evaluated the efficacy of Radicava (formulation/dose not specified) in patients with aneurysmal SAH.[11] At 3 months post-SAH, the incidence of delayed ischemic neurologic deficits (DINDs) in patients treated with Radicava was 10% vs. 21% in patients in a control group; the between-group treatment difference was not significant (P = 0.118). In patients who had DINDs, 66% of patients in the control group had a cerebral infarction caused by vasospasm compared with 0% of Radicava-treated patients (P = 0.028). Additional, well-designed clinical studies are needed to establish if Radicava has a role in therapy post-SAH.

185. **Myocardial Infarction.** Radicava is not indicated for the treatment of myocardial; there are no US or North American studies of Radicava for this indication.[1] One randomized, placebo-controlled, open-label, Japanese study (published) [n = 101] evaluated the effect of Radicava on the long term prognosis in patients experiencing an acute myocardial infarction.[12] Patients were randomized to receive either Radicava (foreign formulation) 30 mg intravenous (IV) or placebo immediately prior to reperfusion. In all patients, successful reperfusion was obtained within 6 hours post-symptom onset. Radicava significantly attenuated the infarct size and incidence of reperfusion arrhythmia compared with placebo (P = 0.035 and P = 0.031, respectively). Further research is warranted to determine if Radicava has a place in therapy in the management of AMI.

186. **Radiation-Induced Brain Injury.** Radicava is not indicated for the treatment of radiation-induced brain injury; there are no US or North American studies of Radicava for this indication.[1] One randomized, open-label, 3-month, Chinese study (published) [n = 137] evaluated the protective effect of Radicava on radiation-induced brain necrosis in patients with nasopharyngeal carcinoma.[13] Patients were randomized to receive Radicava (foreign formulation) 30 mg intravenous (IV) twice daily for 2 weeks (not FDA-approved dosing) + IV corticosteroid therapy or placebo + IV corticosteroid therapy. Following 3 months of therapy, radiologic improvement (reduction in edema of ≥ 25%) was observed in 55.6% of patients who received Radicava (n = 40/72) compared with 35.4% of patients treated with placebo (n = 23/65) [P = 0.025]. The area of T1-weighted contrast enhancement was reduced from baseline with both Radicava and placebo (-1.67 cm and -1.20 cm, respectively); however, the difference between the treatment arms was not statistically significant. Improvement in neurologic signs and symptoms evaluated by the Late Effects of Normal Tissues – Subjective, Objective, Management, Analytic (LENT/SOMA) scale was also observed in 61.1% of Radicava-treated patients vs. 38.5% of placebo-treated patients (P = 0.006). Further research is warranted to determine if Radicava has a place in therapy in the treatment of radiation-induced brain injury.

187. **Retinal Vein Occlusion.** Radicava is not indicated for the prevention of macular edema and improvement of visual acuity after arteriovenous sheathotomy in patients with branch retinal vein occlusion; there are no US or North American studies of Radicava for this indication.[1] A single, small, prospective, Japanese study [published] (n = 47) evaluated the efficacy of Radicava (foreign formulation) in patients with branch retinal vein occlusion undergoing vitrectomy.[14] Patients either received Radicava 30 mg IV at the time of the procedure or no additional therapy. Visual acuity was measured before and 12 months after the procedure. At 12 months following the operation, the logarithm of the minimum angle of resolution (logMAR) units improved from 0.22 to 0.56 logMAR units in patients who had received Radicava and from 0.20 to 0.27 logMAR units in patients who did not receive active treatment (P = 0.016). Additional data are needed to support the use of Radicava for this indication.

188. **Sensorineural Hearing Loss.** Radicava is not indicated for the treatment of sensorineural hearing loss; there are no US-based studies of Radicava for this indication.[1] One small, Japanese study evaluated 14 patients with idiopathic sudden sensorineural hearing loss were treated with Radicava (foreign formulation; dose not specified).[15] These patients were compared with a control group of 14 patients with similar prognostic factors who had been treated with hyperbaric oxygenation therapy. No significant differences were observed between the Radicava group and the control group.

189. Stroke. Radicava is not FDA-approved for the treatment of patients who have experienced stroke.[1] Radicava has been approved in other countries for this indication and there are some foreign data supporting its use.[16] There are no US-based studies of Radicava for stroke at this time. A systematic review assessed available efficacy data from three clinical trials (n = 496) of Radicava for acute ischemic stroke.[17] These trials compared Radicava 30 mg twice daily IV infusion for 14 days + another treatment vs. the other treatment alone within 72 hours of stroke symptom onset. One trial did not find significantly reduced mortality with Radicava vs. the control group; the other two studies did not report this endpoint. Overall, there was a significantly higher proportion of patients who had neurologic improvement in the Radicava group vs. control.

190. Coverage is not recommended for circumstances *not* listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

New Policy	--	04/10/2019
Annual revision	**Amyotrophic Lateral Sclerosis:** For the criteria applying to initial therapy diagnosis of amyotrophic lateral sclerosis and for patients currently receiving Radicava who have responded, wording was updated to more generally allow this determination by the prescriber (criteria previously specified this was according to the prescribing physician). Exservan (riluzole oral film) was added as an option for criterion requiring the patient has received or is currently receiving	04/08/2020

	riluzole tablets (Rilutek, generics) or Tiglutik (riluzole oral suspension).	

APPENDIX*

El Escorial criteria for the diagnosis of ALS were initially developed by the World Federation of Neurology (WFN) in 1990. In 1998, the WFN held a workshop for the Research Committee on Motor Neuron Diseases at the Airlie Conference Center in Virginia, which resulted in a revision of the guidelines in 2000. The pivotal study of Radicava references the El Escorial criteria updated by the WFN in 2000 (Airlie House). According to these guidelines, the diagnosis of ALS requires:

The presence of:

- Evidence of lower motor neuron (LMN) degeneration by clinical, electrophysiological or neuropathologic examination; AND
- Evidence of upper motor neuron (UMN) degeneration by clinical examination; AND
- Progressive spread of symptoms or signs within a region or to other regions, as determined by history or examination.

Together with the absence of:

1. Electrophysiological or pathological evidence of other disease processes that might explain the signs of LMN and/or UMN degeneration; AND
2. Neuroimaging evidence of other disease processes that might explain the observed clinical and electrophysiological signs.

Without pathological confirmation, the diagnosis of ALS may be categorized into levels of certainty using clinical assessment. The following terms are used to describe the categories of diagnostic certainty.

- **Clinically Definite ALS:** defined on clinical evidence alone by the presence of UMN, as well as LMN signs, in the bulbar region and at least two spinal regions or the presence of UMN and LMN signs in three spinal regions.
- **Clinically Probable ALS:** defined on clinical evidence alone by UMN and LMN signs in at least two regions with some UMN signs necessarily rostral to (above) the LMN signs.
- **Clinically Probable ALS – Laboratory-supported:** defined when clinical signs of UMN and LMN dysfunction are in only one region, or when UMN signs alone are present in one region, and LMN signs defined by EMG criteria are present in at least two regions, with proper application of neuroimaging and clinical laboratory protocols to exclude other causes.
- **Clinically Possible ALS:** defined when clinical signs of UMN and LMN dysfunction are found together in only one region or UMN signs are found alone in two or more regions; or LMN signs are found rostral to UMN signs and the diagnosis of Clinically Probable ALS – Laboratory supported cannot be proven by evidence on clinical grounds in conjunction with electrodiagnostic, neurophysiologic, neuroimaging or clinical laboratory studies. Other diagnoses must have been excluded to accept a diagnosis of Clinically Possible ALS.

*** This appendix is for reference; it is NOT intended that patients meet the above criteria for approval of Radicava.**

PRIOR AUTHORIZATION POLICY

POLICY: Neurology – Riluzole Products Prior Authorization Policy

- Exservan™ (riluzole oral film – Covis Pharmaceuticals/Aquestive)
- Rilutek® (riluzole tablets – Covis Pharma; generics)
- Tiglutik® (riluzole oral suspension – ITF Pharma)

REVIEW DATE: 07/22/2020

OVERVIEW

All of the available riluzole products are indicated for the treatment of amyotrophic lateral sclerosis (ALS).[1,2,9] Riluzole is a member of the benzothiazole class; the mechanism by which it exerts its effects in patients with ALS is unknown. Riluzole tablets were initially approved by the FDA in 1995.[1] In the years since, two additional riluzole formulations, Exservan oral film and Tiglutik oral suspension, have been approved.[2,9]

Disease Overview

ALS, also known as Lou Gehrig's disease, is a rapidly progressive, paralyzing disease characterized by degeneration of upper motor neurons (UMNs) and lower motor neurons (LMNs) in the brain, brainstem, and the spinal cord resulting in muscle weakness.[3-5] Patients with ALS typically present with painless, progressive muscle atrophy and weakness, which eventually leads to paralysis and death, primarily due to respiratory failure. The accurate diagnosis of ALS is challenging and delays in diagnosis are common (average diagnostic delay of 11 to 12 months or more). The average survival following diagnosis of ALS is approximately 3 years; 50% of patients will die within 30 months of symptom onset. However, median survival can range from months to several years and the rate of progression of the disease varies considerably between patients.

Guidelines

The American Academy of Neurology (AAN) practice parameter on the care of patients with ALS (last updated 2009; reaffirmed 2020) states that riluzole should be offered to patients with ALS (Level A recommendation), as it is safe and effective for modestly slowing disease progression.[6,7] Based on available clinical trial data, the AAN estimates riluzole prolongs survival by 2 to 3 months. However, some large cohort studies that estimate survival to be prolonged for up to 21 months. Of note, a previous practice advisory from the AAN (1997) had recommended riluzole only in patients with definite or probable ALS of < 5 years duration, with a forced vital capacity (FVC) > 60% and without tracheostomy. However, the 2012 parameter does not include any stipulations on which patients should use riluzole. Riluzole may result in fatigue in some patients and if the risk of fatigue outweighs modest survival benefits, discontinuation of riluzole may be considered (Level C recommendation). The European Federation of Neurological Societies (EFNS) guidelines on the clinical management of ALS (2012) also recommend patients be offered treatment with riluzole as early as possible after diagnosis.[8] While it is noted that riluzole may be less effective in patients with late-stage disease, it is unclear when or if treatment should be discontinued. Patients with progressive muscular atrophy, primary lateral sclerosis, or hereditary spastic paraplegia are not recommended to use riluzole as they were not included in the clinical studies. However, some of these patients fall within the ALS syndrome and therefore may benefit from treatment with riluzole.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of riluzole. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with riluzole as well as the monitoring required for adverse events and long-term efficacy, approval requires riluzole to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of riluzole is recommended in those who meet the following criteria:

FDA-Approved Indications

131. Amyotrophic Lateral Sclerosis (ALS). Approve for 1 year if the agent is prescribed by or in consultation with a neurologist, a neuromuscular disease specialist, or a physician specializing in the treatment of ALS.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of riluzole is not recommended in the following situations:

145. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Northera Prior Authorization Policy

- Northera® (droxidopa capsules – Chelsea Therapeutics)

REVIEW DATE: 12/02/2020

OVERVIEW

Northera, a norepinephrine-type product, is indicated for the treatment of orthostatic dizziness, lightheadedness or the "feeling that one is about to black out" in adult patients with **symptomatic neurogenic orthostatic hypotension (NOH)** caused by primary autonomic failure (Parkinson's disease [PD], multiple system atrophy [MSA], and pure autonomic failure [PAF]), dopamine beta-hydroxylase deficiency, and non-diabetic autonomic neuropathy.[1] According to the prescribing information, the effectiveness beyond 2 weeks of treatment has not been established and should be evaluated periodically.

Disease Overview

Orthostatic hypotension (OH) is a sustained reduction in systolic blood pressure (SBP) of at least 20 mmHg or diastolic blood pressure (DBP) of 10 mmHg within 3 minutes of standing or head-up tilt to at least 60° on a tilt table.[2] OH may be symptomatic or asymptomatic, with only symptomatic OH requiring treatment.[3] NOH is a specific subset of this condition, in which OH is due to inadequate release of norepinephrine from sympathetic vasomotor neurons leading to vasoconstrictor failure.[2] NOH is a rare, chronic and often debilitating condition that is associated with PD (prevalence: 16% to 58%), MSA (prevalence: 60% to 75%), and PAF (prevalence: 100%) and with peripheral neuropathies and ganglionopathies that affect the autonomic nerves.[2,3] Symptoms of NOH include dizziness, lightheadedness, blurred vision, fatigue, and fainting upon standing up.[2] These symptoms can adversely affect patients' quality of life and ability to conduct activities of daily living that involve standing or walking. Many patients with NOH have supine hypertension (i.e., high BP when lying down) even before treatment of hypotension is initiated. Medications may increase the frequency of symptomatic NOH, such as alpha-adrenergic antagonists (e.g., benign prostatic hypertrophy medications), antidepressants (particularly, tricyclic antidepressants), antipsychotics, and dopaminergic agonists (e.g., antiparkinsonian medications).[3]

Treatment of symptomatic NOH is aimed at increasing standing SBP into the range of compensatory cerebrovascular autoregulation (approximately 50 to 150 mmHg).[4,5] Unapproved pharmacologic agents include fludrocortisone (volume expansion and pressor effect), desmopressin (nasal spray or oral) [volume expansion], dihydroergotamine (oral) [pressor effect], indomethacin (oral or intravenous) [pressor effect], pyridostigmine, and erythropoietin (treatment of anemia of chronic autonomic failure can improve orthostatic intolerance).[6-8] Midodrine, an $alpha_1$-agonist, is the only other medication approved with a similar indication (treatment of symptomatic OH) to Northera.[9]

Clinical Efficacy

Northera was evaluated in one 12-month, open-label study which demonstrated the maintenance of improvements from baseline in patient-reported NOH symptom severity and impact on daily activities.[6] Small studies have been published for the use of Northera in hemodialysis patients to prevent orthostatic hypotension (OH)[10,11] and also in restoring neurologic deficit in chronic stoke patients.[12]

Safety
Northera has a Boxed Warning regarding supine hypertension. Northera may cause or exacerbate supine hypertension in patients with NOH. Supine BP should be measured prior to initiating Northera and after dose increases.

Guidelines
According to the American Academy of Neurology (AAN) practice parameter on treatment of nonmotor symptoms of PD (2010), there have been few placebo controlled trials of treatment for OH in PD, and the available data are insufficient to make a recommendation on the use of specific treatments for OH in PD.[13] Small studies have used domperidone, fludrocortisone, and indomethacin. While studies are lacking for mineralocorticoids, alpha-sympathomimetics, and pyridostigmine, they have pharmacologic actions that are consistent with improvement in OH. The only medications currently approved to treat OH are midodrine and Northera.

Consensus panel recommendations initiated by the American Autonomic Society and the National Parkinson Foundation for the screening, diagnosis, and treatment of NOH and associated supine hypertension were published in 2017.[14] Once a patient is diagnosed with NOH, the goals of treatment should be to reduce the burden of symptoms (especially falls), prolong standing time, and restore independence in activities of daily living. The recommendations propose a four-step treatment algorithm for NOH: assessing and adjusting pre-existing medications that may be causing or exacerbating NOH, utilizing non-pharmacologic approaches (e.g., blood volume repletion, increased salt intake, physical conditioning, compression garments, elevating the head of the bed), implementing single-agent pharmacologic treatment, and with great caution, combining pharmacologic treatments. After each step, a 2-week assessment period is recommended to establish whether sufficient symptomatic benefit has been achieved before moving onto the next step. Recommended treatments include midodrine, Northera, fludrocortisone, and pyridostigmine. The initial choice of NOH treatments should be individualized and should consider severity, comorbid disease (especially cardiac or renal failure), and treatment goals. Based on the experience of the consensus panel, the recommendation is to titrate to maximum tolerable dose of a single medication and then, if symptomatic benefit is not obtained, consider switching to a different medication or adding a second agent and titrate from its lowest starting dose.

POLICY STATEMENT
Prior Authorization is recommended for prescription benefit coverage of Northera. Because of the specialized skills required for evaluation and diagnosis of patients treated with Northera as well as the monitoring required for adverse events and long-term efficacy, approval requires Northera to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Northera is recommended in those who meet the following criteria:

FDA-Approved Indications

81. Neurogenic Orthostatic Hypotension (NOH). Approve for 1 year if the patient meets the following criteria (A, B, C, D, and E):
- **A)** Patient is ≥ 18 years of age; AND

B) Patient has been diagnosed with symptomatic NOH due to primary autonomic failure (Parkinson's disease [PD], multiple system atrophy [MSA], and pure autonomic failure [PAF]), dopamine beta-hydroxylase deficiency, or non-diabetic autonomic neuropathy; AND

C) The medication has been prescribed by or in consultation with a cardiologist or a neurologist; AND

D) Patient has tried two other medications; AND
Note: Examples of other medications include fludrocortisone, desmopressin, dihydroergotamine, indomethacin, pyridostigmine, erythropoietin, midodrine.

E) Patient has initiated non-pharmacological measures including but not limited to elevation of the head of the bed, orthostatic compression garments, and appropriate physical training.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Northera is not recommended in the following situations:

191. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Nuedexta Prior Authorization Policy

- Nuedexta® (dextromethorphan hydrobromide and quinidine sulfate capsules – Avanir)

REVIEW DATE: 08/19/2020

OVERVIEW

Nuedexta, a combination product containing dextromethorphan hydrobromide (DM) and quinidine sulfate, is indicated for the treatment of pseudobulbar affect.[1]

DM is a sigma-1 receptor agonist and an uncompetitive *N*-methyl-D-aspartate receptor antagonist.[1] Quinidine increases plasma levels of DM by competitively inhibiting cytochrome P450 2D6, which catalyzes a major biotransformation pathway for DM. The mechanism by which DM exerts therapeutic effects in patients with pseudobulbar affect is unknown. The recommended starting dose is one capsule daily (20 mg of DM and 10 mg of quinidine) by mouth for the initial 7 days of therapy. Thereafter, the daily dose should be two capsules/day (40 mg of DM and 20 mg of quinidine), given as one capsule every 12 hours (BID). The need for continued treatment should be reassessed periodically, as spontaneous improvement of pseudobulbar affect occurs in some patients.

Disease Overview

Pseudobulbar affect is a neurologic condition characterized by involuntary outbursts of laughing and/or crying incongruous or disproportionate to the patients' emotional state.[2,7] There are many terms that have been used to describe this condition, including pathological laughing and crying, affective lability, emotional incontinence, emotionalism, and involuntary emotional expression disorder.[7] Pseudobulbar affect, hypothesized to arise from disconnection of brainstem structures from cortical inhibition, is associated with underlying central nervous system disorders including stroke, traumatic brain injury, Alzheimer's disease, amyotrophic lateral sclerosis (ALS), and multiple sclerosis (MS).[2] It is estimated that pseudobulbar affect impacts more than 1 million people in the US diagnosed with neurological disease or brain injury.[7] Prevalence studies have reported that pseudobulbar affect affects 11% of patients one year after a stroke, 11% of patients during the first year after traumatic brain injury, 18% of patients with Alzheimer's disease, 10% of patients with MS, and 49% of patients with ALS.[2] In addition to the effects of the underlying disorder, pseudobulbar affect pseudobulbar affect can have a severe impact on well-being and social functioning and can be highly disabling, owing in part to the stigma attached to loss of emotional control. Episodes of laughing can also lead to respiratory compromise, especially in patients with a neurological disorder that already compromises respiratory function, such as ALS.[7] For these reasons, treatment should be strongly considered in any patient with pseudobulbar affect. The goal of therapy is to reduce the frequency of attacks.

Clinical Efficacy

The efficacy of Nuedexta was established in one trial in patients with pseudobulbar affect with underlying ALS or MS.[1,2] Two additional trials conducted with higher doses (DM 30 mg/quinidine 30 mg) provided supportive evidence.[3,4] PRISM II, an open-label, 90-day, published study, evaluated Nuedexta in patients with pseudobulbar affect and a diagnosis of dementia, stroke, or traumatic brain injury (n = 367).[8] Nuedexta was shown to be an effective treatment for pseudobulbar affect secondary to dementia, stroke, or traumatic brain injury, showing similar improvement to that reported in patients with pseudobulbar affect secondary to ALS or MS.

Guidelines

There are no guidelines specific to the management of pseudobulbar affect. However, the American Academy of Neurology (AAN) published an evidence-based guideline on the assessment and management of psychiatric disorders in individuals with MS.[5] The guideline found that Nuedexta is possibly effective

and may be considered for treating individuals with MS with pseudobulbar affect (Level C, one Class II study). Also, prior to the approval of Nuedexta, the AAN published a practice parameter on the care of the patient with ALS.[6] With regard to pharmacologic measures to reduce pseudobulbar affect, the AAN concludes that the combination DM/quinidine product is probably effective for pseudobulbar affect in ALS based on one Class I study[3], although side effects may limit its usefulness. Therefore, the AAN recommends that if approved by the FDA, and if side effects are acceptable, the combination DM/quinidine product should be considered for symptoms of pseudobulbar affect in patients with ALS (Level B). No other pharmacologic agents are addressed in the practice parameter for use in the management of pseudobulbar affect.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Nuedexta. Because of the specialized skills required for evaluation and diagnosis of patients treated with Nuedexta as well as the monitoring required for adverse events and long-term efficacy, approval requires Nuedexta to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Nuedexta is recommended in those who meet the following criteria:

FDA-Approved Indications

3. **Treatment of Pseudobulbar Affect.** Approve for 1 year if the patient meets BOTH of the following criteria (A and B):
   - **A)** Patient has pseudobulbar affect associated with a chronic neurological condition; AND
     Note: Examples of chronic neurological conditions include amyotrophic lateral sclerosis, multiple sclerosis, stroke, dementia, traumatic brain injury.
   - **B)** Nuedexta is prescribed by or in consultation with a neurologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Nuedexta is not recommended in the following situations:

1. **Heroin Detoxification.** Limited published data are available in patients undergoing heroin detoxification.[9] The available study was conducted with the DM 30 mg/quinidine 30 mg formulation, using daily doses of DM 60 mg/quinidine 60 mg (dose cannot be achieved with Nuedexta capsules). There were no differences between DM/quinidine and placebo with regard to reducing opioid withdrawal symptoms.

2. **Levodopa-Induced Dyskinesia in Parkinson's Disease.** A single pilot study demonstrated benefit with dextromethorphan/quinidine for treating levodopa-induced dyskinesia in Parkinson's disease.[12] Larger studies with a longer treatment duration are needed to define the place in therapy for Nuedexta in this condition.

3. **Neuropathic Pain.** Limited published data are available in patients (n = 36) with diabetic peripheral neuropathic (DPN) pain (open-label tolerability study).[10] The available study was conducted with the DM 30 mg/quinidine 30 mg formulation, using daily doses up to DM 120 mg/quinidine 120 mg (dose

cannot be achieved with Nuedexta capsules). Higher daily doses of DM and quinidine (60 mg/60 mg and 90 mg/60 mg [doses cannot be achieved with Nuedexta capsules]) have also been evaluated in patients with DPN pain (n = 379) in one Phase III, randomized, placebo-controlled 13-week study.[7] Both DM/quinidine treatment groups had significant reductions in mean daily pain scores vs. placebo. More data are needed to define the place in therapy of Nuedexta in the treatment of neuropathic pain.

4. **Psychosis-Related Aggression**. A case series (n = 4) supports DM/quinidine as a potential alternative to conventional regimens for treating aggression and impulsive behavior in patients with psychotic disorder.[11] More data are needed to define the place in therapy of Nuedexta in the treatment of psychosis-related aggression.

5. **Treatment-Resistant Depression.** A Phase II, open-label, proof-of-concept study (n = 20) demonstrated preliminary efficacy for DM 45 mg/quinidine 10 mg every 12 hours. This dosing could not be achieved with Nuedexta capsules.[13] Additional data are needed to define the place in therapy for Nuedexta in the treatment of treatment-resistant depression.

6. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Abiraterone acetate, an androgen biosynthesis inhibitor, is indicated for following uses **in combination with prednisone**:[1]
- **Metastatic castration-resistant prostate cancer** (mCRPC).
- **Metastatic high-risk castration-sensitive prostate cancer** (mCSPC).

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on prostate cancer (version 3.2020 – November 17, 2020) have the following recommendations for drug therapies (primarily focusing on oral agents, abiraterone acetate and Xtandi® [enzalutamide capsules]):[2]

- At initial diagnosis, for patients classified in the regional risk group (metastases in regional nodes [N1] with no distant metastases [M0]) and with a > 5 year expected patient survival or symptomatic, external beam radiation therapy (EBRT) + androgen deprivation therapy (ADT) [preferred] ± abiraterone acetate and prednisone is a recommended option (category 2A). ADT (without EBRT) ± abiraterone and prednisone is also a category 2A recommended option in this setting.
- If patients are positive for distant metastasis (M1) and have castration-naïve disease, ADT + abiraterone and prednisone and ADT + docetaxel are both category 1 recommended options. Other options are also available.
- For patients who progress to CRPC and are positive for distant metastasis, M1 and there are no visceral metastases, abiraterone and prednisone, docetaxel, Xtandi, sipuleucel-T, and Xofigo® (radium Ra 223 dichloride injection, for intravenous use) [for symptomatic bone metastases] are all category 1 preferred regimens.
  - If there are visceral metastases, Xtandi and docetaxel are category 1 recommended options. Abiraterone and prednisone, mitoxantrone with prednisone, or other secondary hormone therapies are other options (all category 2A).
  - For no visceral metastases, if patients had received prior therapy with Xtandi or abiraterone, then docetaxel and Xofigo are the category 1 options for subsequent therapy. If patients received prior docetaxel therapy, then Xtandi, abiraterone, Xofigo, and cabazitaxel are the category 1 options. For subsequent therapy with visceral metastases, docetaxel is the recommended category 1 option, if either Xtandi or abiraterone were used as prior therapies. For prior therapy with docetaxel, Xtandi, abiraterone, cabazitaxel are the recommended category 1 options.

The STAMPEDE trial assessed the efficacy of abiratereone acetate and prednisone in combination with ADT in newly diagnosed patients with metastatic, node-positive, or high-risk locally advanced prostate cancer.[4] About 20% of the patients had node-positive non-metastatic disease. However, the guidelines note that there was insufficient data available for failure-free survival and follow-up to recommend abiraterone for men with high-risk or very high-risk N0 M0 prostate cancer and more data are needed.[2]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of abiraterone acetate. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of abiraterone acetate is recommended in those who meet the following criteria:

FDA-Approved Indication

1. **Prostate Cancer – Metastatic, Castration-Resistant (mCRPC).** Approve for 3 years if the patient meets the following conditions (A and B):
   - **A)** The medication is used in combination with prednisone; AND
   - **B)** Patient meets ONE of the following criteria (i or ii):
     - **i.** The medication is concurrently used with a gonadotropin-releasing hormone (GnRH) analog.
       Note: Examples are Lupron (leuprolide for injection), Lupron Depot (leuprolide acetate for depot suspension), Trelstar (triptorelin pamoate for injectable suspension), Zoladex (goserelin acetate implant), Vantas (histrelin acetate subcutaneous implant), Firmagon (degarelix for injection), Orgovyx (relugolix tablets); OR
     - **ii.** Patient has had a bilateral orchiectomy.

2. **Prostate Cancer –Metastatic, Castration-Sensitive (mCSPC).** Approve for 3 years if the patient meets the following criteria (A, B, and C):
   - **A)** The medication is used in combination with prednisone; AND
   - **B)** Patient has high-risk disease (e.g., evidence of measurable visceral metastases, lesions on bone scan, total Gleason score ≥ 8) as confirmed by the prescribing physician; AND
   - **C)** Patient meets ONE of the following criteria (i or ii):
     - **i.** The medication is concurrently used with a gonadotropin-releasing hormone (GnRH) analog.
       Note: Examples are Lupron (leuprolide for injection), Lupron Depot (leuprolide acetate for depot suspension), Trelstar (triptorelin pamoate for injectable suspension), Zoladex (goserelin acetate implant), Vantas (histrelin acetate subcutaneous implant), Firmagon (degarelix for injection), Orgovyx (relugolix tablets); OR
     - **ii.** Patient has had a bilateral orchiectomy.

Other Uses with Supportive Evidence

3. **Prostate Cancer – Regional Risk Group.** Approve for 3 years if the patient meets all of the following criteria (A, B, and C):
   - **A)** The medication is used in combination with prednisone; AND
   - **B)** Patient has regional lymph node metastases and no distant metastases; AND
   - **C)** Patient meets one of the following criteria (i or ii):
     - **i.** The medication with prednisone is used in combination with gonadotropin-releasing hormone (GnRH) analog.
       Note: Lupron (leuprolide acetate for injection), Lupron Depot (leuprolide acetate for depot suspension), Trelstar (triptorelin pamoate for injectable suspension), Zoladex (goserelin acetate implant), Vantas (histrelin acetate subcutaneous implant), Firmagon (degarelix for injection), Orgovyx (relugolix tablets); OR
     - **ii**. Patient has had an orchiectomy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of abiraterone acetate is not recommended in the following situations:

192. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Early Annual Revision	Changed name of policy due to the addition of generics to Zytiga. Where appropriate, throughout the policy changed Zytiga to abiraterone acetate or "the medication".	02/06/2019
Annual Revision	Deleted "Locally Advanced" from indication descriptor for "Prostate Cancer – Regional Risk Group, Locally Advanced". Deleted "Prostate Cancer – Metastatic (Castration-Resistant or Castration-Sensitive) Post-External Beam Radiation Therapy" since these patients would be covered under conditions #1 or #2. Added criteria for concomitant use of abiraterone with gonadotropin releasing hormone agonist or patient has had a bilateral orchiectomy, as per prescribing information dosing requirements.	02/19/2020
Selected Revision	Changed gonadotropin-releasing hormone "agonist" to "analog" for all conditions. Added Firmagon as an example.	03/04/2020
Early Annual Revision	**Prostate Cancer Indications:** Added Orgovyx as an example of gonadotropin-releasing hormone analog.	01/06/2021

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Afinitor Prior Authorization Policy

- Afinitor® (everolimus tablets – Novartis, generics 2.5 mg, 5 mg, 7.5 mg)
- Afinitor Disperz® (everolimus tablets for oral suspension – Novartis)

REVIEW DATE: 01/27/2021

OVERVIEW

Afinitor, a kinase inhibitor, is indicated for the following conditions:[1]

- **Breast cancer**, treatment of postmenopausal women with advanced hormone receptor-positive (HR+), human epidermal growth factor receptor 2 (HER2)-negative disease (advanced HR+ breast cancer) in combination with exemestane, after failure of treatment with letrozole or anastrozole.
- **Neuroendocrine tumors (NET)**, treatment of adult patients with progressive disease of pancreatic origin (PNET) and adults with progressive, well-differentiated, non-functional NET of gastrointestinal or lung origin that are unresectable, locally advanced or metastatic. Limitation of Use: Afinitor is not indicated for the treatment of patients with functional carcinoid tumors.
- **Renal cell carcinoma**, treatment of adult patients with advanced disease after failure of treatment with Sutent® (sunitinib capsules) or Nexavar® (sorafenib tablets).

- **Tuberous sclerosis complex (TSC)-associated renal angiomyolipoma,** treatment of adult patients with this disease not requiring immediate surgery.
- **TSC-associated subependymal giant cell astrocytoma (SEGA)**, treatment of adult and pediatric patients ≥ 1 year of age with TSC for the treatment of SEGA that requires therapeutic intervention but cannot be curatively resected. Afinitor Disperz is also FDA-approved for this indication.
- **TSC-associated partial-onset seizures**, adjunctive treatment of adult and pediatric patients ≥ 2 years of age. Afinitor Disperz is FDA-approved for this indication.

Of note, Zortress®, (everolimus tablets) is indicated in combination with other drugs for prophylaxis of organ rejection in adult patients undergoing kidney or liver transplant.[2] The tablet strengths and dosing is different for Zortress than with Afinitor.

Guidelines

The National Comprehensive Cancer Network (NCCN) Compendium recommends use of everolimus for the indications listed in the FDA-approved and Other Uses with Supportive Evidence sections.[3] All of the recommendations are category 1 or category 2A.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Afinitor and Afinitor Disperz. All approvals are provided for the duration noted below. In the clinical criteria, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: a woman is defined as an individual with the biological traits of a woman, regardless of the individual's gender identity or gender expression; men are defined as individuals with the biological traits of a man, regardless of the individual's gender identity or gender expression.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Afinitor (generics) and Afinitor Disperz is recommended in those who meet the following criteria:

FDA-Approved Indications

32. Breast Cancer. Approve for 3 years if the patient meets the following criteria (A, B, C, D, E, and F):
- **A)** Patient has recurrent or Stage IV, hormone receptor positive (HR+) [i.e., estrogen receptor positive {ER+} and/or progesterone receptor positive {PR+}] disease; AND
- **B)** Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND
- **C)** Patient has tried at least one prior endocrine therapy (e.g., anastrozole, letrozole, or tamoxifen); AND
- **D)** Patient meets ONE of the following conditions (i or ii):
  - **i.** Patient is a postmenopausal female* or a male*; OR
  - **ii.** Patient is premenopausal or perimenopausal AND is receiving ovarian suppression/ablation with a gonadotropin-releasing hormone (GnRH) agonist or has had surgical bilateral oophorectomy or ovarian irradiation; AND
    Note: Examples are Lupron® (leuprolide), Trelstar® (triptorelin), Zoladex® (goserelin).
- **E)** Patient meets ONE of the following conditions (i or ii):
  - **i.** If patient is a male AND if Afinitor will be used in combination with exemestane, the patient is receiving a gonadotropin-releasing hormone (GnRH) agonist; OR
    Note: Examples are Lupron [leuprolide], Trelstar [triptorelin], Zoladex (goserelin).
  - **ii.** Afinitor will be used in combination with exemestane, fulvestrant, or tamoxifen; AND
- **F)** Patient has not had disease progression while on Afinitor.

***** Refer to the Policy Statement.

33. **Neuroendocrine Tumors of the Pancreas, Gastrointestinal Tract, Lung and Thymus (Carcinoid Tumors) – Advanced, Unresectable, or Metastatic.** Approve for 3 years.

34. **Renal Cell Carcinoma (Clear Cell or Non-Clear Cell Histology).** Approve for 3 years if the patient meets the following criteria (A and B):
    A) Patient has relapsed or Stage IV disease; AND
    B) If using for clear cell disease, the patient has tried at least one prior systemic therapy.
    Note: Examples of prior systemic therapy are Inlyta [axitinib tablets], Votrient (pazopanib tablets), Sutent (sunitinib capsules), Cabometyx (cabozantinib tablets), Nexavar [sorafenib tablets].

4. **Tuberous Sclerosis Complex (TSC)-Associated Renal Angiomyolipoma.** Approve for 3 years.

5. **Tuberous Sclerosis Complex (TSC)-Associated Subependymal Giant Cell Astrocytoma (SEGA).** Approve for 3 years if therapeutic intervention is required but SEGA cannot be curatively resected.

6. **Tuberous Sclerosis Complex (TSC)-Associated Partial Onset Seizures.** Approve for 3 years.

Other Uses with Supportive Evidence

7. **Differentiated (i.e., papillary, follicular, and Hürthle cell) Thyroid Carcinoma.** Approve for 3 years if refractory to radioactive iodine therapy.

8. **Endometrial Carcinoma.** Approve for 3 years if the patient meets the following criteria (A and B):
    A) The medication will be used in combination with letrozole; AND
    B) Patient has recurrent, metastatic, or high-risk disease.

9. **Gastrointestinal Stromal Tumors (GIST).** Approve for 3 years if the patient meets the following criteria (A, B, C, and D):
    A) Patient has tried imatinib (Gleevec® tablets, generics); AND
    B) Patient has tried Sutent® (sunitinib capsules); AND
    C) Patient has tried Stivarga® (regorafenib tablets); AND
    D) The medication will be used in combination with imatinib (Gleevec tablets, generics), Sutent, or Stivarga.

10. **Classic Hodgkin Lymphoma.** Approve for 3 years in adults ≥ 18 years of age with relapsed or refractory disease.

11. **Meningioma.** Approve for 3 years if the patient has recurrent or progressive disease.

12. **Soft Tissue Sarcoma – Perivascular Epitheloid Cell Tumors (PEComa), Recurrent Angiomyolipoma, Lymphangioleiomyomatosis.** Approve for 3 years.

13. **Thymomas and Thymic Carcinomas.** Approve for 3 years if the patient has tried chemotherapy. Note: Examples are cisplatin plus doxorubicin, cisplatin plus etoposide, carboplatin plus paclitaxel.

14. **Waldenström's Macroglobulinemia/Lymphoplasmacytic Lymphoma (WM/LPL).** Approve for 3 years in patients who meet the following criteria (A or B):
    A) Patient has not responded to primary therapy; OR

Note: Examples are Velcade® [bortezomib intravenous or subcutaneous injection] with dexamethasone; Treanda® [bendamustine intravenous], Rituxan combination therapies; Velcade; Velcade with dexamethasone; Kyprolis® [carfilzomib intravenous injection] with Rituxan and dexamethasone; cyclophosphamide/doxorubicin/vincristine/prednisone/Rituxan; Imbruvica® [ibrutinib capsules]; Rituxan.

B) Patient has progressive or relapsed disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Afinitor (generics) and Afinitor Disperz is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	• Breast Cancer: Criteria were revised to add premenopausal or perimenopausal patients who are receiving ovarian suppression or ablation. Advanced disease was revised to say recurrent, Stage IV, or metastatic disease. Patients with HR-receptor-negative disease with clinical characteristics predicting a HR+ tumor was added as an option. Afinitor use in combination with Faslodex or tamoxifen was added. Afinitor in combination with exemestane continues to be an option in patient with HR+ and HER2-negative breast cancer. The patient has not had disease progression while on Afinitor was added to criteria. • Renal Cell Carcinoma, Advanced: Cabometyx was added to the list of agents tried before receiving Afinitor. • Tuberous Sclerosis Complex (TSC) Associated Partial Onset Seizures: Added new FDA approved use. • Advanced Breast Cancer in Patients with HER2-negative Disease Already Started on Afinitor Therapy. This use was removed. • Endometrial Carcinoma: This condition was added. • Gastrointestinal Stromal Tumors: This condition was added. • Meningioma: This condition was added. • Conditions Not Recommended for Approval: Endometrial Carcinoma and Gastrointestinal Stromal Tumors were removed and added to Other Uses with Supportive Evidence. Chronic Lymphocytic Leukemia, Pancreatic Adenocarcinoma, and Small Cell Lung Cancer were removed.	04/11/2018
Annual Revision	• Breast Cancer: Deleted "metastatic" from criteria describing disease. Re-organized criteria to only approve for HR+/HER2-negative disease. Deleted criteria for HR-negative disease. Added approval for "male" since male with breast cancer treated similar to postmenopausal female. Added gender definition in Policy Statement. Re-worded criteria to state that patient has tried one prior endocrine therapy and listed anastrazole, letrozole, tamoxifen as examples. For Afinitor use in combination with exemestane, added criteria that if the patient is male then gonadotropin-releasing hormone (GnRH) agonist is used. For Afinitor use in combination with Faslodex or Tamoxifen, in males GnRH agonist is not required. • Neuroendocrine Tumors: Added qualifier "of the Pancreas, Gastrointestinal Tract, Lung and Thymus (Carcinoid Tumors" as per guidelines. • Renal Cell Carcinoma: Deleted "advanced" as qualifier. Added "Clear Cell or Non-Clear Cell" to condition as qualifiers. Added criteria to state "relapsed or Stage IV" disease. Deleted criteria separately asking for non-clear cell disease. Modified	05/08/2019

	criteria for clear cell to state "If using for clear cell disease" then "at least one prior systemic therapy" has been tried and listed agents as examples. • Re-worded condition to state Tuberous Sclerosis Complex-"Associated" Renal angiomyolipoma. • Same change to add Tuberous Sclerosis Complex-"Associated" subependymal giant cell astrocytoma. • Osteosarcoma: Deleted criteria since no longer supported in compendium. • Deleted all conditions listed under "Conditions Not Recommended for Approval".	
Selected Revision	• Added generic 2.5 mg, 5 mg, and 7.5 mg tablets to drug target list. No criteria changes.	01/08/2020
Annual Revision	No criteria changes.	05/27/2020

HISTORY (continued)

Early Annual Revision	• Deleted Everolimus tablets 2.5 mg, 5 mg, 7.5 mg from targeted list, since it is already listed next to brand Afinitor. • All throughout policy, where applicable, changed examples to list in Note. • **Hodgkin Lymphoma Classical (nodular sclerosis, mixed cellularity, lymphocyte depleted, and lymphocyte-rich subtypes of Hodgkin lymphoma):** Changed indication name to "Classic Hodgkin Lymphoma" and deleted the subtypes in parentheses to be in-line with other policies with this indication. • **Perivascular Epitheloid Cell Tumors (PEComa), Recurrent Angiomyolipoma, Lymphangioleiomyomatosis.** Added "Soft Tissue Sarcoma" to indication heading to group the subtypes listed under one disease state.	01/27/2021

HR+ – Hormone receptor positive; HR-negative – Hormone receptor negative; HER2 – Human epidermal growth factor 2**.**

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Alecensa® (alectinib capsules – Genentech)

DATE REVIEWED: 02/05/2020

OVERVIEW

Alecensa, a tyrosine kinase inhibitor (TKI), is indicated for the treatment of patients with anaplastic lymphoma kinase (ALK)-positive, metastatic non-small cell lung cancer (NSCLC).[1] Alecensa targets ALK and RET; it also has a major active metabolite, M4, which demonstrated similar *in vitro* potency and activity as alectinib.

GUIDELINES

According to the National Comprehensive Cancer Network (NCCN) NSCLC guidelines (version 2.2020 – December 23, 2019), Alecensa is the category 1preferred therapy for ALK+ NSCLC.[2] Alunbrig™ (brigatinib tablets) and Zykadia™ (ceritinib capsules) are the other recommended, category 1, first-line therapies. , Xalkori® (crizotinib capsules) is a category 1 recommended option "useful in certain circumstances". For subsequent therapy after progression on Xalkori, local therapy, continuing Xalkori therapy, or switching therapy to Zykadia, Alunbrig, or Alecensa (all category 2A) is recommended. For progression on For progression on one of Alecensa, Zykadia, or Alunbrig as first-line therapy, Lorbrena (lorlatinib tablets) can be used upon progression (category 2A).

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Alecensa. All approvals are provided for 3 years in duration unless otherwise noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Alecensa is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Non-Small Cell Lung Cancer (NSCLC).** Approve for 3 years if the patient has *metastatic* anaplastic lymphoma kinase (*ALK*)-positive NSCLC as detected by an approved test.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Alecensa has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

193. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Date Reviewed
New Policy	--	01/20/2016
Annual revision	No criteria changes	01/25/2017
Selected revision	Added approval criteria for first-line setting based on a Phase III trial. Added "after Xalkori therapy" qualifier to indication description for FDA-approved use.	06/14/2017
Annual revision	Deleted approval criteria for "After Xalkori Therapy" since Alecensa is approved in first-line setting. Deleted qualifier "First-Line Therapy" and moved criteria from Other Uses to FDA-Approved Indications. Added "as detected by an approved test" to criteria to check for ALK-positive NSCLC.	01/24/2018
Annual revision	No criteria changes	01/30/2019
Annual revision	No criteria changes	02/05/2020

ALK – Anaplastic lymphoma kinase; NSCLC – Non-small cell lung cancer.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Alunbrig™ (brigatinib tablets – ARIAD/Takeda)

DATE REVIEWED: 06/10/2020

OVERVIEW

Alunbrig, a kinase inhibitor, is indicated for the treatment of patients with anaplastic lymphoma kinase (ALK)-positive, metastatic non-small cell lung cancer (NSCLC) as detected by an FDA-approved test.[1]

Alunbrig targets *ALK*, c-ros oncogene 1 (*ROS1*), insulin-like growth factor-1 receptor (*IGF-1R*), *FLT-3*, epidermal growth factor receptor (*EGFR*) deletion and point mutations.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on NSCLC (version 5.2020 – May 27, 2020) recommend testing for ALK gene rearrangements in all patients with non-squamous NSCLC (category 1).[2] Testing is a prerequisite before treatment. Alecensa® (alectinib capsules) is the "Preferred" first-line therapy. Alecensa and Zykadia™ (ceritinib capsules) are category 1 recommended regiments under "Other Recommended" first-line therapies. Xalkori® (crizotinib capsules) is a category 1 therapy noted as "useful in certain circumstances". For subsequent therapy with progression on Xalkori, Xalkori can be continued, or therapy can be switched to Alecensa, Alunbrig, or Zykadia if not previously [all category 2A]. For patients who progress on Alecensa, Zykadia, or Alunbrig, local therapy can be considered in addition to continuing the kinase inhibitors or therapy can be switched to Lorbrena (lorlatinib tablets) for multiple systemic lesions.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Alunbrig. All approvals are provided for 3 years in duration unless otherwise noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Alunbrig is recommended in those who meet the following criteria:

FDA-Approved Indications

35. Non-Small Cell Lung Cancer (NSCLC). Approve for 3 years if the patient has *metastatic* NSCLC that is anaplastic lymphoma kinase (*ALK*)-positive as detected by an approved test.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Alunbrig has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

194. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Ayvakit Prior Authorization Policy
- Ayvakit® (avapritinib tablets – Blueprint Medicines)

REVIEW DATE: 02/10/2021

OVERVIEW

Ayvakit, a kinase inhibitor, is indicated for the **treatment** of adults with **unresectable or metastatic gastrointestinal stromal tumor (GIST) harboring a platelet-derived growth factor receptor alpha (*PDGFRA*) exon 18 mutation, including *PDGFRA D842V* mutations**.[1] Patients should be selected for treatment with Ayvakit based on the presence of a *PDGFRA* exon 18 mutation; an FDA-approved test for the detection of this mutation is not currently available.

Guidelines

- **Gastrointestinal stromal tumors (GISTs):** According to the National Comprehensive Cancer Network (NCCN) GISTs guidelines (version 1.2021 – October 30, 2020), Ayvakit is one of the primary treatment options (category 2A) for GIST with *PDGFRA* exon 18 mutation, including *PDGFRA* D842V mutations.[2,3] Imatinib is a category 1 recommended option for primary treatment. The guidelines note that most mutations in the *PDGFRA* gene are associated with a response to imatinib, with the notable exception of *PDGFRA* D842V mutation. Ayvakit is listed as one of the recommended therapies after disease progression on imatinib, Sutent, and Stivarga (regorafenib tablets). Ayvakit (for *PDGFRA* exon 18 mutations that are insensitive to imatinib, including the *D842V* mutation) is listed as a preferred regimen for neoadjuvant therapy for resectable GISTs with significant morbidity. Imatinib is also a preferred regimen for neoadjuvant and adjuvant therapy.
- **Myeloid/Lymphoid Neoplasms with Eosinophilia:** The NCCN guidelines for myeloid/lymphoid neoplasms with eosinophilia and tyrosine kinase fusion genes (version 3.2021 – August 21, 2020) notes that since Ayvakit targets *PDGFRA* exon 18 mutation, it may have a role for use in patients with this condition.[3,4] Its use maybe be specific to *PDGFRA* D842V mutation, which is resistant to imatinib. If clinical trial of Ayvakit for this condition is available, then the clinical trial is preferred, rather than off-label use.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Ayvakit. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Ayvakit is recommended in those who meet the following criteria:

FDA-Approved Indications

47. Gastrointestinal Stromal Tumor (GIST). Approve for 3 years if the patient meets the following criteria (A and B):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** The tumor is positive for platelet-derived growth factor receptor alpha (*PDGFRA*) exon 18 mutation.
  Note: *PDGFRA* exon 18 mutation includes *PDGFRA D842V* mutations.

Other Uses with Supportive Evidence

2. Myeloid/Lymphoid Neoplasms with Eosinophilia. Approve for 3 years if the patient meets the following criteria (A and B):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** The tumor is positive for platelet-derived growth factor receptor alpha (*PDGFRA*) *D842V* mutation.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Ayvakit is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
New Policy	--	01/15/2020
Update	3/3/2020: updated with Ayvakit placement in guidelines.	03/03/2020
Annual Revision	**Gastrointestinal Stromal Tumor (GIST):** Added age criterion of ≥ 18 years to define adults. Deleted criteria "patient has unresectable or metastatic disease" since guidelines recommend use of Ayvakit in the neoadjuvant setting. **Myeloid/Lymphoid Neoplasms with Eosinophilia:** Added new approval condition and criteria for this condition based on guidelines.	02/10/2021

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Balversa™ (erdafitinib tablets – Janssen Pharmaceuticals)

DATE REVIEWED: 04/08/2019

OVERVIEW

Balversa is a kinase inhibitor which binds and inhibits the enzymatic activity of fibroblast growth factor receptor (FGFR) 1, FGFR2, FGFR3, and FGFR4, leading to decreased viability in cell lines expressing FGFR genetic alterations.[1] Balversa demonstrated antitumor activity in FGFR expressing cell lines and xenograft models, including bladder cancer.

Balversa is indicated for the treatment of adult patients with locally advanced or metastatic urothelial carcinoma that has susceptible FGFR3 or FGFR2 genetic alterations, and progressed during or following at least one line of prior platinum-containing chemotherapy, including within 12 months of adjuvant or neoadjuvant platinum-containing chemotherapy.[1]

Patients are selected for treatment with Balversa based on the presence of susceptible FGFR genetic alterations in tumor specimens detected by an FDA-approved companion diagnostic.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) clinical practice guidelines for bladder cancer (version 3.2020 – January 17, 2020) recommend Balversa as a single agent, post-platinum or –checkpoint inhibitor therapy in patients with bladder cancer, upper genitourinary tract tumors, and urothelial carcinoma of the prostate with susceptible FGFR2 or FGFR3 genetic alterations.[2,3]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Balversa. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Balversa is recommended in those who meet the following criteria:

FDA-Approved Indications

132. Urothelial Carcinoma, Locally Advanced or Metastatic. Approve for 3 years if the patient meets the following criteria (A and B):

A) The patient has susceptible fibroblast growth factor receptor 3 or fibroblast growth factor receptor 2 genetic alterations; AND

B) The patient has progressed during or following prior platinum-containing chemotherapy (i.e., cisplatin, oxaliplatin) or checkpoint inhibitor therapy.
Note: Checkpoint inhibitors include: Keytruda® (pembrolizumab injection for intravenous use), Opdivo® (nivolumab injection for intravenous use), Tecentriq® (atezolizumab injection for intravenous use), Imfinzi® (durvalumab injection for intravenous use), and Bavencio® (avelumab injection for intravenous use).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Balversa has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

146. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Bosulif Prior Authorization Policy

- Bosulif® (bosutinib tablets – Pfizer)

REVIEW DATE: 04/01/2020

OVERVIEW

Bosulif, a tyrosine kinase inhibitor (TKI), is indicated for the treatment of adults with: newly diagnosed chronic phase Philadelphia chromosome-positive (Ph+) chronic myelogenous leukemia (CML).[1] This indication was approved under accelerated approval based on molecular and cytogenetic response rates. Continued approval for this indication may be contingent upon verification and confirmation of clinical benefit in an ongoing long-term follow-up trial. Bosulif is also indicated for the treatment of adults with chronic phase (CP), accelerated phase (AP), or blast phase (BP) Ph+ CML with resistance or intolerance to prior therapy. Currently, there are four other TKIs approved for the treatment of Ph+ CML: Gleevec® (imatinib tablets, generic), Sprycel® (dasatinib tablets), Tasigna® (nilotinib capsules), and Iclusig® (ponatinib tablets).[2-5] These agents are indicated for the treatment of Ph+ CML in various phases; some TKIs are indicated after resistance or intolerance to prior therapy. Iclusig is approved for patients with T315I-positive CML and in adult patients with CML for whom no other TKI therapy is indicated.[5] Sprycel, Gleevec and Iclusig are also indicated for use in patients with Ph+ acute lymphoblastic leukemia (ALL).[2,3,5]

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for CML (version 3.2020 – January 30, 2020) state that for patients with CP CML with a low-risk score, the primary treatment recommended includes a first-generation TKI (Gleevec or generic imatinib 400 mg QD [Category 1]), or a second-generation TKI (Bosulif 400 mg QD [Category 1], Sprycel 100 mg QD [Category 1], or Tasigna 300 mg BID [Category 1]).[6] For patients with CP CML with an intermediate- or high-risk score, a second-generation TKI is preferred (Bosulif 400 mg QD [Category 1], Sprycel 100 mg QD [Category 1], or Tasigna 300 mg BID [Category 1]). A first-generation TKI (Gleevec or generic imatinib 400 mg QD) is an alternative [Category 2A]. Iclusig is an option for patients with a T315I mutation and for with disease that has not responded to multiple TKIs or in whom another TKI is not indicated.[6] The NCCN guidelines for ALL (adult and adolescent young adults) [version 1.2020 – January 15, 2020] recommend Bosulif as an option for patients with relapsed or refractory ALL.[7]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Bosulif. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Bosulif is recommended in those who meet the following criteria:

FDA-Approved Indications

36. Chronic Myeloid Leukemia (CML) That is Philadelphia Chromosome Positive (Ph+). Approve for 3 years.

Other Uses with Supportive Evidence

2. Acute Lymphoblastic Leukemia (ALL) That is Philadelphia Chromosome Positive (Ph+). Approve for 3 years if the patient has tried at least one other tyrosine kinase inhibitor (TKI) for Ph+ ALL.
Note: Examples include Gleevec® (imatinib tablets) and Sprycel® (dasatinib tablets).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Bosulif is recommended in those who meet the following criteria:

195. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual revision	For the indication in CML, changed the criteria to approve the request for 3 years. Previously, use of Bosulif required a trial of one TKI inhibitor indicated for Ph+ CML. Criteria added to approve Bosulif in patients with ALL that is Philadelphia Chromosome Positive (Ph+) if the patient has tried one other TKI for Ph+ ALL (e.g., Gleevec® [imatinib tablets], Sprycel® [dasatinib tablets]). Also, removed the criteria allowing for approval if the patient has been started on Bosulif for an indication or condition addressed as an approval in the Recommended Authorization section (FDA-approved indications or other uses with supportive evidence).	03/07/2018
Annual revision	No criteria changes.	03/20/2019
Annual revision	The following changes were made: **Acute Lymphoblastic Leukemia that is Ph+:** The wording that the patient has tried one other TKI for acute lymphoblastic leukemia was changed to state "at least one" and examples of TKIs were moved from the criteria to a note. **Conditions Not Recommended for Approval:** The condition of breast cancer was removed. The National Comprehensive Cancer Network breast cancer guidelines do not recommend use of Bosulif and there have been no recent literature published regarding this use.	04/01/2020

CML – Chronic myeloid leukemia; TKI(s) – Tyrosine kinase inhibitor(s); Ph+ CML – Philadelphia chromosome positive chronic myeloid leukemia; ALL Acute lymphoblastic leukemia; Ph+ – Philadelphia chromosome positive; Ph+ ALL – Philadelphila chromosome positive acute lymphoblastic leukemia.

.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Braftovi Prior Authorization Policy
- Braftovi® (encorafenib capsules – Array BioPharma)

REVIEW DATE: 07/08/2020

OVERVIEW

Braftovi, a BRAF inhibitor, is indicated for the following uses:[1]

- **Melanoma**, in combination with Mektovi® (binimetinib tablets), for the treatment of patients with unresectable or metastatic disease and a *BRAF V600E* or *V600K* mutation, as detected by an FDA-approved test.
- **Colorectal cancer**, in combination with Erbitux® (cetuximab infusion), for the treatment of adults with metastatic disease and a *BRAF V600E* mutation, as detected by an FDA-approved test, after prior therapy.

It is a limitation of use that Braftovi is not indicated for wild-type disease.

Guidelines

National Comprehensive Cancer Network (NCCN) guidelines support use of Braftovi in the following cancers.

- **Melanoma:** Guidelines (version 3.2020 – May 18, 2020) recommend BRAF/MEK inhibitor combinations for first-line (preferred if clinically needed for early response) and subsequent treatment of metastatic or unresectable melanoma with a *V600* activating mutation.[2] While combination BRAF/MEK inhibition is preferred, if a combination is contraindicated, monotherapy with a BRAF inhibitor (Tafinlar® [dabrafenib capsules] or Zelboraf® [vemurafenib tablets]) is a recommended option, particularly if the patient is not a candidate for checkpoint immunotherapy. Following resection of limited metastatic disease with a *BRAF V600*-activating mutation, BRAF/MEK combination therapy is among the treatment options for patients with no evidence of disease. Tafinlar + Mekinist® (trametinib tablets) is also recommended in guidelines as adjuvant therapy (including for nodal recurrence) in some patients with Stage III disease, including use post-surgery or use after complete lymph node dissection. If unacceptable toxicity to Tafinlar/Mekinist, other BRAF/MEK combinations can be considered.
- **Colon and Rectal Cancer:** Guidelines for colon cancer (version 4.2020 – June 15, 2020) and rectal cancer (version 6.2020 – June 25, 2020) recommend Braftovi for some situations in patients with *BRAF-V600E* mutated disease.[3,] For primary treatment (following adjuvant chemotherapy) or as subsequent use, Braftovi + Erbitux or Vectibix® (panitumumab IV infusion) is a recommended treatment option.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Braftovi. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Braftovi is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Melanoma.** Approve for 3 years if the patient meets BOTH of the following (A and B):
   - **A)** Patient has unresectable, advanced, or metastatic melanoma; AND
   - **B)** Patient has *BRAF V600* mutation-positive disease.

2. **Colon or Rectal Cancer.** Approve for 3 years if the patient meets the following (A, B, and C):
   - **2.** Patient has *BRAF V600E* mutation-positive disease; AND
   - **3.** Patient has previously received a chemotherapy regimen for colon or rectal cancer; AND
     Note: Examples of chemotherapy regimens include a fluoropyrimidine such as 5-fluorouracil (5-FU), capecitabine; oxaliplatin, irinotecan, or an adjunctive chemotherapy regimen such as FOLFOX (5-FU, leucovorin, and oxaliplatin) or CapeOX (capecitabine and oxaliplatin).
   - **4.** The agent is prescribed as part of a combination regimen for colon or rectal cancer.
     Note: Examples of combination regimens include Braftovi + Erbitux (cetuximab IV infusion), Braftovi + Vectibix (panitumumab IV infusion).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Braftovi is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

New Policy	--	06/27/2018
Annual revision	**Colon or Rectal Cancer:** Add criteria as supported by NCCN colon cancer guidelines. Criteria approve if the patient has *BRAF V600E* mutation-positive disease, and if the patient has previously used chemotherapy, and if Braftovi will be used as part of a combination regimen for colon or rectal cancer.	06/18/2019
Update	**04/10/2020:** Update Overview with information for colon or rectal cancer. Move colon or rectal cancer to FDA-approved uses (previously addressed in Other Uses With Supportive Evidence). No changes to the criteria.	--
Annual revision	**Colon or Rectal Cancer:** Update examples to remove Mektovi from the examples of combination regimens.	07/08/2020

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Brukinsa Prior Authorization Policy

- Brukinsa™ (zanubrutinib capsules – BeiGene)

REVIEW DATE: 06/03/2020; selected revision 01/20/2021

OVERVIEW

Brukinsa, a Bruton's tyrosine kinase inhibitor (BTK), is indicated for the treatment of **mantle cell lymphoma,** in adults who have received at least one prior therapy.[1]

Disease Overview

Mantle cell lymphoma is a rare and fasting-growing type of non-Hodgkin lymphoma (NHL).[2,3] It accounts for approximately 3% of cases of newly diagnosed NHL. The condition is described as aggressive and non-curable. It is defined by the overexpression of cyclin D1. The median age at diagnosis is 68 years of age and it is more common in males. Mantle cell lymphoma is a cancer involving the lymphatic system which is part of the immune system comprised of lymph tissue, lymph nodes, the spleen, thymus, tonsils, and bone marrow. About 15% to 30% of patients have involvement of the gastrointestinal tract. Approximately one-third of patients with mantle cell lymphoma present with high levels of lactate dehydrogenase (LDH). Although there is no definitive standard of care, aggressive chemo-immunotherapy regimens containing rituximab and cytarbine are used for patients depending on fitness. Many targeted therapies are now available. Stem cell transplants is also an option.

Chronic lymphocytic leukemia (CLL) is one of the most prevalent adult leukemias in the Western world.[4] In 2019, an estimated 20,720 patients will be diagnosed with CLL in the US, and approximately 3,930 patients will die from the disease. The condition usually is diagnosed in older adults (≥ 70 years of age) and occurs more frequently in men. The leukemic cells appear as small, mature lymphocytes. CLL and small lymphocytic lymphoma (SLL) are different manifestations of the same condition and are managed similarly. In CLL, many of the abnormal lymphocytes are found in the blood, as well as in the bone marrow and lymphoid tissue. In SLL, there are few, if any, abnormal lymphocytes circulating in blood and most of the disease is in the lymph nodes, bone marrow, and other lymphoid tissue. The diagnosis requires the presence of at least 5×10^9/L monoclonal B-lymphocytes in the peripheral blood. SLL requires the presence of lymphadenopathy and/or splenomegaly with $< 5 \times 10^9$/L B-lymphocytes found in the peripheral blood.

Guidelines

Several guidelines address use of Brukinsa.

- **Chronic Lymphocytic Leukemia (CLL)/Small Lymphocytic Lymphoma (SLL)**:[4] The National Comprehensive Cancer Network (NCCN) guidelines for CLL/SLL (version 2.2021 – December 3, 2020) recommend Brukinsa as an option for second-line and subsequent therapy for patients without 17p deletion/TP53 mutation who are frail patients with significant comorbidity or patients < 65 years of age without significant comorbidities who have intolerance or contraindication to other BTK inhibitors (category 2A). For patients with 17p deletion/TP53 mutation, Brukinsa is recommended as a first-line therapy as an other recommended regimen for patients with a contraindication to other BTK inhibitors (category 2A). Also, for this population, Brukinsa is recommended as second-line and subsequent therapy as an other recommended regimen for patients with intolerance or a contraindication to other BTK inhibitors (category 2A).
- **Mantle Cell Lymphoma:**[2] The NCCN guidelines for B-cell lymphomas (version 4.2020 – August 13, 2020) address mantle tell lymphoma. Brukinsa is recommended as a preferred regimen among several as second-line therapy for patients with short response duration to prior chemoimmunotherapy, as well as for extended response duration prior to chemoimmunotherapy (category 2A).

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Brukinsa. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Brukinsa is recommended in those who meet the following criteria:

FDA-Approved Indication

133. Mantle Cell Lymphoma. Approve for 3 years if the patient has tried at least one prior therapy.
Note: Example of therapies are Calquence® (acalabrutinib capsules); Imbruvica® (ibrutinib tablets and capsules) with or without a rituximab product; Revlimid® (lenalidomide capsules) with or without a rituximab product; Venclexta® (venetoclax tablets) with or without a rituximab product; RDHA (a rituximab product, dexamethasone, cytarabine) plus platinum (carboplatin, cisplatin, oxaliplatin); alternating RCHOP (a rituximab product, cyclophosphamide, doxorubin, vincristine, prednisone)/RDHAP (a rituximab product, dexamethasone, cytarbine, cisplatin); Treanda® (bendamustine injection) plus a rituximab product; RCHOP; NORDIC regimen (dose-intensified induction immunochemotherapy with ritixumab plus cyclophosphamide, vincristine, doxorubicin, prednisone [maxi-CHOP]) alternating with a rituximab product plus high-dose cytarbine); HyperCVAD (cyclophosphamide, vincristine, doxorubicin, and dexamathsone alternating with high-dose methotrexate and cytarabine plus rituximab); and VR-CAP (Velcade® [bortezomib injection for subcutaneous or intravenous use], a rituximab product, cyclophosphamide, doxorubicin, and prednisone).

Other Uses with Supportive Evidence

134. Chronic Lymphocytic Leukemia. Approve for 3 years if the patient has tried at least one prior therapy.
Note: Example of therapies are Imbruvica® (ibrutinib tablets and capsules); Calquence® (acalabrutinib capsules); Copiktra® (duvelisib capsules); Gazyva® (obinutuzumab injection for intravenous use); Calquence with Gazyva; Venclexta® (venetoclax tablets) with Gazyva; Imbruvica with Gazyva; Venclexta with rituximab; Zydelig® (idelalisib tablets); and Zydelig plus rituximab.

135. Small Lymphocytic Lymphoma. Approve for 3 years if the patient has tried at least one prior therapy.
Note: Example of therapies are Imbruvica® (ibrutinib tablets and capsules); Calquence® (acalabrutinib capsules); Copiktra® (duvelisib capsules); Gazyva® (obinutuzumab injection for intravenous use); Calquence with Gazyva; Venclexta® (venetoclax tablets) with Gazyva; Imbruvica with Gazyva; Venclexta with rituximab; Zydelig® (idelalisib tablets); and Zydelig plus rituximab.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Brukinsa is not recommended in the following situations:

196. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Cabometyx Prior Authorization Policy

- Cabometyx™ (cabozantinib tablets – Exelixis)

REVIEW DATE: 02/17/2021

OVERVIEW

Cabometyx, a kinase inhibitor, is indicated for the following uses:[1]

- **Renal cell carcinoma (RCC)**, as monotherapy or in combination with Opdivo (nivolumab for injection) for the first-line treatment of patients with advanced disease.
- **Hepatocellular carcinoma,** for the treatment of patients who have been previously treated with Nexavar® (sorafenib tablets).

Guidelines

- **Renal cell carcinoma (RCC):** In the National Comprehensive Cancer Network (NCCN) clinical practice guidelines for kidney cancer (version 2.2021 – February 3, 2021), the preferred regimens for first-line therapy in favorable risk patients with relapsed or Stage IV RCC with predominant clear cell histology are: Inlyta® (axitinib tablets) + Keytruda (pembrolizumab for injection), Cabometyx + Opdivo (nivolumab for injection), Sutent® (sunitinib malate capsules), and Votrient® (pazopanib tablets) [all category 2A]. Cabometyx (category 2B) is one of the "other recommended regimens" for favorable risk patients.[2] For patients in the poor/intermediate risk grouping, the preferred regimens are Inlyta + Keytruda; Yervoy (ipilimumab for injection) + Opdivo (both category 1); Cabometyx; and Cabometyx + Opdivo (both category 2A). Recommendations for subsequent oral therapies include Cabometyx (category 1, preferred), Inlyta (category 1),

Lenvima™ (lenvatinib capsules) + everolimus [category 1]; everolimus, Sutent, or Votrient are all category 2A recommended therapies. For patients with non-clear cell histology RCC, Sutent and enrollment in clinical trials are noted as preferred therapies (category 2A, preferred); Cabometyx, everolimus, and Lenvima + everolimus are other recommended regimens (both category 2A). Many other agents are listed as useful in certain circumstances.

- **Hepatocellular carcinoma:** The NCCN hepatobiliary cancers (version 5.2020 – August 4, 2020) recommends Cabometyx (Child-Pugh Class A only; Category 1) as a subsequent therapy option, along with many other agents.[3]
- **Non-small cell lung cancer:** The NCCN Non-Small Cell Lung Cancer guidelines (version 3.2021 – February 16, 2021) recommend cabozantinib as "useful in certain circumstances" for *RET* rearrangements (category 2A).[4,5]
- **Gastrointestinal stromal tumors (GIST):** The NCCN GISTs guidelines (version 1.2021 – October 30, 2020) recommend Cabometyx as one of the options after failure on approved therapies ("useful in certain circumstances", category 2A).[4,6] The approved therapies are imatinib and Ayvakit (avapritinib tablets; for *PDGFRA* mutation) first-line; Sutent (sunitinib capsules) as second-line therapy; Stivarga (regorafenib tablets) as third-line therapy; and Gavreto (ripretinib tablets) as fourth-line therapy.
- **Bone cancer:** The NCCN bone cancer guidelines (version 1.2021 – November 20, 2020) recommend Cabometyx as one of the "other recommended regimens" for second-line (relapsed/refractory or metastatic disease) Ewing sarcoma (category 2A).[4,7]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Cabometyx. All approvals are provided for 3 years in duration unless otherwise noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Cabometyx is recommended in those who meet the following criteria:

FDA-Approved Indication

37. Renal Cell Carcinoma (RCC). Approve for 3 years in patients with relapsed or stage IV disease.

2. Hepatocellular Carcinoma. Approve for 3 years if the patient has been previously treated with at least one tyrosine kinase inhibitor therapy.
Note: Examples are Nexavar® (sorafenib tablets), Lenvima (lenvatinib capsules).

Other Uses with Supportive Evidence

3. Non-Small Cell Lung Cancer. Approve for 3 years if the tumor is positive for *RET* rearrangements.

4. Gastrointestinal Stromal Tumors (GIST). Approve for 3 years if the patient meets the following (A and B):
- **A)** Patient has previously tried one of imatinib (Gleevec® tablets, generic) or Ayvakit® (avapritinib tablets); AND
- **B)** Patient has previously tried each of Sutent® (sunitinib capsules), Stivarga® (regorafinib tablets), and Gavreto (ripretinib tablets).

5. Bone Cancer. Approve for 3 years if the patient meets the following criteria (A and B):
- **A)** Patient meets ONE of the following (i or ii):
  - **i.** Patient has Ewing sarcoma; OR
  - **ii.** Patient has osteosarcoma; AND
- **B)** Patient has tried at least one previous systemic regimen.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Cabometyx is not recommended in the following situations:

1. Metastatic Castration-Resistant Prostate Cancer (mCRPC).
Results from the COMET-1 Phase III pivotal study with Cabometyx 60 mg tablets in men with mCRPC are published.[8] Patients included in the study had disease progression after treatment with docetaxel as well as Zytiga® (abiraterone acetate tablets) and/or Xtandi® (enzalutamide capsules). The study failed to meet its primary endpoint of demonstrating statistically significant increase in overall survival (OS) compared with prednisone. The median OS with Cabometyx was 11.0 months vs. 9.8 months with prednisone (hazard ratio [HR] 0.90; 95% CI: 0.76, 1.06; P = 0.213). Based on these results, the second Phase III study, COMET-2 has been discontinued.[9]

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	Added new approval condition for hepatocellular carcinoma based on FDA-approval.	01/23/2019
Annual Revision	No criteria changes	02/05/2020
Annual Revision	**Renal Cell Carcinoma:** Deleted "Advanced, (Predominant Clear Cell or Non-Clear Histology)" from indication heading. Criterion was modified to approve for 3 years "in patients with relapsed or stage IV disease", in-line with guidelines. **Hepatocellular Carcinoma:** Moved examples from within criteria to a Note. **Non-Small Cell Lung Cancer:** Deleted "with RET Gene Arrangements" from indication and moved it to criteria. Now, criteria approves "if the tumor is positive for RET rearrangements". **Gastrointestinal Stromal Tumors (GIST):** Added new approval condition and criteria based on guidelines. **Bone Cancer:** Added new approval condition and criteria for bone cancer, specifically for Ewing sarcoma and osteosarcoma, based on guidelines.	02/17/2021

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Calquence Prior Authorization Policy

- Calquence® (acalabrutinib capsules – Astra Zeneca)

REVIEW DATE: 06/03/2020; selected revision 01/20/2021

OVERVIEW

Calquence, a Bruton tyrosine kinase (BTK) inhibitor, is indicated for the following uses:[1]

- **Chronic lymphocytic leukemia (CLL) or small lymphocytic leukemia (SLL)**, in adults.
- **Mantle cell lymphoma**, in adults who have received at least one prior therapy active disease.

Disease Overview

CLL is one of the most prevalent adult leukemias in the Western world.[2] In 2019, an estimated 20,720 patients will be diagnosed with CLL in the US, and approximately 3,930 patients will die from the disease. The condition usually is diagnosed in older adults (≥ 70 years of age) and occurs more frequently in men. The leukemic cells appear as small, mature lymphocytes. CLL and SLL are different manifestations of the same condition and are managed similarly. In CLL, many of the abnormal lymphocytes are found in the blood, as well as in the bone marrow and lymphoid tissue. In SLL, there are few, if any, abnormal lymphocytes circulating in blood and most of the disease is in the lymph nodes, bone marrow, and other lymphoid tissue. The diagnosis requires the presence of at least 5×10^9/L monoclonal B-lymphocytes in the peripheral blood. SLL requires the presence of lymphadenopathy and/or splenomegaly with $< 5 \times 10^9$/L B-lymphocytes found in the peripheral blood.

Mantle cell lymphoma is a rare and fasting-growing type of non-Hodgkin lymphoma (NHL).[3] It accounts for approximately 6% of cases of newly-diagnosed NHL. The median age at diagnosis is 68 years of age and it is more common in males. Mantle cell lymphoma is a cancer involving the lymphatic system which is part of the immune system comprised of lymph tissue, lymph nodes, the spleen, thymus, tonsils, and bone marrow. Approximately one-third of patients with mantle cell lymphoma present with high levels of lactate dehydrogenase.

Waldenstrom's macroglobulinemia is a B-cell disorder that is hallmarked by bone marrow infiltration with lymphophasmacytic cells, as well as with immunoglobulin M monoclonal gammopathy.[4] The condition is defined as "lymphplasmacytic lymphoma" by the Revised European American Lymphoma and World Health Organization classification systems. There are approximately 1,000 to 1,500 new cases of Waldenstrom's macroglobulinemia diagnosed each year in the US. The condition is observed primarily in older adults as the median age at the time of diagnosis ranges from 60 to 75 years. Some symptoms which necessitate treatment include hyperviscosity; neuropathy; anemia; cytopenia and amyloidosis.

Guidelines

Several guidelines address Calquence.

- **CLL/SLL:** The National Comprehensive Cancer Network (NCCN) guidelines for CLL/SLL (version 4.2021 – December 3, 2020) list Calquence as a preferred option as first-line therapy, as well as for relapsed/refractory therapy, in variety of clinical scenarios in patients with and without del(17p)/TP53 mutation.[2] In some clinical scenarios, Calquence is recommended to be given with Gazyva® (obinutuzumab injection for intravenous use).
- **Mantle Cell Lymphoma:** The NCCN guidelines for B-cell lymphomas (version 1.2020 – January 22, 2020) provide recommendations for patients with mantle cell lymphoma.[3] Calquence is recommended as one of several preferred agents as second-line therapy in various clinical scenarios (category 2A).
- **Waldenstrom's Macroglobulinemia/Lymphoplasmacytic Lymphoma:** The NCCN guidelines for Waldenstrom's Macroglobulinemia/Lymphoplasmacytic Lymphoma recommend Calquence as an Other Recommended Regimen for previously treated disease (category 2A).[4]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Calquence. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Calquence is recommended in those who meet the following criteria:

FDA-Approved Indications

38. Mantle Cell Lymphoma. Approve for 3 years.

39. Chronic Lymphocytic Leukemia (CLL). Approve for 3 years.

40. Small Lymphocytic Lymphoma (SLL). Approve for 3 years.

Other Uses with Supportive Evidence

41. Waldenstrom's Macroglobulinemia/Lymphoplasmacytic Lymphoma. Approve for 3 years if the patient has tried at least one prior therapy.
Note: Examples of therapies include Imbruvica® (ibrutinib tablets and capsules) with or without rituximab; Treanda® (bendamustine injection for intravenous infusion); rituximab; rituximab/cyclophosphamide/dexamethasone; Velcade® (bortezomib injection for subcutaneous or intravenous use)/dexamethasone/rituximab; Velcade with or without rituximab; Velcade/dexamethasone; and fludarabine with or without rituximab.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Calquence is not recommended in the following situations:

197. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	For clarity, the reference to Rituxan when listing previous required therapies was changed to "rituximab". Also, the following changes were also made: 1. **Chronic Lymphocytic Leukemia:** Venclexta plus Gazyva and Copiktra were added to the list of examples of agents that count toward the requirement of a trial of one prior therapy. 2. **Small Lymphocytic Lymphoma:** Venclexta plus Gazyva and Copiktra were added to the list of examples of agents that count toward the requirement of a trial of one prior therapy.	06/05/2019
Selected Revision	The indications of chronic lymphocytic leukemia and small lymphocytic lymphoma were moved from the Other Uses with Supportive Evidence section to the FDA-	12/4/2019

	Approved Indications section. Also, the criteria were revised to approve for these indications and a trial of one prior therapy is no longer required.	
Annual Revision	No criteria changes.	06/03/2020
Selected Revision	**Waldenstrom's Macroglobulinemia/Lymphoplasmacytic Lymphoma:** Criteria added to approve if the patient has tried at least one prior therapy. Examples of therapies are provided in a Note.	01/20/2021

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Caprelsa® (vandetanib tablets – AstraZeneca)

DATE REVIEWED: 05/13/2020

OVERVIEW

Caprelsa is a kinase inhibitor indicated for the treatment of symptomatic or progressive medullary thyroid cancer (MTC) in patients with unresectable locally advanced or metastatic disease.[1] Due to the treatment related risks of Caprelsa, its use in patients with indolent, asymptomatic, or slowly progressing disease should be carefully considered. Caprelsa has a black box warning regarding the increased risk of QT prolongation, Torsades de pointes, and sudden death. It is available only through the restricted distribution program called the Caprelsa Risk Evaluation and Mitigation Strategy (REMS) program. Only prescribers and pharmacies certified with the program are able to prescribe or dispense Caprelsa.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for thyroid carcinoma (version 2.2019 – September 16, 2019) lists surgery as the main treatment option for MTC.[2-3] For *locoregional* , recurrent or persistent disease, or for distant metastases Caprelsa (category 1) or Cometriq™ (cabozantinib capsules) (category 1) are recommended for unresectable locoregional disease that is symptomatic or structurally progressive. The guidelines recommend that Caprelsa be considered if clinical trials or other systemic therapies are not available or appropriate for the treatment of progressive and/or symptomatic iodine refractory thyroid cancer that is unresectable recurrent or persistent locoregional disease or that is distant metastatic disease.[2-3] This recommendation is for follicular, Hürthle cell, and papillary cancer subtypes (all category 2A).

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Caprelsa. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Caprelsa is recommended in those who meet the following criteria:

Food and Drug Administration (FDA)-Approved Indications

42. Medullary Thyroid Cancer (MTC). Approve for 3 years.

Other Uses with Supportive Evidence

2. **Differentiated (i.e., papillary, follicular, and Hürthle) Thyroid Carcinoma.** Approve for 3 years if the disease is refractory to radioactive iodine therapy.

3. **Non-Small Cell Lung Cancer with RET Gene Rearrangements.** Approve for 3 years.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Caprelsa has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

198. **Non-Small Cell Lung Cancer (NSCLC) [Without RET Gene Rearrangements].** The efficacy of Caprelsa for the treatment of NSCLC was evaluated in four Phase III studies; three of these studies did not show any statistically significant improvement with Caprelsa with regards to progression free survival (PFS) or overall survival. In the ZEST (Zactima Efficacy Study versus Tarceva) study, Caprelsa was compared with Tarceva® (erlotinib tablets) in patients (n = 1,240) with advanced NSCLC who have had treatment failure with one or two prior cytotoxic chemotherapy regimens.[6] There was no significant improvement in PFS in patients treated with Caprelsa vs. Tarceva (median PFS 2.6 months vs. 2.0 months, respectively; P = 0.721). In the second Phase III study (ZEPHYR), Caprelsa was assessed for overall survival benefit in patients with locally advanced or metastatic NSCLC who have had treatment failures with one or two previous chemotherapy regimens, including an EGFR tyrosine kinase inhibitor.[7] Patients (n = 924) were randomized 2:1 to receive either Caprelsa 300 mg/day or placebo. There was no statistically significant difference in the primary end point of overall survival in patients receiving Caprelsa or placebo. The median overall survival was 8.5 months for Caprelsa and 7.8 months with placebo (P = 0.527). The estimated percentage of patients alive after 1 year was 35.5% vs. 31.7% for Caprelsa and placebo, respectively. In the ZODIAC (Zactima in cOmbination with Docetaxel In non-smAll cell lung Cancer) Phase III study, Caprelsa in combination with docetaxel was compared with placebo and docetaxel in patients (n = 1,391) with locally advanced or metastatic NCSLC after progression following platinum-based first-line chemotherapy.[8] PFS was statistically significant in the Caprelsa group compared with the placebo group for the overall population (median PFS 4.0 months with Caprelsa vs. 3.2 months with placebo; P < 0.0001). There were no significant differences between the two groups for the secondary endpoint of overall survival. In the ZEAL (Zactima Efficacy with Alimta in Lung cancer) study the efficacy of Caprelsa was assessed in combination with Alimta® (pemetrexed disodium injection) for the second-line treatment of patients with advanced NSCLC.[9] The primary efficacy endpoint of PFS was not statistically significantly different between the treatment groups. The median PFS was 17.6 weeks for Caprelsa and 11.9 weeks for placebo (P = 0.108). There were also no significant differences between the two groups for overall survival.

199. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes*	Date Reviewed
Annual revision	Added new approval indication for Non-Small Cell Lung Cancer with RET Gene Rearrangements based on guidelines. Added clarification to Non-Small Cell Lung Cancer under "Conditions Not Recommended for Approval" that it applies to patients "(Without RET Gene Rearrangements)".	03/15/2017
Annual revision	Deleted the following conditions from Conditions Not Recommended for Approval section due to lack of data in past few years: breast cancer, hepatocellular cancer, ovarian cancer, prostate cancer, and urothelial cancer.	04/11/2018
Annual revision	No criteria changes	04/17/2019
Annual revision	No criteria changes	05/13/2020

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Cometriq™ (cabozantinib capsules – Exelixis Inc.)

DATE REVIEWED: 05/13/2020

OVERVIEW

Cometriq is a kinase inhibitor indicated for the treatment of patients with progressive, metastatic medullary thyroid cancer (MTC).[1] *In vitro* biochemical and cellular assays have shown Cometriq to inhibit the tyrosine kinase activity of rearranged during transfection (RET), MET, vascular endothelial cell growth factor receptor (VEGFR)-1, -2, and -3, KIT, tyrosine-related kinase B (TrkB), Fms-like tyrosine kinase 3 (FLT-3), AXL, and TIE-2.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for thyroid carcinoma (version 2.2019 – September 16, 2019) lists surgery as the main treatment option for MTC.[2-3] For *locoregional* , recurrent or persistent disease, or for distant metastases Caprelsa® (vandetanib tablets) [category 1] or Cometriq (category 1) are recommended for unresectable locoregional disease that is symptomatic or structurally progressive. The guidelines recommend that Cometriq be considered if clinical trials or other systemic therapies are not available or appropriate for the treatment of progressive and/or symptomatic iodine refractory thyroid cancer that is unresectable recurrent or persistent locoregional disease or that is distant metastatic disease.[2-3] This recommendation is for follicular, Hürthle cell, and papillary cancer subtypes (all category 2A).

The NCCN Compendium recommends the use of cabozantinib for RET gene rearrangements in non-small cell lung cancer (category 2A).[3]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Cometriq. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Cometriq is recommended in those who meet the following criteria:

FDA-Approved Indication

43. Medullary Thyroid Cancer (MTC). Approve for 3 years.

Other Uses with Supportive Evidence

44. Non-Small Cell Lung Cancer with RET Gene Rearrangements. Approve for 3 years.

45. Differentiated (i.e., papillary, follicular, and Hürthle) Thyroid Carcinoma. Approve for 3 years if the disease is refractory to radioactive iodine therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Cometriq has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

1. **Metastatic Castration-Resistant Prostate Cancer (mCRPC).** Results from the COMET-1 Phase III pivotal study with cabozantinib 60 mg tablets in men with mCRPC are published.[8] Patients included in the study had disease progressed after treatment with docetaxel as well as Zytiga® (abiraterone acetate tablets) and/or Xtandi® (enzalutamide capsules). The study failed to meet its primary endpoint of demonstrating statistically significant increase in overall survival (OS) compared with prednisone. The median OS with cabozantinib was 11.0 months vs. 9.8 months with prednisone (hazard ratio [HR] 0.90; 95% CI: 0.76, 1.06; P = 0.213). Based on these results, the second Phase III study, COMET-2 has been discontinued.[9]

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Copiktra Prior Authorization Policy
- Copiktra® (duvelisib capsules – Verastem)

REVIEW DATE: 11/04/2020

OVERVIEW

Copiktra, a kinase inhibitor, is indicated for the treatment of adults with:[1]
- **Chronic lymphocytic leukemia (CLL)/small lymphocytic lymphoma** (SLL), relapsed or refractory, after at least two prior therapies.
- **Follicular lymphoma**, relapsed or refractory, after at least two prior systemic therapies.

Disease Overview

CLL is one of the most prevalent adult leukemias in the Western world, with an age-adjusted incidence of 4 to 5 per 100,000.[2,3] In 2019, an estimated 20,720 patients were diagnosed with CLL in the US, and around 3,930 patients will die from the disease.[3] The median age at diagnosis is 72 years of age and men are more affected than women (2:1).[2] Lymphadenopathy may be a finding upon presentation, as well as symptoms such as fevers, night sweat, weight loss, or fatigue.[2,3] CLL and SLL are different manifestations of the same condition but managed similarily.[3] Both diseases are characterized by a progressive accumulation of leukemic cells, which appear as small mature lymphocytes and may be found among occasional larger or atypical cells, in the peripheral blood, bone marrow, and lymphoid tissues. One major distinction is that in CLL, a significant number of the abnormal lymphocytes are present in blood, in addition to bone marrow and lymphoid tissue. Comparably, in SLL there are few, if any, abnormal lymphocytes circulating in blood. The bulk of the disease is in the lymph nodes, bone marrow, and in other lymphoid tissue. Many patients with CLL have cytogenetic abnormalities which can serve as markers that provide prognostic information. Drug therapy for CLL is not curative and is often not necessary in uncomplicated early disease. Some patients can be monitored without therapy until they have progressive or symptomatic/active disease. Many medications and therapy regimens are used to manage CLL. Factors to consider for recommending the most optimal regimen for a patient include disease stage, patient symptoms, fitness and other concomitant illnesses of the patient, genetic factors, and the treatment scenario.

Guidelines

Copiktra is included in several guidelines published by the National Comprehensive Cancer Network (NCCN).
- **CLL/SLL:** The NCCN guidelines for CLL/SLL (version 1.2021 – September 28, 2020) address CLL.[3] Copiktra is one of several therapies for relapsed or refractory therapy (category 2A). The

guidelines note that CLL and SLL are different manifestations of the same condition and are treated similarly.

- **Follicular Lymphoma:** The NCCN guidelines for B-cell Lymphomas (version 4.2020 – August 13, 2020) recommend Copiktra as second-line and subsequent therapy in patients with follicular lymphoma (Grade 1 to 2) among patients relapsed or refractory after two prior therapies (category 2A).[4]
- **Marginal Zone Lymphoma:** The NCCN guidelines for B-Cell Lymphomas (version 4.2020 – August 13, 2020) recommend Copiktra as second-line and subsequent therapy for marginal zone lymphomas that are refractory or refractory to two prior therapies.[4] Other regimens are recommended first-line including many that are rituximab-based. Many recommendations for the different types of gastric MALT and nongastric MALT lymphoma follow those of marginal zone lymphomas.

Safety

Copiktra has a Boxed Warning regarding fatal and serious toxicities such as infections, diarrhea or colitis, cutaneous reactions, and pneumonitis.[1] Copiktra was approved with a Risk Evaluation and Mitigation Strategy (REMS) program to assist physicians in the management of these risks. Other Warnings are present regarding hepatotoxicity, neutropenia, and embryofetal toxicity.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Copiktra. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Copiktra is recommended in those who meet the following criteria:

FDA-Approved Indications

46. Chronic Lymphocytic Leukemia (CLL). Approve for 3 years if the patient has tried two prior therapies.
Note: Examples of therapies include Imbruvica® (ibrutinib capsules and tablets); Venclexta® (venetoclax tablets) with or without rituximab; Venclexta plus Gazyva® (obinutuzumab injection for intravenous use); chlorambucil plus Gazyva; chlorambucil plus rituximab; FCR (fludarabine, cyclophosphamide, and rituximab); FR (fludarabine plus rituximab); PCR (pentostatin, cyclophosphamide, and rituximab); Treanda® (bendamustine injection) with or without rituximab; high-dose methylprednisolone (HDMP) plus rituximab; Campath® (alemtuzumab injection for intravenous use) with or without rituximab; Calquence® (acalabrutinib capsules); Zydelig® (idelalisib tablets) with or without rituximab; Gazyva; Rituxan; Arzerra® (ofatumumab injection for intravenous use); or chlorambucil.

47. Follicular Lymphoma. Approve for 3 years if the patient has tried two prior therapies.
Note: Examples of therapies include Treanda® (bendamustine injection) plus rituximab; Treanda plus Gazyva® (obinutuzumab injection for intravenous use); CHOP (cyclophosphamide, doxorubicin, vincristine, prednisone) plus Gazyyva; RCHOP (rituximab, cyclophosphamide, doxorubicin, vincristine, prednisone); RCVP (rituximab, cyclophosphamide, vincristine, prednisone); chlorambucil with or without rixtuximab; cyclophosphamide with or without rituximab; Gazyva; Revlimid®

(lenalidomide capsules); CVP plus Gazyva; Zydelig® (idelalisib tablets); chlorambucil; cyclophosphamide; or Aliqopa® (copanlisib injection for intravenous use).

48. Small Lymphocytic Lymphoma (SLL). Approve for 3 years if the patient has tried two prior therapies.
Note: Examples of therapies include Imbruvica® (ibrutinib capsules and tablets); Venclexta® (venetoclax tablets) with or without rituximab; Venclexta plus Gazyva® (obinutuzumab injection for intravenous use); chlorambucil plus Gazyva® (obinutuzumab injection for intravenous use); chlorambucil plus rituximab; FCR (fludarabine, cyclophosphamide, and rituximab); FR (fludarabine plus rituximab); PCR (pentostatin, cyclophosphamide, and rituximab); Treanda® (bendamustine injection) with or without rituximab; high-dose methylprednisolone (HDMP) plus rituximab; Campath® (alemtuzumab injection for intravenous use) with or without rituximab; Calquence® (acalabrutinib capsules); Zydelig® (idelalisib tablets) with or without rituximab; Gazyva; Rituxan; Arzerra® (ofatumumab injection for intravenous use); or chlorambucil.

Other Uses with Supportive Evidence

200. MALT Lymphoma (Gastric and Nongastric). Approve for 3 years if the patient has tried two other therapies.
Note: Examples of therapies include rituximab; Treanda® (bendamustine injection for intravenous use) plus rituximab; RCHOP (rituximab, cyclophosphamide, vincristine, prednisone); RCVP (rituximab, cyclophosphamide, vincristine, prednisone); chlorambucil with or without rituximab; cyclophosphamide with or without rituximab; Imbruvica® (ibrutinib tablets and capsules); Zydelig® (idelalisib tablets); Revlimid® (lenalidomide capsules) with or without rituximab; or Aliqopa® (copanlisib injection for intravenous use).

201. Marginal Zone Lymphoma. Approve for 3 years if the patient has tried two other therapies.
Note: Examples of therapies include rituximab; Treanda® (bendamustine injection for intravenous use) plus rituximab; RCHOP (rituximab, cyclophosphamide, vincristine, prednisone); RCVP (rituximab, cyclophosphamide, vincristine, prednisone); chlorambucil with or without rituximab; cyclophosphamide with or without rituximab; Imbruvica® (ibrutinib tablets and capsules); Zydelig® (idelalisib tablets); Revlimid® (lenalidomide capsules) with or without rituximab; or Aliqopa® (copanlisib injection for intravenous use).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Copiktra is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Cotellic Prior Authorization Policy
- Cotellic® (cobimetinib tablets – Genentech/Roche)

REVIEW DATE: 07/08/2020

OVERVIEW
Cotellic is a mitogen-activated extracellular signal regulated kinase (MEK) inhibitor indicated in combination with Zelboraf® (vemurafenib tablets), for the treatment of patients with unresectable or metastatic melanoma with the *BRAF V600E* or *V600K* mutation.[1]

Guidelines
NCCN guidelines for melanoma (version 3.2020 – May 18, 2020) recommend BRAF/MEK inhibitor combinations for first-line (preferred if clinically needed for early response) and subsequent treatment of metastatic or unresectable melanoma with a *V600* activating mutation.[2] While combination BRAF/MEK inhibition is preferred, if a combination is contraindicated, monotherapy with a BRAF inhibitor (Tafinlar® [dabrafenib capsules] or Zelboraf® [vemurafenib tablets]) is recommended option, particularly if the patient is not a candidate for checkpoint immunotherapy. Following resection of limited metastatic disease with a *BRAF V600*-activating mutation, BRAF/MEK combination therapy is among the treatment options for patients with no evidence of disease. Tafinlar + Mekinist® (trametinib tablets) is also recommended in guidelines as adjuvant therapy (including for nodal recurrence) in some patients with Stage III disease, including use post-surgery or use after complete lymph node dissection. If unacceptable toxicity to Tafinlar/Mekinist, other BRAF/MEK combinations can be considered.

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of Cotellic. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Cotellic is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Melanoma.** Approve Cotellic for 3 years if the patient meets ALL of the following (A, B, and C):
   - **A)** Patient has unresectable, advanced, or metastatic melanoma; AND
   - **B)** Patient has *BRAF V600* mutation-positive disease; AND
   - **C)** Cotellic is being prescribed in combination with Zelboraf (vemurafenib tablets).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Cotellic is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Annual revision	No criteria changes.	06/18/2019
Annual revision	No criteria changes.	07/08/2020

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Daurismo Prior Authorization Policy

- Daurismo™ (glasdegib tablets – Pfizer)

REVIEW DATE: 12/02/2020

OVERVIEW

Daurismo, a hedgehog pathway inhibitor, is indicated, in combination with low-dose cytarabine, for the treatment of newly-diagnosed **acute myeloid leukemia** (AML) in adults who are ≥ 75 years of age or who have comorbidities that preclude use of intensive induction chemotherapy.[1]

Disease Overview

AML is a heterogeneous hematologic malignancy that is hallmarked by clonal expansion of myeloid blasts in the peripheral blood, bone marrow, and/or other tissues.[2] It is a rather common form of acute leukemia in adults and it has the largest number of annual deaths from leukemias in the US. Around 19,940 people will be diagnosed with AML in 2020, and 11,180 patients will die from the condition. The median age at diagnosis is 66 years of age. Over one-half and approximately one-third of patients receive the diagnosis at ≥ 65 and ≥ 75 years of age, respectively. The incidence of AML, along with myelodysplastic syndrome (MDS) is rising as patients become older. Environmental factors play a role and include prolonged exposure to petrochemicals; solvents such as benzene; pesticides; and ionizing radiation. Also, two cytotoxic agents that are associated with therapy-related MDS/AML are alkylating agents (e.g., cyclophosphamide) and topoisomerase inhibitors (e.g., doxorubicin). Antimetabolite therapy, notably fludarabine, has also been associated with MDS/AML in patients with lymphoproliferative disorders, especially when given in combination with alkylating agents. Molecular or karyotypic abnormalities can also be identified. Treatment of AML can involve the following modalities at various stages: chemotherapy, radiation therapy, chemotherapy with stem cell transplant, and other drug therapy.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines address Daurismo.[2]

- **Acute Myeloid Leukemia:** NCCN guidelines for AML (version 2.2021 – November 12, 2020) recommended Daurismo with low-dose cytarabine for patients ≥ 60 years of age who are not

candidates for intensive remission induction therapy or declines without an actionable mutation (category 2A). Daurismo is also recommended with low-dose cytarabine as post-induction therapy for patients ≥ 60 years of age who had a response to previous low-intensity therapy. (category 2A).

Safety

Daurismo has a Boxed Warning regarding embryofetal toxicity.[1] Also, patients receiving Daurismo may develop QTc prolongation and ventricular arrhythmias. Serious adverse reactions were reported in 79% of patients given Daurismo plus low-dose cytarabine and the most common were febrile neutropenia (29%), pneumonia (23%), hemorrhage (12%), anemia (7%), and sepsis (7%). Consider specific drug-drug interactions among patients given Daurismo (e.g., strong cytochrome P450 [CYP]3A4 inhibitors, strong CYP3A4 inducers, QTc prolonging medications).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Daurismo. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Daurismo is recommended in those who meet the following criteria:

FDA-Approved Indication

136. Acute Myeloid Leukemia (AML). Approve for 3 years if the patient meets the following criteria (A and B):
- **A)** Patient is using the medication in combination with cytarabine; AND
- **B)** Patient must meet one of the following criteria (i or ii):
  - **i.** Patient is using the medication for treatment induction and meets one of the following (a or b):
    - **a)** Patient is ≥ 75 years of age; OR
    - **b)** Patient meets both of the following [(1) and (2)]:
      1. Patient is ≥ 18 years of age; AND
      2. According to the prescriber, the patient has comorbidities that precludes the use of intensive induction chemotherapy; OR
  - **ii.** Patient meets both of the following (a and b):
    - **a)** Patient is ≥ 18 years of age; AND
    - **b)** Patient is continuing the medication as post-induction therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Daurismo is not recommended in the following situations:

147. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

466. Daurismo™ tablets [prescribing information]. New York, NY: Pfizer; November 2018.
467. The NCCN Acute Myeloid Leukemia Clinical Practice Guidelines in Oncology (Version 2.2021 – November 12, 2020). © 2010 National Comprehensive Cancer Network, Inc. Available at: http://www.nccn.org. Accessed on December 4, 2020.

HISTORY

Type of Revision	Summary of Changes	Review Date
New Policy	Not applicable.	11/28/2018
Selected Revision	For the criteria that requires that the patient is: 1) ≥ 75 years of age or 2) according to the prescribing physician, the patient has comorbidities that preclude the use of intensive induction chemotherapy, it was clarified that this applies to use in treatment induction. Added approval for Daurismo in patients with acute myeloid leukemia who are continuing the agent with cytarabine for post-remission therapy.	02/06/2019
Annual Revision	The word "prescriber" replace the section in the criteria that previously stated "prescribing physician". Also, per National Comprehensive Cancer Network guidelines for acute myeloid leukemia, the criteria that allowed continuation of Daurismo as post-remission therapy was changed to "post-induction" therapy.	12/11/2019
Annual Revision	**Acute Myeloid Leukemia:** For criteria regarding induction therapy, the age qualifier of ≥ 18 years was added to the criteria which states "according to the prescriber, the patient has comorbidities that preclude the use of intensive induction chemotherapy." For post-induction therapy, the age qualifier that the patient is ≥ 18 years of age was also added.	12/02/2020

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Erivedge Prior Authorization Policy

- Erivedge® (vismodegib capsules – Genentech)

REVIEW DATE: 11/04/2020

OVERVIEW

Erivedge, an inhibitor of the hedgehog signaling pathway, is indicated for the treatment of adults with metastatic **basal cell carcinoma**, or with locally advanced basal cell carcinoma that has recurred following surgery or who are not candidates for surgery, and who are not candidates for radiation.[1] It binds to and inhibits Smoothened, a transmembrane protein involved in Hedgehog signal transduction.

Guidelines

National Comprehensive Cancer Network (NCCN) guidelines for basal cell carcinoma (version 1.2020 – October 24, 2019) note that surgical approaches offer the most effective and efficient means for accomplishing a cure; radiation therapy may be chosen as the primary treatment in order to achieve optimal overall results.[2] For residual disease when surgery and radiation therapy are contraindicated and for recurrent disease with nodal or distant metastases, a hedgehog pathway inhibitor should be considered.

For central nervous system cancers, NCCN guidelines (version 3.2019 – September 11, 2020) list Erivedge as a treatment option for ceratin patients with recurrent disease, if chemotherapy has been tried and if there is a mutation of the sonic hedgehog pathway.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Erivedge. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Erivedge is recommended in those who meet the following criteria:

FDA-Approved Indications

49. Basal Cell Carcinoma, Metastatic. Approve for 3 years.

50. Basal Cell Carcinoma, Locally Advanced. Approve for 3 years if the patients meets ONE of the following conditions (A or B):

~~82.~~ Initial Therapy. Approve if the patient meets ONE of the following (i or ii):

i. Patient has recurrent basal cell carcinoma following surgery or radiation therapy; OR

ii. Patient meets BOTH of the following (a and b):

a) Patient is not a candidate for surgery; AND

~~a.~~ According to the prescriber, the patient is not a candidate for radiation therapy.

83. Patient is Currently Receiving Erivedge. Approve.

Other Uses with Supportive Evidence

51. Central Nervous System Cancer. (Note: This includes brain and spinal cord tumors.) Approve for 3 years if the patient meets BOTH of the following (A and B):
- **A)** Patient has tried at least one chemotherapy agent; AND
  Note: Examples of chemotherapy include etoposide, carboplatin, cisplatin.
- **B)** According to the prescriber, the patient has a mutation of the sonic hedgehog pathway.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Erivedge is not recommended in the following situations:

202. Basal Cell Carcinoma (Locally Advanced or Metastatic), in Patients with Disease Progression While on Odomzo® (sonidegib capsules). [Note: This does not apply to patients already started on Erivedge. Refer to criteria for basal cell carcinoma, Locally Advanced for Patients Currently Receiving Erivedge.] There are no data to support the use of Erivedge in patients who have experienced disease progression on Odomzo. Previous use of a hedgehog inhibitor was not allowed in the pivotal study for Odomzo.[3] Patients who develop resistance to one of the hedgehog pathway inhibitors are not expected to respond to another hedgehog pathway inhibitor. There is an open-label study which evaluated patients (n = 9) with advanced basal cell carcinoma who had progressed on Erivedge that showed resistance to Odomzo, another hedgehog signaling pathway used in basal cell carcinoma.[7]

203. Metastatic Colorectal Cancer. Erivedge is not recognized in the treatment recommendations for colon cancer from the NCCN (version 4.2020 – June 15, 2020).[4] In combination with standard of care treatment for first-line disease, Erivedge did not confer incremental clinical benefit as measured by progression-free survival (PFS) compared with standard care therapy alone. A Phase II study was designed to assess whether Erivedge would prolong PFS when combined with standard of care therapy (FOLFOX [leucovorin, fluorouracil, oxaliplatin] or FOLFIRI [leucovorin, fluorouracil, irinotecan] in combination with Avastin® [bevacizumab injection]) in patients requiring first-line treatment for metastatic colorectal cancer.[3] Adults with histologically confirmed disease were randomized 1:1 to Erivedge or placebo (n = 199). There was not a significant difference is median PFS or 12-month survival with Erivedge vs. placebo.

204. Ovarian Cancer. The NCCN guidelines for Ovarian Cancer (version 1.2020 – March 11, 2020) do not address the use of Erivedge for the management of ovarian cancer.[6] The prespecified magnitude of PFS was not achieved in a Phase II, randomized, double-blind, placebo-controlled trial in adults with histologically confirmed epithelial ovarian carcinoma, primary peritoneal carcinoma, or fallopian tube carcinoma. The study was conducted to determine an estimate of clinical benefit of maintenance therapy with Erivedge in the setting of second or third complete remission as measured by PFS using radiographic assessment.[5] Eligible patients had received chemotherapy (platinum based and/or non-platinum based) for recurrent disease and had achieved complete response after their most recent chemotherapy regimen. PFS was not statistically different with Erivedge vs. placebo.

205. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes*	Review Date
Annual Revision	**Patients Already Started on Erivedge:** This criterion only applies to basal cell carcinoma, locally advanced disease; reformat to address in the criteria section for this condition.	10/10/2018
Annual Revision	**Central Nervous System Cancers:** To align with NCCN guidelines, approve for 3 years if the patient has tried chemotherapy, and if, according to the prescriber, there is a mutation of the sonic hedgehog pathway.	10/16/2019
Annual Revision	**Basal Cell Carcinoma, Locally Advanced:** For the criterion applying to a patient who is not a candidate for radiation therapy, wording was updated to more generally allow this determination by the prescriber (criteria previously specified this was according to the prescribing physician).	11/04/2020

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Erleada (apalutamide tablets – Janssen Pharmaceuticals)

DATE REVIEWED: 03/04/2020

OVERVIEW

Erleada is indicated for the treatment of patients with non-metastatic, castration-resistant prostate cancer (nmCRPC).[1] It is also indicated in patients with metastatic castration-sensitive prostate cancer (CSPC). Patients should also receive a gonadotropin-releasing hormone (GnRH) analog concurrently or the patient should have had a bilateral orchiectomy. Erleada is an androgen receptor inhibitor that binds directly to the ligand-binding domain of the androgen receptor.

GUIDELINES

According to the National Comprehensive Cancer Network (NCCN) guidelines for prostate cancer, (version 4.2019 – August 19, 2019) for nmCRPC, androgen deprivation therapy (ADT) is continued to maintain castrate serum levels of testosterone (< 50 ng/dL).[2] Erleada, Xtandi® (enzalutamide capsules), and Nubeqa® (darolutamide tablets) are all category 1 recommended options especially if the PSADT is ≤ 10 months. Other secondary hormone therapy is recommended if PSADT is ≤ 10 months (category 2A): for non-metastatic (M0) CRPC, the options are nilutamide, flutamide, bicalutamide, ketoconazole, corticosteroids. For metastatic, castration-naïve disease, ADT in combination with abirateron + prednisone, Erleada, and Xtandi are all category 1 recommended options. Yonsa (abiraterone acetate) with methylprednisolone is a category 2B recommendation.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Erleada. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Erleada is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Prostate Cancer – Non-Metastatic, Castration-Resistant.** Approve Erleada for 3 years if the patient meets one of the following criteria (A or B):
   - **A)** The medication is used in combination with a gonadotropin-releasing hormone (GnRH) analog. Note: Examples are Lupron (leuprolide acetate for injection), Lupron Depot (leuprolide acetate for depot suspension), Trelstar (triptorelin pamoate for injectable suspension), Zoladex (goserelin acetate implant), Vantas (histrelin acetate subcutaneous implant), Firmagon (degarelix for injection); OR
   - **B)** The patient has had a bilateral orchiectomy.
2. **Prostate Cancer – Metastatic, Castration-Sensitive.** Approve for 3 years if the patient meets one of the following criteria (A or B):
   - **A)** The medication is used in combination with a gonadotropin-releasing hormone (GnRH) analog. Note: Examples are Lupron (leuprolide acetate for injection), Lupron Depot (leuprolide acetate for depot suspension), Trelstar (triptorelin pamoate for injectable suspension), Zoladex (goserelin acetate implant), Vantas (histrelin acetate subcutaneous implant), Firmagon (degarelix for injection); OR
   - **B)** The patient has had a bilateral orchiectomy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Erleada has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

206. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

242. The NCCN Prostate Cancer Clinical Practice Guidelines in Oncology (Version 4.2019 – August 19, 2019). © 2019 National Comprehensive Cancer Network Inc. Available at: http://www.nccn.org. Accessed February 25, 2020.

HISTORY

Type of Revision	Summary of Changes*	Date Reviewed
New Policy	New criteria	02/16/2018
Annual revision	No criteria changes	02/27/2019
Selected revision	Added new FDA-approved indication for metastatic castration-sensitive prostate cancer. Also added criteria for both indications that the medication is used in combination with gonadotropin-releasing hormone agonist or patient has had an orchiectomy.	09/25/2019

Annual revision	For concomitant therapy with gonadotropin-releasing hormone agonist changed verbiage from "agonist" to "analog" since antagonist can also be used. Added Firmagon as example for both conditions.	03/04/2020

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Erlotinib Prior Authorization Policy
- Erlotinib (Tarceva® tablets – Genentech/Astellas/OSI Pharmaceuticals; generics)

REVIEW DATE: 03/17/2021

OVERVIEW

Erlotinib, a kinase inhibitor, is indicated for the following uses:[1]

- **Non-Small Cell Lung Cancer**, treatment of tumors with epidermal growth factor receptor **(EGFR) exon 19 deletions** or **exon 21 (L858R) substitution mutations** as detected by an FDA-approved test receiving first-line, maintenance, or second or greater line treatment after progression following at least one prior chemotherapy regimen. The safety and efficacy of erlotinib have not been established in patients with NSCLC whose tumors have other EGFR mutations.
- **Pancreatic Cancer**, first-line treatment of patients with locally advanced, unresectable, or metastatic pancreatic cancer, in combination with gemcitabine.

Guidelines

- **Non-Small Cell Lung Cancer:** The National Comprehensive Cancer Network (NCCN) guidelines for NSCLC (version 4.2021 – March 3, 2021) recommend *EGFR* mutation testing in patients with nonsquamous NSCLC (i.e., adenocarcinoma, large cell) or in NSCLC not otherwise specified (NOS).[2] Erlotinib, Iressa® (gefitinib tablets), Gilotrif™ (afatinib tablets) Vizimpro® (dacomitinib tablets), and Tagrisso™ (osimertinib tablets) [preferred] are all category 1 recommended for the first-line treatment in patients with sensitizing *EGFR*-mutation positive NSCLC discovered before first-line chemotherapy. Erlotinib + Cyramza (ramucirumab injection) and erlotinib + bevacizumab are both category 2A recommended options.
- **Pancreatic Cancer:** NCCN guidelines for pancreatic adenocarcinoma (version 2.2021 – February 25, 2021) recommend erlotinib and gemcitabine combination for systemic therapy in patients with locally advanced unresectable disease with good performance status (category 2A).[4] Gemcitabine + erlotinib is also recommended for metastatic disease in this population (category 1).
- **Bone Cancer:** The NCCN bone cancer guidelines (version 1.2021 – November 20, 2020) list single-agent erlotinib as one of the systemic treatment options for patients with recurrent chordoma.[6] Other systemic therapy options include imatinib with or without cisplatin or sirolimus, Sutent® (sunitinib capsules), Tykerb® (lapatinib tablets) [for patients with EGFR-positive disease], or Nexavar® (sorafenib tablets).
- **Renal Cell Carcinoma:** The NCCN guidelines for Kidney Cancer (version 2.2021 – February 3, 2021) recommend erlotinib as one of the first-line therapies for relapse or surgically unresectable Stage IV disease with non-clear cell histology (category 2A).[5] Erlotinib, either as monotherapy or in combination with bevacizumab (combination therapy for selected patients with advanced papillary RCC), are category 2A recommended options.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of erlotinib. All approvals are provided for 3 years in duration as noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of erlotinib is recommended in those who meet the following criteria:

FDA-Approved Indications

52. Non-Small Cell Lung Cancer (NSCLC). Approve for 3 years if the patient meets the following criteria (A and B):
~~1.~~Patient has metastatic epidermal growth factor receptor (EGFR) mutation-positive disease; AND
~~2.~~Patient meets ONE of the following criteria (i or ii):
- **i.** Patient has epidermal growth factor receptor (EGFR) exon 19 deletions as detected by an approved test; OR
- **ii.** Patient has exon 21 (L858R) substitution mutations as detected by an approved test.

53. Pancreatic Cancer. Approve for 3 years if the medication is used in combination with gemcitabine.

Other Uses with Supportive Evidence

3. Bone Cancer. Approve for 3 years in patients who meet the following criteria (A and B):
A) Patient has chordoma; AND
B) Patient has tried at least one previous therapy.

4. Renal Cell Carcinoma (RCC). Approve for 3 years if the patient has relapsed or Stage IV non-clear cell histology RCC.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of erlotinib is not recommended in the following situations:

207. Biliary Cancer. There were no differences in PFS and OS between gemcitabine/oxaliplatin and gemcitabine/oxaliplatin with the addition of erlotinib in patients with metastatic biliary-tract cancer (cholangiocarcinoma, gallbladder cancer, or ampulla of Vater cancer) in one Phase III, open-label, randomized study (n = 268); however, in a subgroup of patients with cholangiocarcinoma, the addition of erlotinib to chemotherapy resulted in a significantly prolonged PFS (5.9 months vs. 3.0 months; P = 0.049).[7,8] In patients with advanced (unresectable or metastatic) cholangiocarcinoma or gallbladder cancer, combination therapy with bevacizumab and erlotinib showed clinical activity in one Phase II study (n = 56).[9] Among six patients with confirmed PRs, the median duration of response was 8.4 months (95% CI: 6.0, 11.7). Eighty-seven percent of patients progressed with a median time to disease progression of 4.4 months (95% CI: 3.0, 7.8). Median OS was 9.9 months (95% CI: 7.2, 13.6). As single-agent therapy in one Phase II study, erlotinib showed benefit in patients with unresectable or metastatic biliary cancer previously treated with not more than one prior systemic or locoregional therapy (n = 42).[10] In all, 17% (n = 1/7) of patients (95% CI: 7% to 31%) were progression free at 6 months. One Phase II trial evaluated the efficacy of erlotinib and docetaxel in patients with refractory (up to two prior systemic therapies) hepatocellular (n = 14) and biliary (n = 11) cancers.[11] The 16-week PFS rate was 64% for biliary tract cancer (95% CI: 29.7, 84.5), meeting the 16-week PFS endpoint of ≥ 30%. Median OS was 5.7 months and similar to historical data with single-agent erlotinib therapy.

2. Breast Cancer. One Phase II, non-randomized, open-label, bi-institutional trial did not support beneficial effect of erlotinib plus bevacizumab in patients with metastatic breast cancer with stage IV disease that was stable or had progressed after treatment with one or two chemotherapy regimens; if

the patient's tumor was human epidermal growth factor receptor-2 (HER-2) positive, prior therapy with trastuzumab was required (n = 38).[12] As single-agent therapy, erlotinib had minimal activity in unselected, previously treated women with locally advanced or metastatic breast cancer in one multicenter, Phase II study (n = 69).[13] Metronomic (frequent low-dose) capecitabine tablets and cyclophosphamide plus Bevacizumab and erlotinib was effective in patients with untreated advanced metastatic HER-2 negative, estrogen receptor-negative, and progesterone receptor-poor advanced breast cancer (n = 26).[14] Among 24 patients assessable for response, 4% of patients has a CR [n = 1], 58% of patients had PR (n = 14), 21% of patients had stable disease (SD) > 9 weeks duration (n = 5) and 4% of patients (n = 1) had early progression of disease. The overall clinical benefit (CR + PR + SD > 24 weeks) was 75% (95% CI: 53, 90). Median time to progression was 43 weeks (95% CI: 21, 69). OS was 108 months (95% CI: 70, 110).

3. **Colorectal Cancer, Metastatic (mCRC).** In Phase II studies in patients with untreated mCRC, efficacy has not been demonstrated.[15-18] In one Phase III trial, patients with mCRC received doublet chemotherapy plus bevacizumab as initial therapy.[19] Patients without tumor progression were randomized to maintenance therapy with bevacizumab plus erlotinib (n = 80) or bevacizumab alone (n = 79). Median PFS was 5.7 months with the combination and 4.2 months with bevacizumab alone (HR 0.79; 95% CI: 0.55, 1.12; P = 0.19). The rate of any Grade 3/4 toxicity was 53% with bevacizumab/erlotinib vs. 13% with bevacizumab alone. Another Phase III trial, OPTIMOX3, assessed the efficacy of maintenance bevacizumab plus erlotinib therapy (n = 224) after induction chemotherapy compared with bevacizumab alone (n = 228) in patients with unresectable metastatic colorectal cancer.[20] The median PFS from maintenance was 5.4 months in the bevacizumab plus erlotinib group compared with 4.9 months in the bevacizumab group (HR 0.81; 95% CI: 0.66, 1.01; P = 0.059). The median OS from maintenance was 24.9 months compared with 22.1 months for bevacizumab plus erlotinib and bevacizumab alone, respectively. The Phase III Nordic ACT2 trial demonstrated that the addition of erlotinib to bevacizumab as maintenance therapy in patients with KRAS wild-type mCRC did not significantly improve PFS or OS.[21]

4. **Glioblastoma Multiforme (GBM).** In one Phase II study, concurrent radiation therapy (RT) and temozolomide in combination with erlotinib in patients newly diagnosed with glioblastoma (n = 27) was not efficacious.[22] In two Phase II studies, erlotinib plus temozolomide given during and after RT produced favorable median survival, and PFS, as well as 12- or 14-month survival rates in patients with newly diagnosed GBM or gliosarcoma.[23,24] In patients with newly diagnosed (untreated; could have had resection) GBM or gliosarcoma who received erlotinib plus temozolomide during and after radiation, median survival was longer with erlotinib plus temozolomide vs. historical controls (19.3 months vs. 14.1 months, respectively; HR for survival 0.64; 95% CI: 0.45, 0.91; P = 0.01) in one open-label, single-center, Phase II trial (n = 65).[23] The historical controls were comparable patients from two prospective, Phase II trials (n = 128); the first trial included the use of Thalomid (thalidomide capsules) in combination with temozolomide during and after radiotherapy; the second that included the use of *cis*-retinoic acid with temozolomide during and after radiotherapy. In one open-label, Phase I/II trial, treatment with erlotinib plus temozolomide during and after RT resulted in favorable survival rate (61% of patients were alive at 1 year) and median PFS (7.2 months) in patients with newly diagnosed GBM (following resection); however, there was no significant difference in OS with the addition of erlotinib compared with the temozolomide/RT arm of a historical control trial (15.3 months vs. 15 months, respectively).[24] Erlotinib has failed to demonstrate benefit in recurrent glioblastomas.[25-28]

5. **Head and Neck Cancer, Squamous Cell, Recurrent and/or Metastatic.** Two Phase II studies assessed the use of erlotinib and bevacizumab in different settings and showed promising results.[29,30] One multicenter, Phase II trial assessed the addition of bevacizumab and erlotinib to chemoradiation as first-line treatment for previously untreated patients with locally advanced squamous cell carcinoma of the head and neck (SCCHN) [n = 60].[29] After a median follow-up of 32 months the estimated 3-year

PFS and OS rates were 71% and 82%, respectively. After induction therapy, 65% of patients had major responses; after completion of therapy 95% of patients had either partial or complete radiographic responses. One multi-institutional Phase I/II study enrolled patients with recurrent or metastatic SCCHN (previously treated with ≤ 1 prior regimen for recurrent disease) to receive erlotinib and bevacizumab (n = 56).[30] The median OS and PFS durations were 7.1 months (95% CI: 5.7, 9.0) and 4.1 months (95% CI: 2.8, 4.4), respectively. Treatment with erlotinib monotherapy produced few PRs in unselected (EGFR status not known at baseline) patients with locally recurrent and/or metastatic SCCHN in one open-label, Phase II clinical trial (n = 115); 38.3% of patients achieved SD for a median of 16.1 weeks.[31] In one Phase II study, 204 patients with locally advanced SCCHN were randomized to receive cisplatin in combination with RT with or without erlotinib.[32] Complete response rates evaluated by central review were reported in 40% of patients (n = 42/105) on cisplatin/RT vs. 52% of patients (n = 51/99) on cisplatin/RT/erlotinib (P = 0.08). At a median follow-up of 26 months and 54 progression events, there was no difference in PFS between the two treatment arms (HR 0.0; P = 0.71). In a Phase II study, patients with recurrent SCCHN were treated with erlotinib for 12 months (n = 31). The OS was 61% at 1 year and 56% at 2 years.[33] Disease-free survival was 54% at 1 year and 45% at 2 years. The mean time to recurrence (n = 16) was 8.7 months. Only 8 patients completed the full 12-month course of erlotinib; the median duration of erlotinib therapy was 5 months.

6. **Hepatocellular Carcinoma (HCC), Advanced.** Some Phase II studies have reported activity of erlotinib in patients with HCC while others have not.[34-36] In one Phase III trial, patients with advanced HCC were randomized to Nexavar/erlotinib (n = 362) or Nexavar/placebo (n = 358).[37] Median OS, the primary endpoint, was similar in both groups: 9.5 vs. 8.5 months for Nexavar/erlotinib and Nexavar/placebo, respectively (HR 0.929; P = 0.408). A network meta-analysis of 11 randomized controlled trials with 6,594 patients with advanced hepatocellular carcinoma concluded that Nexavar in combination with erlotinib demonstrated better short-term and long-term efficacy compared with other drugs.[38]

7. **Occult Primary/Cancer of Unknown Primary Site (CUP).** The combination of bevacizumab and erlotinib (alone or combined with paclitaxel and carboplatin) had activity as first- or second-line therapy in patients with occult primary tumors (adenocarcinoma, poorly differentiated carcinoma, poorly differentiated adenocarcinoma, poorly differentiated squamous carcinoma).[39]

8. **Renal Cell Carcinoma (RCC), Advanced – Clear Cell Histology.** Efficacy with erlotinib has not been demonstrated in patients with clear cell histology.[5]

9. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	No criteria changes	03/13/2019
Annual Revision	Added generic tablets to drug targets and changed to generic policy name. For "Bone Cancer – Chordoma", deleted reference to "recurrent disease" and changed criteria to state patients "who have tried at least one previous therapy."	03/11/2020
Annual Revision	**Non-Small Cell Lung Cancer:** Moved "Epidermal Growth Factor Receptor (EGFR) Mutation-Positive" descriptor from indication heading to criteria. **Pancreatic Cancer:** Deleted "Locally Advanced, Unresectable, or Metastatic" from indication heading since it is not needed. Changed wording from erlotinib is "prescribed" in combination with gemcitabine to "the medication is used" in combination with gemcitabine, in-line with other policies. **Renal Cell Carcinoma (RCC):** Deleted "Advanced – Non-Clear Cell Histology" from indication. Within criteria added to approve "if the patient has relapsed or Stage IV non-clear cell histology RCC". **Bone Cancer:** Deleted "Chordoma" from indication descriptor and added it as criteria.	03/17/2021

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Farydak® (panobinostat capsules – Novartis Pharmaceuticals)

DATE REVIEWED: 04/22/2020

OVERVIEW

Farydak is a histone deacetylase (HDAC) inhibitor, which, in combination with Velcade® (bortezomib injection) and dexamethasone, is indicated for the treatment of patients with multiple myeloma who have received at least two prior regimens, including Velcade and an immunomodulatory drug (IMiD) [i.e., Thalomid® {thalidomide capsules}, Revlimid® {lenalidomide capsules}, Pomalyst® {pomalidomide capsules}).[1] The recommended starting dose of Farydak is 20 mg, taken orally once every other day (QOD) for three doses per week in Weeks 1 and 2 of each 21-day cycle for up to eight cycles. Treatment may be continued for an additional eight cycles in patients with clinical benefit who do not experience unresolved severe or medically significant toxicity, up to a maximum of 16 cycles (48 weeks).

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines, which address diagnosis, treatment, and follow-up for patients with multiple myeloma (version 3.2020 – March 10, 2020), note that Farydak/Velcade/dexamethasone (category 1) is an Other Regimen for patients who have tried at least

two previous therapies, including Velcade and an IMiD, for treatment of previously treated disease.[2] Although not approved combinations, Farydak/Kyprolis® (carfilzomib injection) and Farydak/Revlimid/dexamethasone are also listed as potential Other Regimens for previously treated multiple myeloma (both category 2A). While there are small studies evaluating these combinations in previously treated multiple myeloma, there are multiple other regimens that NCCN classifies as Preferred Regimens for previously treated multiple myeloma. These regimens have a more established place in therapy and a stronger recommendation by NCCN.

Safety

There is a Farydak Risk Evaluation and Mitigation Strategy (REMS) program which consists of a communication plan to inform healthcare professionals of risks of cardiotoxicity and diarrhea and how to minimize these events.[3]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Farydak. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

FDA-Approved Indications

54. Multiple Myeloma. Approve for 1 year if the patient meets the following conditions (A and B):
- **3.** Farydak will be taken in combination with Velcade® (bortezomib injection) and dexamethasone; AND
- **4.** The patient has previously tried Velcade and one immunomodulatory drug (i.e., Thalomid [thalidomide capsules], Revlimid [lenalidomide capsules], or Pomalyst [pomalidomide capsules]).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Farydak has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

208. Pancreatic Cancer. A Phase II study evaluating Farydak + Velcade in patients with pancreatic cancer who were progressing on gemcitabine-based therapy was discontinued early due to toxicity and a lack of response.[4]

209. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Gavreto Prior Authorization Policy
- Gavreto™ (pralsetinib capsules – Blueprint Medicines Corporation)

REVIEW DATE: 09/09/2020; selected revision 12/09/2020

OVERVIEW

Gavreto, a kinase inhibitor, is indicated for the treatment of the following conditions:[1]

- **Medullary thyroid cancer**, in adult and pediatric patients ≥ 12 years of age with advanced or metastatic *RET*-mutant disease, who require systemic therapy.
- **Non-small cell lung cancer (NSCLC)**, in adult patients with metastatic rearranged during transfection (*RET*) fusion-positive disease as detected by an FDA approved test.
- **Thyroid cancer**, in adult and pediatric patients ≥ 12 years of age with advanced or metastatic *RET* fusion-positive disease who require systemic therapy and who are radioactive iodine-refractory.

  All of the above indications are approved under accelerated approval based on overall response rate and duration of response. Continued approval for this indication may be contingent upon verification and description of clinical benefit in confirmatory trial(s).

Guidelines

The National Comprehensive Cancer Network (NCCN) NSCLC guidelines (version 8.2020 – September 15, 2020) recommend Gavreto and Retevmo™ (selpercatinib capsules) as "preferred" (both category 2A) first-line therapies for RET rearrangement-positive disease.[2] For patients who were started on other systemic therapy options and had disease progression, Gavreto and Retevmo are recommended as "preferred" subsequent therapies.

Gavreto is not addressed in the thyroid guidelines. In the NCCN thyroid carcinoma guidelines (version 2.2020 – July 15, 2020) the use of Retevmo™ (selpercatinib capsules) is addressed in a variety of therapy settings.[3] Retevmo is a category 2A recommended therapy for patients with *RET* fusion-positive thyroid tumors that are radioactive iodine refractory. For recurrent, persistent, or metastatic medullary thyroid cancer, Caprelsa or Cometriq are both category 1 "preferred" options. Retevmo is listed as a category 2A "preferred" regimen for *RET* mutation-positive medullary thyroid cancer. For anaplastic carcinoma, molecular testing for actionable mutations is recommended; if positive for *RET* fusion, Retevmo can be considered (category 2A).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Gavreto. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Gavreto is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Medullary Thyroid Cancer.** Approve for 3 years if the patient meets the following criteria (A, B, and C):
   Note: For other types of thyroid cancer see criteria below for "Thyroid Cancer".
   A) Patient is ≥ 12 years of age; AND
   B) Patient has advanced or metastatic rearranged during transfection (*RET*)-mutant disease; AND
   C) The disease requires treatment with systemic therapy.

2. **Non-Small Cell Lung Cancer.** Approve for 3 years if the patient meets the following criteria (A, B, and C):
   C) Patient is ≥ 18 years of age; AND
   D) Patient has metastatic disease; AND
   E) Patient has rearranged during transfection (*RET*) fusion-positive disease as detected by an approved test.

3. **Thyroid Cancer.** Approve for 3 years if the patient meets the following criteria (A, B, C, and D):
   Note: For "Medullary Thyroid Cancer" see above criteria.

A) Patient is ≥ 12 years of age; AND
B) Patient has advanced or metastatic rearranged during transfection (RET) fusion-positive disease; AND
C) The disease is radioactive iodine-refractory; AND
D) The disease requires treatment with systemic therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Gavreto is not recommended in the following situations:

148. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
New Policy	--	09/09/2020
Selected Revision	**Non-Small Cell Lung Cancer:** Changed approval duration to 3 years from 1 year. Deleted "FDA-approved" in reference to testing and also deleted criteria requiring specialist physician, to be in-line with other oral oncology policies.	09/23/2020
Selected Revision	**Medullary Thyroid Cancer:** Added new approval condition and criteria based on FDA-approved indication. **Thyroid Cancer:** Added new approval condition and criteria based on FDA-approval.	12/09/2020

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Gilotrif Prior Authorization Policy
- Gilotrif™ (afatinib tablets – Boehringer Ingelheim)

REVIEW DATE: 12/16/2020

OVERVIEW

Gilotrif is a tyrosine kinase inhibitor (TKI) indicated for the following:
- **Non-small cell lung cancer (NSCLC)**, first-line treatment of patients with metastatic disease whose tumors have non-resistant epidermal growth factor receptor (EGFR) mutations as detected by a FDA-approved test.[1] The safety and efficacy of Gilotrif have not been established in patients whose tumors have resistant *EGFR* mutations.
- **NSCLC, squamous,** for the treatment of patients with metastatic disease progressing after platinum-based chemotherapy.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for NSCLC (version 1.2021 – November 25, 2020) recommend Tarceva® (erlotinib tablets), Iressa® (gefitinib tablets), Gilotrif, Vizimpro® (dacomitinib tablets), and Tagrisso™ (osimertinib tablets) as Category 1 recommended options for the first-line treatment in patients with sensitizing *EGFR*-mutation positive NSCLC.[3] Tagrisso is noted as an

"preferred" option in the first-line setting. Upon disease progression, T790M testing is recommended in guidelines. NCCN added a footnote to this recommendation to also consider Gilotrif and Erbitux® (cetuximab for injection) combination regimen in patients with disease progression (T790M-negative multiple systemic lesions) on EGFR-TKI therapy (category 2A). This is based on data demonstrating similar response rates with this combination therapy in patients with T790M mutation-positive or mutation-negative tumors in pre-treated patients with NSCLC. NCCN notes that for squamous cell carcinoma, Gilotrif is not used in the second-line setting at NCCN institutions for these indications related to the efficacy and safety of these agents compared to the efficacy and safety of other available agents.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Gilotrif. All approvals are provided for 3 years in duration as noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Gilotrif is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Non-Small Cell Lung Cancer (NSCLC) – Epidermal Growth Factor Receptor (EGFR) Mutation-Positive.** Approve for 3 years if the patient meets the following criteria (A and B):
   ~~5.~~Patient has *metastatic* NSCLC; AND
   ~~6.~~ Patient has non-resistant *EGFR* mutation-positive NSCLC as detected by an approved test.

2. **Non-Small Cell Lung Cancer (NSCLC) – Squamous Cell Carcinoma.** Approve for 3 years if the patient meets the following criteria (A and B):
   A) Patient has metastatic squamous cell carcinoma; AND
   B) Patient has disease progression after treatment with platinum-based chemotherapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Gilotrif is not recommended in the following situations:

210. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Annual Revision	No criteria changes.	12/04/2019
Annual Revision	No criteria changes.	12/16/2020

EGFR – Epidermal growth factor receptor; NSCLC – Non-small cell lung cancer.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Ibrance Prior Authorization Policy
- Ibrance® (palbociclib capsules and tablets – Pfizer)

REVIEW DATE: 02/24/2021

OVERVIEW

Ibrance, a cyclin-dependent kinase (CDK) 4/6 inhibitor, is indicated for the treatment of adult patients with hormone receptor positive (**HR+**), human epidermal growth factor receptor 2 (**HER2**)-**negative advanced or metastatic breast cancer** in combination with:[1]

- An aromatase inhibitor (AI) as initial endocrine-based therapy in postmenopausal women or in men.
- Fulvestrant in patients with disease progression following endocrine therapy.

Guidelines

- **Breast Cancer:** The National Comprehensive Cancer Network (NCCN) guidelines on breast cancer (version 1.2021 – January 15, 2021) recommend any of the CDK4/6 inhibitors in combination with an AI or fulvestrant as a first-line preferred treatment option for recurrent or Stage IV HR+ and HER2-negative disease in postmenopausal women or premenopausal patient receiving ovarian ablation or suppression (category 1).[2,3] CDK4/6 inhibitor + fulvestrant is recommended for second- and subsequent-line therapy, if CDK4/6 inhibitor was not previously used (category 1). However, the guidelines also state in a footnote that if there is disease progression on CDK4/6 inhibitor therapy or PI3K inhibitor, there are limited data to support an additional line of therapy with another CDK4/6-containing regimen.[2,4] The compendium recommends that men with breast cancer be treated similarly to postmenopausal women, except that the use of an AI is ineffective without concomitant suppression of testicular steroidogenesis.[3]
- **Liposarcoma:** The NCCN guidelines on soft tissue sarcoma (version 6.2019 – February 10, 2020) recommend Ibrance as single-agent therapy for the treatment of well-differentiated/dedifferentiated liposarcoma (WD-DDLS) for retroperitoneal sarcomas (category 2A).[4]

Supportive Data

A multicenter analysis evaluated clinical outcomes in patients (n = 58) with HR+/HER2-negative metastatic breast cancer who received Verzenio (abemaciclib tablets) after disease progression on Ibrance or Kisqali (ribociclib tablets).[5] At data cutoff, 34% of patients (n = 20/58) had progressive disease, while 36% of patients (n = 21/58) had treatment duration exceeding 6 months. The median progression-free survival (PFS) was 5.8 months. Another case report of Verzenio use after 10 lines of therapy, including Ibrance therapy is available, along with literature review of ongoing studies with other CDK 4/6 inhibitors after prior use of another inhibitor.[6] Ibrance and Kisqali also have ongoing studies assessing for their respective efficacy after progression on another CDK4/6 inhibitor.[7,8] Preliminary results from the Kisqali trial (TRINITI-1), a Phase I/II, open-label trial of triplet therapy (Kisqali + everolimus + exemestane) after progression on prior CDK 4/6 inhibitor and up to three lines of therapy are available.[9] A total of 95 patients

were evaluated; 41.1% of patients demonstrated clinical benefit, exceeding the predefined primary endpoint threshold (> 10%). The response rate was 8.4% and the median PFS was 5.7 months, and the 1-year PFS was 33%.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Ibrance. All approvals are provided for 3 years in duration unless otherwise noted below. In the clinical criteria, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: a woman is defined as an individual with the biological traits of a woman, regardless of the individual's gender identity or gender expression; men are defined as individuals with the biological traits of a man, regardless of the individual's gender identity or gender expression.
Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Ibrance is recommended in those who meet the following criteria:

FDA-Approved Indications

55. Breast Cancer in Postmenopausal Women*. Approve for 3 years if the patient meets the following criteria (A, B, and C):
- **7.** Patient has advanced or metastatic hormone receptor positive (HR+) [i.e., estrogen receptor positive {ER+} and/or progesterone receptor positive {PR+}] disease; AND
- **8.** Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND
- **9.** Patient meets ONE of the following criteria (i or ii):
  - **i.** Ibrance will be used in combination with anastrozole, exemestane, or letrozole; OR
  - **ii.** Ibrance will be used in combination with fulvestrant.

***** Refer to the Policy Statement.

2. Breast Cancer in Pre/Perimenopausal Women*. Approve for 3 years if the patient meets the following criteria (A, B, C, and D):
- **A)** Patient has advanced or metastatic hormone receptor positive (HR+) [i.e., estrogen receptor positive {ER+} and/or progesterone receptor positive {PR+}] disease; AND
- **B)** Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND
- **C)** Patient is receiving ovarian suppression/ablation with a gonadotropin-releasing hormone (GnRH) agonist or has had surgical bilateral oophorectomy or ovarian irradiation; AND
  Note: Examples are Lupron (leuprolide), Trelstar (triptorelin), Zoladex (goserelin).
- **D)** Patient meets ONE of the following conditions (i or ii):
  - **i.** Ibrance will be used in combination with anastrozole, exemestane, or letrozole; OR
  - **ii.** Ibrance will be used in combination with fulvestrant.

***** Refer to the Policy Statement.

3. Breast Cancer in Men*. Approve for 3 years if the patient meets the following criteria (A, B, and C):
- **A)** Patient has advanced or metastatic hormone receptor positive (HR+) [i.e., estrogen receptor positive {ER+} and/or progesterone receptor positive {PR+}] disease; AND
- **B)** Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND
- **C)** Patient meets ONE of the following criteria (i or ii):

i. Patient meets BOTH of the following criteria (a and b):
  a) Patient is receiving a gonadotropin-releasing hormone (GnRH) analog; AND
  Note: Examples are Lupron (leuprolide), Trelstar (triptorelin), Zoladex (goserelin), Firmagon (degarelix), Orgovyx (relugolix).
  b) Ibrance will be used in combination with anastrozole, exemestane, or letrozole; OR
ii. Ibrance will be used in combination with fulvestrant.

***** Refer to the Policy Statement.

Other Uses with Supportive Evidence

4. Liposarcoma. Approve for 3 years if the patient has well-differentiated/dedifferentiated liposarcoma (WD-DDLS).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Ibrance is not recommended in the following situations:

211. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	Deleted criteria in all approval conditions which require patient to try a prior endocrine therapy before approving for Ibrance + Faslodex. Likewise, deleted criteria that required Ibrance + aromatase inhibitors use (e.g., letrozole) only as initial therapy. Guidelines support first-line or subsequent therapy use.	04/03/2019
Annual Revision	Added Ibrance "tablets" to drug targets. Use of Ibrance in men is an FDA approved use, so moved it under "FDA-approved Indications".	04/15/2020
Early Annual Revision	**All Breast Cancer Indications:** Deleted criteria requiring no disease progression on Kisqali (ribociclib), Ibrance, or Verzenio (abemaciclib), based on guidelines and available data. **Breast Cancer in Pre/Perimenopausal Women:** Examples of gonadotropin-releasing hormone (GnRH) agonists are moved from criteria to Note. **Breast Cancer in Men:** GnRH "agonist" is changed to "analog". Also, the list of examples of GnRH analog agents are moved from criteria to Note. Firmagon (degarelix) and Orgovyx (relugolix) were added to example list.	02/24/2021

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Iclusig Prior Authorization Policy

- Iclusig® (ponatinib tablets – ARIAD/Takeda)

REVIEW DATE: 04/01/2020

OVERVIEW

Iclusig, a tyrosine kinase inhibitor (TKI), is indicated for the treatment of adults with T315I-positive chronic myeloid leukemia (CML) [chronic phase {CP}, accelerated phase {AP}, or blast phase {BP}] and T135I-positive Philadelphia chromosome positive (Ph+) acute lymphoblastic leukemia (ALL).[1] Iclusig is also indicated for the treatment of adults with CP, AP, or BP CML or Ph+ ALL for whom no other TKI therapy is indicated. A limitation of use is that Iclusig is not indicated and is not recommended for the treatment of patients with newly-diagnosed chronic phase CML. There are four other TKIs approved for the treatment of Ph+ CML: Gleevec® (imatinib tablets, generic), Sprycel® (dasatinib tablets), Tasigna® (nilotinib capsules), and Bosulif® (bosutinib tablets).[5-8] These agents are indicated for the treatment of Ph+ CML in various phases; some TKIs are indicated after resistance or intolerance to prior therapy. Sprycel and Gleevec are also indicated for use in patients with Ph+ ALL.[5,6]

Clinical Efficacy

The PACE (Ponatinib Ph+ ALL and CML Evaluation) trial was a Phase II, open-label, multinational study that assessed Iclusig in patients with CML or Ph+ ALL (n = 449) who were heavily pretreated with resistance to or unacceptable adverse effects with Sprycel® (dasatinib tablets) or Tasigna® (nilotinib capsules) or who had the BCR-ABL T315I mutation.[1,2] Benefits (e.g., major cytogenetic response, complete cytogenetic response) were noted in many patients.[2] A Phase I, dose-escalation trial (n = 81) investigated Iclusig in patients with resistant hematologic cancer including CML and Ph+ ALL.[3] Results suggest that Iclusig was highly active in heavily pretreated patients with Ph+ leukemias with resistance to TKI inhibitors, including patients with the BCR-ABL T315I mutation, other mutations, or no mutations. Other data are also available.[11,12]

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for CML (version 3.2020 – January 30, 2020) state that for patients with CP CML with a low-risk score, the primary treatment recommended includes a first-generation TKI (Gleevec or generic imatinib 400 mg QD [Category 1]), or a second-generation TKI (Bosulif 400 mg QD [Category 1], Sprycel 100 mg QD [Category 1], or Tasigna 300 mg BID [Category 1]).[9] For patients with CP CML with an intermediate- or high-risk score, a second-generation TKI is preferred (Bosulif 400 mg QD [Category 1], Sprycel 100 mg QD [Category 1], or Tasigna 300 mg BID [Category 1]). A first-generation TKI (Gleevec or generic imatinib 400 mg QD) is an alternative [Category 2A]. Iclusig is an option for patients with a T315I mutation and for with disease that has not responded to multiple TKIs or in whom another TKI is not indicated. The NCCN guidelines

for ALL (adult and adolescent young adults) [version 1.2020 – January 15, 2020] recommend Iclusig as an option for patients with relapsed or refractory ALL and note its activity against T315I mutations.[10]

Safety

Iclusig has a Boxed Warning regarding arterial occlusion, venous thromboembolism, heart failure and hepatotoxicity.[1] The dosage and administration section notes that the optimal dose of Iclusig has not been identified. In clinical trials, the initial dose of Iclusig was 45 mg once daily (QD). However, many patients (68%) required dose reductions to 30 mg to 15 mg QD during the therapy course. Consideration should be given to discontinue Iclusig if a response has not occurred by 3 months (90 days). Iclusig has a Risk Evaluation and Mitigation Strategy (REMS) program.[4]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Iclusig. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Iclusig is recommended in those who meet the following criteria:

FDA-Approved Indications

56. Chronic Myeloid Leukemia (CML) That is Philadelphia Chromosome Positive. Approve for 3 years if the patient meets one of the following criteria (A or B):

A) The patient is T315I-positive, OR

B) The patient has tried at least two other tyrosine kinase inhibitors indicated for use in Philadelphia chromosome positive CML.
Note: Examples include Gleevec® (imatinib tablets), Sprycel® (dasatinib tablets), and Tasigna® (nilotinib capsules).

57. Acute Lymphoblastic Leukemia (ALL) That is Philadelphia Chromosome Positive (Ph+). Approve for 3 years if the patient meets ONE of the following criteria (A or B):

C) The patient is T315I-positive; OR

D) The patient has tried at least two other tyrosine kinase inhibitors that are used for Philadelphia chromosome positive ALL.
Note: Examples include Gleevec® (imatinib tablets), and Sprycel® (dasatinib tablets).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Iclusig is not recommended in the following situations:

212. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual revision	Removed the criteria allowing for approval if the patient has been started on Iclusig for an indication or condition addressed as an approval in the Recommended Authorization section.	03/07/2018
Annual revision	No criteria changes.	03/20/2019
Annual revision	The following changes was made: **Chronic Myeloid Leukemia that is Ph+:** The wording that the patient has tried two other tyrosine kinase inhibitors for chronic myeloid leukemia was changed to state "at least two" and examples of tyrosine kinase inhibitors were moved from the criteria to a note. **Acute Lymphoblastic Leukemia that is Ph+:** The wording that the patient has tried two other tyrosine kinase inhibitors for acute lymphoblastic leukemia was changed to state "at least two" and examples of tyrosine kinase inhibitors were moved from the criteria to a note.	04/01/2020

Ph+ – Philadelphia chromosome positive.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Idhifa Prior Authorization Policy
- Idhifa® (ensidenib tablets – Celgene/Agios)

REVIEW DATE: 02/10/2021

OVERVIEW

Idhifa, an isocitrate dehydrogenase-2 (IDH2) inhibitor, is indicated for the treatment of relapsed or refractory acute myeloid leukemia (AML) in adults with an IDH2 mutation as detected by an FDA-approved test.[1]

Disease Overview

AML is a heterogeneous hematologic malignancy characterized by clonal expansion of myeloid blasts in the peripheral blood, bone marrow, and/or other tissues.[2] Undifferentiated blast cells proliferate in bone marrow instead of maturing into normal blood cells. Among adults, it is the most common form of acute leukemia and accounts for the largest number of annual deaths from leukemias in the US. An estimated 19,940 individuals will be diagnosed with AML in 2019 and 11,180 are projected to die from the condition. The median age at diagnosis is 67 years. Diagnosis occurs at ≥ 65 years of age for 54% of patients with around one-third of patients diagnosed at ≥ 75 years of age. The incidence of AML increase as the population ages. Environmental factors such as prolonged exposure to petrochemicals, solvents such as benzene, pesticides, and ionizing radiation have been established to increase the risks for AML, as well as myelodysplastic syndrome (MDS).[2] The cure rates of AML have improved with this outcome noted in

35% to 40% of adult patients who are ≤ 60 years of age and 5% to 15% for patients who are > 60 years of age.[3] However, among patients who are older and unable to receive intensive chemotherapy the survival rates are dismal with a median survival of only 5 to 10 months. Various gene mutations are present in adults with AML. The incidence of IDH2 mutations increase with advancing age.[3] IDH2 mutations have been reported in up to 12% of patients with AML.[2] Mutations have been identified in R172 and R140 of the IDH2 gene with the R140 mutation more frequently occurring.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on AML (version 2.2021 – November 12, 2020) note Idhifa as an alternative for IDH2 mutated AML in a variety of clinical scenarios. Idhifa is recommended for patients who have relapsed or refractory disease who have the IDH2 mutation. Another clinical scenario is for treatment induction among patients ≥ 60 years of age who are not a candidate for intensive remission induction therapy or declines such therapy. In patients ≥ 60 years of age who had a response to previous lower intensity therapy, Idhifa can be continued. Both clinical scenarios apply to patients who are IDH2 mutation positive.

Safety

Idhifa has a Boxed Warning regarding differentiation syndrome.[1]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Idhifa. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Idhifa is recommended in those who meet the following criteria:

FDA-Approved Indication

58. Acute Myeloid Leukemia (AML). Approve for 3 years if the disease is isocitrate dehydrogenase-2 (IDH2)-mutation positive as detected by an approved test.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Idhifa is not recommended in the following situations:

213. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Annual Revision	No criteria changes.	02/10/2021

IDH2 – Isocitrate dehydrogenase-2.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Imatinib (Gleevec) Prior Authorization Policy

- Imatinib (Gleevec) [imatinib mesylate tablets for oral use – Novartis, generic]

REVIEW DATE: 04/01/2020

OVERVIEW

Imatinib, a tyrosine kinase inhibitor (TKI), is indicated for the treatment of: newly-diagnosed adult and pediatric patients with Philadelphia chromosome positive (Ph+) chronic myeloid leukemia (CML) in chronic phase (CP); Ph+ CML in blast crisis (BC), accelerated phase (AP) or in CP after failure of interferon-alpha therapy; adult patients with relapsed or refractory Ph+ acute lymphoblastic leukemia (ALL); pediatric patients with newly-diagnosed Ph+ positive ALL in combination with chemotherapy, adults with myelodysplastic/myeloproliferative disease (MDS/MPD) associated with platelet-derived growth factor receptor (PDGFR) gene rearrangements; adults with aggressive systemic mastocytosis (ASM); adults with hypereosinophilic syndrome (HES) and/or chronic eosinophilic leukemia (CEL); adults with unresectable, recurrent, and/or metastatic dermatofibrosarcoma protuberans (DFSP); patients with Kit (CD 117) positive unresectable and/or metastatic gastrointestinal stromal tumors (GIST); and as adjuvant treatment of adults following resection of Kit (CD117) positive GIST.[1] Imatinib is also available as a generic but it does not have any indications regarding GIST, now the indication for use in pediatric patients with ALL.[2] Currently, there are four other tyrosine kinase inhibitors (TKIs) approved for the treatment of Ph+ CML: Tasigna® (nilotinib capsules), Sprycel® (dasatinib tablets), Bosulif® (bosutinib tablets), and Iclusig® (ponatinib tablets).[3-6] These agents are indicated for the treatment of Ph+ CML in various phases. Iclusig is approved for patients with T315I-positive CML and in adult patients with CML for whom no other TKI therapy is indicated.[6] Sprycel also has FDA-approved indications regarding ALL.[3]

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for CML (version 3.2020 – January 30, 2020) state that for patients with CP CML with a low-risk score, the primary treatment recommended includes a first-generation TKI (Gleevec or generic imatinib 400 mg QD [Category 1]), or a second-generation TKI (Bosulif 400 mg QD [Category 1], Sprycel 100 mg QD [Category 1], or Tasigna 300 mg BID [Category 1]).[7] For patients with CP CML with an intermediate- or high-risk score, a second-generation TKI is preferred (Bosulif 400 mg QD [Category 1], Sprycel 100 mg QD [Category 1], or Tasigna 300 mg BID [Category 1]). A first-generation TKI (Gleevec or generic imatinib 400 mg QD) is an alternative [Category 2A]. Iclusig is an option for patients with a T315I mutation and for with disease that has not responded to multiple TKIs or in whom another TKI is not indicated.

The NCCN guidelines for ALL (adults and adolescent young adults) [version 1.2020 – January 15, 2020][8] and Pediatric ALL (pediatric and adolescent young adults) [version 2.2020 – November 25, 2019][9] recommend imatinib in a variety of clinical scenarios including induction therapy, maintenance, relapsed or refractory ALL and for use in specific mutations.

The NCCN guidelines on dermatofibrosarcoma protuberans (version 1.2020 – October 2, 2019)[10] recommend to consider imatinib in certain cases such as where disease is unresectable, or unacceptable functional or adverse cosmetic outcomes may occur with resection. Of note, the guidelines state that because tumors lacking the t(17;22) translocation may not respond to imatinib, molecular analysis of a tumor using cytogenetics may be useful before initiating imatinib therapy.

The NCCN guidelines on soft tissue sarcoma (version 6.2019 – February 10, 2020) address GIST.[11] GISTs can occur anywhere along the gastrointestinal (GI) tract, but most commonly occur in the stomach and small intestine due to activating mutations in KIT (CD117). Surgery is the primary treatment for patients with resectable GIST; however, this is not always curative or cannot be done. Imatinib is recommended in various clinical settings, including preoperatively, postoperatively, as a primary therapy, as well as for patients with locally advanced or previously unresectable tumors. Imatinib is considered a primary therapy for metastatic GIST.

The NCCN guidelines on myelodysplastic syndromes (MDS) [version 2.2020 – February 28, 2020] note that data have demonstrated that patients with chronic myelomonocytic leukemia (CMML)/myeloproliferative disease (MPD) who have PDGFRβ fusion genes may respond well to imatinib.[12]

The NCCN guidelines for systemic mastocytosis (version 2.2019 – September 20, 2018) recommend imatinib (only if KITD816V mutation negative or unknown or if eosinophilia is present with FIP1L1-PDGFRA fusion gene).[13]

The NCCN guidelines for acquired immune deficiency syndrome (AIDS)-Related Kaposi Sarcoma (version 1.2020 – February 12, 2020) recommended imatinib for subsequent systemic therapy options for relapsed/refractory therapy.[14] First-line systemic therapy options include liposomal doxorubicin (preferred), and paclitaxel. Other subsequent systemic therapy options for relapsed/refractory therapy are also cited (e.g., Pomalyst® [pomalidomide capsules] {preferred], Revlimid® [lenalidomide capsules], Thalomid [thalidomide capsules]).

The NCCN guidelines on bone cancer (version 1.2020 – August 12, 2019) state that imatinib, either as monotherapy or in combination with cisplatin or Rapamune® (sirolimus tablets), is recommended for treatment of chordoma.[15]

The NCCN guidelines on soft tissue sarcoma (version 6.2019 – February 10, 2020) have included non-steroidal anti-inflammatory drugs (NSAIDs), hormonal or biologic agents (tamoxifen, Fareston® [toremifene tablets], or low-dose interferon), chemotherapy (methotrexate and vinorelbine, doxorubicin-based regimens), and TKIs (imatinib and Nexavar® [sorafenib tablets]) as options for systemic therapy for patients with advanced or unresectable desmoid tumors (aggressive fibromatosis).[11]

The NCCN has guidelines regarding hematopoietic cell transplantation (version 1.2020 – October 30, 2019) that address GVHD.[16] Imatinib is cited as one of many therapies recommended for steroid-refractory, chronic GVHD. Some other agents include Imbruvica® (ibrutinib tablets and capsules), low-dose methotrexate, sirolimus, mycophenoate mofetil, Jakafi® (ruxolitinib tablets).

The NCCN guidelines on cutaneous melanoma (version 1.2020 – December 19, 2019) cite imatinib as useful in certain scenarios as systemic therapy for metastatic or resectable disease such as for tumors with activating mutations of KIT.[17]

The NCCN guidelines on soft tissue sarcoma (version 6.2019 – February 10, 2020) cite Turalio (pexidartinib capsules) [category 1] and imatinib (category 2A) as systemic therapies with activity in PVNS/TGCT.[11]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Gleevec and generic imatinib mesylate tablets. If the patient does not meet the criteria regarding brand Gleevec, auto-approvals will be given for generic imatinib mesylate tablets when patients meet conditions for coverage of imatinib as defined in this policy. All approvals are provided for the duration noted below.

Automation: None.

Documentation: In the imatinib (Gleevec) PA, documentation is required for use of generic imatinib as noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes, prescription claims records, prescription receipts and/or other information.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Gleevec and generic imatinib mesylate tablets are recommended in those who meet the following criteria:

FDA-Approved Indications

3. **Acute Lymphoblastic Leukemia (ALL) That is Philadelphia Chromosome Positive (Ph+).** Approve for 3 years if the patient meets one of the following criteria (A or B):
   - **A)** Generic imatinib mesylate tablets are requested; OR
   - **B)** If brand Gleevec is prescribed, the patient has tried generic imatinib mesylate tablets AND cannot take generic imatinib mesylate tablets due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the bioequivalent generic product which, per the prescribing physician, would result in a significant allergy or serious adverse reaction **[documentation required]**.

4. **Chronic Myeloid Leukemia (CML) That is Philadelphia Chromosome Positive (Ph+).** Approve for 3 years if the patient meets one of the following criteria (A or B):
   - **A)** Generic imatinib mesylate tablets are requested; OR
   - **B)** If brand Gleevec is prescribed, the patient has tried generic imatinib mesylate tablets AND cannot take generic imatinib mesylate tablets due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the bioequivalent generic product which, per the prescribing physician, would result in a significant allergy or serious adverse reaction **[documentation required]**.

5. **Dermatofibrosarcoma Protuberans (DFSP).** Approve for 3 years if the patient meets one of the following criteria (A or B):
   - **A)** Generic imatinib mesylate tablets are requested; OR
   - **B)** If brand Gleevec is prescribed, the patient has tried generic imatinib mesylate tablets AND cannot take generic imatinib mesylate tablets due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the bioequivalent generic product which, per the prescribing physician, would result in a significant allergy or serious adverse reaction **[documentation required]**.

6. **Gastrointestinal Stromal Tumors (GIST).** Approve for 3 years if the patient meets one of the following criteria (A or B):
   - **A)** Generic imatinib mesylate tablets are requested; OR
   - **B)** If brand Gleevec is prescribed, the patient has tried generic imatinib mesylate tablets AND cannot take generic imatinib mesylate tablets due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the bioequivalent generic product which, per the prescribing physician, would result in a significant allergy or serious adverse reaction **[documentation required]**.

7. **Hypereosinophilic Syndrome (HES) and/or Chronic Eosinophilic Leukemia (CEL).** Approve for 3 years if the patient meets one of the following criteria (A or B):
   - **A)** Generic imatinib mesylate tablets are requested; OR
   - **B)** If brand Gleevec is prescribed, the patient has tried generic imatinib mesylate tablets AND cannot take generic imatinib mesylate tablets due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the bioequivalent generic product which, per the prescribing physician, would result in a significant allergy or serious adverse reaction **[documentation required]**.

8. **Aggressive Systemic Mastocytosis (ASM).** Approve for 3 years if the patient meets one of the following criteria (A or B):
   - **A)** Generic imatinib mesylate tablets are requested; OR
   - **B)** If brand Gleevec is prescribed, the patient has tried generic imatinib mesylate tablets AND cannot take generic imatinib mesylate tablets due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the bioequivalent generic product which, per the prescribing physician, would result in a significant allergy or serious adverse reaction **[documentation required]**.

9. **Myelodysplastic/Myeloproliferative Disease (MDS/MPD) [e.g., polycythemia vera, myelofibrosis].** Approve for 3 years if the patient meets the following criteria (A and B):
   - **A)** The condition is associated with platelet-derived growth factor receptor (PDGFR) gene rearrangements; AND
   - **B)** The patient meets one of the following criteria (i or ii):
     - **i.** Generic imatinib mesylate tablets are requested; OR
     - **ii.** If brand Gleevec is prescribed, the patient has tried generic imatinib mesylate tablets AND cannot take generic imatinib mesylate tablets due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the bioequivalent generic product which, per the prescribing physician, would result in a significant allergy or serious adverse reaction **[documentation required]**.

Other Uses with Supportive Evidence

10. **Acquired Immune Deficiency Syndrome (AIDS)-Related Kaposi's Sarcoma.** Approve for 3 years if the patient meets the following criteria (A, B and C):
    - **A)** The patient has tried at least one regimen or therapy; AND
      Note: Examples include liposomal doxorubicin, paclitaxel, Pomalyst® (pomalidomide capsules), Revlimid® (lenalidomide capsules), etoposide, and Thalomid® (thalidomide capsules).
    - **B)** The patient has relapsed or refractory disease; AND
    - **C)** The patient meets one of the following criteria (i or ii):
      - **i.** Generic imatinib mesylate tablets are requested; OR
      - **ii.** If brand Gleevec is prescribed, the patient has tried generic imatinib mesylate tablets AND cannot take generic imatinib mesylate tablets due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the bioequivalent generic product which, per the prescribing physician, would result in a significant allergy or serious adverse reaction **[documentation required]**.

11. **Chordoma.** Approve for 3 years if the patient meets one of the following criteria (A or B):
    - **A)** Generic imatinib mesylate tablets are requested; OR
    - **B)** If brand Gleevec is prescribed, the patient has tried generic imatinib mesylate tablets AND cannot take generic imatinib mesylate tablets due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the bioequivalent generic product which, per the prescribing physician, would result in a significant allergy or serious adverse reaction **[documentation required]**.

12. **Fibromatosis (Desmoid Tumors).** Approve for 3 years if the patient meets the following criteria (A and B):
    - **A)** The patient has advanced or unresectable fibromatosis (desmoid tumors); AND
    - **B)** The patient meets one of the following criteria (i or ii):
      - **i.** Generic imatinib mesylate tablets are requested; OR
      - **ii.** If brand Gleevec is prescribed, the patient has tried generic imatinib mesylate tablets AND cannot take generic imatinib mesylate tablets due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the bioequivalent generic product which, per the prescribing physician, would result in a significant allergy or serious adverse reaction **[documentation required]**.

13. **Graft Versus Host Disease (GVHD), Chronic.** Approve for 1 year if the patient meets the following criteria (A and B):
    - **A)** The patient has tried at least one conventional systemic treatment for graft versus host disease; AND
      Note: Examples include corticosteroids (methylprednisolone, prednisone); cyclosporine; tacrolimus; mycophenolate mofetil; Imbruvica® (ibrutinib capsules and tablets); low-dose methotrexate; sirolimus; and Jakafi® (ruxolitinib tablets).
    - **B)** The patient meets one of the following criteria (i or ii):
      - **i.** Generic imatinib mesylate tablets are requested; OR
      - **ii.** If brand Gleevec is prescribed, the patient has tried generic imatinib mesylate tablets AND cannot take generic imatinib mesylate tablets due to a formulation difference in the inactive ingredient(s) [e.g.,

difference in dyes, fillers, preservatives] between the Brand and the bioequivalent generic product which, per the prescribing physician, would result in a significant allergy or serious adverse reaction **[documentation required]**.

14. Metastatic Melanoma: Approve for 3 years if the patient meets the following criteria (A and B):
- **A)** The patient has c-Kit-positive advanced/recurrent or metastatic melanoma; AND
- **B)** The patient meets one the following criteria (i or ii):
  - **i.** Generic imatinib mesylate tablets are requested; OR
  - **ii.** If brand Gleevec is prescribed, the patient has tried generic imatinib mesylate tablets AND cannot take generic imatinib mesylate tablets due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the bioequivalent generic product which, per the prescribing physician, would result in a significant allergy or serious adverse reaction **[documentation required]**.

15. Pigmented Villonodular Synovitis/Tenosynovial Giant Cell Tumor (PVNS/TGCT). Approve for 3 years if the patient meets both of the following criteria (A and B):
- **A)** The patient meets one of the following (i or ii):
  - **i.** The patient has tried Turalio (pexidartinib capsules); OR
  - **ii.** According to the prescriber, the patient cannot take Turalio.

  Note: Examples of reasons for not being able to take Turalio include patients with elevated liver enzymes or concomitant use of medications that are associated with hepatotoxicity; AND
- **B)** The patient meets one of the following (i or ii):
  - **i.** Generic imatinib mesylate tablet are requested; OR
  - **ii.** If brand Gleevec is prescribed, the patient has tried generic imatinib mesylate tablets AND cannot take generic imatinib mesylate tablets due to a formulation difference in the inactive ingredient(s) [e.g., difference in dyes, fillers, preservatives] between the Brand and the bioequivalent generic product which, per the prescribing physician, would result in a significant allergy or serious adverse reaction **[documentation required]**.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of imatinib is recommended in those who meet the following criteria:

214. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	The policy was renamed from Oncology – Gleevec to Oncology – Imatinib (Gleevec) to reflect the generic availability of Gleevec. Criteria were developed for patients with AIDS-related Kaposi Sarcoma to approve for 3 years if the patient has tried one other therapy, has relapsed or refractory disease, and either requests the generic or has experienced certain issues with the generic the patient has tried one systemic therapy. The exclusion for Kaposi Sarcoma was removed.	03/20/2019
Annual Revision	The following changes were made. 1. **Acquired Immune Deficiency Syndrome-Related Kaposi's Sarcoma:** The criteria that requires a trial of one regimen now states "at least one regimen" and the alternatives are now listed as a note instead of in the criteria. 2. **Graft Versus Host Disease, Chronic:** The criteria that requires a trial of one conventional systemic treatment was changed to state "at least one" and the alternatives are now listed as a note instead of in the criteria. 3. **Pigmented Villonodular Synovitis/Tenosynovial Giant Cell Tumor:** Criteria were added that the patient has tried Turalio or according to the prescriber the patient cannot take Turalio. A note was added that reasons for not being able to take Turalio include patients with elevated liver enzymes or concomitant use of medications that are associated with hepatotoxicity. 4. **Other Conditions Not Recommended for Approval:** The following conditions were removed from this section: acute myeloid leukemia; advanced salivary adenoid cystic carcinoma; biliary tract cancer; breast cancer; central nervous system tumors; cervical cancer; chondrosarcoma; head and neck squamous cell carcinoma; hepatocellular carcinoma; idiopathic pulmonary fibrosis; meningioma; merkel cell carcinoma; mesothelioma; multiple myeloma; non-small cell lung cancer (metastatic); ovary/peritoneum, or fallopian tube (carcinoma of); pancreatic adenocarcinoma; prostate cancer; pulmonary arterial hypertension; renal cell carcinoma; restenosis; sarcoma; scleroderma; scleroderma-related interstitial lung disease; small cell lung cancer; spondyloarthritis; testicular cancer/germ cell tumors; thymic epithelial malignancies; thyroid cancer; and uterine carcinosarcomas. Reason for removal include lack of requests for use, limited recent literature, availability of other medications, and/or the conditions are not addressed in related guidelines by the NCCN.	04/01/2020

AIDS – Acquired immunodeficiency syndrome; NCCN – National Comprehensive Cancer Network.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Imbruvica Prior Authorization Policy

- Imbruvica® (ibrutinib tablets and capsules – Pharmacyclics/Janssen)

REVIEW DATE: 06/03/2020

OVERVIEW

Imbruvica, a Bruton kinase inhibitor, is indicated for the treatment mantle cell lymphoma in adults with who have received at least one prior therapy.[1] Accelerated approval for this indication was granted based on overall response rate. Continued approval for this condition may be contingent on verification of clinical benefit in confirmatory trials. Imbruvica is also indicated for the treatment chronic lymphocytic leukemia (CLL) and small lymphocytic lymphoma (SLL) in adults. Regarding CLL and SLL, Imbruvica is also indicated for the treatment of 17p deletion CLL and SLL in adults. Imbruvica is also indicated for the treatment Waldenström's macroglobulinemia in adults. Imbruvica is indicated for the treatment of marginal zone lymphoma in adults with who require systemic therapy and have received at least one prior anti-CD20-based therapy. Accelerated approval was granted for this indication was based on the overall response rate. Continued approval may be based contingent upon verification and description of clinical benefit in a confirmatory trial. Imbruvica is also indicated for the treatment of chronic graft-versus-host disease (GVHD) in adults with after failure of one or more lines of systemic therapy.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for CLL/SLL (version 4.2020 – December 20, 2019) recommend Imbruvica as a treatment option in various scenarios (e.g., first-line therapy for patients with or without deletion 17p/TP53 mutation; and as relapsed/refractory therapy [category 1 recommendations for many scenarios]).[2] Imbruvica plays a vital role in the management of CLL/SLL and many trials describe its efficacy.

The NCCN guidelines for B-Cell Lymphomas (version 1.2020 – January 22, 2020) address mantle cell lymphoma.[3] Imbruvica is recommended as a one of the preferred second-line therapies, with or without rituximab (category 2A).

The NCCN guidelines for B-Cell Lymphomas (version 1.2020 – January 22, 2020) address marginal zone lymphoma.[3] Preferred first-line regimens include use of rituximab with other agents. Imbruvica is cited as an option as a second-line and subsequent therapy.

The NCCN guidelines for Waldenstrom's macroglobulinemia/lymphoplasmacytic lymphomas (version 2.2020 – April 15, 2020) recommend Imbruvica, with or without rituximab, as a primary therapy option as one of several preferred regimens (category 2).[4] For previously treated patients Imbruvica, with or without rituximab, is also cited as a preferred regimen.

The NCCN guidelines for Central Nervous System (CNS) Cancers B-Cell Lymphomas (version 2.2020 – April 30, 2020) recommend Imbruvica as one of the options for patients with relapsed or refractory disease.[5] In some clinical scenarios it is used with rituximab.

The NCCN guidelines for Hairy Cell Leukemia (version 1.2020 – August 23, 2019) recommend Imbruvica as one of the options for patients with relapsed or refractory disease following progression.[6]

The NCCN guidelines for B-Cell Lymphomas (version 1.2020 – January 22, 2020) address diffuse large B-cell lymphoma.[3] Imbruvica is cited as a second-line and subsequent therapy. Other therapy regimens are recommended first-line, many of which are rituximab-based.

The NCCN has guidelines regarding hematopoietic cell transplantation (version 1.2020 – October 30, 2019) that address GVHD.[8] Imbruvica is cited as one of many therapies recommended for steroid-refractory, chronic GVHD. Some other agents include imatinib, low-dose methotrexate, sirolimus, mycophenoate mofetil, Jakafi® (ruxolitinib tablets). Data are also available for Imbruvica.[9]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Imbruvica. All approvals are provided for the duration noted below.

Automation: When available, the ICD-9/ICD-10 codes for chronic lymphocytic leukemia (CLL) (ICD-9: 204.1* [lymphoid leukemia chronic] and ICD-10: C91.1* [chronic lymphocytic leukemia of B-cell type]), Mantle Cell Lymphoma (ICD-9: 200.4* and ICD-10: C83.1*), Small Lymphocytic Lymphoma (ICD-10: C83.0* [small cell B-cell lymphoma]) and Waldenström's macroglobulinemia (ICD-9: 273.3* [macroglobulinemia] and ICD-10: C88.0*) will be used as part of automation to allow approval of the requested medication.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Imbruvica is recommended in those who meet the following criteria:

FDA-Approved Indications

59. Chronic Lymphocytic Leukemia (CLL). Approve for 3 years.

60. Mantle Cell Lymphoma. Approve for 3 years.

61. Marginal Zone Lymphoma. Approve for 3 years.

62. Small Lymphocytic Lymphoma (SLL). Approve for 3 years.

63. Waldenström's Macroglobulinemia. Approve for 3 years.

64. Graft versus Host Disease, Chronic: Approve for 1 year if the patient has tried at least one conventional systemic treatment for graft versus host disease.
Note: Examples include corticosteroids (methylprednisolone, prednisone), imatinib, low-dose methotrexate, sirolimus, mycophenolate mofetil, and Jakafi® (ruxolitinib tablets).

Other Uses with Supportive Evidence

215. Central Nervous System (CNS) Lymphoma (Primary). Approve for 3 years if according to the prescribing physician the patient has relapsed or refractory disease.

216. B-Cell Lymphoma. Approve for 3 years if according to the prescribing physician the patient is using the agent as second-line or subsequent therapy.
Note: Examples of B-Cell Lymphomas include follicular lymphoma, diffuse large B-cell lymphomas, gastric mucosa-associated lymphoid tissue (MALT) lymphoma, nongastric MALT lymphoma, Acquired Immune Deficiency Syndrome (AIDS)-related, and post-transplant lymphoproliferative disorders.

217. Hairy Cell Leukemia. Approve for 3 years if the according to the prescribing physician the patient has relapsed or refractory disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Imbruvica is recommended in those who meet the following criteria:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Change	Review Date
Annual Revision	Added approvals under the "Other Uses with Supportive Evidence" section, for hairy cell leukemia, DLBCL, and central nervous system lymphoma (primary) per recommendations by the respective NCCN guidelines.	05/16/2018
Annual Revision	The following changes were made: **1. Marginal Zone Lymphoma:** The requirement that the patient has tried rituximab, or according to the prescribing physician rituximab is contraindicated, was removed. **2. Graft Versus Host Disease, Chronic:** For clarity, Jakafi was added to the list of examples of conventional systemic agents, one of which must be tried prior to approval of Imbruvica. **3. B-Cell Lymphoma:** The condition was changed to as listed; previously listed as "Diffuse Large B-Cell Lymphoma". Autoimmune Deficiency Syndrome-related and post-transplant lymphoproliferative disorder were added to the examples of B-Cell Lymphoma. The listing of primary diffuse large B-cell lymphoma of the central nervous system was deleted as it is addressed in a different criterion.	06/05/2019
Annual Revision	The following changes were made. **1. Graft Versus Host Disease, Chronic:** The descriptor of "at least" was added to the criterion that requires that the patient has tried one conventional systemic treatment for graft vs. host disease. Also, examples of treatments were moved from the criteria to a note with examples of low-dose methotrexate and sirolimus added and tacrolimus removed. **2. B-Cell Lymphoma:** For this indication, examples of B-Cell Lymphomas were taken out of the cited indication and placed in a note. Diffuse large B-cell lymphoma was added as an example.	06/03/2020

DLBCL – Diffuse large B-cell lymphoma; NCCN – National Comprehensive Cancer Network.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Inlyta® (axitinib tablets – Pfizer)

DATE REVIEWED: 05/20/2020

OVERVIEW

Inlyta, a kinase inhibitor, is indicated for the treatment of advanced renal cell carcinoma (RCC) after failure of one prior systemic therapy.[1]

Guidelines

The NCCN clinical practice guidelines on kidney cancer (version 2.2020 – August 5, 2019) recommend Inlyta + Keytruda (pembrolizumab for intravenous use) as a "preferred regimen" (category 2A) for favorable risk and poor/intermediate risk patients as first-line therapy for clear cell histology.[2] Inlyta + Imfinzi (avelumab for intravenous use) is recommended as one of the "Other recommended regimens" (category 2A) in the same populations. Inlyta as a monotherapy is a category 2B recommended regimen for first-line therapy. Inlyta is a category 1 recommended therapy under "other recommended regimens" for subsequent therapy. Inlyta + Keytruda is another category 2A option in this setting; Inlyta + Imfinzi is a category 3 option. It is one of the systemic therapy options listed under "useful under certain circumstances" for relapse or Stage IV RCC with *non-clear cell histology* (category 2A).

The NCCN thyroid carcinoma guidelines (version 2.2019 – September 16, 2019) recommend Inlyta as one of the kinase inhibitors to be considered if clinical trials or other systemic therapies are not available or appropriate for the treatment of progressive and/or symptomatic iodine refractory thyroid cancer.[3] This recommendation is for follicular, Hürthle cell, and papillary cancer subtypes (all category 2A).

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Inlyta. All approvals are provided for 3 years.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Inlyta is recommended in those who meet the following criteria:

FDA-Approved Indications

65. Renal Cell Carcinoma – Clear Cell or Non-Clear Cell Histology. Approve for 3 years for relapsed or Stage IV disease.

Other Uses with Supportive Evidence

66. Differentiated (i.e., papillary, follicular, and Hürthle cell) Thyroid Carcinoma. Approve for 3 years if refractory to radioactive iodine therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Inlyta has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below.

218. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes*	Date Reviewed
Annual revision	The Renal Cell Carcinoma criterion was revised to add predominant clear cell histology and non-clear cell histology is included. Differentiated Thyroid Carcinoma criteria were revised to only require that the patient's disease is refractory to radioactive iodine therapy. Head and Neck Cancer and Hepatocellular Carcinoma were added to the list of conditions not recommended for approval.	02/10/2016
Annual revision	Approval was removed for patient has been started on Inlyta for an indication or condition addressed as an approval in the Recommended Authorization Criteria section.	03/08/2017
Annual revision	Conditions Not Recommended for Approval: Acute Myeloid Leukemia, Breast Cancer, and Myelodysplastic Syndrome were removed.	04/11/2018
Annual revision	No criteria changes	04/24/2019
Early Annual revision	For Renal Cell Carcinoma, deleted "advanced" and "predominant" with reference to clear cell histology. Added criteria that patient has relapse or Stage IV disease. Deleted all conditions listed under Conditions Not Recommended for Approval.	05/08/2019
Annual revision	No criteria changes	05/20/2020

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Inqovi Prior Authorization Policy

- Inqovi® (decitabine and cedazuridine tablets – Taiho Oncology/Otsuka Pharmaceutical)

REVIEW DATE: 07/22/2020

OVERVIEW

Inqovi, a combination of decitabine (a nucleoside metabolic inhibitor) and cedazuridine (a cytidine deaminase inhibitor), is indicated for the following:[1]

- **Myelodysplastic syndrome (MDS),** in adults, including previously treated and untreated, de novo and secondary MDS with the following French-American-British (FAB) subtypes (refractory anemia, refractory anemia with ringed sideroblasts, refractory anemia with excess blasts, and chronic myelomonocytic leukemia [CMML]) and intermediate-1, intermediate-2, and high-risk International Prognostic Scoring System (IPSS) groups.

Decitabine is available as a parenteral product (Dacogen® [decitabine injection for intravenous {IV} use]; generic) and possesses the same FDA-approved indication as Inqovi.[2] The oral bioavailability of decitabine is limited due to rapid degradation by cytidine deaminase in the gut and liver.[1] As a cytidine deaminase inhibitor, cedazuridine increases decitabine concentrations to therapeutic levels. Oral decitabine has systemic exposure equivalent to the IV form with similar clinical response rates in the population in which Inqovi is FDA-approved.[1,2] The recommended dose of Inqovi is one tablet taken orally once daily on Days 1 through 5 of each 28-day cycle for a minimum of four cycles until disease progression or unacceptable toxicity. A complete or partial response may take longer than four cycles. In the two pivotal trials, the median treatment duration was up to 8 months. Do not substitute Inqovi for the IV decitabine product within a cycle.

Guidelines

Inqovi is not addressed in the guidelines. Dacogen is incorporated into the National Comprehensive Cancer Network (NCCN) guidelines for myelodysplastic syndromes (version 2.2020 – February 28, 2020) and is recommended in various clinical scenarios in patients with MDS (e.g., treatment of lower risk disease, high-risk disease) and CMML (as a single agent or with Jakafi® [ruxolitinib tablets]).[3] In Phase III studies hypomethylating agents (e.g., decitabine, Vidaza® [azacitidine injection for intravenous or subcutaneous use [generic]) have favorable data regarding hematological response and improvement, as well as a decrease in the progression to AML; survival benefits have also been noted.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Inqovi. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Inqovi is recommended in those who meet the following criteria:

FDA-Approved Indications

137. Chronic Myelomonocytic Leukemia. Approve for 1 year.

138. Myelodysplastic Syndromes. Approve for 1 year.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Inqovi is not recommended in the following situations:

149. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Inrebic Prior Authorization Policy

- Inrebic® (fedratinib capsules – Celgene)

REVIEW DATE: 08/26/2020

OVERVIEW

Inrebic, a Janus Associated Kinase 2 (JAK2)-selective kinase inhibitor, is indicated for the treatment of adult patients with intermediate-2 or high-risk primary or secondary (post-polycythemia vera or post-essential thrombocythemia) myelofibrosis. Inrebic labeling includes a Boxed Warning regarding risk of encephalopathy, including Wernicke's encephalopathy, and states that thiamine (vitamin B1) levels should be assessed prior to starting Inrebic and periodically during treatment.

Disease Overview

Myelofibrosis, polycythemia vera, and essential thrombocythemia are a group of uncommon heterogeneous disorders involving the hematopoietic system.[2-4] In the US, the prevalence of myelofibrosis, essential thrombocythemia, and polycythemia vera were approximately 13,000, 134,000, and 148,000 cases respectively.[2] It is a cancer that impacts the normal production of red blood cells and involves the replacement of bone marrow by fibrous scare tissue. There is a lack of red blood cells, and an overabundance of white blood cells. The symptom profile in myeloproliferative neoplasms is complex and symptoms vary among the subtype. Patients may experience fatigue, pruritus, weight loss, splenomegaly, and various laboratory abnormalities (e.g., erythrocytosis, thrombocytosis, and leukocytosis). The

disease can be slowly progressive and early in the disease process patients may be asymptomatic. However, some patients with this condition may have the disease transform into acute myeloid leukemia which is associated with a poor prognosis. The management of myeloproliferative neoplasms involves identification of specific mutations which guide targeted therapies and have resulted in improvement of disease symptoms. Other treatments are symptom-based.

Guidelines

The National Comprehensive Cancer Network has guidelines regarding myeloproliferative neoplasms (version 1.2020 – May 31, 2020) include Inrebic.[2] Inrebic is recommended for higher risk patients with a platelet count ≥ 10 x 10^9/L (category 2B). In this clinical scenario, Jakafi® (ruxolitinib capsules), another kinase inhibitor, has a higher recommendation (category 2A). Inrebic is also recommended in patients who have tried Jakafi with no response or who have loss of response. Jakafi is also recommended among patients with lower-risk myelofibrosis.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Inrebic. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Inrebic is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Myelofibrosis (MF), including Primary MF, Post-Polycythemia Vera MF, and Post-Essential Thrombocythemia MF.** Approve Inrebic for 3 years if the patient has intermediate-2 or high-risk disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Inrebic is not recommended in the following situations:

150. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Iressa Prior Authorization Policy

- Iressa® (gefitinib tablets – AstraZeneca)

REVIEW DATE: 09/02/2020

OVERVIEW

Iressa is a tyrosine kinase inhibitor (TKI) indicated for the first-line treatment of patients with metastatic non-small cell lung cancer (NSCLC) whose tumors have epidermal growth factor receptor (*EGFR*) exon 19 deletions or exon 21 (L858R) substitution mutations as detected by an FDA-approved test.[1] The safety and efficacy of Iressa have not been established in patients whose tumors have other *EGFR* mutations. Iressa binding affinity for *EGFR* exon 19 deletion or exon 21 point mutation L858R mutations is higher than its affinity for the wild-type *EGFR*.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for NSCLC (version 6.2020 – June 15, 2020) recommend Tarceva® (erlotinib tablets), Iressa, Gilotrif™ (afatinib tablets), Tagrisso™ (osimertinib tablets), and Vizimpro® (dacomitinib tablets) as first-line treatment in patients with sensitizing *EGFR*-mutation positive NSCLC (all category 1).[2] Tagrisso is noted as a "preferred" option. Tagrisso is the only agent specifically FDA-approved and recommended in guidelines (category 1) for T790M-positive tumors as subsequent therapy, after progression on first-line Tarceva, Iressa, Vizimpro, or Gilotrif.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Iressa. All approval durations are noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Iressa is recommended in those who meet the following criteria:

FDA-Approved Indications

67. Non-Small Cell Lung Cancer (NSCLC). Approve for 3 years if the patient meets the following criteria (A and B):
- **A)** Patient has metastatic non-small cell lung cancer; AND
- **B)** Patient meets ONE of the following conditions (i or ii):
  - **i.** Patient has epidermal growth factor receptor (*EGFR*) exon 19 deletions as detected by an approved test; OR
  - **ii.** Patient has exon 21 (L858R) substitution mutations as detected by an approved test.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Iressa is not recommended in the following situations:

219. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Jakafi Prior Authorization Policy

- Jakafi® (ruxolitinib tablets – Incyte)

REVIEW DATE: 03/25/2020

OVERVIEW

Jakafi, a kinase inhibitor, is indicated for treatment of patients with 1) intermediate or high-risk myelofibrosis, including primary myelofibrosis, post-polycythemia vera myelofibrosis, and post-essential thrombocythemia myelofibrosis in adults; 2) polycythemia vera in adults who have had an inadequate response to or are intolerant of hydroxyurea; and 3) steroid-refractory acute graft-vs.-host disease in adult and pediatric patients ≥ 12 years of age.[1] Jakafi specifically inhibits Janus Associated Kinases (JAKs) JAK1 and JAK2 which mediate the signaling of various cytokinase and growth factors that are vital for hematopoiesis and immune function.

Disease Overview

Myelofibrosis, polycythemia vera, and essential thrombocythemia are a group of uncommon heterogeneous disorders involving the hematopoietic system.[2-4] In the US, the prevalence of myelofibrosis, essential thrombocythemia, and polycythemia vera were approximately 13,000, 134,000, and 148,000 cases respectively.[2] It is a cancer that impacts the normal production of red blood cells and involves the replacement of bone marrow by fibrous scare tissue. There is a lack of red blood cells, and an overabundance of white blood cells. The symptom profile in myeloproliferative neoplasms is complex and symptoms vary among the subtype. Patients may experience fatigue, pruritis, weight loss, splenomegaly, and various laboratory abnormalities (e.g., erythrocytosis, thrombocytosis, and leukocytosis). The disease can be slowly progressive and early in the disease process patients may be asymptomatic. However, some patients with this condition may have the disease transform into acute myeloid leukemia which is associated with a poor prognosis. The management of myeloproliferative neoplasms involves identification of specific mutations which guide targeted therapies and have resulted in improvement of disease symptoms. Other treatment are symptom-based.

Guidelines

The National Comprehensive Cancer Network (NCCN) has guidelines regarding myeloproliferative neoplasms (version 3.2019 – September 4, 2019) that include Jakafi.[2] Jakafi is recommended among patients with low-, intermediate-, and high-risk myelofibrosis. It is also a recommended therapy for patients with high-risk polycythemia vera.

The NCCN has guidelines regarding hematopoietic cell transplantation that discuss graft-versus-host disease (version 1.2020 – October 30, 2019) that include Jakafi.[7] Jakafi is recommended among patients with steroid-refractory chronic graft-vs.-host disease.[7] Supportive data are available.[8,9] A variety of other agents are also recommended such as cyclosporine, tacrolimus, mycophenolate mofetil, Imbruvica® (ibrutinib capsules and tablets), and imatinib.

The NCCN guidelines for pediatric acute lymphoblastic leukemia (ALL) [version 2.2020 – November 25, 2019] recommend Jakafi in a variety of regimens for pediatric patients and young adults with ALL.[10] The utility of Jakafi is described primarily in patients in which the mutation/pathway is Janus Associated Kinase (JAK)-related.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Jakafi. All approvals are provided for the durations noted below.

Automation: The ICD-9/ICD-10 codes for myelofibrosis (ICD-9: 289.83 and ICD-10: D75.81) will be used as part of automation to allow approval of the requested medication.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Jakafi is recommended in those who meet the following criteria:

FDA-Approved Indications

68. Graft versus Host Disease, Acute. Approve for 1 year if the patient has tried one systemic corticosteroid.

69. Myelofibrosis (MF), including Primary MF, Post-Polycythemia Vera MF, and Post-Essential Thrombocythemia MF. Approve for 3 years.

70. Polycythemia Vera. Approve for 3 years if the patient has tried hydroxyurea.

Other Uses with Supportive Evidence

71. Acute Lymphoblastic Leukemia. Approve for 1 year if the patient meets the following criteria (A and B)
- **A)** The patient is < 21 years of age; AND
- **B)** The mutation/pathway is Janus Associated Kinase (JAK)-related.

72. Graft versus Host Disease, Chronic. Approve for 1 year if the patient has tried one conventional systemic treatment for graft versus host disease.

Note: Examples include systemic corticosteroids [methylprednisolone, prednisone], cyclosporine, tacrolimus, mycophenolate mofetil, Imbruvica® (ibrutinib capsules and tablets), and imatinib.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Jakafi has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

220. Other Refractory Leukemias. Limited data have investigated Jakafi in adults with relapsed and/or refractory acute myeloid leukemia (AML), myelodysplastic syndromes (MDS) [including chronic myelomonocytic leukemia {CMML}], or chronic myelocytic leukemia (CML).[5,6] Further studies are needed to determine the place in therapy of Jakafi for the treatment of refractory leukemias.

221. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Kisqali and Kisqali Femara Co-Pack Prior Authorization Policy
- Kisqali® (ribociclib tablets – Pfizer)
- Kisqali® Femara® Co-Pack (ribociclib tablets; letrozole tablets, co-packaged for oral use – Pfizer)

REVIEW DATE: 02/24/2021

OVERVIEW

Kisqali, a cyclin-dependent kinase (CDK) 4/6 inhibitor, is indicated in hormone receptor-positive (HR+), human epidermal growth factor receptor 2 (HER2)-negative **advanced or metastatic breast cancer** in the following settings:[1-3]

- In combination with an aromatase inhibitor (AI) as initial endocrine-based therapy for the treatment of pre/perimenopausal or postmenopausal women with.
- Kisqali (not Co-Pack) in combination with fulvestrant for the treatment of postmenopausal women, as initial endocrine based therapy or following disease progression on endocrine therapy.
- Kisqali Femara Co-Pack has the same indication with the aromatase inhibitor, letrozole being provided.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on breast cancer (version 1.2021 – January 15, 2021) recommend any of the CDK4/6 inhibitors in combination with an AI or fulvestrant as a first-line preferred treatment option for recurrent or Stage IV HR+ and HER2-negative disease in postmenopausal women or premenopausal patient receiving ovarian ablation or suppression (category 1).[3,4] CDK4/6 inhibitor + fulvestrant is recommended for second- and subsequent-line therapy, if CDK4/6 inhibitor was not previously used (category 1). However, the guidelines also state in a footnote that if there is disease progression on CDK4/6 inhibitor therapy or PI3K inhibitor, there are limited data to support an additional line of therapy with another CDK4/6-containing regimen.[3,5] For men with breast cancer, the compendium recommends they be treated similarly to postmenopausal women, except that the use of an AI is ineffective without concomitant suppression of testicular steroidogenesis.[4]

Supportive Data

A multicenter analysis evaluated clinical outcomes in patients (n = 58) with HR+/HER2-negative metastatic breast cancer who received Verzenio (abemaciclib tablets) after disease progression on Ibrance (palbociclib tablets) or Kisqali.[5] At data cutoff, 34% of patients (n = 20/58) had progressive disease, while 36% of patients (n = 21/58) had treatment duration exceeding 6 months. The median progression-free survival (PFS) was 5.8 months. Another case report of Verzenio use after 10 lines of therapy, including Ibrance therapy is available, along with literature review of ongoing studies with other CDK 4/6 inhibitors after prior use of another inhibitor.[6] Ibrance and Kisqali also have ongoing studies assessing for their respective efficacy after progression on another CDK4/6 inhibitor.[7,8] Preliminary results from the Kisqali trial (TRINITI-1), a Phase I/II, open-label trial of triplet therapy (Kisqali + everolimus + exemestane) after progression on prior CDK 4/6 inhibitor and up to three lines of therapy are available.[9] A total of 95 patients were evaluated; 41.1% of patients demonstrated clinical benefit, exceeding the predefined primary endpoint threshold (> 10%). The response rate was 8.4% and the median PFS was 5.7 months, and the 1-year PFS was 33%.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Kisqali and Kisqali Femara Co-Pack. All approvals are provided for 3 years in duration unless otherwise noted below. In the clinical criteria, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: a woman is defined as an individual with the biological traits of a woman, regardless of the individual's gender identity or gender expression; men are defined as individuals with the biological traits of a man, regardless of the individual's gender identity or gender expression.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

I. Coverage of Kisqali is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Breast Cancer in Postmenopausal Women***. Approve for 3 years if the patient meets the following criteria (A, B, and C):
   - **10.** Patient has advanced or metastatic hormone receptor positive (HR+) [i.e., estrogen receptor positive {ER+} and/or progesterone receptor positive {PR+}] disease; AND
   - **11.** Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND
   - **12.** Patient meets ONE of the following criteria (i or ii):
     - **i.** Kisqali will be used in combination with anastrozole, exemestane, or letrozole; OR
     - **ii.** Kisqali will be used in combination with fulvestrant.

   ***** Refer to the Policy Statement.

2. **Breast Cancer in Pre/Perimenopausal Women*.** Approve for 3 years if the patient meets the following criteria (A, B, C, and D):
   - **A)** Patient has advanced or metastatic hormone receptor positive (HR+) [i.e., estrogen receptor positive {ER+} and/or progesterone receptor positive {PR+}] disease; AND
   - **B)** Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND
   - **C)** Patient is receiving ovarian suppression/ablation with a gonadotropin-releasing hormone (GnRH) agonist or has had surgical bilateral oophorectomy or ovarian irradiation; AND
     Note: Examples of GnRH agonists are Lupron (leuprolide), Trelstar (triptorelin), Zoladex (goserelin).
   - **D)** Patient meets one of the following criteria (i or ii):
     - **i.** Kisqali will be used in combination with anastrozole, exemestane, or letrozole; OR
     - **ii.** Kisqali will be used in combination with fulvestrant**.**

   ***** Refer to the Policy Statement.

Other Uses with Supportive Evidence

3. **Breast Cancer in Men*.** Approve for 3 years if the patient meets the following criteria (A, B, C, and D):
   - **A)** Patient has advanced or metastatic hormone receptor positive (HR+) [i.e., estrogen receptor positive {ER+} and/or progesterone receptor positive {PR+}] disease; AND
   - **B)** Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND
   - **C)** Patient meets ONE of the following criteria (i or ii):
     - **i.** Patient meets BOTH of the following criteria (a and b):
       - **a)** Patient is receiving a gonadotropin-releasing hormone (GnRH) analog; AND

Note: Examples are Lupron (leuprolide), Trelstar (triptorelin), Zoladex (goserelin], Firmagon (degarelix), Orgovyx (relugolix).

b) Kisqali will be used in combination with anastrozole, exemestane, or letrozole; OR

ii. Kisqali will be used in combination with fulvestrant.

***** Refer to the Policy Statement.

II. Coverage of Kisqali Femara Co-Pack is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Breast Cancer in Women***. Approve for 3 years if the patient meets the following criteria (A, B, and C):
   2. Patient has advanced or metastatic hormone receptor positive (HR+) [i.e., estrogen receptor positive {ER+} and/or progesterone receptor positive {PR+}] disease; AND
   ~~3.~~**2.** Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND
   ~~4.~~**2.** If the patient is premenopausal or perimenopausal, then the patient is receiving ovarian suppression/ablation with a gonadotropin-releasing hormone (GnRH) agonist or has had surgical bilateral oophorectomy or ovarian irradiation.
   Note: Examples of GnRH agonists are Lupron (leuprolide), Trelstar (triptorelin), Zoladex (goserelin).

   ***** Refer to the Policy Statement.

Other Uses with Supportive Evidence

1. **Breast Cancer in Men*.** Approve for 3 years if the patient meets the following criteria (A, B, and C):
   A) Patient has advanced or metastatic hormone receptor positive (HR+) [i.e., estrogen receptor positive {ER+} and/or progesterone receptor positive {PR+}] disease; AND
   B) Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND
   C) Patient is receiving a gonadotropin-releasing hormone (GnRH) analog.
   Note: Examples are Lupron [leuprolide], Trelstar [triptorelin], Zoladex (goserelin), Firmagon (degarelix), Orgovyx (relugolix).

   ***** Refer to the Policy Statement.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Kisqali or Kisqali Femara Co-Pack is not recommended in the following situations:

222. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

History

Type of Revision	Summary of Changes	Review Date
Annual Revision	Deleted criteria in all indications requiring Kisqali + aromatase inhibitors to be used as "first-line (initial) endocrine therapy". Now the combination can be used in any setting. Kisqali + Faslodex use was added to premenopausal women based on guidelines. For Kisqali + Faslodex use in postmenopausal women and men indications, deleted criteria requiring prior endocrine therapy use or that it be used as first-line endocrine therapy. For Kisqali Femara Co-Pack since approval is in "women" (includes postmenopausal and premenopausal), deleted specific reference to postmenopausal patient. Instead re-phrased to state, "If patient is premenopausal or perimenopausal…" then patient is receiving ovarian suppression/ablation. For premenopausal patients, added criteria that Kisqali can be used in combination with tamoxifen based on guidelines.	04/03/2019
Annual Revision	Criteria for Kisqali use in combination with tamoxifen as first-line therapy has been deleted for pre/perimenopausal women since it is no longer supported in guidelines due to QTc prolongation.	04/15/2020
Early Annual Revision	**All Breast Cancer Indications:** For Kisqali and Kisqali Femara Co-Pack deleted criteria requiring no disease progression on Kisqali, Ibrance (palbociclib) or Verzenio (abemaciclib), based on guidelines and available data. **Breast Cancer in Pre/Perimenopausal Women:** Examples of gonadotropin-releasing hormone (GnRH) agonists are moved from criteria to Note. **Breast Cancer in Men:** For this indication in Kisqali and Kisqali Femara Co-pack, GnRH "agonist" is changed to "analog". Also, the list of examples of GnRH analog agents are moved from criteria to Note. Firmagon (degarelix) and Orgovyx (relugolix) were added to example list. **Breast Cancer in Women:** Examples of gonadotropin- releasing hormone (GnRH) agonists are moved from criteria to Note.	02/24/2021

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Koselugo™ (selumetinib capsules – AstraZeneca Pharmaceuticals)

DATE REVIEWED: 04/15/2020

OVERVIEW

Koselugo (selumetinib), a kinase inhibitor, is indicated for the treatment of pediatric patients 2 years of age and older with neurofibromatosis type 1 (NF1) who have symptomatic, inoperable plexiform neurofibromas.[1]

Koselugo is a mitogen-activated protein kinase kinases 1 and 2 (MEK1/2) inhibitor.[1]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Koselugo. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Koselugo is recommended in those who meet the following criteria:

FDA-Approved Indications

139. Neurofibromatosis Type 1. Approve for 3 years if the patient meets the following criteria (A and B):

A) The patient meets ONE of the following (i or ii):
- **i.** Patient is 2 to 18 years of age; OR
- **ii.** Patient is ≥ 19 years of age AND has been previously started on therapy with Koselugo prior to becoming 19 years of age; AND

B) Prior to starting Koselugo, the patient has symptomatic, inoperable plexiform neurofibromas, according to the prescriber.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Koselugo has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

151. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Type of Revision	Summary of Changes	Date Reviewed
New Policy	--	04/15/2020

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Lapatinib (Tykerb) Prior Authorization Policy

- Tykerb® (lapatinib ditosylate tablets – Novartis Pharmaceuticals; generics)

OVERVIEW

Lapatinib, a tyrosine kinase inhibitor, is indicated for the following uses:[1]

- **Breast cancer**, in combination with capecitabine tablets for the treatment of patients with **advanced or metastatic disease** whose tumors overexpress human epidermal growth factor receptor 2 (HER2) and who have received prior therapy including an anthracycline, a taxane, and trastuzumab.
  Limitation of use. Patients should have disease progression on trastuzumab prior to initiation of treatment with lapatinib in combination with capecitabine tablets.
- **Breast cancer**, in combination with letrozole tablets for the treatment of postmenopausal women with **hormone receptor-positive (HR+) metastatic disease** that overexpresses HER2 for whom hormonal therapy is indicated. Lapatinib in combination with an aromatase inhibitor (AI) has not been compared to a trastuzumab-containing chemotherapy regimen for the treatment of metastatic breast cancer.

Guidelines

- **Breast Cancer:** The National Comprehensive Cancer Network (NCCN) clinical practice guidelines on breast cancer (version 6.2020 – September 8, 2020) recommend laptinib in combination with trastuzumab (without cytotoxic therapy) or capecitabine for HER2-positive (HER2+) recurrent or metastatic trastuzumab-exposed disease with symptomatic visceral disease or visceral crisis OR that is hormone receptor-negative or HR+ and endocrine therapy refractory (category 2A).[2] Lapatinib is also recommended in combination with an AI with or without trastuzumab for the treatment of recurrent or Stage IV HR+, HER2+ disease in postmenopausal women.[2] Premenopausal women with HR+ disease should have ovarian ablation/suppression and follow the guidelines for postmenopausal patients. Men with breast cancer should be treated similarly to postmenopausal women except that using an AI is ineffective without suppression of testicular steroidogenesis (category 2A). The NCCN clinical practice guidelines on central nervous system (CNS) cancers (version 3.2020 – September 11, 2020) recommend treatments for patients with brain metastases from breast cancer.[3,4] Capecitabine with or without lapatinib is recommended for recurrent disease in patients with limited (one to three) metastatic lesions or treatment for recurrent stable systemic disease in patients with multiple (> three) metastatic lesions if lapatinib is active against the primary tumor (breast).
- **Bone Cancer:** The NCCN guidelines for bone cancer (version 1.2021 – November 20, 2020) and the compendium recommends the use of lapatinib for epidermal growth factor receptor (*EGFR)*-positive recurrent disease.[3,5]
- **Colon or Rectal Cancer:** The NCCN Compendium supports the use of lapatinib in colon or rectal cancer for HER2-amplified, RAS and BRAF wild-type disease, in combination with trastuzumab.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Tykerb. All approvals are provided for 3 years in duration unless otherwise noted below. In the clinical criteria, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: a woman is defined as an individual with the biological traits of a woman, regardless of the individual's gender identity or gender expression; a man is defined as an individual with the biological traits of a man, regardless of the individual's gender identity or expression.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of lapatinib is recommended in those who meet the following criteria:

FDA-Approved Indications

16. Breast Cancer, Human Epidermal Growth Factor Receptor 2 Positive (HER2+). Approve for 3 years if the patient meets one of the following criteria (A or B):

- **A)** Patient has advanced or metastatic breast cancer and the following criteria are met (i or ii):
  - **i.** Patient has received prior therapy with trastuzumab AND the medication will be used in combination with capecitabine; OR
  - **ii.** The medication will be used in combination with trastuzumab; OR
- **B)** Patient has hormone receptor-positive (that is, estrogen- and/or progesterone-positive) metastatic breast cancer and the following criteria are met (i and ii):
  - **i.** One of the following (a, b, or c) applies:
    - **a)** Patient is a postmenopausal woman*; OR
    - **b)** Patient is a premenopausal or perimenopausal woman* and is receiving ovarian suppression/ablation with a gonadotropin-releasing hormone (GnRH) agonist, surgical bilateral oophorectomy, or ovarian irradiation; OR
      Note: Examples are Lupron® [leuprolide], Trelstar® [triptorelin], Zoladex® (goserelin].
    - **c)** Patient is a man* and is receiving a gonadotropin-releasing hormone (GnRH) agonist; AND
      Note: Examples are Lupron [leuprolide, Trelstar [triptorelin], Zoladex (goserelin].
  - **ii.** The medication will be used in combination with an aromatase inhibitor (that is, letrozole, anastrozole, or exemestane).

***** Refer to the Policy Statement.

Other Uses with Supportive Evidence

2. Bone Cancer – Chordoma. Approve for 3 years if the patient has epidermal growth-factor receptor (*EGFR*)-positive recurrent disease.

3. Colon or Rectal Cancer. Approve for 3 years if the patient meets the following criteria (A, B, and C):

- **A)** Patient has unresectable advanced or metastatic disease that is human epidermal receptor2 (HER2)-amplified and with wild-type RAS; AND
- **B)** The medication is used as subsequent therapy in combination with trastuzumab; AND
- **C)** Patient has not been previously treated with a HER2-inhibitor.
  Note: Examples of HER2-inhibitors are trastuzumab products, Nerlynx (neratinib tablets), Kadcyla (ado-trastuzumab emtansine for injection), Perjeta (pertuzumab for injection).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of lapatinib is not recommended in the following situations:

223. **Cervical Cancer.** In one Phase II study (n = 228), Tykerb plus Votrient® (pazopanib tablets) was compared with lapatinib monotherapy or Votrient monotherapy in patients with advanced and recurrent cervical cancer.[6] At the interim analysis, the futility boundary was crossed for combination therapy vs. lapatinib monotherapy, and the combinati○on arm was discontinued. The median PFS was shorter among lapatinib-treated patients vs. Votrient-treated patients (17.1 weeks vs. 18.1 weeks, respectively; HR 0.66; 90% CI: 0.48, 0.91; P < 0.013). On the clinical cutoff date, median OS was 11.6 weeks greater with Votrient vs. lapatinib (50.7 weeks vs. 39.1 weeks; HR: 0.67; 90% CI: 0.46, 0.99; P = 0.045). Patients were not preselected on the basis of EGFR or HER2 amplification.

224. **Gastric, Esophageal, or Gastroesophageal Adenocarcinoma Cancer.** In one Phase II study (n = 47), lapatinib demonstrated modest activity in patients with treatment-naïve advanced/metastatic gastric cancer.[7] A total of four patients had a confirmed partial response, one patient had an unconfirmed partial response, and 10 patients had stable disease. An exploratory analysis revealed gene expression of HER2, interleukin (IL)-8 and genomic polymorphisms IL-8, and vascular endothelial growth factor (VEGF) correlated with OS. In one Phase III, open-label trial conducted in China, Japan, South Korea, and Taiwan, Asian patients (n = 261) with HER2+ advanced gastric cancer were randomized to lapatinib 1,500 mg per day plus paclitaxel 80 mg/m^2 on Days 1, 8, and 15 of a 28-day cycle or to paclitaxel alone.[8] Patients had disease progression after prior therapy. The primary endpoint was OS. Median OS was 11.0 months in patients receiving lapatinib plus paclitaxel vs. 8.9 months with paclitaxel alone (P = 0.1044). There was no significant difference between lapatinib plus paclitaxel or paclitaxel alone in median PFS (5.4 vs. 4.4 months) or time to progression (5.5 vs. 4.4 months), respectively. Overall response rate (ORR) was higher with lapatinib plus paclitaxel vs. paclitaxel alone (27% vs. 9%, respectively; 95% CI: 1.80, 8.87; P <0.001). In one Phase III trial in patients (n = 545) with previously untreated HER2+ advanced gastroesophageal adenocarcinoma were randomized to receive CapeOx (capecitabine plus oxaliplatin) with either lapatinib or placebo.[9] Median OS was 12.2 months (95% CI: 10.6, 14.2) and 10.5 months (95% CI: 9.0, 11.3) for lapatinib and placebo, respectively (HR 0.91; 95% CI: 0.73, 1.12). Preplanned exploratory analysis showed OS in the lapatinib was prolonged in Asian and younger patients.

225. **Head and Neck, Squamous Cell Carcinoma.** In one Phase III study in 688 patients with SCCHN, adding lapatinib to chemoradiotherapy and as maintenance monotherapy was not more effective than placebo in improving disease-free survival or OS.[10]

226. **Renal Cell Carcinoma (RCC).** In one Phase III study in patients (n = 416) with advanced RCC who experienced disease progression through first-line cytokine therapy, lapatinib and hormone therapy (megestrol acetate or tamoxifen, selected by the investigator) demonstrated comparable efficacy: the median time to progression was 15.3 weeks and 15.4 weeks for lapatinib and hormone therapy, respectively (HR 0.94; P = 0.60).[11] The median OS was 46.9 weeks and 43.1 weeks for lapatinib and hormone therapy, respectively (HR 0.88; P = 0.29).

227. **Urothelial Carcinoma.** In one Phase III trial, 232 patients with HER1/HER2 metastatic urothelial bladder cancer who did not have progressive disease during chemotherapy were randomized to receive lapatinib or placebo after completing first-line or initial chemotherapy.[12] Median PFS, the primary endpoint, for lapatinib and placebo was 4.5 months (95% CI: 2.8, 5.4) and 5.1 months (95% CI: 3.0, 5.8), respectively (HR 1.07; 95% CI: 0.81, 1.43; P = 0.63).

228. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	Added new condition for approval in Chordoma based on guidelines/compendium.	12/20/2018
Annual Revision	For Breast Cancer, rearranged criteria to state Tykerb + capecitabine can be used if patient has previously tried trastuzumab. Added new condition of approval under Other Uses with Supportive Evidence for Colon or Rectal cancer based on guidelines. Under Conditions Not Recommended for Approval, deleted the following conditions: Adenoid/non-adenoid cystic carcinoma of the salivary gland, biliary cancer, glioblastoma multiforme, hepatocellular carcinoma, non-small cell lung cancer, ovarian or peritoneal cancer, and prostate cancer.	12/18/2019
Annual Revision	• Tykerb is available as generics; changed Tykerb in filename to generic name. Also changed to generic throughout document where applicable • **Breast Cancer, Human Epidermal Growth Factor Receptor 2 Positive (HER2+):** Moved examples of GnRH agonist from criteria to Note.	01/13/2021

HR+ -- Hormone receptor positive; HER2 – Human epidermal growth factor receptor 2; LHRH – Luteinizing hormone-releasing hormone; GnRH – Gonadotropin-releasing hormone.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Lenvima™ (lenvatinib capsules – Eisai)

DATE REVIEWED: 05/13/2020

OVERVIEW

Lenvima, a kinase inhibitor, is indicated for the treatment of patients with locally recurrent or metastatic, progressive, radioactive iodine (RAI)-refractory differentiated thyroid cancer (DTC).[1] Lenvima is also indicated, in combination with Afinitor® (everolimus tablets), for the treatment of patients with advanced renal cell carcinoma (RCC) following one prior anti-angiogenic therapy. In addition, it is also indicated for the first-line treatment of patients with unresectable hepatocellular carcinoma (HCC). Lenvima, in combination with Keytruda (pembrolizumab for injection), is indicated for the treatment of patients with advanced endometrial carcinoma that is not microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR), who have disease progression following prior systemic therapy and are not candidates for curative surgery or radiation. This indication is approved under accelerated approval based on tumor response rate and durability of response.

Guidelines

According to the National Comprehensive Cancer Network (NCCN) guidelines on thyroid carcinoma (version 2.2019 – September 16, 2019), first-line treatment for DTC is surgery, whenever possible, followed by RAI therapy in selected patients, and levothyroxine therapy in all patients.[2] Systemic therapy options include cytotoxic chemotherapy and kinase inhibitors. Multitargeted kinase inhibitors are recommended in current guidelines for select patients with DTC. The guidelines state that for progressive and/or symptomatic disease, Lenvima (preferred) or Nexavar® (sorafenib tablets) should be considered (Category 2A). It is noted that the majority of the NCCN panel considered Lenvima to be preferred agent in this patient population based on the response rate observed in clinical trials. Lenvima can be considered for treatment of progressive or symptomatic medullary thyroid disease if clinical trials, Caprelsa, or Cometriq are not available or appropriate, or if there is progression on Caprelsa or Cometriq.[2] Lenvima is also listed as "useful under certain circumstances" for anaplastic thyroid carcinoma if there is no curative option and if the patient is not tolerating or has no response to recommended therapies.[4] The compendium notes that Lenvima can be used either first-line for aggressive metastatic disease or as subsequent therapy.

The NCCN kidney cancer guidelines (version 2.2020 – August 5, 2019) recommends Lenvima + everolimus as one of the "other recommended regimens" (category 1) for relapse or stage IV subsequent therapy for clear cell histology. It is also a recommended combination therapy (category 2A) listed as "useful under certain circumstances" for non-clear cell histology.

The NCCN hepatobiliary cancers (version 2.2020 – May 8, 2020) recommends Lenvima as preferred first-line systemic therapy (Child-Pugh Class A only) for hepatocellular carcinoma. It is also recommended as subsequent-line therapy upon disease progression (category 2A).

The NCCN uterine neoplasms guidelines (version 1.2020 – March 6, 2020) recommends Lenvima with Keytruda combination therapy for recurrent, metastatic, or high-risk endometrial carcinoma. This combination is a category 2A recommendation under "Other Recommended Regimens".

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Lenvima. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Lenvima is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Differentiated (i.e., Papillary, Follicular, and Hürthle) Thyroid Carcinoma.** Approve for 3 years if the disease is refractory to radioactive iodine therapy.

2. **Renal Cell Carcinoma (Clear Cell or Non-Clear Cell).** Approve for 3 years if the patient meets the following criteria (A, B, and C):
   - **A)** The patient has relapsed or Stage IV disease; AND
   - **B)** If disease is predominant clear-cell histology, then the patient has tried one antiangiogenic therapy. Note: Examples are Inlyta® [axitinib tablets], Votrient® [pazopanib tablets], Sutent® [sunitinib capsules], or Cabometyx® [cabozantinib tablets]; AND
   - **C)** Lenvima is used in combination with everolimus /Afinitor® Disperz™ (everolimus tablets for oral suspension) therapy.

3. **Hepatocellular Carcinoma, Unresectable.** Approve for 3 years.

4. **Endometrial Carcinoma.** Approve for 3 years if the patient meets the following criteria (A, B, C, and D):
   - **A)** The patient has advanced endometrial carcinoma that is not microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR); AND
   - **B)** The medication is used in combination with Keytruda (pembrolizumab for intravenous injection); AND
   - **C)** The disease has progressed on at least one prior systemic therapy. Note: Examples of systemic therapy are carboplatin, paclitaxel, docetaxel, cisplatin, doxorubicin, ifosfamide, everolimus, letrozole; AND
   - **D)** The patient is not a candidate for curative surgery or radiation.

Other Uses with Supportive Evidence

5. **Medullary Thyroid Carcinoma.** Approve for 3 years if the patient has tried Caprelsa (vandetanib tablets) or Cometriq (cabozantinib capsules).

6. **Anaplastic Thyroid Carcinoma.** Approve for 3 years if the disease does not have a curative option.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Lenvima has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

229. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

History

Type of Revision	Summary of Changes*	Date Reviewed
Annual revision	Deleted Hepatocellular Carcinoma from Conditions Not Recommended for Approval due to pending positive Phase III data results. Also deleted Melanoma from the same section.	03/15/2017
Annual revision	For Renal Cell Carcinoma indication, deleted "Nexavar" from list of examples and added "Cabometyx" instead, based on guidelines. Deleted Medullary Thyroid Carcinoma from Conditional Not Recommended for Approval and moved it to approval conditions under Other Uses with Supportive Evidence, based on thyroid carcinoma guidelines/compendium. Added Hepatocellular Carcinoma as an approval condition under Other Uses based on the published Phase III study comparing it with Nexavar. Deleted Endometrial Cancer and Non-Small Cell Lung Cancer from Conditions Not Recommended for Approval due to lack of new data.	04/11/2018
Selected revision	Moved Hepatocellular Cancer to FDA-approved indications. Added qualifier "First-Line Treatment" based on approved indication.	09/05/2018
Annual revision	Added qualifier "(Clear Cell or Non-Clear Cell)" to renal cell carcinoma indication. Deleted "advanced" from condition qualifier; instead added criteria the patient has relapsed or stage IV disease as per guidelines. Deleted separate criteria for clear cell and non-clear cell; instead noted that "if disease is predominant clear cell histology" then patient has tried prior therapy. Added approval for anaplastic thyroid carcinoma if the disease does not have curative option based on guidelines/compendium.	04/17/2019
Selected revision	Added new approval condition for endometrial carcinoma based on FDA approval.	10/09/2019
Annual revision	For Hepatocellular Carcinoma indication, deleted"First-Line Treatment", since the guidelines recommend Lenvima for subsequent therapy as well.	05/13/2020

NCCN – National Comprehensive Cancer Network; NA – Not applicable; RCC – Renal cell carcinoma.

DATE REVIEWED: 02/26/2020

OVERVIEW

Lonsurf is a combination of trifluridine, a nucleoside metabolic inhibitor, and tipiracil, a thymidine phosphorylase inhibitor, indicated for the treatment of adult patients with metastatic colorectal cancer (mCRC) who have been previously treated with fluoropyrimidine-, oxaliplatin-, and irinotecan-based chemotherapy, an anti-vascular endothelial growth factor (VEGF) biological therapy, and if *RAS* wild-type, an anti-epidermal growth factor receptor (EGFR) therapy.[1] Fluoropyrimidines include 5-fluorouracil (5-FU) intravenous (IV) injection and capecitabine tablets. Anti-VEGF therapies for mCRC include Avastin® (bevacizumab solution for IV injection) and Cyramza® (ramucirumab injection for IV use). Anti-EGFR therapies for mCRC include Erbitux® (cetuximab injection for IV infusion) and Vectibix® (panitumumab injection for IV infusion).

Lonsurf is indicated for the treatment of adult patients with metastatic gastric or gastroesophageal junction adenocarcinoma previously treated with at least two lines of chemotherapy that included a fluoropyrimidine, a platinum, either a taxane or irinotecan, and if appropriate, human epidermal growth factor receptor 2 (HER2)/neu-targeted therapy.[1]

Guidelines

Colon and/or Rectal Cancer

The National Comprehensive Cancer Network (NCCN) colon cancer (version 1.2020 – December, 19, 2019) and rectal cancer (version 1.2020 – December 19, 2019) guidelines recommend Lonsurf as subsequent therapy as a single agent for unresectable advanced or metastatic disease not previously treated with Lonsurf for the following uses:[2-3] for first progression (*KRAS/NRAS* mutant only) or second progression for disease previously treated with FOLFOXIRI (5-FU/leucovorin, irinotecan, oxaliplatin) with or without Avastin, for second progression for disease previously treated with irinotecan- and oxaliplatin-based regimens, or for progression for disease that progressed through all available regimens, including Stivarga® (regorafenib tablets). Lonsurf may be given before or after Stivarga.

Gastric Cancer and/or Esophageal and Esophagogastric Junction Cancer

The NCCN gastric cancer (version 4.2019 – December 20, 2019), and the esophageal and esophagogastric cancer (version 4.2019 – December 20, 2019) guidelines recommend Lonsurf as a single agent for the third line or subsequent therapy for unresectable locally advanced, recurrent, or metastatic gastric and esophagogastric junction adenocarcinoma following prior fluoropyrimidine-, platinum-, taxane-, or irinotecan-based chemotherapy.[4-6]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Lonsurf. All approvals are provided for 3 years in duration unless otherwise noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Lonsurf is recommended in those who meet the following criteria:

FDA-Approved Indications

~~5.~~2. **Colon and Rectal Cancer.** Approve for 3 years if the patient meets the following criteria (A, B, C, and D):[1]

- **A)** The patient has been previously treated with a fluoropyrimidine (e.g., capecitabine, 5-fluorouracil [5-FU]); AND
- **B)** The patient has been previously treated with oxaliplatin; AND
- **C)** The patient has been previously treated with irinotecan; AND
- **D)** If the patient's tumor or metastases are wild-type *RAS* (*KRAS* wild-type and/or *NRAS* wild-type) [that is, the tumors or metastases are *KRAS* and/or *NRAS* mutation negative], Erbitux (cetuximab injection for intravenous infusion) or Vectibix (panitumumab injection for intravenous infusion) has been tried.

2. **Gastric or Gastroesophageal Junction Adenocarcinoma.** Approve for 3 years if the patient has been previously treated with at least two chemotherapy regimens for gastric or gastroesophageal junction adenocarcinoma (e.g., regimens containing one or more of the following agents: capecitabine, 5-fluorouracil [5-FU]), oxaliplatin. paclitaxel, docetaxel, and irinotecan).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Lonsurf has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

230. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes*	Date Reviewed
Annual	Colorectal Cancer criteria revised to add wild-type *RAS*. Previously criteria stated *KRAS* and/or *NRAS* that are the components of *RAS*. Wild-type refers to both *KRAS* and *NRAS*.	10/25/2017
Annual	Removed criteria for patient already started on Lonsurf	10/17/2018
Early annual revision	Added gastric and gastroesophageal junction adenocarcinoma, metastatic as a new condition of approval.	03/06/2019
Annual	Colon and rectal cancer: Removed metastatic from indication for approval. Gastric and gastroesophageal junction adenocarcinoma: Removed metastatic from indication for approval.	02/26/2020

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Lorbrena Prior Authorization Policy
- Lorbrena® (lorlatinib tablets – Pfizer)

REVIEW DATE: 11/18/2020; selected revision 03/17/2021

OVERVIEW
Lorbrena, a kinase inhibitor, is indicated for the treatment of adult patients with **anaplastic lymphoma kinase (*ALK*)-positive metastatic non-small cell lung cancer (NSCLC)** as detected by an FDA-approved test.[1]

GUIDELINES
According to the National Comprehensive Cancer Network (NCCN) NSCLC guidelines (version 4.2021 – March 3, 2021), Alecensa® (alectinib capsules), Alunbrig™ (brigatinib tablets), and Lorbrena are all category 1, first-line,preferred regimens.[2] Other category 1 recommended regimen is Zykadia® (ceritinib capsules). Xalkori is listed as useful in certain circumstances, but it's also a category 1 option. Lorbrena is also recommended as subsequent therapy upon progression on Alecensa, Alunbrig, or Zykadia (category 2A). If Xalkori is used first-line, then Lorbrena is used for subsequent therapy after progression on Alecensa, Alunbrig, or Zykadia (category 2A). Lorbrena is also recommended as subsequent therapy after progression on Xalkori, Rozlytrek (entrectinib capsules) [both "Preferred"], or Zykadia [all category 2A] for ROS1 rearrangement-positive NSCLC. Zykadia is listed as "other recommended" agent in the first-line setting for ROS1 rearrangement.

POLICY STATEMENT
Prior Authorization is recommended for prescription benefit coverage of Lorbrena. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Lorbrena is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Non-Small Cell Lung Cancer (NSCLC).** Approve for 3 years if the patient meets the following criteria (A and B):

A) Patient is ≥ 18 years of age; AND
B) Patient has anaplastic lymphoma kinase (*ALK*)-positive metastatic NSCLC, as detected by an approved test.

Other uses With Supportive Evidence

2. Non-Small Cell Lung Cancer. Approve for 3 years if the patient meets the following criteria (A, B, and C):
A) Patient is ≥ 18 years of age; AND
B) Patient has *ROS1* rearrangement-positive disease; AND
C) Patient has tried at least one of Xalkori (crizotinib capsules), Zykadia (ceritinib capsules), or Rozlytrek (entrectinib capsules).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Lorbrena is not recommended in the following situations:

231. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

REFERENCES

337. Lorbrena® tablets [prescribing information]. New York, NY: Pfizer; March 2021.
338. The NCCN Non-Small Cell Lung Cancer Clinical Practice Guidelines in Oncology (version 4.2021 – March 3, 2021). © 2021 National Comprehensive Cancer Network, Inc. Available at: http://www.nccn.org. Accessed on March 16, 2021.

HISTORY

Type of Revision	Summary of Changes	Review Date
New Policy	--	11/7/2018
Annual Revision	Added new approval condition for ROS1-positive non-small cell lung cancer.	11/13/2019
Annual Revision	**Non-Small Cell Lung Cancer:** Added new criteria for use of Lorbrena after first-line Alunbrig, based on guidelines. Deleted "as the first anaplastic lymphoma kinase (ALK) inhibitor therapy" after Alecensa and Zykadia criteria, since it's not needed.	11/18/2020
Selected Revision	**Non-Small Cell Lung Cancer:** Based on FDA-approval in the first-line setting, deleted criteria requiring prior use of another ALK inhibitor therapy. Added age requirement criterion and added "as detected by an approved test" in reference to ALK mutation testing, as per the label. **Non-Small Cell Lung Cancer:** Under "Other uses with supportive evidence", moved "ROS1 Rearrangement Positive" descriptor from indication to within criteria. Added age criterion to match FDA-approved use above. Reworded criterion referring to patient has "disease progression on" to "Patient has tried at least one of". Added Rozlytrek (entrectinib capsules) as another agent patient could have tried.	03/17/2021

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Lynparza Prior Authorization Policy
- Lynparza™ (olaparib capsules and tablets – AstraZeneca)

REVIEW DATE: 02/03/2021

OVERVIEW

Lynparza, a poly (ADP-ribose) polymerase (PARP) inhibitor, is indicated for the following:[1]

- **Breast cancer**, in adult patients with deleterious or suspected deleterious g*BRCA* mutated, HER2-negative metastatic disease, who have been treated with chemotherapy in the neoadjuvant, adjuvant, or metastatic setting. Patients with hormone receptor (HR)-positive breast cancer should have been treated with a prior endocrine therapy or be considered inappropriate for endocrine therapy.
- **Ovarian cancer, treatment** in adult patients with deleterious or suspected deleterious germline BReast CAncer (g*BRCA*)-mutated advanced who have been treated with three or more prior lines of chemotherapy.
- **Ovarian cancer, maintenance** treatment of adult patients with recurrent epithelial ovarian, fallopian tube, or primary peritoneal cancer, who are in a complete or partial response to platinum-based chemotherapy.
- **Ovarian cancer, maintenance** treatment of adult patients with deleterious or suspected deleterious g*BRCA* or somatic *BRCA*-mutated advanced epithelial ovarian, fallopian tube, or primary peritoneal cancer who are in complete or partial response to first-line platinum-based chemotherapy.
- **Ovarianc cancer, maintenance treatment in combination** with bevacizumab for adult patients with advanced epithelial ovarian, fallopian tube or primary peritoneal cancer who are in complete or partial response to first-line platinum-based chemotherapy and whose cancer is associated with homologous recombination deficiency (HRD)-positive status defined by either: a deleterious or suspected deleterious *BRCA* mutation, and/or genomic instability.
- **Pancreatic adenocarcinoma,** maintenance treatment of adult patients with deleterious or suspected deleterious g*BRCA* mutated metastatic disease, who have not progressed on at least 16 weeks of a first-line platinum-based chemotherapy regimen.
- **Prostate cancer**, castration-resistant (CRPC), for the treatment of adult patients with deleterious or suspected deleterious germline or somatic homologous recombination repair (HRR) gene-mutated metastatic CRPC (mCRPC) who have progressed following prior treatment with Xtandi (enzalutamide tablets) or abiraterone.

Lynparza tablets and capsules are not interchangeable; they have different dosing and bioavailability. The tablet formulation yields a lower daily pill burden than the capsule formulation.

Guidelines

- **Breast Cancer:** The National Comprehensive Cancer Network (NCCN) breast cancer guidelines (version 1.2021 – January 15, 2021) recommend assessing for germline BRCA1/2 mutations in all patients with recurrent or metastatic disease to identify candidates for PARP inhibitor therapy.[3] Lynparza is noted as one of the preferred single agents for BRCA 1/2 positive tumors (category 1). It is noted that although Lynparza is FDA-approved for HER2-negative disease, the NCCN panel supports use in any breast cancer subtype with BRCA1 or BRCA2 mutation.
- **Ovarian Cancer:** The NCCN guidelines on ovarian cancer (version 2.2020 – January 12, 2021) recommend Lynparza for maintenance therapy after primary treatment in patients who have had a complete or partial response.[2] Lynparza is recommended for *BRCA* 1/2 mutations(category 1). Lynparza in combination with bevacizumab is recommended if bevacizumab was used as part of primary therapy. This combination is recommended for both *BRCA*1/2 wild-type (or unknown) [category 2A] and for germline/somatic *BRCA*1/2 mutation (category 1) in patients who have achieved a complete or partial response. The guidelines recommend use of Zejula™ (niraparib capsules), Rubraca™ (rucaparib tablets), or Lynparza as maintenance therapy options in patients with platinum-sensitive disease who have completed two or more lines of platinum-based therapy. The guidelines recommend Lynparza as one of the preferred single-agent targeted therapies for

patients with deleterious germline *BRCA* mutated advanced (persistent disease or recurrence) ovarian cancer-following three or more lines of therapy (category 2A).

- **Pancreatic Cancer:** The NCCN pancreatic adenocarcinoma guidelines (version 1.2021 – October 23, 2020) recommend Lynparza for maintenance therapy after the patient has tried first-line systemic therapy.[4] It is specifically recommended in patients who have germline *BRCA* 1/2 mutations and who have not had disease progression after at least 4 to 6 months of chemotherapy.
- **Prostate Cancer:** The NCCN prostate cancer guidelines (version 3.2020 – November 17, 2020) recommends Lynparza for HRRm in the second-line setting (category 1), after first-line treatment with Xtandi or abiraterone. In patients who have received first-line docetaxel, Lynparza is a category 2B recommended therapy in the second-line setting for HRRm. In a footnote it is noted that Lynparza is a treatment option for patients with mCRPC and a pathogenic mutation (germline and/or somatic) in a HRR gene (*BRCA1*, *BRCA2*, *ATM*, *BARD1*, *BRIP1*, *CDK12*, *CHEK1*, *CHEK2*, *FANCL*, *PALB2*, *RAD51B*, *RAD51C*, *RAD51D*, or *RAD54L)*, who have been treated with androgen receptor-directed therapy. Patients with PPP2R2A mutation in the PROfound trial experienced an unfavorable risk-benefit profile. Therefore, Lynparza is not recommended in patients with a PPP2R2A mutations.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Lynparza. All approvals are provided for 3 years in duration.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Lynparza is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Breast Cancer.** Approve for 3 years if the patient meets the following criteria (A, B, C, and D):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has metastatic, germline *BRCA* mutation-positive breast cancer; AND
   - **C)** Patient meets ONE of the following criteria (i or ii):
     - **i.** Patient meets BOTH of the following criteria (a and b):
       - **a)** Patient has hormone receptor positive (HR+) [i.e., estrogen receptor positive {ER+} and/or progesterone receptor positive {PR+}] disease; AND
       - **b)** Patient meets ONE of the following criteria (1 or 2):
         - **(1)** Patient has been treated with prior endocrine therapy; OR
         - **(2)** Patient is considered inappropriate for endocrine therapy; OR
     - **ii.** Patient has triple negative disease (i.e., ER-negative, PR-negative, and HER2-negative); AND
   - **D)** Patient has been treated with chemotherapy in the neoadjuvant, adjuvant, or metastatic setting.

2. **Ovarian Cancer – Treatment.**
   - **A)** Initial Therapy. Approve for 3 years if the patient meets the following criteria (i, ii, and iii):
     - **i.** Patient is ≥ 18 years of age; AND
     - **ii.** Patient has a germline *BRCA*-mutation as confirmed by an approved test; AND
     - **iii.** Patient has progressed on three or more prior lines of chemotherapy.
   - **B)** Patient is Currently Receiving Lynparza. Approve for 3 years if the patient has a *BRCA* mutation (germline) as confirmed by an approved test.

3. **Ovarian, Fallopian Tube, or Primary Peritoneal Cancer – Maintenance, Monotherapy.** Approve for 3 years if the patient meets the following criteria (A and B):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient meets ONE of the following (i or ii):
     - **i.** Patient meets both of the following criteria for first-line maintenance therapy (a and b):
       - **a)** Patient has a germline or somatic *BRCA* mutation-positive disease as confirmed by an approved test; AND
       - **b)** Patient is in complete or partial response to first-line platinum-based chemotherapy regimen; OR
         Note: Examples are carboplatin with paclitaxel, carboplatin with doxorubicin, docetaxel with carboplatin.
     - **ii.** Patient is in complete or partial response after at least two platinum-based chemotherapy regimens.
       Note: Examples of platinum-based chemotherapy are carboplatin with gemcitabine, carboplatin with paclitaxel, cisplatin with gemcitabine.

4. **Ovarian, Fallopian Tube, or Primary Peritoneal Cancer – Maintenance, Combination Therapy.** Approve for 3 years if the patient meets one of the following criteria (A, B, C, and D):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** The medication is used in combination with bevacizumab; AND
   - **C)** Patient has homologous recombination deficiency (HRD)-positive disease as confirmed by an approved test.
     Note: HRD-positive disease includes patients with *BRCA* mutation-positive disease; AND
   - **D)** Patient is in complete or partial response to first-line platinum-based chemotherapy regimen.
     Note: Examples of chemotherapy regimens are carboplatin with paclitaxel, carboplatin with doxorubicin, docetaxel with carboplatin.

5. **Pancreatic Cancer – Maintenance Therapy.** Approve for 3 years if the patient meets the following criteria (A, B, and C):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has a germline *BRCA* mutation-positive metastatic disease; AND
   - **C)** The disease has not progressed on at least 16 weeks of treatment with a first-line platinum-based chemotherapy regimen.

6. **Prostate Cancer – Castration-Resistant.** Approve for 3 years if the patient meets the following criteria (A, B, C, D, E, and F):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has metastatic disease; AND
   - **C)** Patient meets one of the following criteria (i or ii):
     - **i.** The medication is used concurrently with a gonadotropin-releasing hormone (GnRH) analog; OR
       Note: Examples are Lupron (leuprolide for injection), Lupron Depot (leuprolide acetate for depot suspension), Trelstar (triptorelin pamoate for injectable suspension), Zoladex (goserelin acetate implant), Vantas (histrelin acetate subcutaneous implant), Firmagon (degarelix for injection), Orgovyx (relugolix tablets).
     - **ii.** Patient has had a bilateral orchiectomy; AND
   - **D)** Patient has germline or somatic homologous recombination repair (HRR) gene-mutated disease, as confirmed by an approved test; AND
     Note: HRR gene mutations include *BRCA1*, *BRCA2*, *ATM*, *BARD1*, *BRIP1*, *CDK12*, *CHEK1*, *CHEK2*, *FANCL*, *PALB2*, *RAD51B*, *RAD51C*, *RAD51D*, or *RAD54L*.
   - **E)** Patient does not have a *PPP2R2A* mutation; AND

F) Patient has been previously treated with abiraterone or Xtandi (enzalutamide capsules).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Lynparza is not recommended in the following situations:

232. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	Lynparza got FDA approval for use in first-line maintenance therapy setting in *BRCA*-positive disease. Based on this indication, combined Maintenance therapy criteria for use in first-line and recurrent disease. Specified in recurrent maintenance therapy setting that Lynparza is used after at least two lines of platinum-based chemotherapy regimens.	02/06/2019
Annual Revision	New condition and criteria for Pancreatic Cancer – Maintenance Therapy was added based on FDA-approval. In Ovarian, Fallopian Tube, or Primary Peritoneal Cancer – Maintenance Therapy criteria, deleted criteria "the patient has recurrent disease."	01/15/2020
Selected Revision	Added new approval indications for Lynparza combination use with bevacizumab for maintenance therapy in ovarian cancer and for treatment of metastatic castration-resistant prostate cancer.	05/27/2020

HISTORY (CONTINUED)

Type of Revision	Summary of Changes	Review Date
Annual Revision	**All indications:** Added age criteria of ≥ 18 years. **Breast Cancer:** Deleted criteria requiring use in HER2-negative disease. The breast cancer guidelines recommend use in any subtype with *BRCA* mutation. **Prostate Cancer – Castration-Resistant:** Added Orgovyx as example in Note for GnRH analog.	02/03/2021

BRCA – BReast CAncer; HER2 – Human epidermal growth factor receptor 2; GnRH – Gonadotropin-releasing hormone.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Mekinist Prior Authorization Policy
- Mekinist™ (trametinib tablets – GlaxoSmithKline)

REVIEW DATE: 07/15/2020

OVERVIEW

Mekinist, a kinase inhibitor, is indicated for the treatment of patients with the following conditions:[1]

- **Melanoma**, in the following situations:
  - As a single agent for unresectable or metastatic disease with a BRAF V600E or V600K mutation as detected by an FDA-approved test; AND
  - In combination with Tafinlar® (dabrafenib tablets), for treatment of unresectable or metastatic disease with a BRAF V600E or V600K mutation as detected by an FDA-approved test; AND
  - In combination with Tafinlar for adjuvant treatment of patients with a BRAF V600E or V600K mutation as detected by an FDA-approved test, and involvement of lymph nodes, following complete resection.
- **Non-small cell lung cancer**, in combination with Tafinlar, for treatment of disease that has the BRAF V600E mutation as detected by an FDA-approved test.
- **Thyroid cancer**, in combination with Tafinlar, for treatment of patients with locally advanced or metastatic anaplastic disease with BRAF V600E mutation and with no satisfactory locoregional treatment options.

Guidelines

National Comprehensive Cancer Network (NCCN) guidelines support use of Mekinst in multiple cancers.

- **Melanoma:** Guidelines (version 3.2020 – May 18, 2020) recommend BRAF/MEK inhibitor combinations for first-line (preferred if clinically needed for early response) and subsequent treatment of metastatic or unresectable melanoma with a *V600* activating mutation.[2] While combination BRAF/MEK inhibition is preferred, if a combination is contraindicated, monotherapy with a BRAF inhibitor (Tafinlar or Zelboraf® [vemurafenib tablets]) is a recommended option, particularly if the patient is not a candidate for checkpoint immunotherapy. Following resection of limited metastatic disease with a *BRAF V600*-activating mutation, BRAF/MEK combination therapy is among the treatment options for patients with no evidence of disease. Tafinlar + Mekinist® (trametinib tablets) is also recommended in guidelines as adjuvant therapy (including for nodal recurrence) in some patients with Stage III disease, including use post-surgery or use after complete lymph node dissection. If unacceptable toxicity to Tafinlar/Mekinist, other BRAF/MEK combinations can be considered. NCCN guidelines for uveal melanoma (version 1.2020 – May 21, 2020) list Mekinist as a treatment option for distant metastatic disease.[3]
- **NSCLC:** Guidelines (version 6.2020 – June 25, 2020) list Tafinlar + Mekinist among the first-line therapy and subsequent therapy options for tumors with a *BRAF* mutation.[4] NCCN also notes that

monotherapy with a BRAF inhibitor (Tafinlar or Zelboraf) is a treatment option when combination therapy is not tolerated.

- **Thyroid Cancer:** Guidelines (version 1.2020 – June 12, 2020) list Tafinlar + Mekinist as a treatment option for metastatic anaplastic thyroid cancer with a *BRAF* mutation.[5] Tafinlar and Zelboraf are also treatment options for the treatment of iodine-refractory differentiated thyroid cancer (follicular, Hürthle cell, and papillary cancer subtypes) with a *BRAF V600* mutation.
- **Ovarian, Including Fallopian Tube and Primary Peritoneal Cancer:** Guidelines (version 1.2020 – March 11, 2020) recommend Mekinist among the targeted therapy options for recurrent low-grade serous disease.[6]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Mekinist. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Mekinist is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Melanoma.** Approve for 3 years if the patient meets BOTH of the following (A and B):
   - **A)** Patient has unresectable, advanced (including Stage III or Stage IV disease), or metastatic melanoma; AND
     Note: This includes adjuvant treatment in patients with Stage III disease with no evidence of disease post-surgery.
   - **B)** Patient has *BRAF V600* mutation-positive disease.

2. **Non-Small Cell Lung Cancer.** Approve for 3 years if the patient meets BOTH of the following (A and B):
   - **A)** Patient has *BRAF V600E* mutation-positive disease; AND
   - B) The agent is being used in combination with Tafinlar (dabrafenib capsules).

3. **Thyroid Cancer, Anaplastic.** Approve for 3 years if the patient meets ALL of the following (A, B, and C):
   - **A)** Patient has locally advanced or metastatic anaplastic disease; AND
   - **B)** Mekinist will be taken in combination with Tafinlar, unless intolerant; AND
   - **C)** Patient has *BRAF V600* mutation-positive disease.

Other Uses with Supportive Evidence

4. **Ovarian/Fallopian Tube/Primary Peritoneal Cancer**. Approve for 3 years if the patient meets the following criteria (A and B):
   - **A)** Patient has recurrent disease; AND
   - **B)** The medication is used for low-grade serous carcinoma.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Mekinist is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Early annual revision	Add criteria to approve for 3 years for locally advanced or metastatic anaplastic thyroid cancer that is BRAF V600-positive, if taken in combination with Mekinist (unless intolerant). Due to new indication as adjuvant therapy in resectable melanoma, remove criteria that does not allow coverage in patients who had disease progression while on a BRAF inhibitor. Remove continuation criteria in melanoma; now all approvals require that the patient has unresectable, advanced (including Stage III or Stage IV disease), or metastatic melanoma with a BRAF mutation.	05/23/2018
Annual revision	**NSCLC:** The diagnosis was changed to remove the BRAF mutation from the approval condition. The requirement that the patient has BRAF V600E mutation was added to the criteria for patients with NSCLC. **Colon or Rectal Cancer:** Add criteria as supported by NCCN colon cancer guidelines. Criteria approve if the patient has *BRAF V600E* mutation-positive disease, and if the patient has previously used chemotherapy, and if the agent will be used as part of a combination regimen for colon or rectal cancer.	06/18/2019
Annual revision	**Colon or Rectal Cancer:** This indication was removed from the policy. Mekinist is no longer a recommended therapy in guidelines for colon and rectal cancer. **Ovarian/Fallopian Tube/Primary Peritoneal Cancer:** Based on guidelines, this indication was added as an off-label use. Criteria approve for 3 years, if the patient has recurrent low-grade serous carcinoma.	07/15/2020

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Mektovi Prior Authorization Policy

- Mektovi® (binimetinib tablets – Array BioPharma)

REVIEW DATE: 07/15/2020

OVERVIEW

Mektovi, a kinase inhibitor, is indicated in combination with Braftovi® (encorafenib capsules) for treatment of unresectable or metastatic melanoma with a *BRAF V600E* or *V600K* mutation as detected by an FDA-approved test.[1]

Guidelines

Guidelines (version 3.2020 – May 18, 2020) recommend BRAF/MEK inhibitor combinations for first-line (preferred if clinically needed for early response) and subsequent treatment of metastatic or unresectable melanoma with a *V600* activating mutation.[2] While combination BRAF/MEK inhibition is preferred, if a combination is contraindicated, monotherapy with a BRAF inhibitor (Tafinlar® [dabrafenib capsules] or Zelboraf® [vemurafenib tablets]) is a recommended option, particularly if the patient is not a candidate for checkpoint immunotherapy. Following resection of limited metastatic disease with a *BRAF V600*-activating mutation, BRAF/MEK combination therapy is among the treatment options for patients with no evidence of disease. Tafinlar + Mekinist® (trametinib tablets) is also recommended in guidelines as adjuvant therapy (including for nodal recurrence) in some patients with Stage III disease, including use post-surgery or use after complete lymph node dissection. If unacceptable toxicity to Tafinlar/Mekinist, other BRAF/MEK combinations can be considered.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Mektovi. All approvals are provided the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Mektovi is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Melanoma.** Approve for 3 years if the patient meets ALL of the following (A, B, and C):
   - **C)** Patient has unresectable, advanced, or metastatic melanoma; AND
   - **D)** Patient has *BRAF V600* mutation-positive disease; AND
   - **E)** Mektovi will be used in combination with Braftovi (encorafenib capsules).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Mektovi is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Annual revision	**Colon or Rectal Cancer:** This indication was removed from the policy. Mektovi is no longer a recommended therapy in guidelines for colon and rectal cancer.	07/15/2020

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Nerlynx Prior Authorization Policy

- Nerlynx™ (neratinib tablets – Puma Biotechnology)

REVIEW DATE: 09/23/2020

OVERVIEW

Nerlynx is indicated for the extended adjuvant treatment of adult patients with early-stage human epidermal growth factor receptor 2 (HER2) overexpressed/amplified (i.e., HER2 positive [HER2+]) breast cancer, to follow adjuvant trastuzumab -based therapy.[1] It is also indicated in combination with capecitabine for the treatment of adult patients with advanced or metastatic HER2-positive breast cancer who have received two or more prior anti-HER2-based regimens in the metastatic setting. Nerlynx is a kinase inhibitor that irreversibly binds to epidermal growth factor receptors (EGFR), HER2, and HER4. *In vitro* studies showed Nerlynx has antitumor activity in EGFR and/or HER2 expressing carcinoma cell lines.

Clinical Efficacy

The efficacy of Nerlynx was established in one Phase III pivotal study (ExteNET, Extended Adjuvant Treatment of Breast Cancer with Neratinib) in women with early stage HER2+ breast cancer (n = 2,840).[1,2] In a prespecified exploratory subgroup analysis of invasive disease-free survival (iDFS), Nerlynx was more beneficial in patients with hormone receptor(HR)-positive breast cancer (unstratified hazard ratio 0.49; 95% 0.31, 0.75) than in patients with HR-negative disease (unstratified hazard ratio 0.93; 95% confidence interval [CI]: 0.60, 1.43). In another analysis after a median follow-up of 5.2 years iDFS survival was 90·2% in the Nerlynx group and 87·7% in the placebo group.

An exploratory analysis was conducted to understand why the subgroup of patients with HR-negative disease did not show statistical significance for efficacy in the ExteNET trial.[5] It is hypothesized that the risk of disease recurrence is highest during the first 6 months following completion of trastuzumab therapy

in patients with HR-negative, HER2+ disease; so the greatest benefit with Nerlynx would likely also be in this subgroup of patients completing trastuzumab within 6 months of initiating Nerlynx in the study. The 5-year iDFS for patients with interval 0 to 6 months between prior trastuzumab therapy and Nerlynx randomization in the study was 88.9% for Nerlynx and 86.1% for placebo (HR 0.73; 95% CI: 0.47, 1.14). For interval duration > 6 months, the iDFS for Nerlynx at 5 years was 88.7% compared with 92.7% for placebo (HR 1.52; 95% CI: 0.82, 2.88).

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on breast cancer (version 6.2020 – September 8, 2020) notes that Nerlynx can be considered as extended adjuvant therapy following adjuvant trastuzumab-containing therapy in patients with HR+, HER2+ disease with a perceived high risk of recurrence (such as Stage II or III breast cancer) [category 2A].[4] The benefits or toxicities associated with extended Nerlynx in patients who have received Perjeta is unknown. The guidelines do not include recommendations for using Nerlynx extended adjuvant therapy in patients with HR-negative, HER2+ disease. For the treatment of recurrent or metastatic disease, Nerlynx + capecitabine is listed as a category 2A recommended option under "other recommended regimens".

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Nerlynx. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Nerlynx is recommended in those who meet the following criteria:

FDA-Approved Indications

~~6.~~3. **Breast Cancer – Adjuvant Therapy.** Approve for 1 year (total) if the patient meets the following criteria (A and B):
- **A)** Patient has human epidermal growth factor receptor 2 (HER2)-positive breast cancer; AND
- **B)** Patient meets ONE of the following criteria (i or ii):
  - **i.** The medication is requested for extended adjuvant therapy after the patient has completed 1 year of adjuvant therapy with trastuzumab intravenous products; OR
  - **ii.** Patient has tried adjuvant therapy with trastuzumab intravenous products and could not tolerate 1 year of therapy, according to the prescriber.

2. **Breast Cancer – Advanced or Metastatic Disease.** Approve for 3 years if the patient meets the following criteria (A, B, and C):
- **A)** Patient has human epidermal growth factor receptor 2 (HER-2)-positive breast cancer; AND
- **B)** The medication is used in combination with capecitabine; AND
- **C)** Patient has tried at least two prior anti-HER2 based regimens in the metastatic setting.
  Note: Examples include Perjeta (pertuzumab injection for intravenous use) + trastuzumab + docetaxel, Perjeta + trastuzumab + paclitaxel; Kadcyla (ado-trastuzumab emtansine for intravenous use), trastuzumab + capecitabine, Tykerb (lapatinib tablets) + capecitabine, trastuzumab + Tykerb.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Nerlynx is not recommended in the following situations:

233. Concurrent Use of Nerlynx with Other Medications for Adjuvant or Neoadjuvant Treatment of HER2-Positive Breast Cancer: Nerlynx is not indicated in combination with other medications for adjuvant or neoadjuvant (preoperative) HER2 positive breast cancer (e.g., Herceptin, Perjeta). Studies are not available for this use. Patients with HR+ early breast can receive concurrent adjuvant endocrine therapy.[2]

234. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes*	Review Date
New Policy	New policy	08/23/2017
Selected Revision	Breast cancer in women and in men: added the patient has hormone receptor-positive (that is, estrogen- and/or progesterone-positive) breast cancer. In Conditions Not Recommended for Approval, added Use of Nerlynx For a Total of No Greater than 1 Year Duration During a Patient's Lifetime.	01/03/2018
Update	02/12/2018: Conditions Not Recommended for Approval: In Concurrent Use of Nerlynx with Other Medications for Adjuvant or Neoadjuvant Treatment of HER2-Positive Breast Cancer, the last sentence was revised to replace the word"estrogen" with "endocrine".	NA
Annual Revision	No criteria changes	09/19/2018
Annual Revision	Deleted "Breast Cancer in Men" condition since the criteria are the same for all adult patients. Deleted "in Women" for the approval condition "Breast Cancer". Changed approval duration to "1 year (total)" from "up to 1 year". Deleted criteria "The patient has early stage disease", since it is not needed. Deleted "Herceptin" and referred to it by chemical name due to the availability of biosimilars. Added criteria that "The medication is requested for extended adjuvant therapy" after the patient has 1 year of trastuzumab therapy. Changed from "prescribing physician" to "prescriber".	09/25/2019
Selected Revision	The requirement specifying Nerlynx use only in hormone receptor-positive disease was removed.	12/18/2019
Selected Revision	Added new FDA approved indication for Nerlynx use in advanced or metastatic breast cancer. Deleted condition for 1-year maximum lifetime approval listed under "Conditions Not Recommended for Approval", since this is covered in the criteria for approval already.	03/04/2020
Annual Revision	No criteria changes.	09/23/2020

NA - Not applicable.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology - Nexavar® (sorafenib tablets – Bayer/Onyx)

DATE REVIEWED: 05/20/2020

OVERVIEW

Nexavar, a kinase inhibitor, is indicated for the treatment of patients with unresectable hepatocellular carcinoma (HCC), treatment of patients with advanced renal cell carcinoma (RCC), and for the treatment of patients with locally recurrent or metastatic, progressive, differentiated thyroid carcinoma (DTC) that is refractory to radioactive iodine treatment.[1] Nexavar decreases tumor cell proliferation *in vitro*, and was shown to inhibit multiple intracellular and cell surface kinases, several of which are thought to be involved in tumor cell signaling, angiogenesis, and apoptosis.

Guidelines

The National Comprehensive Cancer Network (NCCN) Compendium recommends Nexavar use for acute myeloid leukemia, for hepatobiliary cancer, kidney cancer, thyroid cancer, ovarian cancer, bone cancer, and soft tissue sarcoma.[2]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Nexavar. All approvals are provided for 3 years.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Nexavar is recommended in those who meet the following criteria:

FDA-Approved Indications

~~7.~~4. **Renal Cell Carcinoma (RCC).** Approve for 3 years in patients who meet the following criteria (A and B):
- **A)** The patient has relapsed or Stage IV clear cell histology RCC; AND
- **B)** The patient has tried at least one prior systemic therapy.
  Note: Examples include Inlyta (axitinib tablets), Votrient (pazopanib tablets), Sutent (sunitinib capsules), Cabometyx (cabozantinib tablets).

~~8.~~5. **Differentiated (i.e. papillary, follicular, and Hürthle cell) Thyroid Carcinoma.** Approve for 3 years if refractory to radioactive iodine therapy.

~~9.~~6. **Hepatocellular Carcinoma (HCC), Unresectable.** Approve for 3 years.

Other Uses with Supportive Evidence

~~10.~~7. **Acute Myeloid Leukemia (AML).** Approve for 3 years if disease is *FLT3*-ITD mutation-positive as detected by an approved test.

~~11.~~8. **Angiosarcoma.** Approve for 3 years.

~~12.~~9. **Chordoma.** Approve for 3 years in patients with recurrent disease.

~~13.~~10. **Desmoid Tumors (aggressive fibromatosis).** Approve for 3 years.

~~14.~~11. **Gastrointestinal Stromal Tumor (GIST).** Approve for 3 years if the patient meets the following criteria (A, B, and C):

C) Patient has previously tried imatinib (Gleevec® tablets, generics); AND
D) Patient has previously tried Sutent (sunitinib capsules); AND
E) Patient has previously tried Stivarga® (regorafenib tablets).

~~15.~~12. **Medullary Thyroid Carcinoma.** Approve for 3 years if the patient has tried Caprelsa® (vandetanib tablets) or Cometriq® (cabozantinib capsules).

~~16.~~13. **Ovarian, Fallopian Tube, Primary Peritoneal Cancer**. Approve for 3 years if the patient meets the following criteria (A and B):

A) The patient has platinum-resistant disease; AND
B) Nexavar is used in combination with topotecan.

~~17.~~14. **Osteosarcoma**. Approve for 3 years if the patient meets the following criteria (A and B):

C) Patient has tried chemotherapy; AND
D) Patient has relapsed/refractory or metastatic disease.

~~18.~~15. **Solitary Fibrous Tumor and Hemangiopericytoma.** Approve for 3 years.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Nexavar has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

235. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes*	Date Reviewed
Annual revision	Renal Cell Carcinoma: Criterion was revised to add that it includes predominant clear cell and non-clear cell histology. Differentiated Thyroid Cancer: Criteria were revised to only require that the patient's disease is refractory to radioactive iodine therapy. Acute Myeloid Leukemia: Criteria were revised to remove all the required conditions of approval. Medullary Thyroid Cancer: Criteria were revised to remove the requirement that the patient has progressive disease or symptomatic distant metastases. Osteosarcoma: Criterion regarding the requirement to try standard chemotherapy was revised to remove the word "standard". Conditions Not Recommended for Approval: Liposarcoma was deleted and the indication, Pancreatic Cancer was changed to Pancreatic Adenocarcinoma.	02/10/2016
Annual revision	Criteria for Chordoma added to Other Uses.	03/08/2017
Annual revision	Solitary Fibrous Tumor and Hemangiopericytoma: New indication was added. Conditions Not Recommended for Approval: Removed Leiomyosarcoma, Lymphoma, and Melanoma.	04/11/2018
Annual revision	• Deleted all conditions listed under "Conditions Not Recommended for Approval." • Ovarian, Fallopian Tube, Primary Peritoneal Cancer. Added new approval condition based on compendium/guidelines. • Desmoid Tumors. Deleted "in patients with advanced or unresectable tumors" since it can be used for resectable tumors. • Acute Myeloid Leukemia. Added if"disease is FLT3-ITD mutation-positive based on approved test" according to compendium/guidelines. • Renal Cell Carcinoma (RCC): Deleted "Advanced, (Predominant Clear Cell or Non-Clear Cell Histology)" as condition qualifiers. Added criteria patient has "relapsed or Stage IV clear cell RCC" and patient has tried one prior systemic therapy. No longer used in non-clear cell.	05/08/2019
Annual revision	• No criteria changes	5/20/2020

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Nilutamide Prior Authorization Policy

- Nilandron (nilutamide tablets – Concordia Pharmaceuticals Inc., generic)

REVIEW DATE: 01/13/2021

OVERVIEW

Nilutamide, in combination with surgical castration, is indicated for the treatment of **metastatic prostate cancer (Stage D_2)**.[1] For maximum benefit, nilutamide treatment must begin on the same day as or on the day after surgical castration.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for prostate cancer (version 3.2020 – November 17, 2020) recommend nilutamide in combination with luteinizing hormone-releasing hormone (LHRH) agonists [Lupron® (leuprolide for injection), Lupron Depot® (leuprolide acetate for depot suspension), Trelstar® (triptorelin pamoate for injectable suspension), Zoladex® (goserelin acetate implant), Vantas® (histrelin acetate subcutaneous implant)] with or without external beam radiation therapy for androgen deprivation therapy.[2,3]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of nilutamide tablets. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of nilutamide is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Prostate Cancer.** Approve for 3 years if nilutamide is used concurrently with a luteinizing hormone-releasing hormone (LHRH) agonist.
   Note: Examples are Lupron (leuprolide for injection), Lupron Depot (leuprolide acetate for depot suspension), Trelstar (triptorelin pamoate for injectable suspension), Zoladex (goserelin acetate implant), Vantas (histrelin acetate subcutaneous implant).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of nilutamide is not recommended in the following situations:

236. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Ninlaro Prior Authorization Policy

- Ninlaro® (ixazomib capsules – Takeda)

REVIEW DATE: 03/10/2021

OVERVIEW

Ninlaro, an oral proteasome inhibitor, is indicated in combination with Revlimid® (lenalidomide capsules) and dexamethasone for treatment of patients with **multiple myeloma** who have received at least one prior therapy.[1] Ninlaro should be taken once a week on the same day and at approximately the same time for the first 3 weeks of a 4-week cycle. There are dose modification guidelines which are recommended to manage treatment-related adverse events, including platelet count, absolute neutrophil count (ANC), and other toxicities (e.g., rash, peripheral neuropathy). Treatment should be continued until disease progression or unacceptable toxicity. Safety and efficacy are not established in patients < 18 years of age.

Guidelines

Ninlaro is discussed in various guidelines from the National Comprehensive Cancer Network (NCCN).

- **Multiple Myeloma:** NCCN guidelines (version 4.2021 – December 10, 2020) list multiple therapeutic regimens that may be used for primary therapy and previously treated multiple myeloma.[2] Ninlaro/Revlimid/dexamethasone is an other recommended regimen (transplant and non-transplant candidates), and Ninlaro/cyclophosphamide/dexamethasone is useful in certain circulstances (transplant candidates). Maintenance with Ninlaro is also listed among the alternatives for transplant candidates. For previously treated disease, multiple regimens are listed, including Ninlaro/Revlimid/dexamethasone (preferred), Ninlaro/Pomalyst/dexamethasone (preferred), Ninlaro/cyclophosphamide/dexamethasone, Ninlaro/dexamethasone.
- **Systemic Light Chain Amyloidosis:** NCCN guidelines (version 2.2021 – February 8, 2021) list Ninlaro ± dexamethasone among the treatment options for patients who have relapsed/refractory disease.[3]
- **Waldenstrom Macroglobulinemia/Lymphoplasmacytic Lymphoma:** NCCN guidelines (version 1.2021 – September 1, 2020) list Ninlaro/rituximab/dexamethasone among the treatment options for primary therapy.[4]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Ninlaro. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Ninlaro is recommended in those who meet the following criteria:

FDA-Approved Indications

~~19.~~16. **Multiple Myeloma.** Approve for 3 years if the patient meets BOTH of the following (A and B):
- **13.** Patient is ≥ 18 years of age; AND
- **14.** Patient meets one of the following (i, ii, or iii):
  - **i.** Ninlaro will be taken in combination with Revlimid (lenalidomide capsules) and dexamethasone; OR
  - **ii.** Patient has received at least ONE prior regimen for multiple myeloma; OR
    Note: Examples include regimens containing Velcade (bortezomib injection), Kyprolis (carfilzomib infusion), Revlimid (lenalidomide capsules), Darzalex (daratumumab injection).
  - **iii.** The medication will be used following autologous stem cell transplantation (ASCT).

Other Uses with Supportive Evidence

~~20.~~17. **Systemic Light Chain Amyloidosis.** Approve for 3 years if the patient meets BOTH of the following (A and B):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has tried at least one other regimen for this condition.
  Note: Examples of agents used in other regimens include Velcade (bortezumab injection), Revlimid (lenalidomide capsules), cyclophosphamide, and melphalan.

~~21.~~18. **Waldenstrom Macroglobulinemia/Lymphoplasmacytic Lymphoma.** Approve for 3 years if the patient meets BOTH of the following (A and B):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** The medication is used in combination with a rituximab product and dexamethasone.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Ninlaro is not recommended in the following situations:

237. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	**Multiple Myeloma:** Add a criterion to approve if being used following autologous stem cell transplantation. Examples of agents for multiple myeloma were updated in the criteria. **Waldenstrom Macroglobulinemia/Lymphoplasmacytic Lymphoma:** Add this condition as an off-label approval, if taken in combination with a rituximab product and dexamethasone.	02/26/2020
Annual Revision	**Multiple Myeloma:** To be consistent with other oral oncology policies, the requirement that the patient is ≥ 18 years of age was added to the criteria. **Systemic Light Chain Amyloidosis:** To be consistent with other oral oncology policies, the requirement that the patient is ≥ 18 years of age was added to the criteria. **Waldenstrom Macroglobulinemia/Lymphoplasmacytic Lymphoma:** To be consistent with other oral oncology policies, the requirement that the patient is ≥ 18 years of age was added to the criteria.	03/10/2021

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Nubeqa Prior Authorization Policy
- Nubeqa (darolutamide tablets – Bayer HealthCare Pharmaceuticals Inc.)

REVIEW DATE: 08/26/2020

OVERVIEW
Nubeqa, an androgen receptor inhibitor, is indicated for the treatment of patients with non-metastatic, castration-resistant prostate cancer (nmCRPC).[1]

GUIDELINES
According to the National Comprehensive Cancer Network (NCCN) guidelines for prostate cancer, (version 2.2020 – May 21, 2020) for nmCRPC, androgen deprivation therapy (ADT) is continued to maintain castrate serum levels of testosterone (< 50 ng/dL).[2] Nubeqa, Erleada™ (apalutamide tablets) and Xtandi® (enzalutamide capsules) are all category 1 preferred regimens especially if the prostate specific antigen doubling time (PSADT) is ≤ 10 months. Observation is noted as an option especially if the PSADT is > 10 months.

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of Nubeqa. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Nubeqa is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Prostate Cancer – Non-Metastatic, Castration-Resistant.** Approve for 3 years if the patient meets the following criteria (A or B):
   A) The medication is used concurrently with a gonadotropin-releasing hormone (GnRH) analog; OR

Note: Examples are Lupron (leuprolide for injection), Lupron Depot (leuprolide acetate for depot suspension), Trelstar (triptorelin pamoate for injectable suspension), Zoladex (goserelin acetate implant), Firmagon (degarelix for injection), Vantas (histrelin acetate subcutaneous implant).

B) Patient has had a bilateral orchiectomy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Nubeqa is not recommended in the following situations:

238. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

New Policy	New criteria	07/31/2019
Selected Revision	Added criteria requiring concomitant use of GnRH agonist with Nubeqa or the patient must have had bilateral orchiectomy, as per Nubeqa prescribing information.	10/09/2019
Annual Revision	**Prostate Cancer – Non-Metastatic Castration-Resistant:** Changed gonadotropin releasing-hormone "agonist" to "analog". Firmagon was added to the list of examples in the Note.	08/26/2020

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Odomzo Prior Authorization Policy

- Odomzo® (sonidegib capsules – Novartis)

REVIEW DATE: 11/04/2020

OVERVIEW

Odomzo, a hedgehog pathway inhibitor, is indicated for the treatment of adults with locally advanced **basal cell carcinoma** that has recurred following surgery or radiation therapy, or those who are not candidates for surgery or radiation therapy.[1] It is an inhibitor of the hedgehog signaling pathway, where it binds to and inhibits Smoothened, a transmembrane protein involved in Hedgehog signal transduction.

Guidelines

National Comprehensive Cancer Network (NCCN) guidelines for basal cell carcinoma (version 1.2020 – October 24, 2019) note that surgical approaches offer the most effective and efficient means for accomplishing a cure; radiation therapy may be chosen as the primary treatment in order to achieve optimal overall results.[2] For residual disease when surgery and radiation therapy are contraindicated and for recurrent disease with distant metastases, a hedgehog pathway inhibitor should be considered.

Other Uses with Supportive Evidence

Although Odomzo is not indicated in metastatic basal cell carcinoma, the pivotal study enrolled adults with histologically confirmed metastatic basal cell carcinoma for which all existing treatment options had been exhausted.[1] In this study, an objective response was obtained by 15% of patients (n = 2/13) patients who were treated with Odomzo 200 mg.[3] In the 12-month analysis, response rates by central review were 7.7% and 17.4% in the Odomzo 200 mg and 800 mg groups, respectively. Disease control rate was 92% in patients treated with either dose of Odomzo. Guidelines for basal cell carcinoma list hedgehog pathway inhibitors (i.e., Erivedge, Odomzo) as treatment options for patients with metastatic basal cell carcinoma.[2]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Odomzo. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Odomzo is recommended in those who meet the following criteria:

FDA-Approved Indications

~~22.~~19. **Basal Cell Carcinoma, Locally Advanced.** Approve for 3 years if the patients meets ONE of the following conditions (A or B):

~~15.~~ Initial Therapy. Approve if the patient meets ONE of the following (i or ii):

- **i.** Patient has recurrent basal cell carcinoma following surgery or radiation therapy; OR
- **ii.** Patient meets BOTH of the following (a and b):
  - ~~a)~~ Patient is not a candidate for surgery; AND
  - ~~b)~~ According to the prescriber, the patient is not a candidate for radiation therapy.

16. Patient is Currently Receiving Odomzo. Approve.

Other Uses with Supportive Evidence

~~23.~~20. **Basal Cell Carcinoma, Metastatic.** Approve for 3 years.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Odomzo is not recommended in the following situations:

239. Basal Cell Carcinoma (Locally Advanced or Metastatic), in Patients with Disease Progression While on Erivedge (vismodegib capsules). [Note: This does not apply to patients already started on Odomzo. Refer to criteria for BCC, Locally Advanced for Patients Currently Receiving Odomzo.] Results from an open-label study (n = 9) showed resistence to Odomzo in patients with advanced BCC who had progressed while taking Erivedge.[6] There are no data to support the use of Odomzo in patients who have experienced disease progression on Erivedge. Previous use of a hedgehog inhibitor was not allowed in the pivotal study for Odomzo.[3] Patients who develop resistance to one of the hedgehog pathway inhibitors are not expected to respond to another hedgehog pathway inhibitor.

240. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	**Patients Already Started on Odomzo:** This criterion only applies to BCC, locally advanced disease; reformat to address in the criteria section for this condition. **Conditions Not Recommended for Coverage:** Remove Solid Tumors Other than Basal Cell Carcinoma from this section of the policy. This indication remains a denial but is not specifically listed in the policy.	10/10/2018
Annual Revision	No criteria changes.	10/16/2019
Annual Revision	**Basal Cell Carcinoma, Locally Advanced:** For the criterion applying to a patient who is not a candidate for radiation therapy, wording was updated to more generally allow this determination by the prescriber (criteria previously specified this was according to the prescribing physician).	11/04/2020

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Onureg Prior Authorization Policy
- Onureg® (azacitadine tablets – Celgene Corporation)

REVIEW DATE: 09/16/2020; selected revisions 11/18/2020

OVERVIEW
Onureg, a nucleoside metabolic inhibitor, is indicated for the continued treatment of **acute myeloid leukemia** (AML) in adults who achieve first complete remission or complete remission with incomplete blood count recovery following intensive induction chemotherapy and are unable to complete intensive curative therapy.[1]

Guidelines
The National Comprehensive Cancer Network (NCCN) AML guidelines (version 1.2021 – October 22, 2021) recommend Onureg for the post-remission maintenance treatment of AML in patients < 60 years of age with intermediate- or poor-risk cytogenetics who decline or not fit or eligible for allogeneic hematopoietic stem cell transplantation or in patients ≥ 60 years of age following complete response to intensive therapy.[2,3]

POLICY STATEMENT
Prior Authorization is recommended for prescription benefit coverage of Onureg. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Onureg is recommended in those who meet the following criteria:

FDA-Approved Indications

140. Acute Myeloid Leukemia. Approve for 3 years if the patient meets the following criteria (A, B, C, and D):

A) Patient is ≥ 18 years of age; AND

B) The medication is used for post-remission maintenance therapy; AND

C) According to the prescriber, the patient meets one of the following (i or ii):

i. Patient has intermediate- or poor-risk cytogenetics who decline or are not fit or eligible for allogeneic hematopoietic stem cell transplant; OR
Note: Examples of intermediate- and poor-risk cytogenetics include the following genetic alterations: wild-type *NPM1* without *FLT3-ITD* or with *FLT3-ITD^{low}*, *MLLT3-KMT2A*, *DEK-NUP214*, and *KMT2A* rearranged.

ii. Patient has complete response to previous intensive induction chemotherapy; AND
Note: Examples of intensive chemotherapy include Venclexta plus subcutaneous azacitidine or Venclexta plus intravenous decitabine.

D) Patient is not able to complete intensive consolidation chemotherapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Onureg is not recommended in the following situations:

152. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

New Policy	--	09/16/2020
Selected revision	**Acute Myeloid Leukemia.** Removed criteria for use following intensive induction chemotherapy in patient who achieve first complete response or first complete response with incomplete blood count recovery. Added criteria for use as post-remission maintenance therapy; and for use in patients with intermediate- or poor-risk cytogenetics who decline or are not fit or eligible for allogeneic hematopoietic stem cell transplant or in patients with complete response to previous intensive chemotherapy.	11/18/2020

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Orgovyx Prior Authorization Policy

- Orgovyx™ (relugolix tablets – Myovant Sciences)

REVIEW DATE: 12/29/2020; 01/20/2021 selected revision

OVERVIEW

Orgovyx, a gonadotropin-releasing hormone (GnRH) receptor antagonist, is indicated for the treatment of adult patients with **advanced prostate cancer**.[1]

Guidelines

Orgovyx is not addressed in the guidelines. The National Comprehensive Cancer Network (NCCN) prostate cancer guidelines (version 3.2020 – November 17, 2020) recommend the use of leutinizing hormone-releasing hormone (LHRH) agonist or antagonist in various stages of the disease. These agents are used for androgen deprivation therapy, to lower and maintain castration levels of testosterone (< 50 ng/dL) in men with prostate cancer.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Orgovyx. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Orgovyx is recommended in those who meet the following criteria:

FDA-Approved Indications

4. Prostate Cancer. Approve for 3 years if the patient meets the following criteria (A and B):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has advanced disease.
  Note: Advanced disease is defined as disease that has spread to other parts of the body, beyond the prostate. It can also include patients with persistent prostate specific antigen (PSA) levels or rising PSA levels after radiotherapy or surgery. Metastatic disease is also considered as advanced disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Orgovyx is not recommended in the following situations:

153. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Pemazyre™ (pemigatinib tablets – Incyte Corporation)

DATE REVIEWED: 04/22/2020

OVERVIEW

Pemazyre is indicated for the treatment of adults with previously treated, unresectable locally advanced or metastatic cholangiocarcinoma with a fibroblast growth factor receptor 2 (FGFR2) fusion or other rearrangement as detected by an FDA-approved test.[1] This indication is approved under accelerated approval based on overall response rate and duration of response. Continued approval for this indication may be contingent upon verification and description of clinical benefit in a confirmatory trial(s).

Guidelines

Pemazyre is not addressed in the guidelines. According to the National Comprehensive Cancer Network (NCCN) hepatobiliary guidelines (version 1.2020 – March 23, 2020), for primary treatment of unresectable and metastatic disease, gemcitabine + cisplatin is the category 1 preferred regimen. Upon disease progression, FOLFOX is the preferred subsequent therapy regimen (category 2A). Other recommended regimens are FOLFIRI (category 2B) or Stivarga (regorafenib tablets) [category 2B]. For neurotrophic receptor tyrosine kinase (*NTRK*) gene fusion-positive tumors, Vitrakvi (larotrectinib capsules) and Rozlytrek (entrectinib capsules) are recommended (both category 2A); Keytruda (pembrolizumab for injection) is recommended for microsatellite instability high (MSI-H) and mismatch repair-deficient (dMMR) tumors (category 2A).

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Pemazyre. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Pemazyre is recommended in those who meet the following criteria:

FDA-Approved Indications

17. Cholangiocarcinoma. Approve for 3 years if the patient meets the following criteria (A and B):
- **A)** The patient has unresectable locally advanced or metastatic disease with a fibroblast growth factor receptor 2 (*FGFR2*) fusion or other rearrangement, as detected by an approved test; AND
- **B)** The patient has been previously treated with at least one systemic therapy regimen.
  Note: Examples are gemcitabine + cisplatin, 5-fluorouracil + oxaliplatin or cisplatin, capecitabine + oxaliplatin or cisplatin, gemcitabine + Abraxane or capecitabine or oxaliplatin, FOLFOX (5-fluorouracil, leucovorin, and oxaliplatin).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Pemazyre has not been shown to be effective or there are limited or preliminary data that are not supportive of general approval for the following conditions.

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Piqray® (alpelisib tablets – Novartis Pharmaceuticals Corporation)

DATE REVIEWED: 06/10/2020

OVERVIEW

Piqray is indicated in combination with fulvestrant injection for the treatment of postmenopausal women and men with hormone receptor (HR)-positive, human epidermal growth factor receptor 2 (HER2)-negative, phosphatidylinositol-3-kinase (*PIK3CA*)-mutated, advanced or metastatic breast cancer as detected by an FDA-approved test following progression on or after an endocrine-based regimen.[1] Patients treated with Piqray should have one or more *PIK3CA* mutations in tumor tissue or plasma specimens. If no mutation is detected in a plasma specimen, tumor tissue should be tested. Information on FDA-approved tests for the detection of *PIK3CA* mutations in breast cancer is available on the FDA website.[2]

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on breast cancer (version 4.2020 – May 8, 2020) recommend Piqray, in combination with fulvestrant, as a preferred regimen (category 1) for *PIK3CA*-mutated tumors in postmenopausal or premenopausal patients (receiving ovarian ablation or suppression, if premenopausal) with HR+/HER2-negative, recurrent or Stage IV disease.[3] It is noted that the safety of Piqray in patients with Type 1 or uncontrolled Type 2 diabetes has not been established. Other preferred regimens for HR+/HER2-negative disease include the following: fulvestrant, aromatase inhibitor (i.e., letrozole, anastrozole, exemestane) + CDK4/6 inhibitor (i.e., Ibrance® [palbociclib capsules], Kisqali® [ribociclib tablets], Verzenio™ [abemaciclib tablets]), fulvestrant + CDK4/6 inhibitor (all category 1), aromatase inhibitor monotherapy, tamoxifen or toremifene, exemestane + Afinitor® (everolimus tablets), fulvestrant + Afinitor, and tamoxifen + Afinitor (all category 2A). Of note, men with breast cancer are treated similarly to postmenopausal women.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Piqray. All approvals are provided for the duration noted below. In the clinical criteria, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: a woman is defined as an individual with the biological traits of a woman, regardless of the individual's gender identity or gender expression; men are defined as individuals with the biological traits of a man, regardless of the individual's gender identity or gender expression.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Piqray is recommended in those who meet the following criteria:

FDA-Approved Indications

18. Breast Cancer. Approve for 3 years if the patient meets the following criteria (A, B, C, D, E, and F):
- **A)** The patient meets one of the following criteria (i or ii):
  - **i.** The patient is a postmenopausal female* or a male*; OR
  - **ii.** The patient is premenopausal* and is receiving ovarian suppression with a gonadotropin-releasing hormone (GnRH) analog or has had surgical bilateral oophorectomy or ovarian irradiation.
    Note: Examples include Lupron/Lupron Depot (leuprolide acetate injectable suspension), Trelstar (triptorelin pamoate injectable suspension), Zoladex (goserelin acetate implant); AND
- **B)** The patient has advanced or metastatic hormone receptor (HR)-positive disease; AND
- **C)** The patient has human epidermal growth factor receptor 2 (HER2)-negative disease; AND
- **D)** The patient has *PIK3CA*-mutated breast cancer as detected by an approved test; AND
- **E)** The patient has progressed on or after at least one prior endocrine-based regimen; AND
  Note: Examples include anastrozole, letrozole, exemestane, tamoxifen, toremifene.
- **F)** Piqray will be used in combination with fulvestrant injection.

* Refer to Policy Statement

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Piqray has not been shown to be effective or there are limited or preliminary data that are not supportive of general approval for the following conditions.

3. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Pomalyst Prior Authorization Policy
- Pomalyst® (pomalidomide capsules – Celgene)

REVIEW DATE: 04/01/2020; selected revision 05/27/2020

OVERVIEW

Pomalyst, a thalidomide analogue, is indicated for the treatment of multiple myeloma in combination with dexamethasone in adults who have received at least two prior therapies including Revlimid® (lenalidomide capsules) and a proteasome inhibitor and have demonstrated disease progression on or within 60 days of completion of the last therapy.[1] Pomalyst is also indicated for the treatment of Acquired Immune Deficiency Syndrome (AIDS)-related Kaposi sarcoma in adults after failure of highly active antiretroviral therapy (HAART) or in patients with Kaposi sarcoma who are Human Immunodeficiency Virus (HIV)-negative.

Disease Overview

Multiple myeloma is a cancer formed by malignant plasma cells which are found in the bone marrow.[2] Normally, B cells responding to an infection change into plasma cells that make the antibodies to help the

body attack and kill pathogens. In multiple myeloma, these plasma cells grow out of control and become cancerous. Often, there are no symptoms of disease until it reaches an advanced stage. The most common signs and symptoms include: bone problems (e.g., pain, bone weakness, broken bones), decreased blood counts (e.g., anemia, leukopenia, thrombocytopenia), hypercalcemia, nervous system symptoms due to spinal cord compression, nerve damage, hyperviscosity, kidney problems, and infections. A monoclonal immunoglobulin (M protein) is produced by myeloma cells and may be found in the blood or excreted in the urine of patients with multiple myeloma. Beta-2 microglobulin is another protein made by myeloma cells, with high levels associated with more advanced disease.

Kaposi's sarcoma is a multifocal malignancy that impacts endothelial cells which manifest with red or brown papules.[3] The skin is the site most commonly involved, but the oral mucosa, lymph nodes, and viscera may also be impacted.[4] The risk of Kaposi's sarcoma is very high among patients who are HIV-positive but is also more common in other patient populations with altered cellular immunity (e.g., patients who have undergone transplants).[3,4] Kaposi's sarcoma is usually associated with human herpes virus 8 (HHV-8) infection.[3] In patients with Kaposi's sarcoma related to HIV, HAART is the foundation of therapy.[4] For patients who do not attain an adequate response with HAART, Kaposi's sarcoma-specific systemic therapies include liposomal anthracyclines (doxorubicin) and paclitaxel which have led to response rates between 46% to 76%.[4] Patients who are not HIV-positive have a less established treatment course but cytotoxics are used. Local therapies are also utilized for patients with limited disease (e.g., Panretin® [alitretinoin gel 0.1%], imiquimod 5%, intralesional chemotherapy with vinblastine).[3,4]

Clinical Efficacy
An open-label, single-center, single-arm clinical trial evaluated the efficacy of Pomalyst in patients with Kaposi'sarcoma.[4] Among the 28 patients, 18 patients were HIV-positive and 10 patients were HIV-negative. Patients received Pomalyst 5 mg once daily (QD) on Days 1 through 21 of each 28 day cycle until disease progression or unacceptable toxicity. All patients who were HIV-positive continued HAART. At the time of enrollment, 75% of patients had advanced disease and 75% of patients had previously received chemotherapy. The overall response rate among all patients was 71%; overall response rates were 67% and 80% among HIV-positive and HIV-negative patients, respectively. The time to first response was approximately 2 months. The duration of response was approximately 1 year.

Guidelines
The National Comprehensive Cancer Network (NCCN) guidelines on multiple myeloma (version 3.2020 – March 10, 2020) include Pomalyst.[5] Pomalyst is recommended in various clinical regimens in varying scenarios and with different agents among patients with multiple myeloma that has been previously treated. It can be used as a monotherapy for patients who are steroid-intolerant.

The NCCN has guidelines regarding AIDS-related Kaposi Sarcoma (version 1.2020 – February 12, 2020).[3] Pomalyst is cited as the preferred subsequent system therapy option for relapsed/refractory therapy. First-line systemic therapy options include liposomal doxorubicin (preferred) and paclitaxel. Of note, the clinical trial with Pomalyst used a dose of 5 mg QD. However, Pomalyst is provided as a 4 mg dose and the NCCN Panel believed that this dose is sufficient.

The NCCN has guidelines regarding Central Nervous System (CNS) Cancers (version 1.2020 – March 10, 2020).[6] Pomalyst is listed as a recommended regimen for patients with relapsed or refractory disease.

The NCCN has guidelines for systemic light chain amyloidosis (version 1.2020 – December 6, 2019).[7] The guidelines list Pomalyst plus dexamethasone as one of several treatment options for patients with previously treated disease.

Safety

Pomalyst has a Boxed Warning regarding embryofetal toxicity and venous arterial thromboembolism.[1] The availability of Pomalyst is through a restricted program called Pomalyst Risk Evaluation and Mitigation Strategy (REMS). Warnings and Precautions include hematologic toxicity, hepatotoxicity, hypersensitivity reactions, and tumor lysis syndrome.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Pomalyst. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Pomalyst is recommended in those who meet the following criteria:

FDA-Approved Indications

~~24.~~21. **Multiple Myeloma.** Approve for 3 years.

~~25.~~22. **Kaposi Sarcoma.** Approve for 3 years if the patient meets both of the following (A and B):
- **A)** The patient is ≥ 18 years of age; AND
- **B)** The patient meets one of the following (i or ii):
  - **i.** The patient is Human Immunodeficiency Virus (HIV)-negative; OR
  - **ii.** The patient meets both of the following (a and b):
    - **a)** The patient is Human Immunodeficiency Virus (HIV)-positive; AND
    - **b)** The patient continues to receive highly active antiretroviral therapy (HAART).

Other Uses with Supportive Evidence

~~26.~~23. **Central Nervous System (CNS) Lymphoma.** Approve for 3 years if the patient has relapsed or refractory disease.

~~27.~~24. **Systemic Light Chain Amyloidosis.** Approve for 3 years.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Pomalyst is not recommended in the following situations:

241. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Early annual revision	No criteria changes.	03/07/2018
Annual revision	Criteria added to approve for patients with acquired immune deficiency syndrome-related Kaposi's sarcoma for 3 years if the patient has relapsed or refractory disease. Criteria added to approve for central nervous system lymphoma for 3 years if the patient has relapsed or refractory disease.	03/20/2019
Annual revision	The following changes were made: 1. **Myelofibrosis:** The condition (and related) criteria was removed as this agent is not recommended in related NCCN guidelines.	04/01/2020
Selected revision	The following changes were made: 1. **Kaposi's Sarcoma:** New criteria were added based on this newly FDA-approved indication for use. Approval is given for 3 years if the patient is greater or equal to 18 years of age if the patient is human immunodeficiency virus negative. For patients who are human immunodeficiency virus positive, the patient must be continuing to receive highly active antiretroviral therapy. 2. **Acquired Immunodeficiency Syndrome Related Kaposi's Sarcoma:** This indication that was listed in the "other uses with supportive evidence" section that approved for 3 years if the patient had relapsed or refractory diseases was removed. New criteria were developed based on its new FDA-approved indication of use.	05/27/2020

NCCN – National Comprehensive Cancer Network; FDA – Food and Drug Administration.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Qinlock™ (ripretinib tablets – Deciphera Pharmaceuticals, LLC)

REVIEW DATE: 05/20/2020

OVERVIEW

Qinlock, a kinase inhibitor, is indicated for the treatment of adult patients with advanced gastrointestinal stromal tumor (GIST) who have received prior treatment with three or more kinase inhibitors, including imatinib. Qinlock inhibits KIT proto-oncogene receptor tyrosine kinase (KIT) and platelet derived growth factor receptor A (PDGFRA) kinase including wild type, primary, and secondary mutations.

Guidelines

According to the National Comprehensive Cancer Network (NCCN) soft tissue sarcoma guidelines (version 2.2020 – May 28, 2020), Qinlock is recommended as a "Preferred Regimen" for fourth-line therapy for unresectable or metastatic disease, after progressive disease on imatinib, Sutent (sunitinib tablets), and Stivarga (regorafenib tablets). Imatinib is a category 1 recommended option for primary treatment. Ayvakit™ (avapritinib tablets) is recommended first-line for platelet-derived growth factor receptor alpha (*PDGFRA*) exon 18 mutation, including *PDGFRA* D842V mutations. Upon disease progression on imatinib, Sutent is a category 1 recommended option. For disease progression on Sutent, Stivarga is the recommended option (category 1). Based on limited data, the guidelines recommend other small molecule inhibitors such as Nexavar® (sorafenib tablets), Votrient® (pazopanib tablets), Tasigna® (nilotinib tablets), Ayvakit, and everolimus + TKI (all category 2A) as "useful in certain circumstances" as fourth-line therapy for unresectable or metastatic disease.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Qinlock. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Qinlock is recommended in those who meet the following criteria:

FDA-Approved Indications

20. Gastrointestinal stromal tumor (GIST). Approve for 3 years if the patient meets the following criteria (A, B, and C):

A) The patient has advanced GIST; AND

B) The patient has been previously treated with imatinib; AND

C) The patient has been previously treated with at least two other kinase inhibitors, in addition to imatinib.

Note: Examples of kinase inhibitors are Sutent (sunitinib capsules), Stivarga (regorafenib tablets), Nexavar (sorafenib tablets), Votrient (pazopanib tablets), Tasigna (nilotinib capsules), Sprycel (dasatinib tablets).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Qinlock has not been shown to be effective or there are limited or preliminary data that are not supportive of general approval for the following conditions.

5. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

NA – Not applicable.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Retevmo™ (selpercatinib capsules – Eli Lilly and Company)

DATE REVIEWED: 05/13/2020

OVERVIEW

Retevmo, a kinase inhibitor, is indicated for the treatment of:

1. Adult patients with metastatic *RET* fusion-positive non-small cell lung cancer (NSCLC);[1]

2. Adult and pediatric patients ≥ 12 years of age with advanced or metastatic *RET*-mutant medullary thyroid cancer who require systemic therapy;

3. Adult and pediatric patients ≥ 12 years of age with advanced or metastatic *RET* fusion-positive thyroid cancer who require systemic therapy and who are radioactive iodine-refractory (if radioactive iodine is appropriate).

Guidelines

Retevmo is not addressed in the guidelines. The National Comprehensive Cancer Network (NCCN) non-small cell lung cancer guidelines (version 3.2020 – February 11, 2020) recommend Cometriq (cabozantinib capsules) and Caprelsa (vandetanib tablets) for *RET* rearrangements.[2]

Retevmo is not addressed in the guidelines. The National Comprehensive Cancer Network (NCCN) thyroid carcinoma guidelines (version 2.2019 – September 16, 2019) recommend Cometriq (cabozantinib capsules) and Caprelsa (vandetanib tablets) for germline *RET* proto-oncogene mutations in locoregional, asymptomatic or symptomatic medullary carcinoma that is recurrent or persistent (both category 1, preferred).[3]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Retevmo. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Retevmo is recommended in those who meet the following criteria:

FDA-Approved Indications

1. Non-Small Cell Lung Cancer (NSCLC). Approve for 3 years if the patient meets the following criteria (A and B):

- **A)** The patient has metastatic disease; AND
- **B)** The tumor is *RET* fusion-positive.

2. Medullary Thyroid Cancer. Approve for 3 years if the patient meets the following criteria (A, B, and C):

Note: For other types of thyroid cancer see criteria below for "Thyroid Cancer".

- **A)** The patient is greater than or equal to 12 years of age; AND
- **B)** The patient has advanced or metastatic *RET*-mutant disease; AND
- **C)** The disease requires treatment with systemic therapy.

3. Thyroid Cancer. Approve for 3 years if the patient meets the following criteria (A, B, C, and D):

Note: For "Medullary Thyroid Cancer" see above criteria.

- **A)** The patient is greater than or equal to 12 years of age; AND
- **B)** That patient has advanced or metastatic *RET* fusion-positive disease; AND
- **C)** The disease is radioactive iodine-refractory (if radioactive iodine is appropriate); AND
- **D)** The disease requires treatment with systemic therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Retevmo has not been shown to be effective or there are limited or preliminary data that are not supportive of general approval for the following conditions.

6. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Revlimid Prior Authorization Policy

- Revlimid® (lenalidomide capsules – Celgene)

REVIEW DATE: 04/01/2020

OVERVIEW

Revlimid, a thalidomide analogue, is indicated in combination with dexamethasone for the treatment of patients with multiple myeloma.[1] It is also indicated as maintenance therapy in patients with multiple myeloma following autologous hematopoietic stem cell transplantation (auto-HSCT). Revlimid is also indicated for the treatment of patients with transfusion-dependent anemia due to low- or intermediate-1-risk myelodysplastic syndromes (MDS) associated with a 5q cytogenetic abnormality with or without additional cytogenetic abnormalities. Revlimid is also indicated for the treatment of patients with mantle cell lymphoma whose disease has relapsed or progressed after two prior therapies, one of which included Velcade® (bortezomib injection). Revlimid is indicated in combination with a rituximab product for the treatment of adults with previously treated follicular lymphoma. Revlimid is indicated in combination with a rituximab product for the treatment of adults with previously-treated marginal zone lymphoma. A limitation of use with Revlimid is that it is not indicated and is not recommended for the treatment of patients with chronic lymphocytic leukemia (CLL) outside of controlled clinical trials.

Guidelines

The NCCN guidelines for acquired immune deficiency syndrome (AIDS)-Related Kaposi Sarcoma (version 1.2020 – February 12, 2020) recommended Revlimid as an Other Recommended Regimen for subsequent systemic therapy options for relapsed/refractory therapy.[2] First-line systemic therapy options include liposomal doxorubicin (preferred), and paclitaxel. Other subsequent systemic therapy options for relapsed/refractory therapy are also cited (e.g., Pomalyst® [pomalidomide capsules] {preferred}, Thalomid® [thalidomide capsules], imatinib).

The National Comprehensive Cancer Network (NCCN) guidelines for B-Cell Lymphomas (version 1.2020 – January 22, 2020) discuss therapeutic options for mantle cell lymphoma.[3] Revlimid, in combination with rituximab, is recommended as a preferred less-aggressive induction therapy (category 2A). Revlimid with or without rituximab is recommended as a preferred second-line therapy (Category 2A). Other recommended second line therapy regimens include Imbruvica, Revlimid, plus rituximab. The NCCN guidelines cited many treatments and medications regimens for mantle cell lymphoma in various clinical scenarios.

The NCCN guidelines for multiple myeloma (version 3.2020 – March 10, 2020) recommend Revlimid in a variety of scenarios.[4] Revlimid is use in various regimens and Revlimid combined with low-dose dexamethasone is cited as a Category 1 agent for primary therapy for non-transplant candidates. As a maintenance therapy, Revlimid also has a Category 1 recommendation. Revlimid, combined with other agents, is also part of a category 1 recommended therapy (preferred) for previously treated multiple myeloma.

The NCCN guidelines for MDS (version 2.2020 – February 28, 2020) recommend Revlimid in a variety of clinical scenarios among patients with symptomatic anemia both with and without 5q deletion abnormalities.[5]

The NCCN guidelines for B-Cell Lymphomas (version 1.2020 – January 22, 2020) recommend Revlimid as an option as subsequent therapy, with or without rituximab, for multi-centric Castleman's disease that has progressed after treatment of relapsed/refractory or progressive disease.[3]

NCCN guidelines for B-Cell Lymphomas (version 1.2020 – January 22, 2020) discuss therapeutic options for diffuse large B-cell lymphoma.[3] Revlimid, with or without rituximab, is mentioned as a second-line therapy. Many examples of first-line therapies are recommended (e.g., RCHOP [Rituximab cyclophosphamide, doxorubicin, vincristine, prednisone] {Category 1}, dose-adjusted EPOCH [etoposide, prednisone, vincristine, cyclophosphamide, doxorubicin] + rituximab {Category 2A}). One examples of a first-line therapy for patients with poor left ventricular function or in those who are frail include RCEPP (rituximab, cyclophosphamide, etoposide, prednisone, procarbazine). NCCN also recommends optional first-line consolidation therapy of Revlimid maintenance (Category 2B) for patients aged 60 to 80 years.

NCCN guidelines for B-Cell Lymphomas (version 1.2020 – January 22, 2020) discuss therapeutic options for follicular lymphoma.[3] Revlimid plus rituximab is a first-line recommended therapy (Category 2A). Many second-line and subsequent therapies are listed, which include Revlimid, with or without rituximab.

The NCCN Hodgkin Lymphoma clinical practice guidelines (version 1.2020 – January 30, 2020) recommend Revlimid as an additional therapy option for treatment of classical Hodgkin lymphoma as a single agent for refractory or relapsed disease.[6]

The NCCN guidelines for B-Cell Lymphomas (version 1.2020 – January 22, 2020) discuss marginal zone lymphomas.[3] Revlimid plus rituximab has a Category 2B recommendation for first-line therapy. Revlimid with or without rituximab is also recommended as a second-line and subsequent therapy.

The NCCN has guidelines regarding myeloproliferative neoplasms (version 2.2019 – October 29, 2018) that discuss myelofibrosis with related anemia.[7] Revlimid is recommended, with or without prednisone, for patients with serum epoetin alfa levels > 500 mU/mL.

The NCCN guidelines for T-Cell Lymphomas (version 1.2020 – January 6, 2020) makes several recommendations that include Revlimid.[8] For peripheral T-cell lymphomas, Revlimid is recommended as second-line and subsequent therapy as a monotherapy. Similarily, Revlimid is recommended as a second-line and subsequent therapy for adult T-cell leukemia/lymphoma.

NCCN guidelines for systemic light chain amyloidosis (version 1.2020 – December 6, 2019) cite Revlimid as a therapeutic option used in combination with other agents in several clinical scenarios, including newly diagnosed disease.[9] The NCCN guidelines state that Phase II studies have noted that Revlimid in combination with dexamethasone is active in the treatment of patients with systemic light chain amyloidosis, including patients with relapsed/refractory disease.

The NCCN guidelines for Central Nervous System (CNS) Cancers (version 1.2020 – March 10, 2020) recommend Revlimid, with or without rituximab, as one of the options for patients with relapsed or refractory disease.[10]

Safety

In a prospective randomized clinical study in the first-line treatment of patients with CLL, use of Revlimid as a single agent increased the risk of death compared with chlorambucil given as a single agent.[1] The trial was stopped for safety in July 2013. In an interim analysis, 34 deaths occurred in 210 patients in the Revlimid treatment arm compared with 18 deaths among the 211 patients in the chlorambucil treatment arm (hazard ratio for overall survival was 1.92 [95% confidence interval {CI}: 1.08, 3.41]), which was consistent with a 92% increase in the risk of death. Also, serious adverse cardiovascular (CV) events, including atrial fibrillation, myocardial infarction, and cardiac failure, occurred more frequently in patients receiving Revlimid. Revlimid has a Boxed Warning regarding embryofetal toxicity, hematologic toxicity, and venous thromboembolism. Revlimid is only available through a restricted distribution program called the Revlimid Risk Evaluation Mitigation Strategy (REMS®). Males and females must follow the required reproductive precautions.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Revlimid. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Revlimid is recommended in those who meet the following criteria:

FDA-Approved Indications

~~28.~~25. **Follicular Lymphoma.** Approve for 3 years if the patient meets one of the following (A or B):

- **A)** The patient is using Revlimid in combination with rituximab; OR
- **B)** The patient has tried at least one prior therapy.
  Note: Examples include Treanda® (bendamustine injection) plus rituximab; Treanda plus Gazyva® (obinutuzumab injection for intravenous use); CHOP (cyclophosphamide, doxorubicin, vincristine, prednisone) plus Gazyva or rituximab; CVP (cyclophosphamide, vincristine, prednisone) plus Gazyva or rituximab; chlorambucil with or without rituximab; cyclophosphamide with or without rituximab; Gazyva; Copiktra™ (duvelisib capsules); Aliqopa® (copanlisib injection for intravenous use); or Zydelig® (idelalisib capsules).

~~29.~~26. **Mantle Cell Lymphoma**. Approve for 3 years.

~~30.~~27. **Marginal Zone Lymphoma.** Approve for 3 years.

~~31.~~28. **Multiple Myeloma.** Approve for 3 years.

~~32.~~29. **Myelodysplastic Syndrome (MDS).** Approve for 3 years if the patient meets ONE of the following (A, B, or C):

- **A)** The patient has symptomatic anemia; OR
- **B)** The patient has transfusion-dependent anemia; OR
- **C)** The patient has anemia that is not controlled with an erythroid stimulating agent (ESA) [e.g., Epogen®/Procrit® {epoetin alfa injection}, Aranesp® {darbepoetin alfa injection}].

Other Uses with Supportive Evidence

~~33.~~30. **Acquired Immune Deficiency Syndrome (AIDS)-Related Kaposi's Sarcoma.** Approve for 3 years if the patient meets the following (A and B):
A) The patient has tried at least one regimen or therapy; AND
B) The patient has relapsed or refractory disease.
Note: Examples include liposomal doxorubicin, paclitaxel, Pomalyst® (pomalidomide capsules), Thalomid® [thalidomide capsules], and imatinib.

~~34.~~31. **Castleman's Disease.** Approve for 3 years in patients with relapsed/refractory or progressive disease.

~~35.~~32. **Central Nervous System (CNS) Cancer (Primary).** Approve for 3 years if according to the prescriber the patient has relapsed or refractory disease.

~~36.~~33. **Diffuse, Large B Cell Lymphoma (DLBCL) [Non-Hodgkin's Lymphoma].** Approve for 3 years if the patient has tried at least one prior therapy.
Note: Examples include RCHOP (rituximab, cyclophosphamide, doxorubicin, vincristine, predisone); dose-adjusted EPOCH (etoposide, prednisone, vincristine, cyclophosphamide, doxorubicin) + rituximab; RCEPP (rituximab, cyclophosphamide, etoposide, prednisone, procarbazine); DHAP (dexamethasone, cisplatin, cytarabine) ± rituximab; ICE (Ifex, carboplatin, etoposide) ± rituximab; or Treanda ± rituximab.

~~37.~~34. **Hodgkin Lymphoma, Classical (nodular sclerosis, mixed cellularity, lymphocyte depleted, and lymphocyte-rich subtypes of Hodgkin lymphoma).** Approve for 3 years in patients with relapsed or refractory disease.

~~38.~~35. **Myelofibrosis.** Approve for 3 years if the patient meets the following criteria (A and B):
A) According to the prescriber the patient has anemia; AND
B) The patient has serum erythropoietin levels ≥ 500 mU/mL.

~~39.~~36. **Peripheral T-Cell Lymphomas.** Approve for 3 years if the patient has tried at least one other therapy or regimen.
Note: Examples of therapies or regimens include Beleodaq® (belinostat injection for intravenous infusion); Adcetris® (brentuximab vedotin injection for intravenous use); DHAP (dexamethasone, cisplatin, cytarabine); ESHAP (etoposide, methylprednisolone, cytarabine, cisplatin); GDP (gemcitabine, dexamethasone, cisplatin); GemOX (gemcitabine, oxaliplatin); ICE (ifosfamide, carboplatin, etoposide); or Istodax® (romidepsin injection for intravenous infusion). Indications regarding peripheral T-cell lymphomas include peripheral T-cell lymphoma not otherwise specified (PTCL-NOS), angioimmunoblastic T-cell lymphoma (AITL); enteropathy-associated T-cell lymphoma (EATL); monomorphic epitheliotropic intestinal T-cell lymphoma (MEITL); nodal peripheral T-cell lymphoma (nodal PTCL) with TFH phenotype (TFH); follicular T-cell lymphoma (FTCL); and hepatosplenic gamma-delta T-cell lymphomas.

~~40.~~37. **Systemic Light Chain Amyloidosis.** Approve for 3 years.

~~41.~~38. **T-Cell Leukemia/Lymphoma.** Approve for 3 years if the patient has tried at least one other therapy or regimen.
Note: Examples include Adcetris® (brentuximab vedotin injection for intravenous use) plus CHP (cyclophosphamide, doxorubicin, and prednisone); CHOP (cyclophosphamide, doxorubicin, vincristine, and prednisone); CHOEP (cyclophosphamide, doxorubicin, vincristine, etoposide, and prednisone); dose-adjusted EPOCH (etoposide, prednisone, vincristine, cyclophosphamide, and doxorubicin); HyperCVAD (cyclophosphamide, vincristine, doxorubicin, and dexamethasone)

alternating with high-dose methotrexate and cytarabine; or Beleodaq® (belinostat injection for intravenous infusion).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Revlimid is not recommended in the following situations:

242. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	Added Venclexta as an option of agents that count as a trial for meeting the criteria for mantle cell lymphoma. Approval for marginal zone lymphoma was added. Added to approve for peripheral T-Cell Lymphomas and T-Cell leukemia/lymphoma if the patient has tried one other regimen.	03/20/2019
Selected Revision	1. Follicular Lymphoma: This condition was moved from Other Uses with Supportive Evidence to the Food and Drug Administration Approved Indications Section. In-line with the new labeling, the requirement was added that the patient is using Revlimid in combination with rituximab OR has tried one prior therapy with several examples provided in the policy. 2. Marginal Zone Lymphoma: This condition was moved from Other Uses with Supportive Evidence to the Food and Drug Administration Approved Indications Section. Criteria remain the same. 3. Mantle Cell Lymphoma: The requirement was removed that the patient had tried two prior regimens OR that the patient had tried one prior therapy or therapeutic regimen and cannot take Velcade according to the prescribing physician.	06/05/2019
Annual Revision	The following changes were made: 1. **Follicular Lymphoma:** The requirement that the patient has tried one prior therapy was changed to state "at least" and the examples of agents were moved from the criteria to a note. 2. **Acquired Immune Deficiency Kaposi's Sarcoma.** Criteria were added to approve if the patient has tried at least one regimen or therapy and the patient has relapsed or refractory disease. The examples of regimens are cited in a note. 3. **Central Nervous System Lymphoma (Primary)**: Criteria were added to approve for 3 years if the patient has relapsed or refractory disease. These were recommendations in NCCN guidelines. **4. Diffuse Large B-Cell Lymphoma:** The requirement that the patient has tried one other medication treatment regimen was changed to state "at least one prior therapy". Also, the examples of agents were moved from the criteria to a note. 5. **Myelofibrosis:** Criteria were revised to include that according to the prescriber the patient has anemia and that serum erythropoietin levels are ≥ 500 mU/mL. With the addition of this criteria, the requirement that the patient has tried one other therapy was removed. 6. **Peripheral T-Cell Lymphomas**: The requirement that the patient has one other chemotherapy regimen was changed to state "at least one other therapy or regimen." The examples of regimens/therapies were moved from the criteria to a note. Examples of Peripheral T-Cell Lymphomas were added as a note. 7. **T-Cell Leukemia/Lymphoma:** The requirement that the patient has one other chemotherapy regimen was changed to state "at least one other therapy or regimen." The examples of regimens/therapies were moved from the criteria to a note. 8. **Conditions Not Recommended for Approval**: The following conditions were deleted from this section: metastatic melanoma; metastatic renal cell carcinoma; ovarian carcinoma; and Waldenstrom macroglobulinemia.	04/01/2020

NCCN – National Comprehensive Cancer Network.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Rozlytrek Prior Authorization Policy

- Rozlytrek™ (entrectinib capsules – Genentech)

REVIEW DATE: 08/26/2020

OVERVIEW

Rozlytrek, a kinase inhibitor, is indicated for the following uses:[1]

- **Non-small cell lung cancer (NSCLC)**, for the treatment of adults with metastatic ROS1-positive disease.

- **Solid tumors**, treatment of adult and pediatric patients ≥ 12 years of age that a) have a neurotrophic tyrosine receptor kinase (*NTRK*) gene fusion without a known acquired resistance mutation, b) are metastatic or where surgical resection is likely to result in severe morbidity, and c) have either progressed following treatment or have no satisfactory alternative therapy.

Guidelines

The National Comprehensive Cancer Network (NCCN) Compendium recommends the use of Rozlytrek for *NTRK* gene fusion-positive tumors in the following disease states:[2] pancreatic cancer, colon and rectal cancer, breast cancer, cutaneous melanoma, cervical cancer, squamous cell carcinoma, endometrial cancer, uterine sarcoma, several types of soft tissue sarcoma, hepatocellular/biliary tract/gallbladder carcinoma, brain metastases, NSCLC, ovarian cancer, salivary gland tumors, esophageal/esophagogastric junction cancers, gastric cancer, and thyroid cancer. It is also recommended for ROS1 rearrangement-positive NSCLC. Rozlytrek is a category 2A recommendation for most cancers.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Rozlytrek. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Rozlytrek is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Solid Tumors.** Approve for 3 years if the patient meets the following criteria (A, B, C, and D):
   - **A)** Patient is ≥ 12 years of age; AND
   - **B)** Patient's tumor has neurotrophic receptor tyrosine kinase (*NTRK*) gene fusion without a known acquired resistance mutation; AND
   - **C)** Patient meets one of the following criteria (i or ii):
     - **i.** The tumor is metastatic; OR
     - **ii.** Surgical resection of tumor will likely result in severe morbidity; AND
   - **D)** Patient meets one of the following criteria (i or ii):
     - **i.** Patient has progressed following treatment; OR
     - **ii.** There are no satisfactory alternative therapies.

2. **Non-Small Cell Lung Cancer.** Approve for 3 years if the patient has *ROS1*-positive metastatic disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Rozlytrek is not recommended in the following situations:

243. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Rubraca Prior Authorization Policy
- Rubraca™ (rucaparib tablets – Clovis Oncology)

REVIEW DATE: 03/10/2021

OVERVIEW

Rubraca, a poly (ADP-ribose) polymerase (PARP) inhibitor, is indicatedfor the following uses:[1]

- **Ovarian, fallopian tube, or primary peritoneal cancer**, for the **treatment** of adult patients with deleterious *BReast CAncer (BRCA)* mutation (germline and/or somatic) associated epithelial disease who have been treated with two or more chemotherapies.
- **Ovarian, fallopian tube, or primary peritoneal cancer,** for the **maintenance treatment** of adult patients with recurrent disease who are in a complete or partial response to platinum-based chemotherapy.
- **Prostate cancer, metastatic castration-resistant (mCRPC)**, treatment of adult patients with a deleterious *BRCA* mutation (germline and/or somatic)-associated disease who have been treated with androgen receptor-directed therapy and a taxane-based chemotherapy.

Guidelines

- **Ovarian Cancer:** According to the National Comprehensive Cancer Network (NCCN) guidelines for ovarian cancer (version 1. 2021 – February 26, 2021), therapy options for patients with recurrent disease are primarily dependent on whether the patient is considered platinum-resistant or platinum-sensitive (patients who relapse ≥ 6 months after initial chemotherapy).[3] NCCN Panel recommends single-agent Rubraca as recurrence therapy for patients with platinum-sensitive or platinum-resistant ovarian cancer that has been treated with two or more lines of chemotherapy and have *BRCA* mutations. The Panel feels that Rubraca is preferred for patients with platinum-resistant disease, because there are fewer good options for this setting. In patients with platinum-sensitive disease who have completed two or more lines of platinum-based therapy and are in a partial or complete response, bevacizumab can be continued as maintenance therapy; or Zejula™ (niraparib capsules), Lynparza™ (olaparib tablets), or Rubraca can be considered as maintenance therapy options (all category 2A).
- **Prostate Cancer:** The NCCN prostate cancer guidelines (version 2.2021 – February 17, 2021) recommend Rubraca for *BRCA1* or *BRCA2* mutation (germline and/or somatic) for its FDA-approved use in mCRPC, either as second-line or subsequent therapy (category 2A). It is listed under "useful in certain circumstances". The guidelines note that if the patient is not fit for chemotherapy, Rubraca can be considered even if taxane-based therapy has not been given.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Rubraca. All approvals are provided for 3 years in duration unless otherwise noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Rubraca is recommended in those who meet the following criteria:

FDA-Approved Indications

~~42.~~39. **Ovarian, Fallopian Tube, or Primary Peritoneal Cancer – Treatment.** Patient meets BOTH of the following (A and B):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient meets ONE of the following criteria (i or ii):
  - **i.** Initial Therapy. Approve for 3 years if the patient meets the following criteria (a and b):
    - **a)** Patient has a *BRCA*-mutation (germline or somatic) as confirmed by an approved test; AND
    - **b)** Patient has progressed on two or more prior lines of chemotherapy; OR
  - **ii.** Patient is Currently Receiving Rubraca. Approve for 3 years if the patient has a *BRCA* mutation (germline or somatic) as confirmed by an approved test.

2. **Ovarian, Fallopian Tube, or Primary Peritoneal Cancer –Maintenance Therapy.** Approve for 3 years if the patient meets the following criteria (A and B):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient is in complete or partial response after at least two platinum-based chemotherapy regimens. Note: Examples are carboplatin with gemcitabine, carboplatin with paclitaxel, cisplatin with gemcitabine.

3. **Prostate Cancer – Castration-Resistant.** Approve for 3 years if the patient meets the following criteria (A, B, C, D, and E):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has metastatic disease that is *BRCA*-mutation positive (germline and/or somatic); AND
   - **C)** Patient meets one of the following criteria (i or ii):
     - **i.** The medication is used concurrently with a gonadotropin-releasing hormone (GnRH) analog; OR
       Note: Examples are Lupron (leuprolide for injection), Lupron Depot (leuprolide acetate for depot suspension), Trelstar (triptorelin pamoate for injectable suspension), Zoladex (goserelin acetate implant), Vantas (histrelin acetate subcutaneous implant), Firmagon (degarelix for injection).
     - **ii.** Patient has had a bilateral orchiectomy; AND
   - **D)** Patient has been previously treated with at least one androgen receptor-directed therapy; AND
     Note: Examples are abiraterone, Xtandi (enzalutamide tablets), Yonsa (abiraterone acetate tablets).
   - **E)** Patient meets one of the following criteria (i or ii):
     - **i.** Patient has been previously treated with at least one taxane-based chemotherapy; OR
       Note: Examples are docetaxel, cabazitaxel.
     - **ii.** Patient is not a candidate or is intolerant to taxane-based chemotherapy, according to the prescriber.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Rubraca is not recommended in the following situations:

244. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	Modified Maintenance Therapy criteria in recurrent disease setting to state that it is after at least two lines of platinum-based chemotherapy, based on guidelines.	02/06/2019
Annual Revision	In Ovarian, Fallopian Tube, or Primary Peritoneal Cancer – Maintenance Therapy criteria, deleted criteria "the patient has recurrent disease."	02/19/2020
Selected Revision	Added new FDA-approved indication in prostate cancer.	05/27/2020
Annual Revision	**For all indications:** Added age requirement that patient ≥ 18 years.	03/10/2021

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Rydapt Prior Authorization Policy
- Rydapt® (midostaurin capsules – Novartis)

REVIEW DATE: 02/10/2021

OVERVIEW

Rydapt, a tyrosine kinase inhibitor, is indicated in adults for the following uses:[1]
- **Acute myeloid leukemia (AML), newly diagnosed, that is FMS-like tyrosine kinase 3 (*FLT3*) mutation-positive** as detected by an FDA-approved test, in combination with standard cytarabine and daunorubicin induction and cytarabine consolidation.
- **Aggressive systemic mastocytosis (AMS), systemic mastocytosis with associated hematological neoplasm (SM-AHN), or mast cell leukemia (MCL)**.

AML

AML is a heterogeneous hematologic malignancy characterized by clonal expansion of myeloid blasts in the peripheral blood, bone marrow, and/or other tissues.[2] Undifferentiated blast cells proliferate in bone marrow instead of maturing into normal blood cells. Among adults, it is the most common form of acute leukemia and accounts for the largest number of annual deaths from leukemias in the US. An estimated 19,940 individuals will be diagnosed with AML in 2019 and 11,180 are projected to die from the condition. The median age at diagnosis is 67 years. Diagnosis occurs at ≥ 65 years of age for 54% of patients with around one-third of patients diagnosed at ≥ 75 years of age. The incidence of AML increase as the population ages. Environmental factors such as prolonged exposure to petrochemicals, solvents such as benzene, pesticides, and ionizing radiation have been established to increase the risks for AML, as well as myelodysplastic syndrome (MDS).[2] The cure rates of AML have improved with this outcome noted in 35% to 40% of adult patients who are ≤ 60 years of age and 5% to 15% for patients who are > 60 years of age.[3] However, among patients who are older and unable to receive intensive chemotherapy the survival rates are dismal with a median survival of only 5 to 10 months. Various gene mutations are present in adults with AML. The prognosis of AML is worse for patients with *FLT3* mutations which comprise approximately 30% to 40% of AML cases. Two major classes of activating *FLT3* mutations have been identified in patients with AML which include the ITD and TKD point mutations. *FLT3*/ITD mutations

occur in approximately 30% of cases and are more common than *FLT3*/TKD mutations, which occur in approximately 10% of patients.

Systemic Mastocytosis (SM)

Mastocytosis describes a rare group of disorders that are caused by too many mast cells in the body.[4-10] c-Kit mutations are implicated in some types of mastocytosis, including SM.[9] There are four major subtypes of SM: indolent SM (ISM), SM-AHN, ASM, and MCL.[8] The prognosis of ASM is highly variable, with a median survival of 3.5 to 7 years depending on the study. The only definitive therapy for ASM remains hematopoietic stem cell transplant (HSCT).[7] In general, the prognosis and treatment of SM-AHN is governed by the associated hematologic disorder while controlling the symptoms of mastocytosis. In SM-AHN, HSCT confers the greatest survival benefit in all forms of advanced SM, with a 3-year survival probability of 74% according to a large global retrospective study. The prognosis of SM-AHN remains poor, with a median survival estimated to be 2 to 4.4 years, depending on the study. MCL is by far the most aggressive form of SM, with median survival of approximately 6 months. HSCT offers a potentially curative role in appropriate patients with MCL, yet reports have failed to demonstrate reproducible evidence of durable eradication of the disease.

Guidelines

Various guidelines from the National Comprehensive Cancer Network (NCCN) address use of Rydapt.

- **Acute Myeloid Leukemia:** The NCCN guidelines on AML (version 2.2021 – November 12, 2020), recommend Rydapt + intravenous chemotherapy (e.g., cytarabine, daunorubicin) among the treatment options for induction, re-induction, and post-remission therapy.[3] It was noted that while Rydapt was not FDA-approved for maintenance therapy, the pivotal trial was designed for consolidation and maintenance Rydapt for a total of 12 months.
- **Myeloid/Lymphoid Neoplasms with Eosinophilia:** The NCCN guidelines myeloid/lymphoid neoplasms with eosinophilia and tyrosine kinase fusion genes (version 3.2021 – August 21, 2020) recommend Rydapt for patients with FGFR1 or FLT3 rearrangements in chronic phase.[11]
- **Systemic Mastocytosis:** In the NCCN has guidelines for systemic mastocytosis (version 1.2020 – May 21, 2020).[12] Rydapt is recommended for the treatment of aggressive systemic mastocytosis (category 2A), for the treatment of systemic mastocytosis with an associated hematologic neoplasm (category 2A), and for mast cell leukemia (category 2A).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Rydapt. Because of the specialized skills required for evaluation and diagnosis of patients treated with Rydapt approval requires Rydapt to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for 3 years.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Rydapt is recommended in those who meet the following criteria:

FDA-Approved Indications

~~43.~~40. **Acute Myeloid Leukemia (AML).** Approve for 3 years if the patient meets the following criteria (A B and C):

A) Patient is ≥ 18 years of age; AND

B) Patient is *FLT3*-mutation positive AML as detected by an approved test; AND

C) Patient is receiving Rydapt in one of the following settings (i, ii, iii, or iv):
- **i.** Induction therapy in combination with cytarabine and daunorubicin; OR
- **ii.** After standard-dose cytarabine induction/reinduction, along with cytarabine and daunorubicin; OR
- **iii.** Post remission or consolidation therapy in combination with cytarabine; OR
- **iv.** Maintenance therapy.

~~44.~~41. **Aggressive Systemic Mastocytosis (ASM).** Approve for 3 years if the patient is ≥ 18 years of age.

~~45.~~42. **Systemic Mastocytosis Associated with Acute Hematologic Neoplasm (SM-AHN).** Approve for 3 years if the patient is ≥ 18 years of age.

~~46.~~43. **Mast Cell Leukemia (MCL).** Approve for 3 years if the patient is ≥ 18 years of age.

Other Uses With Supportive Evidence

~~47.~~44. **Myeloid or Lymphoid Neoplasms with Eosinophilia.** Approve for 3 years if the patient meets one of the following (A or B):

A) Patient is ≥ 18 years of age; AND

B) Patient meets one of the following (i or ii):
- **i.** Patient has an FGFR1 rearrangement; OR
- **ii.** Patient has an FLT3 rearrangement.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Rydapt is not recommended in the following situations:

245. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Annual Revision	The following changes were made: **Acute Myeloid Leukemia:** Added criteria that the patient is ≥ 18 years of age. **Aggressive Systemic Mastocytosis:** Added criteria that the patient is ≥ 18 years of age. **Systemic Mastocytosis Associated with Acute Hematologic Neoplasm:** Added criteria that the patient is ≥ 18 years of age. **Mast Cell Leukemia:** Approve if the patient is ≥ 18 years of age. **Myeloid or Lymphoid Neoplasms with Eosinophilia:** Criteria were added based on guidelines to approve for 3 years if the patient has an FGFR1 rearrangement or an FLT3 rearrangement.	02/10/2021

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Sprycel Prior Authorization Policy

- Sprycel® (dasatinib tablets – Bristol-Myers Squibb)

REVIEW DATE: 04/01/2020

OVERVIEW

Sprycel, a tyrosine kinase inhibitor (TKI), is indicated for the treatment of adults with: newly diagnosed Philadelphia chromosome-positive (Ph+) chronic myeloid leukemia (CML) in chronic phase (CP); chronic, accelerated, or myeloid or lymphoid blast phase Ph+ CML with resistance or intolerance to prior therapy including imatinib; and Ph+ acute lymphoblastic leukemia (ALL) with resistance or intolerance to prior therapy.[1] Additionally, Sprycel is indicated for the treatment of pediatric patients ≥ 1 year of age with Ph+ CML in CP and newly diagnosed Ph+ ALL in combination with chemotherapy. Currently, there are four other TKIs approved for the treatment of CP Ph+ CML: imatinib, Sprycel® (dasatinib tablets), Bosulif® (bosutinib tablets), Tasigna® (nilotinib capsules), and Iclusig® (ponatinib tablets).[2-5] These agents are indicated for the treatment of CP Ph+ CML in various phases; some TKIs are indicated after resistance or intolerance to prior therapy. Iclusig is approved for patients with T315I-positive CML and in adult patients with CML for whom no other TKI therapy is indicated.[5] Imatinib also has indications related to use in ALL.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for CML (version 3.2020 – January 30, 2020) state that for patients with CP CML with a low-risk score, the primary treatment recommended includes a first-generation TKI (Gleevec or generic imatinib 400 mg QD [Category 1]), or a second-generation TKI (Bosulif 400 mg QD [Category 1], Sprycel 100 mg QD [Category 1], or Tasigna 300 mg BID [Category 1]).[6] For patients with CP CML with an intermediate- or high-risk score, a second-generation TKI is preferred (Bosulif 400 mg QD [Category 1], Sprycel 100 mg QD [Category 1], or Tasigna 300 mg BID [Category 1]). A first-generation TKI (Gleevec or generic imatinib 400 mg QD) is an alternative [Category 2A]. Iclusig is an option for patients with a T315I mutation and for with disease that has not responded to multiple TKIs or in whom another TKI is not indicated.

The NCCN guidelines for ALL (version 1.2020 – January 15, 2020)[7] and Pediatric ALL (version 1.2020 – November 25, 2019)[8] recommend Sprycel in a variety of clinical scenarios including induction therapy, maintenance, relapsed or refractory ALL and for use in specific mutations.

The NCCN soft tissue sarcoma guidelines (version 6.2019 – February 10, 2020) indicate that Sprycel is a treatment option for patients with GIST as an additional option for patients who are no longer experiencing benefit from imatinib, Sutent® (sunitinib capsules), or Stivarga® (regorafenib tablets).[9] It is noted that data are limited with Sprycel (e.g., unpublished, Phase II, small numbers, retrospective). However, it was suggested that Sprycel may be a more effective option for patients with the D842V mutation.[8]

The NCCN guidelines on bone cancer (version 1.2020 – August 12, 2019) recommend Sprycel for patients with chondrosarcoma or chordoma.[10]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Sprycel. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Sprycel is recommended in those who meet the following criteria:

FDA-Approved Indications

481. **Acute Lymphoblastic Leukemia (ALL) That is Philadelphia Chromosome Positive (Ph+).** Approve for 3 years.

482. **Chronic Myeloid Leukemia (CML) That is Philadelphia Chromosome Positive (Ph+).** Approve for 3 years.

Other Uses with Supportive Evidence

3. Gastrointestinal Stromal Tumor (GIST). Approve for 3 years if the patient meets the following criteria (A, B, and C):
- **A)** Patient has tried imatinb; AND
- **B)** Patient has tried Sutent® (sunitinib capsules); AND
- **C)** The patient has tried Stivarga® (regorafenib tablets).

4. Chondrosarcoma or chordoma. Approve for 3 years.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Sprycel is not recommended in the following situations:

246. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	Removed the criteria allowing for approval if the patient has been started on Sprycel for an indication or condition addressed as an approval in the Recommended Authorization section (FDA-approved indication or other uses with supportive evidence section).	03/07/2018
Annual Revision	Approval is now given for patients with chordoma and chondrosarcoma for 3 years.	03/20/2019
Annual Revision	The following criteria changes were made: 1. **Conditions Not Recommended for Approval:** The following conditions were removed: breast cancer; chronic lymphocytic leukemia; colorectal cancer; head and neck squamous cell carcinoma; lung cancer; malignant mesothelioma; melanoma; non-small cell lung cancer; prostate cancer (metastatic, castration-resistant); and small cell lung cancer. These conditions are not recommended in the respective National Comprehensive Cancer Network (NCCN) guidelines and there has been a lack of recent literature regarding these uses.	04/01/2020

FDA – Food and Drug Administration.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Stivarga Prior Authorization Policy

- Stivarga® (regorafenib tablets – Bayer HealthCare Pharmaceuticals, Inc.)

REVIEW DATE: 01/20/2021

OVERVIEW

Stivarga, a kinase inhibitor, is indicated for the treatment of patients with the following conditions:[1]

1. **Colorectal cancer, metastatic** in patients who have been previously treated with fluoropyrimidine-, oxaliplatin-, and irinotecan-based chemotherapy, an anti-vascular endothelial growth factor (VEGF) therapy, and, if *RAS* wild-type, an anti-epidermal growth factor receptor (EGFR) therapy.
2. **Gastrointestinal stromal tumor** (GIST), **locally advanced, unresectable or metastatic** in patients who have been previously treatment with imatinib mesylate (Gleevec®) and Sutent® (sunitinib malate capsules).
3. **Hepatocellular carcinoma** in patients who have been previously treated with Nexavar® (sorafenib tablets).

Guidelines

Stivarga is included in a number of National Comprehensive Cancer Network (NCCN) guidelines:

- **Bone cancer**: The NCCN guidelines (version 1.2021 – November 20, 2020) recommend Stivarga as a single agent for second-line therapy for relapsed/refractory or metastatic disease for patients with osteosarcoma (category 1), dedifferentiated chrondrosarcoma, and high-grade undifferentiated pleomorphic sarcoma (category 2B).[6,7]
- **Central nervous system cancers**: The NCCN guidelines on (version 3.2020 – September 11, 2020) recommend Stivarga as a single agent for the treatment of recurrent glioblastoma.[6,8]
- **Colon cancer and rectal cancer**: The NCCN guidelines on (version 1.2021 – December 22, 2020) and (version 1.2021 – December 22, 2020) recommend Stivarga as subsequent therapy as a single

agent for advanced or metastatic disease not previously treated with Stivarga in patients who have progressed through all available regimens except Stivarga or Lonsurf® (trifluridine and tipiracil tablets) with or without bevacizumab. Stivarga may be given before or after Lonsurf.[2,3,6]

- **Gastrointestinal stromal tumors**: The NCCN guidelines (version 1.2021 – September 12, 2019) recommend Stivarga (category 1) as a single agent for treatment of unresectable, recurrent, or metastatic GIST disease with widespread, systemic progression after single-agent therapy with Gleevec and Sutent.[6,9] Stivarga in combination with Afinitor® (everolimus tablets) is recommended for unresectable, recurrent, or metastatic disease after failure on approved therapies.
- **Hepatobiliary cancers**: The NCCN clinical practice guidelines on (version 5.2020 – August 4, 2020) recommend Stivarga for subsequent treatment as a single agent for patients with hepatocellular carcinoma (adenocarcinoma) [Child-Pugh Class A only] and disease progression for the following uses (all are category 1): 1) in patients who are not transplant candidates with unresectable disease, 2) in patients who are inoperable by performance status or comorbidity (local disease or local disease with minimal extrahepatic disease only), or in patients who have extensive liver tumor burden or metastatic disease.[5,6]
- **Soft tissue sarcoma**: The NCCN guidelines (version 1.2021 – October 30, 2020) recommend Stivarga (all category 2A) as single-agent subsequent therapy for patients with: 1) non-adipocytic extremity/body wall, head/neck sarcoma with advanced/metastatic disease with disseminated metastases, 2) non-adipocytic retroperitoneal/intra-abdominal sarcoma with recurrent unresectable or stage IV disease, 3) advanced/metastatic pleomorphic rhabdomyosarcoma, 4) angiosarcoma, or 5) solitary fibrous tumor.[4,6]

Safety

Stivarga has Boxed Warnings concerning risks of hepatotoxicity.[1] Hepatic function should be monitored prior to and during treatment.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Stivarga. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Stivarga is recommended in those who meet the following criteria:

FDA-Approved Indications

~~48.~~45. **Colon and Rectal Cancer.** Approve for 3 years if the patient meets all of the following criteria (A, B, C, D, and E):

17. Patient has advanced or metastatic disease; AND
18. Patient has been previously treated with a fluoropyrimidine (e.g., capecitabine, 5-fluorouracil [5-FU]); AND
19. Patient has been previously treated with oxaliplatin; AND
20. Patient has been previously treated with irinotecan; AND
21. If the patient's tumor or metastases are wild-type *RAS* (*KRAS* wild-type and/or *NRAS* wild-type) [that is, the tumors or metastases are *KRAS* and/or *NRAS* mutation negative], Erbitux (cetuximab injection for intravenous infusion) or Vectibix (panitumumab injection for intravenous infusion) has been tried.

2. Gastrointestinal Stromal Tumor (GIST). Approve for 3 years if the patient meets all of the following criteria (A, B, and C):

A) Patient has recurrent, metastatic, or unresectable disease; AND
B) Patient has been previously treated with imatinib ; AND

C) Patient has been previously treated with Sutent (sunitinib malate capsules).

3. **Hepatocellular Carcinoma.** Approve for 3 years if the patient has been previously treated with at least one tyrosine kinase inhibitor.
   Note: Tyrosine kinase inhibitors include Nexavar® (sorafenib tablets) and Lenvima® (lenvatinib capsules).

Other Uses with Supportive Evidence

4. **Glioblastoma.** Approve for 3 years if the patient has recurrent disease.

5. **Osteosarcoma.** Approve for 3 years if the patient meets both of the following criteria (A and B):
   A) Patient has relapsed/refractory or metastatic disease; AND
   B) Stivarga is used as subsequent therapy.

6. **Soft Tissue Sarcoma.** Approve for 3 years if the patient meets the following criteria (A and B):
   A) Patient has advanced or metastatic disease; AND
   B) Patient has one of the following (i, ii, iii, or iv):
      i. Non-adipocytic extremity/body wall, head/neck, or retroperitoneal/intra-abdominal sarcoma, OR
      ii. Pleomorphic rhabdomyosarcoma; OR
      iii. Angiosarcoma; OR
      iv. Solitary fibrous tumor.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Stivarga is not recommended in the following situations:

247. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	Removed Other Uses with Supportive Evidence.	10/17/2018

Early Annual Revision	Hepatocellular carcinoma criteria revised to require use of at least one TKI prior to Stivarga. Prior criteria required Nexavar specifically. Criteria added for soft tissue sarcoma.	01/30/2019
Annual Revision	Criteria added for osteosarcoma Removed renal cell carcinoma from Conditions Not Recommended for Approval	01/29/2020
Annual Revision	**Colon and Rectal Cancer**: Added "advanced" to criteria, previous criteria stated Patient has metastatic disease. **Gastrointestinal Stromal Tumor**: Added "recurrent" to criteria, previous criteria stated Patient has metastatic or unresectable disease. **Glioblastoma**: Add criteria for glioblastoma. **Soft Tissue Sarcoma**: Added criteria for advanced or metastatic disease. Added angiosarcoma and solitary fibrous tumor to list of soft tissue sarcomas.	01/20/2021

TKI – Tyrosine kinase inhibitor.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Sutent® (sunitinib malate capsules – Pfizer)

DATE REVIEWED: 05/27/2020

OVERVIEW

Sutent, a multi-kinase inhibitor, is indicated for the treatment of gastrointestinal stromal tumor (GIST) after disease progression on or intolerance to imatinib mesylate (Gleevec® tablets, generics); for the treatment of advanced renal cell carcinoma (RCC); for the adjuvant treatment of adult patients at high risk of recurrent RCC following nephrectomy; and for the treatment of progressive, well-differentiated pancreatic neuroendocrine tumors (PNET) in patients with unresectable locally advanced or metastatic disease.[1]

Guidelines

Sutent features prominently in the National Comprehensive Cancer Network (NCCN) compendium for all of the indications listed in the FDA-approved and Other Uses with Supportive Evidence.[2]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Sutent. All approvals are provided for 3 years in duration.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Sutent is recommended in those who meet the following criteria:

FDA-Approved Indications

15. **Gastrointestinal Stromal Tumor (GIST).** Approve for 3 years if the patient has tried imatinib (Gleevec tablets, generics).

~~49.~~46. **Renal Cell Carcinoma (RCC) –Clear Cell or Non-Clear Cell Histology.** Approve for 3 years if the patient meets ONE of the following criteria (A or B):
   - **A)** The patient is at high risk of recurrent clear cell RCC following nephrectomy and Sutent is used for adjuvant therapy; OR

B) The patient has relapsed or Stage IV disease.

3. Neuroendocrine Tumors of the Pancreas. Approve for 3 years for advanced or metastatic disease.

Other Uses with Supportive Evidence

4. Alveolar Soft Part Sarcoma (ASPS). Approve for 3 years.

5. Angiosarcoma. Approve for 3 years.

6. Chordoma. Approve for 3 years in patients with recurrent disease.

7. Differentiated (i.e., papillary, follicular, and Hürthle cell) Thyroid Carcinoma. Approve for 3 years if refractory to radioactive iodine therapy.

8. Medullary Thyroid Carcinoma. Approve for 3 years if the patient has tried Caprelsa® (vandetanib tablets) or Cometriq® (cabozantinib capsules).

9. Meningioma. Approve for 3 years if the patient has recurrent or progressive disease.

10. Solitary Fibrous Tumor/Hemangiopericytoma. Approve for 3 years.

11. Thymic Carcinoma. Approve for 3 years if the patient has tried chemotherapy (e.g., carboplatin/paclitaxel) or radiation therapy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Sutent has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below.

248. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes*	Date Reviewed
Selected revision	Renal Cell Carcinoma: Added criteria for approval in patients post-nephrectomy for adjuvant Sutent therapy based on FDA-approved new indication.	12/06/2017
Annual revision	Gastrointestinal Stromal Tumor: Added criteria for combination of Sutent with Afinitor.	04/11/2018
Annual revision	• Gastrointestinal Stromal Tumors (GIST): Deleted Sutent "is used as a single agent". Deleted criteria for combination therapy with Afinitor since this is covered in the Afinitor PA policy. • Renal Cell Carcinoma: Deleted "advanced" as qualifier; instead added criteria patient has relapsed or Stage IV disease as per guidelines. Deleted"predominant" in reference to clear cell histology in line with guidelines.	05/08/2019

	• Neuroendocrine Tumors of the Pancrease: Added "of the Pancreas" to condition description. Deleted "Advanced or Unresectable". Instead added "advanced or metastatic disease" in criteria. • Deleted all of the 17 conditions listed under "Conditions not Recommended for Approval".	
Annual revision	• No criteria changes	05/27/2020

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Tabrecta™ (capmatinib tablets – Novartis.)

DATE REVIEWED: 05/11/2020

OVERVIEW

Tabrecta, a kinase inhibitor, is indicated for the treatment of adult patients with metastatic non-small cell lung cancer (NSCLC) whose tumors have a mutation that leads to mesenchymal-epithelial transition (MET) exon 14 skipping as detected by an FDA-approved test.[1]

Guidelines

Tabrecta is not addressed in the guidelines. The National Comprehensive Cancer Network (NCCN) non-small cell lung cancer guidelines (version 3.2020 – February 11, 2020) recommend Xalkori (crizotinib capsules) in patients with high-level *MET* amplification or *MET* exon 14 skipping mutation (category 2A).

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Tabrecta. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tabrecta is recommended in those who meet the following criteria:

FDA-Approved Indications

483. **Non-Small Cell Lung Cancer (NSCLC).** Approve for 3 years if the patient meets the following criteria (A and B):
   A) The patient has metastatic disease; AND
   B) The tumor is positive for a mutation that leads to mesenchymal-epithelial transition (MET) exon 14 skipping, as detected by an approved test.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Tabrecta has not been shown to be effective or there are limited or preliminary data that are not supportive of general approval for the following conditions.

7. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Tafinlar Prior Authorization Policy
- Tafinlar® (dabrafenib capsules – GlaxoSmithKline)

REVIEW DATE: 07/15/2020

OVERVIEW

Tafinlar, a BRAF inhibitor, is indicated for the following uses:[1]

- **Melanoma**, in the following situations:[1]
  - As a single agent for the treatment of patients with unresectable or metastatic disease with *BRAF V600E* mutation as detected by an FDA-approved test; AND
  - In combination with Mekinist® (trametinib tablets), for the treatment of patients with unresectable or metastatic disease with *BRAF V600E* or *V600K* mutations as detected by an FDA-approved test; AND
  - As adjuvant treatment of *BRAF V600E* or *V600K* mutation-positive disease as detected by an FDA-approved test, and involvement of the lymph node(s), following complete resection.
- **Non-small cell lung cancer**, in combination with Mekinist for treatment of disease that has the *BRAF V600E* mutation as detected by an FDA-approved test.
- **Thyroid cancer**, in combination with Mekinist, for treatment of patients with locally advanced or metastatic anaplastic disease with *BRAF V600E* mutation and with no satisfactory locoregional treatment options.

Tafinlar is not indicated for the treatment of patients with wild-type BRAF disease.

Guidelines

National Comprehensive Cancer Network (NCCN) guidelines support use of Tafinlar in multiple cancers.

- **Melanoma:** Guidelines (version 3.2020 – May 18, 2020) recommend BRAF/MEK inhibitor combinations for first-line (preferred if clinically needed for early response) and subsequent treatment of metastatic or unresectable melanoma with a *V600* activating mutation.[2] While combination BRAF/MEK inhibition is preferred, if a combination is contraindicated, monotherapy with a BRAF inhibitor (Tafinlar or Zelboraf® [vemurafenib tablets]) is a recommended option, particularly if the patient is not a candidate for checkpoint immunotherapy. Following resection of limited metastatic disease with a *BRAF V600*-activating mutation, BRAF/MEK combination therapy is among the treatment options for patients with no evidence of disease. Tafinlar + Mekinist is also recommended in guidelines as adjuvant therapy (including for nodal recurrence) in some patients with Stage III disease, including use post-surgery or use after complete lymph node dissection. If unacceptable toxicity to Tafinlar/Mekinist, other BRAF/MEK combinations can be considered.

- **Non-Small Cell Lung Cancer:** Guidelines (version 6.2020 – June 25, 2020) list Tafinlar + Mekinist among the first-line therapy and subsequent therapy options for tumors with a *BRAF* mutation.[3] NCCN also notes that monotherapy with a BRAF inhibitor (Tafinlar or Zelboraf) is a treatment option when combination therapy is not tolerated.
- **Thyroid Cancer:** Guidelines (version 1.2020 – June 12, 2020) list Tafinlar + Mekinist as a treatment option for metastatic anaplastic thyroid cancer with a *BRAF* mutation.[4] Tafinlar and Zelboraf are also treatment options for the treatment of iodine-refractory differentiated thyroid cancer (follicular, Hürthle cell, and papillary cancer subtypes) with a *BRAF V600* mutation.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Tafinlar. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tafinlar is recommended in those who meet the following criteria:

FDA-Approved Indications

3. Melanoma. Approve for 3 years if the patient meets BOTH of the following (A and B):
- **A)** Patient has unresectable, advanced (including Stage III or Stage IV disease), or metastatic melanoma; AND
  Note: This includes adjuvant treatment in patients with Stage III disease with no evidence of disease post-surgery.
- **B)** Patient has *BRAF V600* mutation-positive disease.

4. Non-Small Cell Lung Cancer. Approve for 3 years if the patient has *BRAF V600E* mutation-positive disease.

5. Thyroid Cancer, Anaplastic. Approve for 3 years if the patient meets ALL of the following (A, B, and C):
- **D)** Patient has locally advanced or metastatic anaplastic disease; AND
- **E)** Tafinlar will be taken in combination with Mekinist, unless intolerant; AND
- **F)** Patient has *BRAF V600* mutation-positive disease.

Other Uses with Supportive Evidence

6. Thyroid Cancer, Differentiated. Approve for 3 years if the patient meets ALL of the following conditions (A, B, and C):
- **A)** Patient has differentiated thyroid carcinoma; AND
  Note: Examples of differentiated thyroid carcinoma include papillary, follicular, or Hürthle cell thyroid cancers.
- **B)** Patient has disease that is refractory to radioactive iodine therapy; AND
- **C)** Patient has *BRAF* mutation-positive disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tafinlar is not recommended in the following situations:

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

322. The NCCN Thyroid Carcinoma Clinical Practice Guidelines in Oncology (Version 1.2020 – June 12, 2020). © 2020 National Comprehensive Cancer Network, Inc. Available at: http://www.nccn.org. Accessed on July 2, 2020.

HISTORY

Type of Revision	Summary of Changes	Review Date
Early annual revision	Add criteria to approve for 3 years for locally advanced or metastatic anaplastic thyroid cancer that is BRAF V600-positive, if taken in combination with Mekinist (unless intolerant). Due to new indication as adjuvant therapy in resectable melanoma, remove criteria that does not allow coverage in patients who had disease progression while on a BRAF inhibitor. Remove continuation criteria in melanoma; now all approvals require that the patient has unresectable, advanced (including Stage III or Stage IV disease), or metastatic melanoma with a BRAF mutation. In Other Uses with Supportive Evidence, add criteria to approve for 3 years for differentiated thyroid cancer, if BRAF-positive and refractory to radioactive iodine therapy.	05/23/2018
Annual revision	**NSCLC:** The diagnosis was changed to remove the BRAF mutation from the approval condition. The requirement that the patient has BRAF V600E mutation was added to the criteria for patients with NSCLC. **Colon or Rectal Cancer:** Add criteria as supported by NCCN colon cancer guidelines. Criteria approve if the patient has *BRAF V600E* mutation-positive disease, and if the patient has previously used chemotherapy, and if the agent will be used as part of a combination regimen for colon or rectal cancer.	06/18/2019
Annual revision	**Colon or Rectal Cancer:** This indication was removed from the policy. Tafinlar is no longer a recommended therapy in guidelines for colon and rectal cancer.	07/15/2020

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Tagrisso Prior Authorization Policy

- Tagrisso® (osimertinib tablets – AstraZeneca)

REVIEW DATE: 01/06/2021

OVERVIEW

Tagrisso, a kinase inhibitor, is indicated for the treatment of adult patients for the following uses:[1]

- **Non-small cell lung cancer (NSCLC)**, with metastatic epidermal growth factor receptor (*EGFR*) T790M mutation-positive disease, as detected by an FDA-approved test. It is specifically approved for patients who have progressed on or after EGFR tyrosine kinase inhibitor (TKI) therapy (EGFR-TKI).
- **NSCLC**, first-line treatment of patients with metastatic NSCLC whose tumors have *EGFR* exon 19 deletions or exon 21 L858R mutations, as detected by an FDA-approved test.
- **NSCLC**, adjuvant therapy after tumor resection in tumors that have EGFR exon 19 deletions or exon 21 L858R mutations, as detected by an FDA-approved test.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for NSCLC (version 2.2021 – December 15, 2020) recommend *EGFR* mutation testing in patients with nonsquamous NSCLC (i.e., adenocarcinoma, large cell, NSCLC not otherwise specified [NOS]) and squamous cell NSCLC.[2] Tagrisso is recommended for consideration in patients who have been treated with previous adjuvant chemotherapy or ineligible for platinum-based chemotherapy in stage IB-IIIA *EGFR* mutation-positive disease after complete resection (category 2A). For advanced or metastatic disease, erlotinib, Iressa® (gefitinib tablets), Gilotrif™ (afatinib tablets), Vizimpro® (dacomitinib tablets), and Tagrisso (all category 1) are all recommended for the first-line treatment of patients with sensitizing *EGFR*-mutation positive NSCLC. Tagrisso is noted as the "preferred" first-line option by NCCN. Upon disease progression, T790M testing is recommended in guidelines. For systemic multiple lesions that are T790M mutation-positive, Tagrisso, if not previously given, is the category 1 recommended option. If T790M mutation-negative, initial cytotoxic therapy options listed for adenocarcinoma, or squamous cell carcinoma (e.g., doublet chemotherapy) can be considered in this setting (category 2A). NCCN notes that in patients with actionable mutations. Immunotherapy is less effective in the second-line setting, irrespective of PD-L1 expression.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Tagrisso. All approvals are provided for 3 years in duration unless otherwise noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tagrisso is recommended in those who meet the following criteria:

FDA-Approved Indications

~~50.~~47. **Non-Small Cell Lung Cancer (NSCLC) – Epidermal Growth Factor Receptor (*EGFR*) Mutation-Positive.** Approve if the patient meets the following criteria (A and B):

A) Patient is ≥ 18 years of age; AND

B) Patient meets ONE of the following criteria (i, ii, or iii):

i. Approve for up to 3 years (total) if the patient meets BOTH of the following criteria (a and b):

a) The medication is used as adjuvant therapy after tumor resection; AND

b) The tumor is positive for *EGFR* exon 19 deletions or exon 21 L858R mutations, as detected by an approved test; OR

ii. Approve for 3 years if the patient meets BOTH of the following criteria (a and b):

a) Patient has metastatic *EGFR* T790M mutation-positive NSCLC as detected by an approved test; AND

b) Patient has progressed on one of the EGFR-tyrosine kinase inhibitors; OR
Note: Examples are erlotinib , Iressa® [gefitinib tablets], Vizimpro® [dacomitinib tablets], Gilotrif® [afatinib tablets]; OR

iii. Approve for 3 years if the patient meets ONE of the following criteria (a or b):

a) Patient has metastatic disease with *EGFR* exon 19 deletions as detected by an approved test; OR

b) Patient has metastatic disease with *EGFR* exon 21 L858R mutations as detected by an approved test.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tagrisso is not recommended in the following situations:

249. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Selected Revision	Moved approval criteria for use in first-line setting for exon 19 or exon 21 mutations to under FDA-approved use due to new indication approval. Deleted "advanced or" from first-line setting use.	04/25/2018
Annual Revision	Criteria modified for T790M mutation where the list of agents is replaced with "one of the EGFR-tyrosine kinase inhibitors". The agents are listed as examples. Vizimpro was added to this list.	12/19/2018
Annual Revision	No criteria changes.	12/18/2019
Annual Revision	**Non-Small Cell Lung Cancer:** Added age requirement. Added new approval criteria for up to 3 years for Tagrisso use as adjuvant therapy based on FDA-approval. Moved examples of EGFR tyrosine kinase inhibitors to Note.	01/06/2021

EGFR – Epidermal growth factor receptor.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Talzenna Prior Authorization Policy
- Talzenna™ (talazoparib capsules – Pfizer)

REVIEW DATE: 11/11/2020

OVERVIEW
Talzenna, a poly (ADP-ribose) polymerase (PARP) inhibitor, is indicated in adult patients with deleterious or suspected deleterious germline BReast CAncer susceptibility gene **(g*BRCA*)-mutated** human epidermal growth factor receptor 2 **(HER2)-negative locally-advanced or metastatic breast cancer**.[1]

GUIDELINES
The National Comprehensive Cancer Network (NCCN) guidelines on breast cancer (version 6.2020 – September 8, 2020) recommends Talzenna as a category 1 preferred regimen for patients with recurrent or metastatic breast cancer which are HER2-negative and have germline *BRCA*1/2 mutation.[2] Lynparza® (olaparib tablets) is another category 1 recommended option in this setting. The guidelines note that although Talzenna and Lynparza are FDA-approved for HER2-negative disease, the NCCN Panel supports use of these agents in any subtype associated with a germline *BRCA1* or *BRCA2* mutation.

POLICY STATEMENT
Prior Authorization is recommended for prescription benefit coverage of Talzenna. All approvals are provided for 3 years in duration.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Talzenna is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Breast Cancer.** Approve for 3 years if the patient meets the following criteria (A, B, and C):
   - **A.** Patient has locally-advanced or metastatic breast cancer; AND
   - **B.** Patients has germline *BRCA* mutation-positive disease; AND
   - **C.** Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Coverage of Talzenna is not recommended in the following situations:

250. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Annual Revision	No criteria changes	11/11/2020

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Targretin (Oral) Prior Authorization Policy
- Targretin (bexarotene capsule – Bausch Health, generics)

REVIEW DATE: 09/30/2020

OVERVIEW
Bexarotene capsule is indicated for the treatment of cutaneous manifestations of cutaneous T-cell lymphoma in patients who are refractory to at least one prior systemic therapy.[1] Bexarotene capsule has a Boxed Warning about birth defects and bexarotene must not be administered to a pregnant patient.

Disease Overview
CTCL is one of the most common form of T-cell lymphoma.[2,3] The most common type of cutaneous T-cell lymphoma is mycosis fungoides, which accounts for approximately 50% of all cutaneous T-cell lymphomas.[2] Skin symptoms associated with mycosis fungoides include patches, plaques, or tumors and treatment is directed at the skin or the entire body (systemic).[2,3] Sézary syndrome is an advanced, variant form of mycosis fungoides and is characterized by the presence of lymphoma cells in the blood. Patients with Sézary syndrome will have extensive thin, red, itchy rashes usually covering over 80% of the body and treatment will generally include systemic therapies since the use of skin- directed therapies alone is typically inadequate. Skin-directed therapies are useful for patch and limited plaque disease. Systemic therapies are reserved for more advanced disease and initiation of systemic therapy is usually deferred until patients have not responded to topical therapies.

Guidelines
The National Comprehensive Cancer Network (NCCN) guidelines on Primary Cutaneous Lymphomas (version 2.2020 – April 10, 2020) provide treatment recommendations for the different types of cutaneous T-cell lymphomas.[2] Bexarotene capsules are listed as one of the therapies within the Systemic Category A drugs. The Systemic Category A drugs are used before Systemic Category B drugs.

POLICY STATEMENT
Prior Authorization is recommended for prescription benefit coverage of bexarotene capsules. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with bexarotene capsules as well as the monitoring required for adverse events, approval requires bexarotene capsules to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Documentation: Documentation is required for use of bexarotene capsules as noted in the criteria as **[documentation required]**. Documentation may include, but is not limited to, chart notes, prescription claims records, prescription receipts, and/or other information.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of bexarotene capsule is recommended in those who meet the following criteria:

FDA-Approved Indications

~~51.~~48. **Cutaneous T-Cell Lymphoma – Cutaneous Manifestations**. Approve bexarotene capsule for 3 years if the patient meets the following criteria (A and B):

Z) The medication is prescribed by or in consultation with an oncologist or a dermatologist; AND

AA) If brand Targretin is requested, the patient has tried AND cannot take generic bexarotene capsules due to a formulation difference in the inactive ingredient(s) (e.g., difference in dyes, fillers, preservatives) between the brand and the bioequivalent generic product which, per the prescribing physician, would result in a significant allergy or a serious adverse reaction **[documentation required]**.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of bexarotene capsules is not recommended in the following situations:

251. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	Add Poteligeo® (mogamulizumab-kpkc injection) to the list of products in the Note regarding an exception to the requirement for a trial of an oral retinoid, methotrexate, or phototherapy.	09/05/2018
Annual Revision	• Initial Therapy • Removed the criteria: The patient has tried ONE oral retinoid (tretinoin capsules, isotretinoin capsules [Amnesteem®, Claravis™, generics], acitretin capsules [Soriatane®, generics]), methotrexate, or phototherapy. (NOTE: An exception to the requirement for a trial of an oral retinoid, methotrexate, or phototherapy can be made if the patient has already used one of the following: interferons, histone deacetylase [HDAC] inhibitors, extracorporeal photopheresis, Poteligeo® (mogamulizumab-kpkc injection). These patients are not required to "step back" and try an oral retinoid, methotrexate, or phototherapy). • Removed the criterion: The patient has a type of CTCL (e.g., folliculotropic disease, advanced disease) that according to the prescribing physician, requires treatment with oral bexarotene capsules. • With the removal of the above two criteria, the criteria for "Initial Therapy" and for "Patient is currently receiving bexarotene capsule (Targretin, generics) or has received bexarotene capsules in the past" are identical and therefore, the criteria will not distinguish between "Initial Therapy" and "Patient is currently receiving bexarotene capsule (Targretin, generics) or has received bexarotene capsules in the past" (i.e., there will only be one set of criteria).	09/25/2019
Annual Revision	No criteria changes.	09/30/2020

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Targretin (Topical) Prior Authorization Policy
- Targetin® (bexarotene gel 1% - Valeant)

REVIEW DATE: 09/30/2020

OVERVIEW

Targetin gel is indicated for the topical treatment of cutaneous lesions in patients with cutaneous T-cell lymphoma (Stage 1A and 1B) who have refractory or persistent disease after other therapies or who have not tolerated other therapies.[1] Targretin gel is contraindicated in pregnant patients and it should not be given to a pregnant patient or a patient who intends to become pregnant. If a patient becomes pregnant while using Targetin gel, it must be discontinued immediately.

Disease Overview

Cutaneous T-cell lymphoma is one of the most common forms of T-cell lymphoma.[2,3] The most common type of cutaneous T-cell lymphoma is mycosis fungoides, which accounts for approximately 50% of all cutaneous T-cell lymphomas.[2] Skin symptoms associated with mycosis fungoides include patches, plaques, or tumors and treatment is directed at the skin or the entire body (systemic).[2,3] Sézary syndrome is an advanced, variant form of mycosis fungoides and is characterized by the presence of lymphoma cells in the blood. Patients with Sézary syndrome will have extensive thin, red, itchy rashes usually covering over 80% of the body and treatment will generally include systemic therapies since the use of skin- directed therapies alone is typically inadequate. Skin-directed therapies are useful for patch and limited plaque disease. Systemic therapies are reserved for more advanced disease and initiation of systemic therapy is usually deferred until patients have not responded well to topical therapies.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on Primary Cutaneous Lymphomas (version .2020 – April 10, 2020) provide treatment recommendations for the different types of cutaneous T-cell lymphomas.[2] Targretin gel is listed as an option for skin-directed therapies (as initial therapy and for patients who have tried other skin-directed therapies).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Targretin gel. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Targretin gel as well as the monitoring required for adverse events and long-term efficacy, approval requires Targretin gel to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Targretin gel is recommended in those who meet the following criteria:

FDA-Approved Indications

~~52.~~49. **Cutaneous T-Cell Lymphoma – Cutaneous Manifestations.** Approve Targretin gel for 3 years if Targretin is prescribed by or in consultation with an oncologist or a dermatologist

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Targretin gel is not recommended in the following situations:

252. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Annual Revision	• Removed the criterion for Initial Therapy: The patient has tried a topical corticosteroid and topical imiquimod cream (Aldara®, generics; Zyclara®). (NOTE: An exception to the requirement for a trial of a topical corticosteroid and topical imiquimod cream can be made if the patient has already used one of the following: another skin-directed therapy, e.g., topical chemotherapy, topical	9/25/2019

	retinoids, local radiation, phototherapy [UVB, NB-UVB, PUVA], TSEBT; or a systemic therapy, e.g., oral retinoids, interferons, histone deacetylase [HDAC] inhibitors, extracorporeal photopheresis, methotrexate, systemic chemotherapeutic agents, Poteligeo® (mogamulizumab-kpkc injection). These patients are not required to "step back" and try a topical corticosteroid and topical imiquimod cream). • With the removal of the above criterion, the criterion for "Initial Therapy" and "Patient is currently receiving Targretin gel or has received Targretin gel in the past" are identical and therefore, the criterion will not distinguish between "Initial Therapy" and "Patient is currently receiving Targretin gel or has received Targretin gel in the past" (i.e., there will be one set of criterion).	
Annual Revision	No criteria changes.	09/30/2020

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Tasigna Prior Authorization Policy
- Tasigna® (nilotinib capsules – Novartis)

REVIEW DATE: 04/01/2020

OVERVIEW

Tasigna, a kinase inhibitor, is indicated for the treatment of adult and pediatric patients ≥1 year of age with newly diagnosed Philadelphia positive (Ph+) chronic myeloid leukemia (CML) in chronic phase (CP).[1] Tasigna is also indicated for the treatment of CP and accelerated phase (AP) Ph+ CML in adult patients resistant or intolerant to prior therapy that included imatinib. Tasigna is also indicated for use in pediatric patients ≥ 1 year of age with Ph+ CML-CP resistant or intolerant to prior TKI therapy.[1] Currently, there are four other tyrosine kinase inhibitors (TKIs) approved for the treatment of Ph+ CML: imatinib, Sprycel® (dasatinib tablets), Bosulif® (bosutinib tablets), and Iclusig® (ponatinib tablets).[2-5] These agents are indicated for the treatment of Ph+ CML in various phases; some TKIs are indicated after resistance or intolerance to prior therapy. Iclusig is approved for patients with T315I-positive CML and in adult patients with CML for whom no other TKI therapy is indicated.[5] Imatinib, Sprycel and Iclusig are also indicated for patients with Ph+ acute lymphoblastic leukemia (ALL).

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for CML (version 3.2020 – January 30, 2020) state that for patients with CP CML with a low-risk score, the primary treatment recommended includes a first-generation TKI (Gleevec or generic imatinib 400 mg QD [Category 1]), or a second-generation TKI (Bosulif 400 mg QD [Category 1], Sprycel 100 mg QD [Category 1], or Tasigna 300 mg BID [Category 1]).[6] For patients with CP CML with an intermediate- or high-risk score, a second-generation TKI is preferred (Bosulif 400 mg QD [Category 1], Sprycel 100 mg QD [Category 1], or Tasigna 300 mg BID [Category 1]). A first-generation TKI (Gleevec or generic imatinib 400 mg QD) is an alternative [Category 2A]. Iclusig is an option for patients with a T315I mutation and for with disease that has not responded to multiple TKIs or in whom another TKI is not indicated.[6]

NCCN guidelines for (ALL [adults and adolescent young adults] {version 1.2020 – January 15, 2020} and Pediatric ALL [pediatric and adolescent young adults] {version 2.2020 – November 25, 2019}recommend Tasigna for patients with in various induction regimens, as well as in relapsed or refractory ALL.[11,12] Tasigna is also recommended for patients with specific mutations and in certain maintenance regimens. Data are also available regarding use of Tasigna in ALL.[13-15]

The NCCN soft tissue sarcoma guidelines (version 6.2019 – February 10, 2020) indicate that Tasigna is a treatment option for patients with gastrointestinal stroma tumor (GIST) who have disease progression after imatinib, Stivarga® (regorafenib tablets), and Sutent® (sunitinib capsules).[7]

Other Uses with Supportive Evidence

Data are available regarding use of Tasigna in GIST. In one Phase III study (n = 248) Tasigna was compared with best supportive care (BSC) [BSC without TKI therapy; BSC plus imatinib; BSC plus Sutent) in patients with GIST resistant to or intolerant of imatinib and Sutent.[8] Median progression-free survival (PFS) was similar between arms (109 days with Tasigna vs. 111 days with BSC; P = 0.56). A trend in longer overall survival (OS) was noted with Tasigna vs. BSC (332 days vs. 280 days; P = 0.29). Tasigna also demonstrated modest activity in one Phase II study (n = 13) in patients with GIST previously treated with imatinib and Sutent.[9] In a randomized, open-label, multicenter, Phase III trial involving patients (aged ≥ 18 years) with histologically-confirmed unresectable or metastatic GIST (n = 647) showed that PFS was higher with imatinib overall compared with Tasigna and that Tasigna is not an ideal first-line treatment for GIST.[10]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Tasigna. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tasigna is recommended in those who meet the following criteria:

FDA-Approved Indications

484. **Chronic Myeloid Leukemia (CML) That is Philadelphia Chromosome Positive (Ph+).** Approve for 3 years.

Other Uses with Supportive Evidence

485. **Acute Lymphoblastic Leukemia (ALL) That is Philadelphia Chromosome Positive (Ph+).** Approve for 3 years if the patient has tried at least one other tyrosine kinase inhibitor that is used for Philadelphia chromosome positive ALL.
Note: Examples include Gleevec® (imatinib tablets) and Sprycel® (dasatinib tablets).

486. **Gastrointestinal Stromal Tumor (GIST).** Approve for 3 years if the patient meets the following criteria (A, B, and C):
F) Patient has tried Gleevec® (imatinib tablets); AND
G) Patient has tried Sutent® (sunitinib capsules); AND
H) Patient has tried Stivarga® (regorafenib tablets).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tasigna is not recommended in the following situations:

253. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	For the indication regarding ALL, changed the criteria from requiring two TKIs to one TKI that is used for Philadelphia chromosome positive ALL. Removed the criteria allowing for approval if the patient has been started on Tasigna for an indication or condition addressed as an approval in the Recommended Authorization section.	03/07/2018
Annual Revision	No criteria changes.	03/20/2019
Annual Revision	The following criteria changes were made: **1. Acute Lymphoblastic Leukemia that is Ph+:** The wording that the patient has tried one other tyrosine kinase inhibitor for acute lymphoblastic leukemia was changed to state "at least one" and examples of tyrosine kinase inhibitors were moved from the criteria to a note.	04/01/2020

ALL – Acute lymphoblastic leukemia; TKI(s) – Tyrosine kinase inhibitor(s).

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Tazverik Prior Authorization Policy

- Tazverik™ (tazemetostat tablets – Epizyme)

REVIEW DATE: 02/03/2021

OVERVIEW

Tazverik, an EZH2 inhibitor, is approved in the following conditions:[1]

- **Epithelioid sarcoma**, in patients ≥ 16 years of age with a metastatic or locally advanced disease not eligible for complete resection.
- **Follicular lymphoma**, in the following situations:
  - In adults with relapsed or refractory disease, whose tumors are positive for an EZH2 mutation as detected by an approved test and who have received at least two prior systemic therapies.
  - In adults with relapsed or refractory disease who have no satisfactory alternative treatment options.

These indications are approved under accelerated approval based on overall response rate and duration of response. Continued approval may be contingent upon verification and description of clinical benefit in confirmatory trial(s).

Guidelines

Tazverik is addressed in the following guidelines from the National Comprehensive Cancer Network (NCCN):

- **B-cell lymphomas:** Guidelines (version 1.2021 – January 20, 2021) recommend Tazverik be used according to the approved indication.[3] This includes use of Tazverik as a subsequent therapy for follicular lymphoma, in patients with EZH2 mutation positive disease after two prior therapies, or in relapsed or refractory disease with EZH2 wild type or unknown mutation status, in patients who have no satisfactory alternative treatment options.[3]
- **Soft Tissue Sarcoma:** Guidelines (version 1.2021 – October 30, 2020) have been updated to recommend Tazverik as a preferred therapy for treatment of metastatic or locally advanced epithelioid sarcoma not eligible for complete resection.[2] No other therapies are listed for this specific subtype of soft tissue sarcoma. Generally for soft tissue sarcomas, treatment recommendations are based on anatomic site of primary disease (e.g., extremities, trunk, visceral, retroperitoneum, or head and neck).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Tazverik. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tazverik is recommended in those who meet the following criteria:

FDA-Approved Indications

141. Epithelioid Sarcoma. Approve for 3 years if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 16 years of age; AND
- **B)** Patient has metastatic or locally advanced disease; AND
- **C)** Patient is not eligible for complete resection.

142. Follicular Lymphoma. Approve for 3 years if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has relapsed or refractory disease; AND
- **C)** Patient meets ONE of the following (i or ii):
  - **i.** Both of the following apply (a and b):
    - **a)** Tumor is positive for an EZH2 mutation; AND
    - **b)** Patient has tried at least two prior systemic therapies; OR
  - **ii.** According to the prescriber, there are no appropriate alternative therapies.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tazverik is not recommended in the following situations:

154. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Temozolomide Prior Authorization Policy

- Temozolomide capsules (Temodar® – Merck & Co, generic)

REVIEW DATE: 08/12/2020

OVERVIEW

Temozolomide, an alkylating agent, is indicated in adults for the following uses:[1]

- **Anaplastic astrocytoma**, that is refractory, in patients who have experienced disease progression on a drug regimen containing nitrosourea (i.e., BiCNU® [carmustine {BCNU} for injection] or lomustine [CCNU] capsules) and Matulane® (procarbazine capsules).
- **Glioblastoma**, newly diagnosed, concomitantly used with radiotherapy and then as maintenance therapy.

Guidelines

- **Anaplastic Astrocytoma, Glioblastoma, and Other Central Nervous System (CNS) Tumors:** The National Comprehensive Cancer Network (NCCN) CNS cancers clinical practice guidelines (version 2.2020 – April 30, 2020) note temozolomide as a treatment option for the treatment of glioblastoma and anaplastic astrocytoma.[2] Temozolomide is listed for use as monotherapy or as adjuvant therapy (i.e., to be used concurrently with radiation or other chemotherapeutic agents). The guidelines note temozolomide as an option for a myriad of CNS cancers, including anaplastic gliomas (includes mixed anaplastic oligoastrocytoma, anaplastic oligodendroglioma, and other rare anaplastic glioma); intracranial or spinal ependymoma; gliosarcoma; primary CNS lymphoma; low-grade glioma/pilocytic and infiltrative supratentorial astrocytoma/oligodendroglioma; medulloblastoma (as recurrence therapy in patients who have tried other chemotherapeutic agents); and brain metastases from solid tumors (in patients for whom radiation therapy is not an option and who have tried other chemotherapeutic drugs that penetrate the CNS).
- **Ewing's sarcoma or mesenchymal chondrosarcoma:** The NCCN bone cancer guidelines (version 1.2020 – August 12, 2019) note temozolomide as a treatment option in patients with relapsed, refractory, or metastatic disease.[3]
- **Melanoma:** The NCCN cutaneous melanoma guidelines (version 3.2020 – May 18, 2020) note temozolomide as a treatment option in patients with metastatic melanoma.[4]
- **Neuroendocrine tumors**: The NCCN guidelines (version 2.2020 – July 24, 2020) recommends use of temozolomide for neuroendocrine tumors of the gastrointestinal tract, lung or thymus

(carcinoid tumors), pancreas, pheochromocytomas/paragangliomas, and poorly differentiated carcinomas/large or small cell.[5]

- **Mycosis fungoides (MF)/Sezary Syndrome:** The NCCN primary cutaneous lymphomas guidelines (version 2.2020 – April 10, 2020) note temozolomide as a treatment option for this condition in patients who have tried other chemotherapeutic agents; and for primary cutaneous anaplastic large cell lymphoma with multifocal lesions or regional nodes (in patients with CNS involvement).[6,7]
- **Small cell lung cancer:** The NCCN small cell lung cancer guidelines (version 1.2021 – August 4, 2020) note temozolomide as one of the subsequent therapy options for patients with relapsed disease ≤ 6 months.[8] It may be useful in patients with brain metastases.
- **Soft tissue sarcomas:** The NCCN soft tissue sarcoma guidelines (version 2.2020 – May 28, 2020) note temozolomide as a treatment option for angiosarcoma, rhabdomyosarcoma, solitary fibrous tumor; soft tissue sarcomas (in patients with advanced, unresectable, or metastatic disease who have tried other chemotherapeutic agents).[9]
- **Uterine sarcoma:** The NCCN uterine neoplasms guidelines (version 2.2020 – July 24, 2020) note temozolomide as a treatment option for patients with metastatic, recurrent, or medically inoperable uterine sarcoma.[10]
- **Uveal melanoma:** The NCCN uveal melanoma guidelines (version 1.2020 – May 21, 2020) note temozolomide as a treatment option for patients with metastatic or unresectable uveal melanoma.[11]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of temozolomide capsules. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of temozolomide capsules is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Anaplastic Astrocytoma.** Approve for 3 years.

2. **Glioblastoma multiforme (GBM, Glioblastoma, Grade IV Astrocytoma).** Approve for 3 years.

Other Uses with Supportive Evidence

3. **Anaplastic Gliomas (Includes Mixed Anaplastic Oligoastrocytoma, Anaplastic Oligodendroglioma, and Other Rare Anaplastic Gliomas).** Approve for 3 years.

4. **Angiosarcoma.** Approve for 3 years.

5. **Brain Metastases from Solid Tumors.** Approve for 3 years if the patient meets the following criteria (A and B):
   - **A)** Radiation therapy is not an option; AND
   - **B)** At least one chemotherapy drug that penetrates the central nervous system has already been tried.
     Note: Examples of chemotherapy are cyclophosphamide/methotrexate/fluorouracil for breast cancer, carboplatin and etoposide for non-small cell lung cancer.

6. **Ependymoma, Intracranial or Spinal.** Approve for 3 years.

7. **Ewing's Sarcoma or Mesenchymal Chondrosarcoma.** Approve for 3 years in patients with relapsed, refractory or metastatic disease.

8. **Gliosarcoma.** Approve for 3 years.

9. **Low-Grade (WHO Grade I or II) Glioma/ Pilocytic and Infiltrative Supratentorial Astrocytoma/Oligodendroglioma in Adults.** Approve for 3 years.

10. **Medulloblastoma.** Approve for 3 years for recurrence therapy in patients who have received prior chemotherapy.

11. **Melanoma.** Approve for 3 years if the patient has metastatic melanoma.

12. **Mycosis Fungoides/Sézary Syndrome.** Approve for 3 years in patients who have received one prior therapy.

13. **Neuroendocrine Tumors of the Gastrointestinal Tract, Lung or Thymus (Carcinoid Tumors).** Approve for 3 years.

14. **Neuroendocrine Tumors of the Pancreas (Islet Cell Tumors), Pancreatic Neuroendocrine Tumors.** Approve for 3 years.

15. **Neuroendocrine Carcinoma – Poorly Differentiated, Large or Small Cell (Other than Lung), Unknown Primary.** Approve for 3 years.

16. **Pheochromocytoma or Paragangliomas.** Approve for 3 years in patients with metastases.

17. **Primary Central Nervous System Lymphoma.** Approve for 3 years.

18. **Primary Cutaneous Anaplastic Large Cell Lymphoma** Approve for 3 years in patients with relapsed/refractory disease with central nervous system involvement.

19. **Rhabdomyosarcoma.** Approve for 3 years.

20. **Small Cell Lung Cancer.** Approve for 3 years if the patient has tried one chemotherapy regimen.

21. **Soft Tissue Sarcomas.** Approve for 3 years in patients with advanced, unresectable, or metastatic disease.

22. **Solitary Fibrous Tumor.** Approve for 3 years.

23. **Uterine Sarcomas**. Approve for 3 years in patients with metastatic, recurrent or medically inoperable disease.

24. **Uveal Melanoma.** Approve for 3 years for metastatic or unresectable disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of temozolomide capsules is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes*	Review Date
Annual revision	Added new approval conditions for Uveal Melanoma and Neuroendocrine Carcinomas – Poorly Differentiated, Large or Small cell (Other than Lung), Unknown Primary. Deleted the following approval conditions from Other Uses with Supportive Evidence section: Patient has been started on temozolomide and Dermatofibrosarcoma Protuberans (DFSP). Also deleted "Supratentorial Primitive Neuroectodermal Tumor" from Medulloblastoma approval condition.	06/27/2018
Annual revision	Revisions: • **Low-Grade (WHO Grade I or II) Glioma/ Pilocytic and Infiltrative Supratentorial Astrocytoma/Oligodendroglioma in Adults:** The condition of approval was changed to as listed to address pilocytic astrocytoma. Previously, it was listed as Low-Grade Infiltrative Supratentorial Astrocytoma/Oligodendroglioma (excluding pilocytic astrocytoma) in Adults • **Mycosis Fungoides/ Sezary Syndrome:** Criteria were revised to require one prior therapy and examples were removed. Previously, one prior chemotherapy was required and several examples were listed. • **Neuroendocrine Tumors of the Gastrointestinal Tract, Lung or Thymus (Carcinoid Tumors):** This condition of approval was changed to as listed. Previously, it was listed as Neuroendocrine Tumors of the Lung or Thymus (carcinoid tumors). • **Small Cell Lung Cancer:** The list of chemotherapy examples was removed. • **Soft Tissue Sarcomas:** This condition of approval was changed to as listed. Previously, it was listed as Soft Tissue Sarcomas of the Extremities, Superficial Trunk, Head/Neck, or Retroperitoneal/Intra-Abdominal Soft Tissue Sarcomas. The requirement of a trial of one other chemotherapy (single or combination) was removed as it is no longer supported in the National Cancer Center Network (NCCN) guidelines.	07/17/2019

	• **Uterine Sarcomas:** The condition of approval was changed to as listed. Previously, it was listed as Uterine Sarcoma (i.e., High-Grade Endometrial Stromal Sarcoma, Undifferentiated Uterine Sarcoma, Uterine Leiomyosarcoma). • **Primary Cutaneous Large Cell Lymphoma:** The new condition of approval was added. Criteria are to approve for 3 years in patients with relapsed/refractory disease with central nervous system involvement.	
Annual revision	• **Brain Metastases from Solid Tumors**: Instead of "Other chemotherapy drug", rephrased it to say "At least one chemotherapy drug". • **Small Cell Lung Cancer:** Deleted criteria "Patient has metastases to the brain" since it is not part of the guidelines. • **Solitary Fibrous Tumor:** Deleted "Hemangiopericytoma" from indication since it was removed in the guidelines.	08/12/2020

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Tepmetko Prior Authorization Policy
- Tepmetko® (tepotinib tablets – EMD Serono)

REVIEW DATE: 02/08/2021

OVERVIEW
Tepmetko, a kinase inhibitor, is indicated for the treatment of adult patients with **metastatic non-small cell lung cancer (NSCLC)** harboring mesenchymal-epithelial transition **(*MET*) exon 14 skipping alterations**.[1] This indication is approved under accelerated approval based on overall response rate and duration of response. Continued approval for this indication may be contingent upon verification and description of clinical benefit in confirmatory trials.

Guidelines
Tepmetko is not addressed in the guidelines. The National Comprehensive Cancer Network (NCCN) non-small cell lung cancer guidelines (version 2.2021 – December 15, 2020) recommend Tabrecta™ (capmatinib tablets) as the "preferred" first-line therapy (category 2A) in patients with *MET* exon 14 skipping mutation discovered prior to first-line systemic therapy. Xalkori® (crizotinib capsules) is recommended (category 2A) as "useful in certain circumstances" in this setting. In patients with *MET* exon 14 skipping mutation discovered during first-line systemic therapy, Tabrecta or Xalkori are recommended (both category 2A) after completion of planned systemic therapy or systemic therapy can be interrupted followed by either one of these targeted therapies.

POLICY STATEMENT
Prior Authorization is recommended for prescription benefit coverage of Tepmetko. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Tepmetko is recommended in those who meet the following criteria:

FDA-Approved Indications

490. **Non-Small Cell Lung Cancer (NSCLC).** Approve for 3 years if the patient meets the following criteria (A, B, and C):
   A) Patient is ≥ 18 years of age; AND
   B) Patient has metastatic disease; AND
   C) The tumor is positive for mesenchymal-epithelial transition (*MET*) exon 14 skipping alterations.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Coverage of Tepmetko is not recommended in the following situations:

8. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Type of Revision	Summary of Changes	Review Date
New Policy	--	02/08/2021

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Thalomid Prior Authorization Policy
- Thalomid® (thalidomide capsules – Celgene)

REVIEW DATE: 04/01/2020

OVERVIEW
Thalomid is indicated for use in combination with dexamethasone for the treatment of patients with newly diagnosed multiple myeloma.[1] It is also indicated for the acute treatment of the cutaneous manifestations of moderate to severe erythema nodosum leprosum (ENL). It is not indicated as monotherapy for such ENL treatment in the presence of moderate to severe neuritis. Thalomid is also indicated as maintenance therapy for prevention and suppression of the cutaneous manifestations of ENL recurrence.

Guidelines
The National Comprehensive Cancer Network (NCCN) guidelines for multiple myeloma (version 3.2020 – March 10, 2020) recommend use of Thalomid in various scenarios.[2] It is considered useful in certain circumstances among patients with previously treated multiple myeloma, as well as for primary therapy for transplant candidates.

The National Comprehensive Cancer Network (NCCN) has guidelines regarding myeloproliferative neoplasms (version 3.2019 – September 4, 2019) that discuss myelofibrosis.[3] Thalomid is recommended in the management of anemia associated with myelofibrosis, with or without prednisone, for patients with erythropoietin levels ≥ 500 mU/mL.

The NCCN guidelines for acquired immune deficiency syndrome (AIDS)-Related Kaposi Sarcoma (version 1.2020 – February 12, 2020) recommended Thalomid as an agent useful under certain conditions for

subsequent systemic therapy options for relapsed/refractory therapy.[4] First-line systemic therapy options include liposomal doxorubicin (preferred), and paclitaxel. Other subsequent systemic therapy options for relapsed/refractory therapy are also cited (e.g., Pomalyst® [pomalidomide capsules] {preferred}, Revlimid® [lenalidomide], imatinib).

The National Comprehensive Cancer Network (NCCN) guidelines for B-Cell Lymphomas (version 1.2020 – January 22, 2020) recommend use of Thalomid, with or without rituximab, for patients with Castleman's disease who have relapsed/refractory or progressive disease.[5] Thalomid is cited as an other recommended therapy (when given with cyclophosphamide and prednisone) for hyaline vascular histology for patients with multicentric Castleman's disease who are negative for the human immunodeficiency virus (HIV) and human herpesvirus-8 (HHV-8).

Other Uses with Supportive Evidence

Some data support the use of Thalomid for ENL, although the condition is not common and data are limited.[6,7] Data indicates that Thalomid does successfully and quickly improve the cutaneous manifestations of ENL and in some patients the steroid requirement was reduced.

Thalomid has been used for discoid lupus erythematosus and cutaneous lupus erythematosus. Patients usually had refractory disease after trial of other therapies and good responses were achieved for many patients given Thalomid.[8-17] A retrospective medical review was done and involved 29 patients with refractory cutaneous manifestations of cutaneous lupus erythematosus who received Thalomid. Of the 23 patients who took Thalomid for 1 month, 74% of patients (n = 17/23) had complete resolution of the cutaneous manifestations and 13% of patients (n = 3/23) had a 75% or greater partial improvement.[11] Another report involving patients with discoid lupus (n = 18), subacute cutaneous lupus (n = 6), and systemic lupus erythematosus with skin involvement (n = 24) who had been resistant to at least two other treatments found a response rate of 81% (n = 39/48) with use of Thalomid with 60% of patients (n = 29/48) achieving a complete cutaneous remission.[12] Other therapies used for these conditions include antimalarial agents (e.g. hydroxychloroquine), corticosteroids (oral, topical, intralesional), methotrexate, azathioprine, cyclosporine, dapsone, mycophenolate mofetil, topical calcineurin inhibitors (e.g., Elidel, Protopic) and Soriatane.[10,15]

Thalomid has been studied in patients with prurigo nodularis, most of whom were refractory to other treatments or with adverse events (AEs) from the other therapies.[8,18,19] A retrospective review assessed the medical records of 42 patients with prurigo nodularis who were refractory to other therapy and who received Thalomid.[18] Patients received Thalomid for an average of 105 weeks. Previous therapies tried included topical steroids, intralesional steroids, systemic steroids, topical tar, macrolides, cyclosporine, azathioprine, methotrexate, calcineurnin inhibitors, antihistamines, dapsone, capsaicin, laser therapy, PUVA, UVB, retinoids, hydroxyzine, and macrolides. With Thalomid, improvement was noted in approximately one-third of patients.

Recurrent aphthous ulcers and recurrent aphthous stomatitis are associated with frequent and recurring symptoms that are painful and can lead to difficulty in speaking, eating, and swallowing.[20-23] Ulcers are larger and may persist for weeks to months. The conditions are noted in certain disease states such as in patients who are human immunodeficiency virus (HIV)-positive and Bechet's disease. In general, few adequately powered trials have assessed the efficacy of therapeutic agents for aphthous ulcers or aphthous stomatitis.[20] Although the data are older and limited, Thalomid has led to rapid resolution of symptoms in patients with recurrent aphthous ulcers or aphthous stomatitis.[24-29] A double-blind, randomized, placebo-controlled study assessed Thalomid as a therapy for oral aphthous ulcers in patients infected with HIV. In total, 55% of patients (n = 16/29) given Thalomid had complete healing of their aphthous ulcers after 4 weeks compared with only 7% of patients (n = 2/28) who received placebo. Patients given Thalomid had symptom improvements in regards to discomfort that occurred while eating.[25] A retrospective cohort study

involving patients with recurrent aphthous stomatitis found that Thalomid was rapidly effective as 85% of patients (n = 78/92) achieved a complete remission of the condition within 14 days.[29] Many other agents have been used for recurrent aphthous ulcers or stomatitis including topical or intralesional corticosteroids, systemic corticosteroids, topical anesthetics/analgesics (lidocaine 2% viscous solution, benzocaine lozenges), antimicrobial mouth washes (tetracycline, chlorhexidine), topical sucralfate, acyclovir, pentoxifylline, dapsone, colchicine, and azathioprine.[20-23] Due to toxicities, use of Thalomid is generally reserved for patients who have not obtained satisfactory results with other agents.[30,31]

Safety

Thalomid has a Boxed Warning regarding embryofetal toxicity and venous thromboembolism. The safety and effectiveness in pediatric patients < 12 years of age have not been established. Thalomid is available only through the THALOMID Risk Evaluation Mitigation Strategy (REMS™) program. Males and females must follow the required reproductive precautions.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Thalomid. All approvals are provided for 3 years in duration.

Automation: None.

Recommended Authorization Criteria

Coverage of Thalomid is recommended in those who meet the following criteria:

FDA-Approved Indications

2. **Erythema Nodosum Leprosum (ENL).** Approve for 3 years.

3. **Multiple Myeloma.** Approve for 3 years.

Other Uses with Supportive Evidence

3. **Acquired Immune Deficiency Syndrome (AIDS)-Related Kaposi's Sarcoma.** Approve for 3 years if the patient meets the following (A and B):
   - **A)** The patient has tried at least one regimen or therapy; AND
     Note: Examples include liposomal doxorubicin, paclitaxel, Pomalyst® (pomalidomide capsules), Revlimid® [lenalidomide], and imatinib.
   - **B)** The patient has relapsed or refractory disease.

4. **Castleman's Disease.** Approve for 3 years if the patient meets one of the following (A or B):
   - **A)** The patient has relapsed/refractory or progressive disease; OR
   - **B)** The patient meets all of the following (i, ii, and iii):
     - **i.** The patient has multicentric Castleman's disease; AND
     - **ii.** The patient is negative for the human immunodeficiency virus (HIV) and human herpesvirus-8 (HHV-8); AND
     - **iii.** The patient has hyaline vascular histology.

5. **Discoid Lupus Erythematosus or Cutaneous Lupus Erythematosus.** Approve for 3 years if the patient has tried at least two other therapies.

Note: Examples of therapies include corticosteroids (oral, topical, intralesional), antimalarial agents (e.g., hydroxychloroquine), topical calcineurin inhibitors (e.g., Protopic® [tacrolimus ointment], Elidel® [pimecrolimus cream]), azathioprine, cyclosporine, mycophenolate mofetil, methotrexate, dapsone, and Soriatane® (acitretin capsules).

6. **Myelofibrosis.** Approve for 3 years if the patient meets the following criteria (A and B):
   A) According to the prescriber the patient has anemia; AND
   B) The patient has serum erythropoietin levels ≥ 500 mU/mL.

7. **Prurigo Nodularis.** Approve for 3 years if the patient has tried at least two other therapies.
   Note: Examples of therapies include topical steroids, intralesional steroids, systemic steroids, topical tar, cyclosporine, macrolides, azathioprine, methotrexate, topical calcineurin inhibitors (Elidel, Protopic), retinoids, antihistamines, hydroxyzine, dapsone, capsaicin, psoralen plus ultraviolet A (PUVA) therapy, and ultraviolet B (UVB) therapy.

8. **Recurrent Aphthous Ulcers or Aphthous Stomatitis.** Approve for 3 years if the patient has tried at least two other therapies.
   Note: Examples include topical or intralesional corticosteroids, systemic corticosteroids, topical anesthetics/analgesics (e.g., lidocaine 2% viscous solution, benzocaine lozenges), antimicrobial mouthwashes (e.g., tetracycline, chlorhexidine), topical sucralfate, acyclovir, pentoxifylline, dapsone, colchicine, and azathioprine.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Thalomid has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

254. Cancer Cachexia. Several small studies are available that have investigated Thalomid in the management of cancer cachexia related to various cancers.[32-36] A single center double-blind, controlled trial randomized patients with pancreatic cancer who had lost at least 10% of their body weight to receive Thalomid or placebo for 24 weeks (n = 50).[33] Of the 33 patients evaluable at 4 weeks, patients given Thalomid had gained an average of 0.37 kg compared with a loss of 2.21 kg in the patients given placebo.[33] A published review of data regarding use of Thalomid for the management of cancer cachexia concluded that there is inadequate evidence to recommend Thalomid in clinical practice.[36]

255. Crohn's Disease. Several publications report use of Thalomid in patients with Crohn's disease.[37-53] Thalomid was used as an adjunctive therapy, or in those refractory to other therapy, and usually involved children. The data were not of high quality and primarily consisted of open-label designs or retrospective reviews, without a placebo control, and involved very few patients.[37-53] Guidelines from the American College of Gastroenterology (2018) for the management of Crohn's disease in adults do not mention Thalomid as a therapeutic alternative.[48] Although some improvements were noted in published data with Thalomid, more definite data from randomized, controlled trials are required before this is a recommended therapy.[48] Consensus guidelines of the European Crohn's and Colitis Organization (ECCO) and the European society of Pediatric Gastroenterology, Hepatology and Nutrition (ESOGGAN) [2014] state that even though some data are available that suggest efficacy of Thalomid in refractory pediatric Crohn's disease, there are insufficient data to recommended Thalomid therapy at this juncture.[53] Many other therapies are available for the management of Crohn's disease.

256. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes*	Review Date
Annual Revision	No criteria changes.	03/07/2018
Annual Revision	Added approval for patients with acquired immune deficiency syndrome (AIDS)-Related Kaposi's Sarcoma for 3 years if the patient has tried one regimen therapy (e.g., liposomal doxorubicin, paclitaxel, Pomalyst® [pomalidomide capsules], imatinib) and the patient has relapsed or refractory disease. Added criteria to approve for Castleman's disease in patients with relapsed/refractory or progressive disease.	03/20/2019
Annual Revision	The following changes were made: **1. Acquired Immune Deficiency Syndrome-Related Kaposi's Sarcoma:** The requirement that the patient has tried one regimen or therapy was changed to state "at least" and the examples of agents were moved to a note, with Revlimid added. **2. Castleman's Disease:** Criteria were added to approve for 3 years if the patient has multicentric Castleman's disease, is negative for the human immunodeficiency virus and human herpesvirus-8, and has hyaline vascular histology. The previous criteria that allowed approvals if the patients had relapsed/refractory or progressive disease remains.	04/01/2020

	3. **Discoid Lupus Erythematosus or Cutaneous Lupus Erythematosus:** The requirement that the patient has two other therapies was changed to state "at least" and the examples of agents were moved to a note. 4. **Myelofibrosis:** Criteria were revised to include that according to the prescriber the patient has anemia and that serum erythopoetin levels are ≥ 500 mU/mL. With the addition of this criteria, the requirement that the patient has tried one other therapy was removed. 5. **Prurigo Nodularis:** The requirement that the patient has two other therapies was changed to state "at least" and the examples of agents were moved to a note. 6. **Recurrent Aphthous Ulcers or Aphthous Stomatitis:** The requirement that the patient has two other therapies was changed to state "at least" and the examples of agents were moved to a note. 7. **Systemic Light Chain Amyloidosis:** The criteria to approve for this condition was removed. It is not recommended in NCCN guidelines. 8. **Waldenstrom's Macroglobulinemia/Lymphoplastmacytic Lymphoma:** The criteria to approve for this condition was removed. It is not recommended in NCCN guidelines. 9. **Conditions Not Recommended for Approval:** The following indications were removed from the policy: breast cancer; glioblastoma multiforme; hepatocellular carcinoma; metastatic renal cell carcinoma; and myelodysplastic syndromes. NCCN guidelines do not recommend use of these therapies and there is a lack of recent literature recommending use of these agents.	

AIDS – Acquired immune deficiency syndrome; NCCN – National Comprehensive Cancer Network.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Tibsovo Prior Authorization Policy
- Tibsovo® (ivosidenib tablets – Agios)

REVIEW DATE: 02/10/2021

OVERVIEW

Tibsovo, an isocitrate dehydrogenase-1 (IDH1) inhibitor, is indicated for the following uses in patients with a susceptible IDH1 mutation as detected by an FDA-approved test:[1]

- **Acute myeloid leukemia (AML), treatment in adults with newly diagnosed disease** who are ≥ 75 years of age who have comorbidities that preclude use of intensive induction chemotherapy.
- **Acute myeloid leukemia in adults with relapsed or refractory disease**.

Data are available regarding use of Tibsovo in patients with IDH1-mutatant chemotherapy-refractory cholangiosarcinoma[2] and chondrosarcoma[3].

Disease Overview

AML is a heterogeneous hematologic malignancy hallmarked by clonal expansion of myeloid blasts in the peripheral blood, bone marrow, and/or other tissues.[4] Undifferentiated blast cells proliferate in bone marrow instead of maturing into normal blood cells. Among adults, it is the most common form of acute leukemia and accounts for the largest number of annual deaths from leukemias in the US. An estimated 21,450 individuals will be diagnosed with AML in 2019 and 10,920 are projected to die from the condition. The median age at diagnosis is 67 years. Diagnosis occurs at ≥ 65 years of age for 54% of patients with around one-third of patients diagnosed at ≥ 75 years of age. The incidence of AML increases as the population ages. Environmental factors such as prolonged exposure to petrochemicals, solvents such as benzene, pesticides, and ionizing radiation have been established to increase the risks for AML, as well as myelodysplastic syndrome (MDS).[4] The cure rates of AML have improved with this outcome noted in 35% to 40% of adult patients who are ≤ 60 years of age and 5% to 15% for patients who are > 60 years of age.[5] However, among patients who are older and unable to receive intensive chemotherapy the survival

rates are dismal with a median survival of only 5 to 10 months.[5] Various gene mutations are present in adults with AML.[4,5] The incidence of IDH1 mutations have been reported in 6% to 9% of AML cases.[6]

Guidelines

Various guidelines by the National Comprehensive Cancer Network (NCCN) address Tibsovo.[2]

- **Acute Myeloid Leukemia:** NCCN guidelines for AML (version 2.2021 – November 12, 2020) cite Tibsovo as a preferred therapy for treatment induction for patients with the IDH1 mutation, as well as in the setting of relapsed or refractory disease (category 2A).[4]
- **Cholangiosarcinoma:** NCCN guidelines for hepatobiliary cancers (version 5.2020 – August 4, 2020) cite Tibsovo useful in certain circumstances for patients with cholangiocarcinoma with IDH1 mutations.[7]
- **Chondrosarcoma:** The NCCN guidelines for bone cancer (version 1.2021 – November 20, 2020) cite Tibsovo for conventional (grades 1 to 3) and dedifferentiated chondrosarcoma in patients with susceptible IDH1 mutations.[8]

Safety

Tibsovo has a Boxed Warning regarding differentiation syndrome.[1] Warnings and Precautions include QTc interval prolongation and Guillain-Barre Syndrome.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Tibsovo. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tibsovo is recommended in those who meet the following criteria:

FDA-Approved Indication

~~53.~~50. **Acute Myeloid Leukemia (AML).** Approve for 3 years if the patient meets the following criteria (A and B):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Disease is isocitrate dehydrogenase-1 (IDH1) mutation positive as detected by an approved test.

Other Uses with Supportive Evidence

~~54.~~51. **Cholangiocarcinoma.** Approve for 3 years if the patient meets both of the following (A, B and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Disease is isocitrate dehydrogenase-1 (IDH1) mutation positive; AND
- **C)** Patient has been previously treated with at least one chemotherapy regimen.
  Note: Examples are gemcitabine plus cisplatin; 5-fluorouracil plus oxaliplatin or cisplatin; capecitabine + oxaliplatin or cisplatin; gemcitabine + Abraxane® (paclitaxel protein-bound particles for injectable suspension) or capecitabine or oxaliplatin; and FOLFOX (5-fluorouracil, leucovorin, and oxaliplatin).

~~55.~~52. **Chondrosarcoma.** Approve for 3 years if the disease is isocitrate dehydrogenase-1 (IDH1) mutation positive.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Tibsovo is not recommended in the following situations:

257. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

IDH1 – Isocitrate dehydrogenase-1.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Tukysa™ (tucatinib tablets – Seattle Genetics, Inc.)

DATE REVIEWED: 04/22/2020

OVERVIEW

Tukysa is indicated in combination with trastuzumab and capecitabine for the treatment of adult patients with advanced unresectable or metastatic human epidermal growth factor receptor 2 (HER2)-positive breast cancer, including patients with brain metastases, who have received one or more prior anti-HER2-based regimens in the metastatic setting.[1]

Guidelines

Tukysa is not addressed in the guidelines. According to the National Comprehensive Cancer Network (NCCN) breast cancer guidelines (version 3.2020 – March 6, 2020), Enhertu is a recommended therapy, as per its FDA-approved indication after two or more prior HER2-targeted therapies, for the treatment of recurrent or Stage IV metastatic disease that is HER2-positive.[2] Trastuzumab + Perjeta + docetaxel is category 1, preferred regimen; or trastuzumab + Perjeta + paclitaxel (category 2A, preferred). Other recommended regimens include: Kadcyla; trastuzumab + vinorelbine, trastuzumab + capecitabine, Tykerb (lapatinib tablets) + capecitabine, and trastuzumab + Tykerb. For HR+, HER2-positive disease, endocrine therapy options include aromatase inhibitor ± trastuzumab; aromatase inhibitor + trastuzumab ± Tykerb; fulvestrant ± trastuzamab, tamoxifen ± trastuzumab (all category 2A). For premenopausal patients, ovarian ablation or suppression is recommended in addition to endocrine therapy ± trastuzumab.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Tukysa. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Tukysa is recommended in those who meet the following criteria:

FDA-Approved Indications

491. **Breast Cancer.** Approve for 3 years if the patient meets ALL of the criteria (A, B, and C):
   - **A)** The patient has advanced unresectable or metastatic human epidermal growth factor receptor 2 (HER2)-positive disease; AND
   - **B)** The patient has received at least one prior anti-HER2-based regimen in the metastatic setting.
     Note: Examples of anti-HER2-based regimens include Perjeta (pertuzumab injection for intravenous use) + trastuzumab + docetaxel, Perjeta + trastuzumab + paclitaxel; Kadcyla (ado-trastuzumab emtansine for intravenous use), trastuzumab + capecitabine, trastuzumab + Tykerb (lapatinib tablets); AND
   - **C)** The medication is used in combination with trastuzumab and capecitabine.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Tukysa has not been shown to be effective or there are limited or preliminary data that are not supportive of general approval for the following conditions.

9. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Turalio Prior Authorization Policy
- Turalio® (pexidartinib capsules – Daiichi Sankyo)

REVIEW DATE: 07/29/2020

OVERVIEW

Turalio, a kinase inhibitor, is indicated for the treatment of adult patients with symptomatic tenosynovial giant cell tumor (TGCT) associated with severe morbidity or functional limitations and not amenable to improvement with surgery.[1] Turalio targets the colony stimulating factor 1 (CSF1) receptor ; it also inhibits KIT proto-oncogene receptor tyrosine kinase ,as well as FMS-like tyrosine kinase 3 with an internal tandem duplication mutation. Due to the risk of hepatotoxicity, Turalio is only available through a restricted Risk Evaluation and Mitigation Strategy (REMS) program.

Disease Overview

TGCTs are rare, benign tumors of the synovium (joint lining), bursae, and tendon sheath.[2] Tumors cause thickening and overgrowth of the affected tissues, leading to pain, swelling, and reduced mobility. Disease is caused by a chromosomal translocation resulting in CSF1 overexpression, leading to macrophage recruitment and inflammation. The exact incidence is unknown but is estimated at approximately 43 cases per 1 million in the general population, of which approximately 10% are the diffuse subtype (also known as pigmented villonodular synovitis).[2,3] Diffuse TGCTs have a high recurrence rate after surgery of up to 50%, often with multiple recurrences.[4] Untreated or recurrent disease can lead to damage and degeneration of the affected joint. Disease typically affects a single joint, most commonly the knee or hip.

Guidelines

According to the National Comprehensive Cancer Network (NCCN) guidelines for soft tissue sarcoma (version 2.2020 – May 28, 2020), Turalio (category 1) and imatinib (category 2A) are preferred regimens for systemic therapy in TGCT.[5]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Turalio. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Turalio is recommended in those who meet the following criteria:

FDA-Approved Indications

1) **Tenosynovial Giant Cell Tumor (Pigmented Villonodular Synovitis).** Approve for 3 years if, according to the prescriber, the tumor is not amenable to improvement with surgery.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Turalio is not recommended in the following situations:

258. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Ukoniq Prior Authorization Policy
- Ukoniq™ (umbralisib tablets – TG Therapeutics)

REVIEW DATE: 02/10/2021

OVERVIEW
Ukoniq, a phosphoinositide 3-kinase delta (PI3Kδ) and casein kinase (CK1ε) inhibitor, is indicated for the following uses:[1]
- **Follicular lymphoma**, in adults with relapsed or refractory disease who have received at least three prior lines of systemic therapy.
- **Marginal zone lymphoma**, in adults with relapsed or refractory disease who have received at least one prior anti-CD20-based regimen.

Both indications have been approved under accelerated approval based on overall response rate. Continued approval for these indications may be contingent upon verification and description of clinical benefit in a confirmatory trial(s).

Guidelines
Ukoniq is not addressed in the National Comprehensive Cancer Network treatment guidelines.

POLICY STATEMENT
Prior Authorization is recommended for prescription benefit coverage of Ukoniq. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Ukoniq is recommended in those who meet the following criteria:

FDA-Approved Indications

143. Follicular Lymphoma. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has received at least three prior lines of systemic therapy.
  Note: Examples of systemic therapy include bendamustine + rituximab, CHOP (cyclophosphamide, doxorubicin, vincristine, prednisone), CVP (cyclophosphamide, vincristine, prednisone), and Revlimid® (lenalidomide capsule) + rituximab.

144. Marginal Zone Lymphoma. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has received at least one prior anti-CD20-based regimen.
  Note: Examples of anti-CD20-based therapy includes rituximab, rituximab + Revlimid® (lenalidomide capsule), and Gazyva® (obinutuzumab injection for intravenous use) + bendamustine.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Ukoniq is not recommended in the following situations:

155. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Valchlor Prior Authorization Policy

- Valchlor® (mechlorethamine gel for topical use – Helsinn Therapeutics)

REVIEW DATE: 10/28/2020

OVERVIEW

Valchlor, a nitrogen mustard, is indicated for the topical treatment of stage IA and IB **mycosis fungoides-type cutaneous T-cell lymphoma** in patients who have received prior skin-directed therapy.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for **primary cutaneous lymphomas** (version 1.2021 – October 12, 2020) recommend Valchlor for the topical treatment of primary cutaneous B-cell lymphoma, mycosis fungoides/Sezary syndrome, and primary cutaneous CD30+ T-cell lymphoproliferative disorders.[2,3]

The NCCN guidelines for **T-cell lymphomas** (version 1.2021 – October 5, 2020) recommends Valchlor for the topical treatment of adult T-cell leukemia/lymphoma – chronic/smoldering subtype.[2,4]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Valchlor. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Valchlor is recommended in those who meet the following criteria:

FDA-Approved Indications

145. Cutaneous Lymphomas Note: Includes mycosis fungoides/Sezary syndrome, primary cutaneous B-cell lymphoma, primary cutaneous CD30+ T-cell lymphoproliferative disorders. Approve for 3 years.

Other Uses with Supportive Evidence

146. Adult T-Cell Leukemia/Lymphoma. Approve for 3 years if the patient has chronic/smoldering subtype of adult T-cell leukemia/lymphoma.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Valchlor is not recommended in the following situations:

156. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Venclexta Prior Authorization Policy

- Venclexta® (venetoclax talets – AbbVie and Genentech)

REVIEW DATE: 06/03/2020

OVERVIEW

Venclexta, a B-cell lymphoma-2 (BCL-2) inhibitor, is indicated for the treatment of adults with chronic lymphocytic leukemia (CLL) or small lymphocytic lymphoma (SLL).[1] Additionally, Venclexta is indicated for use in combination with azacitidine or decitabine or low-dose cytarabine for the treatment of newly diagnosed acute myeloid leukemia (AML) in adults who are ≥ 75 years of age or who have comorbidities that preclude use of intensive induction chemotherapy.

Disease Overview

CLL is one of the most prevalent adult leukemias in the Western world.[2] In 2019, an estimated 20,720 patients will be diagnosed with CLL in the US, and approximately 3,930 patients will die from the disease. The condition usually is diagnosed in older adults (≥ 70 years of age) and occurs more frequently in men. The leukemic cells appear as small, mature lymphocytes. CLL and SLL are different manifestations of the same condition and are managed similarly. In CLL, many of the abnormal lymphocytes are found in the blood, as well as in the bone marrow and lymphoid tissue. In SLL, there are few, if any, abnormal lymphocytes circulating in blood and most of the disease is in the lymph nodes, bone marrow, and other lymphoid tissue. The diagnosis requires the presence of at least 5 x 10^9/L monoclonal B-lymphocytes in the peripheral blood. SLL requires the presence of lymphadenopathy and/or splenomegaly with < 5 x 10^9/L B-lymphocytes found in the peripheral blood.

AML is a heterogeneous hematologic malignancy that is hallmarked by clonal expansion of myeloid blasts in the peripheral blood, bone marrow, and/or other tissues.[3] It is a rather common form of acute leukemia in adults and it has the largest number of annual deaths from leukemias in the US. Around 21,450 people will be diagnosed with AML in 2019, and 10,920 patients will die from the condition. The median age at diagnosis is 67 years. Over one-half and approximately one-third of patients receive the diagnosis at ≥ 65 and ≥ 75 years of age, respectively. The incidence of AML, along with myelodysplastic syndrome (MDS) is rising as patients become older. Environmental factors play a role and include prolonged exposure to petrochemicals; solvents such as benzene; pesticides; and ionizing radiation. Also, two cytotoxic agents that are associated with therapy-related MDS/AML are alkylating agents (e.g., cyclophosphamide) and topoisomerase inhibitors (e.g., doxorubicin). Antimetabolite therapy, notably fludarabine, has also been associated with MDS/AML in patients with lymphoproliferative disorders, especially when given in combination with alkylating agents. Molecular or karyotypic abnormalities can also be identified. Treatment of AML can involve the following modalities at various stages: chemotherapy, radiation therapy, chemotherapy with stem cell transplant, and other drug therapy.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for CLL/SLL (version 4.2020 – December 20, 2019) cite Venclexta in several scenarios.[2] Venclexta plus Gazyva® (obinutuzumab injection for intravenous use) is listed as a first-line therapy (preferred regimen) in frail patients with comorbidities, patients ≥ 65 years, and in younger patients with significant comorbidities without 17p deletion/TP53 mutation (category 2A). This regimen is also cited as another recommended regimen (category 2B) in patients < 65 years of age without significant comorbidity. Venclexta plus rituximab is listed as preferred regimen option for patients with relapsed/refractory therapy without 17p deletion (category 1).[3] The NCCN also cite Venclexta as an option for relapsed/refractory therapy among patients with CLL without deletion 17p/TP53 mutation (category 2A).[3] For patients with 17p deletion/TP53 mutation, Venclexta plus Gazyva is recommended as a preferred regimen first-line (category 2A). Also, among this population, Venclexta with rituximab (category 1) and Venclexta alone (category 2A) are recommended in patients with relapsed or refractory disease as preferred regimens. Many other first-line options are recommended. CLL and SLL are different manifestations of the same diseases which are managed similarly.[3]

NCCN guidelines for AML (version 3.2020 – December 23, 2019) recommend Venclexta (in combination with decitabine, azacitidine or low-dose cytarabine) for treatment induction in patients ≥ 60 years of age who are candidates for intensive remission induction therapy with unfavorable-risk cytogenetics.[3] It is also recommended in other induction therapy clinical scenarios in patients who are not candidates for intensive remission. Venclexta (along with decitabine, azacitidine, or low-dose cytarabine) is also recommended as AML post-induction therapy for patients ≥ 60 years of age.

The NCCN guidelines for B-Cell Lymphomas (version 1.2020 – January 22, 2020) address mantle cell lymphoma. Venclexta is cited as a preferred second-line therapy regimen (category 2A) in patients with a short response duration to prior chemoimmunotherapy.[4] Other regimens recommended second-line are Venclexta plus Imbruvica (category 2B). Venclexta is recommended as an other recommended regimen in patients with an extended response duration to prior chemoimmunotherapy.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Venclexta. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Venclexta is recommended in those who meet the following criteria:

FDA-Approved Indications

~~56.~~53. **Chronic Lymphocytic Leukemia (CLL).** Approve for 3 years.

~~57.~~54. **Small Lymphocytic Lymphoma (SLL).** Approve for 3 years.

~~58.~~55. **Acute Myeloid Leukemia (AML).** Approve for 3 years if the patient is using Venclexta in combination with either azacitidine, decitabine, or cytarabine.

Other Uses with Supportive Evidence

~~59.~~56. **Mantle Cell Lymphoma.** Approve for 3 years if the patient has tried at least one prior therapy. Note: Examples of therapies include Imbruvica® (ibrutinib capsules and tablets) with or without rituximab; Calquence® (acalabrutinib capsules); Revlimid® (lenalidomide capsules) with or without rituximab; RDHAP (rituximab, dexamethasone, cytarabine, cisplatin); alternating RCHOP/RDHAP [rituximab, cyclophosphamide, doxorubicin, vincristine, prednisone/rituximab, dexamethasone, cytarabine, cisplatin]; HyperCVAD (cyclophosphamide vincristine, doxorubicin, and dexamethasone alternating with high-dose methotrexate and cytarabine) plus rituximab; RCHOP; or Treanda® (bendamustine injection for intravenous use) plus rituximab.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Venclexta is not recommended in the following situations:

259. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	Added criteria for mantle cell lymphoma and small lymphocytic lymphoma per NCCN guidelines. The alternatives were changed for patients with CLL and CLL with 17p deletion in-line with NCCN guidelines.	05/16/2018
Selected Revision	Criteria were updated to reflect that Venclexta is now FDA-approved for CLL with or without the 17p deletion. Prior to this, the product was FDA-approved only for 17p deletion CLL; however, the criteria previously addressed both settings. The specific approval condition and related criteria for CLL with 17p deletion were deleted. The criteria for CLL was moved from the Other Uses with Supportive Evidence Section to	06/20/2018

	the FDA-Approved Indications section. The alternatives cited that qualify as a trial of one prior therapy for CLL, which is required before approval, were merged such that no changes were needed in the listing of agents. Criteria were updated to reflect that Venclexta is now indicated for SLL, with or without 17p deletion. The criteria addressing SLL, which require that the patient has tried one prior therapy, was moved from the Other Uses with Supportive Evidence Section to the FDA-approved indications section.	
Selected Revision	Criteria added to address the new indication for AML.	11/28/2018
Selected Revision	Criteria regarding the diagnosis of AML were revised per guidance from updated NCCN guideline for AML (version 1.2019 – January 18, 2019). The following criteria were removed regarding this diagnosis: 1) the patient is ≥ 75 years of age, and 2) according to the prescribing physician, the patient has comorbidities that preclude the use of intensive induction chemotherapy.	02/06/2018
Annual Revision	1. **Chronic Lymphocytic Leukemia:** The requirement of a trial of one prior therapy prior to approval was removed. 2. **Small Lymphocytic Lymphoma:** The requirement of a trial of one prior therapy prior to approval was removed. 3. **Mantle Cell Lymphoma:** For clarity, in criteria, the reference to Rituxan when listing previous required therapies was changed to "rituximab".	06/05/2019
Annual Revision	**The following changes were made:** 1. **Mantle Cell Lymphoma:** Wording of the criteria that states that patients are required to have tried at least one prior therapy had the caveat of "at least" added before it. Also, examples of therapies were moved from the criteria to a note. The example of RDHAX (rituximab, dexamethasone, cytarabine, oxaliplatin) was removed.	06/03/2020

NCCN – National Comprehensive Cancer Network; CLL – Chronic lymphocytic leukemia; FDA – Food and Drug Administration; SLL – Small lymphocytic leukemia; AML – Acute myeloid leukemia.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Verzenio Prior Authorization Policy

- Verzenio™ (abemaciclib tablets – Eli Lilly and Company)

REVIEW DATE: 02/24/2021

OVERVIEW

Verzenio, a cyclin-dependent kinase (CDK) 4/6 inhibitor, is indicated in hormone receptor-positive (HR+), human epidermal growth factor receptor 2 (HER2)-negative **advanced or metastatic breast cancer** in the following settings:[1]

- In combination with an aromatase inhibitor (AI) as initial endocrine-based therapy for the treatment of postmenopausal women.
- In combination with fulvestrant for the treatment of women with disease progression following endocrine therapy. Pre/perimenopausal women treated with Verzenio plus fulvestrant should be treated with a gonadotropin-releasing hormone (GnRH) agonist according to current clinical practice standards.
- As monotherapy for the treatment of adult patients with disease progression following endocrine therapy and prior chemotherapy in the metastatic setting.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on breast cancer (version 1.2021 – January 15, 2021) recommend any of the CDK4/6 inhibitors in combination with an AI or fulvestrant as a first-line preferred treatment option for recurrent or Stage IV HR+ and HER2-negative disease in postmenopausal women or premenopausal patient receiving ovarian ablation or suppression (category 1).[2,3] CDK4/6 inhibitor + fulvestrant is recommended for second- and subsequent-line therapy, if CDK4/6 inhibitor was not previously used (category 1). However, the guidelines also state in a footnote that if there

is disease progression on CDK4/6 inhibitor therapy or PI3K inhibitor, there are limited data to support an additional line of therapy with another CDK4/6-containing regimen.[2,4] For men with breast cancer, the compendium recommends they be treated similarly to postmenopausal women, except that the use of an AI is ineffective without concomitant suppression of testicular steroidogenesis.[3]

Supportive Data

A multicenter analysis evaluated clinical outcomes in patients (n = 58) with HR+/HER2-negative metastatic breast cancer who received Verzenio after disease progression on Ibrance (palbociclib tablets) or Kisqali (ribociclib tablets).[4] At data cutoff, 34% of patients (n = 20/58) had progressive disease, while 36% of patients (n = 21/58) had treatment duration exceeding 6 months. The median PFS was 5.8 months. Another case report of Verzenio use after 10 lines of therapy, including Ibrance therapy is available, along with literature review of ongoing studies with other CDK 4/6 inhibitors after prior use of another inhibitor.[5] Ibrance and Kisqali also have ongoing studies assessing for their respective efficacy after progression on another CDK4/6 inhibitor.[6,7] Preliminary results from the Kisqali trial (TRINITI-1), a Phase I/II, open-label trial of triplet therapy (Kisqali + everolimus + exemestane) after progression on prior CDK 4/6 inhibitor and up to three lines of therapy are available.[8] A total of 95 patients were evaluated; 41.1% of patients demonstrated clinical benefit, exceeding the predefined primary endpoint threshold (> 10%). The response rate was 8.4% and the median PFS was 5.7 months, and the 1-year PFS was 33%.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Verzenio. All approvals are provided for 3 years in duration unless otherwise noted below. In the clinical criteria, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: a woman is defined as an individual with the biological traits of a woman, regardless of the individual's gender identity or gender expression; men are defined as individuals with the biological traits of a man, regardless of the individual's gender identity or gender expression.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Verzenio is recommended in those who meet the following criteria:

FDA-Approved Indications

~~60.~~57. **Breast Cancer in Postmenopausal Women***. Approve for 3 years if the patient meets the following criteria (A, B, and C):

- **22.** Patient has advanced or metastatic hormone receptor positive (HR+) [i.e., estrogen receptor positive {ER+} and/or progesterone receptor positive {PR+}] disease; AND
- **23.** Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND
- **24.** Patient meets ONE of the following criteria (i, ii, or iii):
  - **i.** Verzenio will be used in combination with anastrozole, exemestane, or letrozole; OR
  - **ii.** Verzenio will be used in combination with fulvestrant ; OR
  - **iii.** The patient meets the following conditions (a, b, and c):
    - **a)** Verzenio will be used as monotherapy; AND
    - **b)** Patient's breast cancer has progressed on at least one prior endocrine therapy; AND
      Note: Examples are anastrozole, exemestane, letrozole, tamoxifen, Fareston® [toremifene], exemestane plus everolimus, fulvestrant, everolimus plus fulvestrant or tamoxifen, megestrol acetate, fluoxymesterone, ethinyl estradiol.
    - **c)** Patient has tried chemotherapy for metastatic breast cancer.

***** Refer to the Policy Statement.

2. **Breast Cancer in Pre/Perimenopausal Women.*** Approve for 3 years if the patient meets the following criteria (A, B, C, and D):
   - **A)** Patient has advanced or metastatic hormone receptor positive (HR+) [i.e., estrogen receptor positive {ER+} and/or progesterone receptor positive {PR+}] disease; AND
   - **B)** Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND
   - **C)** Patient is receiving ovarian suppression/ablation with a gonadotropin-releasing hormone (GnRH) agonist or has had surgical bilateral oophorectomy or ovarian irradiation; AND
     Note: Examples are Lupron (leuprolide), Trelstar (triptorelin), Zoladex (goserelin).
   - **D)** Patient meets ONE of the following conditions (i, ii, or iii):
     - **i.** Verzenio will be used in combination with anastrozole, exemestane, or letrozole; OR
     - **ii.** Verzenio will be used in combination with fulvestrant; OR
     - **iii.** Patient meets the following conditions (a, b, and c):
       - **a)** Verzenio will be used as monotherapy; AND
       - **b)** Patient's breast cancer has progressed on at least one prior endocrine therapy; AND
         Note: Examples are anastrozole, exemestane, letrozole, tamoxifen, Fareston® [toremifene], exemestane plus everolimus, fulvestrant, everolimus plus fulvestrant or tamoxifen, megestrol acetate, fluoxymesterone, ethinyl estradiol.
       - **c)** Patient has tried chemotherapy for metastatic breast cancer.

***** Refer to the Policy Statement.

Other Uses With Supportive Evidence

3. **Breast Cancer in Men*.** Approve for 3 years if the patient meets the following criteria (A, B, and C):
   - **D)** Patient has advanced or metastatic hormone receptor positive (HR+) [i.e., estrogen receptor positive {ER+} and/or progesterone receptor positive {PR+}]disease; AND
   - **E)** Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND
   - **F)** Patient meets ONE of the following criteria (i, ii, or iii):
     - **i.** Patient meets BOTH of the following conditions (a and b):
       - **a)** Patient is receiving a gonadotropin-releasing hormone (GnRH) analog; AND
         Note: Examples are Lupron (leuprolide), Trelstar (triptorelin), Zoladex (goserelin), Firmagon (degarelix), Orgovyx (relugolix).
       - **b)** Verzenio will be used in combination with anastrozole, exemestane, or letrozole; OR
     - **ii.** Verzenio will be used in combination with fulvestrant; OR
     - **iii.** Patient meets the following conditions (a, b, and c):
       - **a)** Verzenio will be used as monotherapy; AND
       - **b)** Patient's breast cancer has progressed on at least one prior endocrine therapy; AND
         Note: Examples are anastrozole, exemestane, letrozole, tamoxifen, Fareston (toremifene), exemestane plus everolimus, fulvestrant, everolimus plus fulvestrant or tamoxifen, megestrol acetate, fluoxymesterone, ethinyl estradiol.
       - **c)** Patient has tried chemotherapy for metastatic breast cancer**.**

***** Refer to the Policy Statement.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Verzenio is not recommended in the following situations:

260. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	Deleted requirement in all conditions that Verzenio + aromatase inhibitor use should be in first-line setting. For use of Verzenio + Faslodex, deleted requirement to try a prior endocrine therapy since guidelines recommend first-line use. In the monotherapy criteria, re-worded to state patient has progressed on at least one prior endocrine therapy and changed the list of endocrine therapies to examples.	04/03/2019
Annual Revision	Limited data are available that Verzenio can be used after the patient has progressed on Ibrance or Kisqali. Due to this, the criteria "The patient has not had disease progression while on Verzenio, Ibrance, or Kisqali" has been modified to state "The patient has not had disease progression while on Verzenio."	04/15/2020
Early Annual Revision	**All Breast Cancer Indications:** Deleted criteria requiring no disease progression on Verzenio, based on guidelines and available data. **Breast Cancer in Pre/Perimenopausal Women:** Examples of gonadotropin-releasing hormone (GnRH) agonists are moved from criteria to Note. **Breast Cancer in Men:** GnRH "agonist" is changed to "analog". Also, the list of examples of GnRH analog agents are moved from criteria to Note. Firmagon (degarelix) and Orgovyx (relugolix) were added to example list.	02/24/2021

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Vistogard Prior Authorization Policy

- Vistogard® (uridine triacetate oral granules – Wellstat Therapeutics)

REVIEW DATE: 07/29/2020

OVERVIEW

Vistogard, a pyrimidine analog, is indicated for the emergency treatment of adult and pediatric patients:

- Following a fluorouracil or capecitabine overdose regardless of the presence of symptoms; or
- Who exhibit early-onset, severe or life-threatening toxicity affecting the cardiac or central nervous system, and/or early-onset, unusually severe adverse reactions (e.g., gastrointestinal toxicity, neutropenia) within 96 hours following the end of fluorouracil or capecitabine administration.[1]

As a limitation of use, Vistogard is not recommended for the non-emergent treatment of adverse events associated with fluorouracil or capecitabine because it may diminish the efficacy of these drugs.[1] Additionally, the safety and efficacy of Vistogard initiated more than 96 hours following the end of fluorouracil or capecitabine administration have not been established. Vistogard is supplied in 10 gram packets. For adults, the dose is 10 grams (1 packet) every 6 hours for 20 doses. For pediatric patients, the dose is 6.2 grams/m^2 of body surface area (not to exceed 10 grams per dose) every 6 hours for 20 doses. Any unused portion of a packet must be discarded; it should not be saved for subsequent doses.

Disease Overview

Fluorouracil and capecitabine (a fluorouracil prodrug) are widely used chemotherapeutic agents with potential for significant toxicity. Exaggerated sensitivity to capecitabine or fluorouracil may occur due to genetic variations in certain enzymes, renal impairment, or other causes.[2] Toxicity results in tissue damage, often manifesting as ulcerative mucositis with neutropenia leading to sepsis, shock, and organ failure. Additionally, central neurotoxicity and cardiac toxicity may occur without any identifiable predisposing factors. Exogenous uridine competes with the toxic metabolite fluorouridine triphosphate for incorporation into RNA in normal tissues, thereby protecting the tissues from toxicity.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Vistogard. All approvals are provided for the duration noted below.

Automation: None

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Vistogard is recommended in those who meet the following criteria:

FDA-Approved Indications

26. Capecitabine or Fluorouracil Overdose. Approve for 7 days.

27. Capecitabine or Fluorouracil Toxicity, Severe or Life-Threatening. Approve for 7 days.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Vistogard is not recommended in the following situations:

6. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Vitrakvi Prior Authorization Policy

- Vitrakvi® (larotrectinib capsules and oral solution – Loxo Oncology/Bayer)

REVIEW DATE: 12/16/2020

OVERVIEW

Vitrakvi, a kinase inhibitor, is indicated for the treatment of adult and pediatric patients with **solid tumors** that: have a **neurotrophic receptor tyrosine kinase (NTRK) gene fusion** without a known acquired resistance mutation; are metastatic or where surgical resection is likely to result in severe morbidity; and have no satisfactory alternative treatments or that have progressed following treatment.[1]

Guidelines/Compendium

The National Comprehensive Cancer Network (NCCN) Compendium lists the following cancers as recommended uses for Vitrakvi:[2] breast cancer, cervical cancer, esophageal and esophagogastric cancer, gastric cancer, gastrointestinal stromal tumors (GISTs), extra and intrahepatic cholangiocarcinoma, gallbladder cancer, hepatocellular carcinoma, soft tissue sarcoma, uterine sarcoma, endometrial carcinoma, small bowel adenocarcinoma, angiosarcoma, rhabdomyosarcoma, retroperitoneal/intra-abdominal sarcoma, salivary gland tumors, cutaneous melanoma, central nervous system cancers, thyroid carcinoma, rectal cancer, non-small cell lung cancer, colon cancer, ovarian cancer, pancreatic cancer, and vulvar cancer (squamous cell carcinoma).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Vitrakvi. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Vitrakvi is recommended in those who meet the following criteria:

FDA-Approved Indications

2. **Solid Tumors.** Approve for 3 years if the patient meets the following criteria (A, B, and C):
   A) Patient's tumor has a neurotrophic receptor tyrosine kinase (*NTRK*) gene fusion without a known acquired resistance mutation; AND

B) Patient meets one of the following criteria (i or ii):
- **i.** The tumor is metastatic; OR
- **ii.** Surgical resection of tumor will likely result in severe morbidity; AND

C) Patient meets one of the following criteria (i or ii):
- **i.** There are no satisfactory alternative treatments; OR
- **ii.** Patient has disease progression following treatment.

CONDITIONS NOT RECOMMENDED FOR APPROVAL
Coverage of Vitrakvi is not recommended in the following situations:

261. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Vizimpro Prior Authorization Policy
- Vizimpro® (dacomitinib tablets – Pfizer Labs)

REVIEW DATE: 10/21/2020

OVERVIEW
Vizimpro, a kinase inhibitor, is indicated for the first-line treatment of patients with metastatic non-small cell lung cancer (NSCLC) with epidermal growth factor receptor (EGFR) exon 19 deletion or exon 21 (L858R) substitution mutations as detected by an FDA-approved test.[1]

Guidelines
The National Comprehensive Cancer Network (NCCN) guidelines for NSCLC (version 8.2020 – September 15, 2020) recommends Vizimpro, Tarceva® (erlotinib tablets), Iressa® (gefitinib tablets), Gilotrif™ (afatinib tablets) and Tagrisso™ (osimertinib tablets) [all category 1] for the first-line treatment of patients with sensitizing *EGFR*-mutation positive NSCLC discovered before first-line chemotherapy.[2] Tagrisso is noted as the "preferred" option; whereas the rest of the agents are "Other Recommended" first-line therapies. Upon disease progression, T790M testing is recommended. Tagrisso is a category 1 recommended option if T790M mutation-positive. Patients can also continue Vizimpro, Tarceva, Gilotrif, or Iressa (category 2A).

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Vizimpro. All approvals are provided for 3 years in duration as noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Vizimpro is recommended in those who meet the following criteria:

FDA-Approved Indications

~~61.~~58. **Non-Small Cell Lung Cancer (NSCLC) – Epidermal Growth Factor Receptor (EGFR) Mutation-Positive.** Approve for 3 years if the patient meets the following criteria (A and B):

~~25.~~ Patient has *metastatic* NSCLC; AND

~~26.~~ Patient meets ONE of the following criteria (i or ii):

- **i.** Patient has epidermal growth factor receptor (EGFR) exon 19 deletion as detected by an approved test; OR
- **ii.** Patient has exon 21 (L858R) substitution mutations as detected by an approved test.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Vizimpro is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Votrient® (pazopanib tablets – GlaxoSmithKline)

DATE REVIEWED: 05/27/2020

OVERVIEW

Votrient, a multi-tyrosine kinase inhibitor, is indicated for the treatment of patients with advanced renal cell carcinoma (RCC), and for the treatment of patients with advanced soft tissue sarcoma (STS) who have received prior chemotherapy.[1] Limitation of Use. The efficacy of Votrient for the treatment of patients with adipocytic STS or gastrointestinal stromal tumors (GIST) has not been demonstrated.

Guidelines

Votrient features prominently in the National Comprehensive Cancer Network (NCCN) guidelines for soft tissue sarcomas and kidney cancer and others. The indications listed in the FDA-approved and Other Uses with Supportive Evidence sections are supported by the prescribing information and/or the NCCN Compendium/Guidelines.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Votrient. All approvals are provided for 3 years in duration unless otherwise noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Votrient is recommended in those who meet the following criteria:

FDA-Approved Indications

~~62.~~59. **Renal Cell Carcinoma** (Clear Cell or Non-Clear Cell Histology). Approve for 3 years for relapsed or Stage IV disease.

2. **Soft Tissue Sarcoma (STS).** Approve for 3 years if the patient meets the following criteria (A, B, and C):
   - **A)** The soft tissue sarcoma is advanced or metastatic; AND
   - **B)** The patient has ONE of the following (i, ii, iii, iv, v, or vi):[3]
     - **i.** Angiosarcoma; OR
     - **ii.** Pleomorphic rhabdomyosarcoma; OR
     - **iii.** Retroperitoneal/intra-abdominal soft tissue sarcoma that is unresectable or progressive; OR
     - **iv.** Soft tissue sarcoma of the extremity/superficial trunk or head/neck, including synovial sarcoma; OR
     - **v.** Solitary fibrous tumor/hemangiopericytoma; OR
     - **vi.** Alveolar soft part sarcoma; OR
   - **C)** The patient does not have gastrointestinal stromal tumor (GIST) [see Criterion 4].

Other Uses with Supportive Evidence

3. **Differentiated (i.e., papillary, follicular, and Hürthle cell) Thyroid Carcinoma.** Approve for 3 years if refractory to radioactive iodine therapy.

4. **Gastrointestinal Stromal Tumor (GIST).** Approve for 3 years if the patient meets the following criteria (A, B, and C):
   - **I)** Patient has previously tried imatinib (Gleevec® tablets, generics); AND
   - **J)** Patient has previously tried Sutent® (sunitinib capsules); AND
   - **K)** Patient has previously tried Stivarga® (regorafinib tablets).

5. **Medullary Thyroid Carcinoma.** Approve for 3 years if the patient has tried Caprelsa® (vandetanib tablets) or Cometriq® (cabozantinib capsules).

6. **Ovarian Cancer (i.e., Epithelial Ovarian, Fallopian Tube, or Primary Peritoneal Cancer).** Approve for 3 years if the patient has persistent or recurrent disease.

7. **Uterine Sarcoma (e.g., endometrial stromal sarcoma, undifferentiated uterine sarcoma, uterine leiomyosarcomas).** Approve for 3 years in patients with recurrent, advanced, or metastatic disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Votrient has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below.

262. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes*	TAC Approval Date
Annual revision	Soft Tissue Sarcoma: Head/neck was added to the list of indications. Ovarian Cancer: Criteria were revised to add patients with persistent or recurrent disease.	03/08/2017
Annual revision	• Dermatofibrosarcoma Protuberans: This indication was removed. The NCCN guidelines no longer recommend this use. • Uterine sarcoma: "Recurrent" was added to the criteria.	04/18/2018
Annual revision	• Renal Cell Carcinoma: Deleted "advanced" and "predominant" descriptor with regards to clear cell. Added patient has "relapsed or Stage IV disease". • Soft Tissue Sarcoma: Added Alveoloar soft part sarcoma and Solitary fibrous tumor/hemeangiopericytoma. Deleted "Other non-lipogenic soft tissue sarcoma. • Ovarian Cancer: Deleted criteria requiring patient to have complete clinical remission after prior chemotherapy. • Deleted all conditions listed under "Conditions Not Recommended for Approval".	05/08/2019
Annual revision	• No criteria changes	05/27/2020

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Xalkori Prior Authorization Policy
- Xalkori® (crizotinib capsules – Pfizer)

REVIEW DATE: 12/16/2020; 01/27/2021 selected revision

OVERVIEW

Xalkori, an oral kinase inhibitor, is indicated for the treatment of patients with:[1]

- **Non-small cell lung cancer (NSCLC)**, whose tumors are anaplastic lymphoma kinase (ALK)-positive as detected by an FDA-approved test.
- **NSCLC,** metastatic, whose tumors are ROS1-positive.
- **Anaplastic large cell lymphoma (ALCL)**, treatment of pediatric patients ≥ 1 year of age and young adults with relapsed or refractory, systemic ALCL that is *ALK*-positive.
  Limitations of Use: The safety and efficacy of Xalkori have not been established in older adults with relapsed or refractory, systemic *ALK*-positive ALCL.

Rearrangements involving the ALK locus on chromosome 2p33 have been documented in approximately 50% of inflammatory myofibroblastic tumors (IMTs).[7] IMTs occur primarily during the first two decades of life and typically arise in the lung, retroperitoneum, or abdominal region. Sustained partial response to Xalkori in a patient *with* ALK-translocated IMT, and no observed activity in a patient *without* ALK translocation have been reported. In another case report, a 45-year old Hispanic female was eventually diagnosed to have IMT with systemic involvement and ALK gene rearrangement.[8] The patient was treated with Xalkori and had a successful resolution of her lesions and symptoms. After a 27-month follow-up, the patient remained in complete clinical and radiologic remission.

Guidelines

According to the National Comprehensive Cancer Network (NCCN) guidelines:

- **NSCLC** (version 1.2021 – November 25, 2020), Alecensa® (alectinib capsules) is the preferred therapy (category 1).[2,5] Other recommended therapies include Zykadia™ (ceritinib capsules) and Alunbrig™ (brigatinib tablets) [both also category 1]. Xalkori (category 1 as well) is listed as Useful in Certain Circumstances. For subsequent therapy with progression on Xalkori, therapy can be switched to Zykadia, Alecensa, or Alunbrig (if not previously given) [all category 2A]. For

progression on Alecensa, Alunbrig, or Zykadia, Lorbrena (lorlatinib tablets) is recommended (category 2A). Xalkori (Preferred) or Zykadia (Other Recommended therapy) are recommended as first-line therapy for ROS1 rearrangement-positive NSCLC (both category 2A). Lorbrena can be used as subsequent therapy for ROS1 rearrangement. Xalkori is also recommended as an emerging targeted therapy in patients with high level *MET* amplification or *MET* exon 14 skipping mutation in lung cancer (category 2A).

- **Soft tissue sarcoma** guidelines (version 1.2021 – October 30, 2020) recommend Xalkori as single-agent therapy for the treatment of IMT with ALK translocation (category 2A recommendation).[3,5]
- **T-Cell lymphoma** guidelines (version 1.2021 – October 5, 2020) recommend Xalkori use in ALK-positive anaplastic large cell lymphoma (ALCL) as a second-line and subsequent therapy option (category 2A) in patients with intent to proceed to transplant and in those who do not intend to proceed to transplant.[4,5]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Xalkori. All approvals are provided for 3 years unless otherwise noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Xalkori is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Non-Small Cell Lung Cancer (NSCLC).** Approve for 3 years if the patient has metastatic anaplastic lymphoma kinase (ALK)-positive NSCLC as detected by an approved test.

2. **Non-Small Cell Lung Cancer (NSCLC) with ROS1 Rearrangement.** Approve for 3 years if the patient has recurrent or metastatic disease as detected by an approved test.

3. **Anaplastic Large Cell Lymphoma.** Approve for 3 years if the patient meets the followring criteria (A, B, and C):
   - **A)** Patient were ≥ 1 year of age and ≤ 21 years of age; AND
   - **B)** Patient has anaplastic lymphoma kinase (*ALK*)-positive disease; AND
   - **C)** Patient has received at least one prior systemic treatment regimen.
     Note: Examples of systemic treatment were Adcetris (brentuximab vendotin for injection) in combination with CHP (cyclophosphamide, doxorubicin, and prednisone), CHOP (cyclophosphamide, doxorubicin, vincristine, prednisone), CHOEP (cyclophosphamide, doxorubicin, vincristine, etoposide, prednisone).

Other Uses with Supportive Evidence

4. **Non-Small Cell Lung Cancer (NSCLC) with High Level *MET* Amplification or MET Exon 14 Skipping Mutation.** Approve for 3 years.

5. **Soft Tissue Sarcoma – Inflammatory Myofibroblastic Tumor (IMT) with ALK Translocation.** Approve for 3 years.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Xalkori is not recommended in the following situations:

263. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	No criteria changes.	12/19/2018
Annual Revision	For ROS1 rearrangement, added "if the patient has recurrent or metastatic disease as detected by an approved test. For Peripheral T-Cell Lymphoma indication, deleted phrases "a single agent for second-line" and "in patients with intention to proceed and no intention to proceed to transplant." Added "for relapsed or refractory disease."	12/18/2019
Annual Revision	No criteria changes.	12/16/2020
Selected Revision	**Anaplastic Large Cell Lymphoma:** Added new approval condition and criteria based on FDA-approval and guidelines. **Peripheral T-Cell Lymphoma – Anaplastic Large Cell Lymphoma (ALCL), ALK-Positive:** Deleted this approval condition and criteria from Other Uses with Supportive Evidence, now that is addressed as an FDA-approved indication.	01/27/2021

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Xermelo™ (telotristat ethyl tablets – Lexicon Pharmaceuticals)

DATE REVIEWED: 05/13/2020

OVERVIEW

Xermelo is indicated for the treatment of carcinoid syndrome diarrhea in combination with somatostatin analog (SSA) therapy in adults inadequately controlled by SSA therapy.[1] Telotristat, the active metabolite, inhibits tryptophan hydroxylase, which mediates the rate limiting step in serotonin biosynthesis. Serotonin plays a role in mediating secretion, motility, inflammation, and sensation of the gastrointestinal tract and is overproduced in patients with carcinoid syndrome. Xermelo specifically reduces the production of peripheral serotonin and decreases the frequency of carcinoid syndrome diarrhea. The inclusion criteria for the TELESTAR pivotal study required all patients randomized to Xermelo or placebo groups to have at least four bowel movements per day while on SSA therapy.[2] The study also required patients to be receiving a stable-dose of SSA therapy for at least 3 months prior to trial enrollment.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Xermelo. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Xermelo is recommended in those who meet the following criteria:

FDA-Approved Indications

~~63.~~60. Carcinoid Syndrome Diarrhea.

A) Initial Therapy. Approve for 3 years if the patient meets all of the following criteria (i, ii, and iii):

i. The patient has been on a long-acting somatostatin analog (SSA) therapy for at least 3 consecutive months.
Note: Examples of long-acting SSA therapy are Somatuline® Depot (lanreotide for injection), Sandostatin® LAR Depot (octreotide for injection); AND

ii. While on a long-acting somatostatin analog therapy (prior to starting Xermelo), the patient continues to have at least four bowel movements per day; AND

iii. Xermelo will be used concomitantly with a long-acting somatostatin analog therapy.

B) Patient is Currently Receiving Xermelo. Approve for 3 years if the patient is continuing to take Xermelo concomitantly with a long-acting somatostatin analog therapy for carcinoid syndrome diarrhea.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Xermelo has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

264. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Xospata Prior Authorization Policy

- Xospata® (gilteritinib tablets – Astellas)

REVIEW DATE: 12/02/2020

OVERVIEW

Xospata, an inhibitor of tyrosine kinases including FMS-like tyrosine-kinase 3 (FLT3), is indicated for the treatment of relapsed or refractory **acute myeloid leukemia** (AML) in adults with an FLT3 mutation as detected by an FDA-approved test.[1]

Disease Overview

AML is a heterogeneous hematologic malignancy that is hallmarked by clonal expansion of myeloid blasts in the peripheral blood, bone marrow, and/or other tissues.[2] It is a rather common form of acute leukemia in adults and it has the largest number of annual deaths from leukemias in the US. Around 19,940 people will be diagnosed with AML in 2020, and 11,180 patients will die from the condition. The median age at diagnosis is 68 years of age. Over one-half and approximately one-third of patients receive the diagnosis at ≥ 65 and ≥ 75 years of age, respectively. The incidence of AML, along with myelodysplastic syndrome (MDS) is rising as patients become older. Environmental factors play a role and include prolonged exposure to petrochemicals; solvents such as benzene; pesticides, and

ionizing radiation. Also, two cytotoxic agents that are associated with therapy-related MDS/AML are alkylating agents (e.g., cyclophosphamide) and topoisomerase inhibitors (e.g., doxorubicin). Antimetabolite therapy, notably fludarabine, has also been associated with MDS/AML in patients with lymphoproliferative disorders, especially when given in combination with alkylating agents. Treatment of AML can involve the following modalities at various stages: chemotherapy, radiation therapy, chemotherapy with stem cell transplant, and other drug therapy. Molecular or karyotypic abnormalities can also be identified, of which FLT3 is noted. The two major classes of activating FLT3 mutations are internal tandem duplications (ITD) and tyrosine kinase domain (TKD) point mutations. FLT3-ITD mutations occur in around 30% of cases and are more common than FLT3-TKD mutations, which occur in approximately 10% of patients. Prognosis can be worse in patients with certain types of FLT3 mutations (e.g. shorter remissions, decreased overall survival).

Guidelines

The National Comprehensive Cancer Network (NCCN) has various guidelines that address Daurismo.[2,3]

- **Acute Myeloid Leukemia:** NCCN guidelines for AML (version 2.2021- November 12, 2020) recommended Xospata in patients ≥ 18 years of age for therapy for relapsed or refractory disease for patients with the FLT3-ITD and FLT3-TKD mutation (category 1 for both).[2]
- **Myeloid/Lymphoid Neoplasms:** NCCN guidelines for myeloid/lymphoid neoplasms with eosinophilia and tyrosine kinase fusion genes (version 3.2021 – August 21, 2020) recommend Xospata in various clinical scenarios involving lymphoid, myeloid or mixed lineage neoplasms with eosinophilia and FLT3 rearrangement (category 2A).[3]

Safety

Xospata has a Boxed Warning regarding differential syndrome, which can be fatal if not treated. If differentiation syndrome is suspected, initiate corticosteroid therapy and hemodynamic monitoring until resolution of symptoms.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Xospata. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Xospata is recommended in those who meet the following criteria:

FDA-Approved Indications

147. Acute Myeloid Leukemia (AML). Approve for 3 years if the patient meets the following criteria (A, B, and C).
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has relapsed or refractory disease; AND
- **C)** Disease is *FLT3*-mutation positive as detected by an approved test.

Other Uses with Supportive Evidence

148. Lymphoid, Myeloid, or Mixed Lineage Neoplasms. Approve for 3 years if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has eosinophilia; AND
- **C)** Disease is *FLT3*-mutation positive as detected by an approved test.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Xospata is not recommended in the following situations:

157. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available Condition.

Annual Revision	**Acute Myeloid Leukemia:** Added criteria that the patient is ≥ 18 years of age per National Comprehensive Cancer Network criteria and the FDA-approval age threshold. **Lymphoid, Myeloid, or Mixed Lineage Neoplasms:** Added new criteria in the "Other Uses with Supportive Evidence" section to approve for 3 years per guidance from National Comprehensive Cancer Network guidelines for patients ≥ 18 years of age with eosinophilia and have disease that is FLT3-mutation positive as detected by an approved test.	12/02/2020

FLT3 – FMS-like tyrosine kinase 3.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Xospata® (gilteritinib tablets – Astellas)

DATE REVIEWED: 12/04/2019

OVERVIEW

Xospata, an inhibitor of tyrosine kinases including FMS-like tyrosine-kinase 3 (FLT3), is indicated for the treatment of adults who have relapsed or refractory acute myeloid leukemia (AML) with a FLT3 mutation as detected by an FDA-approved test.[1] The recommended initial dose is 120 orally once daily (QD). Response may be delayed. In the absence of disease progression or unacceptable toxicity, treatment for a minimum of 6 months is recommended to allow time for a clinical response. Dosage modifications are recommended for patients who experience toxicities related to Xospata.

Disease Overview

AML is a heterogeneous hematologic malignancy that is hallmarked by clonal expansion of myeloid blasts in the peripheral blood, bone marrow, and/or other tissues.[2] It is a rather common form of acute leukemia in adults and it has the largest number of annual deaths from leukemias in the US. Around 21,450 people will be diagnosed with AML in 2019, and 10,920 patients will die from the condition. The median age at diagnosis is 67 years. Over one-half and approximately one-third of patients receive the diagnosis at ≥ 65 and ≥ 75 years of age, respectively. The incidence of AML, along with myelodysplastic syndrome (MDS) is rising as patients become older. Environmental factors play a role and include prolonged exposure to petrochemicals; solvents such as benzene; pesticides, and ionizing radiation. Also, two cytotoxic agents that are associated with therapy-related MDS/AML are alkylating agents (e.g., cyclophosphamide) and topoisomerase inhibitors (e.g., doxorubicin). Antimetabolite therapy, notably

fludarabine, has also been associated with MDS/AML in patients with lymphoproliferative disorders, especially when given in combination with alkylating agents. Treatment of AML can involve the following modalities at various stages: chemotherapy, radiation therapy, chemotherapy with stem cell transplant, and other drug therapy. Molecular or karyotypic abnormalities can also be identified, of which FLT3 is noted. The two major classes of activating FLT3 mutations are internal tandem duplications (ITD) and tyrosine kinase domain (TKD) point mutations. FLT3-ITD mutations occur in around 30% of cases and are more common than FLT3-TKD mutations, which occur in approximately 10% of patients. Prognosis can be worse in patients with certain types of FLT3 mutations (e.g. shorter remissions, decreased overall survival).

Clinical Efficacy

The efficacy of Xospata was evaluated in a trial called ADMIRAL, which involved adults with relapsed or refractory AML having a FLT3, ITD, D835, or 1836 mutation.[1,3] The first interim analysis of the trial involved 138 patients.[1] The median follow-up was 4.6 months. Among the 106 patients who were dependent on red blood cell and/or platelet transfusions at baseline, approximately 31% of patients became independent of RBC and platelet transfusions during any 56-day post-baseline period. The rate of complete remission (CR)/complete remission with partial hematologic recovery (CR/CRh) was 21% (n = 29/138). The final analysis involved 371 patients who received Xospata 120 mg QD (n = 247) over continuous 28-day cycles or a prespecified chemotherapy regimen (n = 124) which included high intensity combinations (MEC [mitoxantrone, etoposide, and cytarabine] and FLAG-IDA [fludarabine, cytarabine, granulocyte colony-stimulating factor, and idarubicin) and low intensity regimens (LDAC [low-dose cytarabine] and AZA [azacitidine]). At the time of analysis, the median follow-up was 17.8 months. Patients who received Xospata had a significant longer survival compared with patients given chemotherapy (hazard ratio 0.64; 95% confidence interval: 0.49, 0.83; P = 0.0004).

Guidelines

The National Comprehensive Cancer Network (NCCN) has guidelines for AML (version 2.2020 – September 3, 2019) are extensive.[2] Many medications are utilized at various stages of patients with AML. For relapsed or refractory disease, Xospata is a recommended therapy for AML among patients with an FLT3-ITD mutation (category 1). Hypomethylating agents (azacitidine or decitabine) plus Nexavar® (sorafenib tablets) are also recommended for patients with an FLT3-ITD mutation (category 2A). For patients with AML with an FLT3-TKD mutation, Xospata is recommended (category 1).

Safety

Xospata has a Boxed Warning regarding differential syndrome, which can be fatal if not treated. If differentiation syndrome is suspected, initiate corticosteroid therapy and hemodynamic monitoring until resolution of symptoms.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Xospata. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Xospata is recommended in those who meet the following criteria:

FDA-Approved Indications

149. Acute Myeloid Leukemia (AML). Approve for 3 years if the patient meets the following criteria (A and B).
- **A)** The patient has relapsed or refractory disease; AND
- **B)** The disease is *FLT3*-mutation positive as detected by an approved test.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Xopsata has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

158. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available Condition.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Xpovio Prior Authorization Policy

- Xpovio™ (selinexor tablets – Karyopharm Therapeutics)

REVIEW DATE: 02/03/2021

OVERVIEW

Xpovio, a nuclear export inhibitor, is indicated for treatment of the following conditions:[1]

- **Diffuse large B-cell lymphoma** (DLBCL), not otherwise specified (including DLBCL arising from follicular lymphoma), for treatment of adults with relapsed or refractory disease, after at least two lines of systemic therapy.
- **Multiple myeloma**:
  - In combination with dexamethasone for adults with relapsed or refractory disease who have received at least four prior therapies and whose disease is refractory to at least two proteasomes inhibitors, at least two immunomodulatory agents, and an anti-CD38 monoclonal antibody.
  - In combination with bortezomib and dexamethasone, in adults who have received at least one prior therapy.

For both of these indications, Xpovio was approved under accelerated approval based on response rate. Continued approval may be contingent upon verification in a confirmatory trial.

Guidelines

Xpovio is addressed in the following guidelines from the National Comprehensive Cancer Network (NCCN):

- **B-Cell Lymphoma:** NCCN guidelines (version 1.2021 – January 20, 2021) recommend Xpovio as third-line and subsequent therapy of DLBCL, after at least two lines of systemic therapy.[3]
- **Multiple Myeloma:** NCCN guidelines (version 4.2021 – December 10, 2020) recommend various regimens as primary therapy (transplant eligible and non-transplant candidates), maintenance therapy, and previously treated multiple myeloma.[2] Xpovio/bortezomib/dexamethasone is among the other recommended regimens for previously treated disease. Xpovio/dexamethasone (specifically for the approved indication), Xpovio/Darzalex (daratumumab injection)/dexamethasone, and Xpovio/Pomalyst (pomalidomide capsules)/dexamethasone are among the regimens considered useful in certain circumstances for previously treated multiple myeloma.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Xpovio. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Xpovio is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Diffuse Large B-Cell Lymphoma.** Approve for 3 years if the patient meets BOTH of the following (A and B):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has been treated with at least two prior systemic therapies.

2. **Multiple Myeloma.** Approve for 3 years if the patient meets ALL of the following (A, B, and C):
   - **5.** Patient is ≥ 18 years of age; AND
   - **6.** The medication will be taken in combination with dexamethasone; AND
   - **7.** Patient meets one of the following (i, ii, or iii):
     - **A)** Patient has tried at least four prior regimens for multiple myeloma; OR
     - **B)** Patient meets both of the following (a and b):
       - **i.** Patient has tried at least one prior regimen for multiple myeloma; AND
       - **ii.** The medication will be taken in combination with bortezomib; OR
     - **C)** Patient meets both of the following (a and b):
       - **i.** Patient has tried at least one prior regimen for multiple myeloma; AND
       - **ii.** The medication will be taken in combination with Darzalex (daratumumb infusion), Darzlaex Faspro (daratumumab and hyaluronidase-fihj injection), or Pomalyst (pomalidomide capsules).

     Note: Examples include bortezomib/Revlimid (lenalidomide capsules)/dexamethasone, Kyprolis (carfilzomib infusion)/Revlimid/dexamethasone, Darzalex (daratumumab injection)/bortezomib or Kyprolis/dexamethasone, or other regimens containing a proteasome inhibitor, immunomodulatory drug, and/or anti-CD38 monoclonal antibody.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Xpovio is not recommended in the following situations:

159. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
New Policy	--	07/08/2019
Annual Revision	**Diffuse B-Cell Lymphoma:** This newly approved indication was added as a 3-year approval, if the patient is ≥ 18 years of age, and if the patient has tried at least two prior systemic therapies. **Multiple Myeloma:** Criteria were added to require that the patient is ≥ 18 years of age, and that Xpovio be prescribed in combination with dexamethasone. This is aligned with the FDA-approved labeling. Sarclisa and Darzalex Faspro were added as examples of anti-CD38 monoclonal antibodies which may have been tried prior to Xpovio.	07/01/2020
Update	07/10/2020: No criteria changes. Overview was updated to include NCCN recommendations for diffuse large B-cell lymphoma.	N/A
Early Annual Revision	**Multiple Myeloma:** Criteria were added to approve in the second-line setting, if the patient is ≥ 18 years of age, patient has tried one previous regimen, and Xpovio will be taken in combination with dexamethasone and one of the following medications: bortezomib, Darzalex (daratumumb infusion), Darzlaex Faspro (daratumumab and hyaluronidase-fihj injection), or Pomalyst (pomalidomide capsules). For use in the fifth-line setting, criteria were changed to require at least four prior regimens for multiple myeloma, with examples of regimens listed in a note. Previously, criteria specified which mechanisms of action must have been in the regimens and included two proteasome inhibitors, two immunomodulatory drugs, and an anti-CD-38 monoclonal antibody.	02/03/2021

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Xtandi® (enzalutamide capsules – Astellas Pharma/Catalent Pharma Solutions/Medivation)

DATE REVIEWED: 03/04/2020

OVERVIEW

Xtandi is an androgen receptor inhibitor indicated for the treatment of patients with castration-resistant prostate cancer (CRPC).[1] It is also indicated for the treatment of patients with metastatic castration-sensitive prostate cancer (mCSPC). Patients should receive Xtandi with a concurrent gonadotropin-releasing hormone (GnRH) analog or should have had a bilateral orchiectomy.

Guidelines

According to the NCCN guidelines on prostate cancer (version 4.2019 – August 19, 2019), all patients with mCRPC should maintain castrate levels of serum testosterone (< 50 ng/dL) and receive best supportive care.[2] Erleada™ (apalutamide tablets), Nubeqa (darolutamide tablets), and Xtandi are all category 1 recommended options for non-metastatic CRPC (M0) especially if the prostate specific antigen doubling time (PSADT) ≤ 10 months.

- For patients who progress to CRPC and are positive for distant metastasis, M1, and there are no visceral metastases, Zytiga® (abiraterone acetate tablets) and prednisone, docetaxel, Xtandi, and Xofigo® (radium Ra 223 dichloride injection, for intravenous use) [for symptomatic bone metastases] are all category 1 recommended options.
  - If there are visceral metastases, and if it is adenocarcinoma (majority), Xtandi and docetaxel are category 1 recommended options. Zytiga and prednisone, mitoxantrone with prednisone, or other secondary hormone therapies are other options (all category 2A).
  - For no visceral metastases, if patients had received prior therapy with Xtandi or Zytiga, then docetaxel and Xofigo are the category 1 options for subsequent therapy. If patients received prior docetaxel

therapy, then Xtandi, Zytiga, Xofigo, and cabazitaxel are the category 1 options. For subsequent therapy with visceral metastases, docetaxel is the recommended category 1 option, if either Xtandi or Zytiga were used as prior therapies. For prior therapy with docetaxel, Xtandi, Zytiga, cabazitaxel are the recommended category 1 options.

- For metastatic, castration-naïve disease, ADT in combination with abirateron + prednisone, Erleada, and Xtandi are all category 1 recommended options. Yonsa (abiraterone acetate) with methylprednisolone is a category 2B recommendation.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Xtandi. All approvals are provided for 3 years in duration unless otherwise noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Xtandi is recommended in those who meet the following criteria:

FDA-Approved Indication

~~64.~~61. **Prostate Cancer –Castration-Resistant (CRPC) [Metastatic or Non-Metastatic].** Approve for 3 years if the patient meets the following criteria (A or B):

A) The medication is used concurrently with a gonadotropin-releasing hormone (GnRH) analog.
Note: Examples are Lupron (leuprolide for injection), Lupron Depot (leuprolide acetate for depot suspension), Trelstar (triptorelin pamoate for injectable suspension), Zoladex (goserelin acetate implant), Vantas (histrelin acetate subcutaneous implant), Firmagon (degarelix for injection); OR

B) The patient has had a bilateral orchiectomy.

2. **Prostate Cancer – Metastatic, Castration-Sensitive.** Approve for 3 years if the patient meets one of the following criteria (A or B):

A) The medication is used concurrently with a gonadotropin-releasing hormone (GnRH) analog.
Note: Examples are Lupron (leuprolide for injection), Lupron Depot (leuprolide acetate for depot suspension), Trelstar (triptorelin pamoate for injectable suspension), Zoladex (goserelin acetate implant), Vantas (histrelin acetate subcutaneous implant), Firmagon (degarelix for injection); OR

B) The patient has had a bilateral orchiectomy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Xtandi has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval).

265. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes*	Date Reviewed
Early Annual revision	No criteria changes	02/01/2017
Annual revision	No criteria changes	02/28/2018
Selected revision	Xtandi is now FDA-approved for use in CRPC, regardless of metastatic status. Modified approval condition to match FDA indication. Deleted separate approval for non-metastatic CRPC from Other Uses with Supportive Evidence.	07/25/2018
Annual revision	No criteria changes	02/27/2019
Selected revision	For all indications, added criteria for concomitant use of Xtandi with GnRH agonist or patient has had bilateral orchiectomy, as per Xtandi dosing requirements. Based on Phase III Enzamet trial and guideline support, added approval indication for Xtandi use in metastatic castration-sensitive prostate cancer under "Other Uses with Supportive Evidence."	10/09/2019
Update	01/03/2020. Deleted "Other Uses with Supportive Evidence" heading since metastatic castration-sensitive prostate cancer is now an FDA-approved use for Xtandi.	N/A
Annual revision	For concurrent use of Xtandi with gonadotropin-releasing hormone "agonist", changed criteria to state "analog" since both agonists and antagonist can be used. Added Firmagon as an example for antagonist.	03/04/2020

N/A – Not applicable.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Yonsa® (abiraterone acetate tablets – Sun Pharmaceutical Industries, Inc.)

DATE REVIEWED: 06/10/2020

OVERVIEW

Yonsa is an androgen biosynthesis inhibitor that inhibits the enzyme 17 α-hydroxylase/C17,20-lyase (CYP17).[1] This enzyme is expressed in testicular, adrenal, and prostatic tumor tissues and is required for androgen biosynthesis. Yonsa, in combination with methylprednisolone, is indicated for the treatment of patients with metastatic castration-resistant prostate cancer (mCRPC). Inhibition of CYP17 by Yonsa can also result in increased mineralocorticoid production by the adrenal glands; the use of methylprednisolone with Yonsa is to counteract this mineralocorticoid excess.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on prostate cancer (version 2.2019 – April 17, 2019) have the following recommendations for Zytiga® [abiraterone acetate tablets] and Yonsa.[2]

- At initial diagnosis, for patients classified in the regional risk group (metastases in regional nodes [N1] with no distant metastases [M0]) and with a > 5 year expected patient survival, external beam radiation therapy (EBRT) + androgen deprivation therapy (ADT) [category 1] + Zytiga and prednisone (category 2A) or Yonsa and methylprednisolone (category 2B) are recommended options. ADT (without EBRT) ± Zytiga and prednisone is a category 2A recommended option in this setting; ADT + Yonsa and methylprednisolone is a category 2B recommendation.
- If patients are positive for distant metastasis (M1) and have castration-naïve disease, ADT + Zytiga and prednisone and ADT + docetaxel are both category 1 recommended options. ADT + Yonsa and methylprednisolone is a category 2B recommendation in this setting.
- For patients who progress to CRPC and are positive for distant metastasis, M1 and there are no visceral metastases, Zytiga and prednisone, docetaxel, Xtandi, and Xofigo® (radium Ra 223 dichloride injection, for intravenous use) [for symptomatic bone metastases] are all category 1 recommended options. Yonsa + methylprednisolone is a category 2A recommendation for mCRPC either as first-line or subsequent therapy option.

- If there are visceral metastases, Xtandi and docetaxel are category 1 recommended options. Zytiga and prednisone, Yonsa and methylprednisolone are category 2A recommendations for first-line or second-line treatment after Xtandi. If docetaxel was used previously, Zytiga and prednisone is a category 1 recommendation; Yonsa and methylprednisolone is a category 2A recommendation.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Yonsa. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Yonsa is recommended in those who meet the following criteria:

FDA-Approved Indication

4. Prostate Cancer – Metastatic, Castration-Resistant (mCRPC). Approve for 3 years if the patient meets the following criteria (A and B):
- **A)** The medication is used in combination with methylprednisolone; AND
- **B)** The patient meets ONE of the following criteria (i or ii):
  - **i.** The medication is concurrently used with a gonadotropin-releasing hormone (GnRH) analog. Note: Examples are Lupron (leuprolide for injection), Lupron Depot (leuprolide acetate for depot suspension), Trelstar (triptorelin pamoate for injectable suspension), Zoladex (goserelin acetate implant), Vantas (histrelin acetate subcutaneous implant), Firmagon (degarelix for injection); OR
  - **ii.** The patient has had a bilateral orchiectomy.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Yonsa has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

266. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

POLICY: Oncology – Zejula Prior Authorization Policy
- Zejula™ (niraparib capsules – Tesaro, Inc.)

REVIEW DATE: 12/09/2020

OVERVIEW

Zejula, a poly (ADP-ribose) polymerase (PARP) inhibitor, is indicated:[1]

- **Ovarian, fallopian tube, primary peritoneal cancer**, **maintenance treatment** of adult patients with advanced epithelial ovarian, fallopian tube, or primary peritoneal cancer who are in a complete or partial response to first-line platinum-based chemotherapy.
- **Ovarian, fallopian tube, primary peritoneal cancer**, **maintenance treatment** of adult patients with recurrent epithelial ovarian, fallopian tube, or primary peritoneal cancer who are in a complete or partial response to platinum-based chemotherapy.
- **Ovarian, fallopian tube, primary peritoneal cancer**, **treatment** of adult patients with advanced ovarian, fallopian tube, or primary peritoneal cancer who have been treated with three or more prior chemotherapy regimens and whose cancer is associated with homologous recombination deficiency (HRD) positive status defined by either: a) a deleterious or suspected deleterious BRCA mutation OR b) genomic instability and who have progressed more than six months after response to the last platinum-based chemotherapy.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for ovarian cancer (version 1.2020 – March 11, 2020) has the following recommendations:[2]

Recurrent Disease – Treatment

For recurrent disease, Lynparza™ (olaparib capsules), Rubraca™ (rucaparib tablets), and Zejula are among the preferred targeted therapy agents for both platinum-sensitive and platinum-resistant disease (all category 2A). All are recommended following two or more lines of chemotherapy (Lynparza and Rubraca) or three or more lines of chemotherapy (Zejula) are otherwise recommended as per their FDA-approved use in the treatment of patients with advanced ovarian cancer. Zejula + bevacizumab (category 2A) is also an Other Recommended targeted therapy regimen for platinum-sensitive disease. NCCN lists several other potentially active agents for recurrence therapy.

First-Line Maintenance

Maintenance recommendations following primary treatment (first-line maintenance) apply to stage II, III, or IV ovarian cancer after primary treatment if the patient is in complete or partial remission. In patients with a germline or somatic *BRCA* mutation, both Lynparza and Zejula have a category 1 recommendation if no bevacizumab was used during primary therapy. If bevacizumab was used during primary therapy for patients with a germline or somatic *BRCA* mutation, Lynparza + bevacizumab is a category 1 recommendation for maintenance, whereas monotherapy with Lynparza or Zejula have category 2A recommendations. For patients with *BRCA* wild-type or unknown mutation status, Zejula (if no bevacizumab during primary therapy) and Lynparza + bevacizumab (if bevacizumab was used during primary therapy) are among the recommendations for maintenance (category 2A for both).

Recurrent Disease – Maintenance

In patients with platinum-sensitive disease who have completed at least two lines of platinum-based therapy for persistent disease or recurrence and have achieved a complete or partial response, Zejula, Rubraca, or Lynparza (all category 2A) can be considered for maintenance therapy.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Zejula. All approvals are provided for 3 years in duration unless otherwise noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zejula is recommended in those who meet the following criteria:

FDA-Approved Indications

~~65.~~62. **Ovarian, Fallopian Tube, or Primary Peritoneal Cancer – Maintenance Therapy.** Approve for 3 years if the patient meets the following (A, and B):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient is in complete or partial response after platinum-based chemotherapy regimen.
  Note: Examples of chemotherapy regimens are carboplatin with gemcitabine, carboplatin with paclitaxel, cisplatin with gemcitabine.

2. **Ovarian, Fallopian Tube, or Primary Peritoneal Cancer – Treatment.** Approve for 3 years if the patient meets the following criteria (A, B, and C):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient has tried at least three prior chemotherapy regimens; AND
     Note: Examples of chemotherapy regimens are carboplatin/gemcitabine, carboplatin/liposomal doxorubicin, carboplatin/paclitaxel, cisplatin/gemcitabine, capecitabine, irinotecan.
   - **C)** Patient has homologous recombination deficiency (HRD)-positive disease as confirmed by an approved test.
     Note: HRD-positive disease includes patients with *BRCA* mutation-positive disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Zejula is not recommended in the following situations:

267. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
New Policy	--	04/19/2017
Early Annual Revision	Deleted criteria requiring at least two prior chemotherapy regimens to align it with FDA approved indication. Added qualifier "Maintenance Therapy" to approval condition description.	02/07/2018
Annual Revision	Modified Maintenance Therapy criteria in recurrent disease setting to state that it is after at least two lines of platinum-based chemotherapy, based on guidelines.	02/06/2019
Early Annual Revision	Added new indication for Zejula use in treatment setting.	11/20/2019
Selected Revision	In "Maintenance Therapy" indication, deleted criteria "patient has recurrent disease."	03/11/2020
Selected Revision	Due to the FDA approval of Zejula in the maintenance therapy setting after first-line chemotherapy, deleted reference to "at least two" platinum-based chemotherapies.	05/13/2020
Annual Revision	**Ovarian, Fallopian Tube, or Primary Peritoneal Cancer**: Added age criteria for both indications (Maintenance and Treatment).	12/09/2020

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Zelboraf Prior Authorization Policy

- Zelboraf® (vemurafenib tablets – Genentech/Daiichi Sankyo)

REVIEW DATE: 07/15/2020

OVERVIEW

Zelboraf, a BRAF inhibitor, is indicated for the following indications:[1]

- **Erdheim-Chester disease**, for treatment of patients with the *BRAF V600* mutation.
- **Melanoma**, for treatment of unresectable or metastatic disease with *BRAF V600E* mutation as detected by an FDA-approved test.

Of note, Cotellic® (cobimetinib tablets) is a MEK inhibitor that is indicated to be given in combination with Zelboraf in a similar patient population with melanoma). Zelboraf is not recommended for use in patients with wild-type BRAF melanoma.

Guidelines

National Comprehensive Cancer Network (NCCN) guidelines support use of Zelboraf in multiple cancers.

- **Melanoma:** Guidelines (version 3.2020 – May 18, 2020) recommend BRAF/MEK inhibitor combinations for first-line (preferred if clinically needed for early response) and subsequent treatment of metastatic or unresectable melanoma with a *V600* activating mutation.[2] While combination BRAF/MEK inhibition is preferred, if a combination is contraindicated, monotherapy with a BRAF inhibitor (Tafinlar® [dabrafenib capsules] or Zelboraf) is a recommended option, particularly if the patient is not a candidate for checkpoint immunotherapy. Following resection of limited metastatic disease with a *BRAF V600*-activating mutation, BRAF/MEK combination therapy is among the treatment options for patients with no evidence of disease. Tafinlar + Mekinist® (trametinib tablets) is also recommended in guidelines as adjuvant therapy (including for nodal recurrence) in some patients with Stage III disease, including use post-surgery or use after complete lymph node dissection. If unacceptable toxicity to Tafinlar/Mekinist, other BRAF/MEK combinations can be considered.
- **Hairy Cell Leukemia:** NCCN guidelines for hairy cell leukemia (version 1.2020 – August 23, 2019) list Zelboraf ± rituximab among the treatment options for relapsed or refractory disease.[3]

- **Non-Small Cell Lung Cancer:** NCCN guidelines (version 6.2020 – June 25, 2020) list Tafinlar + Mekinist among the first-line therapy and subsequent therapy options for tumors with a *BRAF* mutation.[4] NCCN also notes that monotherapy with a BRAF inhibitor (Tafinlar or Zelboraf) is a treatment option when combination therapy is not tolerated.
- **Thyroid Cancer:** Guidelines (version 1.2020 – June 12, 2020) list Tafinlar + Mekinist as a treatment option for metastatic anaplastic thyroid cancer with a *BRAF* mutation.[5] Tafinlar and Zelboraf are also treatment options for the treatment of iodine-refractory differentiated thyroid cancer (follicular, Hürthle cell, and papillary cancer subtypes) with a *BRAF V600* mutation.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Zelboraf. All approvals are provided for 3 years unless otherwise noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zelboraf is recommended in those who meet the following criteria:

FDA-Approved Indications

7. **Erdheim-Chester Disease.** Approve for 3 years if the patient has *BRAF V600* mutation-positive disease.

8. **Melanoma.** Approve Zelboraf for 3 years if the patient meets BOTH of the following (A and B):
   A) Patient has unresectable, advanced, or metastatic melanoma; AND
   B) Patient has *BRAF V600* mutation-positive disease.

Other Uses with Supportive Evidence

9. **Hairy Cell Leukemia.** Approve for 3 years if the patient has tried at least one other systemic therapy for hairy cell leukemia.
   Note: Examples of other systemic therapies include cladribine, Nipent (pentostatin injection), rituximab injection, Intron A (interferon alpha-2b injection).

10. **Non-Small Cell Lung Cancer.** Approve for 3 years if the patient has *BRAF V600E* mutation-positive disease.

11. **Thyroid Cancer, Differentiated.** Approve Zelboraf for 3 years if the patient meets ALL of the following conditions (A, B, and C):
    D) Patient has differentiated thyroid carcinoma; AND
    Note: Examples of differentiated thyroid carcinoma include papillary, follicular, or Hürthle cell thyroid cancers.
    E) Patient has disease that is refractory to radioactive iodine therapy; AND
    F) Patient has *BRAF* mutation-positive disease.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Zelboraf is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

411. The NCCN Non-Small Cell Lung Cancer Clinical Practice Guidelines in Oncology (Version 6.2020 – June 15, 2020). © 2020 National Comprehensive Cancer Network, Inc. Available at: http://www.nccn.org. Accessed on July 2, 2020.
412. The NCCN Thyroid Carcinoma Clinical Practice Guidelines in Oncology (Version 1.2020 – June 12, 2020). © 2020 National Comprehensive Cancer Network, Inc. Available at: http://www.nccn.org. Accessed on July 2, 2020.

HISTORY

Type of Revision	Summary of Changes	Review Date
Early annual revision	Align criteria for melanoma with Tafinlar PA criteria; remove criteria that does not allow coverage in patients who had disease progression while on a BRAF inhibitor. Remove continuation criteria in melanoma; now all approvals require that the patient has unresectable, advanced, or metastatic melanoma with a BRAF mutation.	05/23/2018
Annual revision	**Colon or Rectal Cancer:** Add criteria as supported by NCCN colon cancer guidelines. Criteria approve if the patient has *BRAF V600E* mutation-positive disease, and if the patient has previously used chemotherapy (including as adjuvant use), and if the agent will be used as part of a combination regimen for colon or rectal cancer. **Hairy Cell Leukemia:** To align with updated guidelines, change criteria to require at least one previous therapy (previously required two therapies prior to Zelboraf). **NSCLC:** The diagnosis was changed to remove the BRAF mutation from the approval condition. The requirement that the patient has BRAF V600E mutation was added to the criteria for patients with NSCLC.	06/18/2019
Annual revision	**Colon or Rectal Cancer:** This indication was removed from the policy. Zelboraf is no longer a recommended therapy in guidelines for colon and rectal cancer. **Hairy Cell Leukemia:** For the criterion that requires a previous therapy, clarify that that this must be a systemic therapy. Since a previous systemic therapy is required, remove the requirement that the patient has relapsed/refractory disease (not needed). Examples of systemic therapies were moved to a Note (previously listed as examples within the criteria). **Thyroid Cancer:** Examples of differentiated thyroid cancer were moved to a note (previously listed as an i.e. within criteria).	07/15/2020

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Zolinza Prior Authorization Policy

- Zolinza® (vorinostat capsules – Merck)

REVIEW DATE: 07/22/2020

OVERVIEW

Zolinza, a histone deacetylase inhibitor, is indicated for the treatment of cutaneous manifestations in patients with cutaneous T-cell lymphoma who have progressive, persistent or recurrent disease on or following two systemic therapies.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) clinical practice guidelines for primary cutaneous lymphomas (Version 2.2020 – April 10, 2020) list Zolinza as a preferred systemic therapy for mycosis fungoides/Sezary syndrome.[2,3] Zolinza can be used for primary treatment or for relapsed, persistent, or refractory disease.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Zolinza. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zolinza is recommended in those who meet the following criteria:

FDA-Approved Indications

150. Cutaneous T-Cell Lymphoma including Mycosis Fungoides/Sezary Syndrome. Approve for 3 years.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Zolinza is not recommended in the following situations:

160. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Zydelig Prior Authorization Policy
- Zydelig® (idelalisib tablets – Gilead)

REVIEW DATE: 06/03/2020

OVERVIEW

Zydelig, an inhibitor of phosphatidylinositol 3-kinase, is indicated for the treatment of patients with 1) relapsed chronic lymphocytic leukemia (CLL), in combination with rituximab, in patients for whom rituximab alone would be considered appropriate therapy due to other comorbidities; 2) relapsed follicular B-cell non-Hodgkin lymphoma in patients who have received at least two prior systemic therapies; and 3) relapsed small lymphocytic lymphoma (SLL) in patients who have received at least two prior systemic therapies.[1] Accelerated approval was given for the relapsed follicular B-cell non-Hodgkin lymphoma and SLL indications based on overall response rate (ORR). Improvement in patient survival or disease-related symptoms has not been established. A limitation of use for all three indications is that Zydelig is not indicated and is not recommended for first-line treatment.

Disease Overview

CLL is one of the most prevalent adult leukemias in the Western world.[5] In 2019, an estimated 20,720 patients will be diagnosed with CLL in the US, and approximately 3,930 patients will die from the disease. The condition usually is diagnosed in older adults (≥ 70 years of age) and occurs more frequently in men. The leukemic cells appear as small, mature lymphocytes. CLL and SLL are different manifestations of the same condition and are managed similarly. In CLL, many of the abnormal lymphocytes are found in the blood, as well as in the bone marrow and lymphoid tissue. In SLL, there are few, if any, abnormal lymphocytes circulating in blood and most of the disease is in the lymph nodes, bone marrow, and other lymphoid tissue. The diagnosis requires the presence of at least 5×10^9/L monoclonal B-lymphocytes in the peripheral blood. SLL requires the presence of lymphadenopathy and/or splenomegaly with $< 5 \times 10^9$/L B-lymphocytes found in the peripheral blood.

Follicular lymphoma is the most common subtype of indolent non-Hodgkin's lymphoma accounts for approximately 22% of all newly diagnosed cases of non-Hodgkin lymphoma.[8] Most cases (90%) of follicular lymphoma have a t(14;18) translocation, which results in the deregulated expression of BCL-2 protein. Pediatric type follicular lymphoma may occur, albeit rare.[8] Many patients with follicular lymphoma present with asymptomatic lymphadenopathy and bone marrow involvement is present. Some patients also have increased serum lactate dehydrogenase (LDH) is present. Patients with early stage disease generally receive radiation therapy as good responses have been achieved. Although further study is required, chemoimmunotherapy or systemic therapy plus radiation therapy may improve outcomes. Most patients present with advanced disease at diagnoses. Patients who are asymptomatic may not require immediate treatment. Rituximab, used with or without other therapies, has dramatically changed the course of treating follicular lymphoma, with noted improvement in survival. Autologous or allogeneic stem cell transplantations may be considered in some clinical scenarios but are generally reserved for patients with relapsed or refractory disease.

Guidelines

The National Comprehensive Cancer Network (NCCN) clinical practice guidelines for CLL/SLL (version 4.2020 – December 20, 2019) address CLL. Zydelig is recommended with or without rituximab for relapsed or refractory therapy for CLL in various scenarios.[5] Many other agents have a more prominent role in the first-line management of CLL.[5,6] The guidelines note that CLL and SLL are different manifestations of the same condition and are treated similarly.

The NCCN clinical practice guidelines for B-cell Lymphomas (version 1.2020 – January 22, 2020) recommend Zydelig as second-line and subsequent therapy in patients with follicular lymphoma (grade 1-2) among patients refractory to two prior therapies.[8]

The NCCN clinical practice guidelines for B-Cell Lymphomas (version 1.2020 – January 22, 2020) recommend Zydelig as second-line and subsequent therapy for marginal zone lymphomas that are relapsed/refractory to two prior therapies.[8] Other regimens are recommended first line that are primarily rituximab-based.

Safety

Zydelig has a Boxed Warning regarding fatal and serious toxicities such as hepatotoxicity, fatal and/or serious and severe diarrhea or colitis, fatal and serious pneumonitis, fatal and/or serious infections, and fatal and serious intestinal perforation.[1] Zydelig was approved with a Risk Evaluation and Mitigation Strategy (REMS) program to highlight toxicities noted in the Boxed Warning.[2] The REMS program involves a communication plan. In March 2016, the FDA issued a healthcare professionals alert regarding studies with Zydelig which revealed an increased rate of adverse events (AEs), including deaths, in clinical trials when Zydelig was used in combination with other cancer medications.[3] The manufacturer is halting six clinical trials in patients with CLL, SLL and indolent non-Hodgkin lymphomas.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Zydelig. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zydelig is recommended in those who meet the following criteria:

FDA-Approved Indications

~~66.~~63. **Chronic Lymphocytic Leukemia (CLL).** Approve for 3 years if the patient has tried at least two prior therapies.
Note: Examples include Imbruvica® (ibrutinib capsules and tablets); chlorambucil plus Gazyva® (obinutuzumab injection for intravenous use); chlorambucil plus rituximab; FCR (fludarabine, cyclophosphamide and rituximab); FR (fludarabine plus rituximab); PCR (pentostatin, cyclophosphamide, rituximab); Treanda® (bendamustine injection) with or without rituximab; high-dose methylprednisolone (HDMP) plus rituximab; Campath® (alemtuzumab injection for intravenous use) with or without rituximab; Venclexta® (venetoclax tablets) with or without rituximab; Calquence® (acalabrutinib capsules); Gazyva; rituximab; Arzerra® (ofatumumab injection for intravenous use); chlorambucil; Venclexta plus Gazyva; or Copiktra (duvelisib capsules).

~~67.~~64. **Follicular Lymphoma.** Approve for 3 years if the patient has tried at least two prior therapies.
Note: Examples include Treanda® (bendamustine injection) plus rituximab; Treanda plus Gazyva®

(obinutuzumab injection for intravenous use); CHOP (cyclophosphamide, doxorubicin, vincristine, prednisone) plus Gazyyva or rituximab; CVP (cyclophosphamide, vincristine, prednisone) plus Gazyva or rituximab; chlorambucil with or without rituximab; cyclophosphamide with or without rituximab; Gazyva; Revlimid® (lenalidomide capsules); Copiktra™ (duvelisib capsules); or Aliqopa® (copanlisib injection for intravenous use).

~~68.~~65. **Small Lymphocytic Lymphoma (SLL).** Approve for 3 years if the patient has tried at least two prior therapies.
Note: Examples include Imbruvica® (ibrutinib capsules or tablets); chlorambucil plus Gazyva® (obinutuzumab injection for intravenous use); chlorambucil plus rituximab; FCR (fludarabine, cyclophosphamide and rituximab); FR (fludarabine plus rituximab); PCR (pentostatin, cyclophosphamide, rituximab); Treanda® (bendamustine injection) with or without rituximab; high-dose methylprednisolone (HDMP) plus rituximab; Venclexta® (venetoclax tablets) with or without rituximab; Calquence® (acalabrutinib capsules); Gazyva; rituximab; Arzerra® (ofatumumab injection for intravenous use); chlorambucil; Venclexta plus Gazyva; or Copiktra (duvelisib capsules).

Other Uses with Supportive Evidence

268. Marginal Zone Lymphoma. Approve for 3 years if the patient has tried at least two other therapies.
Note: Examples include rituximab; Treanda® (bendamustine injection for intravenous use) plus rituximab; RCHOP (rituximab, cyclophosphamide, vincristine, prednisone); RCVP (rituximab, cyclophosphamide, vincristine, prednisone); chlorambucil with or without rituximab; cyclophosphamide with or without rituximab; Imbruvica® (ibrutinib tablets and capsules); Copiktra™ (duvelisib capsules); Revlimid® (lenalidomide capsules) with or without rituximab; or Aliqopa® (copanlisib injection for intravenous use).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Zydelig has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Early Annual Revision	Alternatives for CLL revised (agents removed or added) based on NCCN guidelines. For Follicular B-Cell Non-Hodgkin Lymphoma changed the requirement that patients have tried two prior therapies instead of one therapy, to make it in-line with FDA-approved labeling; therapy alternatives were slightly revised based on NCCN guidelines. For SLL changed the requirement that patients have tried two prior therapies instead of one therapy to make it in-line with FDA-approved labeling; therapy alternatives were slightly revised based on NCCN guidelines. Criteria added regarding approval for marginal zone lymphoma if the patient had tried two other prior therapies based on NCCN guidelines.	05/16/2018
Annual Revision	For clarity, the reference to Rituxan when listing previous required therapies was changed to "rituximab". The following changes were also made: 1. **Chronic Lymphocytic Leukemia:** The number of therapies required prior to approval of Zydelig was changed from one to two. Also, Venclexta plus Gazyva and Copiktra were added to the list of examples of agents that count toward this requirement. 2. **Follicular Lymphoma:** The wording "B-Cell Non-Hodgkin" was removed from the cited condition. The RCHOP regimen was removed from the listing of alternatives and the regimen that cited "CHOP plus Gazyva" was the changed to "CHOP plus Gazyva or rituximab". Likewise, the RCVP alternative was changed to state "CVP plus Gazyva or rituximab". Copiktra was also listed as an alternative that counts as the requirement to try two prior therapies. 3. **Small Lymphocytic Lymphoma:** Venclexta plus Gazyva and Copiktra were added to the list of examples of agents that count toward the requirement of a trial of two prior therapies. 4. **Marginal Zone Lymphoma:** Copiktra and Revlimid (with or without rituximab) were added as alternatives that count towards the requirement of two prior therapies.	06/05/2019
Annual Revision	**The following changes were made:** 1. **Chronic Lymphocytic Leukemia:** The wording of "at least" was added to the requirement that patients try two therapies. Also, the examples of therapies were removed from the criteria and placed into a note. Chlorambucil plus Arzerra® (ofatumumab injection for intravenous use) was removed from the list of examples. 2. **Follicular Lymphoma:** The wording of "at least" was added to the requirement that patients try two therapies. Also, the examples of therapies were removed from the criteria and placed into a note. 3. **Small Lymphocytic Lymphoma:** The wording of "at least" was added to the requirement that patients try two therapies. Also, the examples of therapies were removed from the criteria and placed into a note. Chlorambucil plus Arzerra® (ofatumumab injection for intravenous use) was removed from the list of examples. 4. **Marginal Zone Lymphoma:** The wording of "at least" was added to the requirement that patients try two therapies. Also, the examples of therapies were removed from the criteria and placed into a note.	06/03/2020

CLL – Chronic lymphocytic leukemia; NCCN – National Comprehensive Cancer Network; FDA – Food and Drug Administration; SLL – Small lymphocytic lymphoma.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology – Zykadia™ (ceritinib capsules and tablets – Novartis Pharmaceuticals)

DATE REVIEWED: 06/10/2020

OVERVIEW

Zykadia, a kinase inhibitor, is indicated for the treatment of patients with anaplastic lymphoma kinase (*ALK*)-positive metastatic non-small cell lung cancer (NSCLC), as detected by an FDA-approved test.[1] Using biochemical or cellular assays at clinically relevant concentrations, it has been noted that Zykadia inhibits *ALK*, insulin-like growth factor 1 receptor (IGF-1R), insulin receptor (InsR), and c-ros oncogene 1 (ROS1). Among these, Zykadia is most effective against *ALK*.

A multicenter, open-label, Phase II study evaluated the efficacy of Zykadia in patients with ROS1-rearranged NSCLC (n = 32).[5] All patients, except two, were Xalkori treatment-naïve. Patients received Zykadia at the recommended dose of 750 mg/day. The overall objective response rate (ORR) was 62% (95% CI: 45%, 77%); in Xalkori-naïve patients the ORR was 67%. The median PFS was 9.3 months and the median PFS for Xalkori-naïve patients was 19.3 months (95% CI: 1, 37). The median OS was 24 months (95% CI: 5, 43) with a 6-month OS rate of 84% and a 12-month OS rate of 56%. Only eight patients had brain metastases at baseline. The overall intracranial ORR was 25% (n = 2/8) and the DCR was 63% (n = 5/8). The NCCN NSCLC guidelines recommend Xalkori (preferred) or Zykadia as first-line options for ROS1-positive NSCLC (both category 2A).

GUIDELINES

According to the National Comprehensive Cancer Network (NCCN) NSCLC guidelines (version 5.2020 – May 27, 2020), Alecensa® (alectinib capsules) is the "preferred" first-line therapy for ALK-positive NSCLC. Zykadia and Alunbrig® (brigatinib tablets) are "Other Recommended" first-line therapies. Xalkori® (crizotinib capsules) is a category 1 agent under "Useful in Certain Circumstances". and [[2] For progression on Alecensa, Alunbrig, or Zykadia, for multiple systemic lesions, Lorbrena (lorlatinib tablets) is a recommended option or initial systemic therapy options can be considered (both category 2A). Xalkori (preferred) or Zykadia are recommended as first-line therapy for ROS1 rearrangement-positive NSCLC (both category 2A). Lorbrena is recommended for subsequent therapy.

The NCCN guidelines for soft tissue sarcoma (version 2.2019 – February 4, 2019) recommend Zykadia as a single-agent therapy for the treatment of IMT with ALK translocation (category 2A recommendation).[4-5]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Zykadia. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Zykadia is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Non-Small Cell Lung Cancer (NSCLC).** Approve for 3 years if the patient has metastatic anaplastic lymphoma kinase (*ALK*)-positive NSCLC as detected by an approved test.

Other Uses with Supportive Evidence

2. **Non-Small Cell Lung Cancer (NSCLC) with ROS1 Rearrangement – First-Line Therapy.** Approve for 3 years.

3. **Soft Tissue Sarcoma Inflammatory Myofibroblastic Tumor (IMT) with ALK Translocation.** Approve for 3 years.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Zykadia has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

269. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Adcetris Prior Authorization Policy

- Adcetris® (brentuximab injection for intravenous use – Seattle Genetics, Inc.)

REVIEW DATE: 09/23/2020

OVERVIEW

Adcetris, a CD30 directed antibody conjugate, is indicated for the following uses:

- **Classical Hodgkin lymphoma**, in patients with previously untreated Stage III or IV disease, in combination with doxorubicin, vinblastine, and dacarbazine.
- **Classical Hodgkin lymphoma**, in patients at high risk of relapse or progression as post-autologous hematopoietic stem cell transplantation consolidation.
- **Classical Hodgkin lymphoma**, in patients who are not autologous hematopoietic stem cell transplantation candidates and after failure of autologous hematopoietic stem cell transplantation or after failure of at least two prior multi-agent chemotherapy regimens.
- **Primary cutaneous anaplastic large cell lymphoma** or **CD30-expressing mycosis fungoides**, in patients who have received prior systemic therapy.
- **Systemic anaplastic large cell lymphoma** or other **CD30-expressing peripheral T-cell lymphomas**, including angioimmunoblastic T-cell lymphoma and peripheral T-cell lymphomas not otherwise specified, in previously untreated patients in combination with cyclophosphamide, doxorubicin, and prednisone.
- **Systemic anaplastic large cell lymphoma**, in patients who have failed at least one prior multi-agent chemotherapy regimen.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) Hodgkin Lymphoma Clinical Practice Guidelines (version 2.2020 – April 17, 2020) recommend Adcetris for the treatment of classical Hodgkin Lymphoma in combination with chemotherapy, as second-line or subsequent therapy for relapsed or refractory disease, as maintenance therapy following high-dose therapy and autologous stem cell rescue for relapsed or refractory disease, or as palliative therapy.[2,3]

The NCCN T-Cell Lymphomas Clinical Practice Guidelines (version 1.2020 – January 6, 2020) recommend Adcetris as a preferred first-line therapy in combination with CHP (cyclophosphamide, doxorubicin, prednisone) for the treatment of CD30+ anaplastic large cell lymphoma (ALCL), CD30+ peripheral T-cell lymphoma not otherwise specified, CD30+ angioimmunoblastic T-cell lymphoma, CD30+ enteropathy-associated T-cell lymphoma, CD30+ monomorphic epitheliotropic intestinal T-cell lymphoma, CD30+ nodal peripheral T-cell lymphoma with T follicular helper (TFH) phenotype, CD30+ hepatosplenic gamma-delta T-cell lymphoma, or CD30+ follicular T-cell lymphoma.[2,4] As a single agent for subsequent therapy for relapsed/refractory ALCL, CD30+ peripheral T-cell lymphoma, CD30+ hepatosplenic gamma-delta T-cell lymphoma, CD30+ extranodal NK/T-cell lymphoma – nasal type, or CD30+ angioimmunoblastic T-cell lymphoma. As a single agent or as a component of CHP for the treatment of CD30+ adult T-cell leukemia/lymphoma. As a single agent or in combination with CHP for the adjuvant treatment of CD30+ breast implant-associated ALCL.

The NCCN Primary Cutaneous Lymphomas Clinical Practices Guidelines (version 2.2020 – April 10, 2020) recommend Adcetris for the systemic therapy of CD30+: mycosis fungoides/Sezary syndrome, primary cutaneous anaplastic large cell lymphoma, and lymphomatoid papulosis.[2,5]

The NCCN B-Cell Lymphomas Clinical Practice Guidelines (version 4.2020 – August 13, 2020) recommend Adcetris for the second-line or subsequent treatment of histologic transformation of follicular lymphoma to CD30+ diffuse large B-cell lymphoma (DLBCL), histologic transformation of nodal marginal zone lymphoma to CD30+ DLBCL, CD30+ DLBCL, CD30+ high-grade B-cell lymphoma, CD30+ acquired immunodeficiency syndrome (AIDS)-related B-cell lymphoma, and CD30+ post-transplant lymphoproliferative disorders.[2,6]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Adcetris. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Adcetris as well as the monitoring required for adverse events and long-term efficacy, approval requires Adcetris to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Adcetris is recommended in those who meet the following criteria:

FDA-Approved Indications

151. Hodgkin Lymphoma. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has classical Hodgkin lymphoma; AND
- **C)** The medication is prescribed by or in consultation with an oncologist.

152. T-Cell Lymphoma. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Adcetris is used for CD30+ T-cell lymphoma; AND
  Note: Examples include CD30+ systemic anaplastic large cell lymphoma, CD30+ angioimmunoblastic T-cell lymphoma, CD30+ peripheral T-cell lymphoma not otherwise specified, CD30+ mycosis fungoides/Sezary syndrome, CD30+ primary cutaneous anaplastic large cell lymphoma, CD30+ lymphomatoid papulosis, CD30+ breast implant-associated anaplastic large cell lymphoma, CD30+ adult T-cell leukemia/lymphoma.

C) The medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

153. B-Cell Lymphoma. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Adcetris is used as second-line or subsequent therapy for CD30+ B-cell lymphoma; AND
  Note: Examples include CD30+ diffuse large B-cell lymphoma, CD30+ post-transplant lymphoproliferative disorders, CD30+ AIDS-related B-cell lymphoma, CD30+ high-grade B-cell lymphoma.
- **C)** The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Adcetris is not recommended in the following situations:

161. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Aliqopa Prior Authorization Policy
- Aliqopa™ (copanlisib injection for intravenous use – Bayer)

REVIEW DATE: 09/02/2020

OVERVIEW

Aliqopa, a kinase inhibitor, is indicated for the treatment of adults with relapsed follicular lymphoma who have received at least two prior systemic therapies.[1] This indication was granted accelerated approval based on overall response rate. Continued approval may be dependent on verification and description of clinical benefit in a confirmatory trial.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on B-Cell Lymphomas (version 4.2020 – August 13, 2020) recommend Aliqopa as subsequent therapy for relapsed/refractory follicular lymphoma (grade 1 or 2), gastric and nongastric MALT, splenic marginal zone lymphoma, and nodal marginal zone lymphoma after ≥ 2 prior therapies.[2,3]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Aliqopa. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Aloqopa as well as the monitoring required for adverse events and long-term efficacy, approval requires Aliqopa to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Aliqopa is recommended in those who meet the following criteria:

FDA-Approved Indications

154. Follicular Lymphoma. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has received ≥ 2 prior systemic therapies; AND
  Note: Examples of systemic therapies include bendamustine, cyclophosphamide, doxorubicin, vincristine, rituximab product (e.g., Rituxan, Truxima), Gazyva® (obinutuzumab injection for intravenous use).
- **C)** Aliqopa is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

155. Marginal Zone Lymphoma (NOTE: Includes Gastric MALT, Nongastric MALT, Nodal Marginal Zone Lymphoma, and Splenic Marginal Zone Lymphoma). Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has received ≥ 2 prior systemic therapies; AND
  Note: Examples of systemic therapies include bendamustine, cyclophosphamide, doxorubicin, vincristine, rituximab product (e.g., Rituxan, Truxima), Gazyva® (obinutuzumab injection for intravenous use).
- **C)** Aliqopa is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Aliqopa is not recommended in the following situations:

162. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Arsenic Trioxide Prior Authorization Policy

- Arsenic Trioxide injection for intravenous use (Trisenox® – Teva Pharmaceuticals, generics)

REVIEW DATE: 09/23/2020

OVERVIEW

Arsenic trioxide is indicated for **acute promyelocytic leukemia (APL)**:

- In combination with tretinoin for the treatment of adults with newly-diagnosed low-risk disease whose APL is characterized by the presence of the t(15;17) translocation or PML/RAR-alpha gene expression.
- For induction of remission and consolidation in patients with APL who are refractory to, or have relapsed from, retinoid and anthracycline chemotherapy, and whose APL is characterized by the presence of the t(15;17) translocation or PML/RAR-alpha gene expression.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) Clinical Practice Guidelines for Acute Myeloid Leukemia (version 3.2020 – December 23, 2019) recommends arsenic trioxide for induction and consolidation therapy in low-risk (white blood cell [WBC] count < 10,000/µL) and in high risk (WBC > 10,000/µL) APL with or without cardiac issues.[2,3] NCCN also recommends arsenic trioxide for the first relapse (either morphologic or molecular) and as single agent consolidation therapy in patients that are not transplant candidates and are polymerase chain reaction (PCR) negative following second remission (morphologic).

The NCCN Clinical Practice Guidelines for T-Cell Lymphoma (version 1.2020 – January 6, 2020) recommends arsenic trioxide in combination with interferon alfa-2b for the second-line or subsequent treatment of nonresponders to first-line therapy for adult T-cell leukemia/lymphoma, acute or lymphoma subtypes.[4]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of arsenic trioxide. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with arsenic trioxide as well as the monitoring required for adverse events and long-term efficacy, approval requires arsenic trioxide to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of arsenic trioxide is recommended in those who meet the following criteria:

FDA-Approved Indications

156. Acute Promyelocytic Leukemia. Approve for 1 year if the medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

157. Adult T-Cell Leukemia/Lymphoma. Approve for 1 year if the patient meets the following criteria (A, B, C, D, and E):

A) Patient is ≥ 18 years of age; AND

B) Patient has acute or lymphoma subtype; AND

C) Patient has tried chemotherapy; AND
Note: Examples include CHOP (cyclophosphamide, doxorubicin, vincristine, and prednisone), CHOEP (cyclophosphamide, doxorubicin, vincristine, etoposide, and prednisone).

D) Arsenic trioxide will be used in combination with interferon alfa-2b; AND
Note: Includes Intron A.

E) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of arsenic trioxide is not recommended in the following situations:

163. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Arzerra Prior Authorization Policy

- Arzerra® (ofatumumab injection for intravenous use – Novartis)

REVIEW DATE: 10/14/2020

OVERVIEW

Arzerra is indicated for the treatment of **chronic lymphocytic leukemia** (CLL) in the following situations:

- Previously untreated patients, in combination with chlorambucil, in patients for whom fludarabine-based therapy is considered inappropriate.
- Recurrent or progressive CLL, in patients who are in complete or partial response after at least two lines of therapy.
- Refractory CLL, in patients with disease refractory to fludarabine and alemtuzumab.
- Relapsed CLL, in combination with fludarabine and cyclophosphamide.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on **B-cell lymphomas** (version 4.2020 – August 13, 2020) recommends Arzerra as a substitute for rituximab products (Rituxan, Truxima) and Gazyva (obinutuzumab injection) in patients with B-cell lymphomas experiencing rare complications such as paraneoplastic pemphigus, Stevens-Johnson syndrome, lichenoid dermatitis, vesiculobullous dermatitis, and toxic epidermal necrolysis.[2,5]

The NCCN guidelines on **chronic lymphocytic leukemia/small lymphocytic lymphoma** (version 1.2021 – September 28, 2020) recommends Arzerra in combination with bendamustine for the first-line treatment of CLL/small lymphocytic lymphoma (SLL) without del(17p)/TP53 mutation; as a single agent, or in combination with fludarabine and cyclophosphamide for relapsed or refractory CLL/SLL without del(17p)/TP53 mutation; as a single agent for relapsed or refractory disease with del(17p)/TP53 mutation in patients with lymph nodes < 5 cm; and post second-line maintenance therapy following complete or partial response to treatment for relapsed or refractory disease.[2,3]

The NCCN guidelines on **Waldenstrom macroglobulinemia/lymphoplasmacytic lymphoma** (version 1.2021 – September 1, 2020) recommends Arzerra as a single agent or in combination therapy in rituximab (Rituxan, Truxima) intolerant patients, anywhere that rituximab is given, for previously treated disease that does not response to primary treatment or for relapsed or progressive disease.[2,4]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Arzerra. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Arzerra as well as the monitoring required for adverse events and long-term efficacy, approval requires Arzerra to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Arzerra is recommended in those who meet the following criteria:

FDA-Approved Indications

158. Chronic Lymphocytic Leukemia/Small Lymphocytic Lymphoma. Approve for 6 months if the patient meets the following criteria (A and B):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** The medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

159. B-Cell Lymphoma. Note: Examples include follicular lymphoma, MALT lymphoma, marginal zone lymphoma, mantle cell lymphoma, diffuse large B-cell lymphoma, high-grade B-cell lymphoma. Approve for 6 months if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 18 years of age; AND

B) Patient experienced an adverse event or intolerance to a rituximab product or Gazyva® (obinutuzumab injection); AND
Note: Examples of adverse events or intolerance include paraneoplastic pemphigus, Stevens-Johnson syndrome, lichenoid dermatitis, vesiculobullous dermatitis, toxic epidermal necrolysis.
C) The medication is prescribed by or in consultation with an oncologist.

160. Waldenstrom Macroglobulinemia/Lymphoplasmacytic Lymphoma. Approve for 6 months if the patient meets the following criteria (A, B, C, and D):
A) Patient is ≥ 18 years of age; AND
B) Patient is intolerant to a rituximab product; AND
C) Patient has relapsed or progressive disease; AND
D) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Arzerra is not recommended in the following situations:

164. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Asparlas Prior Authorization Policy
- Asparlas™ (calaspargase pegol mknl injection, for intravenous use)

REVIEW DATE: 12/16/2020

OVERVIEW

Asparlas is indicated as a component of a multi-agent chemotherapy regimen for the treatment of **acute lymphoblastic leukemia** (ALL) in pediatric and young adults, age 1 month to 21 years.[1]

Asparlas is a conjugate of L-asparaginase, produced by *E. coli*, and monomethoxypolyethylene glycol (mPEG) with a succinimidyl carbonate linker.[1] The succinimidyl carbonate linker forms a stable chemical

bond between mPEG and L-asparaginase. Asparlas catalyzes the conversion of L-asparagine into aspartic acid and ammonia. Leukemia cells with low expression of asparagine synthetase cannot make L-asparagine and require exogenous sources for survival. Asparlas kills leukemia cells by depleting the plasma of exogenous L-asparagine.

Guidelines

The National Comprehensive Cancer Network (NCCN) clinical practice guidelines for ALL (version 2.2020 – October 23, 2020) and pediatric ALL (version 2.2021 – October 22, 2020) state that Asparlas can be substituted for pegaspargase in patients aged 1 month to 21 years for more sustained asparaginase activity.[2-4]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Asparlas. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Asparlas as well as the monitoring required for adverse events and long-term efficacy, approval requires Asparlas to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Asparlas is recommended in those who meet the following criteria:

FDA-Approved Indications

8. Acute Lymphoblastic Leukemia. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** Patient is 1 month to 21 years of age; AND
- **B)** Asparlas is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Asparlas is not recommended in the following situations:

165. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Azedra Prior Authorization Policy
- Azedra® (iobenguane I 131 injection, for intravenous use – Progenics Pharmaceuticals, Inc.)

REVIEW DATE: 09/02/2020

OVERVIEW

Azedra is a radioactive therapeutic agent indicated for the treatment of adult and pediatric patients 12 years of age and older with iobenguane scan positive, unresectable, locally advanced or metastatic pheochromocytoma or paraganglioma who require systemic anticancer therapy.[1]

Azedra, a high-specific iodine-131-metaiodobenzylguanidine (I-131 MIBG) product, is produced by a manufacturing process, Ultratrace®.[2] Compared with conventional I-131 MIBG, Azedra has little to no unlabeled MIBG. Theoretical advantages of using a high-specific activity product are improved targeting, greater tumor concentration, and decreased potential for side effects.[3,4]

The recommended Azedra regimen consists of one dosimetric dose and two therapeutic doses; the doses are administered via intravenous infusion.[1] Three scans are recommended after the dosimetric dose. Administration of the therapeutic doses may need to be reduced or delayed based on dosimetry data or adverse events (e.g., myelosuppression, pneumonitis). In one of the studies, patients received the first therapeutic dose 7 to 28 days after the dosimetric dose.[2] The two therapeutic doses should be separated by a minimum of 90 days.[1]

The administration of Azedra requires the use of pre- and concomitant medications.[1] Inorganic iodine therapy should be initiated before Azedra therapy and continued for 10 days after each Azedra dose. Fluid intake should be increased before Azedra therapy and continued for 1 week after each Azedra dose. Drugs that reduce catecholamine uptake or deplete catecholamine stores should be discontinued before Azedra therapy and should not be re-initiated for at least 7 days after each Azedra dose. Antiemetics are recommended before each Azedra dose.

DISEASE OVERVIEW

Pheochromocytoma is a rare tumor that develops in chromaffin cells in the central part of the adrenal glands. Paraganglioma also develops in chromaffin cells, but outside of the adrenal glands.[5-7] Most pheochromocytomas and paragangliomas are benign, but approximately 10% to 15% of pheochromocytomas and 20% to 50% of paragangliomas are malignant; cancer cells often migrate to the lymph nodes, bones, liver, or lungs.[5-8] Pheochromocytomas and paragangliomas release hormones, primarily adrenaline (epinephrine) and noradrenaline (norepinephrine) that cause episodic or persistent high blood pressure.[8] Hypertensive crisis can lead to cardiac arrhythmias, myocardial infarction, and death. Surgery is the standard of care for patients with localized or regional pheochromocytomas and paragangliomas.[5,6,8,9]

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for Neuroendocrine and Adrenal Tumors (version 2.2020 – July 24, 2020) note surgical resection as the mainstay of treatment for benign and malignant pheochromocytomas and paragangliomas.[10] Azedra or other I-131 MIBG therapy (requires

positive MIBG scan) is recommended (among other therapies) for unresectable tumors or in the presence of distant metastases.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Azedra. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Azedra, as well as the monitoring required for adverse events and long-term efficacy, approval requires Azedra to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Azedra is recommended in those who meet one of the following criteria:

FDA-Approved Indications

21. Pheochromocytoma. Approve Azedra for 6 months if the patient meets ALL of the following conditions (A, B, and C):
- **C)** Patient is ≥ 12 years of age; AND
- **D)** Patient has iobenguane scan positive, unresectable, locally advanced or metastatic pheochromocytoma; AND
- **E)** The medication is prescribed by, or in consultation with, an oncologist or radiologist.

22. Paraganglioma. Approve Azedra for 6 months if the patient meets ALL of the following conditions (A, B, and C):
- **B)** Patient is ≥ 12 years of age; AND
- **C)** Patient has iobenguane scan positive, unresectable, locally advanced or metastatic paraganglioma; AND
- **D)** The medication is prescribed by, or in consultation with, an oncologist or radiologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Azedra is not recommended in the following situations:

270. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Bavencio Prior Authorization Policy

- Bavencio® (avelumab injection for intravenous use – EMD Serono, Inc.)

REVIEW DATE: 07/15/2020

OVERVIEW

Bavencio, a programmed cell death ligand-1 (PD-L1) blocking antibody, is indicated for the treatment of the following:

- **Merkel cell carcinoma**, in adults and pediatric patients ≥ 12 years of age with metastatic disease.
- **Renal cell carcinoma**, in combination with Inlyta (axitinib tablets), for the first-line treatment of patients with advanced disease.
- **Urothelial carcinoma**, in patients with locally advanced or metastatic disease who have **a)** disease progression during or following platinum-containing chemotherapy; or **b)** have disease progression within 12 months of neoadjuvant or adjuvant treatment with platinum-containing chemotherapy; and for **c)** first-line maintenance treatment of locally advanced or metastatic disease that has not progressed with first-line platinum-containing chemotherapy.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on bladder cancer (version 5.2020 – May 12, 2020) recommends Bavencio as one of the "alternative preferred regimens" for subsequent therapy (category 2A) for locally advanced or metastatic disease (Stage IV, post-platinum).[2] It is recommended as second-line therapy for locally advanced or metastatic disease (stage IV) [post-platinum]. Bavencio can be used regardless of PD-L1 expression levels. The new indication in the maintenance setting after platinum therapy is not yet addressed in the guidelines. The NCCN Compendium[3] recommends Bavencio for urothelial carcinoma of the bladder; for upper genitourinary tract tumors (metastatic disease); urothelial carcinoma of the prostate (metastatic disease); and for primary carcinoma of the urethra (recurrent or metastatic disease).

The NCCN guidelines on Merkel cell carcinoma (version 1.2020 – October 2, 2019) recommends Bavencio as one of the options for disseminated disease (category 2A).[4] Clinical trial is preferred in this setting; but

other PD-1/PD-L1 inhibitor options for disseminated disease include Keytruda® (pembrolizumab for injection) and Opdivo® (nivolumab for injection) [all category 2A].

The NCCN guidelines for kidney cancer (version 2.2020 – August 5, 2019) recommends Bavencio in combination with Inlyta for first-line treatment in all risk group patients (favorable and poor/intermediate) for relapsed or Stage IV disease. It is one of the "other recommended regimens" for clear cell histology renal cell carcinoma with a category 2A recommendation. For subsequent therapy, Bavencio + Inlyta is a category 3 recommendation.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Bavencio. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Bavencio, as well as the monitoring required for adverse events and long-term efficacy, approval requires Bavencio to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Bavencio is recommended in those who meet the following criteria:

FDA-Approved Indication

5. Merkel Cell Carcinoma. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 12 years of age; AND
- **B)** Patient has metastatic (disseminated) Merkel cell carcinoma; AND
- **C)** The medication is prescribed by or in consultation with an oncologist.

2. Renal Cell Carcinoma. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Patient has relapsed or Stage IV clear cell disease; AND
- **B)** The medication will be used in combination with Inlyta (axitinib tablets); AND
- **C)** The medication is prescribed by or in consultation with an oncologist.

3. Urothelial Carcinoma. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Patient has locally advanced or metastatic urothelial carcinoma; AND
- **B)** Patient has tried platinum-containing chemotherapy (cisplatin or carboplatin); AND
- **C)** The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Bavencio is not recommended in the following situations:

271. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Beleodaq Prior Authorization Policy
- Beleodaq® (belinostat injection for intravenous use – Spectrum Pharmaceuticals)

REVIEW DATE: 09/02/2020

OVERVIEW
Beleodaq, a histone deacetylase inhibitor, is indicated for the treatment of patients with relapsed or refractory peripheral T-cell lymphoma.[1]

Guidelines
The National Comprehensive Cancer Network (NCCN) guidelines on T-Cell Lymphomas (version 1.2020 – January 6, 2020) recommends Beleodaq as a single-agent for second-line and subsequent therapy of peripheral T-cell lymphoma, adult T-cell leukemia/lymphoma, extranodal NK/T-cell lymphoma – nasal type, and hepatosplenic gamma – delta T-cell lymphoma.[2,3]

NCCN guidelines on Primary Cutaneous Lymphomas (version 2.2020 – April 10, 2020) recommend Beleodaq for systemic therapy of mycosis fungoides/Sezary syndrome and for primary cutaneous CD30+ T-cell lymphoproliferative disorders.[3,4]

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of Beleodaq. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Beleodaq as well as the monitoring required for adverse events and long-term efficacy, approval requires Beleodaq to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Beleodaq is recommended in those who meet the following criteria:

FDA-Approved Indications

3. T-Cell Lymphoma. Approve for 1 year if Beleodaq is prescribed by or in consultation with an oncologist or a dermatologist.
Note: Examples include Peripheral T-Cell Lymphoma, Mycosis Fungoides/Sezary Syndrome, Primary Cutaneous CD30+ T-Cell Lymphoproliferative Disorders, Adult T-Cell Leukemia/Lymphoma, Hepatosplenic Gamma-Delta T-Cell Lymphoma, Extranodal NK/T-Cell Lymphoma – Nasal Type

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Beleodaq is not recommended in the following situations:

166. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Bendamustine Products Prior Authorization Policy

- Belrapzo™ (bendamustine injection for intravenous use – Eagle Pharmaceuticals)
- Bendeka® (bendamustine injection for intravenous use – Teva Pharmaceuticals, Inc.)
- Treanda® (bendamustine injection for intravenous use – Cephalon, Inc.)
- Bendamustine injection for intravenous use – various manufacturers

REVIEW DATE: 07/15/2020

Overview

Bendamustine, an alkylating agent, is indicated for the treatment of patients with:

- **B-cell non-Hodgkin lymphoma, indolent**, that has progressed during or within 6 months of treatment with rituximab or a rituximab containing regimen.
- **Chronic lymphocytic leukemia**. Efficacy compared to first-line agents other than chlorambucil has not been established.[1-3]

Guidelines

B-Cell Lymphomas

The National Comprehensive Cancer Network (NCCN) guidelines for B-cell lymphomas (version 2.2020 – July 9, 2020) recommend bendamustine for the treatment of a variety B-cell lymphomas, including follicular lymphoma (grade 1 and 2), gastric MALT lymphoma, nongastric MALT lymphoma, nodal marginal zone lymphoma, splenic marginal zone lymphoma, histologic transformation of marginal zone lymphoma to diffuse large B-cell lymphoma (DLBCL), mantle cell lymphoma, DLBCL, high-grade B-cell lymphoma, acquired immunodeficiency syndrome (AIDS)-related B-cell lymphoma, and post-transplant lymphoproliferative disorders.[4,6] Bendamustine is recommended as monotherapy, or in combination with rituximab, Polivy™ (polatuzumab vedotin-piiq injection for intravenous use), or Gazyva depending on the lymphoma type and previous treatment history.

Chronic Lymphocytic Leukemia/Small Lymphocytic Lymphoma

The NCCN guidelines for chronic lymphocytic leukemia/small lymphocytic lymphoma (version 4.2020 – December 20, 2019) recommend bendamustine, in combination with rituximab (e.g., Rituxan, Truxima), Gazyva® (obinutuzumab injection for intravenous [IV] use), or Arzerra® (ofatumumab injection for IV use), for the first-line treatment of patients ≥ 65 years of age without del(17p)/TP53 mutation, or younger patients with or without significant comorbidities.[4,5] Bendamustine in combination with rituximab is recommended for the treatment of relapsed or refractory disease without del(17p)/TP53 mutation in patients ≥ 65 years of age, or in patients < 65 years of age with or without significant comorbidities.

Hodgkin Lymphoma

The NCCN guidelines for Hodgkin lymphoma (version 2.2020 – April 17, 2020) recommend bendamustine for the treatment of recurrent or refractory classic Hodgkin Lymphoma.[4,7] In patients ≥ 18 years of age, bendamustine in combination with gemcitabine and vinorelbine, or in combination with Adcetris® (brentuximab injection for IV use) is recommended for second-line or subsequent therapy (if not previously used), or in combination with carboplatin and etoposide for third-line or subsequent therapy, or as a single agent for subsequent therapy. In patients > 60 years of age, bendamustine is recommended as a single agent for palliative therapy of relapsed or refractory disease.

Multiple Myeloma

Bendamustine is recommended in the NCCN guidelines for multiple myeloma (version 4.2020 – May 8, 2020) as a treatment option for relapsed or progressive multiple myeloma.[4,8] Bendamustine is recommended as a single agent, or in combination with dexamethasone and Revlimid® (lenalidomide capsules) or with dexamethasone and Velcade® (bortezomib injection for IV and subcutaneous use).

Primary Cutaneous Lymphomas

The NCCN guidelines for primary cutaneous lymphomas (version 2.2020 – April 10, 2020) recommend bendamustine for the systemic treatment of mycosis fungoides/Sezary syndrome with or without skin-directed or radiation therapy, and as a single agent for the treatment of relapsed/refractory primary cutaneous CD30+ T-cell lymphoproliferative disorders.[4,9]

T-Cell Lymphomas

The NCCN guidelines for T-cell lymphomas (version 1.2020 – January 6, 2020) recommend bendamustine as a single agent for the treatment of relapsed or refractory peripheral T-cell lymphomas, adult T-cell leukemia/lymphoma, and refractory hepatosplenic gamma-delta T-cell lymphoma as subsequent therapy.[4,10]

Waldenstrom Macroglobulinemia/Lymphoplasmacytic Lymphoma

Bendamustine is recommended in the NCCN guidelines for Waldenstrom macroglobulinemia/lymphoplasmacytic lymphoma (version 2.2020 – April 15, 2020) as a single agent or in combination with rituximab for primary treatment, for the treatment of previously treated disease that did not respond, or for progressive or relapsed disease.[4,11]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of bendamustine. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with bendamustine as well as the monitoring required for adverse events and long-term efficacy, approval requires bendamustine to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of bendamustine is recommended in those who meet the following criteria:

FDA-Approved Indications

9. B-Cell Non-Hodgkin Lymphoma. Approve for 6 months if bendamustine is prescribed by or in consultation with an oncologist.

10. Chronic Lymphocytic Leukemia/Small Lymphocytic Lymphoma. Approve for 6 months if bendamustine is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

11. Hodgkin Lymphoma. Approve for 6 months if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Bendamustine is used as second-line or subsequent therapy; AND
- **C)** Bendamustine is prescribed by or in consultation with an oncologist.

12. Multiple Myeloma. Approve for 6 months if the patient meets the following criteria (A and B):
- **A)** Patient has relapsed or refractory disease; AND
- **B)** Bendamustine is prescribed by or in consultation with an oncologist.

13. T-Cell Lymphoma. (Note: Examples include Peripheral T-Cell Lymphoma, Mycosis Fungoides/Sezary Syndrome, Primary Cutaneous CD30+ T-Cell Lymphoproliferative Disorders, Adult T-Cell Leukemia/Lymphoma, Hepatosplenic Gamma-Delta T-Cell Lymphoma). Approve for 6 months if bendamustine is prescribed by or in consultation with an oncologist.

14. Waldenstrom Macroglobulinemia/Lymphoplasmacytic Lymphoma. Approve for 6 months if bendamustine is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of bendamustine is not recommended in the following situations:

167. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Besponsa Prior Authorization Policy

- Besponsa™ (inotuzumab ozogamicin injection for intravenous use – Pfizer)

REVIEW DATE: 07/15/2020

OVERVIEW

Besponsa, an antibody-drug conjugate directed against human CD22, is indicated for the treatment of adults with relapsed or refractory B-cell precursor acute lymphoblastic leukemia (ALL).[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for ALL (version 1.2020 – January 15, 2020) recommend Besponsa for the treatment of relapsed/refractory Philadelphia chromosome negative (Ph-) B-cell ALL, or relapsed/refractory Philadelphia chromosome positive (Ph+) B-cell ALL with tyrosine kinase inhibitor intolerant or refractory disease, as a single agent or in combination with mini-hyper CVD (cyclophosphamide, dexamethasone, vincristine, methotrexate, cytarabine).[2,3]

The NCCN guidelines on pediatric ALL (version 2.2020 – November 25, 2019) recommend Besponsa as a single-agent for the treatment of pediatric patients with relapsed/refractory Ph- B-cell ALL, or relapsed/refractory Ph+ B-cell ALL with tyrosine kinase inhibitor intolerant or refractory disease.[4]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Besponsa. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Besponsa as well as the monitoring required for adverse events and long-term efficacy, approval requires Besponsa to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Besponsa is recommended in those who meet the following criteria:

FDA-Approved Indications

4. **Acute Lymphoblastic Leukemia.** (Note: This applies to Philadelphia chromosome positive and negative acute lymphoblastic leukemia.) Approve for 6 months if the patient meets the following criteria (A and B):

D) Patient has relapsed or refractory, B-cell precursor acute lymphoblastic leukemia; AND

E) Besponsa is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Besponsa is not recommended in the following situations:

168. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Bevacizumab Products Prior Authorization Policy

- Avastin® (bevacizumab injection for intravenous injection – Genentech, Inc.)
- Mvasi™ (bevacizumab-awwb injection for intravenous infusion – Amgen)
- Zirabev™ (bevacizumab-bvzr injection for intravenous infusion – Pfizer)

REVIEW DATE: 03/17/2021

OVERVIEW

Bevacizumab is a recombinant humanized monoclonal antibody that binds to and inhibits the biologic activity of human vascular endothelial growth factor (VEGF), a key mediator of angiogenesis.[1] Bevacizumab is indicated for the following uses:

- **Cervical cancer** (persistent, recurrent, or metastatic), in combination with paclitaxel and cisplatin OR paclitaxel and topotecan.
- **Colorectal cancer (CRC)**, metastatic, in combination with intravenous 5-fluorouracil [5-FU]-based chemotherapy for first- or second-line treatment; or for mCRC, in combination with fluoropyrimidine (5-FU, capecitabine)-irinotecan-based or fluoropyrimidine-oxaliplatin-based chemotherapy for second-line treatment in patients who have progressed on a first-line bevacizumab-containing regimen; Limitation of use: Bevacizumab is not indicated for adjuvant treatment of colon cancer.
- **Glioblastoma**, treatment of recurrent disease in adults.
- **Hepatocellular carcinoma (HCC)**: Bevacizumab in combination with Tecentriq (atezolizumab injection for intravenous use) is indicated for the treatment of patients with unresectable or metastatic HCC who have not received prior systemic therapy.
- **Non-small cell lung cancer (NSCLC)**, non-squamous, in combination with carboplatin and paclitaxel for first-line treatment of unresectable, locally advanced, recurrent or metastatic disease.

- **Ovarian (epithelial), fallopian tube, or primary peritoneal cancer**, recurrent disease, that is platinum-resistant in combination with paclitaxel, Doxil® (doxorubicin liposome intravenous infusion; i.e., pegylated liposomal doxorubicin), or topotecan for the treatment of patients who received no more than two prior chemotherapy regimens, OR disease that is platinum-sensitive in combination with carboplatin and paclitaxel or in combination with carboplatin and gemcitabine, followed by bevacizumab as a single agent; or in combination with carboplatin and paclitaxel, followed by bevacizumab as a single agent, in patients with stage III or IV disease following initial surgical resection.
- **Renal cell carcinoma (mRCC)**, metastatic, in combination with interferon alfa subcutaneous injection.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of bevacizumab in patients with conditions other than ophthalmic. The intent of this policy is to provide recommendations for uses other than ophthalmic conditions. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with bevacizumab as well as the monitoring required for adverse events and long-term efficacy, approval requires bevacizumab to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of bevacizumab products is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Central Nervous System Tumors.** Approve for 1 year if the patient meets the following criteria (A, B, and C):
   - **A)** The medication is prescribed by or in consultation with an oncologist; AND
   - **B)** Patient has tried at least one previous therapy; AND
     Note: Examples are temozolomide capsules or injection, etoposide, carmustine, radiotherapy.
   - **C)** Patient has ONE of the following (i, ii, iii, or iv):
     - **i.** Anaplastic gliomas; OR
     - **ii.** Glioblastoma; OR
     - **iii.** Intracranial and spinal ependymoma (excluding subependymoma) in patient ≥ 18 years of age; OR
     - **iv.** Meningiomas.

2. **Cervical Cancer.** Approve for 1 year if the patient meets the following criteria (A and B):
   - **A)** The medication is prescribed by or in consultation with an oncologist; AND
   - **B)** Patient has recurrent or metastatic cervical cancer.

3. **Colon or Rectal Cancer.** Approve for 1 year if the patient meets the following criteria (A, B, C, and D):
   - **A)** The medication is prescribed by or in consultation with an oncologist; AND
   - **B)** Patient has advanced or metastatic colon or rectal cancer [Stage IV]; AND
   - **C)** The medication is used in combination with a chemotherapy regimen; AND
     Note: Examples of chemotherapy regimens are 5-fluorouracil with leucovorin, and may include one or both of oxaliplatin, irinotecan; capecitabine with or without oxaliplatin; irinotecan with or without oxaliplatin.
   - **D)** Bevacizumab is not being used for adjuvant treatment of colon cancer.

4. **Hepatocellular Carcinoma (HCC).** Approve for 1 year if the patient meets the following criteria (A, B, and C):
   - **A)** Bevacizumab is prescribed by or in consultation with an oncologist; AND
   - **B)** The medication is used in combination with Tecentriq (atezolizumab injection); AND

C) Patient has not received prior systemic therapy.

5. Non-Small Cell Lung Cancer (NSCLC). Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** The medication is prescribed by or in consultation with an oncologist; AND
- **B)** Patient has advanced or metastatic non-squamous NSCLC (i.e., adenocarcinoma, large cell, or NSCLC not otherwise specified) and meets ONE of the following criteria (i, ii, iii, or iv):
  - **i.** The NSCLC tumor is positive for epidermal growth factor receptor (*EGFR*) mutation and bevacizumab is used in combination with erlotinib; OR
  - **ii.** Patient has previously received targeted drug therapy for an actionable mutation; OR
    Note: Examples of actionable mutations include sensitizing epidermal growth factor (*EGFR*) mutation, anaplastic lymphoma kinase (*ALK*) fusions, *RET* rearrangement positive, *MET* exon 14 skipping, *NTRK* gene fusion positive, *BRAF V600E* mutation positive, and ROS proto-oncogene 1 (*ROS1*) rearrangement positive.
  - **iv.** The NSCLC tumor is negative or unknown for actionable mutations and the patient meets ONE of the following criteria (a or b):
    Note: Examples of actionable mutations include sensitizing epidermal growth factor receptor (*EGFR*) mutation, anaplastic lymphoma kinase (*ALK*) fusions, *RET* rearrangement positive, *MET* exon 14 skipping, *NTRK* gene fusion positive, *BRAF V600E* mutation positive, and ROS proto-oncogene 1 [*ROS1*] rearrangement positive.
    - **a)** Bevacizumab is used as initial therapy in combination with other systemic therapies; OR
      Note: Examples of systemic therapies are cisplatin, carboplatin, Tecentriq (atezolizumab for intravenous use), Alimta (pemetrexed for intravenous use), paclitaxel.
    - **b)** Bevacizumab is used as subsequent therapy.
      Note: Bevacizumab can be used either as a single agent or in combination with other agents.

6. Ovarian, Fallopian Tube, or Primary Peritoneal Cancer. Approve for 1 year if the medication is prescribed by or in consultation with an oncologist.

7. Renal Cell Cancer. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** The medication is prescribed by or in consultation with an oncologist; AND
- **B)** Patient has advanced (e.g., relapsed, metastatic, or Stage IV) renal cell cancer.

Other Uses with Supportive Evidence

8. Breast Cancer. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** The medication is prescribed by or in consultation with an oncologist; AND
- **B)** Patient has recurrent or metastatic human epidermal growth factor receptor 2 (HER2)-negative breast cancer; AND
- **C)** The medication is used in combination with paclitaxel.

9. Endometrial Carcinoma. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** The medication is prescribed by or in consultation with an oncologist; AND
- **B)** Patient has progressed on prior chemotherapy.
  Note: Examples of chemotherapy are carboplatin, cisplatin, paclitaxel, docetaxel, doxorubicin.

10. Malignant Pleural Mesothelioma. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Bevacizumab is prescribed by or in consultation with an oncologist; AND
- **B)** Patient has unresectable malignant pleural mesothelioma; AND
- **C)** One of the following applies (i or ii):
  - **i.** Bevacizumab will be used in combination with a chemotherapy regimen; OR
    Note: Examples of chemotherapy regimens are Alimta [pemetrexed injection], cisplatin, carboplatin.

ii. Bevacizumab is being used as a single agent for maintenance therapy after the patient has received combination chemotherapy regimen.
Note: Examples of chemotherapy regimens are Alimta [pemetrexed injection], cisplatin, carboplatin.

11. **Neovascular or Vascular Ophthalmic Conditions.** Approve for 3 years.
    Note: Examples of neovascular or vascular ophthalmic conditions include diabetic macular edema (includes patients with diabetic retinopathy and diabetic macular edema), macular edema following retinal vein occlusion, myopic choroidal neovascularization, neovascular (wet) age-related macular degeneration, other neovascular diseases of the eye (e.g., neovascular glaucoma, retinopathy of prematurity, sickle cell neovascularization, choroidal neovascular conditions).

12. **Small Bowel Adenocarcinoma.** Approve for 1 year if the patient meets the following criteria (A and B):
    A) The medication is prescribed by or in consultation with an oncologist; AND
    B) The medication is used in combination with chemotherapy.
    Note: Examples of chemotherapy are fluorouracil, leucovorin, and oxaliplatin (FOLFOX), capecitabine and oxaliplatin (CapeOX), fluorouracil, leucovorin, oxaliplatin, and irinotecan (FOLFOXIRI).

13. **Soft Tissue Sarcoma.** Approve for 1 year if the patient meets BOTH of the following criteria (A and B):
    A) Patient has angiosarcoma or solitary fibrous tumor; AND
    B) The medication is prescribed by or in consultation with an oncologist.

14. **Vulvar Cancer (Squamous Cell Carcinoma).** Approve for 1 year if the patient meets the following criteria (A and B):
    A) The medication is prescribed by or in consultation with an oncologist; AND
    B) Bevacizumab is used in combination with a chemotherapy regimen.
    Note: Examples of chemotherapy regimens are cisplatin and paclitaxel, carboplatin and paclitaxel.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of bevacizumab products is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
New Policy	--	03/27/2019
Selected Revision	Addition of Zirabev™ (bevacizumab-bvzr solution for intravenous infusion – Pfizer) to the product list. Ophthalmic conditions are no longer targeted in this policy. A new indication of **Neovascular and Vascular Ophthalmic Conditions** was created to combine all indication previously listed in the policy. All requests for ophthalmic indications are to approve for 1 year. • **Diabetic Macular Edema (Includes Patients with Diabetic Retinopathy and Diabetic Macular Edema).** Existing criteria was removed. This indication was placed within the new indication of **Neovascular and Vascular Ophthalmic Conditions.** • **Endometrial Cancer.** Added new condition for approval. Previously, this condition was listed under Other Cancer-Related Indications. • **Macular Edema Following Retinal Vein Occlusion.** Existing criteria was removed. This indication was placed within the new indication of **Neovascular and Vascular Ophthalmic Conditions.** • **Myopic Choroidal Neovascularization.** Existing criteria was removed. This indication was placed within the new indication of **Neovascular and Vascular Ophthalmic Conditions.** • **Neovascular (Wet) Age-Related Macular Degeneration.** Existing criteria was removed. This indication was placed within the new indication of **Neovascular and Vascular Ophthalmic Conditions.** • **Other Neovascular Diseases of the Eye (e.g., neovascular glaucoma, retinopathy of prematurity, sickle cell neovascularization, choroidal neovascular conditions).** Existing criteria was removed. This indication was placed within the new indication of **Neovascular and Vascular Ophthalmic Conditions.** • **Small Bowel Adenocarcinoma.** Added new condition for approval based on guideline recommendations. • **Soft Tissue Sarcoma.** Added new condition for approval. Previously, this was listed under Other Cancer-Related Indications. • **Other Cancer-Related Indications.** Deleted this indication. Listed out conditions as separate criteria.	09/11/2019
Selected Revision	Approval duration for **Neovascular or Vascular Ophthalmic Conditions** was changed from 1 year to 3 years.	11/06/2019
Annual Revision	• **Non-Small Cell Lung Cancer (NSCLC).** Added new criteria for bevacizumab use in EGFR mutation-positive NSCLC in combination with erlotinib in first-line setting.	04/01/2020
Selected Revision	• Added new FDA-approval indication for hepatocellular carcinoma	06/10/2020
Annual Revision	• **Central Nervous System Tumors:** Moved the subtypes of tumors from indication to criteria. Changed patient has tried "one other therapy" to "one previous therapy". Added carmustine and etoposide to existing examples in Note. For Intracranial and spinal ependymoma subtype, deleted reference to "adults" and instead added "in patient ≥ 18 years of age". • **Non-Small Cell Lung Cancer:** Changed "targetable" mutations to "actionable" mutations. For bevacizumab use in combination with erlotinib, deleted criteria requiring "as first-line therapy". Modified criteria requiring use of at least one targeted therapy (if positive for actionable mutation), to state "patient has previously received targeted drug therapy for an actionable mutations". Moved actionable mutations to list as examples in a new Note and added new actionable mutations *RET* rearrangement positive, *MET* exon 14 skipping, *NTRK* gene fusion positive, *BRAF*	03/17/2021

	V600E mutation positive to the list. Deleted criteria referring to NSCLC tumor that is *BRAF V600E* mutation-positive and bevacizumab use as either first-line or subsequent therapy. This is not needed due to the modified criteria regarding targeted drug therapy for actionable mutation. For criteria referring to negative or unknown actionable mutations, moved examples to new Note and updated the list of actionable mutations as above. Previous criteria referring to bevacizumab use specifically in combination with "platinum therapies" was deleted and instead criteria was modified to say "with other systemic therapies". A new Note has been added with examples of systemic therapies. For the other criteria referring to bevacizumab use as subsequent therapy, the criteria referring to "and is used as a single agent or in combination with other agents" was moved to a new Note. • **Soft Tissue Sarcoma:** Moved the subtypes angiosarcoma and solitary fibrous tumor from indication to criteria. Deleted reference to hemangiopericytoma since it is no longer in guidelines.	

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Blenrep Prior Authorization Policy

- Blenrep™ (belantamab mafodotin-blmf intravenous infusion – GlaxoSmithKline)

REVIEW DATE: 08/13/2020

OVERVIEW

Blenrep, a B-cell maturation antigen-directed antibody and microtubule inhibitor conjugate, is indicated for treatment of adults with relapsed or refractory multiple myeloma, in those who have received at least four prior therapies, including an anti-CD38 monoclonal antibody, a proteasome inhibitor, and an immunomodulatory agent. This indication was approved under accelerated approval based on response rate. Continued approval may be contingent upon verification and description of clinical benefit in confirmatory trial(s). It is administered as a 2.5 mg/kg intravenous infusion given once every 3 weeks.

Guidelines

Blenrep has not yet been addressed in guidelines for multiple myeloma. National Comprehensive Cancer Network (NCCN) guidelines for multiple myeloma (version 4.2020 – May 8, 2020) recommend various regimens as primary therapy (transplant eligible and non-transplant candidates), maintenance therapy, and previously treated multiple myeloma.[2] The choice of regimen takes into account patient factors as well as response and tolerability to previous regimens. Triplet regimens (e.g., with a proteasome inhibitor, immunomodulatory drug, and corticosteroid) are standard therapy for multiple myeloma. Blenrep is an other recommended regimen for its approved use in relapsed/refractory disease. Other available therapies used as monotherapy or in combination regimens include agents from the following drug classes:

- Proteasome inhibitors (e.g., Velcade® [bortezomib injection], Kyprolis® [carfilzomib injection], Ninlaro® [ixazomib capsules]);
- Immunomodulatory drugs (e.g., Thalomid® [thalidomide capsules], Revlimid® [lenalidomide capsules], Pomalyst® [pomalidomide capsules]);
- Steroids (e.g., dexamethasone, prednisone);
- CD38-directed monoclonal antibodies (Darzalex® [daratumumab intravenous infusion], Darzalex Faspro™ [daratumumab and hyaluronidase-fihj subcutaneous injection], Sarclisa® (isatuximab-irfc intravenous infusion]);
- Histone deacetylase inhibitor (Farydak® [panobinostat capsules]);
- Signaling Lymphocytic Activation Molecule Family member 7-directed immunostimulatory antibody (Empliciti® [elotuzumab injection]);
- Nuclear export inhibitor (Xpovio™ [selinexor tablets]);

- Alkylating agents (e.g., cyclophosphamide, melphalan); and
- Other cytotoxic drugs (e.g., vincristine, doxorubicin, liposomal doxorubicin).

Safety

Blenrep may cause changes in the corneal epithelium resulting in vision changes, including severe vision loss and corneal ulcer. The patient may experience symptoms such as blurred vision and dry eyes. Ophthalmic examinations should be conducted at baseline and prior to each dose, and promptly upon worsening of symtoms. Blenrep should be withheld until improvement and resumed or permanently discontinued based on the severity. Due to risks of ocular toxicity, there is a Risk Evaluation and Mitigation Strategy (REMS) program for Blenrep. Included in the program is a requirement for prescribers to be certified and counsel patients regarding ocular toxicity and the need for ophthalmic examinations prior to each dose. Patients must also be enrolled in the REMS and comply with monitoring.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Blenrep. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Blenrep as well as the monitoring required for adverse events and long-term efficacy, approval requires Blenrep to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Blenrep is recommended in those who meet the following criteria:

FDA-Approved Indications

5. Multiple Myeloma. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
- **15.** Patient is ≥ 18 years of age; AND
- **16.** Patient has tried at least four prior systemic lines of therapy; AND
- **17.** Among the previous therapies tried, the patient has received at least one drug from each of the following classes (i, ii, and iii):
  - **i.** Proteasome inhibitor; AND
    Note: Examples include Velcade (bortezomib injection), Kyprolis (carfilzomib infusion), Ninlaro (ixazomib capsules).
  - **ii.** Immunomodulatory drug; AND
    Note: Examples include Revlimid (lenalidomide capsules), Pomalyst (pomalidomide capsules), Thalomid (thalidomide capsules).
  - **iii.** Anti-CD38 monoclonal antibody; AND
    Note: For example, Darzalex (daratumumab infusion), Darzalex Faspro (daratumumab and hyaluronidase-fihj subcutaneous injection), or Sarclisa (isatuximab-irfc infusion).
- **18.** The agent will be prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Blenrep is not recommended in the following situations:

169. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Blincyto Prior Authorization Policy

- Blincyto® (blinatumomab injection for intravenous use – Amgen)

REVIEW DATE: 09/02/2020

OVERVIEW

Blincyto, a bispecific CD19-directed CD3 T-cell engager, is indicated for the treatment of adults and children with:

- B-cell precursor acute lymphoblastic leukemia (ALL) in first or second complete remission with minimal residual disease (MRD) $\geq$ 0.1%.[1] Accelerated approval was granted for this indication based on MRD response and hematologic relapse-free survival. Continued approval may be dependent on verification and description of clinical benefit in confirmatory trials.
- Relapsed or refractory B-cell ALL.[1]

Blincyto contains a boxed warning for Cytokine Release Syndrome which may be life-threatening or fatal and Neurologic toxicities which may be severe, life-threatening or fatal.[1] Stop or discontinue Blincyto as recommended for either toxicity.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on Acute Lymphoblastic Leukemia (version 1.2020 – January 15, 2020) and Pediatric Acute Lymphoblastic Leukemia (version 2.2020 – November 25, 2019) guidelines recommend Blincyto as single-agent therapy for relapsed/refractory B-cell ALL; consolidation therapy in adolescents, young adults, and adults with positive MRD after complete response to induction therapy; and for pediatric patients with MRD positive disease, less than complete response, or high-risk genetics.[2-4]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Blincyto. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Blincyto, as well as the monitoring required for adverse events and long-term efficacy, approval requires Blincyto to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Blincyto is recommended in those who meet the following criteria:

FDA-Approved Indications

161. Acute Lymphoblastic Leukemia. Approve for 1 year if the patient meets the following criteria (A, B, and C):

F) Patient has B-cell precursor disease; AND

G) Patient meets one of the following (i or ii):
- **a.** Patient is Philadelphia chromosome negative and meets one of the following (a or b):
  - **a)** Patient has relapsed or refractory disease; OR
  - **b)** Patient is minimal residual disease positive; OR
- **b.** Patient is Philadelphia chromosome positive and meets one of the following (a, b, c, or d):
  - **a)** Patient has tried at least one tyrosine kinase inhibitor (TKI) used for the treatment of acute lymphoblastic leukemia; OR
    Note: Examples of a TKI include Gleevec® (imatinib tablets), Sprycel® (dasatinib tablets), Tasigna® (nilotinib capsules).
  - **b)** Patient does not have a complete response to induction therapy; OR
  - **c)** Patient is minimal residual disease positive; OR
  - **d)** Patient has high-risk genetics; AND

H) Blincyto is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Blincyto is not recommended in the following situations:

170. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Bortezomib (Velcade) Prior Authorization Policy

- Velcade® (bortezomib intravenous or subcutaneous injection – Millennium Pharmaceuticals, generics [intravenous only])

REVIEW DATE: 10/14/2020; selected revision 01/20/2021

OVERVIEW

Bortezomib, a proteasome inhibitor, is indicated in adults with the following conditions:[1]

- **Mantle cell lymphoma**.
- **Multiple myeloma**.

Guidelines

Bortezomib is mentioned in several guidelines published by the National Comprehensive Cancer Network (NCCN).

- **Acute lymphoblastic leukemia:** Guidelines for pediatric disease (version 1.2021 – September 16, 2020) include bortezomib-based regimens among the other recommended regimens for relapsed or refractory disease.
- **AIDS** (**acquired immune deficiency syndrome)-related Kaposi sarcoma:** Guidelines (version 3.2020 – July 15, 2020) include bortezomib among the other recommended regimens for patients who have relapsed/refractory disease.
- **B-cell lymphomas:** Guidelines for B cell lymphoma (version 4.2020 – August 13, 2020) recommend bortezomib (as a component of (VR-CAP [bortezomib/Rituxan/cyclophosphamide/doxorubicin/prednisone]) as a preferred less aggressive therapy option for the initial treatment of patients (induction therapy) with newly diagnosed mantle cell lymphoma.[10] VR-CAP, bortezomib/bendamustine/rituximab, and bortezomib ± rituximab are also listed as second-line therapies for relapsed or refractory mantle cell lymphoma. For patients with relapsed or refractory Castleman's disease, bortezomib ± rituximab is listed among the treatment options.
- **Classic Hodgkin lymphoma:** Guidelines for pediatric disease (version 1.2021 – September 28, 2020) include bortezomib/ifosfamide/vinorelbine among the subsequent therapy options for relapsed or refractory disease.
- **Multiple myeloma:** Bortezomib features prominently in the NCCN Multiple Myeloma clinical practice guidelines (version 2.2021 – September 9, 2020).[3] Various bortezomib-containing regimens are listed as Preferred for primary therapy (transplant and nontransplant candidates) and previously treated disease. Bortezomib is also a component of multiple other regimens across the spectrum of disease. For maintenance therapy, bortezomib ± Revlimid (lenalidomide capsules) are also listed as treatment options.
- **Systemic light chain amyloidosis:** Guidelines (version 1.2021 – September 1, 2020) list bortezomib alone or in combination with other agents for primary therapy (transplant and non-transplant candidates) and previously treated disease.[11] NCCN notes that bortezomib was well tolerated at doses up to 1.6 mg/m^2 on a once-weekly schedule and 1.3 mg/m^2 on a twice-weekly schedule. The once-weekly regimen was associated with lower neurotoxicity.
- **Waldenstrom's macroglobulinemia/lymphoplasmacytic lymphoma:** Guidelines (version 1.2021 – September 1, 2020) recommend the following bortezomib-based regimens for primary therapy and for previously treated disease: bortezomib ± Rituxan, bortezomib/dexamethasone, and bortezomib/dexamethasone/Rituxan.[15]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of bortezomib. All approvals are provided for the duration noted below. Because of the of the specialized skills required for evaluation and diagnosis of patients treated with bortezomib, as well as the monitoring required for adverse events and long-term efficacy, approval requires bortezomib to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

6. Mantle Cell Lymphoma. Approve for 1 year if the patient meets BOTH of the following (A and B):

A) Patient meets ONE of the following criteria (i or ii):

i. Patient has previously tried at least one other therapy for mantle cell lymphoma; OR
Note: Examples of other therapies for mantle cell lymphoma include regimens containing a rituximab product, cytarabine, cisplatin, cyclophosphamide, doxorubicin, vincristine, or bendamustine.

ii. The medication is used in combination with at least one other agent; AND
Note: Examples of other agents used in combination with bortezomib for mantle cell lymphoma include a rituximab product, bendamustine, cyclophosphamide, and doxorubicin.

B) The medication is prescribed by or in consultation with an oncologist or a hematologist.

7. Multiple Myeloma. Approve for 1 year if the patient meets BOTH of the following (A and B):

19. Patient meets ONE of the following criteria (i or ii):

i. The medication will be used in combination with at least one other agent; OR
Note: Examples of other agents that may be used in combination with Velacade include dexamethasone, cyclophosphamide, doxorubicin, Doxil® (doxorubicin liposomal injection), Revlimid® (lenalidomide capsules), Thalomid® (thalidomide capsules), cisplatin, etoposide, Darzalex® (daratumumab for injection), Pomalyst (pomalidomide capsules), bendamustine, Empliciti® (elotuzumab for injection), Farydak® (panobinostat capsules).

ii. The medication is being used for maintenance therapy; AND

20. The medication is prescribed by or in consultation with an oncologist or a hematologist.

Other Uses with Supportive Evidence

8. Acute Lymphoblastic Lymphoma. Approve for 1 year if the patient meets BOTH of the following (A and B):

A) Patient has relapsed or refractory disease; AND

B) The medication is prescribed by or in consultation with an oncologist.

9. AIDS (Acquired Immune Deficiency Syndrome)-Related Kaposi Sarcoma. Approve for 1 year if the patient meets BOTH of the following (A and B):

A) Patient has tried at least one systemic chemotherapy; AND
Note: Examples of systemic chemotherapies for AIDS-related Kaposi sarcoma include doxorubicin and paclitaxel.

B) The medication is prescribed by or in consultation with an oncologist.

10. Castleman's Disease. Approve for 1 year if the patient meets BOTH of the following (A and B):

A) Patient has relapsed, refractory, or progressive disease; AND

B) The medication is prescribed by or in consultation with an oncologist.

11. Classic Hodgkin Lymphoma. Approve for 1 year if the patient meets the following (A and B):

A) Patient has tried at least one systemic chemotherapy regimen; AND
Note: Examples of systemic chemotherapies used in regimens for Hodgkin lymphoma include doxorubicin, bleomycin, vincristine, etoposide, and dacarbazine.

B) The medication is prescribed by or in consultation with an oncologist.

12. Systemic Light Chain Amyloidosis. Approve for 1 year if prescribed by or in consultation with an oncologist or a hematologist.

13. Waldenstrom's Macroglobulinemia/Lymphoplasmacytic Lymphoma. Approve for 1 year if prescribed by or in consultation with an oncologist or a hematologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of bortezomib is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Breyanzi Prior Authorization Policy
- Breyanzi® (lisocabtagene maraleucel suspension for intravenous infusion – Bristol-Myers Squibb)

REVIEW DATE: 02/17/2021; selected revision 03/10/2021

OVERVIEW
Breyanzi, a CD19-directed genetically modified autologous T-cell immunotherapy, is indicated for the treatment of adults with **relapsed or refractory large B-cell lymphoma** after two or more lines of systemic therapy.[1] This includes diffuse large B-cell lymphoma (DLBCL) not otherwise specified (including DLBCL arising from indolent lymphoma), high-grade B-cell lymphoma, primary mediastinal large B-cell lymphoma, and follicular lymphoma grade 3B.

Limitations of use: Breyanzi is not indicated for the treatment of patients with primary central nervous system lymphoma.[1]

Guidelines
The National Comprehensive Cancer Network clinical practice guidelines for B-cell lymphomas (version 2.2021 – February 16, 2021) recommend Breyanzi for the treatment of a variety of lymphomas after at least two prior chemoimmunotherapy regimens.[2,3] This includes relapsed or refractory DLBCL, high-grade B-cell lymphoma, acquired immunodeficiency syndrome (AIDS)-related B-cell lymphoma, post-transplant lymphoproliferative disorders, transformed nodal marginal zone lymphoma and follicular lymphoma, gastric and non-gastric mucosa-associated lymphoid tissue (MALT) lymphoma, and splenic marginal zone lymphoma.[2,3]

Safety
Breyanzi has a Boxed Warning regarding cytokine release syndrome (CRS) and neurologic toxicities.[1] Breyanzi is only available through a restricted program under a Risk Evaluation and Mitigation Strategy (REMS) called the Breyanzi REMS.

POLICY STATEMENT
Prior Authorization is recommended for prescription benefit coverage of Breyanzi. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Breyanzi as well as the monitoring required for adverse events and long-term efficacy, approval requires Breyanzi to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Breyanzi is recommended in those who meet the following criteria:

FDA-Approved Indications

162. B-Cell Lymphoma. Approve a single dose if the patient meets the following criteria (A, B, C, D, E, and F):

A) Patient meets one of the following diagnoses (i, ii, iii, iv, v, vi, vii, viii, ix, x, xi, or xii):
- **i.** Large B-cell lymphoma; OR
- **ii.** Diffuse large B-cell lymphoma; OR
- **iii.** High-grade B-cell lymphoma; OR
- **iv.** Primary mediastinal large B-cell lymphoma; OR
- **v.** Follicular lymphoma; OR
- **vi.** Gastric mucosa-associated lymphoid tissue (MALT) lymphoma; OR
- **vii.** Non-gastric mucosa-associated lymphoid tissue (MALT) lymphoma; OR
- **viii.** Splenic marginal zone lymphoma; OR
- **ix.** Transformed nodal marginal zone lymphoma to diffuse large B-cell lymphoma; OR
- **x.** Transformed follicular lymphoma to diffuse large B-cell lymphoma; OR
- **xi.** Acquired immunodeficiency syndrome (AIDS)-related B-cell lymphoma; OR
- **xii.** Post-transplant lymphoproliferative disorders; AND

B) Patient is ≥ 18 years of age; AND

C) Patient has received two or more lines of systemic therapy; AND

D) Patient has received lymphodepleting chemotherapy prior to infusion of Breyanzi; AND

E) Patient has not been previously treated with CAR-T therapy; AND
Note: CAR-T therapy includes Breyanzi, Kymriah® (tisagenlecleucel suspension for intravenous infusion), Tecartus™ (brexucabtagene suspension for intravenous infusion), and Yescarta® (axicabtagene suspension for intravenous infusion).

F) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Breyanzi is not recommended in the following situations:

171. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Cosela Prior Authorization Policy
- Cosela™ (trilaciclib injection for intravenous use – G1 Therapeutics)

REVIEW DATE: 02/24/2021

OVERVIEW

Cosela, a cyclin dependent kinase (CDK) 4/6 kinase inhibitor, is indicated to **decrease the incidence of chemotherapy-induced myelosuppression** in adult patients when administered prior to a platinum/etoposide-containing regimen or topotecan-containing regimen for extensive-stage small cell lung cancer (SCLC).[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) small cell lung cancer guidelines (version 2.2021 – January 11, 2021) have not addressed Cosela.[2]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Cosela. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Cosela as well as the monitoring required for adverse events and long-term efficacy, approval requires Cosela to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Cosela is recommended in those who meet the following criteria:

FDA-Approved Indications

23. Small Cell Lung Cancer. Approve for 6 months if the patient meets all of the following criteria (A, B, C, D, and E):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has extensive-stage disease; AND
- **C)** The medication is used to decrease the incidence of chemotherapy-induced myelosuppression; AND
- **D)** Patient meets ONE of the following criteria (i or ii):
  - **i.** Patient will be receiving platinum (carboplatin or cisplatin) and etoposide-containing chemotherapy regimen; OR
  - **ii.** Patient will be receiving topotecan-containing regimen; AND
- **E)** The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Cosela is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
New Policy	--	02/24/2021

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Cyramza® (ramucirumab injection for intravenous use – Eli Lilly and Company)

DATE REVIEWED: 06/10/2020

OVERVIEW

Cyramza, a human vascular endothelial growth factor receptor 2 (VEGFR2) antagonist, is approved for the following indications:[1]

1) Gastric or gastroesophageal (GE) junction adenocarcinoma, as a single agent or in combination with paclitaxel injection for the treatment of patients with advanced or metastatic disease with disease progression on or after prior fluoropyrimidine- or platinum-containing chemotherapy;
2) Metastatic non-small cell lung cancer (NSCLC), in combination with docetaxel intravenous injection (Docefrez™, Taxotere®, generics) for the treatment of patients with disease progression on or after platinum-based chemotherapy. Patients with epidermal growth factor receptor (*EGFR*) or anaplastic lymphoma kinase (*ALK*) genomic tumor aberrations should have disease progression on FDA-approved therapy for these aberrations prior to receiving Cyramza.
3) Metastatic NSCLC, in combination with erlotinib for the first-line treatment of NSCLC with EGFR exon 19 deletions or exon 21 (L858R) mutations.
4) Metastatic colorectal cancer (mCRC), in combination with FOLFIRI (irinotecan, leucovorin, and 5-fluorouracil [5-FU]) for the treatment of patients with disease progression on or after prior therapy with Avastin® (bevacizumab intravenous injection), oxaliplatin, and a fluoropyrimidine.
5) Hepatocellular carcinoma (HCC), as a single agent in patients who have an alpha fetoprotein of ≥ 400 ng/mL and have been treated with sorafenib.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on colon cancer (version 3.2020 – May 6, 2020) and rectal cancer (version 4.2020 – May 21, 2020) recommend Cyramza as primary therapy and subsequent therapy for patients with unresectable advanced or metastatic disease, and as adjuvant treatment for unresectable metachronous metastases that converted to resectable disease after primary treatment, in combination with either irinotecan or FOLFIRI.[2-4]

The NCCN guidelines on gastric cancer (version 2.2020 – May 13, 2020) and esophageal and esophagogastric junction cancers (version 2.2020 – May 13, 2020) recommend Cyramza as palliative treatment for patients who are not surgical candidates or have unresectable locally advanced, recurrent, or metastatic disease.[4-6]

The NCCN guidelines on NSCLC (version 5.2020 – May 27, 2020) recommend Cyramza as subsequent therapy in combination with docetaxel for metastatic disease for patients who have not previously received docetaxel either following progression on initial cytotoxic therapy or for further progression on a systemic immune checkpoint inhibitor or other systemic therapy.[4,7] Cyramza is also recommended in combination with erlotinib for patients with EGFR mutation positive, recurrent, advanced, or metastatic disease as first-line therapy or as continuation therapy following disease progression on Cyramza and erlotinib.

The NCCN guidelines for hepatobiliary cancers (version 3.2020 – June 1, 2020) recommends Cyramza as a single agent for the treatment of patients with progressive disease with an alpha fetoprotein ≥ 400 ng/mL.[4,8]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Cyramza. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Cyramza as well as the monitoring required for adverse events and long-term efficacy, approval requires Cyramza to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Cyramza is recommended in those who meet the following criteria:

FDA-Approved Indications

14. **Colon or Rectal Cancer**. Approve for 1 year if the patient meets the following criteria (A, B, and C):
    - **A)** Cyramza is prescribed by or in consultation with an oncologist; AND
    - **B)** The patient has received oxaliplatin and a fluoropyrimidine (e.g., 5-fluorouracil [5-FU], capecitabine); AND
    - **C)** Cyramza will be used in combination with irinotecan or with FOLFIRI (irinotecan, folinic acid [leucovorin], and 5-fluorouracil [5-FU]).

15. **Gastric, Esophagogastric Junction, or Esophageal Cancer**. Approve for 1 year if the patient meets the following criteria (A, B, and C):
    - **A)** Cyramza is prescribed by or in consultation with an oncologist; AND
    - **B)** The patient meets one of the following criteria (i, ii, or iii):
        - **i.** Cyramza will be used alone; OR
        - **ii.** Cyramza will be used in combination with paclitaxel; OR
        - **iii.** Cyramza will be used in combination with fluorouracil and irinotecan; AND
    - **C)** The patient has received chemotherapy with at least ONE of the following (i or ii):
        - **i.** 5-Fluorouracil (5-FU) or capecitabine; OR
        - **ii.** Cisplatin, carboplatin, or oxaliplatin.

16. **Non-Small Cell Lung Cancer.** Approve for 1 year if the patient meets the following criteria (A and B):
    - **A)** Cyramza is prescribed by or in consultation with an oncologist; AND
    - **B)** The patient meets of the following criteria (i or ii):
        - **i.** Cyramza will be used as first-line therapy; AND
            - a) The patient has epidermal growth factor receptor (EGFR) positive disease; AND
            - b) Cyramza will be used in combination with erlotinib (Tarceva®, generics); OR
        - **ii.** Cyramza will be used as subsequent therapy; AND
            - a) Cyramza will be used in combination with docetaxel intravenous injection (Docefrez™, Taxotere®, generics); AND

b) The patient has received targeted drug therapy if the patient's tumor is positive for a targetable mutation (i.e., sensitizing epidermal growth factor receptor mutation, anaplastic lymphoma kinase fusions).

17. Hepatocellular Carcinoma. Approve for 1 year if the patient meets the following criteria (A, B, C, and D):
- **A)** Cyramza is prescribed by or in consultation with an oncologist; AND
- **B)** The patient has been treated with Nexavar® (sorafenib tablet); AND
- **C)** Cyramza will be used as a single agent; AND
- **D)** The patient has an alpha fetoprotein of ≥ 400 ng/mL.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Cyramza has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

172. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Danyelza Prior Authorization Policy
- Danyelza® (naxitamab-gqgk injection – Y-mAbs Therapeutics)

REVIEW DATE: 12/16/2020

OVERVIEW

Danyelza, a glycolipid disialoganglioside (GD2)-binding monoclonal antibody, is indicated, in combination with granulocyte-macrophage colony-stimulating factor (GM-CSF), for the treatment of relapsed or refractory high-risk neuroblastoma in the bone or bone marrow in patients ≥ 1 year of age who have demonstrated a partial response, minor response, or stable disease to prior therapy.[1] This indication is approved under accelerated approval based on overall response rate and duration of response. Continued approval for this indication may be contingent upon verification and description of clinical benefit in a confirmatory trial.

Disease Overview

Neuroblastoma is a rare cancer; however, it is the most common extracranial solid tumor of childhood.[2] Neuroblastoma originates from primodial neural crest cells[3] that develop into sympathetic neural ganglia and adrenal medulla.[2] There are approximately 700 cases diagnosed each year in the US,[4] and around 90% of cases are diagnosed in patients < 5 years of age.[5] Patients most commonly present with an abdominal mass,[4,5] most often arising from the adrenal gland.[2] The mass may be asymptomatic or associated with abdominal pain, hypertension, distension, and constipation. Other tumors may also initiate in the neck, chest, and pelvis.[4] In 10% to 15% of patients, the tumor extends to the epidural or intradural space and may result in spinal cord compression and paraplegia.[2] Patients may

also present with proptosis and periorbital ecchymosis, bone pain, pancytopenia, watery diarrhea, presence of Horner syndrome, and subcutaneous skin nodules.[5]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Danyelza. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Danyelza as well as the monitoring required for adverse events and long-term efficacy, approval requires Danyelza to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Danyelza is recommended in those who meet the following criteria:

FDA-Approved Indications

163. Neuroblastoma. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 1 year of age; AND
- **B)** Danyelza is used as subsequent therapy; AND
- **C)** Danyelza is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Danyelza is not recommended in the following situations:

173. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Darzalex Faspro Prior Authorization Policy

- Darzalex™ Faspro (daratumumab and hyaluronidase-fihj injection for subcutaneous use – Janssen Biotech)

OVERVIEW

Darzalex Faspro, a CD38-directed antibody, is approved for use in adults in the following situations:[1]

- **Multiple myeloma**:
  - in newly diagnosed patients, in combination with Revlimid (lenalidomide capsules) and dexamethasone, for the treatment of patients who are ineligible for autologous stem cell transplant and in relapsed/refractory disease, in combination with Revlimid and dexamethasone in patients who have received at least one prior therapy; AND
  - in newly diagnosed patients, in combination with Velcade (bortezumab injection), melphalan, and prednisone in those ineligible for autologous stem cell transplant; AND
  - in newly diagnosed patients, in combination with Velcade, Thalomid (thalidomide capsules), and dexamethasone, for treatment of patients who are eligible for autologous stem cell transplant; AND
  - in patients who have received at least one prior therapy, in combination with Velcade and dexamethasone; AND
  - in patients who have received at least three prior lines of therapy (including a proteasome inhibitor and an immunomodulatory agent or who are double-refractory to a proteasome inhibitor and an immunomodulatory agent), as monotherapy.
- **Light chain (AL) amyloidosis**, in newly diagnosed patients, in combination with Velcade, cyclophosphamide, and dexamethasone.

In multiple myeloma, Darzalex Faspro binds to CD38 and inhibits the growth of CD38-expressing tumor myeloma cells. Darzalex Faspro is a fixed combination of daratumumab and hyaluronidase (recombinant human). It contains the identical molecular antibody of daratumumab available in Darzalex intravenous (IV), but hyaluronidase has been added to facilitate systemic delivery. Darzalex Faspro should be administered under the care of a healthcare provider as a 3 to 5 minute subcutaneous injection. The dose of Darzalex Faspro is fixed regardless of the patient's body surface area (BSA); dose reductions are not recommended. Safety and efficacy is not established in patients < 18 years of age.

Guidelines

Darzalex Faspro is addressed in guidelines from the National Comprehensive Cancer Network (NCCN).

- **Multiple Myeloma:** Guidelines (version 4.2020 – May 8, 2020) address the diagnosis, treatment, and follow-up for patients with multiple myeloma.[2,3] In the most recent update, a footnote was added to clarify that Darzalex Faspro is included in the recommendations for all of the daratumumab-containing regimens. NCCN does recommend Darzalex IV in multiple regimens both as primary treatment and in previously treated disease. Darzalex IV/Velcade/Thalomid/dexamethasone is recommended as primary therapy for transplant candidates. For patients who are non-transplant candidates, Darzalex IV/Revlimid/prednisone is a Preferred regimen, and Darzalex IV/Velcade/melphalan/prednisone is an Other regimen for primary treatment. For previously treated multiple myeloma, Darzalex IV/dexamethasone plus Velcade or Revlimid are among the Preferred regimens, whereas Darzalex IV monotherapy, Darzalex IV/Kyprolis/dexamethasone, and Darzalex IV/Pomalyst/dexamethasone are listed as other recommended regimens.
- **Light Chain Amyloidosis:** NCCN guidelines for systemic light chain amyloidosis have not been updated since approval of Darzalex Faspro in the first line setting. Current guidelines (version 1.2021 – September 1, 2020) list monotherapy with Darzalex Faspro for previously treated disease.[4]

Dosing Information

Darzalex Faspro is available as a single-dose vial containing 1,800 mg of daratumumab and 30,000 units of hyaluronidase per 15 mL. Dosing schedule varies depending on regimen prescribed. Refer to the prescribing information for more specific FDA-approved regimens. Dose reductions are not recommended. In cases of myelosuppression, dose delay may be required to allow recovery of blood cell counts.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Darzalex Faspro. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Darzalex Faspro as well as the monitoring required for adverse events and long-term efficacy, approval requires Darzalex Faspro to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Darzalex Faspro is recommended in those who meet the following criteria:

FDA-Approved Indications

18. Multiple Myeloma. Approve for 1 year if the patient meets BOTH of the following (A and B):
- **21.** The patient meets ONE of the following (i or ii):
  - **A)** Darzalex Faspro is used in combination with at least one other agent.
    Note: Examples of agents that may be used in combination with Darzalex Faspro include Revlimid (lenalidomide capsules), melphalen, or Velcade (bortezumab injection); OR
  - **B)** Patient has tried at least three different regimens for multiple myeloma.
    Note: Examples of agents used in other regimens include Velcade (bortezumab injection), Kyprolis (carfilzomib injection), Revlimid (lenalidomide capsules), cyclophosphamide, Ninlaro (ixazomib capsules); AND
- **22.** Darzalex Faspro is prescribed by or in consultation with an oncologist or a hematologist.

19. Light Chain Amyloidosis. Approve for 1 year if the patient meets all of the following conditions (A, B, and C):
- **A)** Patient meets one of the following (i or ii):
  - **i.** The medication is being used in combination with bortezomib injection, cyclophosphamide, and dexamethasone; OR
  - **ii.** Patient has received at least one other regimen for this condition; AND
    Note: Examples of agents used in other regimens include bortezomib injection, Revlimid (lenalidomide capsules), cyclophosphamide, and melphalan.
- **B)** Patient does NOT have severe heart failure, according to the prescriber; AND
  Note: Severe heart failure is defined as New York Heart Association Class IIIB or IV cardiac disease or Mayo Stage IIIB.
- **C)** The medication is prescribed by or in consultation with an oncologist or a hematologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Darzalex Faspro is not recommended in the following situations:

174. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
New Policy	--	05/06/2020
Update	06/16/2020: Update overview to include updated NCCN guidelines. No criteria changes.	NA
Selected Revision	**Light Chain Amyloidosis:** This newly approved condition was added to the policy. Criteria approve for 1 year if the patient has tried another therapy, or if for a new start, the medication will be given in combination with bortezomib/cyclophosphamide/dexamethasone. For all approvals, the patient does NOT have severe heart failure defined as New York Heart Association Class IIIB or IV cardiac disease, or Mayo Stage IIIB; and Darzalex Faspro must be prescribed by or in consultation with an oncologist or hematologist.	02/03/2021

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Darzalex Intravenous Prior Authorization Policy

- Darzalex™ (daratumumab injection for intravenous use – Janssen Biotech)

REVIEW DATE: 03/10/2021

OVERVIEW

Darzalex, a CD38-directed cytolytic antibody, is indication for treatment of **multiple myeloma** in the following situations:[1]

- in newly diagnosed patients, in combination with Revlimid (lenalidomide capsules) and dexamethasone, for the treatment of patients who are ineligible for autologous stem cell transplant and in relapsed/refractory disease, in combination with Revlimid and dexamethasone in patients who have received at least one prior therapy.
- in newly diagnosed patients, in combination with bortezomib, melphalan, and prednisone in those ineligible for autologous stem cell transplant.
- in newly diagnosed patients, in combination with bortezomib, Thalomid (thalidomide capsules), and dexamethasone, for treatment of patients who are eligible for autologous stem cell transplant.
- in patients who have received at least one prior therapy, in combination with bortezomib and dexamethasone.
- in patients who have received at least two prior therapies (including Revlimid and a proteasome inhibitor), in combination with Pomalyst (pomalidomide capsules) and dexamethasone.
- in patients who have received at least three prior lines of therapy (including a proteasome inhibitor and an immunomodulatory agent or who are double-refractory to a proteasome inhibitor and an immunomodulatory agent), as monotherapy.
- in relapsed/refractory disease, in combination with Kyprolis (carfilzomib intravenous infusion) and dexamethasone in patients who have received one to three prior lines of therapy.

Safety and efficacy is not established in patients < 18 years of age.

Guidelines

Darzalex Intravenous is discussed in guidelines from the National Comprehensive Cancer Network (NCCN).

- **Multiple Myeloma:** NCCN guidelines (version 4.2021 – December 10, 2020) recommend Darzalex in treatment regimens for primary therapy.[2-3] Darzalex/Revlimid/bortezomib/dexamethasone (preferred), Darzalex/bortezomib/ Thalomid/dexamethasone, and Darzalex/cyclophosphamide/bortezomib/dexamethasone are among the recommended regimens for primary therapy for transplant candidates. For patients who are non-transplant candidates, Darzalex/Revlimid/prednisone (preferred), Darzalex/bortezomib/melphalan/prednisone, and Darzalex/cyclophosphamide/bortezomib/dexamethasone are among the regimens for primary treatment. For previously treated multiple myeloma, Darzalex/dexamethasone plus bortezomib, Revlimid, or Kyprolis are among the Preferred regimens, whereas Darzalex monotherapy, Darzalex/Pomalyst/dexamethasone, Darzalex/Xpovio (selinexor tablets)/dexamethasone, and Darzalex/cyclophosphamide/bortezomib/dexamethasone are listed as other or useful in certain circumstances.
- **Systemic Light Chain Amyloidosis:** The NCCN guidelines (version 2.2021 – February 8, 2021) list Darzalex Intravenous as a therapy for previously treated disease, but not for primary therapy.[4] Of note, Darzalex Faspro is indicated and is specifically recommended as a first-line therapy for systemic light chain amyloidosis, given in combination with cyclophosphamide and dexamethasone.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Darzalex. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Darzalex as well as the monitoring required for adverse events and long-term efficacy, approval requires Darzalex to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Darzalex Intravenous is recommended in those who meet one of the following criteria:

FDA-Approved Indications

1. **Multiple Myeloma**. Approve for 1 year if the patient meets ALL of the following (A, B, and C):
   1. Patient is ≥ 18 years of age; AND
   2. Patient meets ONE of the following (i or ii):
      - **A)** Darzalex is used in combination with at least one other therapy; OR
        Note: Examples of therapies that may be used in combination with Darzalex include Revlimid (lenalidomide capsules), Pomalyst (pomalidomide capsules), Thalomid (thalidomide capsules), melphalan, bortezomib, or Kyprolis (carfilzomib injection).
      - **B)** Patient has tried at least three different regimens for multiple myeloma; AND
        Note: Examples of agents used in other regimens include bortezomib, Kyprolis (carfilzomib injection), Revlimid (lenalidomide capsules), cyclophosphamide, Ninlaro (ixazomib capsules).
   3. The medication is prescribed by or in consultation with an oncologist or a hematologist.

Other Uses with Supportive Evidence

2. **Light Chain Amyloidosis.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
   - **A)** Patient is ≥ 18 years of age; AND

B) Patient has received at least one other regimen for this condition; AND
Note: Examples of agents used in other regimens include bortezomib, Revlimid (lenalidomide capsules), cyclophosphamide, and melphalan.
C) The medication is prescribed by or in consultation with an oncologist or a hematologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Darzalex Intravenous is not recommended in the following situations:

175. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	**Multiple Myeloma:** Examples of agents for multiple myeloma were updated in the criteria. **Systemic Light Chain Amyloidosis:** To align with NCCN guidelines, this indication was added an Other Use With Supportive Evidence. Criteria approve if the patient has tried at least one other regimen for this condition, and if prescribed by or in consultation with an oncologist or hematologist.	02/26/2020
Annual Revision	**Multiple Myeloma:** To be consistent with other oncology policies, the requirement that the patient is ≥ 18 years of age was added. **Light Chain Amyloidosis:** To align with this indication in other policies, the qualifier "systemic" was removed from the indication. To align with the multiple myeloma indication, the requirement that the patient is ≥ 18 years of age was added.	03/10/2021

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Decitabine Prior Authorization Policy

- Decitabine injection for intravenous use (Dacogen® – Otsuka America Pharmaceutical, generics)

REVIEW DATE: 10/28/2020

OVERVIEW

Decitabine (Dacogen), a hypomethylating agent, is indicated for the treatment of **myelodysplastic syndromes** (MDS) in adults including previously treated and untreated, *de novo* and secondary MDS of all French-American-British subtypes (refractory anemia, refractory anemia with ringed sideroblasts, refractory anemia with excess blasts, refractory anemia with excess blasts in transformation, and chronic myelomonocytic leukemia) and intermediate-1, intermediate-2, and high-risk International Prognostic Scoring System groups.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for **Acute Myeloid Leukemia** (version 4.2020 – September 28, 2020) recommend decitabine as a single agent, or in combination with Nexavar® (sorafenib tablet) or Venclexta® (venetoclax tablet) in patients ≥ 60 years of age, and as a single agent, or in combination with Nexavar or Venclaxta for the treatment of relapsed/refractory disease.[2,4] NCCN also recommends decitabine in combination with Venclaxta for relapsed/refractory blastic plasmacytoid dendritic cell neoplasm.

The NCCN guidelines for **Myelodysplastic Syndromes** (version 1.2021 – September 11, 2020) recommend decitabine for the treatment of lower risk and higher risk MDS, and for the treatment of myelodysplastic/myeloproliferative neoplasms.[2,3]

The NCCN guidelines for **Myeloproliferative Neoplasms** (version 1.2020 – May 21, 2020) recommend decitabine for the treatment of myelofibrosis (MF)-accelerated phase or MF-blast/acute myeloid leukemia phase.[2,5]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of decitabine. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with decitabine as well as the monitoring required for adverse events and long-term efficacy, approval requires decitabine to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of decitabine is recommended in those who meet the following criteria:

FDA-Approved Indications

164. Myelodysplastic Syndromes. Note: Includes Refractory Anemia, Refractory Anemia with Ringed Sideroblasts, Refractory Anemia with Excess Blasts, Refractory Anemia with Excess Blasts in Transformation, Chronic Myelomonocytic Leukemia. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** The medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

165. Acute Myeloid Leukemia. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** Patient meets one of the following criteria (i or ii):
  - **i.** Patient is ≥ 60 years of age; OR
  - **ii.** Patient has relapsed or refractory disease; AND
- **B)** The medication is prescribed by or in consultation with an oncologist.

166. Blastic Plasmacytoid Dendritic Cell Neoplasm. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Patient has relapsed or refractory disease; AND
- **B)** Decitabine is used in combination with Venclexta® (venetoclax tablet); AND
- **C)** The medication is prescribed by or in consultation with an oncologist.

167. Myelofibrosis. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** Patient has accelerate phase, or blast/acute myeloid leukemia phase; AND

B) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of decitabine is not recommended in the following situations:

176. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Elzonris Prior Authorization Policy

- Elzonris™ (tagraxofusp-erzs injection for intravenous use – Stemline Therapeutics)

REVIEW DATE: 12/16/2020

OVERVIEW

Elzonris is indicated for the treatment of blastic plasmacytoid dendritic cell neoplasm in patients ≥ 2 years of age.[1]

Elzonris is a CD-123 directed cytotoxin, consisting of recombinant human interleukin-3 (IL-3) fused with truncated diphtheria toxin and is produced by recombinant DNA technology in *Escherichia coli* cells.[1] Elzonris inhibits protein synthesis and causes cell death in cells expressing CD-123.

Guidelines

The National Comprehensive Cancer Network clinical practice guidelines for **acute myeloid leukemia** (version 2.2021 – November 12, 2020) recommend Elzonris as a single agent for the treatment of blastic plasmacytoid dendritic cell neoplasm.[2,3]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Elzonris. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Elzonris as well as the monitoring required for adverse events and long-term efficacy, approval requires Elzonris to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Elzonris is recommended in those who meet the following criteria:

FDA-Approved Indications

168. Blastic Plasmacytoid Dendritic Cell Neoplasm. Approve for 1 year if the patient meets the following criteria (A and B):

A) Patient is ≥ 2 years of age; AND

B) Elzonris is prescribed by or consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Elzonris is not recommended in the following situations:

177. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Empliciti Prior Authorization Policy

- Empliciti® (elotuzumab injection for intravenous use – Bristol-Myers Squibb)

REVIEW DATE: 03/10/2021

OVERVIEW

Empliciti, a SLAMF7 (signaling lymphocytic activation molecule family member 7)-directed immunostimulatory antibody, is indicated in **multiple myeloma**, in the following situations:[1]

0. in patients who have received one to three prior therapies, in combination with Revlimid (lenalidomide capsules) and dexamethasone.
1. in patients who have received at least two prior therapies (including Revlimid and a proteasome inhibitor), in combination with Pomalyst® (pomalidomide) and dexamethasone.

Safety and efficacy have not been established in patients < 18 years of age.

Guidelines

The National Comprehensive Cancer Network (NCCN) Multiple Myeloma clinical practice guidelines (version 4.2021 – December 10, 2020) recommend Empliciti in treatment regimens for patients who were previously treated for multiple myeloma.[3] In this population, Empliciti/Revlimid (lenalidomide capsules)/dexamethasone, Empliciti/Velcade (bortezomib injection)/dexamethasone and Empliciti/Pomalyst/dexamethasone are listed as among the other recommended regimens.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Emplicti. Because of the specialized skills required for evaluation and diagnosis of patients treated with Emplicti as well as the monitoring required for adverse events and long-term efficacy, approval requires Emplicti to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Empliciti is recommended in those who meet one of the following criteria:

FDA-Approved Indications

3. **Multiple Myeloma**. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
   4. Patient is ≥ 18 years of age; AND
   5. Patient has tried at least one other regimen for multiple myeloma; AND
      Note: Examples of agents used in other regimens include Velcade (bortezomib injection), Revlimid (lenalidomide capsules), cyclophosphamide, Darzalex (daratumumab injection).
   6. Empliciti is used in combination with at least one other agent; AND
      Note: Examples of agents that may be used in combination with Empliciti include Revlimid® (lenalidomide capsules), Velcade (bortezomib injection), and Pomalyst (pomalidomide capsules).
   7. Empliciti is prescribed by or in consultation with an oncologist or a hematologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Empliciti is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Enhertu Prior Authorization Policy

- Enhertu® (fam-trastuzumab deruxtecan-nxki injection for intravenous use – Daiichi Sankyo, Inc. and AstraZeneca Pharmaceuticals)

REVIEW DATE: 01/13/2021; selected revision 01/27/2021

OVERVIEW

Enhertu is indicated for the following uses[1]:

- **Breast cancer**, treatment of adult patients with unresectable or metastatic human epidermal growth factor receptor 2 (HER2)-positive disease who have received two or more prior anti-HER2-based regimens in the metastatic setting.[1] This indication is approved under accelerated approval based

on tumor response rate and duration of response. Continued approval for this indication may be contingent upon verification and description of clinical benefit in a confirmatory trial.

- **Gastric cancer**, treatment of adult patients with locally advanced or metastatic HER2-positive gastric or gastroesophageal junction (GEJ) adenocarcinoma, who have received a prior trastuzumab-based regimen.
- Enhertu cannot be substituted for or with trastuzumab or Kadcyla (ado-trastuzumab emtansine).

Guidelines

- **Breast Cancer:** According to the National Comprehensive Cancer Network (NCCN) breast cancer guidelines (version 6.2020 – September 8, 2020), Enhertu is a recommended therapy, as per its FDA-approved indication after two or more prior HER2-targeted therapies, for the treatment of recurrent or Stage IV metastatic disease that is HER2-positive.[2,3] Preferred regimens include trastuzumab + Perjeta + docetaxel (category 1)and trastuzumab + Perjeta + paclitaxel (category 2A). Other recommended regimens include: Kadcyla; trastuzumab + vinorelbine, trastuzumab + capecitabine, Tykerb (lapatinib tablets) + capecitabine, and trastuzumab + Tykerb. For hormone receptor-positive (HR+), HER2-positive disease, endocrine therapy options include aromatase inhibitor ± trastuzumab; aromatase inhibitor + trastuzumab ± Tykerb; fulvestrant ± trastuzamab, tamoxifen ± trastuzumab (all category 2A). For premenopausal patients, ovarian ablation or suppression is recommended in addition to endocrine therapy ± trastuzumab.
- **Colon or Rectal Cancer:** The NCCN Compendium supports use of Enhertu for colon and rectal cancer for patients in the first-line setting who are not candidates for intensive therapy or as subsequent therapy.[2,4,5]
- **Gastric Cancer:** The NCCN guidelines for gastric cancer (version 4.2020 – December 23, 2020) have not addressed Enhertu. Trastuzumab is recommended as a preferred regimen for addition to first-line chemotherapy (fluorouracil or capecitabine + oxaliplatin [category 2A] or cisplatin [category 1]) in HER2 overexpression positive adenocarcinoma
- **Non-Small Cell Lung Cancer (NSCLC):** The NCCN Compendium supports use of Enhertu for HER2-positive disease.[2,6]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Enhertu. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Enhertu as well as the monitoring required for adverse events and long-term efficacy, approval requires Enhertu to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Enhertu is recommended in those who meet the following criteria:

FDA-Approved Indications

24. Breast Cancer. Approve for 1 year if the patient meets ALL of the following criteria (A, B, C, and D):

A) Patient is ≥ 18 years of age; AND

B) Patient has unresectable or metastatic human epidermal growth factor receptor 2 (HER2)-positive disease; AND

C) Patient has received at least two prior anti-HER2-based regimens in the metastatic setting; AND
Note: Examples of anti-HER2-based regimens include Perjeta (pertuzumab injection for intravenous use) + trastuzumab + docetaxel, Perjeta + trastuzumab + paclitaxel; Kadcyla (ado-trastuzumab emtansine for intravenous use), trastuzumab + capecitabine, trastuzumab + Tykerb (lapatinib tablets).
D) The medication is prescribed by or in consultation with an oncologist.

2. Gastric or Gastroesophageal Junction Cancer. Approve for 1 year if the patient meets ALL of the following criteria (A, B, C, and D):
A) Patient is ≥ 18 years of age; AND
B) Patient has human epidermal growth factor receptor 2 (HER2)-positive disease; AND
C) Patient has received at least one prior trastuzumab-based regimen; AND
D) The medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

3. Colon or Rectal Cancer. Approve for 1 year if the patient meets ALL of the following criteria (A, B, C, and D):
A) Patient is ≥ 18 years of age; AND
B) Patient has human epidermal growth factor receptor 2 (HER2)-positive, *RAS* and *BRAF* wild-type tumors; AND
C) Patient meets ONE of the following (i or ii):
i. Patient has tried at least one chemotherapy; OR
Note: Examples of chemotherapy are fluoropyrimidine such as 5-fluorouracil (5-FU), capecitabine; oxaliplatin, irinotecan, or an adjunctive chemotherapy regimen such as FOLFOX (5-FU, leucovorin, and oxaliplatin) or CapeOX (capecitabine and oxaliplatin).
ii. Patient has unresectable or metastatic disease and is not a candidate for intensive therapy, according to the prescriber; AND
D) The medication is prescribed by or in consultation with an oncologist.

4. Non-Small Cell Lung Cancer (NSCLC). Approve for 1 year if the patient meets ALL of the following criteria (A, B, and C):
A) Patient is ≥ 18 years of age; AND
B) Patient has human epidermal growth factor receptor 2 (HER2)-positive disease; AND
C) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Enhertu is not recommended in the following situations.

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HER2 – Human epidermal growth factor receptor 2.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Erbitux Prior Authorization Policy

- Erbitux® (cetuximab injection for intravenous infusion – ImClone LLC/Eli Lilly and Company)

REVIEW DATE: 07/22/2020

OVERVIEW

Erbitux, an epidermal growth factor receptor (EGFR) chimeric monoclonal antibody, is indicated for the treatment of the following conditions:

- **Colorectal cancer** (CRC), *KRAS* wild-type, EGFR-expressing, metastatic CRC as determined by FDA-approved tests for the following uses:
  - In combination with FOLFIRI (irinotecan, 5-fluorouracil [5-FU], leucovorin) for first-line treatment;
  - In combination with irinotecan in patients who are refractory to irinotecan-based chemotherapy; and
  - As a single agent in patients who have failed oxaliplatin- and irinotecan-based chemotherapy or who are intolerant to irinotecan.

  Limitation of use: Erbitux is not indicated for treatment of *RAS*-mutant CRC or when the results of the *RAS* mutation tests are unknown.
- **Squamous Cell Carcinoma of the Head and Neck**:
  - In combination with radiation therapy for the initial treatment of locally or regionally advanced SCCHN;
  - In combination with platinum-based therapy with 5-FU for the first-line treatment of patients with recurrent locoregional or metastatic disease; and
  - As a single agent in patients with recurrent or metastatic disease for whom prior platinum-based therapy has failed.[1]

Guidelines

Colon Cancer

The National Comprehensive Cancer Network (NCCN) colon cancer guidelines (version 4.2020 – June 15, 2020) recommend Erbitux as primary therapy for unresectable, advanced, or metastatic *KRAS/NRAS/BRAF* wild-type gene and left-sided tumors only, in combination with irinotecan, FOLFOX (5-FU, leucovorin, oxaliplatin), FOLFIRI, or FOLFOXIRI (5-FU, leucovorin, oxaliplatin, irinotecan) regimens in patients who can tolerate intensive therapy or as a single agent in patients who cannot tolerate intensive therapy.[2,7] Reference to left-sided only disease refers to a primary tumor that originated in the left side of the colon and only refers to use of Erbitux as first-line therapy for metastatic disease. Therapies recommended after first progression vary depending on the initial treatment regimen (i.e., 5-FU/leucovorin-based or capecitabine-based therapy) that was used. The NCCN guidelines recommend Erbitux, in combination with irinotecan, FOLFOX, or FOLFIRI for the subsequent treatment of *KRAS/NRAS/BRAF* wild-type tumors; or in combination with Braftovi (encorafenib capsules) for the subsequent treatment of *BRAF V600E* positive disease. The NCCN rectal cancer guidelines (version 6.2020 – June 25, 2020) make the same recommendations for Erbitux for the treatment of rectal cancer.[3,7]

Head and Neck Cancer
The NCCN head and neck cancers guidelines (version 2.2020 – June 9, 2020) recommend Erbitux in combination with radiation therapy, with a platinum agent (cisplatin or carboplatin) with or without 5-FU, with a platinum agent plus either docetaxel or paclitaxel, or as a single agent.[4,7]

Non-Small Cell Lung Cancer (NSCLC)
The NCCN guidelines on NSCLC (version 6.2020 – June 15, 2020) recommend Erbitux in combination with Gilotrif (afatinib tablets) as subsequent therapy for recurrent, advanced, or metastatic disease in patients with a known sensitizing *EGFR* mutation who are *EGFR T790M* negative, have progressed on EGFR tyrosine kinase inhibitor (TKI) therapy, and have multiple symptomatic systemic lesions; or with a known sensitizing EGFR mutation who have progressed on EGFR TKI therapy, and have asymptomatic disease, symptomatic brain lesions, or isolated symptomatic lesions.[5,7]

In one multicenter, Phase 1b trial conducted in the US and the Netherlands, patients (n = 126) with *EGFR*-mutant lung cancer with acquired resistance to Tarceva or Iressa received oral Gilotrif 40 mg daily plus Erbitux 500 mg/m^2 intravenously every 2 weeks.[6] Patients were heavily pretreated with 52% (n = 65/126) having received ≥ 2 lines of therapy; 79% of patients had received cytotoxic chemotherapy in addition to Tarceva or Iressa. At baseline, the *EGFR* mutation status was as follows: Deletion 19 positive (n = 78), L858R positive (n = 41); and other (n = 4). *T790M* mutation status was available in 124 patients with 71 patients being *T790M* positive and 53 patients being *T790M* negative. The rate of confirmed overall response was 29% (n = 37/126) with all being partial responses; 18% of patient had ≥ 50% tumor shrinkage from baseline. There was no significant difference in overall response rate between patients harboring *T790M*-positive and *T790M*-negative tumors (32% vs. 25%, respectively; P = 0.341). Median duration of response was 5.7 months.

Penile Cancer
The NCCN guidelines on penile cancer (version 1.2020 – January 14, 2020) recommend Erbitux as a single agent for the subsequent treatment of patients with metastatic disease.[7,8]

Squamous Cell Skin Cancer
The NCCN guidelines on squamous cell skin cancer (version 2.2020 – July 14, 2020) recommend Erbitux in combination with radiation therapy for inoperable or incompletely resected regional disease, or as systemic therapy alone in patients ineligible for checkpoint inhibitors with inoperable or incompletely resected regional disease, or regional recurrence or distant metastases.[7,10]

POLICY STATEMENT
Prior authorization is recommended for prescription benefit coverage of Erbitux. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Erbitux as well as the monitoring required for adverse events and long-term efficacy, approval requires Erbitux to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Erbitux is recommended in those who meet the following criteria:

FDA-Approved Indications

4. **Colon and Rectal Cancer.** Approve for 1 year if the patient meets the following criteria (A, B, C, D, and E):
   8. Patient has advanced or metastatic disease; AND

9. Patient's tumor or metastases are wild-type *RAS* (*KRAS* wild-type and/or *NRAS* wild-type) [that is, the tumor or metastases are *KRAS* and/or *NRAS* mutation negative]; AND
10. If Erbitux is being used for first-line treatment, the primary tumor originated on the left side of the colon (from splenic flexure to rectum); AND
11. Patient meets ONE of the following criteria (i or ii):
- **i.** Patient's tumor or metastases are wild-type *BRAF* (that is, the tumor or metastases are *BRAF V600E* mutation-negative); OR
- **ii.** Patient's tumor or metastases are *BRAF V600E* mutation-positive and the patient meets the following (a and b):
  - **a)** Patient has previously received a chemotherapy regimen for colon or rectal cancer; AND
    Note: Examples of chemotherapy regimens include a fluoropyrimidine such as 5-fluorouracil (5-FU), capecitabine, oxaliplatin, irinotecan, or an adjunctive chemotherapy regimen such as FOLFOX (5-FU, leucovorin, and oxaliplatin) or CapeOX (capecitabine and oxaliplatin).
  - **b)** Erbitux is prescribed in combination with Braftovi (encorafenib capsules); AND

E) Erbitux is prescribed by or in consultation with an oncologist.

5. Head and Neck Squamous Cell Carcinoma (HNSCC). Approve for 1 year if the patient meets the following criteria (A and B):
A) Patient meets ONE of the following criteria (i, ii, or iii):
- **iii.** Erbitux will be used in combination with radiation therapy; OR
- **iv.** Erbitux will be used in combination with platinum-based therapy; OR
  Note: Examples of platinum chemotherapy include cisplatin and carboplatin.
- **v.** Erbitux will be used as a single agent; AND

B) Erbitux is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

6. Non-Small Cell Lung Cancer. Approve for 1 year if the patient meets the following criteria (A, B, C, D, and E):
A) Patient has advanced, or metastatic non-small cell lung cancer; AND
B) Patient has a known sensitizing epidermal growth factor receptor *(EGFR)* mutation; AND
C) Patient has received at least ONE tyrosine kinase inhibitor; AND
Note: Examples of tyrosine kinase inhibitors include Tarceva® (erlotinib tablets), Iressa® (gefitinib tablets), or Gilotrif® (afatinib tablets).
D) Erbitux will be used in combination with Gilotrif (afatinib tablets).
E) Erbitux is prescribed by or in consultation with an oncologist.

7. Penile Cancer. Approve for 1 year if the patient meets the following criteria (A, B, C, and D):
A) Patient has metastatic disease; AND
B) Erbitux will be used as subsequent therapy; AND
C) Erbitux will be used as a single agent; AND
D) Erbitux is prescribed by or in consultation with an oncologist.

8. Squamous Cell Skin Cancer. Approve for 1 year if the patient meets the following criteria (A and B):
A) Patient meets one of the following (i, ii, or iii):
- **i.** Patient has inoperable or incompletely resected regional disease; OR
- **ii.** Patient has regional disease; OR
- **iii.** Patient has distant metastases; AND

B) Erbitux is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Erbitux is not recommended in the following situations:

178. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
New Policy	--	07/24/2019
Annual revision	**Colon and Rectal Cancer.** Revised criteria for *BRAF V600E* criteria to allow Erbitux use in combination with Braftovi only. **Head and Neck Squamous Cell Carcinoma.** Revised criteria for single agent use of Erbitux by removing "in patients who have failed prior platinum-based therapy" and removed the Note. **Non-Small Cell Lung Cancer.** Removed criteria for testing to be negative for epidermal growth factor *T790M* mutation. **Penile Cancer**. Added criteria for penile cancer. **Squamous Cell Skin Cancer.** Added criteria for squamous cell skin cancer.	07/22/2020

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Erwinaze® (asparaginase *Erwinia chrysanthemi* injection for intramuscular and intravenous use – Jazz Pharmaceuticals)

DATE REVIEWED: 06/03/2020

OVERVIEW

Erwinaze is *Erwinia chrysanthemi*-derived L-asparaginase.[1] Asparaginase reduces the plasma levels of asparagine by catalyzing the breakdown of asparagine to aspartic acid and ammonia. Leukemia cells have a deficiency of asparagine synthetase activity and rely on exogenous sources of L-asparagine for survival. Erwinaze depletes plasma L-asparagine levels leading to leukemia cell death.

Erwinaze is indicated as a component of a multi-agent chemotherapeutic regimen for the treatment of patients with acute lymphoblastic leukemia (ALL) who have developed hypersensitivity to *Escherichia coli*-derived asparaginase.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for ALL (Version 1.2020 – January 15, 2020) recommend *E. chrysanthemi*-derived asparaginase for patients who have systemic allergic reactions or anaphylaxis due to pegaspargase hypersensitivity, and for induction therapy for ALL in patients ≥ 65 years of age.[2,3]

The NCCN guidelines for Pediatric ALL (Version 2.2020 – November 25, 2019) recommend *E. chrysanthemi*-derived asparaginase for patients who have systemic reactions or anaphylaxis due to pegaspargase hypersensitivity.[3,4]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Erwinaze. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Erwinaze as well as the monitoring required for adverse events and long-term efficacy, approval requires Erwinaze to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Erwinaze is recommended in those who meet the following criteria:

FDA-Approved Indications

169. Acute Lymphoblastic Leukemia. Approve for 1 year if the patient meets the following criteria (A and B):

- **A)** Erwinaze is used for one of the following (i or ii):
  - **i.** The patient has a systemic allergic reaction or anaphylaxis to a pegylated asparaginase product; OR
  - **ii.** Induction therapy in adults ≥ 65 years of age; AND
- **B)** Erwinaze is prescribed by or consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Erwinaze has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

179. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Annual Revision	No change to criteria	06/03/2020

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Folotyn® (pralatrexate injection – Spectrum Pharmaceuticals)

DATE REVIEWED: 06/03/2020

OVERVIEW

Folotyn is an antineoplastic folate analog which competitively inhibits dihydrofolate reductase.[1]

Folotyn is indicated for the treatment of patients with relapsed or refractory peripheral T-cell lymphoma.[1] This indication is based on overall response rate. Continued approval for this indication may be contingent on verification and description of clinical benefit in a confirmatory trial.

Guidelines

The National Comprehensive Cancer Network (NCCN) Primary Cutaneous Lymphomas clinical practice guidelines (version 2.2020 – April 10, 2020) recommend Folotyn as systemic therapy for mycosis fungoides/Sezary syndrome with or without skin-directed therapy and as a single agent for primary cutaneous CD30+ T-cell lymphoproliferative disorders.[2,3]

The NCCN T-Cell Lymphomas clinical practice guidelines (version 1.2020 – January 6, 2020) recommend Folotyn as a single agent for the second-line or subsequent therapy of relapsed or refractory peripheral T-cell lymphomas including anaplastic large cell lymphoma, peripheral T-cell lymphoma not otherwise specified, angioimmunoblastic T-cell lymphoma; enteropathy-associated T-cell lymphoma, monomorphic epitheliotropic intestinal T-cell lymphoma, and nodal peripheral T-cell lymphoma with T-follicular helper (TFH) phenotype; follicular T-cell lymphoma; adult T-cell leukemia/lymphoma; extranodal NK/T-cell lymphoma – nasal type; and hepatosplenic gamma-delta T-cell lymphoma.[3,4]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Folotyn. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Folotyn as well as the monitoring required for adverse events and long-term efficacy, approval requires Folotyn to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Folotyn is recommended in those who meet the following criteria:

FDA-Approved Indications

170. T-Cell Lymphoma, Peripheral. Approve for 1 year if the patient meets the following criteria (A, B, and C):

A) The patient has relapsed or refractory disease; AND

B) Folotyn is used as a single agent; AND

C) Folotyn is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

171. Mycosis Fungoides/Sezary Syndrome. Approve for 1 year if Folotyn is prescribed by or in consultation with an oncologist or dermatologist.

172. Cutaneous CD30+ T-Cell Lymphoproliferative Disorders. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** The patient has one of the following diagnoses (i or ii):
  - **i.** Primary cutaneous anaplastic large cell lymphoma with multifocal lesions; OR
  - **ii.** Cutaneous anaplastic large cell lymphoma with regional nodes; AND
- **B)** Folotyn is used as a single agent; AND
- **C)** Folotyn is prescribed by or in consultation with an oncologist.

173. Adult T-Cell Leukemia/Lymphoma, Acute or Lymphoma Subtype. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Folotyn is used as second-line or subsequent therapy; AND
- **B)** Folotyn is used as a single agent; AND
- **C)** Folotyn is prescribed by or in consultation with an oncologist.

174. Extranodal NK/T-Cell Lymphoma, Nasal Type. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** The patient has relapsed/refractory disease following combination, asparaginase-based chemotherapy; AND
- **B)** Folotyn is used as a single agent; AND
- **C)** Folotyn is prescribed by or in consultation with an oncologist.

175. Hepatosplenic Gamma-Delta T-Cell Lymphoma. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Folotyn is used as second-line or subsequent therapy; AND
- **B)** Folotyn is used as a single agent; AND
- **C)** Folotyn is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Folotyn has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

180. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Fulvestrant (Faslodex injection for intramuscular use – AstraZeneca; generics)

DATE REVIEWED: 05/06/2020

OVERVIEW

Fulvestrant is an estrogen receptor (ER) antagonist that binds to the estrogen receptor in a competitive manner.[1] Its affinity to the ER is comparable to that of estradiol. By binding to the ER, Faslodex downregulates the ER protein in human breast cancer cells.

Fulvestrant is indicated for the following:

- As monotherapy, for the treatment of hormone receptor-positive (HR+) [i.e., ER+ or progesterone receptor (PR+)], human epidermal growth factor receptor 2 (HER2)-negative advanced breast cancer in postmenopausal women not previously treated with endocrine therapy; or
- As monotherapy, for the treatment of patients with HR+ advanced breast cancer in postmenopausal women with disease progression following endocrine therapy.[1]
- Fulvestrant is indicated in combination with Kisqali (ribociclib tablets) as initial endocrine based therapy or following disease progression on endocrine therapy for HR+, HER2-negative advanced or metastatic breast cancer in postmenopausal women.
- Fulvestrant is indicated in combination with Ibrance® (palbociclib capsules) or Verzenio™ (abemaciclib tablets) in women with disease progression after endocrine therapy for HR+, HER2-negative advanced or metastatic breast cancer.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on breast cancer (version 3.2020 – March 6, 2020) recommends fulvestrant in combination with cyclin dependent kinase 4/6 inhibitors (i.e., Ibrance, Kisqali, Verzenio) and non-steroidal aromatase inhibitors (i.e., anastrozole, letrozole) for the treatment of recurrent or metastatic HR+, HER2-negative disease (category 1 preferred regimen).[2] The guidelines note that CDK4/6 inhibitors or anastrozole/letrozole in combination with fulvestrant may be considered as a treatment option for first-line therapy for women who are postmenopausal or premenopausal (receiving ovarian suppression or ablation). If CDK4/6 inhibitor was not previously used, fulvestrant + CDK4/6 inhibitor is a category 1, preferred regimen as second/subsequent-line therapy. It is also recommended as a second/subsequent-line therapy, category 1, preferred regimen for *PIK3CA* mutated tumors in combination with Piqray (alpelisib tablets). Fulvestrant in combination with everolimus (category 2A) is another option for second/subsequent-line therapy. As monotherapy, fulvestrant is listed

as one of the preferred options (category 2A) for second/subsequent-line therapy. Men with breast cancer should be treated similarly to postmenopausal women, except that use of an aromatase inhibitor is ineffective without concomitant suppression of testicular steroidogenesis.[2-3] Based on a review article, there are limited data to support the use of fulvestrant monotherapy in men; however, there are no randomized prospective or retrospective trial data with the use of everolimus or cyclin dependent kinase (CDK) 4/6 inhibitor in men.[4]

The NCCN compendium for fulvestrant and the respective guidelines support fulvestrant use for low-grade serous carcinoma (ovarian/fallopian tube/primary peritoneal cancer), uterine sarcoma, and endometrial carcinoma.[3]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of fulvestrant. All approvals are provided for the duration noted below. Because of the of the specialized skills required for evaluation and diagnosis of patients treated with fulvestrant, as well as the monitoring required for adverse events and long-term efficacy, approval requires fulvestrant to be prescribed by or in consultation with a physician who specializes in the condition being treated.

In the approval indication, as appropriate, an asterisk (*) is noted next to the specified gender. In this context, the specified gender is defined as follows: men/males are defined as individuals with the biological traits of a man, regardless of the individual's gender identity or gender expression. Female/women are defined as individuals with the biological traits of a woman, regardless of the individual's gender identity or gender expression.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of fulvestrant is recommended in those who meet one of the following criteria:

FDA-Approved Indications

9. **Breast Cancer – Fulvestrant Monotherapy**. Approve for 1 year if the patient meets the following criteria (A, B, and C):
   - **12.** The medication is prescribed by or in consultation with an oncologist; AND
   - **13.** Patient has recurrent or metastatic hormone receptor (HR)-positive (i.e., estrogen receptor- [ER] or progesterone receptor [PR]-positive) disease; AND
   - **14.** Patient meets one of the following criteria (i or ii):
     - **i.** Patient is a postmenopausal female* or a male*; OR
     - **ii.** Patient is premenopausal and is receiving ovarian suppression with a gonadotropin-releasing hormone (GnRH) agonist or has had ovarian ablation.
       Note: Examples of GnRH agonist are Zoladex (goserelin), Lupron (leuprolide), Trelstar (triptorelin). Examples of ovarian ablation are surgical bilateral oophorectomy, ovarian irradiation.

   * Refer to the Policy Statement.

10. **Breast Cancer – Fulvestrant Combination Therapy**. Approve for 1 year if the patient meets the following criteria (A, B, C, and D):
    - **I)** The medication is prescribed by or in consultation with an oncologist; AND
    - **J)** Patient has recurrent or metastatic hormone receptor (HR)-positive (i.e., estrogen receptor- [ER] or progesterone receptor [PR]-positive) disease; AND
    - **K)** Patient meets ONE of the following criteria (i or ii):
      - **A)** Patient is a postmenopausal female* or a male*; OR

ii. Patient is premenopausal and is receiving ovarian suppression with a gonadotropin- releasing hormone (GnRH) agonist or has had ovarian ablation.
Note: Examples of GnRH agonist are Zoladex (goserelin), Lupron (leuprolide), Trelstar (triptorelin). Examples of ovarian ablation are surgical bilateral oophorectomy, ovarian irradiation; AND

L) Patient meets one of the following criteria (i or ii):
i. Patient has human epidermal growth factor receptor 2 (HER2)-negative breast cancer and meets one of the following criteria (a or b):
a) The patient meets both of the following criteria (1 and 2):
(1) The patient has progressed on or after at least one prior endocrine-based therapy.
Note: Examples of endocrine therapy are tamoxifen, anastrozole, letrozole, exemestane; AND
(2) The patient has *PIK3CA*-mutated tumor and the medication is used in combination with Piqray (alpelisib tablets); OR
b) The medication will be used in combination with one of: a cyclin dependent kinase 4/6 (CDK 4/6) inhibitor, non-steroidal aromatase inhibitor (i.e., anastrozole or letrozole), or everolimus.
Note: Examples of CDK4/6 inhibitors are Kisqali (ribociclib tablets), Ibrance (palbociclib capsules), Verzenio (abemaciclib tablets); OR
ii. Patient has human epidermal growth factor receptor 2 (HER2)-positive breast cancer and the medication is used in combination with trastuzumab products.

* Refer to the Policy Statement.

Other Uses with Supportive Evidence

11. Ovarian/Fallopian Tube/Primary Peritoneal Cancer. Approve for 1 year if the patient meets the following criteria (A and B):
A) The medication is prescribed by or in consultation with an oncologist; AND
B) The medication is used as recurrence therapy for low-grade serous carcinoma.

12. Uterine Sarcoma. Approve for 1 year if the patient meets the following criteria (A and B):
A) The medication is prescribed by or in consultation with an oncologist; AND
B) Patient meets one of the following criteria (i or ii):
i. Patient has low-grade endometrial stromal sarcoma; OR
ii. Patient has hormone receptor-positive uterine leiomyosarcoma.

13. Endometrial Carcinoma. Approve for 1 year if the medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Fulvestrant has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

2. Other Indications (Non-Cancer). Coverage is not recommended for circumstances not listed in the Authorization Criteria (FDA-approved indications and Other Uses with Supportive Evidence). Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes*	Date Reviewed
New policy	New criteria	04/10/2019
Selected revision	Due to the availability of generics, changed policy name to Oncology – Fulvestrant instead of brand name. For Breast Cancer – Fulvestrant Combination Therapy, added criteria for combination use with Piqray if patient has tried prior endocrine regimen. Based on guidelines, fulvestrant and CDK4/6 inhibitor/Afinitor use does not require prior endocrine regimen. Due to generics, changed reference from brand name to generic name where applicable.	10/02/2019
Annual revision	For Breast Cancer - Fulvestrant Combination Therapy indication, added non-steroidal aromatase inhibitors (i.e., letrozole or anastrozole) as one of the agents that could be used in combination with fulvestrant.	05/06/2020

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Gazyva Prior Authorization Policy

- Gazyva® (obinutuzumab injection for intravenous use – Genentech, Inc.)

REVIEW DATE: 10/14/2020

OVERVIEW

Gazyva is indicated for the treatment of:

- **Chronic lymphocytic leukemia**, in combination with chlorambucil in previously untreated patients.
- **Follicular lymphoma**, in combination with bendamustine followed by Gazyva monotherapy, for patients who relapse or are refractory to a rituximab containing regimen.
- **Follicular lymphoma, stage II bulky, III or IV**, in combination with chemotherapy, followed by Gazyva monotherapy for patients achieving at least a partial remission, in previously untreated patients.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on **B-cell lymphomas** (version 4.2020 – August 13, 2020) recommend Gazyva for the first-line and second-line treatment of follicular lymphoma (grade 1 or 2) in combination with CHOP (cyclophosphamide, doxorubicin, vincristine, and prednisone), CVP (cyclophosphamide, vincristine, and prednisone), bendamustine, or Revlimid (lenalidomide capsules); or as maintenance treatment.[2,4] The guidelines also recommend Gazyva as second-line or maintenance therapy for gastric and nongastric MALT lymphoma, nodal marginal zone lymphoma, and splenic marginal zone lymphoma. Gazyva is also recommended as a substitute for rituximab products (e.g., Rituxan, Truxima) in patients experiencing rare complications, regardless of histology.

The NCCN guidelines on c**hronic lymphocytic leukemia/small lymphocytic lymphoma** (CLL/SLL) (version 1.2021 – September 28, 2020) recommends Gazyva in combination with Calquence® (acalabrutinib capsules); in combination with Venclexta® (venetoclax tablets) in frail patients with significant comorbidities; in combination with chlorambucil, bendamustine, Venclexta, or Imbruvica® (ibrutinib capsules and tablets); or as a single agent for the first-line treatment of CLL/SLL without del(17p)/TP53 mutation.[2,3] Gazyva is also recommended as a single agent or

in combination with Venclexta or Calquence for the first-line treatment of CLL/SLL with del(17p)/TP53 mutation; and as a single agent for relapsed or refractory CLL/SLL without del(17p)/TP53 mutation.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Gazyva. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Gazyva as well as the monitoring required for adverse events and long-term efficacy, approval requires Gazyva to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Gazyva is recommended in those who meet the following criteria:

FDA-Approved Indications

176. Chronic Lymphocytic Leukemia/Small Lymphocytic Lymphoma. Approve for 6 months if the patient meets the following criteria (A and B):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** The medication is prescribed by or in consultation with an oncologist.

177. Follicular Lymphoma. Approve for 6 months if the patient meets the following criteria (A, B, and C):
- **B)** Patient is ≥ 18 years of age; AND
- **C)** Gazyva will be used in ONE of the following situations (i, ii, or iii):
  - **i.** In combination with chemotherapy; OR
    Note: Examples include CHOP (cyclophosphamide, doxorubicin, vincristine, and prednisone), CVP (cyclophosphamide, vincristine, and prednisone), or bendamustine.
  - **ii.** For maintenance treatment following Gazyva in combination with chemotherapy; OR
  - **iii.** Patient experienced an adverse event or intolerance to a rituximab product; AND
    Note: Examples of adverse events or intolerance includes paraneoplastic pemphigus, Stevens-Johnson syndrome, Lichenoid Dermatitis, vesiculobullous dermatitis, toxic epidermal necrolysis.[2,4]
- **C)** The medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

178. Marginal Zone Lymphoma. Note: Includes Nodal Marginal Zone Lymphoma, Splenic Marginal Zone Lymphoma, Gastric MALT, or Nongastric MALT. Approve for 6 months if the patient meets the following criteria (A, B, and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Gazyva will be used in ONE of the following situations (i or ii):
  - **i.** Second-line or subsequent therapy for recurrent or progressive disease; OR
  - **ii.** Patient experienced an adverse event or intolerance to a rituximab product: AND
    Note: Examples of adverse events or intolerance includes paraneoplastic pemphigus, Stevens-Johnson syndrome, Lichenoid Dermatitis, vesiculobullous dermatitis, toxic epidermal necrolysis.[2,4]
- **C)** The medication is prescribed by or in consultation with an oncologist.

179. Other B-Cell Lymphoma. Note: Includes Diffuse Large B-Cell Lymphoma, Mantle Cell Lymphoma, High-Grade B-Cell Lymphoma, Burkitt Lymphoma, AIDS-Related B-Cell Lymphoma,

Post-Transplant Lymphoproliferative Disorders, Castleman's Disease. Approve for 6 months if the patient meets the following criteria (A, B, and C):

A) Patient is ≥ 18 years of age; AND

B) Patient experienced an adverse event or intolerance to a rituximab product: AND
Note: Includes paraneoplastic pemphigus, Stevens-Johnson syndrome, Lichenoid Dermatitis, vesiculobullous dermatitis, toxic epidermal necrolysis.[2,4]

C) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Gazyva is not recommended in the following situations:

181. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
New Policy	--	10/09/2019
Annual Revision	No criteria changes.	10/14/2020

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Gonadotropin-Releasing Hormone Analogs Prior Authorization Policy

- Eligard® (leuprolide acetate for subcutaneous injection – Tolmar Pharmaceuticals Inc.)
- Firmagon® (degarelix for subcutaneous injection – Ferring Pharmaceuticals Inc.)
- Trelstar® (triptorelin pamoate for intramuscular injection – Verity Pharmaceuticals Inc.)

REVIEW DATE: 12/09/2020

OVERVIEW

Eligard, Trelstar, and Firmagon are all indicated for the treatment of advanced prostate cancer.[1-3] Eligard and Trelstar are gonadotropin-releasing hormone (GnRH) agonists, whereas Firmagon is a GnRH antagonist. Both Eligard and Firmagon are as a subcutaneous injection and Trelstar is administered as an intramuscular injection.

Guidelines

The National Comprehensive Cancer Network (NCCN) Guidelines for Head and Neck Cancer (version 1.2021 – November 9, 2020) recommend the use of androgen receptor therapy (i.e., leuprolide, bicalutamide) for androgen receptor (AR)-positive, recurrent salivary gland tumors with distant metastases.[4,5]

The NCCN Guidelines for Prostate Cancer (version 3.2020 – November 17, 2020) note androgen deprivation therapy as primary systemic therapy for regional or advanced prostate cancer and as neoadjuvant/concomitant/adjuvant therapy in combination with radiation in localized or locally advanced prostate cancer.[6] Many different drugs can be used as androgen deprivation therapy, including Eligard, Firmagon, and Trelstar.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Eligard, Firmagon, and Trelstar. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Eligard, Firmagon, and Trelstar as well as the monitoring required for adverse events and long-term efficacy, approval requires these agents to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Eligard, Firmagon, or Trelstar is recommended in those who meet the following criteria:

FDA-Approved Indications

180. Prostate Cancer. Approve Eligard, Firmagon, or Trelstar for 1 year if prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

181. Head and Neck Cancer – Salivary Gland Tumors. Approve Eligard for 1 year if the patient meets the following criteria (A, B, and C):

A) Patient has recurrent disease with distant metastases; AND
B) Patient has androgen receptor (AR)-positive disease; AND
C) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Eligard, Trelstar, or Firmagon is not recommended in the following situations:

182. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Halaven® (eribulin mesylate injection for intravenous use – Eisai Inc.)

DATE REVIEWED: 02/26/2020

OVERVIEW

Halaven is a microtubule inhibitor indicated for the treatment of patients with metastatic breast cancer who have previously received at least two chemotherapeutic regimens for the treatment of metastatic disease.[1] Prior therapy should have included an anthracycline and a taxane in either the adjuvant or metastatic setting. Halaven is also indicated for the treatment of patients with unresectable or metastatic liposarcoma who have received a prior anthracycline-containing regimen.

Guidelines

The National Comprehensive Cancer Network (NCCN) breast cancer guidelines (version 2.2020 – February 5, 2020) lists Halaven as one of the preferred single-agent regimens for patients with human epidermal growth factor receptor-2 (HER2)-negative recurrent or metastatic breast cancer.[2,3] It can also be used in HER2-positive disease when used in combination with Herceptin (trastuzumab for intravenous use) for recurrent or metastatic disease.

The NCCN soft tissue sarcoma guidelines (version 6.2019 – February 10, 2020) lists Halaven as a single-agent therapy (most are category 2A) for a variety of subtypes with non-specific histologies.[3] For liposarcoma, Halaven is a category 1 recommended agent. The NCCN compendium[2] recommends Halaven for the following soft tissue sarcoma subtypes: extremity/superficial trunk, head/neck, retroperitoneal/intra-abdominal, angiosarcoma, and pleomorphic rhabdomyosarcoma. Halaven is a category 2B recommended therapy for uterine sarcoma.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Halaven. Because of the specialized skills required for evaluation and diagnosis of patients treated with Halaven as well as the monitoring required for adverse events and long-term efficacy, approval requires the medication to be prescribed by or in consultation with a prescriber who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Halaven is recommended in those who meet the following criteria:

FDA-Approved Indications

3. Breast Cancer. Approve for 1 year if the patient meets the following criteria (A, B, and C):

A) The patient has metastatic disease; AND
B) The patient has been previously treated with at least two chemotherapy regimens.
Note: Examples of chemotherapy include doxorubicin, epirubicin, paclitaxel, docetaxel, Abraxane (albumin-bound paclitaxel); AND
C) The medication is prescribed by or in consultation with an oncologist.

2. Soft Tissue Sarcoma of the Extremity/Superficial Trunk, Head/Neck, Retroperitoneal/Intra-Abdominal, Angiosarcoma, Pleomorphic Rhabdomyosarcoma, and Liposarcoma. Approve for 1 year if the patient meets the following criteria (A, B, and C):
A) The patient has unresectable, progressive, or metastatic disease; AND
B) The patient has been treated with at least one prior anthracycline-containing chemotherapy regimen.
Note: Examples of chemotherapy regimen include doxorubicin and dacarbazine, doxorubicin with ifosfamide and mesna, epirubicin with ifosfamide and mesna; AND
C) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Halaven has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

272. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Herceptin Hylecta Prior Authorization Policy
- Herceptin Hylecta™ (trastuzumab and hyaluronidase-oysk for subcutaneous use – Genentech)

REVIEW DATE: 03/17/2021

OVERVIEW

Herceptin Hylecta is indicated for the following uses:[1]

- **Breast Cancer, adjuvant treatment** of adults with human epidermal growth factor receptor 2 (HER2) overexpressing node positive or node negative (estrogen receptor [ER]-/progesterone receptor [PR]-negative or with one high risk feature) breast cancer:
  - **a)** As part of a treatment regimen consisting of doxorubicin, cyclophosphamide, and either paclitaxel or docetaxel.
  - **b)** As part of a treatment regimen with docetaxel and carboplatin.
  - **c)** As a single agent following multi-modality anthracycline based therapy.
- **Breast Cancer**, metastatic, in adults with HER2-overexpressing disease:
  - **a)** In combination with paclitaxel for first-line treatment.
  - **b)** As a single agent for the treatment of patients who have received one or more chemotherapy regimens for metastatic disease.

Guidelines

The National Comprehensive Cancer Network (NCCN) Breast Cancer clinical practice guidelines (version 2.2021 – March 12, 2021) recommend substitution of Herceptin Hylecta for trastuzumab intravenous (IV) in the treatment algorithm.[2,3] The guidelines note the different dose and dosage form of Herceptin Hylecta compared with trastuzumab. It is also noted that Herceptin Hylecta cannot be substituted for Kadcyla™ (ado-trastuzumab emtansine for intravenous injection). Trastuzumab is recommended as part of a preferred regimen in the preoperative/adjuvant therapy setting in HER2-positive disease. As part of a preferred regimen, it can be used in combination with doxorubicin/cyclophosphamide followed by paclitaxel plus trastuzumab ± Perjeta® (pertuzumab for injection); paclitaxel + trastuzumab; and docetaxel/carboplatin/trastuzumab ± Perjeta. Docetaxel + cyclophosphamide + trastuzumab is noted under "useful in certain circumstances." Other recommended regimens are doxorubicin/cyclophosphamide followed by docetaxel + trastuzumab ± Perjeta. If there is no residual disease after preoperative therapy or no preoperative therapy: complete up to one year of HER2-targeted therapy with trastuzumab (category 1) ± Perjeta. If there is residual disease after preoperative therapy: Kadcyla alone (category 1) is preferred. If Kadcyla is discontinued for toxicity, then trastuzumab (category 1) ± Perjeta can be used to complete 1 year of therapy. For systemic treatment of recurrent or stage IV (M1) disease that is hormone-receptor positive and HER2-positive, trastuzumab + Perjeta + taxane is preferred; or trastuzumab + chemotherapy; or Kadcyla can be used; or endocrine therapy ± HER2-targeted therapy. For HER2-positive disease and postmenopausal and premenopausal patients endocrine therapy options include, aromatase inhibitor ± trastuzumab; aromatase inhibitor + trastuzumab ± Tykerb® (lapatinib tablets); Faslodex® (fulvestrant for injection) ± trastuzamab, tamoxifen ± trastuzumab (all category 2A). For premenopausal patients, ovarian ablation or suppression is recommended in addition to endocrine therapy ± trastuzumab.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Herceptin Hylecta. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Herceptin Hylecta as well as the monitoring required for adverse events and long-term efficacy, approval requires Herceptin Hylecta to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Herceptin Hylecta is recommended in those who meet the following criteria:

FDA-Approved Indications

25. Breast Cancer. Approve for the duration noted below if the patient meets ALL of the criteria (A, B, C, and D):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has human epidermal growth factor receptor 2 (HER2)-positive disease; AND
- **C)** Patient meets one of the following criteria (i or ii):
  - **i.** Approve for up to 1 year (total) if the medication is used for adjuvant treatment; OR
  - **ii.** Approve for 1 year if the medication is used for metastatic disease; AND
- **D)** The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Herceptin Hylecta is not recommended in the following situations:

3. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Imfinzi Prior Authorization Policy
- Imfinzi® (durvalumab injection for intravenous use – AstraZeneca)

REVIEW DATE: 07/15/2020; 03/03/2021 selected revision

OVERVIEW

Imfinzi, a programmed cell death ligand 1 (PD-L1) blocking antibody, is indicated for the treatment of the following conditions:

- **Non-small cell lung cancer (NSCLC)**, in adult patients with unresectable Stage III disease that has not progressed following concurrent platinum-based chemotherapy and radiation therapy.
- **Small cell lung cancer**, in combination with etoposide and either carboplatin or cisplatin for the first-line treatment of adult patients with extensive-stage disease.

Guidelines

- **Non-Small Cell Lung Cancer:** The National Comprehensive Cancer Network (NCCN) guidelines on NSCLC (version 6.2020 – June 15, 2020) recommends Imfinzi (category 1) as consolidation therapy for patients with unresectable Stage III disease with a performance status of 0 or 1.[3,4] Imfinzi can be used regardless of the PD-L1 status in patients who have not progressed after two or more cycles of definitive concurrent platinum-based chemoradiation therapy. Imfinzi is not recommended for patients following definitive surgical resection.
- **Small Cell Lung Cancer:** The NCCN guidelines for small cell lung cancer (version 4.2020 – July 7, 2020) recommends the use of Imfinzi in combination with etoposide and carboplatin/cisplatin as "preferred" first-line treatment option (category 1).[3,5] Imfinzi is used in maintenance setting, after 4 cycles in combination with chemotherapy, as single-agent once every 28 days until disease progression or unacceptable toxicity.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Imfinzi. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Imfinzi, as well as the monitoring required for adverse events and long-term efficacy, approval requires Imfinzi to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Imfinzi is recommended in those who meet the following criteria:

FDA-Approved Indications

1. **Non-Small Cell Lung Cancer.** Approve for 1 year (total) of therapy if the patient meets the following criteria (A, B, and C):
   - **A)** Patient has unresectable Stage III disease; AND
   - **B)** Patient has not had disease progression following treatment with concurrent platinum-based chemotherapy and radiation therapy; AND
   - **C)** The medication is prescribed by or in consultation with an oncologist.

2. **Small Cell Lung Cancer.** Approve for 1 year if the patient meets the following criteria (A and B):
   - **A)** Patient meets one of the following (i or ii):
     - **i.** The medication is used in combination with etoposide and platinum chemotherapy (cisplatin or carboplatin); OR
     - **ii.** The medication is used as single-agent for maintenance after chemotherapy; AND
   - **B)** The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Imfinzi is not recommended in the following situations:

273. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Imlygic® (talimogene laherparepvec intralesional injection – Amgen)

TAC APPROVAL DATE: 02/19/2020

OVERVIEW

Imlygic is an oncolytic viral therapy indicated for the local treatment of unresectable cutaneous, subcutaneous, and nodal lesions in patients with melanoma recurrent after initial surgery.[1] It is a limitation of use that Imlygic has not been shown

to improve overall survival or have an effect on visceral metastases. Imlygic should be continued for at least 6 months, unless other treatment is required or there are no injectable lesions to treat and may also be reinitiated if new unresectable cutaneous, subcutaneous, or nodal lesions appear following a complete response. In the pivotal trial, adults with unresectable stage III (30%) or stage IV (70%) melanoma were treated for at least 6 months, or until no remaining injectable lesions. During the initial 6 months of the trial, treatment continued despite increased size or number of lesions. Following 6 months of treatment, patients could continue Imlygic until clinically relevant disease progression (i.e., disease progression associated with a decline in performance status and/or alternative therapy was needed, according to the prescriber). Imlygic requires specialized storage conditions (-130° to -94° F). Personal protective equipment (including a gown/laboratory coat, safety glasses or face shield, and gloves) while preparing or administering, and procedures for accidental exposure to Imlygic should be followed. Healthcare providers should be prepared to manage adverse events, including immune-mediated events (e.g., glomerulonephritis, vasculitis, pneumonitis) and plasmocytoma at the injection site. Safety and efficacy have not been established in patients < 18 years of age.

Disease Overview

Oncolytic virus immunotherapy is a form of cancer therapy which uses native or genetically modified viruses to selectively enter, replicate, and lyse tumor cells.[2] Oncolytic viruses are able to be engineered to deliver therapeutic genes to cancer cells, thus, causing additional antitumor effects through cytokine secretion and induction of antitumor immune response.[3] Of note, herpes simplex virus (HSV)-1 is an attractive option for oncolytic virus therapy because it can infect a wide range of host cells and causes lysis following viral replication.[2] Imlygic, previously referred to as T-VEC, is the first oncolytic virus immunotherapy approved in the US. It is genetically modified to attenuate HSV-1, increase selectivity for cancer cells, and secrete granulocyte macrophage colony-stimulating factor (GM-CSF). Secretion of GM-CSF is intended to enhance tumor antigen presentation to the immune system and induce systemic immune responses to the tumors.[3]

Clinical Efficacy

In the pivotal trial, the initial dose of Imlygic was administered at 10^6 PFU/mL (to seroconvert HSV-seronegative patients). Subsequent doses were 10^8 PFU/mL administered 3 weeks after the first dose, then every 2 weeks. Total volume of Imlygic was up to 4.0 mL per treatment session. It may not be possible to inject all lesions at each treatment visit or over the full course of treatment. Previously injected and/or uninjected lesions may be injected at subsequent treatment visits. Continue treatment for at least 6 months unless other treatment is required or until there are no injectable lesions to treat. Imlygic may be reinitiated if new unresectable cutaneous, subcutaneous, or nodal lesions appear after a complete response. Refer to the Appendix for injection volume associated with lesion size.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for melanoma (version 1.2020 – December 19, 2019) list Imlygic as an option in multiple treatment situations, including as primary and second-line treatment for Stage III melanoma; for recurrent disease (including nodal recurrence), and second-line or subsequent therapy; for disseminated metastatic disease; and in combination with Yervoy (ipilimumab injection), for metastatic or unresectable disease following disease progression or maximal clinical benefit from BRAF targeted therapy.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Imlygic. Because of the specialized skills required for evaluation and diagnosis of patients treated with Imlygic as well as the monitoring required for adverse events and long-term efficacy, approval requires Imlygic to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Imlygic is recommended in those who meet the following criteria:

FDA-Approved Indications

E) Melanoma. Approve for the duration noted if the patient meets ONE of the following (A or B):

A) Initial Therapy (This includes reinitiation in patients with new lesions following a complete response). Approve for 6 months if the patient meets ALL of the following (i, ii, and iii):

i. The patient is ≥ 18 years of age; AND

ii. Imlygic will be directly injected into advanced, metastatic, recurrent, or unresectable cutaneous, subcutaneous, or nodal lesions; AND

iii. Imlygic will be administered by or under the supervision of an oncologist, dermatologist, or surgeon.

B) Patient is Currently Receiving Imlygic. Approve for 1 year if the patient meets ALL of the following (i, ii, and iii):

i. The patient has remaining injectable lesions for treatment; AND

ii. According to the prescriber, the patient has not experienced clinically relevant disease progression (e.g., disease progression associated with a decline in performance status and/or alternative therapy was needed); AND

iii. Imlygic will be administered by or under the supervision of an oncologist, dermatologist, or surgeon.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Imlygic has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

1. **Concurrent Use with Anti-Herpetic Viral Agents.** Imlygic is a genetically modified, live, attenuated HSV-1 that is sensitive to acyclovir. Anti-herpetic viral agents (e.g., acyclovir, valacyclovir, famciclovir) may interfere with efficacy.

2. **Immoncompromised Patients.** Imlygic is contraindicated in patients who are immunocompromised, including those with a history of primary or acquired immunodeficient states, leukemia, lymphoma, acquired immunodeficiency syndrome (AIDS), or other clinical manifestations of infection with human immunodeficiency viruses, and those on immunosuppressive therapy.

3. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Ixempra Prior Authorization Policy

- Ixempra® (ixabepilone injection for intravenous use – R-Pharm US)

REVIEW DATE: 12/16/2020

OVERVIEW

Ixempra, a microtubule inhibitor, is indicated in combination with capecitabine for the treatment of patients with metastatic or locally advanced **breast cancer** resistant to treatment with an anthracycline and a taxane, or whose cancer is taxane resistant and for whom further anthracycline therapy is contraindicated.[1] Ixempra is indicated as monotherapy for the treatment of metastatic or locally advanced breast cancer in patients whose tumors are resistant or refractory to anthracyclines, taxanes, and capecitabine.

Anthracycline resistance is defined as progression while on therapy or within 6 months in the adjuvant setting or 3 months in the metastatic setting.[1] Taxane resistance is defined as progression while on therapy or within 12 months in the adjuvant setting or 4 months in the metastatic setting.

Guidelines

The National Comprehensive Cancer Network (NCCN) **breast cancer** (version 6.2020 – September 8, 2020) clinical practice guidelines recommend Ixempra as a single agent for recurrent or stage IV human epidermal growth factor receptor 2 (HER2)-negative disease and in combination with trastuzumab for HER2-positve disease.[2,3]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Ixempra. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Ixempra as well as the monitoring required for adverse events and long-term efficacy, approval requires Ixempra to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Ixempra is recommended in those who meet the following criteria:

FDA-Approved Indications

182. Breast Cancer. Approve for 1 year if the patient meets the following criteria (A and B):

A) Patient has recurrent or metastatic disease; AND

B) Ixempra is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Ixempra is not recommended in the following situations:

183. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Jevtana® (cabazitaxel injection for intravenous use – Sanofi-Aventis LLC)

DATE REVIEWED: 02/26/2020

OVERVIEW

Jevtana is a microtubule inhibitor indicated in combination with prednisone for the treatment of patients with metastatic castration-resistant prostate cancer (CRPC) previously treated with a docetaxel-containing treatment regimen.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) prostate cancer guidelines (version 4.2019 – August 19, 2019) lists Jevtana as one of the category 1 recommended therapies in the post-docetaxel setting for metastatic CRPC.[2,3] The guidelines note that Jevtana (in combination with steroid) can be considered in patients who are not candidates for docetaxel or are intolerant to docetaxel; however, current data do not support greater efficacy of Jevtana over docetaxel.[2]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Jevtana. Because of the specialized skills required for evaluation and diagnosis of patients treated with Jevtana as well as the monitoring required for adverse events and long-term efficacy, approval requires the medication to be prescribed by or in consultation with a prescriber who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Jevtana is recommended in those who meet the following criteria:

FDA-Approved Indications

4. Prostate Cancer. Approve for 1 year if the patient meets the following criteria (A, B, C, and D):
- **A)** The patient has metastatic castration-resistant prostate cancer; AND
- **B)** The medication will be used in combination with a systemic corticosteroid (e.g., prednisone); AND
- **C)** The patient meets one of the following criteria (i or ii):
  - **i.** The patient has been previously treated with a docetaxel-containing treatment regimen; OR
  - **ii.** The patient is not a candidate or is intolerant to docetaxel therapy, according to the prescriber; AND
- **D)** The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Jevtana has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

274. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Kadcyla Prior Authorization Policy
- Kadcyla® (ado-trastuzumab emtansine for intravenous [IV] injection – Genentech)

REVIEW DATE: 08/12/2020

OVERVIEW

Kadcyla is indicated for the treatment of patients with human epidermal growth factor receptor 2 (HER2)-positive breast cancer in the following settings:[1]
- **Early breast cancer**, as a single agent, for the adjuvant treatment in patients who have residual invasive disease after neoadjuvant taxane and trastuzumab-based treatment.

- **Metastatic breast cancer**, in patients who previously received trastuzumab and a taxane, separately or in combination. Patients should have either received prior therapy for metastatic disease or developed disease recurrence during or within 6 months of completing adjuvant therapy.

Guidelines

- **Breast cancer:** The National Comprehensive Cancer Network (NCCN) breast cancer guidelines (version 5.2020 – July 15, 2020) recommend Kadcyla as a preferred adjuvant therapy in patients who have residual disease after receiving neoadjuvant (preoperative) therapy (category 1).[2,3] Kadcyla is also recommended for the treatment of HER2-positive recurrent or Stage IV metastatic disease (category 2A).
- **Non-small cell lung cancer:** The NCCN non-small cell lung cancer (NSCLC) guidelines (version 6.2020 – June 15, 2020) and Compendium recommend Kadcyla for HER2 mutation-positive NSCLC (category 2A).[3,4]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Kadcyla. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Kadcyla, as well as the monitoring required for adverse events and long-term efficacy, approval requires Kadcyla to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Kadcyla is recommended in those who meet the following criteria:

FDA-Approved Indications

26. Breast Cancer. Approve if the patient meets the following criteria (A, B, and C):
- **A)** Patient has human epidermal growth factor receptor 2 (HER2)-positive disease; AND
- **B)** Patient meets ONE of the following criteria (i or ii):
  - **i.** Approve for 1 year if Kadcyla is used for recurrent or metastatic breast cancer; OR
  - **ii.** Approve for 1 year (total) if Kadcyla will be used as adjuvant therapy; AND
- **C)** Kadcyla is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

2. Non-Small Cell Lung Cancer (NSCLC). Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** Patient has human epidermal growth factor receptor 2 (HER2) mutation-positive non-small cell lung cancer; AND
- **B)** The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Kadcyla is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Annual revision	No changes to criteria.	06/27/2018
Annual revision	Changed Breast Cancer criteria to a regular PA from pharmacogenomic PA. Added criteria for treatment of metastatic disease and for adjuvant therapy. Also added requirement for prescriber specialty. Added new approval condition for non-small cell lung cancer with HER2 mutation based on NCCN guidelines/Compendium support.	07/24/2019
Annual revision	No criteria changes	08/12/2020

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Keytruda Prior Authorization Policy

- Keytruda® (pembrolizumab for injection, for intravenous use and injection for intravenous use – Merck & Co., Inc.)

REVIEW DATE: 06/17/2020; selected revision 12/02/2020

OVERVIEW

Keytruda, a human programmed death receptor-1 (PD-1) blocking antibody, is indicated for the treatment of the following indications:[1]

- **Breast cancer, triple-negative**, in combination with chemotherapy for the treatment of patients with locally recurrent unresectable or metastatic disease whose tumors express PD-L1 (combined positive score [CPS] ≥ 10) as determined by an FDA-approved test.*
- **Cervical cancer**, for treatment of patients with recurrent or metastatic disease with disease progression on or after chemotherapy whose tumors express PD-L1 (CPS ≥ 1) as determined by an FDA-approved test.*
- **Classical Hodgkin lymphoma**, in the following situations:
  - For treatment of adult patients with relapsed or refractory disease.
  - For the treatment of pediatric patients with refractory disease, or disease that has relapsed after two or more prior lines of therapy.
- **Cutaneous squamous cell carcinoma,** treatment of patients with recurrent or metastatic disease that is not curable by surgery or radiation.
- **Endometrial cancer**, in combination with Lenvima (lenvatinib capsules), for the treatment of patients with advanced disease that is not microsatellite instability high (MSI-H) or mismatch repair deficient (dMMR), who have disease progression following prior systemic therapy and are not candidates for curative surgery or radiation.
- **Esophageal cancer**, treatment of patients with recurrent locally advanced or metastatic squamous cell carcinoma of the esophagus whose tumors express PD-L1 (CPS ≥ 10) as determined by an FDA-approved test, with disease progression after one or more prior lines of systemic therapy.

- **Gastric cancer**, for treatment of patients with recurrent locally advanced or metastatic gastric or gastroesophageal junction (GEJ) adenocarcinoma whose tumors express PD-L1 (CPS ≥ 1) as determined by an FDA-approved test, with disease progression on or after two or more lines of therapy including fluoropyrimidine- and platinum-containing chemotherapy and if appropriate, human epidermal growth factor receptor 2 (HER2)/neu-targeted therapy.*
- **Head and neck squamous cell carcinoma**, in the following situations:
  - As a single agent for the treatment of recurrent or metastatic disease with disease progression on or after platinum-containing chemotherapy; AND
  - In combination with platinum and fluorouracil (FU) for the first-line treatment of patients with metastatic or with unresectable, recurrent disease; AND
  - As a single agent, for the first line treatment of patients with metastatic or with unresectable, recurrent disease whose tumors express PD-L1 (CPS ≥ 1) as determined by an FDA-approved test.
- **Hepatocellular carcinoma**, for treatment of patients who have been previously treated with Nexavar® (sorafenib tablets).*
- **Melanoma**, for the treatment of patients with unresectable or metastatic disease. Keytruda is also indicated for the adjuvant treatment of patients with melanoma with involvement of lymph node(s) following complete resection.
- **Merkel cell carcinoma**, for adult and pediatric patients with recurrent, locally advanced, or metastatic disease.*
- **Microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR)**, for treatment of adult and pediatric patients with unresectable or metastatic disease, in the following situations:
  - solid tumors that have progressed following prior treatment and who have no satisfactory alternative treatment options;* OR
  - colorectal cancer that has progressed following treatment with a fluoropyrimidine, oxaliplatin, and irinotecan.*

  Limitation of Use: The safety and effectiveness of Keytruda in pediatric patients with MSI-H central nervous system cancers have not been established.
- **Microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR) colorectal cancer,** for the first-line treatment of patients with unresectable or metastatic disease.
- **Non-small cell lung cancer** (**NSCLC**), in the following situations:
  - As a single agent for the first-line treatment of patients whose tumors have high PD-L1 expression (tumor proportion score [TPS] ≥ 1%) as determined by an FDA-approved test, with no epidermal growth factor receptor (*EGFR*) or anaplastic lymphoma kinase (*ALK*) genomic tumor aberrations, and is stage III where patients are not candidates for surgical resection or definitive chemoradiation or for metastatic disease; AND
  - As a single agent for the treatment of patients with metastatic disease whose tumors express PD-L1 (TPS ≥ 1%) as determined by an FDA-approved test and with disease progression on or after platinum-containing chemotherapy. Patients with *EGFR* or *ALK* genomic tumor aberrations should have disease progression on FDA-approved therapy for these aberrations prior to receiving Keytruda; AND
  - In combination with Alimta® (pemetrexed intravenous injection) and platinum-based chemotherapy, for the first-line treatment of patients with metastatic nonsquamous NSCLC with no *EGFR* or *ALK* genomic tumor aberrations; AND
  - In combination with carboplatin and either paclitaxel or Abraxane® (nab-paclitaxel injection), for first-line treatment in metastatic squamous NSCLC.
- **Primary mediastinal large B-cell lymphoma** (PMBCL), for treatment of adult and pediatric patients with refractory disease, or who have relapsed after two or more prior lines of therapy.
  Limitation of Use: Keytruda is not recommended for treatment of patients with PMBCL who require urgent cytoreductive therapy.

- **Renal cell carcinoma**, in combination with Inlyta (axitinib tablets), for the first-line treatment of patients with advanced disease.
- **Small cell lung cancer**, for treatment of metastatic disease and disease progression on or after platinum-based chemotherapy and at least one other prior line of therapy.*
- **Tumor mutational burden-high (TMB-H) cancer**, treatment of adult and pediatric patients with unresectable or metastatic disease (≥ 10 mutations/megabase), as determined by an FDA-approved test, that have progressed following prior treatment and who have no satisfactory alternative treatment options.*
  Limitation of Use: The safety and effectiveness of Keytruda in pediatric patients with TMB-H central nervous system (CNS) cancers have not been established.
- **Urothelial carcinoma**, in the following situations:
  - Treatment of locally advanced or metastatic disease in patients who are not eligible for cisplatin-containing chemotherapy and whose tumors express PD-L1 (CPS ≥ 10) as determined by an FDA-approved test, or in patients who are not eligible for any platinum-containing chemotherapy regardless of PD-L1 status;* AND
  - Treatment of patients with locally advanced or metastatic urothelial carcinoma who have disease progression during or following platinum-containing chemotherapy or within 12 months of neoadjuvant or adjuvant treatment with platinum-containing chemotherapy; AND
  - Treatment of Bacillus Calmette-Guerin (BCG)-unresponsive, high-risk, non-muscle invasive bladder cancer with carcinoma in situ with or without papillary tumors who are ineligible for or have elected not to undergo cystectomy.

*This indication is approved under accelerated approval based on tumor response rate and durability of response. Continued approval for this indication may be contingent upon verification and description of clinical benefit in the confirmatory trials.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Keytruda. Because of the specialized skills required for evaluation and diagnosis of patients treated with Keytruda as well as the monitoring required for adverse events and long-term efficacy, approval requires the medication to be prescribed by or in consultation with a prescriber who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Keytruda is recommended in those who meet one of the following criteria:

FDA-Approved Indications

2. Breast Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):
- **A)** Patient has locally unresectable or metastatic disease; AND
- **B)** Patient has triple-negative breast cancer (i.e., estrogen receptor-negative, progesterone receptor-negative, human epidermal growth factor receptor 2 [HER2]-negative); AND
- **C)** The medication is used in combination with chemotherapy; AND
- **D)** Patient's tumor expression for programmed death-ligand 1 (PD-L1) as determined by an approved test has a combined positive score (CPS) ≥ 10; AND
- **E)** The medication is prescribed by or in consultation with an oncologist.

Note: Also see **Microsatellite Instability-High (MSI-H) or Mismatch Repair Deficient (dMMR) Solid Tumors**.

3. **Cervical Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
   A) Patient has tried chemotherapy; AND
   Note: Examples of chemotherapy are cisplatin, paclitaxel, bevacizumab, topotecan, carboplatin).
   B) Patient's tumor expression for programmed death-ligand 1 (PD-L1), as determined by an approved test, has a combined positive score (CPS) ≥ 1; AND
   C) The medication is prescribed by or in consultation with an oncologist.

   Note: Also see **Microsatellite Instability-High (MSI-H) or Mismatch Repair Deficient (dMMR) Solid Tumors.**
4. **Classic Hodgkin Lymphoma.** Approve for 1 year if the patient meets BOTH of the following (A and B):
   A) Patient meets ONE of the following (i or ii):
      i. Patient meets both of the following criteria (a and b):
         a) Patient is ≥ 18 years of age; AND
         b) Patient has tried at least one systemic regimen.
         Note: Examples of systemic regimens are ABVD (doxorubicin, bleomycin, vinblastine, dacarbazine), CHOP (cyclophosphamide, doxorubicin, vincristine, prednisone + rituximab), Adcetris (brentuximab vedotin for injection), DHAP (dexamethasone, cisplatin, high-dose cytarabine), bendamustine.
      ii. Patient meets BOTH of the following criteria (a and b):
         a) Patient is < 18 years of age; AND
         b) Patient has tried at least two systemic regimens; AND
         Note: Examples of systemic regimens include AVPC (doxorubicin, vincristine, prednisone, cyclophosphamide), ABVE-PC (doxorubicin, bleomycin, vincristine, etoposide, prednisone, cyclophosphamide), OEPA (vincristine, etoposide, prednisone, doxorubicin), Adcetris (brentuximab vendotin) with one of bendamustine, gemcitabine, or Opdivo (nivolumab for injection), DHAP (dexamethasone, cytarabine, cisplatin).
   B) The medication is prescribed by or in consultation with an oncologist.

5. **Cutaneous Squamous Cell Carcinoma.** Approve for 1 year if the patient meets the following criteria (A, B, and C):
   A) Patient has recurrent or metastatic disease; AND
   B) The disease is not curable by surgery or radiation; AND
   C) The medication is prescribed by or in consultation with an oncologist.

6. **Endometrial Carcinoma.** Approve for 1 year if the patient meets the following criteria (A, B, C, D, and E):
   A) Disease is not microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR); AND
   B) The medication is used in combination with Lenvima™ (lenvatinib capsules); AND
   C) Patient has progressed on at least one prior systemic therapy; AND
   Note: Examples of systemic therapy are carboplatin, paclitaxel, docetaxel, cisplatin, doxorubicin, ifosfamide, everolimus, letrozole.
   D) Patient is not a candidate for curative surgery or radiation; AND
   E) The medication is prescribed by or in consultation with an oncologist.

   Note: Also see **Microsatellite Instability-High (MSI-H) or Mismatch Repair Deficient (dMMR) Solid Tumors.**

6. **Esophageal and Esophagogastric Junction Cancer.** Approve for 1 year if the patient meets the following (A and B):
   A) Patient meets one of the following criteria (i or ii):

i. Patient meets BOTH of the following criteria (a and b):
  a) Patient's tumor expression for programmed death-ligand 1 (PD-L1) as determined by an approved test has a combined positive score (CPS) ≥ 10; AND
  b) Patient has tried at least one previous chemotherapy regimen; OR
  Note: Examples of chemotherapy regimens are fluoropyrimidine (fluorouracil or capecitabine) and oxaliplatin, fluoropyrimidine and cisplatin, paclitaxel with cisplatin or carboplatin, docetaxel with cisplatin.

ii. Patient meets BOTH of the following criteria (a and b):
  a) Patient's tumor expression for programmed death-ligand 1 (PD-L1) as determined by an approved test has a combined positive score (CPS) ≥ 1; AND
  b) Patient has tried at least two previous chemotherapy regimens; AND
  Note: Examples of chemotherapy regimens are fluoropyrimidine (fluorouracil or capecitabine) and oxaliplatin, fluoropyrimidine and cisplatin, paclitaxel with cisplatin or carboplatin, docetaxel with cisplatin.

B) The medication is prescribed by or in consultation with an oncologist.

Note: Also see **Microsatellite Instability-High (MSI-H) or Mismatch Repair Deficient (dMMR) Solid Tumors.**

7. **Gastric Cancer.** Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
   C) Patient's tumor expression for programmed death-ligand 1 (PD-L1) as determined by an approved test has a combined positive score (CPS) ≥ 1; AND
   D) Patient has tried at least two previous chemotherapy regimens; AND
   Note: Examples of chemotherapy regimens are fluoropyrimidine (fluorouracil or capecitabine) and oxaliplatin, fluoropyrimidine and cisplatin, paclitaxel with cisplatin or carboplatin, docetaxel with cisplatin 5.
   E) If the patient's tumor is human epidermal growth factor receptor 2 (HER2) or HER2/neu positive, targeted therapy with trastuzumab has been tried; AND
   F) The medication is prescribed by or in consultation with an oncologist.

   Note: Also see **Microsatellite Instability-High (MSI-H) or Mismatch Repair Deficient (dMMR) Solid Tumors.**

8. **Head and Neck Squamous Cell Carcinoma (HNSCC).** Approve for 1 year if the patients meets the following (A, B, and C):
   A) Patient has recurrent or metastatic disease; AND
   B) Patient meets one of the following criteria (i or ii):
     i. If the medication is used for first-line treatment, patient has to meet one of the following criteria (a or b):
       a) Keytruda is used in combination with chemotherapy; OR
       Note: Examples of chemotherapy are cisplatin, carboplatin, fluorouracil.
       b) Keytruda is used as a single agent if the tumors are PD-L1-positive (combined positive score ≥ 1), as determined by an approved test.
     ii. For subsequent therapy, patient has tried at least one platinum-containing chemotherapy regimen; AND
     Note: Examples of platinum-contain chemotherapy regimens are: cisplatin or carboplatin with Erbitux® [cetuximab intravenous infusion], gemcitabine, or 5-fluorouracil [5-FU].
   C) The medication is prescribed by or in consultation with an oncologist.

9. **Hepatocellular Carcinoma, Including Hepatobiliary Cancers**. Approve for 1 year if the patient meets the following conditions (A and B):
   A) Patient has tried at least one tyrosine kinase inhibitor; AND

Note: Examples of tyrosine kinase inhibitors include Nexavar (sorafenib tablets) and Lenvima (levatinib capsules).

B) The medication is prescribed by or in consultation with an oncologist.

Note: Also see **Microsatellite Instability-High (MSI-H) or Mismatch Repair Deficient (dMMR) Solid Tumors.**

10. Melanoma [Note: This includes cutaneous melanoma, brain metastases due to melanoma and uveal melanoma]. Approve for the duration noted below if the patient meets BOTH of the following (A and B):

A) Patient meets ONE of the following (i or ii):

i. Approve for 1 year if the patient has unresectable, advanced, or metastatic melanoma; OR

ii. Approve for up to 1 year (total) if Keytruda will be used as adjuvant treatment; AND
Note: For example, in a patient with no evidence of disease following resection of node-positive disease, locoregional recurrence, or in transit recurrence.

B) The medication is prescribed by or in consultation with an oncologist.

11. Merkel Cell Carcinoma. Approve for 1 year if the patient meets BOTH of the following (A and B):

A) Patient has recurrent, locally advanced, or metastatic disease; AND

B) The medication is prescribed by or in consultation with an oncologist.

12. Microsatellite Instability-High (MSI-H) or Mismatch Repair Deficient (dMMR) Solid Tumors. Note**:** Examples of solid tumors with MSI-H or dMMR are breast cancer, biliary tract cancers, gastric, gastroesophageal or esophageal cancers, colon or rectal cancer, Ewing sarcoma, occult primary (cancer of unknown primary), osteosarcoma, mesenchymal chondrosarcoma, poorly differentiated neuroendocrine tumor, pancreatic adenocarcinoma, endometrial carcinoma, penile, adrenal gland, vulvar, cervical, ovarian, fallopian tube, primary peritoneal, small bowel adenocarcinoma, testicular cancer. Approve for 1 year if the patient meets BOTH of the following (A and B):

A) One of the following conditions apply (i, ii, or iii):

i. Patient has tried at least one prior systemic therapy for an MSI-H or dMMR solid tumor); OR

ii. Patient has unresectable or metastatic gallbladder cancer (including intra- and extra-hepatic cholangiocarcinoma); OR

iii. Patient has unresectable or metastatic colon or rectal cancer.

B) The medication is prescribed by or in consultation with an oncologist.

13. Non-Small Cell Lung Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

A) Patient has advanced or metastatic disease; AND

B) Patient meets one of the following (i, ii, or iii):

i. The tumor proportion score (TPS) for PD-L1 as determined by an approved test is ≥ 1% AND the tumor is negative for targetable mutations; OR
Note: In this setting, Keytruda can be used in both non-squamous (that is, adenocarcinoma, large cell, or NSCLC not otherwise specified) and squamous cell carcinoma, either as first-line or continuation maintenance therapy.

ii. Patient has non-squamous cell carcinoma (that is, adenocarcinoma, large cell, or NSCLC not otherwise specified) and meets one of the following (a or b):

a) The tumor is negative for actionable mutations and the medication is used first-line in combination with platinum chemotherapy (that is, carboplatin or cisplatin) and Alimta (pemetrexed for injection); OR

b) Patient has previously received targeted drug therapy for actionable mutation; OR
Note: Examples of actionable mutations include sensitizing epidermal growth factor receptor [*EGFR*] mutation, anaplastic lymphoma kinase [*ALK*] fusions, *RET* rearrangement positive, *MET* exon 14 skipping, *NTRK* gene fusion positive, *BRAF V600E* mutation positive, and *ROS1* rearrangement positive.

iii. Patient has squamous cell carcinoma and meets one of the following (a or b):

Note: Keytruda can be used in this setting regardless of the PD-L1 expression levels.

a) The tumor is negative for actionable mutations and the medication is used first-line in combination with platinum chemotherapy (that is, carboplatin or cisplatin) and either one of paclitaxel or Abraxane (paclitaxel protein-bound for injection); OR

b) Patient has previously received targeted drug therapy for an actionable mutation; AND
Note: Examples of actionable mutations include sensitizing epidermal growth factor receptor [*EGFR*] mutation, anaplastic lymphoma kinase [*ALK*] fusions, *RET* rearrangement positive, *MET* exon 14 skipping, *NTRK* gene fusion positive, *BRAF V600E* mutation positive, and *ROS1* rearrangement positive.

C) The medication is prescribed by or in consultation with an oncologist.

14. Primary Mediastinal Large B-Cell Lymphoma. Approve for 1 year if the patient meets BOTH of the following (A and B):

A) Patient has relapsed after, or is refractory to, at least two previous regimens; AND
Note: Examples of previous regimens include autologous hematopoietic stem cell transplant (auto-HSCT), EPOCH-R (etoposide, prednisone, vincristine, cyclophosphamide, doxorubicin, rituximab), RCHOP (rituximab, cyclophosphamide, doxorubicin, vincristine, prednisone], RCEPP (rituximab, cyclophosphamide, doxorubicin, vincristine, prednisone).

B) The medication is prescribed by or in consultation with an oncologist.

15. Renal Cell Carcinoma. Approve for 1 year if the patient meets BOTH of the following (A, B, and C):

A) Patient has advanced disease; AND

B) The medication is used in combination with Inlyta (axitinib tablets); AND

C) The medication is prescribed by or in consultation with an oncologist.

16. Small Cell Lung Cancer. Approve for 1 year if the patient meets BOTH of the following criteria (A and B):

A) Patient has tried at least one other chemotherapy regimen; AND
Note: Examples of chemotherapy regimen are cisplatin, carboplatin, etoposide, irinotecan, topotecan, paclitaxel.

B) The medication is prescribed by or in consultation with an oncologist.

17. Tumor Mutational Burden-High (TMB-H) Cancer. Approve for 1 year if the patient meets the following (A, B, and C):

A) Patient has unresectable or metastatic tumor mutational burden-high (≥ 10 mutations/megabase) solid tumor; AND
Note: Examples of solid tumors are anal cancer, cervical cancer, chondrosarcoma, chordoma, endometrial carcinoma, Ewing sarcoma, mesothelioma cancer, neuroendocrine cancer, osteosarcoma, salivary gland tumors, small cell lung cancer, thyroid cancer, uterine sarcoma, vulvar cancer.

B) Patient has progressed on prior therapy; AND

C) Patient has no satisfactory alternative treatment options.

18. Urothelial Carcinoma. Approve for 1 year if the patient meets BOTH of the following (A and B):

A) Patient meets ONE of the following conditions (i, ii, iii, or iv):

i. Patient has tried at least one platinum-based chemotherapy; OR
Note: Cisplatin and carboplatin are platinum-based chemotherapies.

ii. Patient meets both of the following (a and b):

a) According to the prescriber, patient is not eligible for cisplatin-based chemotherapy, AND

b) The tumor expresses PD-L1, defined as a combined positive score (CPS) ≥ 10; OR

iii. According to the prescriber, patient is not eligible for platinum-based chemotherapy (i.e., with cisplatin and carboplatin); OR
Note: This is regardless of PD-L1 status.

iv. Patient meets both of the following (a and b):

a) Patient has non-muscle invasive bladder cancer; AND

b) Patient has tried Bacillus Calmette-Guerin (BCG) or intravesical chemotherapy; AND
Note: Examples of agents used as intravesical chemotherapy include mitomycin and gemcitabine.

B) The medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

19. Anal Carcinoma. Approve for 1 year if the patient meets BOTH of the following (A and B):

A) Patient has received at least one other chemotherapy regimen; AND
Note: Examples of chemotherapy regimens are 5-fluorouracil (5-FU), cisplatin, carboplatin, paclitaxel, FOLFOX (oxaliplatin, leucovorin, and 5-FU).

B) The medication is prescribed by or in consultation with an oncologist.

20. Gestational Trophoblastic Neoplasia. Approve for 1 year if the patient meets the following criteria (A and B):

A) The patient meets one of the following (i or ii):

i. Patient has tried at least one previous chemotherapy regimen for recurrent or progressive disease; OR
Note: Examples of chemotherapy regimens contain etoposide, cisplatin/carboplatin, paclitaxel, bleomycin, ifosfamide, methotrexate.

ii. Patient has methotrexate-resistant high-risk disease; AND

B) The medication is prescribed by or in consultation with an oncologist.

21. Malignant Pleural Mesothelioma. Approve for 1 year if the patient meets BOTH of the following (A and B):

A) Patient has tried first-line chemotherapy; AND
Note: Examples of chemotherapy are Alimta (pemetrexed intravenous injection) with or without cisplatin or carboplatin, gemcitabine plus cisplatin, vinorelbine.

B) The medication is prescribed by or in consultation with an oncologist.

22. Mycosis Fungoides/Sezary Syndrome. Approve for 1 year if the medication is prescribed by or in consultation with an oncologist.

23. Extranodal NK/T-Cell Lymphoma, Nasal Type. Approve for 1 year if the patient meets the following criteria (A and B):

A) The patient has received an asparaginase-based chemotherapy regimen; AND
Note: Examples of asparaginase-based chemotherapy are dexamethasone, ifosfamide, pegaspargase, etoposide; and gemcitabine, pegaspargase, oxaliplatin.

B) The medication is prescribed by or in consultation with an oncologist.

24. Thymic Carcinoma. Approve for 1 year if the patient meets the following criteria (A and B):

A) Patient has tried at least one other chemotherapy regimen; AND
Note: Examples of chemotherapy regimen are carboplatin, paclitaxel, cisplatin, doxorubicin, cyclophosphamide.

B) The medication is prescribed by or in consultation with an oncologist.

25. Vulvar Cancer. Approve for 1 year if the patient meets the following criteria (A, B, and C):

A) The tumors are PD-L1-positive (combined positive score ≥ 1), as determined by an approved test; AND

B) Patient has tried at least one other chemotherapy regimen.
Note: Examples of chemotherapy regimen are cisplatin, carboplatin, fluorouracil, paclitaxel; AND

C) The medication is prescribed by or in consultation with an oncologist.

Note: Also see **Microsatellite Instability-High (MSI-H) or Mismatch Repair Deficient (dMMR) Solid Tumors** and **Tumor Mutational Burden-High (TMB-H) Cancer.**

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Keytruda is not recommended in the following situations:

2. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual revision	• **Cervical Cancer:** New FDA approved indication was added. • **cHL:** Criteria were revised to include patients of all ages who have one of the following: the patient has had an auto-HSCT and post-transplant Adcetris therapy, the patient has had ≥ 3 lines of systemic therapy and this includes an auto-HSCT as one line of therapy, or the patient is ineligible for transplant. Previously, criteria were separated by age groups. • **MSI-H or dMMR CRC:** Removed criterion that CRC is MSI-H or dMMR since this is in the indication. • **NSCLC:** For the criterion of Keytruda will be used in combination with Alimta and carboplatin, cisplatin was added as an alternative to carboplatin. • **PMBCL:** New FDA approved indication was added. • **Anal Carcinoma:** New indication recommended by NCCN guidelines was added. • **Brain Metastases Due to Melanoma or NSCLC:** Criteria were revised to add patients newly diagnosed with asymptomatic metastases. • **Melanoma, Uveal:** New indication was added based on NCCN guidelines. • **Extended Approval:** Throughout the policy revised to add "or stable disease". • **Duration of Therapy:** Throughout the policy revised so the patient has a response or stable disease as determined by the prescribing physician. • **Other Cancer-Related Indications:** Nasopharyngeal HNSCC (category 2B) was added. Cervical cancer and vulvar cancer were removed and added to the MSI-H or dMMR CRC discussion.	06/20/2018
Update 06/21/18	• The indication for urothelial carcinoma in the overview was updated based on revised prescribing information. The wording of the indication for treatment of patients with locally advanced or metastatic urothelial carcinoma who are not eligible for cisplatin-containing chemotherapy was revised to add "and whose tumors express PD-L1 (CPS ≥ 10), or in patients who are not eligible for any platinum-containing chemotherapy regardless of PD-L1 status."	Not applicable
Annual revision	**All Indications** • Changed approval duration to 1 year (previously was 6 months). • Removed response criteria for continuation of therapy (now must meet PA criteria for reauthorization). • Removed requirement in dosing section that Keytruda is infused over 30 minutes. **Brain Metastases Due to Melanoma or NSCLC, Uveal Melanoma, Patient has been Started on Keytruda** • Conditions were deleted and are now generally included under respective cancers (melanoma and NSCLC). For patients already started on Keytruda, patients must meet criteria and dosing for continuation of therapy. **Cervical Cancer** • Since chemotherapy is required, delete requirement that the patient has recurrent or metastatic disease (presumed to be recurrent or metastatic if chemotherapy has been tried). • Simplify list of therapies that may have been tried so as to clarify that specific regimens are not required to be tried prior to Keytruda but are examples that may be tried as part of a regimen for cervical cancer. • Remove criterion that requires Keytruda be administered as a single agent (not needed). **Classic Hodgkin Lymphoma** • Since multiple therapies or stem cell transplant is required, delete requirement that the patient has relapsed or progressive disease (presumed to be relapsed or recurrent if multiple therapies has been tried). • Remove criterion that requires Keytruda be administered as a single agent (not needed). • For an exception to the requirement that the patient is required to have tried 3 previous lines of therapy, remove requirement that patients undergoing stem cell transplantation must undergo an autologous procedure (allogeneic procedures also mentioned in guidelines). To align with guidelines, remove requirement that the patient received post-transplant therapy with Adcetris. **Gastric, Gastroesophageal Junction, or Esophageal Cancer** • Since chemotherapy is required, delete requirement that the patient has locally advanced or metastatic disease (presumed to be locally advanced or metastatic if chemotherapy has been tried).	12/19/2018

	• Remove criterion that requires Keytruda be administered as a single agent (not needed). **Head and Neck Squamous Cell Carcinoma (HNSCC)** • Since chemotherapy is required unless contraindicated, delete requirement that the patient has recurrent or metastatic disease (presumed to be recurrent or metastatic if chemotherapy has been tried). Since used in nasopharyngeal disease, remove requirement that the patient has non-nasopharyngeal HNSCC. • Remove criterion that required the patient has disease progression on or after trying platinum-containing chemotherapy. For the criterion that requires a previous trial of chemotherapy, add cisplatin and carboplatin to the list of examples. • Remove criterion that requires Keytruda be administered as a single agent (not needed). **Hepatocellular Carcinoma, Including Hepatobiliary Cancers** • Add criteria to approve for this FDA-approved indication if the patient has tried at least one tyrosine kinase inhibitor, and if prescribed by or in consultation with an oncologist. **Melanoma** • Add a note to clarify that the criteria apply to cutaneous melanoma, brain metastasis due to melanoma, and uveal melanoma. • Add a criterion to approve for use of Keytruda in the adjuvant setting. **Microsatellite Instability-High (MSI-H) or Mismatch Repair Deficient (dMMR) Solid Tumors** • When chemotherapy is required, delete requirement that the patient has unresectable or metastatic disease (presumed to be unresectable or metastatic if chemotherapy has been tried). • Remove criterion that requires Keytruda be administered as a single agent (not needed). • Add criteria to approve in the first-line setting for unresectable or metastatic gallbladder cancer. • For colon or rectal cancer simplify criteria to require a previous trial of chemotherapy (previously required progression while on a fluoropyrimidine or adjuvant therapy with FOLFOX). Remove requirement that patients who progressed after treatment with a fluoropyrimidine have not previously been treated with Keytruda or Opdivo. • For other MSI-H or dMMR solid tumors, change wording to require a trial of at least one prior systemic therapy (previously required disease progression). Remove requirement that there are no satisfactory alternative treatment options (not in guidelines for majority of these tumors). • Remove criterion that does not cover Keytruda for children with central nervous system tumors. **Non-Small Cell Lung Cancer** • When chemotherapy is required, delete requirement that the patient has metastatic disease (presumed to be metastatic if chemotherapy has been tried). • For non-squamous cell carcinoma, change criteria so that patients with unknown status for targetable mutations are not required to undergo testing (aligns with guidelines). • For patients with a tumor proportion score of ≥ 1% and ≥ 50%, remove criterion that requires Keytruda be administered as a single agent (not needed). For those with a tumor proportion score of at least 1%, remove criterion that excluded coverage if Keytruda, Opdivo, or Tecentiq have been used in the past. • To approve in the first-line setting, generally require use in combination with chemotherapy (applies to squamous and non-squamous histologies). Previously, use in the first-line setting only applied to non-squamous histology and required a specific regimen to be taken with Keytruda. • In the dosing section, clarify that dosing of 10 mg/kg given every 2 weeks and 2 mg/kg given every 3 weeks are approvable in patients with brain metastases. **Urothelial Carcinoma** • When chemotherapy is required, delete requirement that the patient has locally advanced or metastatic disease (presumed to be unresectable or metastatic if chemotherapy has been tried). • Remove criterion that requires Keytruda be administered as a single agent (not needed). • For patients that are not eligible for cisplatin, add that the tumor must express PD-L1. • Add criteria to allow an exception for patients who, according to the prescriber, are not eligible for platinum-based chemotherapy. Note that this is regardless of PD-L1 status. • Reword criteria to require a previous trial of at least one platinum-containing chemotherapy. Criteria previously required disease progression during or after trying one of these therapies.	

	Anal Carcinoma • Since chemotherapy is required, delete requirement that the patient has metastatic disease (presumed to be metastatic if chemotherapy has been tried). • Remove criterion that requires Keytruda be administered as a single agent (not needed). **Malignant Pleural Mesothelioma** • Remove criterion that requires Keytruda be administered as a single agent (not needed). • In dosing, add criteria to approve 200 mg as an intravenous infusion given once every 3 weeks. **Merkel Cell Carcinoma** • Move this condition to the FDA-Approved Uses section of the policy. Previously was approvable as an Other Uses With Supportive Evidence. • Change criteria to approve for recurrent, locally advanced, or metastatic disease, which aligns with the approved labeling. Criteria previously approved for disseminated disease. • Add 200 mg as an intravenous infusion given once every 3 weeks as an approvable dose. **Small Cell Lung Cancer** • Add this off-label indication as an approval, if the patient has tried at least one other systemic therapy within the past 6 months, and if prescribed by or in consultation with an oncologist. The approvable dose is 200 mg as an intravenous infusion given once every 3 weeks. **Other Cancer-Related Indications** • Remove nasopharyngeal head and neck cancer (included in criteria). Add T-cell lymphoproliferative disorders, chronic lymphocytic leukemia/small lymphocytic lymphoma, and gestational trophoblastic neoplasia to the list of oncology indications that are reviewed on a case-by-case basis by the Medical Director.	
Selected revision	**Melanoma:** For adjuvant treatment, criteria were changed to allow up to 1 year (total) of treatment. This aligns with the treatment duration for this use in the published study and for this indication in the Opdivo CC policy. Previously, criteria did not limit total treatment duration.	01/30/2019
Annual revision	**All Indications.** For Dosing, added "not more frequently than" with regards to frequency. If "e.g" are listed in criteria they were re-formatted to a Note. For criteria "Keytruda is prescribed by…" was changed to "The medication is prescribed by.." Where applicable, prescribing physician was changed to prescriber. **Endometrial Carcinoma**. New approval indication was added. **Esophageal and Esophagogastric Junction Cancer**. Previously was listed together with Gastric Cancer. Now, this indication is separated out since the guidelines are also separate for these conditions. **Gastric Cancer.** Deleted "Gastroesophageal Junction (GEJ) Cancer, or Esophageal Cancer" from indication. Criteria regarding the patient has tried a fluoropyrimidine and platinum was changed to "at least two previous chemotherapy regimens". **Head and Neck Squamous Cell Carcinoma**. The following criteria were added: the patient has recurrent or metastatic disease; for first-line setting, Keytruda is used in combination with chemotherapy or for use as single agent, the tumor has to be PD-L1-positive; for subsequent therapy, the wording was changed to at least one platinum-containing chemotherapy regimen has been tried. The other criteria providing exception for chemotherapy contraindication was deleted. **Melanoma.** Deleted criteria Keytruda will not be used in combination with Yervoy. **Microsatellite Instability High (MSI-H) or Mismatch Repair Deficient (dMMR) Solid Tumors**. Added a list of different solid tumors in a Note under the indication as examples. Deleted the examples from within criteria. **Non-Small Cell Lung Cancer**. Modified criteria with regards to tumor proportion score for PD-L1 to state ≥ 1 and < 50% and added criteria that Keytruda is used as a single agent for maintenance. For non-squamous cell carcinoma with regards to targeted mutations, deleted criteria,"tumor is negative or unknown for these targetable mutations." **Renal Cell Carcinoma**. Added new approval condition and criteria. **Small Cell Lung Cancer.** Instead of systemic therapy, changed to "chemotherapy regimen". Deleted criteria "within the past 6 months" with regards to trying chemotherapy. **Anal Carcinoma**. Added "at least one" with regards to trying chemotherapy "regimen". **Gestational Trophoblastic Neoplasia.** Added new approval condition and criteria. **Mycosis Fungoides/Sezary Syndrome**. Added new approval condition and criteria.	12/11/2019

	Thymic Carcinoma. Added new approval condition and criteria. **Vulvar Cancer.** Added new approval condition and criteria. **Other Cancer-Related Indications**. Deleted to be in-line with other policies.	
Early annual revision	**Classic Hodgkin Lymphoma:** Examples of systemic therapies were moved to a Note (previously listed as examples within the criteria). **Endometrial Carcinoma:** Criteria were modified to allow coverage for a patient with recurrent disease, if other conditions are met. Previously, criteria only addressed advanced disease. **Hepatocellular Carcinoma, Including Hepatobiliary Cancers:** Examples of tyrosine kinase inhibitors were moved to a Note (previously listed as examples within the criteria). **Melanoma:** Examples of adjuvant therapy uses were moved to a Note (previously listed as examples within the criteria). **Non-Small Cell Lung Cancer:** Criteria that applied specifically to patients with a tumor proportion score (TPS) ≥ 1% and < 50% were deleted from the policy. Now all criteria for NSCLC apply to any patient with a TPS ≥ 1%. Criteria applying to a patient with non-squamous cell carcinoma were modified to be listed in a Note as examples of targetable mutations (previously listed as i.e. within the criteria). RET rearrangement positive, MET exon 14 skipping, NTRK gene fusion positive, BRAF V600E mutation positive, and ROS1 rearrangement positive were added to list of targetable mutations. **Urothelial Carcinoma:** Examples of platinum-based chemotherapies were moved to a Note (previously listed as examples within the criteria). Clarify in criteria that tumor expression of PD-L1 is defined by combined positive score (CPS) ≥ 10 (previously CPS was listed as an i.e. in the criteria). Criteria were added to approve Keytruda if the patient has non-muscle invasive bladder cancer and has tried Bacillus Calmette-Guerin (BCG) or intravesical chemotherapy. **Extranodal NK/T-Cell Lymphoma, Nasal Type:** To align with NCCN recommendations, this indication was added as an Other Use With Supportive Evidence. Criteria approve for 1 year if the patient has tried asparaginase-based chemotherapy regimen and if prescribed by or in consultation with an oncologist.	06/17/2020
Selected Revision	• **Breast Cancer:** Added new approval condition and criteria based on new FDA approval. • **Classic Hodgkin Lymphoma:** Aligned criteria with modified FDA-approved indication. Deleted references to transplant and modified examples to align with guidelines. Criteria separated for adult and pediatric patients based on the number of prior therapies required prior to Keytruda approval. • **Cutaneous Squamous Cell Cancer:** Added new approval condition and criteria based on FDA-approval. • **Hepatocellular Carcinoma, Including Hepatobiliary Cancers:** Added **Note** to see **Microsatellite Instability-High (MSI-H) or Mismatch Repair Deficient (dMMR) Solid Tumors.** • **Microsatellite Instability High (MSI-H) or Mismatch Repair Deficient (dMMR) Solid Tumors:** Added occult primary (cancer of unknown primary) and biliary tract cancers to list of examples. Endometrioid carcinoma changed to endometrial cancer. Modified colorectal cancer criteria to match FDA-approved use in first-line setting by deleting criteria for prior chemotherapy use and deleting criteria regarding patient not suitable for intensive therapy. Added "unresectable or metastatic" disease. • **Non-Small Cell Lung Cancer:** With regards to tumor proportion score (TPS) for PD-L1, added criteria that tumor is negative for targetable mutations. Included a Note under this criteria to clarify the conditions in which Keytruda can be used. Added new criteria for non-squamous and squamous cell carcinoma separately. Within these histologies, added criteria specifying use of Keytruda when the tumor is targetable mutation-positive or negative. • **Tumor Mutational Burden-High (TMB-H) Cancer:** Added new approval condition and criteria based on FDA-approved indication. • **Vulvar Cancer:** In the existing Note, added reference to see "Tumor Mutational Burden-High (TMB-H) Cancer."	12/02/2020

NSCLC – Non-small cell lung cancer; EGFR – Epidermal growth factor receptor; ALK – Anaplastic lymphoma kinase; cHL – Classic Hodgkin Lymphoma; HNSCC – Head and neck squamous cell carcinoma; MSI-H – Microsatellite Instability-High; dMMR – Mismatch Repair Deficient; PD-L1 – Programmed death-ligand 1; GEJ – Gastroesophageal Junction; NCCN – National Comprehensive Cancer Network; auto-HSCT – Autologous-hematopoietic stem cell transplantation; PMBCL – Primary Mediastinal Large B-Cell Lymphoma.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Kymriah® (tisagenlecleucel suspension for intravenous infusion – Novartis Oncology)

DATE REVIEWED: 04/29/2020

OVERVIEW

Kymriah, a CD19-directed genetically modified autologous T cell immunotherapy, is indicated for the treatment of patients up to 25 years of age with B-cell precursor acute lymphoblastic leukemia (ALL) that is refractory or in second or later relapse.[1] Kymriah is also indicated for adult patients with relapsed or refractory large B-cell lymphoma after two or more lines of systemic therapy including diffuse large B-cell lymphoma (DLBCL) not otherwise specified, high-grade B-cell lymphoma, and DLBCL arising from follicular lymphoma. Regarding this specific indication, Kyrmiah is not indicated for treatment of patients with primary central nervous system lymphoma.[1] Kymriah has a Boxed Warning regarding cytokine release syndrome (CRS) and neurological toxicities. Due to these risks, Kymriah is only available through a restricted program under a Risk Evaluation and Mitigation Strategy (REMS) called the Kymriah REMS.[1]

Kymriah is supplied as a frozen suspension of genetically modified autologous T cells in infusion bag(s) labeled for the specific recipient.[1] Kymriah is shipped directly to the cell laboratory associated with the infusion center in a liquid nitrogen Dewar. The product and patient-specific labels are found inside the Dewar. Store the infusion bag in the vapor phase of liquid nitrogen (less than or equal to minus 120°C) in a temperature-monitored system. Kymriah should be thawed prior to infusion.

Clinical Efficacy

The efficacy of Kymriah in pediatric and young adults with relapsed or refractory B-cell precursor ALL was assessed in an open-label, multicenter, single-arm study called ELIANA.[1-2] Therapy consisted of lymphodepleting chemotherapy (fludarabine 30 mg/m^2 daily for 4 days and cyclophosphamide 500 mg/m^2 daily for 2 days) followed by a single Kymriah dose.[1-2] Among the 63 patients who were evaluable for efficacy in the Kymriah prescribing information, 83% of patients achieved complete remission or complete remission with incomplete blood count recovery.[1] The published study evaluated 75 patients and the overall remission rate (the rate of complete remission or complete remission with incomplete hematologic recovery) within 3 months was 81%.[2] The efficacy of Kymriah was assessed in an open-label, multicenter, single-arm trial called JULIET.[1,3] Patients were ≥ 18 years of age with relapsed or refractory DLBCL who had previously received at least two lines of chemotherapy (including Rituxan® [rituximab injection for intravenous use] and an anathracycline), or relapsed following autologous hematopoietic stem cell transplantation (HSCT).[1] A single Kymriah infusion was administered after 2 to 11 days following the completion of lymphodepleting chemotherapy which involved fludarabine and cyclophosphamide, or Treanda® (bendamustine injection for intravenous use). Lymphodepleting chemotherapy was not required if the patient's white blood cell count was < 1,000 cells/μL. In total, 160 patients were enrolled and 106 patients received Kymriah; 92 patients received product that was manufactured in the US. The efficacy evaluation population included 68 patients and the overall response rate was 50% (n = 34/68).

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for ALL (version 1.2020 – January 15, 2020) address Kymriah.[4,5] In Philadelphia chromosome-positive B-cell ALL, Kymriah is cited as a treatment option for patients < 26 years of age and with refractory disease or ≥ two relapses and failure of two tyrosine kinase inhibitors (TKIs) [category 2A]. For Philadelphia chromosome-negative B-cell ALL, Kymriah is listed as a therapy option for patients < 26 years of age and with refractory disease or ≥ two relapses (category 2A).

The NCCN guidelines for Pediatric ALL (version 2.2020 – November 25, 2019) recommends Kymriah for the treatment of patients with refractory or ≥ 2 relapses, TKI intolerant or refractory disease, or relapse post-hematopoietic stem cell transplantation (category 2A).[5,7] Kymriah is also recommended for patients who are minimal residual disease positive after consolidation therapy, and in Philadelphia chromosome-positive disease with less than complete response, or high-risk genetics.

The NCCN guidelines for B-cell lymphomas (version 1.2020 – January 22, 2020) recommend Kymriah for the treatment of the following relapsed or refractory disease after at least two course of systemic therapy: DLBCL following transformation from follicular lymphoma or nodal marginal zone lymphoma, DLBCL, primary mediastinal large B-cell lymphoma, high-grade B-cell lymphoma, AIDS-related B-cell lymphoma, human herpes virus 8 (HHV8)-positive DLBCL, and post-transplant lymphoproliferative disorders (category 2A).[5,6]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Kymriah. All approvals for initial therapy are provided for the initial approval duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Kymriah as well as the monitoring required for adverse events and long-term efficacy, approval requires Kymriah to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Kymriah is recommended in those who meet the following criteria:

FDA-Approved Indications

183. Acute Lymphoblastic Leukemia, B-Cell Precursor. Approve a single dose if the patient meets the following criteria (A, B, C, D, and E):
- **C)** The patient is < 26 years of age; AND
- **D)** Kymriah is prescribed by or in consultation with an oncologist; AND
- **E)** The patient meets one of the following (i, ii, or iii):
  - a. The patient has disease that is refractory, or in second or later relapse; OR
  - b. The patient is minimal residual disease positive after consolidation therapy; OR
  - c. The patient is Philadelphia chromosome-positive and one of the following (a, b, c, or d):
    - i. Less than complete response; OR
    - ii. High-risk genetics; OR
    - iii. Tyrosine kinase inhibitor intolerant or refractory;
      Note: Tyrosine kinase inhibitors include Sprycel® (dasatinib tablets), imatinib tablets, Iclusig® (ponatinib tablets), Tasigna® (nilotinib capsules), and Bosulif® (bosutinib tablets); OR
    - iv. Relapse post-hematopoietic stem cell transplantation; AND
- **D)** The patient received lymphodepleting chemotherapy prior to Kymriah infusion: AND
- **E)** The patient has not been previously treated with Kymriah.

2. B-Cell Lymphoma. Approve a single dose if the patient meets the following criteria (A, B, C, D, E, and F):
- **A)** The patient meets one of the following diagnoses (i, ii, iii, iv, v, vi, vii, viii, or ix):
  - **i.** Large B-cell lymphoma; OR
  - **ii.** Diffuse large B-cell lymphoma; OR
  - **iii.** Primary mediastinal large B-cell lymphoma; OR

iv. High-grade B-cell lymphoma; OR
v. Diffuse large B-cell lymphoma arising from follicular lymphoma; OR
vi. Diffuse large B-cell lymphoma arising from nodal marginal zone lymphoma; OR
vii. Acquired immune deficiency syndrome (AIDS)-related B-cell lymphoma; OR
viii. Human Herpes Virus 8-positive diffuse large B-cell lymphoma; OR
ix. Post-transplant lymphoproliferative disorders, B-cell type; AND

B) The patient is ≥ 18 years of age; AND
C) Kymriah is prescribed by or in consultation with an oncologist; AND
D) Kymriah is being used for disease that is relapsed or refractory after two or more lines of systemic therapy; AND
E) The patient must meet one of the following (i or ii):
i. The patient received lymphodepleting chemotherapy prior to Kymriah infusion; OR
ii. The patient's white blood cell count is less than or equal to 1 x 10^9/L within 1 week prior to Kymriah infusion; AND
F) The patient has not been previously treated with Kymriah or Yescarta® (axicabtagene ciloleucel injection).

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Kymriah has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

184. Re-treatment with Kymriah. Kymriah is for one time use, repeat dosing is not approvable.

185. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Date Reviewed
New Policy	--	04/24/2019
Annual Revision	**Acute Lymphoblastic Leukemia:** Added additional criteria for approval including minimal residual disease positive after consolidation therapy; and for Philadelphia chromosome-positive disease – less than complete response, high-risk genetics, tyrosine kinase inhibitor intolerant or refractory disease, and relapse post-hematopoietic stem cell transplant.	04/29/2020

	B-cell lymphoma: Added approval criteria for diffuse large B-cell lymphoma arising from nodal marginal zone lymphoma. Revised criteria to not allow previous treatment with Yescarta.	

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Kyprolis Prior Authorization Policy
- Kyprolis (carfilzomib injection for intravenous use – Amgen/Onyx Pharmaceuticals)

REVIEW DATE: 03/10/2021

OVERVIEW

Kyprolis, a proteasome inhibitor, is approved for **multiple myeloma** the following situations:[1]
- for relapsed or refractory disease, in combination with dexamethasone ± Revlimid® (lenalidomide capsules) or Darzalex (daratumumab injection)/dexamethasone in patients who have received one to three lines of previous therapy.
- for relapsed or refractory disease, as a single agent in those who have received one or more lines of therapy.

Safety and efficacy is not established in patients < 18 years of age.

Guidelines

Kyprolis is discussed in guidelines from the National Comprehensive Cancer Network (NCCN).[2]
- **Multiple Myeloma:** The NCCN guidelines (version 4.2021 – December 10, 2020) recommend multiple therapeutic regimens that may be used for primary therapy and previously treated multiple myeloma.[3] For transplant and non-transplant candidates, Kyprolis/Revlimid/dexamethasone is recommended as an other regimen for primary treatment, and Kyprolis/cyclophosphamide/dexamethasone is among the regimens that are useful in certain circumstances. For previously treated multiple myeloma, multiple regimens are listed, including Kyprolis/Revlimid/dexamethasone and Kyprolis/Darzalex (daratumumab injection)/dexamethasone are among the Preferred regimens, whereas Kyprolis (twice weekly)/dexamethasone, Kyprolis/cyclophosphamide/dexamethasone, and Kyprolis/Pomalyst (pomalidomide capsules)/dexamethasone, are listed as other regimens. Kyprolis/Farydak (panobinostat capsules), Kyprolis/cyclophosphamide/Thalomid (thalidomide capsules)/dexamethasone, and Kyprolis (weekly)/dexamethasone are among the regimens that are useful in certain circumstances.
- **Waldenstrom's Macroglobulinemia/Lymphoplasmacytic Lymphoma:** In NCCN guidelines (version 1.2021 – September 1, 2020), Kyprolis/rituximab/dexamethasone is listed among other recommended regimens for primary treatment of Waldenstrom's Macroglobulinemia/lymphoplasmacytic lymphoma.[4]

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Kyprolis. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Kyprolis as well as the monitoring required for adverse events and long-term efficacy, approval requires Kyprolis to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Kyprolis is recommended in those who meet one of the following criteria:

FDA-Approved Indications

14. Multiple Myeloma. Approve for 1 year if the patient meets ALL of the following (A, B, and C):
- **15.** Patient is ≥ 18 years of age; AND
- **16.** Patient meets ONE of the following (i or ii):
  - **A)** Kyprolis will be used in combination with Revlimid (lenalidomide capsules) and dexamethasone; OR
  - **B)** Patient has tried at least ONE prior regimen for multiple myeloma; AND
    Note: Examples include Velcade (bortezomib injection), Revlimid (lenalidomide capsules), Darzalex (daratumumab injection), Ninlaro (ixazomib capsules).
- **17.** The medication is prescribed by or in consultation with an oncologist or a hematologist.

Other Uses with Supportive Evidence

15. Waldenstrom's Macroglobulinemia/Lymphoplasmacytic Lymphoma. Approve for 1 year if the patient meets ALL of the following (A, B, and C):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** The medication will be used in combination with a rituximab product and dexamethasone; AND
- **C)** The medication is prescribed by or in consultation with an oncologist or a hematologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Kyprolis is not recommended in the following situations:

186. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
Annual Revision	**Multiple Myeloma:** To align with other policies and NCCN guidelines, criterion for combination therapy was updated to require dexamethasone and Revlimid to be taken in combination with Kyprolis (previously required dexamethasone and at least one other agent with Revlimid listed as an example). In patients that had tried at least one other regimen, the criterion that required Kyprolis be used as part of a combination regimen was removed.	02/26/2020
Annual Revision	**Multiple Myeloma:** To be consistent with other oncology policies, the requirement that the patient is ≥ 18 years of age was added. **Waldenstrom's Macroglobulinemia/Lymphoplasmacytic Lymphoma:** To align with criteria for multiple myeloma, the requirement that the patient is ≥ 18 years of age was added.	03/10/2021

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Levoleucovorin Products Prior Authorization Policy
- Fusilev® (levoleucovorin injection for intravenous use – Spectrum Pharmaceuticals)
- Khapzory™ (levoleucovorin injection for intravenous use – Spectrum Pharmaceuticals)
- Levoleucovorin injection for intravenous use – various manufacturers

REVIEW DATE: 06/17/2020

OVERVIEW

Levoleucovorin (Fusilev, Khapzory, generics) is the pharmacologically active, levo-isomer of racemic *d,l*-leucovorin.[1,2] Levoleucovorin is a chemically reduced derivative of folic acid, which can counteract the toxic and therapeutic effects of folic acid antagonists, such as methotrexate. In addition, levoleucovorin can enhance the therapeutic and toxic effects of fluoropyrimidines used in oncology.

Levoleucovorin is indicated:
- For rescue after high-dose methotrexate therapy in osteosarcoma, and
- To diminish the toxicity of impaired methotrexate elimination or overdosage of folic acid antagonists, and
- For use in combination chemotherapy with 5-fluorouracil in the treatment of patients with advanced metastatic colorectal cancer.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) Drugs & Biologics Compendium recommends levoleucovorin use in combination with methotrexate for the treatment of gestational trophoblastic neoplasia, rhabdomyosarcoma, T-cell lymphomas, central nervous system cancers, B-cell lymphomas, chronic lymphocytic leukemia/small lymphocytic lymphoma, acute lymphoblastic leukemia, and osteosarcoma.[3] The NCCN Compendium recommends levoleucovorin use in combination with fluorouracil-based chemotherapy for the treatment of occult primary cancer, neuroendocrine and adrenal tumors, hepatocellular carcinoma, ovarian/fallopian tube/primary peritoneal cancer, thymomas and thymic carcinomas, esophageal and esophagogastric junction cancer, anal cancer, colon cancer, gastric cancer, small bowel adenocarcinoma, cervical cancer, rectal cancer, pancreatic adenocarcinoma, and bladder cancer.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of levoleucovorin. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Because of the specialized skills required for evaluation and diagnosis of patients treated with levoleucovorin as well as the monitoring required for adverse events and long-term efficacy, approval requires levoleucovorin to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of levoleucovorin is recommended in those who meet the following criteria:

FDA-Approved Indications

184. Osteosarcoma. Approve for 1 year if the patient meets the following criteria (A and B):
- **A)** Levoleucovorin is used in combination with high-dose methotrexate; AND
- **B)** Levoleucovorin is prescribed by or in consultation with an oncologist.

185. Colon or Rectal Carcinoma. Approve for 1 year if the patient meets the following criteria (A and B):

A) Levoleucovorin is used in combination with fluorouracil-based chemotherapy; AND

B) Levoleucovorin is prescribed by or in consultation with an oncologist.

186. Methotrexate Overdosage, or Impaired Methotrexate Elimination. Approve for 1 month.

Other Uses with Supportive Evidence

187. Cancer Diagnosis Currently Being Treated With Methotrexate. (Note: Examples include T-cell lymphoma, B-cell lymphoma, gestational trophoblastic neoplasm, central nervous system cancer). Approve for 1 year if levoleucovorin is prescribed by or in consultation with an oncologist.

188. Cancer Diagnosis Currently Being Treated With 5-Fluorouracil. (Note: Examples include hepatocellular carcinoma, ovarian cancer, gastric cancer, cervical cancer). Approve for 1 year if levoleucovorin is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Levoleucovorin has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

187. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Libtayo Prior Authorization Policy

- Libtayo® (cemiplimab-rwlc injection, for intravenous use – Regeneron/Sanofi Genzyme)

REVIEW DATE: 10/28/2020; 03/03/2021 selected revision

OVERVIEW

Libtayo, a programmed death receptor-1 (PD-1) blocking antibody, is indicated for the treatment of patients for the following uses:[1]

- **Cutaneous Squamous Cell Carcinoma (CSCC)**, metastatic or locally advanced disease, who are not candidates for surgery or curative radiation.
- **Basal Cell Carcinoma**, treatment of patients with locally advanced or metastatic disease, previously treated with a hedgehog pathway inhibitor or for whom a hedgehog pathway inhibitor is not appropriate.
- **Non-Small Cell Lung Cancer**, first-line treatment in patients with tumors that have high programmed death-ligand 1 (PD-L1) expression (tumor proportion score [TPS] ≥ 50%), as determined by an FDA-approved test, with no epidermal growth factor receptor (EGFR), anaplastic lymphoma kinase (ALK), or ROS1 aberrations. The disease can be locally advanced where patients are not candidates for surgical resection or definitive chemoradiation or for metastatic disease.

GUIDELINES

- **Basal Cell Carcinoma:** According to the National Comprehensive Cancer Network (NCCN) guidelines on basal cell skin cancer (version 2.2021 – February 25, 2021), Libtayo is recommended for locally advanced or metastatic disease previously treated with a hedgehog pathway inhibitor or for whom such a therapy is not appropriate (category 2A).[2]
- **Cutaneous Squamous Cell Carcinoma:** According to the NCCN guidelines (version 2.2020 – July 14, 2020) on squamous cell carcinoma (SCC), the primary goals of treatment are the complete removal of the tumor and the maximal preservation of function and cosmesis.[3] Surgical excision offers the most effective and efficient means for curative therapy, but considerations of patient preference, preservation of function and cosmesis may lead to choosing radiation therapy as primary treatment to achieve optimal results. Libtayo is recommended as a "preferred" therapy (category 2A) for complicated cases of locally advanced disease in which curative surgery and curative radiotherapy are not feasible; for regional disease if curative radiotherapy is not feasible; and also for regional recurrence or distant metastatic disease if surgery or radiotherapy are not feasible.
- **Non-Small Cell Lung Cancer:** The NCCN guidelines for non-small cell lung cancer (version 4.2021 – March 3, 2021) recommend Libtayo as one of the Preferred, category 1, treatment option for first-line therapy for programmed death ligand-1 (PD-L1) ≥ 50% and negative for actionable molecular markers.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Libtayo. Because of the specialized skills required for evaluation and diagnosis of patients treated with Libtayo as well as the monitoring required for adverse events and long-term efficacy, approval requires Libtayo to be prescribed by, or in consultation with, a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Libtayo is recommended in those who meet the following criteria:

FDA-Approved Indications

~~69.~~66. **Basal Cell Carcinoma.** Approve for 1 year if the patient meets ALL of the following criteria (A, B, and C):
- **A)** Patient has locally advanced or metastatic disease; AND
- **B)** Patient meets ONE of the following (i or ii):
  - **i.** Patient has received previous treatment with at least one hedgehog pathway inhibitor; OR
    Note: Examples are Erivedge (vismodegib capsules), Odomzo (sonidegib capsules).
  - **ii.** Hedgehog pathway inhibitor is not an appropriate therapy for patient; AND
    Note: Not appropriate due to intolerance or lack of efficacy.
- **C)** The medication is prescribed by or in consultation with an oncologist.

~~70.~~67. **Cutaneous Squamous Cell Carcinoma.** Approve for 1 year if the patient meets ALL of the following criteria (A, B, and C):
- **A)** Patient has locally advanced or metastatic disease; AND
- **B)** Patient is not a candidate for curative surgery or curative radiation; AND
- **C)** The medication is prescribed by or in consultation with an oncologist.

3. Non-Small Cell Lung Cancer. Approve for 1 year if the patient meets ALL of the following criteria (A, B, C, and D):
- **A)** Patient meets ONE of the following criteria (i or ii):
  - **i.** Patient has locally advanced disease and is not eligible for surgical resection or chemoradiation; OR
  - **ii.** Patient has metastatic disease; AND
- **B)** The tumor proportion score (TPS) for programmed death ligand-1 (PD-L1) as determined by an approved test is ≥ 50%; AND
- **C)** The tumor is negative for actionable mutations; AND
  Note: Examples include sensitizing epidermal growth factor receptor (*EGFR*) mutation, anaplastic lymphoma kinase (*ALK*) fusions, *RET* rearrangement positive, *MET* exon 14 skipping, *NTRK* gene fusion positive, *BRAF V600E* mutation-positive, and *ROS1* rearrangement positive.
- **D)** The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Libtayo is not recommended in the following situations:

275. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Lumoxiti Prior Authorization Policy

- Lumoxiti™ (moxetumomab pasudotox-tdfk injection for intravenous use - AstraZeneca)

REVIEW DATE: 09/23/2020

OVERVIEW

Lumoxiti, a CD22-directed cytotoxin, is indicated for the treatment of adult patients with relapsed or refractory hairy cell leukemia who received at least two prior systemic therapies, including treatment with a purine nucleoside analog.[1] Limitations of Use: Lumoxiti is not recommended for use in patients with a creatinine clearance ≤ 29 mL/min.

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines on Hairy Cell Leukemia (version 1.2020 – August 23, 2020) recommend purine nucleoside analogs (cladribine and/or pentostatin) as first-line agents for hairy cell leukemia.[2,3] Lumoxiti is recommended as a single agent for the treatment of progression of hairy cell leukemia after therapy for relapsed/refractory disease.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Lumoxiti. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Lumoxiti as well as the monitoring required for adverse events and long-term efficacy, approval requires Lumoxiti to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Lumoxiti is recommended in those who meet the following criteria:

FDA-Approved Indications

16. Hairy Cell Leukemia. Approve for 6 months if the patient meets the following criteria (A, B, C, and D):

M) Patient is ≥ 18 years of age; AND

N) Patient has received ≥ 2 prior systemic therapies, including therapy with a purine analog; AND
Note: Purine analogs include cladribine and pentostatin.

O) Patient has an estimated creatinine clearance ≥ 30 mL/min; AND

P) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Lumoxiti is not recommended in the following situations:

3. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Margenza Prior Authorization Policy

- Margenza™ (margetuximab injection for intravenous use – MacroGenics, Inc.)

REVIEW DATE: 02/10/2021

OVERVIEW

Margenza, in combination with chemotherapy, is indicated for the treatment of adult patients with metastatic human epidermal growth factor receptor 2 (**HER2)-positive breast cancer** who have received two or more prior anti-HER2 regimens, at least one of which was for metastatic disease.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) breast cancer guidelines (version 1.2021 – January 15, 2021) have not addressed Margenza.[2] The recommended therapies for HER2-positive disease are as follows: trastuzumab + Perjeta (pertuzumab injection for intravenous use) + docetaxel is category 1, preferred regimen; or trastuzumab + Perjeta + paclitaxel (category 2A, preferred). Other recommended regimens include: Tukysa (tucatinib tablets) + trastuzumab + capecitabine (category 1), Kadcyla (ado-trastuzumab emtansine for intravenous use) [category 1], Enhertu (fam-trastuzumab deruxtecan-nxki injection for intravenous use), trastuzumab + paclitaxel ± carboplatin, trastuzumab + vinorelbine, trastuzumab + capecitabine, lapatinib + capecitabine, trastuzumab + lapatinib, Nerlynx (neratinib tablets) + capecitabine, and trastuzumab + other agents. For hormone receptor-positive (HR+), HER2-positive disease, endocrine therapy options include aromatase inhibitor ± trastuzumab; aromatase inhibitor + trastuzumab ± lapatinib; fulvestrant ± trastuzumab, tamoxifen ± trastuzumab (all category 2A).

Safety

Margenza has Boxed Warning for left ventricular dysfunction and embryo-fetal toxicity.[1] Margenza may lead to reductions in left ventricular ejection fraction (LVEF); treatment should be discontinued for a confirmed clinically significant decrease in left ventricular function.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Margenza. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Margenza as well as the monitoring required for adverse events and long-term efficacy, approval requires Margenza to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Margenza is recommended in those who meet the following criteria:

FDA-Approved Indications

27. Breast Cancer. Approve for 1 year if the patient meets all of the following (A, B, C, D, E, and F):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has metastatic human epidermal growth factor receptor 2 (HER2)-positive disease; AND
- **C)** Patient has tried at least two prior anti-HER2 regimens; AND
  Note: Some examples of anti-HER2 regimens are Perjeta (pertuzumab injection for intravenous use) + trastuzumab + docetaxel, Perjeta + trastuzumab + paclitaxel; Tukysa (tucatinib tablets) + trastuzumab + capecitabine, Kadcyla (ado-trastuzumab emtansine for intravenous use), Enhertu (fam-trastuzumab deruxtecan-nxki injection for intravenous use), trastuzumab + capecitabine, trastuzumab + lapatinib.
- **D)** At least one of the prior anti-HER2 regimen was used for metastatic disease; AND
- **E)** The medication is used in combination with chemotherapy; AND
  Note: Examples of chemotherapy are capecitabine, eribulin, gemcitabine, vinorelbine.
- **F)** The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Margenza is not recommended in the following situations:

4. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Monjuvi Prior Authorization Policy
- Monjuvi® (tafasitamab-cxix injection for intravenous use – MorphoSys US/Incyte)

REVIEW DATE: 08/05/2020

OVERVIEW

Monjuvi, a CD19-directed antibody-drug conjugate, is indicated in combination with Revlimid® (lenalidomide capsules) for adults with relapsed or refractory diffuse large B-cell lymphoma (DLBCL) not otherwise specified, including DLBCL arising from low grade lymphoma, and who are not eligible for autologous stem cell transplant.[1] Monjuvi is administered as a weight-based intravenous infusion. It should be given in combination with Revlimid for a maximum of 12 cycles, then as monotherapy until disease progression or unacceptable toxicity. Accelerated approval was granted for this indication based on overall response rate. Continued approval for this indication may be contingent upon verification and description of clinical benefit in a confirmatory trial.

Guidelines

Monjuvi is not yet addressed in guidelines from the National Comprehensive Cancer Network (NCCN).[2] For second-line or subsequent treatment of relapsed or refractory DLBCL in patients ineligible for transplantation, preferred regimens recommended by NCCN (version 3.2020 – August 4, 2020) include GemOx (gemcitabine/oxaliplatin) ± rituximab and Polivy® (polatuzumab vedotin intravenous injection) ± bendamustine ± rituximab (after ≥ two prior therapies). A variety of other chemotherapy-based regimens ± rituximab are also included among the other recommended regimens. Xpovio® (selinexor tablets), a nuclear export inhibitor, is listed for third-line or subsequent use.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Monjuvi. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Monjuvi as well as the monitoring required for adverse events and long-term efficacy, approval requires Monjuvi to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Monjuvi is recommended in those who meet the following criteria:

FDA-Approved Indications

189. Diffuse Large B-Cell Lymphoma. Approve for 1 year if the patient meets the following criteria (A, B, C, D, and E):
- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has been treated with at least one prior chemotherapy regimen; AND
- **C)** According to the prescriber, the patient is not eligible for autologous stem cell transplant; AND
- **D)** Patient meets one of the following (i or ii):
  - **i.** Monjuvi will be used in combination with Revlimid (lenalidomide capsules); OR
  - **ii.** Patient has already received 12 cycles of Monjuvi; AND
- **E)** The agent is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Monjuvi is not recommended in the following situations:

188. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
New Policy	--	08/05/2020

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Mylotarg Prior Authorization Policy

- Mylotarg™ (gemtuzumab ozogamicin for injection – Pfizer)

REVIEW DATE: 07/15/2020; selected revisions 07/29/2020

OVERVIEW

Mylotarg, an antibody-drug conjugate directed towards the CD33 antigen, is indicated for the treatment of:

- **CD33-positive acute myeloid leukemia (AML)**, newly diagnosed, in adults and pediatric patients ≥ 1 month of age; AND
- **CD33-positive AML**, relapsed or refractory, in adults and in pediatric patients ≥ 2 years of age.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for AML (version 3.2020 – December 23, 2019) recommend Mylotarg for induction therapy, post-remission therapy, and for relapsed/refractory CD33-positive AML.[2,3] Mylotarg can be used as a single agent or in combination with cytarabine and daunorubicin. The NCCN guidelines for AML also recommend Mylotarg in patients ≥ 18 years of age for induction and consolidation therapy for high-risk (white blood cell count > 10,000/µL) acute promyelocytic leukemia, and for relapsed disease. Mylotarg can be used in combination with tretinoin and/or arsenic trioxide.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Mylotarg. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Mylotarg as well as the monitoring required for adverse events and long-term efficacy, approval requires Mylotarg to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Mylotarg is recommended in those who meet the following criteria:

FDA-Approved Indications

17. **Acute Myeloid Leukemia – Newly Diagnosed CD33-Positive.** Approve for 1 year if the patient meets the following criteria (A and B):
    - **F)** Patient is ≥ 1 month of age; AND
    - **G)** Mylotarg is prescribed by or in consultation with an oncologist.

18. **Acute Myeloid Leukemia – Relapsed or Refractory CD33-Positive.** Approve for 1 month if the patient meets the following criteria (A and B):
    A) Patient is ≥ 2 years of age; AND
    B) Mylotarg is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

19. **Acute Promyelocytic Leukemia – High Risk.** Approve for 6 months if the patient meets the following criteria (A, B, and C):
    A) Patient is ≥ 18 years of age; AND
    B) Patient has high risk disease, defined as white blood cell count > 10,000/mcL; AND
    C) Mylotarg is prescribed by or in consultation with an oncologist.

20. **Acute Promyelocytic Leukemia – First Relapse (Morphologic or Molecular).** Approve for 6 months if the patient meets the following criteria (A and B):
    A) Patient is ≥ 18 years of age; AND
    B) Mylotarg is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Mylotarg is not recommended in the following situations:

189. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

Annual Revision	**Acute Myeloid Leukemia – Newly Diagnosed CD33-Positive**. Revised approval criteria down to ≥ 1 month of age.	07/15/2020
Selected Revision	**Acute Promyelocytic Leukemia – First Relapse (Morphologic or Molecular)**. Revised age criteria to ≥ 18 years of age.	07/29/2020

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Oncaspar® (pegaspargase injection for intramuscular or intravenous use – Servier)

DATE REVIEWED: 06/03/2020

OVERVIEW

Oncaspar is a conjugate of *Escherichia coli*-derived L-asparaginase and monomethoxypolyethylene glycol (mPEG).[1] L-asparaginase catalyzes the breakdown of L-asparagine into aspartic acid and ammonia. Leukemia cells have a

deficiency of asparagine synthetase and rely on exogenous sources of L-asparagine for survival. Oncaspar depletes plasma L-asparagine levels leading to leukemia cell death.

Oncaspar is indicated as a component of a multi-agent chemotherapy regimen for:

- The first-line treatment of pediatric and adult patients with acute lymphoblastic leukemia (ALL), and
- The treatment of pediatric and adult ALL patients with hypersensitivity to native forms of L-asparaginase.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) guidelines for ALL (version 1.2020 – January 15, 2020) and the NCCN guidelines for Pediatric ALL (version 2.2020 – November 25, 2019) recommend pegaspargase as a component of a multiagent chemotherapeutic regimen for induction/consolidation therapy for ALL, for induction therapy in Philadelphia chromosome-negative ALL in patients ≥ 65 years of age, for relapsed/refractory Philadelphia chromosome-negative ALL, and relapsed/refractory Philadelphia chromosome-positive ALL.[2,3,5]

The NCCN guidelines for T-cell lymphomas (version 1.2020 – January 6, 2020) recommend pegaspargase as a component of therapy for extranodal NK/T-cell lymphoma, nasal type and as an alternative induction regimen if no response or progressive disease after primary treatment for hepatosplenic gamma-delta T-cell lymphoma.[3,4]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Oncaspar. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Oncaspar as well as the monitoring required for adverse events and long-term efficacy, approval requires Oncaspar to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Oncaspar is recommended in those who meet the following criteria:

FDA-Approved Indications

190. Acute Lymphoblastic Leukemia. Approve for 1 year if Oncaspar is prescribed by or consultation with an oncologist.

Other Uses with Supportive Evidence

191. Extranodal NK/T-cell Lymphoma, Nasal Type. Approve for 1 year if Oncaspar is prescribed by or in consultation with an oncologist.

192. Hepatosplenic Gamma-Delta T-cell Lymphoma. Approve for 1 year if the patient meets the following criteria (A and B):

A) The patient had no response or progressive disease after primary treatment; AND

B) Oncaspar is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Oncaspar has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

190. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

New Policy	--	06/05/2019
Annual Revision	Extranodal NK/T-cell Lymphoma, Nasal Type: Removed "Oncaspar is used for one of the following (i, ii, or iii)" criteria. Added criteria for Hepatosplenic Gamma-Delta T-cell Lymphoma.	06/03/2020

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Onivyde® (irinotecan liposome injection – Ipsen Biopharmaceuticals)

DATE REVIEWED: 04/22/2020

OVERVIEW

Onivyde is a topoisomerase 1 inhibitor formulated into a liposomal dispersion for intravenous (IV) use.[1] Topoisomerase 1 inhibitors prevent the repair of breaks in single-strands of DNA, eventually leading to double-strand damage to DNA and cell death.

Onivyde is indicated, in combination with fluorouracil and leucovorin, for the treatment of patients with metastatic adenocarcinoma of the pancreas after disease progression following gemcitabine-based therapy.[1] Limitation of use: Onivyde is not indicated as a single agent for the treatment of patients with metastatic adenocarcinoma of the pancreas.

Guidelines

The National Comprehensive Cancer Network (NCCN) Pancreatic Adenocarcinoma practice guidelines (Version 1.2020 – November 26, 2019) recommend Onivyde, in combination with fluorouracil and leucovorin, for the second-line treatment of locally advanced, or metastatic pancreatic adenocarcinoma in patients with Eastern Cooperative Oncology Group (ECOG) performance status of 0 to 2.[2,3]

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Onivyde. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with

Onivyde as well as the monitoring required for adverse events and long-term efficacy, approval requires Onivyde to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Onivyde is recommended in those who meet the following criteria:

FDA-Approved Indications

---

193. Pancreatic Adenocarcinoma, Locally Advanced or Metastatic. Approve for 1 year if the patient meets the following criteria (A, B, and C):

- **A)** Patient has tried at least one chemotherapy regimen for pancreatic adenocarcinoma, either gemcitabine-based chemotherapy, or fluoropyrimidine-based chemotherapy without irinotecan; AND
- **B)** Onivyde will be used in combination with fluorouracil and leucovorin; AND
- **C)** Onivyde is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Onivyde has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions.

191. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Opdivo Prior Authorization Policy

- Opdivo® (nivolumab injection for intravenous use – Bristol-Myers Squibb)

REVIEW DATE: 01/13/2021

OVERVIEW

Opdivo, a human programmed death receptor-1 (PD-1) blocking antibody, is indicated for the treatment of the following:[1]

- **Classical Hodgkin lymphoma**, for adults that have relapsed or progressed after* autologous hematopoietic stem cell transplantation (auto-HSCT) and Adcetris® (brentuximab vedotin intravenous injection) OR three or more lines of systemic therapy that includes auto-HSCT.
- **Colorectal cancer**, with or without Yervoy for patients ≥ 12 years of age with microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR) metastatic disease that has progressed following treatment with a fluoropyrimidine, oxaliplatin, and irinotecan.*
- **Esophageal squamous cell carcinoma**, for patients with unresectable advanced, recurrent, or metastatic disease after prior fluoropyrimidine- and platinum-based chemotherapy.
- **Head and neck squamous cell carcinoma**, in patients with recurrent or metastatic disease with disease progression on or after platinum-based therapy.
- **Hepatocellular carcinoma** (HCC), in patients who have been previously treated with Nexavar® (sorafenib tablets), with or without Yervoy.*
- **Malignant pleural mesothelioma:**
  - First-line treatment, in combination with Yervoy (ipilimumab intravenous injection) of adult patients with unresectable disease.
- **Melanoma**, in patients with:
  - Unresectable or metastatic disease as a single agent, OR
  - Unresectable or metastatic disease in combination with Yervoy® (ipilimumab intravenous injection) in patients with melanoma;** AND
  - Adjuvant treatment for lymph node involvement or metastatic disease who have undergone complete resection.
- **Non-small cell lung cancer**:
  - As first-line treatment in combination with Yervoy, in adults with metastatic disease expressing programed death-ligand 1 (≥ 1%) as determined by an FDA-approved test, without epidermal growth factor receptor (*EGFR*) or anaplastic lymphoma kinase (*ALK*) genomic tumor aberrations; AND
  - As first-line treatment in combination with Yervoy and two cycles of platinum-doublet chemotherapy, in adults with recurrent or metastatic disease without *EGFR* or *ALK* genomic tumor aberrations; AND
  - Patients with metastatic disease and progression on or after platinum-based chemotherapy. Patients with *EGFR* or *ALK* genomic tumor aberrations should have disease progression on FDA-approved therapy for these aberrations prior to receiving Opdivo.
- **Renal cell carcinoma** (RCC):
  - Patients with advanced disease who have received prior anti-angiogenic therapy; AND
  - In combination with Yervoy, for patients with intermediate or poor risk and previously untreated advanced RCC.
- **Urothelial carcinoma**, in patients with advanced or metastatic disease who:*
  - Have disease progression during or following platinum-containing chemotherapy; OR
  - Who have disease progression within 12 months of neoadjuvant or adjuvant treatment with platinum-containing chemotherapy.

* This indication is approved under accelerated approval based on overall response rate and duration of response. Continued approval for this indication may be contingent upon verification and description of clinical benefit in the confirmatory trials.

** This indication is approved under accelerated approval based on progression-free survival. Continued approval for this indication may be contingent upon verification and description of clinical benefit in the confirmatory trials.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Opdivo. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Opdivo as well as the monitoring required for adverse events and long-term efficacy, approval requires the medication to be prescribed by or in consultation with a prescriber who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Opdivo is recommended in those who meet the following criteria:

FDA-Approved Indications

7. **Classic Hodgkin Lymphoma (cHL).** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
   - **A)** Patient is ≥ 18 years of age; AND
   - **B)** Patient meets one of the following conditions (i, ii, or iii):[2]
     - **i.** Patient has had a hematopoietic stem cell transplantation (HSCT); OR
     - **ii.** Patient has tried three or more systemic regimens AND this includes an auto-HSCT as one line of therapy; OR
       Note: Examples are ABVD (doxorubicin, bleomycin, vinblastine, and dacarbazine), Sanford V (doxorubicin, vinblastine, mechlorethamine, etoposide, vincristine, bleomycin, and prednisone), escalated BEACOPP (bleomycin, etoposide, doxorubicin, cyclophosphamide, vincristine, procarbazine, and prednisone).
     - **iii.** Patient is not eligible for transplant according to the prescriber; AND
   - **C)** The medication is prescribed by or in consultation with an oncologist.

     Note: For pediatric patients, see **Pediatric Hodgkin Lymphoma** criteria.

8. **Colon or Rectal Cancer, Microsatellite Instability-High (MSI-H) or Mismatch Repair Deficient (dMMR).** Approve for 1 year if the patient meets ALL of the following (A, B, and C):
   - **A)** Patient is ≥ 12 years of age; AND
   - **B)** Patient meets one of the following (i or ii):
     - **i.** Patient has tried chemotherapy; OR
       Note: Examples of chemotherapy are fluoropyrimidine such as 5-fluorouracil (5-FU), capecitabine; oxaliplatin, irinotecan, or an adjunctive chemotherapy regimen such as FOLFOX (5-FU, leucovorin, and oxaliplatin) or CapeOX (capecitabine and oxaliplatin).
     - **ii.** Patient has unresectable or metastatic disease and is not a candidate for intensive therapy, according to the prescriber; AND
   - **C)** The medication is prescribed by or in consultation with an oncologist.

9. **Esophageal Squamous Cell Carcinoma.** Approve for 1 year if the patient meets BOTH of the following (A and B):
   - **A)** Patient has tried fluoropyrimidine- and platinum-based chemotherapy; AND
     Note: Examples of fluoropyrimidines are 5-fluorouracil (5-FU) and capecitabine. Examples of platinum medications are cisplatin, carboplatin, and oxaliplatin.
   - **B)** The medication is prescribed by or in consultation with an oncologist.

10. **Head and Neck Squamous Cell Carcinoma.** Approve for 1 year if the patient meets ALL of the following (A, B, and C):

A) Patient has non-nasopharyngeal disease; AND
B) Patient meets ONE of the following conditions (i or ii):
  i. Patient has tried chemotherapy; OR
  Note: Examples of chemotherapy are cisplatin, carboplatin**,** Erbitux® (cetuximab intravenous infusion), 5-fluorouracil (5-FU), capecitabine, paclitaxel, docetaxel, methotrexate (MTX).
  ii. A platinum-containing chemotherapy regimen or other chemotherapy is contraindicated, according to the prescriber; AND
C) The medication is prescribed by or in consultation with an oncologist.

11. Hepatocellular Carcinoma, Including Hepatobiliary Cancers. Approve for 1 year if the patient meets BOTH of the following (A and B):
G) Patient has tried at least one tyrosine kinase inhibitor (TKI); AND
Note: Examples are Nexavar (sorafenib tablets), Lenvima (levatinib capsules).
H) The medication is prescribed by or in consultation with an oncologist.

12. Malignant Pleural Mesothelioma. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
A) Patient is ≥ 18 years of age; AND
B) Patient has unresectable disease; AND
C) The medication is used in combination with Yervoy (ipilimumab for injection); AND
D) The medication is prescribed by or in consultation with an oncologist.

13. Melanoma Approve for the duration noted if the patient meets BOTH of the following (A and B):
Note: This includes cutaneous melanoma, brain metastases due to melanoma, and uveal melanoma.
A) Patient meets ONE of the following (i or ii):
  i. Approve for 1 year if the patient has unresectable, advanced, or metastatic melanoma; OR
  ii. Approve for up to 1 year of treatment (total) if Opdivo will be used as adjuvant treatment; AND
  Note: Examples are in a patient with no evidence of disease following resection of node-positive disease, locoregional recurrence, or in-transit recurrence.
B) The medication is prescribed by or in consultation with an oncologist.

14. Non-Small Cell Lung Cancer (NSCLC). Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
A) Patient is ≥ 18 years of age; AND
B) Patient has advanced or metastatic disease; AND
C) Patient meets one of the following (i, ii, or iii):
  i. Opdivo is used as first-line therapy and the patient meets all of the following (a, b, and c):
    a) The tumor expresses programmed death-ligand 1 (PD-L1) ≥ 1% as determined by an FDA-approved test; AND
    b) Opdivo will be used in combination with Yervoy® (ipilimumab intravenous injection); AND
    c) The tumor is negative for actionable mutations; OR
    Note: Examples of actionable mutations include sensitizing epidermal growth factor receptor (*EGFR*) mutation, anaplastic lymphoma kinase (*ALK*) fusions, *NTRK* gene fusion-positive, *ROS1, BRAF V600E, MET 14* skipping mutation, *RET* rearrangement.
  ii. Opdivo is used as first-line therapy and the patient meets BOTH of the following (a and b):
  Note: This is regardless of PD-L1 status.
    a) The tumor is negative for actionable mutations; AND
    Note: Examples of actionable mutations include sensitizing epidermal growth factor receptor (*EGFR*) mutation, anaplastic lymphoma kinase (*ALK*) fusions, *NTRK* gene fusion-positive, *ROS1, BRAF V600E, MET 14* skipping mutation, *RET* rearrangement.

b) The medication will be used in combination with Yervoy (ipilimumab intravenous injection) AND platinum-doublet chemotherapy; OR
Note: Examples of platinum-doublet chemotherapy are carboplatin or cisplatin with Alimta (pemetrexed for injection), carboplatin and paclitaxel.

iii. Opdivo is used as subsequent therapy and the patient meets all of the following (a, b, and c):

a) Patient has tried systemic chemotherapy; AND
Note: Examples of systemic chemotherapy include cisplatin, carboplatin, Alimta (pemetrexed injection], Abraxane (paclitaxel albumin-bound injection), gemcitabine, paclitaxel.

b) Patient has not progressed on prior therapy with a programmed death-1 (PD-1)/PD-ligand 1 (PD-L1) inhibitor; AND
Note: This includes previous therapy with either one of Opdivo, Keytruda (pembrolizumab for injection), or Tecentriq (atezolizumab for injection).

c) If the tumor is positive for an actionable mutation, the patient has received targeted drug therapy for the specific mutation.
Note: Examples of actionable mutations include sensitizing epidermal growth factor receptor (*EGFR*) mutation, anaplastic lymphoma kinase (*ALK*) fusions, *NTRK* gene fusion-positive, *ROS1*, *BRAF V600E, MET 14* skipping mutation, *RET* rearrangement; AND

D) The medication is prescribed by or in consultation with an oncologist.

15. Renal Cell Carcinoma. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

A) Patient has advanced (e.g., relapsed, Stage IV, or metastatic) disease; AND

B) If used as first-line therapy, the medication is used in combination with Yervoy (ipilimumab for injection); AND

C) The medication is prescribed by or in consultation with an oncologist.

16. Urothelial Carcinoma. Approve for 1 year if the patient meets BOTH of the following (A and B):

A) Patient has tried at least one other chemotherapy regimen; AND
Note: Examples of chemotherapy regimens are cisplatin, carboplatin, gemcitabine, Keytruda (pembrolizumab intravenous infusion), Tecentriq (atezolizumab intravenous infusion).

B) The medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

17. Anal Carcinoma. Approve for 1 year if the patient meets BOTH of the following (A and B):

C) Patient has received other chemotherapy; AND
Note: Examples of chemotherapy are 5-fluorouracil (5-FU), cisplatin, carboplatin plus paclitaxel, FOLFOX (oxaliplatin, leucovorin, and 5-FU).

D) The medication is prescribed by or in consultation with an oncologist.

18. Endometrial Carcinoma. Approve for 1 year if the patient meets ALL of the following (A, B, and C):

A) Patient has progressed on at least one prior systemic therapy; AND
Note: Examples are carboplatin, paclitaxel, docetaxel, cisplatin, doxorubicin, topotecan, ifosfamide, everolimus/letrozole.

B) Patient has mismatch repair deficient (dMMR) disease; AND

C) The medication is prescribed by or in consultation with an oncologist.

19. Extranodal NK/T-Cell Lymphoma, Nasal Type. Approve for 1 year if the patient meets ALL of the following (A and B):

A) Patient has received an asparaginase-based chemotherapy regimen; AND
Note: Examples of asparaginase-based chemotherapy are dexamethasone, ifosfamide, pegaspargase, etoposide; and gemcitabine, pegaspargase, oxaliplatin.
B) The medication is prescribed by or in consultation with an oncologist.

20. Gastric Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
A) The disease is negative for human epidermal growth factor receptor 2 (HER2) overexpression; AND
B) The tumor expression for programmed death ligand-1 (PD-L1) has a combined positive score (CPS) ≥ 5; AND
C) The medication is used in combination with fluoropyrimidine (fluorouracil or capecitabine) and oxaliplatin; AND
D) The medication is prescribed by or in consultation with an oncologist.

21. Gestational Trophoblastic Neoplasia. Approve for 1 year if the patient meets BOTH of the following (A and B):
A) Patient meets one of the following (i or ii):
i. Patient has tried at least one previous chemotherapy regimen for recurrent or progressive disease; OR
Note: Examples of chemotherapy regimens contain etoposide, cisplatin/carboplatin, paclitaxel, bleomycin, ifosfamide, methotrexate.
ii. Patient has methotrexate-resistant high-risk disease; AND
B) The medication is prescribed by or in consultation with an oncologist.

22. Merkel Cell Carcinoma. Approve for 1 year if the patient meets BOTH of the following (A and B):
A) Patient has disseminated Merkel cell carcinoma; AND
B) The medication is prescribed by or in consultation with an oncologist.

23. Pediatric Hodgkin Lymphoma. Approve for 1 year if the patient meets ALL of the following (A, B, C, and D):
A) Patient is < 18 years of age; AND
B) Patient has tried at least one prior systemic chemotherapy; AND
Note: Examples are AVPC (doxorubicin, vincristine, prednisone, cyclophosphamide), ABVE-PC (doxorubicin, bleomycin, vincristine, etoposide, prednisone, cyclophosphamide), OEPA (vincristine, etoposide, prednisone, doxorubicin).
C) If used for re-induction therapy, the medication is used in combination with Adcetris (brentuximab vedotin); AND
D) The medication is prescribed by or in consultation with an oncologist.

24. Small Bowel Adenocarcinoma. Approve for 1 year if the patient meets ALL of the following (A, B, and C):
A) Patient has advanced or metastatic disease that is deficient mismatch repair/microsatellite instability-high (dMMR/MSI-H); AND
B) Patient meets one of the following criteria (i or ii):
i. If the medication is used as initial therapy, the patient has tried oxaliplatin in the adjuvant setting or has a contraindication to oxaliplatin; OR
ii. The medication will be used as subsequent therapy; AND
C) The medication is prescribed by or in consultation with an oncologist.

19. Vulvar Cancer. Approve for 1 year if the patient meets ALL of the following (A, B, and C):
A) Patient has human papilloma virus (HPV)-related disease; AND

B) Patient has tried at least one prior systemic therapy; AND
Note: Examples are cisplatin, carboplatin, fluorouracil, paclitaxel, bevacizumab.
C) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Opdivo is not recommended in the following situations:

276. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
New Policy	New criteria	12/18/2019
Selected Revision	**Non-Small Cell Lung Cancer:** Added criteria for use of Opdivo as first-line therapy. **Extranodal NK/T-Cell Lymphoma, Nasal Type:** Added new approval condition and criteria.	06/24/2020
Annual Revision	**Classic Hodgkin Lymphoma:** Added age requirement of at least 18 years since indication is in adults. Added Note referring to Pediatric Hodgkin Lymphoma indication for pediatric patients. **Endometrial Carcinoma:** Added new approval condition and criteria based on guidelines. **Gastric Cancer:** Added new approval condition and criteria based on guidelines/compendium. **Malignant Pleural Mesothelioma:** Moved to FDA-approved uses. Modified criteria and deleted requirement of prior therapy since it is approved for first-line use. Added age requirement for adults, criteria for use in combination with Yervoy, and disease is unresectable. **Non-Small Cell Lung Cancer:** Added age requirement of at least 18 years since indication is in adults. Added new criteria based on FDA-approval for use in combination with Yervoy and platinum-doublet chemotherapy and no actionable mutations. In subsequent therapy criteria, deleted specification of nonsquamous cell NSCLC. In reference to mutations, changed verbiage from "targetable" mutations to "actionable" mutations. Added *NTRK* gene fusion-positive to list of examples of actionable mutations and specified *BRAF* as *V600E* mutation. **Pediatric Hodgkin Lymphoma:** Added criteria and approval condition based on guidelines. **Renal Cell Carcinoma:** Added criteria that if medication is used first-line, it is used in combination with Yervoy. **Small Cell Lung Cancer:** Removed approval condition and criteria since FDA-approval for this indication has been rescinded since confirmatory trials did not meet overall survival endpoint. **Vulvar Cancer:** Added new approval condition and criteria based on guidelines.	01/13/2021

NSCLC – Non-small cell lung cancer.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Padcev Prior Authorization Policy

- Padcev™ (enfortumab vedotin – ejfv injection for intravenous use – Astellas Pharma and Seattle Genetics)

REVIEW DATE: 12/16/2020

OVERVIEW

Padcev, an antibody-drug conjugate, is indicated for the treatment of adult patients with locally advanced or metastatic urothelial cancer who have previously received a programmed death receptor-1 (PD-1) or programmed death-ligand 1 (PD-L1) inhibitor, and a platinum-containing chemotherapy in the neoadjuvant/adjuvant, locally advanced or metastatic setting.[1]

Guidelines

The National Comprehensive Cancer Network (NCCN) **bladder cancer** clinical practice guidelines (version 6.2020 – July 16, 2020) recommend Padcev for the subsequent treatment of locally advanced or metastatic urothelial carcinoma of the bladder, upper genitourinary tract, prostate, and urethra.[2,3] Patients should have previously received platinum-containing chemotherapy and a checkpoint inhibitor, if eligible.

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Padcev. All approvals are provided for the duration noted below.

Because of the specialized skills required for evaluation and diagnosis of patients treated with Padcev as well as the monitoring required for adverse events and long-term efficacy, approval requires Padcev to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Padcev is recommended in those who meet the following criteria:

FDA-Approved Indications

194. Urothelial Carcinoma. Approve for 1 year if the patient meets the following criteria (A, B, C, D, and E):

- **A)** Patient is ≥ 18 years of age; AND
- **B)** Patient has locally advanced or metastatic disease; AND
- **C)** Patient has previously received a programmed death receptor-1 or programmed death-ligand 1 inhibitor (checkpoint inhibitor), unless the prescriber determines the patient is not eligible for checkpoint inhibitor therapy; AND
  Note: Programmed death receptor-1 and programmed death-ligand 1 inhibitors include: Opdivo® (nivolumab injection), Keytruda® (pembrolizumab injection), Tecentriq® (atezolizumab injection), Bavencio® (avelumab injection), and Imfimzi® (durvalumab injection).
- **D)** Patient has previously received platinum-containing chemotherapy, unless the prescriber determines the patient is not eligible for platinum chemotherapy; AND
  Note: Examples include cisplatin, carboplatin, and oxaliplatin.
- **E)** Padcev is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Padcev is not recommended in the following situations:

192. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Pepaxto Utilization Review Medical Policy
- Pepaxto® (melphalan flufenamide intravenous infusion – Oncopeptides)

REVIEW DATE: 03/10/2021

OVERVIEW
Pepaxto, an alkylating drug, is indicated in combination with dexamethasone, for treatment of adults with relapsed or refractory **multiple myeloma**, who have received at least four prior lines of therapy, and whose disease is refractory to at least one proteasome inhibitor, one immunomodulatory agent, and one CD38-directed monoclonal antibody. Pepaxto is not recommended for use as a conditioning regimen for transplant.

Guidelines
Pepaxto is not addressed in current guidelines from the National Comprehensive Cancer Network (NCCN).[2] NCCN guidelines for multiple myeloma (version 4.2021 – December 10, 2020) address the diagnosis, treatment, and follow-up for patients with multiple myeloma.[2,3] Although Pepaxto is not addressed, other formulations of melphalan (melphalan, melphalan hydrochloride) are addressed in the guidelines. For non-transplant candidates, melphalan in combination with Darzalex/bortezomib/prednisone is among the regimens for primary therapy.

POLICY STATEMENT
Prior Authorization is recommended for prescription benefit coverage of Pepaxto. All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Pepaxto as well as the monitoring required for adverse events and long-term efficacy, approval requires Pepaxto to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA
Coverage of Pepaxto is recommended in those who meet one of the following criteria:

FDA-Approved Indications

21. Multiple Myeloma. Approve for 1 year if the patient meets ALL of the following (A, B, C, D, and E):
- **18.** Patient is ≥ 18 years of age; AND
- **19.** The medication will be used in combination with dexamethasone; AND
- **20.** Patient has tried at least four regimens for multiple myeloma; AND
- **21.** Among the previous therapies tried, the patient has received at least one drug from each of the following classes (i, ii, and iii):
  - **i.** Proteasome inhibitor; AND
    Note: Examples include Velcade (bortezomib injection), Kyprolis (carfilzomib infusion), Ninlaro (ixazomib capsules).
  - **ii.** Immunomodulatory drug; AND
    Note: Examples include Revlimid (lenalidomide capsules), Pomalyst (pomalidomide capsules), Thalomid (thalidomide capsules).
  - **iii.** Anti-CD38 monoclonal antibody; AND

Note: For example, Darzalex (daratumumab infusion), Darzalex Faspro (daratumumab and hyaluronidase-fihj subcutaneous injection), or Sarclisa (isatuximab-irfc infusion).

22. The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Pepaxto is not recommended in the following situations:

193. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

HISTORY

Type of Revision	Summary of Changes	Review Date
New policy	--	03/10/2021

PRIOR AUTHORIZATION POLICY

POLICY: Oncology (Injectable) – Perjeta Prior Authorization Policy

- Perjeta® (pertuzumab injection, for intravenous use – Roche/Genentech)

REVIEW DATE: 07/29/2020

OVERVIEW

Perjeta, a human epidermal growth factor receptor 2 (HER2) antagonist, is indicated for the treatment of HER2-positive breast cancer for the following uses:[1]

- **Neoadjuvant treatment,** of patients with locally advanced, inflammatory, or early stage disease (either greater than 2 cm in diameter or node positive) as part of a complete treatment regimen for early breast cancer, in combination with trastuzumab and chemotherapy.
- **Adjuvant treatment,** of patients with early disease at high risk of recurrence, in combination with trastuzumab and chemotherapy.
- **Metastatic disease,** in combination with trastuzumab and docetaxel in patients who have not received prior anti-HER2 therapy or chemotherapy for metastatic disease.

Guidelines

The National Comprehensive Cancer Network (NCCN) breast cancer guidelines (version 5.2020 – July 15, 2020) and Compendium has the following recommendations.[2,3] For preoperative (neoadjuvant)/adjuvant therapy in HER2-positive disease, doxorubicin/cyclophosphamide followed by paclitaxel plus trastuzumab and Perjeta is one of the preferred regimens (category 2A). Docetaxel/carboplatin/trastuzumab/Perjeta is another recommend regimen (category 2A). Under other recommended regimens, doxorubicin/cyclophosphamide followed by docetaxel + trastuzumab + Perjeta is also listed (category 2A). In the neoadjuvant/adjuvant setting, the chemotherapy agents in combination with trastuzumab + Perjeta are administered for usually four cycles, followed by trastuzumab ± Perjeta to complete 1 year of therapy.

In the metastatic setting, the preferred regimens are Perjeta + trastuzumab + docetaxel (category 1) or Perjeta + trastuzumab + paclitaxel (category 2A). In this setting, chemotherapy + trastuzumab + Perjeta is continued until disease progression or unmanageable toxicity.

The NCCN guidelines and compendium recommends use of Perjeta in combination with trastuzumab in patients with HER2-amplified, *RAS* and *BRAF* wild-type, colon and rectal cancer.[3-5] Perjeta is recommended for use in a variety of therapy settings (e.g., adjuvant therapy, primary treatment, subsequent therapy) in combination with trastuzumab, in patients who are not appropriate for intensive therapy and with no previous treatment with a HER2 inhibitor. It is category 2A recommended for primary and subsequent therapy settings; category 2B recommended for adjuvant therapy.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Perjeta. All approvals are provided for the duration noted below. Because of the specialized skills required for the evaluation and diagnosis of patients treated with Perjeta, as well as the monitoring required for the adverse events and long-term efficacy, approval requires Perjeta to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Perjeta is recommended in those who meet the following criteria:

FDA-Approved Indications

28. Breast Cancer – Neoadjuvant or Adjuvant Therapy. Approve for 1 year (total) if the patient meets the following criteria (A, B, C, and D):
- **A)** Patient has human epidermal growth factor receptor 2 (HER2)-positive disease; AND
- **B)** Patient meets ONE of the following criteria (i or ii):
  - **i.** The medication will be used in combination with chemotherapy; OR
    Note: Examples include docetaxel, paclitaxel.
  - **ii.** The medication is continued after chemotherapy to complete 1 year of neoadjuvant or adjuvant therapy; AND
- **C)** Perjeta will be used in combination with a trastuzumab product; AND
- **D)** The medication is prescribed by or in consultation with an oncologist.

2. Breast Cancer – Metastatic Disease. Approve for 1 year if the patient meets all of the following (A, B, C, and D):
- **A)** Patient has human epidermal growth factor receptor 2 (HER2)-positive disease; AND
- **B)** Patient has not been previously treated with anti-HER2 therapy or chemotherapy for metastatic disease; AND
- **C)** The medication will be used in combination with trastuzumab and chemotherapy; AND
  Note: Examples of chemotherapy are docetaxel, paclitaxel.
- **D)** The medication is prescribed by or in consultation with an oncologist.

Other Uses with Supportive Evidence

3. Colon or Rectal Cancer. Approve for 1 year if the patient meets the following criteria (A, B, and C):
- **A)** Patient has human epidermal growth factor receptor 2 (HER2)-positive disease; AND

B) The medication is used in combination with trastuzumab; AND
C) The medication is prescribed by or in consultation with an oncologist.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Perjeta is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.
